By the treaty of Paris (1856) Russia relinquished the right to keep war-vessels on the Black Sea, and lost a part of Bessarabia. But during the Franco-German war (1870), when no resistance could be made, she announced her resumption of supremacy on the Black Sea, and Bessarabia was restored by the treaty of Berlin (1878). From the first, Alexander evinced liberal tendencies. He opened the empire more than ever before to the arts, ideas, and civilization of the West. In 1861 he gained the title of The Liberator, by decreeing the emancipation of the serfs. This great reform reconstructed the economic and political relations of the people. The state indemnified the landlords, and the peasants became the collective possessors of the communal land. In 1863 a fresh Polish insurrection was suppressed by Mouravieff with great rigor. Aside from this severity, the reign was signalized by liberal progress and unprecedented material development. Conspicuous among its features was the prosecution of the Russian advance into Asia. In 1858, by treaty with China, Russia acquired all the left bank of the Amur. The capture of Schamyl in 1859 ended the persistent revolt in the Caucasus. A double advance into Central Asia was made in 1863, and in the period from 1865 to 1868 Tashkend, Khojend, and Samarcand successively fell into Russian hands. The Khiva expedition of 1873, ending in the capture of Khokan in 1875, completed the conquest of Central Asia. Outbreaks of the Slavonic Christians within the sultan's domains led Russia in 1877 to war with Turkey. The treaty of San Stefano (1878), which crowned Russia's triumph, modified by the Congress of Berlin, liberated and readjusted the Balkan principalities, enlarging Servia, making Roumania independent, and creating free Bulgaria subject to Turkish suzerainty. The later years of Alexander's reign were marked by the rapid development of Nihilism. His progressive policy, however, continued, and under the influence of the liberal minister Loris Melikoff a constitutional project providing for a consultative assembly of delegates elected by the provincial zemstvos had been signed and was about to be proclaimed by the emperor, when, after four attempts had failed, he was assassinated Mar. 1 (13), 1881. His son and successor, Alexander III. (1881–94), had been consulted as to the proposed project, and had assented, but upon his accession other influences prevailed, and the reform which would have been the first step toward parliamentary government was not promulgated. Melikoff gave place to Ignatieff, and reactionary forces became dominant. Panslavism asserted itself with new vigor. Violent anti-Semitic outbreaks occurred in different parts of the empire, and were followed by the May laws of 1882, which restricted the Jews to the pale of settlement, consisting of fifteen provinces of the southwest, and imposed other restraints upon them. After a short period these laws became obsolete, but in 1890 measures were again taken for their partial enforcement, until the public opinion of other countries remonstrated. Except in minor and spasmodic clashes in Central Asia, the reign of Alexander III. was free from war. In foreign relations he sedulously cultivated peace, and came to be known as the peace-keeper of Europe. He threw off the subserviency to Germany which had marked much of Russian statecraft, and without alienating the friendship of the powers of the Triple Alliance he encouraged France as a counterpoise for peace. In Bulgaria his hand rested heavily on Prince Alexander, who abdicated. In contrast with the policy of his predecessor, he discouraged Western influence, and devoted himself to developing the national spirit of his people. He was a Russian of Russians. He sympathized with the spirit of political and religious reaction, and it stamped the character of his reign. He died Nov. 1, 1894. His son and successor, Nicholas II., mounting the throne at twenty-six years of age, was married immediately after his accession to Princess Alix of Hesse. See Russia, History of, in the Appendix.

Bibliography.—Besides Russian works, the following are among the more important: Eckardt, *Modern Russia* (translated from the German, London, 1870); Hepworth Dixon, *Free Russia* (London, 1870); Ralston, *Early Russian History* (London, 1874); Alfred Rambaud, *History of Russia from Earliest Times to 1882* (3 vols., new ed. 1885); D. Mackenzie Wallace, *Russia* (New York, 1877); Charles Augustus Stoddard, *Across Russia* (New York, 1891); Count Lyof N. Tolstoï, *What to do?* (New York, 1887); Stepniak, *Russian Peasantry, and Underground Russia* (New York, 1888); W. T. Stead, *Truth about Russia* (New York and London, 1888); L. Tikhourirov, *Russia, Political and Social*; Henry Morley, *Sketches of Russia* (Philadelphia, 1890); Emilia Pardo Bazan, *Russia: its People and Literature* (Chicago, 1890); Pauli, *The Peoples of Russia*; Anatole Le Roy Beaulieu, *The Empire of the Tsars and the Russians*, translated by Z. A. Ragozin (New York, 1893); Thomas Mitchell, *Russian Picture* (London, 1889); Murray, *Russians of To-day* (London, 1878); Alex. Verestchagin, *At Home and in War* (New York, 1888); Kinglake's *Crimea*; Mezhoff, Bibliographical Indexes, published yearly by the Russian Geographical Society; Morfill, *Poland*, in Story of the Nations Series (London, 1893); Yanson's *Researches into the Allotments of the Peasants* (1882); Elisée Reclus, *Universal Geography*, vol. v.; and a work of great value, *The Industries, Manufactures, and Trade of Russia*, published by the ministry of finance for the World's Columbian Exposition at Chicago, English translation edited by J. M. Crawford, U. S. consul-general to Russia (5 vols., St. Petersburg, 1893). See also bibliography in article on Siberia.

Russia Leather: See Leather.

Russian Language: the largest branch of the Slavic family of languages. It is spoken not only by the descendants of the former Slavic population of the great Russian plain between the Carpathians and the Don, between the Black Sea and the sources of the Volga, but also by various tribes of Finnish, Turkish-Tartaric, and Mongolian origin, which have been Russianized through colonization or subjugation. While the Slavs lost ground in Western Europe—namely, in Germany—they made extensive gains in the north and east. None of the alien tribes availed to affect the character of the Russian as a pure Slavic idiom, so far at least as its grammatical organism was concerned, but they have enriched its vocabulary with a considerable mass of loan-words, which are in part universally current. The grammatical type of the Russian remains entirely upon the old Slavic basis both as to sound and form. Dobrovsky was in error in explaining as a Finnism the so-called Russian *voll-laut* or anaptyxis; e. g. *solóma*, straw, Slav. *slama*; *gorod*, city, Slav. *grad*. The Russian has indeed of all the branches departed least widely from the ideal type of the Slavic mother speech—a fact which may have its explanation in the continuous residence in the original home of all the Slavs. All the other Slavic peoples may be regarded as emigrants, at least in comparison with the Russians and their home. A portion of the Poles alone remained as permanently located.

General Characterization.—The Russian language, with its variety of dialects, constitutes a unity distinguished from the other Slavic languages by the following characteristics: 1. It is distinguished from all other Slavic languages by the *voll-laut* (anaptyxis); Russ. *storoná*: all other Slavic languages *strona*, *strana*; Russ. *gólod*: all others *glod*, *glad*; Russ. *béreg*: all others, *brêg*; Russ. *molokó*: all others, *mlêko*, etc. 2. In Russian the two weak vowels (*ŭ*, *ĭ*) of proethnic Slavic are replaced by the vowels *o* and *e*: Russ. *son*, but Polish, Bohemian, Slovenian, *sen*, Servian *san*, Bulgarian *sŭn*. 3. In all Russian dialects the nasal vowels *e*, *a* are replaced by *ja*, *u*, whereas the other Slavic languages yield various different sounds: e. g. Russ. *piat'*: Polish, *piec*: Bohem. *pět'*; South Slav. *pet*. 4. The Russian in all its dialects changes by the so-called dental palatalization *dj* to *ž*, *tj* to *č*, whereas the other Slavic languages show various, in part different, resultants: Polish, *dz–c*, Bohemian, *z–c*, Slovenian, *j–č*, Servian-Croatian, *gj–c*, Bulgarian, *žd–št*; e. g. Russ. *mežá*: Pol. *miedza*: Moravian *meza*: Sloven. *meja*: Serv.-Croat. *megja*: Bulgar. *mežda*; further, Russ. *sviečá*: Pol. *świeca*: Bohem. *svíce*: Sloven. *sveča*: Serv.-Croat. *svijeca*: Bulgar. *svĕšta*. 5. The mobility of the accent, coupled with lack of distinction in quantity, characterizes all the Russian dialects as a whole, in contrast to the other Slavic languages, where in some cases the accentual mobility is lacking, as in Polish and Bohemian; in others the distinction of quantity also appears, as in the South Slavic languages.

The above-mentioned peculiarities, appearing uniformly in all dialects of the Russian, whereas the other Slavic languages in these points follow separate paths, are to be regarded as of characterizing and constitutive value. There are also to be found, of course, phenomena of the Russian which appear either in one or the other of Slavic languages—e. g. in the so-called labialism (*l epentheticum*) the Russian accords with the Servian-Croatian and Slovenian in contrast to the Polish and Bohemian; thus Russian, Servian-Croat., Sloven. *kupljen*: Polish, Bohemian *kupiony*, *kupěný* (*koupený*). By the blending of the two vowels *y* (hard velar) and *i* (soft palatal) in a middle (German) *i* of the Little or South Russian, the Russian agrees with the South Slavic languages, which also ignore the distinction between *y* and *i*. In the same way the hard *e* of Little Russian connects with the similar South Slavic *e*, whereas the Pole pronounces the original *e* much softer even than the Great Russian. Finally, the assibilated pronunciation of the dentals *t*, *d* in White Russian, i. e. as *ts*, *dz*, constitutes a notable connection between Russian and Polish.

It is therefore incorrect to group the Russian with the South Slavic languages into a special southeastern division in contrast with a northwestern division, to include the Bohemian, Polish, Lusatian Sorabian, and the extinct Polabic. Such a dualism can not in reality ever have existed. On the contrary, the Russian presents many indications of close relationship, particularly with the Polish; thus, e. g., in declension the use of the accusative plural for the nominative, in conjugation the loss of aorist and imperfect, the omission of the auxiliary verb *jesm* with the participle in *t* and elsewhere in the predicate. Many of the distinctive terms of civilized life during the fifteenth to the seventeenth centuries entered Russian from the Polish.

The Russian Dialects.—These appear in two unequal groups, the northern, or the Great Russian, and the southern, or Little Russian. The latter is the smaller group. The Little Russians, also called Ukrains or Ruthenes, are distinguished from the Great Russian not only in dialect, but also by various ethnological peculiarities, like costume, household economy, folk-usages, folk-songs, etc. Though dialectal divergences undoubtedly existed among the Russian Slavs from the beginning of the historical period (ninth to tenth century A. D.), yet, owing to the literary domination of the Church Slavonic, only scanty traces of the popular forms of speech appear in the oldest documents (eleventh century). It is certain, however, that a series of characteristic differences between Great and Little Russian owe their extension and establishment to a later period (thirteenth to sixteenth century). Here belongs, e. g., *ê* > Little Russ. *i* (narrow palatal), Great Russ. *e* (palatal); thus Gr. Russ. *d'élo* (pron. *djelo*), *zv'ezdá* (pron. *zvjezda*), *m'éra* (pron. *mjera*), but L. Russ. *d'ilo*, *zv'izda*, *m'ira* (pron. *djilo*, *zvjizda*, *mjira*), etc. Relatively late arose in Little Russian the change of *o* in closed syllable to palatalized *i*. Thus compare Gr. Russ. *dom*, *nos*, *plot*, *rog*, *rod* with L. Russ. *d'im*, *n'is*, *pl'it*, *r'ih*, *r'id*, but in oblique cases, *domu*, *nosa*, *plotu*, *roha*, *rodu*. The period at which L. Russ. obscured the distinction between *y* and *i* can not be determined. Gr. Russ. has *dym*, *ty*, *my* with velar *y*, and *bit'*, *t'icho*, *m'ilost'*, with palatalized *i*, but L. Russ. blends both vowels in an unpalatalized (hard) *i*: *dim*, *ti*, *mi*, *biti*, *ticho*, *milost'*. Genuine *e* is likewise palatalized in Gr. Russ., but hard in L. Russ.; thus Gr. Russ. *t'esat'* (pron. *tjesat'*): L. Russ. *tesati*. L. Russ. generally changes *g* to *h*; Gr. Russ. *noga*, *mnogo*: L. Russ. *noha*, *mnoho*. Besides these differences, which, as universally established, serve to give the Little Russian a distinctive character, there are certain others which may be mentioned; e. g. the L. Russ. mediation between *v* and *u*, pronounced neither as genuine *v* nor as *u*, but more like Engl. *w*; thus Gr. Russ. *vchod*, entrance, and *uchod*, exit become L. Russ. *wchid*. L. Russ. sets often a *v* before initial *o*, or its representative *i*; thus Gr. Russ. *otŭ*: L. Russ. *v'id* or *v'it*; Gr. Russ. *ovcá*: L. Russ. *v'ivc'a*. Fewer are the cases where the Gr. Russ. has departed from the original and L. Russ. has preserved it. Gr. Russ. has gone further in the umlaut of accented *e* to *io*, where L. Russ. has confined itself to the cases after palatals; L. Russ. *ovés*, *orél*, *médu*, *idéš*, *idé*, but Gr. Russ. pronounces *avjós*, *arjól*, *mjódu*, *idjóš*, *idjót*, though writing *oves*, *orel*, etc. The Gr. Russ. departs from the common Russian and Slavic basis in various inflexions, where the palatalization of *k*, *g*, *ch* to *c*, *z*, *s* before *ê* and *î* is relinquished, though kept in L. Russ.

Thus in Gr. Russ. the datives of *nogá*, *ruká* are *nog'ê*, *ruk'ê* (pron. *nogjé*, *rukjé*), while L. Russ. *noz'í*, *ruc'í* abide by the old Slavic *nozê*, *rucê*. Gr. Russ. locative of *duch* is *duch'ê* (pron. *duchje*) : L. Russ. *dus'i*. Gr. Russ. imperative of *ljagú* is *ljagí* : L. Russ. *ljaz'*. The Gr. Russ. has lost the voeat. sing. mase. and femin., while the L. Russ. has kept it; thus Gr. Russ. *drug moj*, *syn moj*, but L. Russ. *druže moj*, *synu moj*; Gr. Russ. *duší moja* : L. Russ. *dúšo mojá*.

On the whole, Great Russian has been more conservative than Little Russian, in part owing to the faet that the former has been more uninterruptedly and strongly influenced by the Chureh Slavonic. Although the Little Russians, like the Great Russians, are adherents of the Greek confession (only a fragment of the Little Russian—namely, in Galicia—holds to Rome), and use the same Chureh Slavonic in the liturgy, yet under the influenee of the Roman Catholie Poles and their higher civilization, which lasted for centuries, the prestige of the Chureh Slavonie yielded much earlier than with the Great Russians, and even as early as the sixteenth century the folk-speech aequired some reeognition. This is particularly true of the Ruthenian dialeet in Galieia, whieh was reeognized in the schools and in official use. In voeabulary and syntax it has been strongly influeneed by the Polish, and differs in many points from the mueh purer and more original Ukrain dialect.

The rivers Pripet and Desna, emptying into the Dnieper, form the northern boundary of Little Russian against the White Russian and Great Russian. The northern line extends on to the Don below the eities Kursk and Voronej, whose vieinity is South Great Russian. S. of this line dwell the Little Russians, stretching W. even beyond the boundaries of Russia into Galieia, and even over the Carpathians into Northeastern Hungary. Farther to the S. they border in Bessarabia upon the Roumanians, the Black Sea forming their southern bounday. They extend on the E. as far as the Don, though here mixed with the Great Russians. They also oecupy, mixed with Great Russians, the districts of Kuban and Tschernomorie to the E. of the Sea of Azov.

The South or Little Russian dialect consists of several closely related varieties. Of greatest extent is the Ukrain variety which covers Podolia and Bessarabia, the provinces of Kieff, Poltava, Kherson, Kharkoff, Ekaterinoslaf, Taurida, part of Voronej, and the lower valley of the Don. N. of this extends the Polesje variety, occupying a part of Volhynia and the provinee Chernigoff. W. of the Ukrain appears the so-called Red Russian (called in Galieia Ruthenian), covering Podolia, Galicia into the Carpathians, and on thenee into Hungary, and Bukovina.

The Great Russian in its widest sense includes the Great Russian proper and the White Russian. The latter forms in some sense a transition to the Little Russian, and is therefore by some authorities regarded as a braneh of Little Russian, while others prefer to treat the White Russian as a third main division. The linguistic facts favor, in the opinion of the writer, the reference of White Russian to the Great Russian group. The characteristic peculiarities of White Russian are, in the voealism, the spread of the vowel *a* or *ia* not only to displaee *o*, but also *e*, generally in unaecented syllables: *zjaljóny* (for *zeljony*), *bjarjóza* (for *b'erjoza*), *sjaljcó* (for *seljcó*), etc.; in consonantism, the pronunciation of soft *d* and *t*, as *dz*, *ts*, as *tsérem* for *t'erem*, *dzévjats* for *djevjat'*, etc.

The White Russians occupy the provinces of Vilna, Vitebsk, Minsk, Moghilev, and also extend into the provinees of Pskoff, Tver, and Smolensk. Physically they are the weakest and most unenergetic of the Russian raee, and until recent years were entirely subject to the dominating influence of the Poles.

The Great Russians proper, the most numerous, the strongest, and the most enterprising Russian tribe, early effeeted from old Novgorod the colonization of the north, and later from Moseow secured the control of all European and Asiatic Russia. They are divided into two groups on the basis of the pronuneiation of the unaeeented *o*-vowel—an *o*-group (northern) and an *a*-group (southern), the former ealled North Great Russian, the latter South Great Russian. The North Great Russians oeeupy the entire north of European Russia down to the provinee of Tver, the greater part of which speaks *o*, then on to the province of Moscow, where only a small territory in the extreme north speaks *o*. Almost the whole of the provinee of Vladimir and the northern parts of Nijni-Novgorod and Kazan are ineluded in the *o*-group; so also the Ural region and parts of Siberia.

The South Great Russians, or the *a*-speakers, occupy parts of the provinee of Smolensk, almost all of Moseow, all of Kaluga, Tula, Orel, Ryazan, Tamboff, Kursk, Voronej (so far as it is Great Russian), the southern parts of Nijni-Novgorod, and Kazan, the provinee of Penza, and also Simbirsk, Samara, and Saratoff.

The ehief differenee between the North Great Russians and the South Great Russians lies in the pronunciation of *o* as *o* by the former, and as *a* (either pure or as *a*°, i. e. midway between *a* and *o*) by the latter. This applies only to unaccented syllables. Cf. N. Gr. Russ. *slóvo*, *máslo*, *zachot'él* : S. Gr. Russ. *slóva*, *másla*, *zychat'él*. The *a*-speakers are distinguished by a broad pronuneiation, whereas among the *o*-speakers the sound *o* is often close, almost like *u*. They are therefore ealled also the Low Great Russians. A further differenee between the two varieties is that unaecented *e* in South Great Russian generally, exeept at the end of words, is pronounced almost as *i*—e. g. *p'iró* for *p'eró*, *v'izú* for *v'ezú*, *p'irichód* for *p'erechód*—whereas in North Great Russian this same unaeeented *e* is freely rendered as *jo*—e. g. *pjoró*, *vjozú*, *sjoló*, *bjodró* (S. Gr. Russ. *s'iló*, *b'idró*); ef. N. Gr. Russ. *jovó* (for *jegó*) : S. Gr. Russ. *jivó*. The North Great Russian exhibits furthermore two features laeking in South Great Russian: (1) Primitive Slavie *ê*, whieh usually beeomes soft *e* in Great Russian, is oeeasionally pronounced in North Great Russian as a soft *i*, just as in Little Russian : *s'íno* for *s'éno*, *sv'íčka* for *sv'éčka*, ete.; (2) the widely spread pronuneiation of *č* as *c* and *c* as *č* : *cort* for *čort*, *colov'ék* for *čolov'ék*, *car'* for *car'*, *cérkov* for *cerkov*. The confusion of the eonsonants is universal in the northern provinces, the old territory of the republie of Novgorod, whereas their correct use is limited to the southern provinees of the North Great Russian territory, viz., Tver, Vladimir, Yaroslav, Kostroma, Nijni-Novgorod, and Kazan.

The Standard or Literary Russian.—Until near the end of the seventeenth eentury, and especially since the establishment of Moseow as a political and religious eenter, it was a generally accepted prineiple that the language of the Church should be regarded as the medium of literature and of all that belonged to the intellectual or higher life. Its poverty in the means of expression oeeasioned, when it was applied to profane purposes—as in civil doeuments, laws, and later, too, in narrative literature—the adoption of popular expressions, construetion, and phrases, even in the face of protest from individual writers. A dualism was not felt and not recognized, even though it may have actually existed. It remained for Russia's great reformer, Peter the Great, to determine the separation of the profane from the sacred literature, and to give it outward indieation through the form of the alphabet. As early as 1697, during his residence at Amsterdam, Peter awarded a Dutch bookseller the privilege of printing Russian books in a style of type varying from the alphabet then used in Russia, and distinguished by a smoothness and roundness of form evidently borrowed from the Latin alphabet. This same form of letter was later introdueed (1707) into Russia itself, and was there (Moseow) reproduced in a sueeessful manner by the type-founder M. Jefremov. The first book printed in Russia in this new "civil type" appeared in 1708 at Moscow—a work on geometry. The czar approved so heartily of the undertaking that in 1710 he examined a colleeted list of letter-symbols and struck out with his own hand those which he did not approve, and gave orders that from that time those which had been approved should be used in the printing of books on historieal and general subjects. The seeularization of the Russian literature in speech and print was thus sanctioned through the all-powerful will of the autoerat. The language was nevertheless for some time subject to great confusion; every man wrote or translated according as knowledge or caprice might admit. Fortunately there arose soon after Peter the Great a second man of genius, who extended to the narrower field of literature and sciene the work begun in the larger field. This literary Peter the Great was a peasant's son from the high north, the academician, poet, physicist, grammarian, and historian, Lomonosov. He rendered to the langnage a serviee the value of which can not be easily overrated. He appreciated how to lead the confused and normless language into the right courses, into a healthy popular form tempered by historical traditions, and, while carrying out the prineiple of Peter the Great, he avoided laying the ban of interdiction upon the hitherto revered language of the Church. He eonceived it as desirable that the language should not cease to draw its nourishment from the rich sources of

the sacred literature. This conservatism framed as it were the golden bridge between the olden time and the new, and served to prevent a radical breach in the connections between the old literature and the new, thus saving the Russian literature from the dangers of dialectal disintegration. A further advance toward the nationalization of the Russian language was made at the end of the eighteenth century through the work of the famous imperial historian Karamzin, especially in his character as writer of love-tales and narratives of travel. Contemporary with him was, among others, the gifted story-teller Krylov. Later phases in the development of the Russian language as well as literature are marked by the famous poet-princes Pushkin and Lermontov, the great humorist Gogol, the exquisite novelist Turgenev, the unexcelled plastic Goncharov, to mention only the most eminent among those no longer living. Thanks to the immense progress made in the eighteenth century, the Russian literary language has become in its inner character truly Great Russian and national, but at the same time has kept itself, by a reasonable adherence to the graphic representation of individual words as historically determined, from decadence into the vulgar types of the separate folk-dialects. As written language, it appears in a form suited to conciliate the differences of dialects, to represent the inheritance of tradition, and so to adapt itself to the acceptance and understanding of all. Through this combination of the traditional form for the eye with the popular spoken form for the ear a relation was established between the written and spoken language similar to that now existing in French and English. Pronunciation is widely removed from orthography. The pronunciation follows the recognized Moscow standard, while the written form is based upon traditions that are centuries old—e. g. the standard pronunciation of the word *orel* is *arjól*, though *orjót* and *orél* are also heard; so *togo* is pronounced *tavó*, or also *tohó* and *togó*; *dobrago* is pronounced *dóbrava*, or also *dóbrogo*, *dóbroho*; and the words *tegkij*, *rubtj* are pronounced *ljockki*, *rup*.

From what has been said it can be readily understood how the separate letters of the Cyrillic alphabet, which were originally adapted to the Old Church Slavonic and then upon Russian soil were forced into the service of representing the Russian sounds, have with time come to possess a peculiar and often highly complicated value or function. For example, after a word ending in a consonant there is still written, in deference to early tradition, a vowel which now represents no sound whatever, but at most indicates the hard pronunciation of the preceding consonant, which even without this letter would be unmistakable. This is customarily called the "hard sign," in distinction from another letter which formerly indicated a narrow vowel between *e* and *i*, but serves as a sign of the palatization of the preceding consonant. Thus the words *dubŭ*, *bogŭ*, *rodŭ*, *mužŭ* are pronounced *dup*, *boh*, *rot*, *muš*, and *vlastĭ*, *znatĭ*, *m'edĭ*, *carĭ* as *vlast'*, *znat'*, *mjet'*, *car'*. The vowel-signs *e*, *i* indicate a soft *je*, *ji* affecting the pronunciation of the preceding consonant. The combinations *da*, *de*, *di*, *do* are not uniform in pronunciation; *da* and *do* have a hard sound, while *de* and *di* are pronounced nearly as *dje*, *dji*, or, more exactly, *d'e*, *d'i*.

The language is still very rich in forms, especially in declension, where six cases are still preserved. The vocative has been gradually eliminated from the literary idiom. In the verb-conjugation the lost tense-forms for aorist and imperfect are replaced by finely differentiated verbal stems; thus "I spoke" is *ja govoríl*, and, with change of stem, "I used to speak" is *ja govarival*. The Russian has in reality only a present tense, which may be made to represent the future or the present (e. g. *idú*, "I go"; *výjdu*, compounded of *vy* and *idu*, is future, "I shall go out"), and a participle inflected in number and gender, which, without the addition of an auxiliary, expresses the perfect; thus *ja p'isál*, "I (have) written" (masc.), *ja p'isála*, "I (have) written" (femin.). Besides these the Russian possesses only the imperative (second sing. and second plur.), the infinitive, and several participles. It is in close correspondence to the positive temper of the Slavic mind that the verb shows a lack in all the various subjective modal-signs, in which regard it is inferior to the Romanic and Teutonic languages. In other respects the Russian syntax is finely elaborated and original, and rich in many marvelous turns and varieties of expression. The modern Russian style, fashioned on French models, is brief and mobile. V. Jagić.

Translated by Benj. Ide Wheeler.

Russian Literature: literature in the language of the Russians. In her literature as in her history Russia has been a late comer into the family of nations, and for the same reasons. At one time but little behind the rest of Europe, she was cut off from the communion of thought and new life of the West by her conversion through Constantinople to the Greek Orthodox form of Christian belief, while her conquest by the Tartars made her a part of Asia, checked or destroyed her beginnings of civilization, profoundly modified her character, and, when the yoke was at length thrown off, left her so far in the rear of other lands that to this day she has not been able to make up all of the lost ground. After the conversion of the country to Christianity the language of the Church was the old Slavonic, a dialect of Bulgarian origin into which Cyril and Methodius, the apostles to the Slavs, had translated the Scriptures, and to suit which they had created the Cyrillic alphabet. This alphabet was taken chiefly from the Greek, with the addition of a few Coptic, Armenian, and Hebrew characters. With modifications it has remained that of the Russians, Servians, and Bulgarians, and the old Church Slavonic has not only influenced for centuries the language of Russia, but is still used for the liturgy. From Greece and Bulgaria a large number of tales and legends were adopted, but the first independent native work which we possess, though it doubtless had predecessors, is the invaluable *Chronicle of Nestor* (latter part of the eleventh century), and this was followed by chronicles of *Novgorod*, *Tver*, *Moscow*, etc., of a similar nature, by the lives of *Saints Boris and Gteb* and of *The Fathers at Kiev*, the *Will of Vtadimir Monomachus* (twelfth century), and the *Memorial of Daniel Zatochnik* (the Prisoner), etc., not to mention the famous *Tale of the Troop of Igor*, of doubtful authenticity. At this time, as for ages after, there existed among the people a great number of poetical tales and legends called *bylini*, most of them revolving about the person of the mythical national hero, Ilĭa Muromets, while others have reference to various historical or legendary events even as late as the invasion of Napoleon. These *bytini*, handed down from one to another by a succession of peasant bards, now nearly extinct, first attracted the attention of literary men about the beginning of the nineteenth century. They have been collected and published in large numbers, though they must differ greatly from their original versions.

During the disastrous period of Tartar domination Russian literature almost disappeared, only gradually struggling into new existence with the liberation of the country. The most important monuments of the time are the *Zadonchina*, an epic poem describing the victory of Dmitriĭ of the Don at Kulikovo (1380), and the *Domostroĭ* (Housekeeper's Manual) of the monk Silvester, the counselor of Ivan IV., the Terrible. Ivan III. had protected the establishment of the first printing-press at Moscow, which began its activity with the Acts of the Apostles and the Epistles of Paul (1564), and in 1581 the Bible was printed in Little Russian at Ostrog in Lithuania. The controversy between Ivan IV. and Prince Lithuania. The controversy between Ivan IV. and Prince Kurbskiĭ, the works of the Croat monk Krizhanich, written in a mongrel jargon meant to be comprehensible to all Slav peoples (about 1665), and a description of Russia by Kotoshikin (about 1666–67), a fugitive secretary from the foreign office, are works of much historical and some literary importance. Meanwhile that part of the country which had been severed from the rest and with the kingdom of Lithuania united to Poland awoke to fresher active life under the influence of the more advanced Polish civilization. Polish attempts to convert the Orthodox to Roman Catholicism, and particularly the propaganda of the Jesuits, led in self-defense and reaction to a study of the Russian language, to the foundation of Russian schools, and to controversial theological works, whose authors could hope to compete with their adversaries only after careful study and training. When in 1667 Kieff was conquered by the Czar Alexis the greater civilization and enlightenment that prevailed there gradually made their influence felt at Moscow. The three chief theologians of the time of Peter the Great—Simeon of Polotsk (d. 1682), Dmitriĭ of Rostov (d. 1709), and Feofan Prokopovich (1681–1736)—were all Little Russians.

Peter himself favored literature, especially when it had practical aims, as an ally in his reforms. He modified and improved the alphabet, encouraged the printing of Russian books, both original and translations, and he even occasionally contributed to the *St. Petersburg Gazette*, the first Russian newspaper, founded under his auspices in 1703.

With his reign the history of modern ideas in his country begins. The peasant Pososhkov (1670–1726) was at the same time an old-fashioned theologian and a liberal political economist. Prince Antiokh Kantemir (1708–44), who passed much of his life abroad, turned out satires in the style of Boileau, which even had the honor of being rendered into French. Vasiliĭ Tatistchev (1685–1750) wrote the first history of Russia; Trediakovskiĭ (1703–69) translated much and made a guide to versification, while unable to write good poetry himself. Far more important than any of these was Lomonosov (1711–65), not so much as an author, although he tried his talents at literature of many sorts, but as a grammarian and literary lawgiver. The language of Russian books was still under the yoke of the church Slavonic, and teemed with archaic expressions, while Western words, brought in with Western ideas, added to the general confusion in which there were no accepted models to follow. Lomonosov, in his grammar (1755), laid down the laws for all to obey, his own varied works served as examples of at least grammatical correctness, and by his successful introduction of tonic instead of the previous syllabic versification he brought Russian poetry back to the form suited to the natural genius of the language. The period that followed was very creditable, although few of the works then written are read to-day or possess originality. French influence and taste, then dominant in all Europe, were nowhere more supreme than at St. Petersburg. Sumarokov (1718–77), the first in his country to have no other profession than that of author, besides shorter poems, composed many stiff tragedies in alexandrine verse; Kniazhnin (1742–91), Kheraskov (1733–1807), and others followed in the same vein, and the last named likewise composed a ponderous epic, the *Rossiada*; von Vizin (1744–92) wrote two really good comedies, *Nedorosl* (the Minor) and *Brigadier*; Kniazhnin, with his *Khvastun* (the Boaster), etc., Kapnist (1757–1824), with his *Iabeda* (Calumny), succeeded nearly as well; and the Empress Catherine II. herself showed cleverness in one or two light satirical plays. Khemnitser (1745–84), and later Dmitriev (1760–1837), were successful writers of fables; Bogdanovich (1743–1803) gained a great reputation by his poem of *Dushenka*, though he ranks below Derzhavin (1743–1816), the greatest lyric poet of Russia of his time, and entitled to an honorable place among European writers of the century. He is best known for his stately if frigid odes, one of which, the *Ode to God*, was translated into many languages, including Chinese and Japanese, and hung up in a temple at Peking. The most important prose-writers of the same date were the Freemason publisher and bookseller Novikov (1744–1818), and Radistchev (1749–1802), author of the *Journey from St. Petersburg to Moscow*.

The last years of Catherine's reign were marked by a reaction against everything that savored of liberalism, and from then till after the fall of Napoleon the literary movement was less active. The most important figure was Karamzin (1766–1826), who did for Russian style much what Lomonosov had done for grammar, discarding antique forms, clumsy expressions, and foreign interpolations, besides furnishing by his own productions models for others to study and profit by. He was a many-sided writer, whose most famous works are his *Letters of a Traveler*, his sentimental novel *Bednaia* (Poor) *Luisa*, and especially his great *History of Russia*. He also founded the *Vestnik Evropy* (Messenger of Europe), still perhaps the best magazine in the empire. In his political ideas he was national and conservative, and may be looked on as an ancestor of the modern Slavophils. In this same transition period we find the dramatist Ozerov (1770–1816), whose plays, though still following for the most part the approved rules of classical tragedy, show the beginnings of the new romantic spirit.

The Romantic School.—The romantic school arose at about the same time in Russia as in other countries. The impulse to it came from abroad, especially from Germany and England. Goethe, Schiller, Shakspeare, and later, above all, Byron, displaced the French models of the previous generation. The great champion and genius of the new movement was Alexander Pushkin (1799–1838), the initiator was his friend Zhukovskiĭ (1783–1852), who has left comparatively few original works, but a great number of excellent translations, which made known to his countrymen many of the masterpieces of foreign literature. His friend Kozlov (1779–1840) did much the same thing with less success, while Batiushkov (1788–1855), who early became insane, was the author of a few remarkable poems that imitate the plastic perfection of classic masters. Griboedov (murdered in 1829 when ambassador at Teheran) left behind a comedy, *Gore ot Uma* (Trouble from Cleverness), which ranks with the first of its kind in all literature. The war against Napoleon had caused a general awakening that usually took on a patriotic or liberal form. The former characteristic brought about the discovery and study of the old national *bylini*; the latter led to the December rising at the accession of Nicholas I. The young poet Ryleev (1795–1826) was hanged with others of the chief conspirators, while his friends, the critic and story-teller Bestuzhev (pseudonym *Marlinskiĭ*, 1795–1837) and the poet Prince Odoevskiĭ (1802–39), were banished to Siberia and the Caucasus. Only a fortunate absence from St. Petersburg preserved Pushkin from being in the plot. He, too, had to suffer banishment from the capital on account of his liberal ideas, but his genius gained by the change of scene and particularly by his visit to the Caucasus. His first poem, *Ruslan and Liudmila*, like Victor Hugo's *Hernani*, in France, started a great controversy which resulted in the complete triumph of the romantic school. Pushkin's style both in prose and poetry approaches perfection. His shorter poems were the delight of his own and succeeding generations; his *Kapitanskaia Doch* (The Captain's Daughter) served as a model of a story; his *Boris Godunov* (Eng. trans. of parts by N. H. Dole in *Poet Lore*, Boston, No. 2, 1889: Nos. 3 and 11, 1890; Nos. 8 and 11, 1891) founded genuine Russian tragedy; his *Evgeniĭ Onegin* (Eng. trans. by Lieut.-Col. Spalding, London, 1881) is a long poem recalling *Don Juan* and *Beppo*, with passages of great beauty and still oftener of brilliant wit, and has a hero who can be looked on as the ancestor of the realistic characters of later writers. Around Pushkin gathered his friends and disciples, the poets Delvig (1798–1831), Baratynskiĭ (1800–44), Iazykov (1803–46), Venevitinov (1805–27), Gnedich (1784–1833), the translator of the *Iliad*, and the unfortunate Polezhaev (1807–38). The greatest of Pushkin's successors was the passionate and unhappy Lermontov (1814–41), the embodiment of the Byronic spirit, which he did not live long enough to outgrow. The most combative member of the romantic school was N. Polevoĭ (1796–1846); its great critic Belinskiĭ (1810–48). The poet Tiuchev (1803–73) was its last distinguished survivor. Contemporary with it, but not belonging to it, were the peasant poet Koltsov (1809–42), and the writer of fables Krylov (1768–1844), who has no equal of his kind except La Fontaine.

The realistic movement begins with Gogol (1809–52), the first of the great Russian novelists. His comedy the *Revisor*, his shorter stories, and his *Mertvyia Dushi* (Dead Souls) are among the masterpieces of literature. No countries, except Great Britain and France, can compare with Russia for the number and genius of her novelists and story-tellers of both the first and the second rank. Almost contemporary with Gogol we find the later Nihilist Alexander Hertzen (1812–70), whose chief novel, *Kto Vinovat?* (Whose Fault?), is a plea for free love; and the series of novelists continues uninterrupted to the present day. Three names stand out above all others: Turgenev (1818–83), Dostoevskiĭ (1822–81), and Lev Tolstoĭ (b. 1828). Not far behind them come Goncharov (1814–91), the author of *Oblomov*, *Obyknovennyia Istoria* (A Common Story), etc., and Pisemskiĭ (1820–81), from whose works all traces of ideal have disappeared; and then numerous men of second rank like Pisarev (1840–68), Vasiliĭ Krestovskiĭ (b. 1840), Potekhin (b. 1829), etc. Most of them have also written short stories. Among the many especial story-tellers mention might be made of Sollogub and Gleb Uspenskiĭ. As a satirical writer Soltykov (pseudonym *Stshedrin*, 1826–89) has no rival but Heine in the nineteenth century. Chernyshevskiĭ's famous romance *Shto Delat?* (What is to be done?) has less literary worth than value as the gospel of the earlier Nihilists. Among the most recent writers are Garshin—a disciple of Tolstoĭ—and the Little Russian Korolenko. The poets of the latter part of the nineteenth century have not equaled those of the earlier. The greatest of them was Nekrasov (1822–77), a champion of the poor and oppressed. Many of the most recent ones, however, without attaining the first rank, have written fine things. Among them are Khomiakov (1804–60), the Panslavist; Maïkov (b. 1821), distinguished by the beautiful finish of his verse; Shenshin (pseudonym *Fet*, b. 1820), a singer of love and nature; the melancholy Polonskiĭ (b. 1820); the peasant poet Nikitin (1824–61); Meĭ (1822–62); Stcherbina (1821–69); Plestcheev (1825–93), etc. One of the most promising of the younger poets to-day is the Grand Duke Konstantin Konstantinovich, who writes over the signature K. R. In tragedy the

first plaee belongs to the trilogy on the *Death of Ivan the Terrible*, by Alekscï Tolstoï (1817–75), and to two lyrieal dramas of Maïkov. Ostrovskiï (1824–86) has been the most remarkable and fruitful of the dramatists of popular life, but Pisemskiï, Turgenev, Lev Tolstoï, and others have also been sueeessful in this way. The literature of translation has also gone on inereasing, almost every Russian poet having added his quota, until it is doubtful if any other language possesses sueh fine reproduetions of the works of foreign genius.

History.—In the domain of history Karamzin has found worthy sueeessors, who, if they have not equaled him in brilliancy of style, have attained greater scientific aeeuraey. Russian historians have not as yet distinguished themselves greatly in treating of other eountries, but they have thoroughly investigated and satisfaetorily elueidated the story of their own, in spite of the jealous restraint of the eensorship, whenever they eome to deal with anything like reeent times. Kostomarov (1817–85) was perhaps the ablest of them, his longest work being his unfinished *History of Russia in Monographs* (13 vols.). Solovĭev (1820–79) left twenty-nine volumes, whieh will serve as a mine to future historians rather than as a book for the use of the public. Ustrĭalov and Bestuzhev-Rĭumin have likewise written general works, and many others have taken up particular subjects. Geography, ethnography, law, and seientifie topies have attracted an inereasing number of talents, and many foreign works in all these fields have been translated. Lev Tolstoï and others have dwelt on religion and morals. P. Polevoï, O. Miller, Galakhov, Pypin, ete., have treated of the history of language and literature.

Journalism.—In spite of the rigid wateh of the eensors, whieh, however, has varied very much in intensity at different times, Russian journalism has had a vigorous and exciting if eheekered life. In the newspapers, and still more in the magazines, all the literary and many of the politieal questions of the day have been ably and hotly discussed. The two great parties in the main have been the Slavophils, who have tended to ultra-nationalism in Chureh and state, to Panslavism, to distrust of Western Europe, and the Zapadniki, or Westerners, whose name indieates their more foreign and liberal tendeneies. The former have usually had the upper hand. Between 1855 and 1860 the *Kolokol* (Alarm Bell), published in London by the Nihilists Alexander Hertzen, the poet Ogarev, and others, penetrated into Russia by secret means in great numbers, and exereised mueh influenee even in the palaee of the emperor. It lost its authority by espousing the eause of the Polish rebels in 1863, when the position of leader of publie opinion was taken by the editor of the *Moskovskyĭa Vedomosti*, Katkov, the apostle of reaetion and nationalism. The Panslavists, headed by the brothers Aksakov, followed in the main the same aims, and it was they who sueceeded in foreing the Government into the war of 1878. Among the most important journals in Russia to-day are the *Novoe Vremĭa* (New Times), *Novosti* (News), *Grashdanin* (Citizen), *Petersburgskyĭa Vedomosti* (Petersburg Gazette), and the weekly *Nedetĭa* (Week), all in St. Petersburg; and the *Moskovskyĭa Vedomosti* and *Moskvitĭanin* (Museovite), both in Moscow. Perhaps the two best magazines are the *Vestnik Evropy* (Messenger of Europe) and the *Russkiĭ Vestnik* (Russian Messenger).

The literature of Little Russia eoineides in its first period with that of Great Russia, and its separate existence begins only with the annexation of Little Russia to Lithuania and Poland. In its seeond stage it was represented by theological writings, mysteries, educational works, annals, etc., besides a mass of popular songs and legends; Russia and Poland showed themselves equally hostile to it. The third and present period is hardly older than the nineteenth eentury. Ivan Kotlarewskij (1769–1839) was the first to make it a modern literature. He was the author of a travesty on the *Æneid* and two dramas, *Natalka Poltawka* (Natalie of Poltava) and *Moskal Czariwnik* (The Soldier as a Magieian). Kwitka (1773–1848, best novel *Marusja*), Wowezok, Kulisz (b. 1819), and numerous others eontinued the work, but the greatest of all was the poet Shevchenko (*q. v.*; 1814–61). In 1876 the imperial Government entirely forbade the printing of books in Little Russian, sinee which time literary produetions in that tongue have been eonfined to the Austrian province of Galieia, whose eastern part is inhabited by members of the nationality. They have produced many writers, though none of extended reputation. The popular poetry of the Little Russians is among the riehest and most interesting in the world. The first place belongs to the *Dumy* or historical songs whieh tell of the heroie times of Cossaek adventure. Tales, legends, proverbs, etc., are also numerous, and many of them have been colleeted. See, above all, the first volume of the *History of Slav Literature*, by Pypin and Spasovich (1879 in Russian, German trans. 1880).

The literature of White Russia eonsists of sareely more than a few songs and proverbs.

See in Russian the works of Belinskiï, Galakhov, P. Polevoï, and many others. The best eomplete history of Russian literature in any Western language is that of Reinhold in German (Leipzig, 1886); the little French one of Courrière (1874) is not without value. Specimens of many kinds with biographieal notes can be found in *La Littérature Russe*, by L. Léger, 1893. For the earliest times, Rallston's *The Songs of the Russian People* (1872); Miss Hapgood's *Epic Songs of Russia* (1886); Morfill's *Slavonic Literature* (1883); and Rambaud's *Russie Épique* (1876) may be eonsulted; for a few modern novelists, Melehior de Vogüé, *Le Roman Russe*, and Ch. Dupuy, *Great Masters of Russian Literature* (Eng. trans. by N. H. Dole, 1885). For examples of poetry, see Bowring's *Russian Poets* (2 vols., 1821–23), *Russian Lyrics in English Verse*, by C. T. Wilson (1887), *Rhymes from the Russian*, by John Pollen (1891), and Lermontov's *Demon*, by F. Storr (1894); for Pushkin alone, *The Bakchesarian Fountain* (trans. by W. D. Lewis, Philadelphia, 1849), Ivan Panin's *The Poems of Alexander Pushkin*, and artieles in *Blackwood's Magazine* (June, July, and Aug., 1845), and in *The Westminster Review* (Apr., 1883). Turgenev, Dostoevskiï, and L. Tolstoï have been translated into English, as have a few prose works of other writers, but more authors have been rendered into Freneh or German.

Archibald Cary Coolidge.

Russ'niaks, or **Red Russians**: See Ruthenians.

Russo-Turkish War: a confliet between Russia and Turkey in the years 1877 and 1878.

Causes.—The true eause of the war was Russia's long-cherished desire to acquire territory in the Balkan peninsula, with a view to bringing her nearer to the ultimate objeet of her Eastern policy, the possession of Constantinople. The proximate eause, however, was the trouble between the Porte and its Christian subjeets. In the summer of 1875 Turkish oppression provoked a revolt of the Christians of Bosnia and Herzegovina, who were privately aided by Servia and Montenegro. Disturbed by these troubles on her frontier, and sympathizing with the Christians, Austria negotiated with Russia and Germany for the adoption of a eommon poliey toward the Porte, and the three powers agreed to demand of Turkey the introduction of important reforms in her government of the Christian provinees, and the formation of a eommission eomposed equally of Christians and Mohammedans to see to the exeeution of these reforms. These demands, embodied in the so-called Andrássy note, which was supported by Great Britain and Franee, were aeeepted in all essentials by the Porte; but the insurgents, distrusting all promises till steps were taken toward their fulfillment, eontinued under arms. The eonfliet was renewed, and the fanatieal fury of the Turks showed itself not only against their Christian subjects but against the foreigner. While another eonference of the three Eastern powers was in session in Berlin, news arrived of the murder of the Freneh and German eonsuls at Saloniea by the Turks. Angered by this outrage, the conferenee drew up the Berlin memorandum demanding an armistiee of two months and the immediate appointment of the eommission deseribed in the Andrássy note. Franee and Italy eoneurred in this aetion, but Great Britain refused it her support. The Turkish massacres in Bulgaria, involving, it was said, not less than 12,000 victims, roused universal sympathy with the Christians, and caused a revulsion of feeling in Great Britain; but Beaeonsfield kept his Government from favoring any projeet for foreing reforms upon the Porte. Servia and Montenegro deelared war. Russia, determined on war if the eoneerted action of the powers failed of effect, formed the Treaty of Reichstadt with Austria (July 8, 1876), stipulating that the latter power should obtain Bosnia and Herzegovina if Russia undertook to liberate Bulgaria. At the instance of Great Britain another eonferenee was held at Constantinople, demanding of the Porte the exeeution of the reforms, but Turkey still remained obstinate. One final effort was made by the powers in the London protoeol Mar. 13, 1877, and upon the Porte's rejeetion of this Russia declared war Apr. 24, 1877.

The War.—Underestimating the strength of their enemy the Russians entered upon the campaign with inadequate

forces. After gaining a few successes in Armenia they were forced to retreat toward their own frontier. In the Balkan peninsula they divided their forces in Bulgaria, and though they gained possession of Nicopolis, Lovatz, and other places, garrisoned them by weak detachments, and allowed the approach of a Turkish army, 35,000 strong, under Osman Pasha, to escape their notice. In the first battle of Plevna (July 20) the Russians were defeated with considerable loss; in the second (July 30) they fared still worse, leaving a fifth of their number on the field. Gourko, who had led a Russian division beyond the Balkans, was forced to fall back upon Shipka Pass, where he was attacked by superior forces, and saved only by the timely arrival of re-enforcements. Russia now raised fresh troops and obtained aid from Roumania. After regaining Lovatz the allied Russians and Roumanians attacked Plevna, but though they succeeded in capturing one of the fortresses the attack on the inner line of defense was repulsed with enormous losses (Sept. 11–12). Public opinion laid the blame of these disasters upon the Russian headquarters, for both officers and men had acquitted themselves well on the field of battle. Todleben, the defender of Sebastopol, was now placed in control of the operations around Plevna. Cut off from all supplies, the Turks made a last desperate effort to break through the Russian lines on Dec. 10, but failed, and were forced to surrender. The victors crossed the Balkans, captured one Turkish army at Shipka, routed another on their way to Adrianople, and entered the latter city on Jan. 22, 1878. The Porte had already begun to negotiate for peace, and on Jan. 31 an armistice was granted by the Russians.

Results of the War.—Great Britain's dread of Russian designs on Constantinople led to the dispatch of a British fleet to that city, and brought the two nations to the verge of war. Nor were matters improved when the terms of the treaty of San Stefano (Mar. 3, 1878) between Russia and Turkey became known. By these, Bulgaria, with its territory enlarged so as to include the greater part of European Turkey, was to constitute an autonomous tributary principality, whose prince, elected by the people, was to be confirmed by the Porte. A Russian commissioner, holding office for two years, was to superintend the introduction of the new system, and a Russian army was to occupy the country for the same period. Improvements were to be introduced in the administration of Epirus, Thessaly, and the other parts of European Turkey for which the treaty did not provide a special constitution; also in Armenia, whose inhabitants were to be guaranteed security from Kurds and Circassians. In lieu of part of the war indemnity claimed by Russia she was to receive the districts of Kars, Ardahan, Batoum, and Bayazid in Asia, and the Dobrudscha in Europe, but the last-named district was to be ceded to Roumania in return for Bessarabia. Russia still claimed a balance of 3,000,000 rubles. A European congress was proposed, to be held in Berlin, but, to the chagrin of Great Britain, Russia denied the right of such a congress to decide finally upon the articles of the treaty. War seemed more imminent than ever, but at length Russia consented to certain modifications of the treaty, and the congress was opened on June 13. The work of the congress was embodied in the Treaty of Berlin (July 13), by which Bulgaria was limited to the country N. of the Balkans, the Russian commissioner was shorn of his powers, the portion of Bulgaria S. of the Balkans was formed into the autonomous province of Eastern Roumelia, subject to the direct authority of the sultan, and the Russian occupation was limited to nine months. Austria gained Bosnia and Herzegovina, and Turkey retained Bayazid. The powers recommended that Turkey should cede Thessaly and part of Epirus to Greece, a recommendation subsequently acted upon by the Porte. In other respects but slight changes were made in the provisions of the former treaty. See BERLIN CONGRESS and EASTERN QUESTION. F. M. COLBY.

Rustam, or **Rustem**, rōōs'tem: a great hero in the mythical times of ancient Iran. He was the son of Zāl and Rūdābah, and his feats of gigantic prowess and prodigious strength play a romantic *rôle* in the great Persian epic, the *Shāh-Nāmah*. (See FIRDAUSĪ.) The *haft khān*, or seven labors of Rustam, rival those of Hercules. The sad story of his slaying his own son Sohrāb, in single combat, forms one of the most pathetic episodes in the *Shāh-Nāmah*, and has parallels in other literatures; for example, in the old Germanic story of Hildebrand and Hadubrand and in the Celtic tale of Cuculin and Conloch. A. V. WILLIAMS JACKSON.

Rustchuk, roost-chook': town of Bulgaria, on the Danube; 40 miles by rail S. by W. of Bucharest (see map of Turkey, ref. 3–D); the northwestern corner of the Bulgarian quadrilateral. (See QUADRILATERAL.) It has played an important part in the wars between Russia and the Ottoman empire. Captured by the Russians in 1810, it was held by them till 1812. The fortifications then destroyed were rapidly rebuilt, but razed to the ground again in 1829 in accordance with the Treaty of Adrianople. They were once more erected in 1853. Rustchuk escaped capture in the Russo-Turkish war of 1877. Since the creation of the semi-independent principality of Bulgaria, the city has rapidly improved in appearance and business activity has developed. Pop. (1893) 28,121. E. A. GROSVENOR.

Rüstow, rüs'tō, WILHELM: soldier and writer on military subjects; b. at Brandenburg, Prussia, May 25, 1821; entered the Prussian army in 1838; was arrested and indicted in 1850 for his *Der Deutsche Militärstaat vor und während der Revolution* (1850), but escaped; settled at Zurich; became a celebrated military author; found practical employment in the Swiss army, and took part with distinction in the campaigns of Garibaldi in Sicily and Naples in 1860. Besides his *Geschichte des Griechischen Kriegswesens* (1852; supp. 1854–55) and *Heerwesen und Kriegführung Julius Cäsars* (1855), he published critical representations of all the recent European wars, and a number of theoretical works on tactics, strategy, elementary military organization and education: *Die Feldherrnkunst des 19ten Jahrhunderts* (Zurich, 1857; 3d ed. 1877); *Geschichte der Infanterie* (2 vols., Gotha, 1857–58; 3d ed. Leipzig, 1884); *Allgemeine Taktik* (Zurich, 1858); *Militärisches Handwörterbuch* (2 vols., Zurich, 1859); *Strategie und Taktik der neuesten Zeit* (3 vols., 1872–75). D. at Zurich, Aug. 14, 1878.

Rusts: the popular name for various parasitic fungi, especially for those which produce reddish or brownish discolorations upon the plants which they attack. Botanists are inclined to restrict the term to the UREDINEÆ (*q.v.*), which include the rusts of wheat and other cereals, besides many species attacking other plants of little or no economic importance. One of the species affecting wheat is the *Puccinia graminis* (Fig. 1), whose first stage develops in the

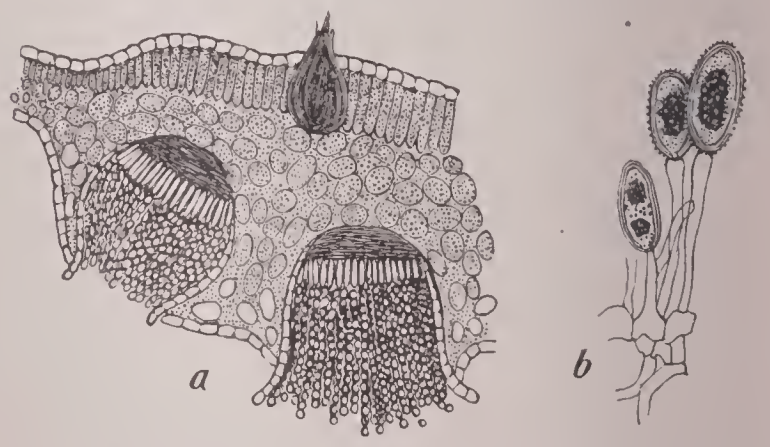

FIG. 1.—Wheat-rust: *a*, first stage, on barberry; *b*, second stage, red rust, on wheat (highly magnified).

leaves of the barberry, where it forms many bead-like rows of spores (*conidia*) in masses which are at first internal, but eventually burst through the epidermis in the form of minute cups (Fig. 1, *a*). The yellow spores of this "cluster-cup" stage germinate upon and penetrate the leaves of the wheat, where the threads of the parasite produce clusters of reddish-yellow spores (Fig. 1, *b*), which burst through the epidermis in elongated patches. This is the "red-rust" stage, so common when the wheat is about full-grown. The red-rust spores (called *uredospores*, or *stylospores*) serve to propagate the fungus still further; each one falling upon a wheat leaf and finding sufficient moisture germinates, and penetrates the epidermis, giving rise to another growth of parasitic threads, and another mass of red-rust spores. Somewhat later, the fungus forms small, dark-colored spore-sacs, each containing two relatively large spores (Fig. 2), which burst through the epidermis as elongated black patches. These spores (black-rust spores, or teleutospores) being thick-walled, are capable of remaining on the straw without injury during the winter, and in the following spring germinate in the moisture of the rotting straw, each spore forming a short thread upon which are borne a few very minute spores (*sporidia*). When the latter fall upon a

young leaf of the barberry they germinate and penetrate its tissues, giving rise to the cluster-cups first described, and thus completing the round of life.

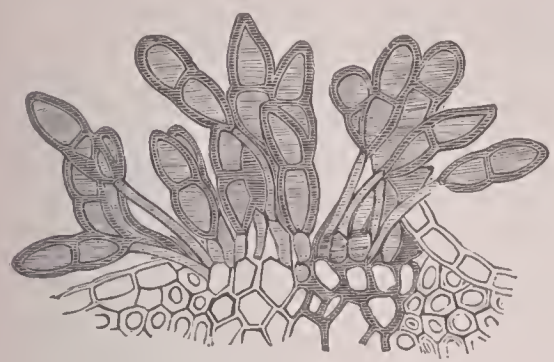

FIG. 2.—Wheat-rust, third stage, showing teleutospores (magnified).

The foregoing is essentially the structure and mode of development of most of the true rusts (*Uredineæ*). In all the species which affect the grasses and the sedges, the cluster-cups are developed upon some other host-plant, as in the wheat-rust described, but in many species attacking dicotyledons, and some monocotyledons, all the stages are upon the same host. For a long time it was thought by botanists that the three stages of rusts were distinct kinds of fungi, and were therefore given different names. Thus the cluster-cups were regarded as species of the genus *Æcidium*, the red rust as species of the genus *Uredo*, and the black rusts as species of *Puccinia*. Accordingly, we still speak of the first stage as the æcidium stage, and its spores as æcidiospores; and the second stage is often called the uredo stage, and its spores the uredospores.

Another wheat-rust, usually much more common than the one described above, is *Puccinia rubigo-vera*. Upon the Great Plains of the central part of the U. S. it appears to live perennially in the uredo stage, without the intervention of the æcidium stage. At all times in the year, on some area upon the region stretching from the Rio Grande to the Saskatchewan, the uredo stage is to be found upon wheat and other cereals, and many grasses; and from this affected area it spreads from field to field every year. In the spring the uredo stage advances with the season from the southern portion of the region to the northern. In Europe the æcidium stage, which occurs on *Boraginaceæ*, is well known, but in North America, if it occurs at all, it is very rare.

The two wheat-rusts may be distinguished in the uredo stage by the shape and size of the spores, which in *P. graminis* are elliptical, ovate, or pear-shaped, 24 to 45 micro-millimeters long by 14 to 21 wide, and with two opposite germ-spores; while in *P. rubigo-vera* they are globose, or ovate, 20 to 32 micro-millimeters long by 17 to 24 wide, and with three or four germ-spores.

No remedy or preventive is known for the wheat-rusts.

Apple-rust is a common disease of the apple-tree, in which the leaves become affected by yellow swollen patches. It is caused by a fungus of the order *Uredineæ*, and is in fact the æcidium stage of one of the species of *Gymnosporangium*, a genus closely related to *Puccinia*. Experiments have shown that the spores of the æcidium taken from the leaves of the apple may be made to produce the diseased growths on red-cedar trees known as cedar-apples, and microscopical examinations show that the latter consist of masses of teleutospores imbedded in a gelatinous matter. Here, as in the case of the wheat-rust, it was for a long time not known that the apple-rust had any connection with the cedar apples, but the matter is now settled conclusively. The former was called *Rœstelia pyrata*, and

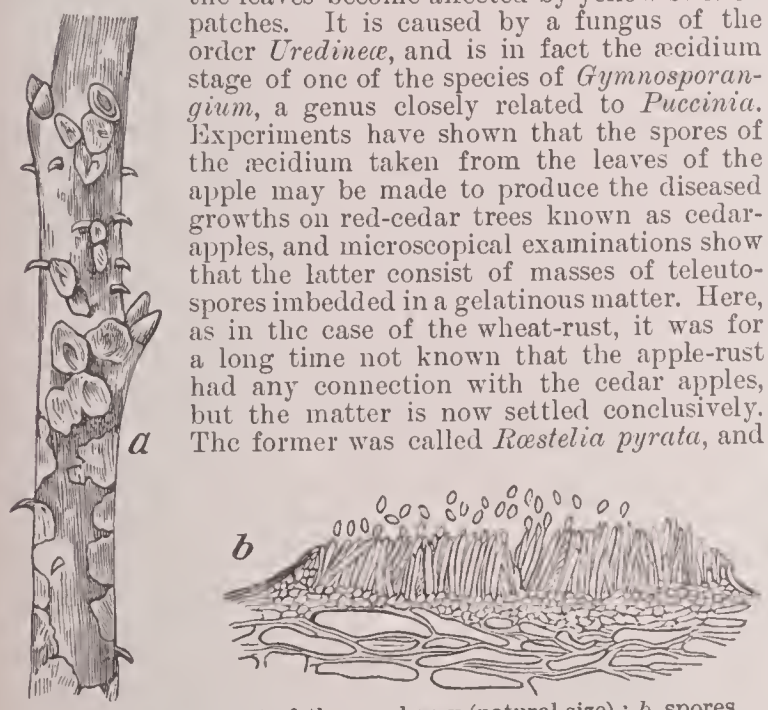

FIG. 3.—*a*, cane-rust of the raspberry (natural size); *b*, spores (highly magnified).

the latter *Gymnosporangium macropus*, which name both stages now bear.

The early collection and destruction of every cedar-apple will eradicate the apple-rust.

The *white rusts* differ greatly from the foregoing *Uredineæ*, and are near relatives of the MILDEWS (*q. v.*), with which they agree in mode of sexual reproduction. A common example is the white rust of the cabbage (*Cystopus cubicus*), in which the parasite grows in the interior of the leaves of the host, eventually producing myriads of spores (*conidia*) which burst through the epidermis in white pustule-like patches. These spores are blown to other leaves, which they infect, and thus spread the disease. Later the interior threads produce large, thick-walled resting-spores, which germinate in the following spring, and these start the disease again.

This species attacks many other kinds of cruciferous plants, as radish, mustard, pepper-grass, shepherd's-purse, etc. Other species attack various *Compositæ*, *Portulaca*, *Amaranthus*, etc.

The *cane-rust* of the raspberry and blackberry (otherwise called the raspberry anthracnose) is a troublesome disease, producing white patches upon the stems and eventually causing their death (Fig. 3, *a*). It is due to a minute parasite belonging to the so-called Imperfect Fungi, and is known as *Glœosporium venetum*. Its threads penetrate the tissues of the bark, and its spores are borne upon very minute erect threads in the white patches (Fig. 3, *b*). The early removal and destruction of the affected stems, and the application of a strong solution of copper sulphate before the buds open in the spring, will reduce the disease.

CHARLES E. BESSEY.

Rutaba'ga: the Swedish turnip, a highly important root crop, believed to be an artificial variety of *Brassica campestris*. It has many sub-varieties, some of which are among the most valued of the turnips. See TURNIP.

Ruta'ceæ [Mod. Lat., named from *Ruta*, one of the genera, from *ru'ta*, rue]: a family of dicotyledonous trees, shrubs, and herbs. Rue, buchu, and the prickly ash (*Xanthoxylum*) are representative plants. Botanists have recently attached the *Aurantiaceæ* (orange, lemon, citron, etc.) to this family, which numbers nearly 800 species.

Revised by CHARLES E. BESSEY.

Rutebeuf, rüt'böf': one of the most original French poets of the thirteenth century. Little is known about his life except that he was a poor minstrel, lived at Paris, was twice married, made but a precarious living, kept bad company, and died about 1280. His *Miracle de Théophile*, his two *Vies de Saints*, and his *Complaintes funèbres* are rather perfunctory performances, but in his lyric poems and *fabliaux* he shows great sincerity, power of realistic observation, and keen satire, especially against the clergy. Jubinal has given an edition of his *Œuvres* (3 vols., Paris, 1874–75); see also L. Clédat, *Rutebeuf* (Paris, 1891). A. G. CANFIELD.

Rutgers, HENRY: soldier and philanthropist; b. in New York, Oct. 7, 1745; graduated at Columbia College 1766; was a captain during the war of the Revolution, and subsequently a colonel of militia. He was a wealthy citizen of New York, a prominent member of the Reformed Dutch Church, and an active politician; was several times a member of the New York Assembly and a regent of the University of New York from 1802 to 1826. D. in New York, Feb. 17, 1830. Rutgers (originally Queen's) College took his name in consequence of a donation of $5,000, and several important charities in New York were recipients of his bounty.

Rutgers College: an institution at New Brunswick, N. J. In 1766 Gov. William Franklin of New Jersey granted a charter for a college to be called Queen's College, which was to be primarily an institution for the education of young men for the ministry in the Reformed Dutch denomination, and secondarily to instruct all who might resort to it in all the branches of a collegiate education. An amended charter was granted in 1770, under which the college went into active operation. The first president was the Rev. Jacob R. Hardenbergh, D. D. His successors have been Rev. John H. Livingston, D. D., Rev. Philip Milledoler, D. D., Hon. A. Bruyn Hasbrouck, LL. D., Hon. Theodore Frelinghuysen, LL. D., Rev. William H. Campbell, D. D., LL. D., Merrill E. Gates, Ph. D., LL. D., Austin Scott, Ph. D., LL. D. The president is required by the charter to be a communicant in the Reformed (Dutch) Church in America, but no sectarian religious instruction is given, and students of all denominations have always been found in this college. Its history for a long time is that of a struggle with various difficulties, especially pov-

erty, and for a time its exercises were suspended. In 1825 it was revived under the name of Rutgers, in honor of its benefactor, Col. Henry Rutgers, of New York. Since then its work has been carried on uninterruptedly and successfully, its resources and facilities having been greatly increased. In 1863 Rutgers Scientific School was organized, and in 1864 was designated by the State as the New Jersey State College "for the benefit of agriculture and the mechanic arts," with which, as a department, the college experiment station is connected. In 1900 the number of students in the classical and scientific departments was 200, and of professors and instructors, 28. AUSTIN SCOTT.

Ruth, Book of [*Ruth* is from Heb., liter., appearance, beauty]: a canonical book of the Old Testament. It is a beautiful pastoral story, relating the love of Ruth, a young Moabitess, the widow of a Hebrew, for her mother-in-law, Naomi, and the subsequent marriage of Ruth to Boaz, a rich husbandman of Bethlehem-Judah. It is a picture of domestic virtue and happiness amid the troubled times of the Judges, when might was right. Ruth was the great-grandmother of King David. The date and authorship of the book must be inferred solely from its contents and from its position in the canon. It has an Aramaic tinge, and in the Hebrew Bibles is classified as one of the five little rolls of the Hagiographa; and from these facts some have inferred its post-exilian origin. English Bibles, however, following the Septuagint, place it as one of the five consecutive stories of the times of the Judges (Jud. xiii. 2–xvi.; xvii.–xviii.; xix.–xxi.; Ruth; 1. Sam. i.–iv. 1, first clause), and such testimony as that of Josephus and Origen shows that this is the more ancient classification. There is no reason for dating any of these stories later than the reign of David. David's conquests over Damascus-Syria and other Aramæan peoples doubtless had an Aramaizing effect in Israel, equally with the later events of the times of the exile. See Stephen H. Tyng, *The Rich Kinsman* (1856); C. H. H. Wright, *The Book of Ruth in Hebrew and Chaldee* (London, 1864); R. W. Bush, *Popular Introduction to the Book of Ruth* (London, 1883); Paulus Cassel in the Schaff-Lange *Commentary*; James Morison in the *Pulpit Commentary*; J. Glentworth Butler's *Bible Work*, vol. iii., 1889. Goethe pronounces the book of Ruth "the loveliest thing in the shape of an epic or idyl which has come down to us."
Revised by W. J. BEECHER.

Ruthe'nian Rite: a branch of the Roman Catholic Church, consisting of the United Grecks of Austria, Hungary, and Poland, who, as a rule, speak the Russniak language, a Slavic tongue resembling the Polish. They have in Austria an archbishopric (Lemberg, with two united sees of Sanok and Sambor) and two bishoprics (Przemysl and Stanislawów). Their number is 2,653,567. They have 2,376 priests, who care for 1,535 parishes. In 1830, by an act of fraud and violence, the Ruthenians dwelling on the soil of Russian Poland were separated from the Roman Church. See EASTERN RITE, and *Annales Ecclesiæ Rutheuæ*, etc., Leopoli (1862); Pelesz, *Geschichte der Union der ruthenischen Kirche mit Rom von den ältesten Zeiten* (1881); Jordan, *Schematismus der gesammten Katholischen Kirche Oesterreich-Ungarns* (1887); Werner, S. J., *Orbis Terrarum Catholicus* (Freiburg, 1890). J. J. KEANE.

Ruthenians, or **Russniaks**, sometimes called **Red Russians**: the Russian inhabitants of Austria-Hungary, some 3,500,000 in number, who are usually classed with the Little Russians, from whom they are distinguished by a few slight differences of dialect. Most of them are found in Western Galicia and the Bukovina, but about 400,000 are settled on the other side of the Carpathians, in Northern Hungary. Owing to their long subjection to Poland they are chiefly a nation of peasants, as the aristocracy is Polish or Polonized. They are intelligent, quiet, and peaceful, but backward in civilization, poor, and addicted to drunkenness. The centuries of political and religious subjection that they underwent at the hands of their masters have engendered bitter hatreds, which have shown themselves by cruel massacres of the nobles during Polish revolts in the nineteenth century. Despite their numbers they have succeeded in electing but few members to the Austrian Reichsrath, though they are beginning to gain ground. As a rule they belong to the United Greek Church, but their political sympathies are apt to be with their brethren in Russia. Their literature, like the Little Russian, of which it forms a part, is particularly rich in folk-lore and songs. For specimens see Vaclav, *Piesni Polski i Ruskie* (1833). They translated the Bible in 1581. They have a theater and several schools and newspapers. Those in Hungary have made less progress, owing to the crushing policy of Magyarization of the Government at Budapest. A German grammar of the language was published by Levicki in 1833, and a catalogue of Ruthenian literature by Kotula (Lemberg, 1878). See also Bidermann, *Die ungarischen Ruthenen* (2 vols., Innsbruck, 1863–68); Szujski, *Die Polen und Ruthenen in Galizien* (Teschen, 1882); Kupczanko, *Die Schicksale der Ruthenen* (Leipzig, 1887). See RUSSIAN LANGUAGE. A. C. COOLIDGE.

Ruthe'nium [Mod. Lat., named from Ruthenia, a name of Russia, where it was first found]: a metal discovered in association with native platinum by Claus in 1846. It occurs chiefly in the hard grains of iridosmine in small proportion, not above 6 per cent. Its extraction is difficult and tedious. The metal is obtained as a white spongy mass, density 8·6, by calcining the ammonio-chloride. Next to osmium it is the most infusible known metal, but Deville and Debray fused it, and found a density of 11·4. It is scarcely attacked by aqua regia, but easily oxidized by fusion with hydrate of potash, more easily with saltpeter. Chlorine attacks it at incandescence. It forms three chlorides, $RuCl_2$, $RuCl_3$, and $RuCl_4$; six oxides, RuO, Ru_2O_3, RuO_2, RuO_3, Ru_2O_7, and RuO_4; and two sulphides, Ru_2S_3 and RuS_2. Its fumes are not poisonous. Revised by IRA REMSEN.

Rutherford: borough; Bergen co., N. J.; near the Passaic river, on the N. Y., Lake Erie and W. Railroad; 7 miles S. E. of Paterson, 8 miles N. by W. of Jersey City (for location, see map of New Jersey, ref. 2–E). It is an attractive residential place, built up chiefly by New York business men, and contains several churches, public schools, school-district library, and three weekly newspapers. Pop. (1880) 2,299; (1890) 2,293; (1900) 4,411.

Rutherford, SAMUEL: theologian and controversialist; b. at Nisbet, Roxburghshire, Scotland, about 1600; graduated M. A. from the University of Edinburgh 1621; became minister of Anwoth 1627; was deprived by the high commission court of Galloway 1630, and silenced for preaching against the Articles of Perth and banished to Aberdeen 1636; was restored to Anwoth in 1638; was a delegate to the General Assembly Nov., 1638; Professor of Divinity in New College, St. Andrews, Oct., 1639; principal of that college 1647, and rector of the university; was commissioner to the Westminster Assembly 1643–47, but was deprived of his posts 1660, and cited to appear before the next Parliament on the charge of high treason. During the four years of his service on the commission he wrote *The Due Right of Presbyteries* (1644); *Lex Rex* (1645), which was burned under his windows at St. Andrews in 1661; *The Trial and Triumph of Faith* (1645); and *Christ Dying and Drawing Sinners to Himself* (1647). D. in Edinburgh, Mar. 29, 1661. He was prominent among the Presbyterian divines of his time, and author of a large number of theological treatises, which were highly esteemed; among them were a reply to Rev. Thomas Hooker's *Summe of Church Discipline*; *Coveuant of Life* (1655); *Civil Policy* (1657); *Life of Grace* (1659), etc. There have been reissued *Twelve Communion Sermons* (1876) and *Quaint Sermons* (edited by A. A. Bonar, 1885). See A. A. Bonar, *Letters of Rev. Samuel Rutherford*, with a sketch of his life (1851; new and revised ed. London, 1894); another ed. of his *Letters* (New York, 1891), and the *Life* by Andrew Thomson (London, 1884; 2d ed. 1891).
Revised by S. M. JACKSON.

Rutherfurd, LEWIS MORRIS: astronomer; b. at Morrisania, N. Y., Nov. 25, 1816; gradnated at Williams College in 1834; admitted to the bar in 1837; retired from practice in 1849 to devote himself to travel and study, especially of astronomy. He was the first to apply photography to accurate celestial measurements. In 1864 he had a large telescope especially constructed for photographic purposes, and his pictures of celestial objects taken with this instrument have not yet been surpassed. In 1883 he retired from active astronomical work, and presented his instruments to Columbia College. D. at Tranquillity, N. J., May 30, 1892.
S. NEWCOMB.

Rutherglen, rŭg'len: town of Lanarkshire, Scotland; on the Clyde, 3 miles S. E. of Glasgow (see map of Scotland, ref. 12–G). It was formerly a place of great importance, but is now dependent on its connections with Glasgow for both its trade and its manufactures. Pop. (1891) 13,361.

Rutile [from Lat. *ru'tilus*, red, golden red]: a native oxide of titanium used to color porcelains and artificial teeth

yellow. It is widely distributed, but only in small amount. It often penetrates quartz in blade-like or needle-like crystals, and is then called Venus's-hair stone, sagenite, or *flèches d'amour*. When compact it can be cut into a gem, with a luster and color like cut black diamond. G. F. K.

Rü'timeyer, Ludwig: zoölogist; b. at Biglen, Switzerland, in 1825; studied first theology at Bern, afterward medicine and natural science in Paris under Élic de Beaumont and in London under Owen, and in Leyden, and was in 1855 appointed Professor of Comparative Anatomy and Zoölogy at Basel. The most important of his works refer to geology and palæontology: *Untersuchungen der Thierreste aus den Pfahlbauten in der Schweiz* (Zurich, 1860); *Die Fauna der Pfahlbauten in der Schweiz* (Basel, 1861); *Beiträge zur Kenntniss der fossilen Pferde* (Basel, 1863); (in connection with W. His) *Crania helvetica. Sammlung schweiz. Schädelformen* (Basel, 1864); *Versuch einer natürlichen Geschichte des Rindes in seinen Beziehungen zu den Wiederkäuern im allgemeinen* (2 parts, Zurich, 1866–67); *Die fossilen Schildkröten von Solothurn* (2 vols., Zurich, 1866–73); *Die Veränderungen der Thierwelt in der Schweiz seit Anwesenheit des Menschen* (Berlin, 1875); *Beiträge zu einer natürlichen Geschichte der Hirsche* (3 parts, Geneva, 1880–84), etc. H. S. Williams.

Rutland: an inland county of England, bounded by the counties of Leicester, Lincoln, and Northampton. Area, 150 sq. miles. Rutland is divided into two portions by the Wash; the northern is level, and the southern consists of low hills separated by a number of valleys. The soil is rich and well cultivated. Rearing of cattle is the chief branch of industry. Rutland returns one member to Parliament. Pop. (1901) 19,708. Principal towns, Oakham and Uppingham.

Rutland: city (incorporated 1892); capital of Rutland co., Vt.; on the East and Otter creeks, and on the Rutland Division of the Central Vermont Railway, and the Bennington and Rutland and Rutland and Washington and Saratoga Divisions of the Delaware and Hudson Railway; 55 miles S. S. W. of Montpelier, the State capital, and midway between Burlington and Bellows Falls (see map of Vermont, ref. 7–B). The original town was chartered by New Hampshire in 1761, and settled in 1770. The old boundaries lay between the Green Mountains on the E. and the Taconic Range on the W., and had an area of 26,000 acres. Present area about 8¼ sq. miles. It is in a rich mineral region, and has become widely known through the extent and value of its marble deposit, which was early discovered, and has been successfully quarried since 1830. In 1886 a division of the town was made, and the new towns of West Rutland and Proctor were erected and set off. By this action and by the subsequent creation of the city in 1892 four separate municipalities were formed. As a result of these changes the marble quarries all came within the boundaries of the new towns, but the manufacture of marble and of quarrying and channeling machines is still carried on in the city to a considerable extent. There are also lumber and brick yards, manufactures of machinery, engines, and boilers, dairy and cheese factory apparatus, sugar-evaporators, doors, sashes, blinds, and (Howe's) scales. There is a fine water-system, the supply being taken from East creek, a pure mountain stream, at a point 3 miles distant from the storage reservoir; a paid fire department (the first in Vermont), gas and electric plants, and an electric street-railway. The public buildings include the U. S. court-house, the post-office, the county court-house, the city-hall, Memorial Hall (cost over $60,000, besides the expense of material contributed by the quarry companies), in memory of the soldiers of Rutland who fell in the civil war, Baxter Memorial Hall, House of Correction, an opera-house, and many handsome business blocks. The city has 7 churches, graded and high schools, Roman Catholic parochial school, a convent school, and the Rutland English and Classical Institute. It has 5 national and 2 savings banks and 2 trust companies. During the Revolution Rutland was a fortified post on the Great Northern Military road, two forts having been erected within its borders. It was made the chief town of the county in 1781, and from 1784 to 1804 was one of the capitals of the State. Pop. of original town (1880) 12,149; of the three divisions (1890), Rutland 11,760, West Rutland 3,680, Proctor 1,758; city of Rutland (1900) 11,499. Henry F. Field.

Rutledge, Edward: signer of the Declaration of Independence; b. at Charleston, S. C., Nov. 23, 1749; studied law in the office of his brother John and in the Temple in London; began practice in Charleston 1773; was elected a member of the first Continental Congress 1774; was one of the signers of the Declaration of Independence, a member of the first board of war (June, 1776), of the committee appointed to draft Gen. Washington's commission (1775), and to draw up the first Articles of Confederation; also of that sent to confer with Lord Howe on Staten Island; commanded a company of artillery during the siege of Charleston, where he was taken prisoner 1780; was eleven months a prisoner at St. Augustine; sat in the Legislature 1791, when he drew up the act for the abolition of the rights of primogeniture; became U. S. Senator 1794; Governor of South Carolina 1798. D. at Charleston, Jan. 23, 1800.

Rutledge, John: brother of Edward Rutledge; b. at Charleston, S. C., in 1739; studied law in the Temple, London; began practice at Charleston 1761; was a member of the Stamp Act congress at New York in 1765, of the South Carolina convention of 1774, and of the Continental Congress 1774–75; sat in the South Carolina convention of 1776, and was chairman of the committee which drew up the State constitution; was president of the new government and commander-in-chief of the State; resigned, through dissatisfaction with the new State constitution, 1778; was chosen Governor with extensive powers 1779; took the field at the head of the militia against the invaders; retired to North Carolina on the fall of Charleston May, 1780; accompanied the army of Greene until 1782, when he summoned the Assembly of North Carolina and afterward retired from the governorship and was elected to Congress; became chancellor of South Carolina Mar., 1784; was a member of the convention which framed the Federal Constitution, where he favored assumption of State debts by the Federal Government, and opposed the abolition of the slave-trade; was appointed a justice of the U. S. Supreme Court Sept., 1789; resigned that office 1791 to accept the chief justiceship of South Carolina; was appointed by Washington chief justice of the Supreme Court of the U. S. July, 1795, and presided at the August term, but as he lost his reason shortly after, the Senate declined to confirm the appointment. D. at Charleston, July 23, 1800. Revised by F. Sturges Allen.

Rütli: See Grütli.

Ru'tuli: a people of ancient Italy, inhabiting the coast of Latium, where they built the city of Ardea. They figure very conspicuously in the legendary fictions about Æneas, etc., but they were subdued by the Romans before the overthrow of the monarchy, and they are not mentioned in history after that time, with the exception of a curious notice found in the list given by Cato of the cities that took part in the foundation of the celebrated temple of Diana at Aricia. Revised by G. L. Hendrickson.

Ruvo di Puglia, roo'vō-dee-pool'yaă (anc. *Rubi*): town of Italy, province of Bari delle Puglie; 22 miles W. of Bari (see map of Italy, ref. 6–G). It is surrounded by a wall, outside of which are extensive suburbs, and it is entered by four gates. It is celebrated for the great number of beautiful antique vases found in the necropolises of the vicinity. The adjacent country is productive, grain, vegetables, and choice fruit being abundant. Pop. 17,728. M. W. H.

Ruysbroek, rois'brook, John: the patriarch of the Dutch and German Mystics; b. about 1293, taking his name from the place of his nativity, a village near Brussels. About 1316 he became vicar of a church in Brussels; about 1352 joined the Augustinian monastery of Groenendael, near Waterloo, and rose to the position of prior 1381. D. in the monastery Dec. 2, 1381. He advocated oneness with God and assimilation to him, to be achieved by contemplation. He avoided the antinomianism of the pantheistic Mystics, and had the spirit of a reformer. He drew much from pseudo-Dionysius and Eckhart. He wrote in Latin and Flemish, and his works were published in Latin translation by Surius (Cologne, 1552), and in German by Arnold (Offenbach, 1701). The original Flemish appeared at Ghent, 1858, 5 vols. (incomplete). See J. G. v. Engelhardt's *Richard v. St. Victor u. Joh. Ruysbroek* (1838) and C. Ullmann's *Reformers before the Reformation* (1841; Eng. trans. 1855, vol. ii., pp. 36–55). Revised by S. M. Jackson.

Ruysdael, Jacob: See Ruisdael, J. V.

Ruyter, roi'ter, Michael Adriaanszoon, van: admiral; b. at Flushing, Zealand, Mar. 24, 1607, of humble parentage; went to sea as a cabin-boy in 1618; was made a captain in the Dutch navy in 1635, and a rear-admiral in 1645. In the war between Spain and Portugal he sunk in 1647 an Alge-

rine piratical squadron off the port of Salé, and subsequently distinguished himself still more in the war between Holland and England, 1652, and in the Danish service. In 1667 he sailed up the Thames, destroyed the shipping at Sheerness, and burned a number of English men-of-war; in 1672 he attacked the English and French fleets, and compelled England to conclude the Peace of Breda. In the war with France he commanded in the Mediterranean, but was defeated off the eastern coast of Sicily by Admiral du Quesne. He succeeded in conducting his fleet safely into the harbor of Syracuse, where he died next day, Apr. 29, 1676.

Ryan, Harris Joseph, M. E.: electrical engineer; b. at Powell's Valley, Pa., Jan. 8, 1866; educated at Baltimore City College, Lebanon Valley College, and Cornell University, graduating at the last named in 1887; instructor in physics, Cornell University, 1888–89; appointed Associate professor of Electrical Engineering, Cornell University, 1889. Prof. Ryan is the author of various papers on electrical machinery read before the American Institute of Electrical Engineers, of which he is a member, and is a contributor to *The Electrical World*, *The Electrical Engineer*, *The Sibley Journal of Engineering*, and numerous other U. S. and European electrical journals. C. H. T.

Ryan, Stephen Vincent, D. D.: bishop; b. near Almonet, Upper Canada, Jan. 1, 1825; was taken when a child to Pennsylvania; was educated at St. Charles's Seminary, Philadelphia, Pa.; completed his theological studies at St. Mary's Seminary, Barrens, Mo.; was ordained priest June 24, 1849, in St. Louis, Mo.; was prefect and professor for some years at St. Mary's Seminary, and afterward at St. Vincent's College, Cape Girardeau, Mo., of which institution he became president about the year 1856; was named provincial visitor of the Congregation of the Mission in 1857; appointed by the Holy See second Bishop of Buffalo Mar. 3, 1868, and was consecrated Nov. 8 of the same year. D. Apr. 10, 1896.

Ryazan: See Riazan.

Rybinsk': town of Russia, government of Yaroslav; on the Volga; 48 miles N. W. of Yaroslav (see map of Russia, ref. 6–E). It is one of the most important centers of internal commerce in the empire, and is at the head of the Mariinskaia and Tikhvinskaia Canals which unite the basins of the Volga and the Neva and Dwina, and thus the Caspian with the Baltic. It has a large transit trade in cereals, flax and hemp and their seeds, lard, spirits, metals, cloths, and other manufactures, and the Volga is open on an average 219 days per year. The town is an ancient one, first mentioned in history in 1137; became important in the middle of the eighteenth century, when the canals were finished. Pop. (1890) 32,111. Mark W. Harrington.

Rydberg, rid'bärch, Abraham Victor: author; b. at Jönköping, Sweden, Dec. 18, 1829; educated in the Latin school of Wexiö, studied at the University of Lund, and was for many years editor of *Göteborgs Handels- och Sjöfartstidning*, one of the most influential papers of Scandinavia. He has published several translations (Goethe's *Faust*) and novels, among which *Den siste Athenaren* (The Last of the Athenians, 1859), a picture of the last contests between Greek paganism and Christianity, was translated into German and English; several poems characterized by finish and originality; a number of æsthetical and historical studies, *Venus från Milo* (1874), *Romerska dagar* (1875–77), etc.; and a series of works belonging to the philosophy of religion—*Bibelns lära om Kristus* (The Teaching of the Bible about Christ, 1862), *Medeltidens magi* (Magic of the Middle Ages, 1864), *Romerska sagnar om Apostlarin Paulus och Petrus* (Romish Legends about the Apostles Peter and Paul, 1871), *Urpatriarkernes tafla i Genesis* (The Primitive Patriarchs' Tables in Genesis, 1873), etc. His *Undersökningar i germanisk Mythologi* (1886: Eng. trans. 1889, under the title *Teutonic Mythology*) is a brilliant but wholly unscientific work. D. in Stockholm, Sept. 21, 1895. D. K. Dodge.

Ryde: town of England; on the northeast coast of the Isle of Wight, opposite Portsmouth, at the other side of the Spithead roadstead (see map of England, ref. 14–I). It is a fashionable watering-place; it consists of Upper and Lower Ryde—the former being on the site of an ancient village (La Rye or La Riehe), while the latter is of recent construction. Pop. (1891) 10,952.

Rydqvist, rid'kwist, Johan Erik: scholar; b. at Gothenburg, Sweden, Oct. 20, 1800; was editor of a literary journal, *Heimdal* (1828–32); became a royal librarian; was elected a member of the Swedish Academy. His *Svenska språkets lagar* (Principles of the Swedish Language, 5 vols., 1850–74) is still, in spite of the many changes in linguistics, the authoritative work on that subject. He was also the author of a study of the early Scandinavian drama *Nordens äldsta skådespel*, and the translator of a number of Moore's poems. D. at Stockholm, 1878. D. K. Dodge.

Rye: a cereal plant (*Secale cereale*), native of the country about the Caspian Sea. It is largely cultivated in Central and Northern Europe, where the grain is the chief breadstuff and the straw is largely used for thatching. Rye grows well in a cold climate, and will thrive on poor sandy soils better than wheat. Rye is not so nutritious as wheat, and makes an inferior and darker-colored bread. An average analysis of rye grown in the U. S. gives: Water, 11·6; ash, 1·9; protein, 10·6; fiber, 1·7; carbohydrates, 72·5; fat, 1·7. Fertilizer analyses give for grain a percentage of 1·76 nitrogen, 0·82 phosphoric acid, 0·54 potash; and for straw a percentage of 3·25 ash, 0·46 nitrogen, 0·28 phosphoric acid, 0·79 potash.

In the U. S. about 30,000,000 bush. are produced annually. In the eastern States the straw is often of as much value as the grain. Machinery has been devised for threshing the grain without breaking the straw, which is used largely for matting, mattresses, and saddlery. Whisky is extensively distilled from rye in the U. S., gin in Holland, and a liquor called kvass in Russia. George C. Watson.

Rye-grass: the *Lolium perenne*, a European grass naturalized in the U. S. In Europe it is highly esteemed both for hay and pasture, and is the most important of all forage plants, but in the U. S. it is not very highly valued. The Italian rye-grass (*L. italicum*) is also greatly valued in Great Britain. For the *Lolium temulentum* see Darnel.

Rye House Plot: a scheme devised by some English Whigs to kill King Charles II. while on his way from Newmarket, and to give the crown to the Duke of Monmouth. It was so called from the Rye House, a farm near Newmarket, where the murder of the king was to be undertaken. The plot was discovered, and many leading Whigs, including Algernon Sydney and Lord Russell, were sent to the block, and many others were severely punished.

Rylance, Joseph Hine: See the Appendix.

Ryleev, ril-ā'yef, Kondratiĭ Fedorovich: poet; b. in Russia, Sept. 18, 1796, the son of a retired officer. He was brought up in the first corps of cadets, was in the artillery during the campaign of 1814, and withdrew from the army four years later. In St. Petersburg, where he took up his residence, he served as a Government official and then as secretary of the Russian American Company. At the same time he was active in literature and politics. He published poems in different papers, and with his friend A. Bestuzhev was editor of the *Severnaĭa Zvesda* (North Star), an organ of the romantic school. He was one of the chiefs of the band of conspirators who brought about the futile military rising at the accession of the Emperor Nicholas I., although convinced that success was impossible, and was hanged with four of his comrades July 26, 1826. His character seems to have been exceedingly pure, and his patriotism of the highest kind. His complete works were published at St. Petersburg, 1872. See *The Poems of K. F. Relaieff*, translated by F. Hart-Davies (London, 1887). A. C. Coolidge.

Rymer, or **Rymour**, Thomas: historiographer; b. at Northallerton, Yorkshire, England, about 1641; educated at Sidney-Sussex College, Cambridge; studied law at Gray's Inn; became historiographer to William III. in 1692; now chiefly remembered for the vast Latin collection of English historical and diplomatic documents known as *Rymer's Fœdera* (20 vols. folio, 1704–35, of which 15 were edited by himself and the remainder by Robert Sanderson). D. in London, Dec. 14, 1713. Rymer left 58 MS. vols. of important historical documents, now in the British Museum. A *Syllabus* (in English) of the *Fœdera* was published by Sir Thomas Duffus Hardy (3 vols., 1869–86).

Rymour, Thomas: See Rhymer, Thomas.

Ryswick, riz'wik: small town of the Netherlands, province of South Holland; 2 miles S. E. of The Hague (see map of Holland and Belgium, ref. 6–E). It is famous for the treaty of peace between France and the allies, Germany, Holland, England, and Spain, signed here Sept. 20, 1697.

Rzhef: See Rshef.

S

: the nineteenth letter of the English alphabet.

Form.—The form of the letter is derived through the Latin alphabet from the Greek *sigma*, which appears in the oldest inscriptions in the following various forms: Three-stroke ϟ, ≷, rounded Ϛ, four-stroke ξ, ϟ, rounded ξ Ϛ. It represents the twenty-first letter of the Phœnician alphabet, *shin*, ש.

Name.—The English name *ĕs* comes through the Old French from the Latin phonetic name *es*; cf. *ef*, *el*, *em*, *en*, *er*. The Greek name *sigma* does not correspond to the Semitic name (*shin*) of its letter, but is probably a corruption of *samekh* or *samka*, the name of the fifteenth Phœnician letter, for which, with its new value, the Greeks had devised the new name *ksei* (ξεῖ, later ξῖ). *Samka* was changed to *sigma* probably under the influence of σίζω (σιγμός), hiss, i. e. the hissing sound. The Semitic name *shin*, tooth, was, like the other Semitic names, applied both because of the fancied resemblance in the form of the letter, and because of the sound initial in the name.

Sound.—The sound commonly denoted by *s* is the voiceless dental sibilant, formed by forcing voiceless breath through a narrow channel between the blade of the tongue and the alveolar terrace against the teeth. This sound appears, e. g., in English *sakes*, *set*, *base*. It is also denoted by *c*, e. g., in *cell*, *place*; and by *sc*, e. g., in *scene*, *descend*. The letter *s* has also the value of (1) *z* in, c. g., *easy*, *lives*, *his*; (2) *sh* (š), e. g., in *sure*, *sugar*, *sensual*; (3) *zh* (ž), e. g., in *usual*, *pleasure*.

Sources.—The main sources of the English *s*-sound are: (1) Teutonic *s* < Indo-Europ. *s*, as in *seven*: Lat. *septem*: Sanskr. *saptá*; *sister*: Lat. *soror*: Sanskr. *svásar-*; (2) the Indo-Europ. combination dental + *t*, as in *wise*: Lat. *vīsus* < Indo-Europ. *vid-to-s*; (3) Lat. *s*, viâ O. Fr., as in *state* < Lat. *status*; *feast* < Lat. *festa*; *case* < Lat. *casus*; (4) Lat. *c* before *e*, *i* (viâ Fr.), as in *city* (pron. *sĭtĭ*) < Lat. *civitas*; *cent* < Lat. *centum*; *voice* < Lat. *vox*, *vocem*; *peace* < Lat. *pax*, *pacem*; (5) Lat. *ti* (viâ Fr.), as in *ransom* < Lat. *redemptio'nem*; *grace* < Lat. *gratiam*.

Symbolism.—S (in chemistry) = sulphur; in £ *s. d.* = Lat. *solidus* for *shilling*; S. = Saturday or Sunday, south, southern. See Abbreviations.

Benj. Ide Wheeler.

Saadya ben Joseph (known in Arabic literature as Saïd ibn Ya'kūb al Fayyūmī): Jewish writer; b. at Fayyūm (Pithom), Egypt, in 892. He was called in 928 to be rector of the Talmudic school in Sura (Babylon) with the title of Gāōn (highness). He died in 942. He was the first among the Jews to attempt an exposition of philosophy and theology from the standpoint of rabbinical Judaism. His principal work is called *Book of Religions and Dogmas*. The original Arabic text has been published by S. Landauer (Leyden, 1880). The Hebrew translation was made by Judah ibn Tibbon in 1186. A German translation by Julius Fürst appeared at Leipzig, 1845, but it is not reliable. (See Guttmann, *Die Religionsphilosophie des Saadya*, Göttingen, 1882.) Saadya was the first to translate parts of the Bible into Arabic. He also wrote commentaries on nearly the whole of the Bible. (See Munk, *Notice sur R. Saadiah Gaon* (Paris, 1838); Graetz, *Hist. of Jews*, iii., chap. vii.; Friedlander, *Life and Works of Saadia* in *The Jewish Quarterly Review*, v., p. 177.) In honor of the thousandth anniversary of his birth, J. Derenberg has begun a critical edition of Saadya's works (vol. i., *Version arabe du Pentateuque*, Paris, 1893).

Richard Gottheil.

Saa'le: the name of several German rivers. The most important is the Saxon or Thuringian Saale, which rises in the Fichtelgebirge, flows in a northern direction through the Prussian province of Saxony, where it becomes navigable, and falls into the Elbe after a course of about 200 miles.

Saalfeld, zaal'felt: town; in the duchy of Saxe-Meiningen, Germany; on the Saale; 31 miles by rail S. S. W. of Jena (see map of German Empire, ref. 5–F). It has a fine ducal palace, a magnificent church, several good educational institutions, and manufactures of chemicals, vinegar, etc. On Oct. 10, 1806, the Prussians were defeated here by the French. Pop. (1895) 9,960.

Saarbrücken, zaar'brü-ken: town of Rhenish Prussia, on the left bank of the Saar; connected by a floating bridge with the suburb of St. Johann on the right bank (see map of German Empire, ref. 6–C). It was the theater of the opening of the Franco-German war of 1870–71. On Aug. 2, 1870, Napoleon III., at the head of a whole army-corps and accompanied by his son, attacked the town, which was feebly garrisoned by the Germans, compelled the garrison to retreat, and marched into the town. Next day the French evacuated the place, and on Aug. 6 a violent encounter took place in the vicinity, the German army attacking the French position on the hills of Spichern to the S. W. of the town. The French were defeated and forced to retreat across Eslingen to Blittersdorf, leaving many prisoners, their camp equipage, pontoons, and provisions. Pop. (1895) 17,081.

Saardam: See Zaandam.

Saavedra, saă-vā'-drăă, Angel, de, Duque de Rivas: statesman and poet; b. at Cordova, Spain, Mar. 1, 1791; entered the royal guards 1807; fought gallantly in the war of independence. He took part in the revolution of 1820, and was elected to the Cortes, of which he became secretary in 1821; lived in exile (England, Malta, and France) 1823–34, soon after which he inherited his dukedom; became secretary of the chamber of peers 1835; Minister of the Interior in the cabinet of Isturiz May, 1836; in exile again 1837–43; ambassador at Naples 1843–48, and later for a short time at Paris. D. in Madrid, June 26, 1865. He wrote *Ensayos Poéticos* (2 vols., 1813); *Florinda* (1824–25), an epic on the Moorish conquest of Spain; *El Moro Expósito* (1834), a national epic; many dramas; and histories of Masaniello (1860) and of the Neapolitan revolution (2 vols., 1848; new ed. 1881).

Saba, saa'bă: a small island of the Lesser Antilles, West Indies, crossed by lat. 17° 39′ N. It is high and rocky; the inhabitants are of Scotch descent, but the island belongs to the Dutch, and is a dependency of Curaçoa. Pop. (1890) 1,883.

H. H. S.

Sabadell': town; in the province of Barcelona, Spain; on the Ripoll; 14 miles by rail N. W. of Barcelona (see map of Spain, ref. 14–K). It is a prosperous manufacturing town, with a number of woolen and cotton spinning and weaving factories. Pop. (1887) 19,645.

Sabadilla, Cebadilla (or **Cevadilla**): See Asagræa.

Sabæ'ans: the tribe of Saba, anciently inhabiting Yemen, the southwest corner of the Arabian peninsula. About 1100 B. C. they became of importance, and about 900 B. C. their princes, who took the title of Kings of Saba, supplanted the Minæans, the dominant tribe of Arabia. During the period 400 B. C.–300 A. D. the Sabæan rulers subdued the Himyarites and Abyssinians, and drove the latter to Africa. In the period 300–600 A. D. the title of King of Saba, Dhū-Raidān, Hadramaut, and Yemen was borne by the monarchs. The Abyssinians made two attempts to reoccupy Saba, but were finally driven out toward the end of the sixth century by the Persians, who had been contending with Rome for possession of Arabia. The appearance of Mohammed put an end to the quarrels, and for a time united the whole peninsula. About 1,600 Minæo-Sabæan inscriptions have been found. They are written in a dialect akin to the Arabic and Ethiopic, and in a script which is the parent of the Ethiopic. See Halévy, *Études Sabéennes* (Paris, 1873); Müller, *Süd-Arabische Studien* (Vienna, 1877). The name Sabæans is also given to certain religious sects of Western Asia. See Sabism and Mandæans.

Richard Gottheil.

Sab'aka: an Ethiopian who invaded Egypt, defeated and burned Bocchoris, the sole king of the twenty-fourth dynasty, and himself became the first king of the twenty-fifth dynasty. He is supposed to have been the *So* or *Seveh* of the Bible and the *Shabe* of the Assyrian monuments. His approximate date was 700 B. C., but the length of his reign is uncertain (twelve years according to the monuments; fifty

years according to Herodotus, ii., 137). His reign in Egypt was mild, and he left monumental remains in Thebes. Hoshea of Israel (2 Kings xvii. 4) asked his aid against Shalmaneser of Assyria in vain, and later other Syrian princes made alliance with him against Assyria. Sargon, who defeated Sabaka at Raphia, S. of Gaza, and afterward exacted tribute of him, calls him a "prince," and his cartouche, found at Nineveh, shows him wearing the crown of Lower Egypt. Stade considers him to have been simply a petty local ruler. CHARLES R. GILLETT.

Sabal Palmetto: See PALMETTO.

Sabanilla, sä̆a-bä̆a-neel'yä̆a, or **Savanilla**: seaport of the department of Bolivar, Colombia; on a bay 7 miles W. of the delta of the river Magdalena (see map of South America, ref. 1–B). It is connected by railway with Barranquilla, on the river, and is the maritime port of that place, and consequently of the greater part of the republic. The bay is shallow, and vessels anchor in a roadstead several miles below. The population is small. H. H. S.

Sabbath [from Heb. *shabbāth*, rest, sabbath, deriv. of *shabāth*, rest from labor]: the weekly day of religious rest. The observance of a weekly rest-day is very widely held to have a natural basis in the constitution of man. The persistency with which such an institution has been maintained for many ages among Jews, Christians, Mohammedans, and even some pagan nations, supports this view. Inquiries instituted by a commission of the British Parliament in 1832, the testimony of 641 medical men of London in a petition to Parliament in 1853, and of a great number of medical societies, physicians, physiologists, political economists, and managers of industrial establishments, go to prove that in the case of men engaged in ordinary bodily or mental labor the rest of the night does not fully restore the waste of energies during the day, and that to maintain a condition of vigor a supplementary rest of about one day in seven is needed. This view is confirmed by the experience of France during the Revolution, when the decade was substituted for the week, and each tenth day devoted to rest—a proportion of time which was found to be insufficient. The need of a weekly respite from daily toil appears also in the social nature and relations of man as a member of the family and of the state. These aspects of the weekly rest have been ably illustrated by Pierre Proudhon, the French radical philosopher, in his essay *La Célébration du Dimanche*, and more fully in papers presented at the Sunday Rest Congress in connection with the Paris Exposition of 1889; and in papers read at the Chicago Sunday Rest Congress in 1893, published as *The Sunday Problem* (New York, 1894).

The week of seven days may be traced to the dawn of human history, and it is probable that wherever the week existed it was marked by the observance of sabbath or rest-days. A weekly Sabbath was known to the Semitic Assyrians and Babylonians, and it is claimed that the name *Sabattu* is found in the inscriptions, where it is defined as "a day of rest for the heart." It seems also to have been known to the Accado-Sumerians, the aboriginal inhabitants of Chaldea, and their equivalent term for Sabbath is explained to mean "a day of completion of labor." (Sayce, *Hibbert Lectures for 1887* and *Social Life among the Assyrians*, 1893.) The Assyrian Sabbath differed widely from that of the Hebrews, and the connection between the two is as yet uncertain. See Francis Brown's *Assyriology* and J. D. Davis's *Genesis and Semitic Tradition*.

The first mention in the Bible of such an institution is in Gen. ii. 2, 3—a passage which forms the close of the earliest of the records of which the Mosaic history, according to the theory of many biblical scholars, is composed. The seventh day is consecrated by the Creator, who, having finished the creative work of six days, or periods, blessed and hallowed the seventh because he rested therein. The natural meaning of the passage is the establishment of a holy rest-day after every six days of labor for the race just created. The natural law of periodic rest was thus lifted out of the sphere of mere physical necessities into that of intellectual and spiritual privilege and enjoyment, as befitting a creature made in the image of the Creator and capable of holding fellowship with him. Its connection with the Creation shows that, with the family constitution, it was intended to lie at the basis of the development of all human life, inclusive of all human conditions, and not merely for any sect or age. As to the observance of the Sabbath in the patriarchal period, the Mosaic narrative, which is very brief and meager, gives us no knowledge save what may be inferred from the occasional intimations of the division of time by weeks (Gen. xxix. 27; viii. 10, 12; iv. 10, etc.).

The first mention of the Sabbath by name occurs in Ex. xvi. 23, *seq.*, where its observance is not introduced with the formalities with which an institution of such importance would be inaugurated for the first time, but in language which seems to imply that it was not wholly unknown to the people. It next appears among the Ten Commandments, which were distinguished from the rest of the Jewish law by the circumstances of peculiar solemnity under which they were spoken on Mt. Sinai and given to Moses engraved on stone tablets by the hand of God (Ex. xx. 8). Its observance was enforced by gratitude for deliverance from bondage (Deut. v. 15), and was constituted a sign of covenant between God and the Jews. Like other of these great commands, the law of the Sabbath reappears in the Jewish municipal and ceremonial code with special prescriptions and penalties, all of which show the importance attached to its observance and the great care taken—as by the prohibition of servile work, gathering of sticks, kindling fires, etc.—that all alike, servants as well as masters, strangers as well as members of the congregation, should enjoy its benefits. A single instance is recorded of the punishment of death being inflicted upon a presumptuous transgressor (Num. xv. 30, *seq.*). Connected with the weekly Sabbath there was ordained in the Jewish municipal and ceremonial law a system of sabbatical years of local and national significance and use (Lev. xxv.). The Sabbath also, in its leisure and opportunity for social intercourse and holy convocation (Lev. xxiii. 3), sustained an important relation to the free republican institutions of the Jews. In later periods of the Jewish history, Isaiah (lviii. 13) and Jeremiah (xvii. 21, *seq.*) enforced its observance with threatenings and promises; Ezekiel (xx. 12, *seq.*) put its violation foremost among the national sins; Nehemiah (x. 31; xiii. 15) narrates the public efforts at reformation after the return from the Babylonish captivity. Henceforward the Sabbath was kept with scrupulous care, and gradually to the time of Christ became burdened with self-enforced severities and ridiculous prohibitions.

Christ, while observing the Sabbath, sought by his example and teachings to rescue it from the puerile superstitions by which it had come to be degraded. He performed miracles of healing, and with his disciples gathered ears of grain for food as he passed through the fields on the Sabbath, and justified his conduct by showing that such works of necessity and mercy were not violations of its true law. He taught that the Sabbath was made for man, for his benefit, and not man for the Sabbath, and that He, the Son of man, the one in whom all humanity is represented in its perfection, was so the Lord of the Sabbath as rightfully to define and prescribe its true obligation and use (Mark ii. 27, 28).

The resurrection of Christ and his subsequent appearances to his disciples till his ascension, and the miraculous descent of the Holy Spirit on the first day of the week, led to that day being set apart for the special religious assemblies of the Christians and for the simple services of their faith. For a time the Jewish converts observed both the seventh day, to which the name Sabbath continued to be given exclusively, and the first day, which came to be called the Lord's Day. St. Paul sought to relieve the consciences of the Gentile Christians from the obligation of keeping the Jewish Sabbath, and warned them that such observance might even be an evidence of backsliding (Col. ii. 16; Gal. iv. 10). Within a century after the death of the last of the apostles we find the observance of the first day of the week, under the name of the Lord's Day, established as a universal custom of the Church, according to the testimony of the *Didache*, and of Barnabas, Ignatius, Pliny, Justin Martyr, and Tertullian. It was regarded not as a continuation of the Jewish Sabbath—which was denounced, together with circumcision and other Jewish and anti-Christian practices (*Apology of Aristides*, A. D. 125)—but rather as a substitute for it; and naturally its observance was based on the resurrection of Christ rather than on the Creation rest-day or the Sabbath of the Decalogue. Tertullian (about 200), in saying that Sunday was given to joy, and enjoining abstinence from secular care and labor on it, makes it evident that the Lord's Day was regarded as taking the true place of the original seventh-day Sabbath. But the position of the early Church, struggling into existence, exposed to persecution, and with many of its members slaves of heathen masters, would prevent unbroken regularity of worship and a general cessation of labor, until in the time of

Constantine (321) the observance of Sunday as the weekly rest-day was protected by law. Later in the history of the Church the connection between the Lord's Day and the original Sabbath became explicitly recognized. The second Council of Macon (585), in forbidding secular work on that day, and enjoining that it be occupied with the hymns and praise of God, says, "For this is the day of perpetual rest; this is shadowed out to us by the seventh day in the Law and the Prophets." At the Reformation, Luther, Zwingli, Calvin, and Bucer at first favored the abolition of all holy days but the Lord's Day; but their antagonism to what they considered the Judaizing legalism of Rome, and their zeal for evangelical freedom, led them at times to deny the scriptural obligation of a weekly rest-day. They were not, however, always consistent with themselves. Luther says of the Sabbath, "Keep it holy for its use's sake both to body and soul, but if anywhere the day is made holy for the mere day's sake, if anywhere any one sets up its observance upon a Jewish foundation, then I order you to work on it, to ride on it, to dance on it, to feast on it, to do anything that shall reprove this encroachment on the Christian spirit and liberty." Elsewhere he represents the observance of Sunday as "good and necessary," and defends the Ten Commandments as still binding on Christians. Upon the Continent, since the Reformation, both among Roman Catholics and Protestants, the observance of the Sabbath was until later years commonly based upon ecclesiastical authority. A different view early obtained in Great Britain, and there and in the U. S. the prevalent doctrine recognizes the weekly rest-day as founded in the nature of man, consecrated by the example of God at the Creation, authoritatively promulgated in the Fourth Commandment, confirmed by Christ, and, while transferred from the seventh to the first day of the week and invested with new significance, perpetuated in the Lord's Day of the Christian Church. See Robt. Cox, *Literature of the Sabbath Question* (1865); Hessey, *Bampton Lectures* (1860); Oehler, *Theol. of Old Test.*; P. J. Proudhon, *La Célébration du Dimanche*; Philip Schaff, *Hist. of the Apostolic Age* and *Church Hist.*; Tayler Lewis, Excursus in his trans. of Lange's *Com. on Genesis*, ch. i.; N. Y. Sabb. Com., *Doc. 26*; *Eight Studies of the Lord's Day*; *The Sunday Problem, its Present-day Aspects.* See Lord's Day and Sunday.

W. W. Atterbury.

Sabbathai' Lewi', or **Shabbatai Tsevi**: See Jews (*In Turkey and the Levant*).

Sabbatical Festivals: four festivals enjoined by the laws of Moses. These were: (1) The Sabbath day. (2) The Sabbath month, which was Tisri, the seventh in the Hebrew year, corresponding with our October. It opened with the Feast of Trumpets, contained the Day of Atonement (10th), and the Feast of Tabernacles (15th to 22d). (3) The Sabbath year, which in Exodus (xxiii. 10, 11) has an agricultural aspect (the land is to rest from culture); in Deuteronomy (xv. 1, 2) has a commercial aspect (debts were either to be relinquished or held in abeyance); and in Leviticus (xxv. 3–7) a religious aspect ("for the Lord"). Every seventh year was thus interdicted to secular and selfish uses; but before the Babylonian captivity the ordinance appears not to have been well observed, as may be gathered from Jer. xxv. 11, 12, compared with 2 Chron. xxxvi. 21. After the Captivity it was different. Alexander, who conquered Syria 332 B. C., remitted the tribute of the Jews every seventh year, "that they might enjoy the laws of their forefathers" (Josephus, *Ant.*, xi., 8, 5). Julius Cæsar afterward did the same (*Ant.*, xiv., 10, 6). According to Jewish reckoning, the year from Oct., 1888, to Oct., 1889, was a sabbatical year. (4) The Year of Jubilee, which was not, as some say, every forty-ninth, but every fiftieth year, so that there were then two successive years of rest. In that year every Hebrew servant was to regain his freedom, and landed property to revert to the representatives of its original proprietors.

Sabel'lius: ecclesiastic; b. in Africa about 180 A. D.; was active in Rome until his excommunication by Pope Calixtus about 217 A. D. He turns up later in Egypt, and was again excommunicated by Bishop Dionysius of Alexandria (260). The heresy which bears his name, called Sabellianism, is essentially the same as that styled Patripassianism in the Western Church. It teaches that the Trinity of the Godhead is not a trinity of persons, but of manifestations and periods in the history of revelation. God is strictly one in person, but reveals himself in a threefold aspect as Father, Son, and Holy Spirit in the works of creation, redemption, and sanctification. For his few remains see M. J. Routh, *Reliquiæ Sacræ*.

Revised by S. M. Jackson.

Sabine, săb'in, Sir Edward, D. C. L., F. R. S.: physicist; b. in Dublin, Ireland, Oct. 14, 1788; entered the British army as second lieutenant of artillery 1803; became captain 1813; took part in the campaign on the Niagara frontier, commanding the batteries at the siege of Fort Erie, 1814; accompanied the Arctic expedition of Ross and Parry 1818, and that of Parry 1819–20, when he made important researches in terrestrial magnetism, which were communicated to the Royal Society; aided in the preparation of the *Natural History* of Parry's first expedition (1824); made a series of voyages, ranging from the equator to the Arctic Circle (1821–25), in quest of data concerning the variations of the magnetic needle, the figure of the earth, and other problems in meteorology and terrestrial physics; published *An Account of Experiments to determine the Figure of the Earth* (1825); and *The Variability of the Intensity of Magnetism upon Many Parts of the Globe* (1838); edited the records of magnetic observations made at Cape Town, Toronto, St. Helena, Hobarton, and other colonial observatories in several large volumes (1843–60), and contributed numerous memoirs to the Royal Society; was made a Knight of the Bath 1869. D. at Richmond, Surrey, June 26, 1883.

Sa'bine Dialect: See Italic Languages.

Sabine (să-been') **Pass**: the mouth of Sabine river and lake; it has a muddy bar, with shoal water and a narrow channel. Dredging and jetty-building have been undertaken to improve this pass. There is a brick lighthouse on Brant Point, the east side, lat. 29° 43′ 55″ N., lon. 93° 50′ 19″ W., with a flashing dioptric light of the third order. The Southern Pacific Railroad (Sabine and East Texas Division) extends to the harbor, which is from 25 to 40 feet deep.

Sabine River: a stream which rises in Hunt co., Tex., flows S. E. to the western boundary of Louisiana, and then turns southward, forming throughout the rest of its course the boundary between Texas and Louisiana for 250 miles. It is 500 miles long, is navigable in its lower course, and after traversing Sabine Lake enters the Gulf of Mexico through Sabine Pass, its mouth.

Sabines (Lat. *Sabini*): the ancient inhabitants of a tract of Central Italy lying E. and N. of Rome. They were a confederation of communities, of which Cures maintained a sort of headship, the most important other places being Reate (birthplace of Varro) and Amiternum. These municipalities were, however, of no commercial importance, and were indeed little more than peasant villages. As a people the Sabines were engaged in agriculture and grazing, and, from the simplicity of their life and their physical prowess, they obtained a reputation like that of the Spartans for severity of discipline and sturdiness of character. The narrow limits of the Sabine territory made emigration necessary, and probably in this way they came in contact with the growing power of Rome, to which the story of the joint rule of Romulus and Titus Tatius points, and the fact that Numa was of Sabine origin. They were not finally subdued by Rome until 290 B. C., and some twenty years later they were admitted to citizenship.

G. L. Hendrickson.

Sabi'nus, Masurius: a famous jurist of the reign of Tiberius, pupil of Capito, and founder of the school of Sabiniani. He was the author of several works, the most important being *Libri iii. Juris Civitis*, which was much used and commented upon by later jurists, but is not extant. See Huschke, *Jurisprudentia Antejustiniana* (5th ed. Leipzig, 1886, pp. 123–128).

M. W.

Sabism, or **Zabism**: the religious system of the Sābiün (Baptists), a Christian sect in Mesopotamia and North Arabia who adhered to much of their original nature-worship, but were known chiefly for their frequent washings. For this reason they have been wrongly identified with the Mandæans (*q. v.*), with other sects in South Babylonia, with the Jewish Μασβώθεοι, and with a certain Samaritan sect. They are, perhaps, the same as the Elkasaïtes. Mohammed and his first followers were called Sābians by the heathen Arabs. Mohammed had only a vague idea who they were, but in the Koran mentions them favorably together with Jews and Christians. Under Al-Ma'mūn 830 A. D., the inhabitants of Harrān, whose religion was a fusion of heathenism and Neoplatonic ideas, but who still worshiped stars and offered sacrifices, shielded themselves by declaring that they were the

Sābians mentioned in the Koran. They even asserted that they were descendants of one Sābī, son of Seth or Adam. See Chwoson, *Die Ssabier* (St. Petersburg, 1856); Wellhausen, *Skizzen*, iii., p. 206; Dozy, *Nouveaux documents pour l'étude de la religion des Harraniens* in *Actes du sixième congrès des Orientalistes* (Leyden, 1885, ii., 1, p. 281).
RICHARD GOTTHEIL.

Sable [from O. Fr. *sable*; cf. Fr. *zibeline*, *soble*, Ital. *zibellino*, Germ. *zobel*; loan-word from Russ. *sobolj*]: a name given to species of the family *Mustelidæ* and genus *Mustela*. The animals in external appearance resemble the weasel, but they are considerably larger and their bodies are not so elongated. In summer the color is reddish or brownish yellow, clouded with black, and becoming lighter toward the head; in winter it is dark. The length of the body in well-grown sables does not vary much from 17 inches from the snout to the tail, while the tail is from 7 to 10 inches long. The Old World form (*Mustela zibellina*) inhabits Northern Europe and Asia. The sable furs are chiefly obtained in Siberia. This Siberian form in winter often has the whole body covered with lustrous blackish-brown or sometimes quite black hairs, but with these are generally intermingled white ones. The posterior tubercular grinder of the upper jaw is oblong, and nearly twice as long on the inner as on the outer side. The American sable (*Mustela americana*) is most abundant in British America, and the furs in the markets are chiefly obtained by the Hudson Bay Company. It is distinguished from the Siberian species by the posterior tubercular grinder of the upper jaw being quadrate, and rather longer on the inner than on the outer side. The furs of both species are held in high esteem. Revised by F. A. LUCAS.

Sable, Cape: See CAPE SABLE.

Sable Island [Fr. *sable*, sand]: an island 104 miles S. E. of Cape Canso, in Nova Scotia. It is a dependency of Nova Scotia, and is an arc 34 miles long, convex to the S., and from 1¼ to 5 miles in breadth. It is composed of grass-covered sand-hills, inclosing a lake 11 miles long with a maximum depth of 12 feet. Lat. of east point, 43° 59′ N., lon. 59° 47′ W.; lat. of west point, 43° 57′ N., lon. 60° 8′ W. Many ponies are bred here. The island has a life-saving station, it being surrounded by extensive and very dangerous shoals. It is in the regular course of ships from Europe to Southern Nova Scotia and New Brunswick. It is said to be slowly growing smaller. It was colonized in 1598 by forty French convicts, but five years later only twelve survived, and the colony was broken up. The island should not be confounded with Cape Sable island. See CAPE SABLE. Revised by M. W. HARRINGTON.

Sables, or **Les Sables d'Olonne**, lā′saab′l′dō′lōn′: town; in the department of Vendée, France; on the Bay of Biscay; 50 miles S. by W. of Nantes (see map of France, ref. 5–C). It was founded by Louis XI., who built its harbor and constructed its fortifications. It is a favorite watering-place, and carries on extensive fisheries and a large export trade in grain, wine, wood, salt, and fish. Pop. (1896) 11,826.

Sabri'na: a celebrated temporary volcanic islet of the Azores, a short distance S. W. of Cape Ferraria, the western point of San Miguel island. It appeared in 1811, and the process was watched by the crew of the British frigate Sabrina, from which its name is derived. Sixteen days after the eruption the cone attained its greatest dimensions —215 feet in height and 6,000 in circumference. It was composed of ashes and scoria without cohesion, and was gradually washed away until in 1850 the lead showed a depth of 15 fathoms where it had formerly stood. M. W. H.

Sacaline: a forage plant (*Polygonum sachalinense*) from the island of Saghalin, on the Russian shore of the Pacific, introduced in the U. S. in 1894. It is a perennial woody herb, growing 6 to 12 feet high. It is said to be relished by live stock, and the shoots and leaves are recommended as a kitchen vegetable. The plant is supposed to resist severe drouth. L. H. B.

Saccar'do, PIETRO ANDREA, Ph. D.: botanist; b. at Treviso, Italy, Apr. 23, 1845; Professor of Botany in the University of Padua, and author of many works on the fungi, the most important of which are *Fungi Italici* (1877–86) and the *Sylloge Fungorum Omnium huc usque Cognitorum* (10 vols., 1882–92), containing descriptions of 39,663 species. He has made a distribution of specimens under the title of *Mycotheca Veneta*. C. E. B.

Saccas: See AMMONIUS.

Saccharim'etry [Lat. *sac'charum*, sugar + Gr. *μέτρον*, measure]: the process of ascertaining the proportion of sugar dissolved in a liquid. This can be effected by using the hydrometers of Brix or Balling, sometimes called saccharimeters, which are specially constructed so as to indicate the percentage of sugar in an aqueous solution. (See HYDROMETER.) But the means generally adopted is by utilizing the optical properties of sugar. All sugars and their solutions have the power of rotating the plane of polarization of light; some, such as cane-sugar and grape-sugar, rotate the plane to the right, while lævulose rotates the plane to the left. (See OPTICS and POLARIZATION.) If θ is the angle of rotation, l the length of solution traversed, and p the number of units of weight of dry sugar present in a certain volume of solution, $\theta = lp\alpha$, where α is positive or negative according to the species of sugar, and has a determinate value for a given temperature. The latter quantity, which is the angle of rotation for $l = 1$, $p = 1$, is called the specific rotatory power. Hence l being assigned, and θ and α being obtained by experiment, the value of p. giving the percentage of sugar, is calculated. The experiments are carried out by means of a saccharimeter, an instrument of which there is a considerable number of varieties. These are divided into two classes. One measures the angle of rotation directly, while the other determines the rotation by the contrary rotation caused by a thin plate of quartz. The latter are called shadow saccharimeters, from the principle involved. The original instrument of this kind was due to Prof. Jellett, of Dublin, but it has been greatly improved upon by Duboscq and Cornu. Another somewhat different form, devised by Laurent, has been adopted by the French Government. The distinguishing feature is that for certain positions of the optical parts of the instrument the field, one half of which is covered with a half-wave plate of quartz or mica, appears divided into two half disks, one bright and the other dark, and in another position as a uniform shadow without a dividing line. In the latter case the instrument is adjusted for use. Then if the observation tube is filled with a solution of sugar and placed in the saccharimeter between two Nicol prisms, a polarizer and an analyzer, so that the light passes through it before reaching the latter prism, the equality of tone in the two half disks is annulled. The analyzer is then made to revolve in the proper direction until the inequality disappears. The angle of rotation is shown by a scale indicating angular degrees, while another scale gives the corresponding percentage of sugar. R. A. ROBERTS.

Saccharomy'ces: a genus of fungi, including the yeast-plant. See FERMENTATION.

Sacchini, saăk-kee′nĕe, ANTONIO MARIA GASPARO: composer; b. at Pozzuoli, near Naples, July 23, 1734; was educated in the conservatory of Sant' Onofrio at Naples; achieved a great success at Rome in 1762 by his opera *Semiramide*, and at Venice in 1768 by his *Alessandro nell' Indie*; after composing about fifty operas for Italian theaters, went to Germany in 1771; repaired next year to London, where he was very successful with his operas, but whence he at last was compelled to flee in 1782 on account of debt; found employment in Paris, but only one of his operas, *Œdipe à Colone*, performed after his death, made any great impression. D. in Paris, Oct. 7, 1786.

Sac City: city: capital of Sac co., Ia.; on the north fork of the Raccoon river, and the Chicago and N. W. Railway; 45 miles W. by S. of Fort Dodge (for location, see map of Iowa, ref. 4–E). It is in an agricultural and dairying region, is an important trading and shipping point, and derives good power for manufacturing from the river. There are 6 churches, graded public schools, Sac City Institute (Baptist, founded in 1894), a national bank with capital of $50,000, a State bank with capital of $75,000, a monthly and 2 weekly periodicals, flour-mill, and windmill and lightning-rod factories. Pop. (1880) 595; (1890) 1,249; (1900) 2,079. EDITOR OF "SUN."

Saccomy'idæ [Mod. Lat., named from *Sac'comys*, the typical genus; Gr. *σάκκος*, sack + *μῦς*, mouse]: a family of mouse-like rodents peculiar to North America; distinguished by the hind limbs being much longer than the fore, and hence adapted for leaping; the presence of large external cheek-pouches not connected with the mouth, and lined with fur within; and the development of a long tail. The skull is thin, with the interorbital space rather broad; the tympanics inflated and vestibular; the petrosals approximated; the squamosals more or less restricted to the orbit; the mastoids roofing over in part the cerebral cavity; the nasals

are produced forward beyond the line of the incisors; the zygomatic arches are very slender; and no special anteorbital foramen is developed. In the dental series the molars are $\frac{4}{4}(\times 2)$. The species are confined to the western and southern portions of the U. S. and Middle America. They vary in size, some being smaller than the ordinary house-mouse, while others are nearly as large as a rat. They progress chiefly by long leaps, in the fashion of the kangaroo or ordinary jumping-mice. Revised by D. S. Jordan.

Saccopharyn'gidæ [Mod. Lat., named from *Saccopharynx*, the typical genus; Gr. *σάκκος*, sack + *φάρυγξ*, throat]: a family of fishes supposed to be related to the eels. The caudal portion of the body is extremely elongated, band-like, and tapers into an attenuated thread-like extremity; the skin is lax and destitute of scales; the head is very large; the snout short, pointed, flexible, and like an appendage overlapping the gape; the eye situated far forward; the mouth is fissured far backward; the teeth slender, curved, with points directed inward; dorsal and anal fins rudimentary, the former more so than the latter, and indicated by a groove bordered by a whitish line on each side; pectoral fins small. The skeleton has thin soft bones, deficient in inorganic matter, and connected by a lax, easily torn fibrous tissue; the stomach is distensible in an extraordinary degree, so that these fishes can swallow larger ones, and when full has a bag-like form, which is alluded to in the name. The family has been instituted for the reception of two or three species of deep-sea fishes, of which the body is so soft that a comparative study of the species is difficult. The order *Lyomeri* has been framed by Dr. Gill for the reception of these species. Its place is probably near the eels, but this is uncertain. Revised by D. S. Jordan.

Sacculi'na [Mod. Lat., from Lat. *Sacculus*, a little sac]: a genus of root-barnacles (see Cirripedia) often mentioned as an instance of Degeneration (*q. v.*).

Sacer'dos, Marius Plotius: a Roman grammarian of the third century, whose three books treating of grammar and meter are printed in Keil's *Grammatici Latini*, vol. vi., pp. 427–546.

Sac-fungi: See Ascomycetes.

Sachau, sää'*k*how, Karl Eduard: Orientalist; b. at Neumünster, Holstein, July 20, 1845; studied at Kiel and Leipzig; Professor extraordinary of Semitic Languages at the University of Vienna 1869; ordinary professor 1872; Professor of Semitic Languages in the University of Berlin 1876; member of the Royal Prussian Academy of Sciences June 30, 1887. He is the founder and director of the Seminary for (living) Oriental Languages. (See *Bericht über die Eröffnung des Seminars*, Berlin, 1888.) Among his numerous works are *Inedita Syriaca* (Vienna, 1870); *Chronologie Orientalischer Völker von Albêrûnî* (Leipzig, 1878); *Kurzes Verzeichniss Syrischer Handschriften* (Berlin, 1885); *Alberuni's India* (London, 1887–88); *Indo-Arabische Studien* (Berlin, 1888); and *Die Inschrift des Königs Panammu von Sam'al* (Berlin, 1893). Richard Gottheil.

Sacher-Masoch, sää'*k*her-maa'so*k*h, Leopold: novelist; b. at Lemberg, Galicia, Jan. 27, 1835; studied at Prague; was for some time a teacher of history at Gratz, and settled in Vienna, devoting himself entirely to literature. He published a great number of novels, of which especially the series *Cain's Inheritance* (*Die Liebe*, *Das Eigenthum*, etc.) attracted much attention. His more recent publications added little to his reputation. D. at Lindenheim, Mar. 9, 1895. Revised by Julius Goebel.

Sache'verell, Henry, D. D.: pulpit orator; b. at Marlborough, Wiltshire, England, about 1672; educated at Magdalen College, Oxford, where he became a fellow; took orders in the Church of England; received the living of Cannock, Staffordshire; appointed preacher at St. Saviour's, Southwark, 1705; preached a sermon at Derby assizes Aug. 15, and another before the lord mayor of London at St. Paul's Nov. 5, 1709, in both of which he denounced toleration of Dissenters, attacked Low Churchmen, inculcated the tenet of passive obedience, and declared that the Church was in danger; was impeached for these discourses by the House of Commons Feb. 27, 1710, found guilty of a misdemeanor Mar. 23, and sentenced to three years' suspension from preaching, the offending sermons being burned by the common hangman. Great excitement prevailed throughout England during this trial, and large numbers of pamphlets were printed on both sides, the Tories favoring the publicity of Sacheverell's sermons, of which at least 40,000 copies were sold, while 30,000 copies of the record of the trial (1710) were circulated. Sacheverell profited by this easy martyrdom; he was invited by the new (Tory) House of Commons to preach before them on the day his sentence expired, and was presented by Queen Anne to the rectory of St. Andrew's, Holborn. D. in London, June 5, 1724. The eloquent defense he pronounced at the bar of the Lords was written by Francis Atterbury. Revised by S. M. Jackson.

Sachs, Bernard, A. B., M. D.: neurologist and alienist; b. in Baltimore, Md., Jan. 2, 1858; educated in New York schools and at Harvard University, whence he graduated A. B. in 1878; studied medicine at Strassburg University, graduating M. D. in 1882; studied his specialty in Vienna, Berlin, and London; returned to New York to practice in 1883; appointed Professor of Nervous Diseases New York Polyclinic 1888; appointed neurologist to Montefiore Home in 1890, and to Mt. Sinai Hospital in 1893. He has made original investigations in the nervous diseases of childhood, publishing many papers on the subject. He was president of the American Neurological Association 1894. Among his published works are monographs on *Cerebral Hæmorrhage, Embolism, and Thrombosis* in Keating's *Cyclopædia of Diseases of Children* (1890); *Chorea*, in Hare's *System of Therapeutics* (1892); *Criminal Insanity*, in Hamilton's *System of Medical Jurisprudence* (1894); *Die Hirnlähmungen der Kinder* in *Samlung Klinischer Vorträge* (1892); *Nervous and Mental Diseases of Childhood* (New York, 1894). Editor *Journal of Nervous and Mental Diseases* (1887 and 1888), and of *The Polyclinic* (1893).
S. T. Armstrong.

Sachs, za*k*hs, Hans: poet and mastersinger; b. at Nuremberg, Germany, Nov. 5, 1494; attended one of the Latin schools of his native city until he was fifteen years of age, when he was apprenticed to a shoemaker, receiving at the same time instruction in the art of the mastersong; traveled all over Germany, working at his trade and practicing his poetic art wherever he found schools of mastersong; finally settled in Nuremberg; was married twice; d. Jan. 20, 1576. He began his literary career as a mastersinger, producing his first attempts at poetry according to the precepts of the school of mastersong. Later he became an enthusiastic admirer of Luther, and an ardent advocate of the cause of Reformation. He then broke through the narrow formalism of the mastersong, and in numerous poems, farces, and dramas he proclaimed the fundamental truths of the Reform doctrine. But he does not confine himself to the Bible for the subject-matter of his poetry. Among his sources we also find the German hero-legend, Boccaccio, Herodotus, Plutarch, Livy, and other writers of classical antiquity, which, through the efforts of the Humanists, had been translated into German. While comparatively few of his many lyric poems, which for the most part retain the traditional forms of the mastersong, have become popular, his short-rhymed narratives (*Schwänke*) still charm the reader, on account of their delightful humor and their sound but unobtrusive moral tone. Hans Sachs is the greatest representative of the German popular drama of the sixteenth century. Though he was not a dramatist of original power, and knew very little about the true dramatic art, he nevertheless exerted a great influence upon his contemporaries by his carnival plays (*Fastnachtspiele*), comedies, and tragedies, of which he wrote more than 200. The coarse carnival-play of the fifteenth century he raised into a higher and purer sphere, and in all of his plays he appears as a wise and good-natured teacher of his people. There was little room for pure æsthetic culture in Germany during the century of religious, social, and mental revolution, and we would be disappointed if we looked for absolute æsthetic beauty in Sachs; but his works will always remain a valuable source for our knowledge of the life and thought of his times, and his language ranks in force of expression and idiomatic beauty second to that of Luther. His memory was revived by Goethe in his poem *Hans Sachsens poetische Sendung*, after the great mastersinger had been slandered and forgotten for a long time. A complete collection of Sachs's poetic works, of which he himself in 1567 enumerates over 6,000 pieces, has not been published. See the editions by A. Keller and E. Götze, Goedeke and Tittmann; also M. S. Ranisch, *Hans Sachs* (1765); I. L. Hoffmann, *Hans Sachs* (1847); Ch. Schweitzer, *Un poète allemand au XVI^e^ siècle* (Paris, 1887); Kawerau, *Hans Sachs und die Reformation* (1889); E. Götze, *Hans Sachs* (1891); Drescher, *Studien zu Hans Sachs* (1891). Julius Goebel.

Sachs, Julius, von, Ph. D.: botanist; b. at Breslau, Silesia, Oct. 2, 1832; studied at the university at Prague, and in 1859 became assistant in physiological botany in the laboratory of agricultural chemistry at Tharandt; in 1861 Professor of Botany at Bonn; in 1867 Professor of Botany in the University at Freiburg, and in 1868 at Würzburg, where there has been established under his guidance a great institute for the study of plant-physiology. He has published many botanical works, among which the best known are *Handbuch der Experimental-Physiologie der Pflanzen* (1865); *Lehrbuch der Botanik* (1868; 4th ed. 1874; the 3d and 4th editions were translated into English in 1875 and 1892, under the title *Text-book of Botany, Morphological and Physiological*); *Geschichte der Botanik* (1875; trans. into English 1890); *Vorlesungen über Pflanzen-Physiologie* (1882; trans. into English 1887); *Abhandlungen über Pflanzen-Physiologie* (1892). The influence of Sachs upon botany has been greater than that of any other botanist of recent times.

Charles E. Bessey.

Sac Indians: See Algonquian Indians.

Sackbut [from O. Fr. *saqueboute*, Fr. *saquebute*: Span. *sacabuche*, originally a hooked lance by which foot-soldiers drew or pushed riders from their horses; O. F. *sachier*, draw out < Lat. *sacca're* + O. F. *boter* (> Fr. *bouter*): Ital. *bottare*, push, from Teuton. *bōtan*, O. Eng. *bēatan*]: a wind instrument somewhat resembling the trumpet, having a slide like the modern trombone. It is mentioned in the book of Daniel, but the translation is probably wrong, the English sackbut being a very different instrument, derived from a model found at Pompeii.

Sackett's Harbor: village; Jefferson co., N. Y.; on Black River Bay (an inlet of Lake Ontario), and the Rome, Watertown and Ogdensburg Railroad; 8 miles E. of Lake Ontario, 170 miles W. N. W. of Albany (for location, see map of New York, ref. 2–G). It has an excellent inner harbor, with sufficient depth of water to accommodate the largest vessels, good water-power for manufacturing, and agricultural surroundings. Its banking is done at Watertown. The Oneida, the first U. S. war-vessel ever launched on Lake Ontario, was built at Sackett's Harbor in 1809. In the war with Great Britain (1812–15) the village was an important naval station. Two war-vessels, the frigate Superior and the Madison, were built here in eighty and forty-five days respectively from the time the timber was cut. A third war-ship, partially completed when peace was declared, remained on the stocks, and was for many years an object of local pride. The U. S. Government has a military station here, known as Madison barracks. Pop. (1880) 885; (1890) 787; (1900) 1,266.

Sackville: town of Westmoreland County, New Brunswick; at the head of the Bay of Fundy and on the Intercolonial Railway, terminus of a branch railway extending 37 miles to Cape Tormentine, on Northumberland Strait; 129 miles N. E. of St. John (see map of Quebec, etc., ref. 5–I). It has a good harbor, a brisk trade, foundries, factories, and a steam-tannery, and is the seat of a considerable ship-building industry. It is the seat of Mt. Allison College (Wesleyan) and of Wesleyan male and female seminaries. Pop. (1891) 1,500.

Revised by M. W. Harrington.

Sackville, George Germain, Viscount, better known as Lord George Germain, third son of the first Duke of Dorset; soldier; b. in England, Jan. 26, 1716; educated at Westminster School and at Trinity College, Dublin; served with credit at the battles of Dettingen (1743) and Fontenoy (1745), and under the Duke of Cumberland against the Pretender in Scotland; became a privy councilor; was secretary for Ireland 1751; made lieutenant-general 1758; commanded the allied cavalry at the battle of Minden, Aug. 1, 1759, when he failed to execute the orders of the commander-in-chief, Prince Ferdinand of Brunswick, to charge upon the French infantry; was tried by court martial and cashiered early in 1760, but was restored to favor at the accession of George III. (Oct., 1760); entered Parliament 1761; was restored to the privy council 1766; entered the cabinet of Lord North as Secretary of State for the Colonies Oct., 1775; retained that post throughout the war of the American Revolution, distinguishing himself by his bitterness against the Americans, and resigned Feb., 1782, on which occasion he was created Viscount Sackville. D. Aug. 26, 1785. He is one of the persons whose claims to the authorship of the letters of Junius have been advocated. See Junius, The Letters of.

Sackville, Lionel Sackville West, Baron: diplomatist; b. at Bourn Hall, Cambridgeshire, England, July 19, 1827; educated at home; entered diplomatic service 1847; minister to Argentine Republic 1873; to Spain 1878; to the U. S. 1881; represented Great Britain in the Washington conference on Samoan affairs 1887; negotiated Fisheries Treaty of Washington 1888; having become a *persona non grata* on account of a letter written by him to a Mr. Murchison in advocacy of the re-election of President Cleveland in 1888 (on the ground that it would be to the advantage of Great Britain), he received his passports from the U. S. Government and returned to England.

Sackville, Thomas: See Dorset, Thomas Sackville.

Saco: city; York co., Me.; on the Saco river, and the Boston and Maine Railroad; 14 miles W. S. W. of Portland, 100 miles E. of Boston (for location, see map of Maine, ref. 11–A). The river, which is here navigable for vessels of 9 feet draught during nine months of the year, provides excellent power for manufacturing by a fall of 40 feet, and is crossed by four bridges. The city is surrounded by an agricultural region; contains a public high school, 14 public-school buildings, Thornton Academy, 2 libraries (York Institute, founded 1866, and Dyer, founded 1881) containing over 10,000 volumes, 2 national banks, and 2 savings-banks; and has manufactories of cotton goods, cotton-machinery, boots and shoes, lumber, brushes, belting, and other articles. There is considerable coasting trade. About 3½ miles from the city is Old Orchard beach, a popular summer resort, with commodious hotels, and the grounds of Methodist Episcopal national and district camp-meetings. Pop. (1880) 6,389; (1890) 6,075; (1900) 6,122.

Saco River: a stream which rises in the White Mountains, New Hampshire, and flows S. E. 160 miles through New Hampshire and Maine to the Atlantic; has several considerable falls, one of which, Great Falls, is 72 feet in height, and furnishes water-power, which is utilized at many places for manufactories.

Sacrament [from Lat. *sacramen'tum*, oath, sacred thing, mystery, deriv. of *sacra're*, make sacred, declare sacred, deriv. of *sa'cer*, sacred]: a term used in the Church since Tertullian (about 200), in a loose sense, of sacred doctrines and ceremonies (like the Gr. μυστήριον), and then, more particularly, of baptism, the Eucharist, and a few other solemn rites connected with Christian worship. St. Augustine defines sacrament in the narrower sense to be the visible sign of an invisible grace (*signum visibile gratiæ invisibilis*). To this was afterward added by Protestants, as a third mark, that it must be instituted by Christ and enjoined upon his followers. Sacraments are also called signs, seals, and means of grace. Their number is by Protestants confined to two —viz., baptism and the Lord's Supper—on the ground that these alone are instituted by Christ and expressly commanded to be observed to the end of time. The Roman Catholic and the Greek Churches add to them five others—viz., confirmation, penance, extreme unction, ordination, and matrimony. The Council of Trent anathematizes those who deny that there are more or less than seven sacraments (*esse plura vel pauciora quam septem sacramenta*). In the Greek Church they are called "mysteries." As to the efficacy of the sacraments, Protestants require faith as a subjective condition, while the Roman Catholic Church teaches that the sacraments work *ex opere operato*—i. e. by the inherent power God has imparted to the institution or by the performance of the act. The Roman Catholic Church curses any one that "saith that, in the three sacraments, to wit, baptism, confirmation, and order [ordination], there is not imprinted in the soul a character, that is, a certain spiritual and indelible mark, on account of which they can not be repeated." (*Canons and Decrees of the Council of Trent*, ses. vii., canon ix.; Schaff, *Creeds*, ii., 121.) There has been much controversy about the sacraments, especially the Lord's Supper, which is sometimes emphatically called *the* sacrament, between Protestants and Roman Catholics, and also between Luther, Zwingli, and Calvin, and their followers. The Quakers reject the sacraments as external ceremonies, and hold only to internal baptism or regeneration of the Spirit, and internal communion with Christ. See articles on the several sacraments, especially Eucharist.

Revised by S. M. Jackson.

Sacramentarians: the opprobrious epithet applied to the followers of Zwingli by the Lutherans in Reformation times because the former denied the presence of the body

and blood of Christ in the Eucharist, and affirmed that the consecrated elements were mere symbols. The Calvinists later came in for the same designation, although approaching much nearer the old Church doctrine. See TETRAPOLITAN CONFESSION. S. M. J.

Sacramen'to: city; capital of the State of California and of Sacramento County; on the east bank of the Sacramento river at its junction with the American river, and on the Southern Pacific Railroad; lat. 38° 31′ N., lon. 121° 20′ W. from Greenwich; 50 miles N. of Stockton, 90 miles N. E. of San Francisco (for location, see map of California, ref. 6-C). It is at the head of navigation for large steamers, although vessels ply between points 100 miles N.

Plan and Appearance.—The city has an area of about 2½ sq. miles, is built on a plain 30 feet above sea-level, and is laid out in rectangular blocks. It is protected from overflow by levees, which were erected at a cost of about $300,000. The climate is semi-tropical, tempered by cool southerly breezes in summer. Water for domestic and other uses is supplied from the river. The streets are lighted with electricity, are wide and commodious and well paved, and conform to the cardinal points of the compass. Those running N. and S. are designated by numerals; those running E. and W. by letters. Capitol Park (20 acres) is maintained in excellent order by the State, and there are other city and two private parks. The electric street railways have a total length of 20 miles.

Notable Buildings.—The State Capitol, built of granite, brick, and iron at a cost of $2,500,000, is the most conspicuous. Others are the Roman Catholic Cathedral, E. B. Crocker Art Gallery—owned by the city, presented to it by Mrs. Margaret E. Crocker, and administered by the California Museum Association—California State Bank, County Court-house, new U. S. Government building (cost $303,000), and Sutter's Fort, rebuilt and cared for by a State commission as an object of historic interest.

State Capitol, Sacramento, Cal.

Churches, Schools, etc.—There are 6 Methodist Episcopal churches, 5 Baptist, 2 Presbyterian, 1 Congregational, 2 Protestant Episcopal, 3 Lutheran, 3 Roman Catholic, a United Brethren, a Unitarian, a Christian, and a Jewish, besides 10 meeting-places of miscellaneous sects, including the Salvation Army. The public schools consist of a high school, 3 grammar and 6 primary schools, an ungraded school, a night school, and 6 kindergartens. In 1901 they had 134 teachers, average attendance of more than 4,500 pupils, and property valued at $330,000. There are 6 private schools (including a business college), and several libraries and reading-rooms, including the Free Public Library and the State Library. The latter is quartered in the Capitol, and contains more than 100,000 volumes. The publications comprise 2 daily and 6 weekly newspapers. The charitable institutions include the Marguerite Home for old ladies (founded in 1884 by Margaret E. Crocker), Protestant Orphan Asylum, Mater Misericordiæ Home, and the Stanford-Lathrop Home for friendless children; City Dispensary, Southern Pacific Hospital for railway employees, Women's Christian Temperance Union Mission, Sacramento Foundling Home, and the Children's Day Home. The only penal institutions are the city and county jails. There are 79 fraternal, charitable, and protective lodges and unions, and 5 clubs. There are two private hospitals, "The Sisters" and the "Wentworth-Igo," and a semi-hospital and refuge, "The Rescue Home," under charge of the Peniel Mission.

Business Interests.—Sacramento has a number of manufactories and several large canneries and packing-works. The chief industrial plant comprises the shops of the Southern Pacific Railroad Company, employing from 2,000 to 3,000 men in car and machinery construction and repairing. There are two commercial and three savings-banks, and their combined capital in 1901 was $1,525,500. Two large electrical companies supply the city with light and power; in one case the current is generated in the mountains 34 miles distant, in the other in the foothills 22 miles away—both from water-power. Sacramento has cheaper electrical rates than any city of the coast. The city is the largest and chief fruit-shipping center of the State. The dryness of the atmosphere, centrality of location, seven lines railway, and river transportation advantages make it a commercial center for the whole great valleys region, which it supplies to better advantage than San Francisco.

Finances.—In 1900 the city receipts were $711,426.68; disbursements, $699,727.39; assessed valuation, $16,511,800.

History.—Sacramento was first known as a small trading-post called New Helvetia. The settlement was made and controlled by Capt. John A. Sutter, who in 1839 secured a grant from the Mexican Government for land in and adjacent to the present city. The discovery of gold by James W. Marshall while digging a mill-race on American river at Coloma, 60 miles away, brought 100,000 immigrants to the city in a single year. The first building was erected in 1849, and the city became the State capital in 1854. The city has suffered severely—twice by fire and twice by flood. After the inundation of 1860 the principal streets were raised 8 feet and the levees strengthened. Pop. (1890) 26,386; (1900) 29,282. J. A. WOODSON.

Sacramento River: a stream which rises in Northern California, flows southward, and empties into an arm of San Francisco Bay. It drains the northern portion of the great valley of California, lying between the Sierra Nevada and Coast Range. The only outlet for the waters of this vast basin is through the Golden Gate. S. of Mt. Shasta the Sacramento joins Pitt river, which is the longer and larger stream, and should properly bear the name of the main trunk. The length of the Sacramento is about 400 miles. From the source of Pitt river in the extreme northeast corner of the State to the mouth of the Sacramento is approximately 600 miles. The Sacramento is navigable to Red Bluff, 275 miles, but in recent years steamboats have not gone above McIntosh landing, 45 miles below. Feather river joins the main stream 16 miles above the capital, and is navigable for 30 miles. Placer mining on many of the tributaries of the Sacramento has caused vast quantities of *débris* to be deposited in it. This and natural obstacles have necessitated the expenditure of large sums in improving navigation. Sacramento valley is exceedingly fertile, and yields a large wheat harvest. ISRAEL C. RUSSELL.

Sacred Heart, Ladies of the: an order of nuns founded in 1800 in France by J. D. Varin, a Jesuit, and Magdalen Sophie Louise Barat; approved by the pope in 1826. In 1818 it was established in the U. S., where there are now many houses. There is also an order of Sisters of the Sacred Agonizing Heart of Jesus, with a few houses in the U. S.

Sacred Hearts of Jesus and Mary, Brothers of the: a Roman Catholic community founded at Lyons, France, by M. Coindre, a priest, in 1822. They were first established in the U. S. in 1847. Their work is educational.

Sacrifice [viâ O. Fr. from Lat. *sacrifi'cium*; *sa'cra*, sacred rites, or victims (neut. plur. of *sa'cer*, sacred) + *facere*, make, do]: an offering to the Deity, as an expression of thanksgiving, penitence, or consecration. The origin of sacrifices has been much debated, but is lost in the dimness of antiquity. The earliest records, whether sacred or profane, show sacrifice as an existing institution, and in the former as receiving the Divine approbation. The object was everywhere the same—to provide a means whereby man might approach God. The theory of their efficacy seems to have been very different among the heathen and among the Israelites. In the former sacrifices were looked upon as in some sort a compensation to the gods, and their efficacy therefore depended somewhat upon their value, so that in extreme cases even human sacrifices were offered, as among rude nations in modern times; among the chosen people different views prevailed, or at least were distinctly embodied in their law and taught by their prophets. Here the fact was recognized that the disturbed communion with God could be restored only on the basis of holiness, and the primeval promise that in the long struggle with evil the "seed of the woman"

should obtain the final victory was always the central point of their national existence. Meantime, sacrifices in great variety were provided, but those especially appointed as "sin-offerings" were always of the same character and value. A more valuable sacrifice was indeed required as the sin-offering of the high priest or of the collective congregation, and also one slightly more valuable from a "prince," for obvious reasons; but there was no gradation in the value of the victim in proportion to the aggravation of the offense. Their efficacy was thus made to depend simply upon the Divine appointment.

The chief kinds of Hebrew sacrifices were the whole burnt-offering, which was wholly consumed upon the altar, and with which an oblation of fine flour and oil, with incense, and a drink-offering of wine were offered; the sin-offering, of which only the fat and kidneys were burned upon the altar, the flesh being either "burned without the camp" in case the blood had been sprinkled within the sanctuary, or eaten by the priests alone in case the blood had been only sprinkled upon the brazen altar; and the trespass-offering, which is distinguished clearly from the last, although the ground of the distinction is not entirely clear. These were all propitiatory offerings, and with them the priest was required "to make atonement" for the people. Besides these were the peace-offerings, perhaps the most common of all, which might be offered in any number and of any sacrificial animal. Of these, the same parts were burned on the altar, a portion given to the priests to be eaten by them and their families, and the rest of the flesh eaten by the offerer and his friends in a holy feast before the Lord. There were other important sacrifices required. Such were the Passover lamb offered in memory of the deliverance from Egypt and as a special type of Christ by each head of a family on the fourteenth of the month Nisan in each year, and eaten in their homes on the following night; the two goats on the great day of atonement in each year, of which one was sacrificed at the altar, the other sent as a "scape-goat" into the wilderness; the red heifer, burned without the camp and its ashes used in purifications; and a great variety of sacrifices for individuals on special occasions. The original comprehensive offering, from which all the others were specialized, appears to have been the burnt-offering.

Under the Levitical law the essential point of the sacrifice was the blood, the treatment of which always formed the culminating point in the sacrificial ritual. A burnt-offering of a lamb for the whole people was regularly offered every morning and evening, with its accompanying oblation or "meat-offering." In regard to the sin-offering, in order to bring it within the reach of all it was provided that for the required animal might be substituted by the poor a pair of doves, or even in case of extreme poverty an offering of flour. The symbolical character and significance of the sacrifices are set forth at some length in the Epistle to the Hebrews. See G. F. Oehler, *Theology of the Old Testament*, Eng. trans., ed. G. E. Day (New York, 1883); A. Cave, *The Scriptural Doctrine of Sacrifice* (2d ed. Edinburgh, 1890); and W. Robertson Smith, *Religion of the Semites* (2d ed. 1894). Revised by S. M. Jackson.

Sacrobos'co, Joannes, de: Latinized name of John Hollywood, an English mathematician of the thirteenth century. Little is known of him, except that he entered the University of Paris 1221, became professor there, and died in 1244 or 1256. He was the author of a treatise *De Sphæra Mundi*, a paraphrase of a part of Ptolemy's *Almagest*, which he had employed in Arabic. It was first printed in 1472, and was reprinted with commentaries about sixty times until the end of the seventeenth century.

Sacrum [Mod. Lat. (sc. *os*, bone), the sacred bone, neut. of Lat. *sa'cer*, sacred]: in the vertebrate skeleton, a bone situated below or behind the lumbar and above or before the coccygeal vertebræ. In man it is formed of five (rarely four or six) united vertebræ. It is large, roughly triangular, and is penetrated by foramina for the passage of nerves. It is developed from thirty-five centers of ossification. The rabbins called it *luz*, and said that it never decays, but forms the germ of the new body at the resurrection; the Arabs say that the judgment angel sits upon it and judges the soul of the departed.

Sacy, săă'see', Antoine Isaac, Baron Silvestre, de: Orientalist; b. in Paris, France, Sept. 21, 1758; studied law and Oriental languages; elected to the Académie des Inscriptions 1785; overseer in the mint 1791–92; Professor of Arabic at the École des Langues orientales; called to the Institute (section of literature and fine arts) 1795, but did not take his place till 1803; Professor of Persian at the Collège de France 1805; represented Paris in the Corps Législatif 1805–15; created baron by the emperor 1813; administrator of the Collège de France and the École des Langues orientales 1822; entered the Chamber of Peers 1832; conservator of the Oriental MSS. of the Bibliothèque Nationale and perpetual secretary of the Académie des Inscriptions 1833. D. in Paris, Feb. 21, 1838. A few of his principal works are: *Grammaire Arabe* (1810; 2d ed. 1831); *Chrestomathie Arabe* (1806; 2d ed. 1826); *Principes de la Grammaire générale* (1799; 8th ed. 1852); *Relation de l'Égypte par Abd-allatiph* (1810); *Mémoire d'histoire et de littérature orientales* (1818); *Les Séances de Hariri* (1822; 2d ed. 1847); and *Exposé de la religion des Druses* (1838). See Reinaud, *Notice historique et littéraire sur Silvestre de Sacy* (Paris, 1838). Richard Gottheil.

Sacy, Samuel Ustazade Silvestre, de: journalist; son of Baron de Sacy; b. in Paris, Oct. 17, 1801; appointed on the staff of the *Journal des Débats* 1828, which position he held for more than thirty years; member of the Academy May 18, 1854; keeper of the Mazarin Library 1836; its administrator 1848; member of the council of public education 1864. He published essays, *Variétés littéraires* (1858); edited *Bibliothèque Spirituelle* and *Lettres de Madame de Sévigné* (1861–64). D. Feb. 14, 1879. R. G.

Saddle: a contrivance designed to rest on the back of an animal and serve as a seat for a rider or as a support for other weights. It thus includes the pack-saddle and the part of a single harness that supports the weight of the shafts; for four-wheeled vehicles this is merely a broad padded strap buckled around the animal's body, but for a heavy two-wheeled cart, since part of the weight of the load rests on the shafts, the saddle is large and more heavily padded than a riding-saddle. The pack-saddle varies much in form, but that most used in the transportation of goods consists of crossed stieks, like a common saw-horse, securely fastened to saddle-bars of long bearing.

The use of riding-saddles is of ancient origin. Pancirollus relates that Constantine the younger was killed in the year 340 by falling from his saddle, and the Emperor Theodosius, in the year 385, forbade the use on post-horses of saddles weighing over 60 lb. Riding-saddles may be classed under two types, Hungarian and Moorish. The original of the former consisted of wide parallel bars, joined at the ends by heavy bows, to which were secured parallel strips of hide. There were no stirrups. The Hungarian saddle of the present closely resembles the primitive one, while the English saddle is the most highly developed form of the type in Europe, and the McClellan saddle (named after Gen. George B. McClellan) the best in the U. S. These two saddles, though from the same source, are quite different in construction. The tree of the English saddle is a skeleton on which the saddle is made. As completed, the seat and bearings are all padded, with scarcely anything of the original outline showing, except at the edges. Probably in point of style it is the most perfect saddle made, but one who is in the saddle all day is glad to exchange it for something easier. The McClellan tree forms the saddle itself. The tree-bows are shaped to fit the animal's back, and padding is dispensed with, even for the seat. It is covered with rawhide, and all but necessary strapping is eliminated. The fender of the McClellan is borrowed from the Mexican saddle, and is improved in the modification of the McClellan saddle known as the Whitman, after its inventor, Col. Whitman, U. S. army. The trade nomenclature of saddles of the Hungarian type includes also the Shaftoe, Somerset, Kilgore, and Morgan. A later form is a pneumatic saddle, in which a rubber bag, filled with air, is placed under the leather covering of the seat. The object is to increase the comfort of the rider, and lessen the concussion of his weight on the animal's back. It has been most successful as applied to racing-saddles.

The so-called Moorish type probably originated in Persia. In the primitive form a number of skins were superimposed on the animal's back, with a front and back wooden cantle, the whole confined by straps completely surrounding the animal. In the construction of its various forms the finest fabrics have been employed, and it has always been the most expensive saddle made. Mexican, Texas, and California saddles are derived from this type, retaining the main features of the original. The Moorish saddle has heavy, long

bars, a high and broad arch, and a large knob or horn, which was originally in the shape of a box in which to carry knives and other articles, the shape being much like the "muley" of the present time. The horn in its present shape is a Mexican addition, serving to hold a lariat or lasso, and as a writing-desk. It is in some cases 10 inches in diameter. The Texas and California models are stronger in construction and lighter than the Mexican. A characteristic feature is the hang of the stirrup-leathers, which are suspended centrally under the body of the rider, whereas in the English saddle they are hung in front of the leg. The girthing is also different; straps and buckles are replaced by hair cinches, fastened securely by withes.

Ladies' saddles originated with the pillion, which was nothing but a well-stuffed cushion or pad, with dependent strap foot-rest and an iron back, to which the rider was fastened by a strap encircling the waist. The Icelandic saddle was an improvement on this, and partook more of the nature of a chair, the pad being built on bars, something like a man's saddle. The pommel and cantle were added to the saddle in England in early times. The present type of side-saddle seems to have come into vogue about 1680. Some authorities say Anne of Bohemia introduced the saddle into England in 1380. The third pommel, or leaping-horn, appeared about 1830, and by the firmer grip given at once eliminated much of the danger in woman's riding. At present the off-side pommel is merely a slight projection.

Riding and pack saddles for animals other than horses are numerous. The camel riding-saddle is like a hollowed-out wooden footstool, square, with semicircular niches on two sides for the legs, and a kind of fence front and back to hold in the rider. The elephant howdah is made with bars and placed on the back, or it is made to depend from the sides. The Chilian *montura* is a close approach to the original Moorish saddle of skins and straps. The tilting-saddle used in jousts in the fourteenth century was covered with hide and canvas, and gaily decorated. The rider's seat was 10 inches above the tree-bars, being merely two wooden rings through which he put his legs, the limbs being protected by an apron of wood. Probably it was the clumsiest saddle ever made. C. H. E. Redding.

Sad'ducees: one of the two great parties in Judæa in New Testament times; uniformly represented as dividing public attention with the Pharisees, who were much more numerous and much more respected. The party was essentially aristocratic. Its founder was Zadok, high priest under David (2 Sam. xx. 25), who succeeded Abiathar, became high priest alone under Solomon (1 Kings, ii. 27, 35), and established the high-priestly line which extended to the time of Jesus. Thus through all the Jewish Bible history the party of the high priest were Zadokites or Sadducees. During the subsequent Persian and Greek periods the priestly aristocracy controlled the political fortunes of their people. This fact explains their worldly-mindedness. They practically rejected the distinctive spiritual claims of the Jewish people. In theology they seem, however, to have maintained the primitive faith as taught in the Pentateuch, which knew nothing of the resurrection of the body, future retribution, or even of personal immortality. They rejected the elaborations of the Pharisaic party, which had made the commandments of God vain by their traditions, and maintained that only the written law was binding, not the oral. They accepted, like the Pharisees, the entire Scriptures, but they interpreted them differently. In New Testament times their religious teaching embraced a denial of angels and spirits, and of divine co-operation in human affairs, maintaining that good and evil are at the choice of man, who can do the one or the other at his discretion. The Zadokites were then ruling priestly families, for Annas and Caiaphas were Sadducees. They joined the Pharisees in condemning Jesus, whose religious zeal and Messianic claim had stirred their liveliest opposition. When Jerusalem fell (A. D. 70) the Sadducees fell likewise; and as they were linked with the Jewish state, when that state disappeared they disappeared. Soon they were completely forgotten, so that the Talmud scarcely mentions them. Were it not for the New Testament and Josephus it might almost be questioned whether they ever existed. See Schürer, *Jewish People*, Eng. trans., second division, vol. ii., pp. 29–43.

Samuel Macauley Jackson.

Sa'dī, sä'dee: poet and moralist; b., according to best authority, about A. D. 1184 (A. H. 580), at Shīrāz, Persia, whence his common designation Muṣliḥ ad-dīn Shīrāzī, though his name is more correctly given as Musharrif ad-dīn ben Muṣliḥ ad-dīn. Upon the death of his father, who appears to have held office with favor under the Atābeg rulers of Fars, the youth received the patronage of the Atābeg Sa'd ben Zengī (A. D. 1195–1223), who for nearly thirty years gave material encouragement to the zealous scholar in pursuing his studies and perfecting his education at Nizāmiah College in Baghdād. In honor of his royal patron he assumed the name Sa'dī. His early literary productions gave promise of reflecting renown upon the learned masters how had been his college teachers, although his two great works were not produced until very old age. More than thirty years of his middle life were spent in travel or residence in Syria, India, Abyssinia, Egypt, and other countries, and he was over seventy years of age when he returned to his old home at Shīrāz under the favor of the son of his old patron, and the rest of his long life, of more than five score years, he enjoyed there, and died in 1292, or, according to another statement, in 1291 (A. H. 690). The place of his tomb is still shown at Shīrāz.

The works on which Sa'dī's fame rests are the *Būstān*, or Garden of Perfumes (A. D. 1257, Ethé), and the *Gulistān* (A. D. 1258, Ethé); both of them were written when, advanced in years and after his return to his early home. The *Būstān* is composed entirely in verse and comprises ten chapters; the *Gulistān* is written in prose with verses intermingled, and comprises eight chapters. Both these productions have a moral and didactic tendency; the *Gulistān* abounds in charmingly told anecdotes and bright illustrations. Perhaps not inferior to these masterpieces is Sa'dī's *Dīvān*, a collection of short lyrical poems, besides which he wrote a considerable number of miscellaneous pieces composed in Arabic and Hindūstānī as well as in his native Persian.

Bibliography.—On Sa'dī's life and works, see W. Bacher, *Sa'dī, Aphorismen und Sinngedichte, herausgegeben und übersetzt mit Biographie* (Strassburg, 1879); Rieu, *Catalogue of the Persian Manuscripts in the British Museum*, ii., p. 506; also Sir Gore Ouseley, *Biographical Notices of Persian Poets* (London, 1846); and for a special study of the poetical and philosophical character of Sa'dī, consult H. Ethé, *Der Sūfismus und seine drei Hauptvertreter*, in *Morgenländische Studien* (Leipzig, 1870). There is an English translation of the *Būstān*, by W. Clarke (London, 1879). Selections have been rendered by F. Falconer (London, 1838), Schlechta-Wssehrd (Vienna, 1852), and Strong (Simla, 1872). There is an edition of a *Būstān* manuscript prepared by photographic process, and collated, by Platts and Rogers (London, 1891); in the same year appeared *A Commentary on the Bostān, by Fek Chand Bahar* (Lucknow, 1891). The chief modern editions of the *Gulistān* are by Sprenger (Calcutta, 1851), F. Johnson (London, 1863), Platts (London, 1874), and likewise a lithographed edition of the text (Lucknow, 1882). Among translations of the *Gulistān* may be mentioned those by Dumoulin (Calcutta, 1807), Gladwin (London, 1822), J. Ross (London, 1823), Lee (London, 1827), and especially the translation and introduction by Eastwick, *Gulistān*, in Trübner's Oriental Series (London, 1880). Also see among the literary remains of F. Rückert, *Politische Gedichte übersetzt mit Einleitung über Saadi's Leben und Werke*, von E. A. Bayer (Berlin, 1894).

A. V. Williams Jackson.

Sadler, or **Sadleir**, Sir Ralph: b. at Hackney, England, in 1507; was a *protégé* of Thomas Cromwell; employed by Henry VIII. in effecting the dissolution of the religious houses, and shared in their spoil 1535–37; was ambassador to Scotland in 1537, and again in 1540 and 1541–43; negotiated a treaty for a marriage between Prince Edward and Mary, the infant Queen of Scots, July 1, which was, however, declared null by the Scots Dec. 11, 1543; distinguished himself in the ensuing war with Scotland, being made knight-banneret upon the battle-field of Pinkie Sept. 10, 1547; was made privy councilor by the will of Henry VIII. and master of the wardrobe soon afterward; bore a prominent part in the administration under Edward VI.; lived in retirement during the reign of Mary; was recalled to the privy council on the accession of Elizabeth, and again sent on a mission to Scotland 1558; was one of the commissioners in the conferences at York respecting the charges made against Mary Queen of Scots, Oct. 4, 1568; was her keeper when imprisoned at Tutbury Castle 1562, and was again envoy to Scotland about 1586. D. at Standon, Mar. 30, 1587. His interesting *Letters and Negotiations*, first printed in 1720, were

edited by Arthur Clifford, with a memoir and notes by Sir Walter Scott, under the title *State Papers and Letters of Sir R. Sadler* (2 vols., 1809).

Sadlier, Anna Theresa: See the Appendix.

Sadlier, Mary A. (*Madden*): See the Appendix.

Sado, saa'dō: an island in the sea of Japan; about 30 miles from the Japanese mainland; between 138° and 139° E. lon. and 37½° and 38½° N. lat. It forms part of the prefecture of Niigata, and has a population of about 103,000; it possesses gold and silver mines, but their output has not of late years much more than covered expenses of working. The island, which is chiefly of limestone formation, is very hilly, with one plain between two mountain groups.

Sadoleto, saă-dō-lā'tō, Jacopo: cardinal; b. at Modena, Italy, July 14, 1477; was ordained priest in Rome in 1502; appointed secretary to Leo X. in 1513; made Bishop of Carpentras, in France, in 1517, and cardinal in 1536. D. in Rome, Oct. 18, 1547. He made a favorable impression even on the most zealous Reformers by his conciliatory spirit, and he was often employed in the diplomatic negotiations between Charles V., Francis I., and the popes. His writings, *Philosophiæ Consolationes* (1502); *De Liberis recte instituendis* (1533); *Phædrus sive de Laudibus Philosophiæ* (1538), etc., and his *Letters* were published in a collected edition at Verona (4 vols., 1737) and at Rome (5 vols., 1759). See Joly, *Étude sur Sadolet* (Caen, 1857).

Sadowa, saă'dō-vaă: village of Bohemia: on the Bistritz; 9 miles N. W. of Königgrätz (see map of Austria-Hungary, ref. 3–E). This is the name given by the Austrians to the battle of Königgrätz (*q. v.*), in which, on July 3, 1866, 240,000 Prussians defeated 220,000 Austrians and Saxons. The Prussian loss was 9,000 men, while the Austrians lost over 40,000 men in killed, wounded, and prisoners.

Sa'fed [= Arab.; Heb. *Tsephath*, liter., watch-tower]: town in Palestine, in the ancient province of Galilee (altitude, 2,749 feet), with splendid view of Jebel Zebūt, Jebel Jermak, Tabor, and Carmel; thought by some to be mentioned in Matt. v. 14. A fortress was built there by Fulke 1140, defended by the Templars; taken by the Sultan of Damascus 1220; reconstructed by the Templars 1240; taken definitely by the Moslems 1266, and made capital of a province. In 1799 it was occupied by a French garrison. Jews settled there in large numbers in the sixteenth century, expecting that the Messiah would make it his capital. Its bazaar is of little importance. See Neubauer, *Géogr. d. Talmud* (1868, p. 227); Baedecker, *Palest. und Syria* (2d ed. 1894, p. 258); Tristram, *Land of Israel* (London, 1865, p. 576). Richard Gottheil.

Safes: structures designed to protect papers, money, or other contents from loss either by theft or by fire. For the latter see Fire-proof Safes. Those supposed to be proof against burglarious attacks, directed either upon the inclosing walls or merely against the lock (see Lock) securing the door, should successfully resist for twelve hours at least any attempts to open them; but such is the perfection of the mechanical and chemical means used that probably there are none of the so-called burglar-proof safes the contents of which could not be abstracted by an undisturbed burglar in very much less time.

Burglar-proof safes are of two distinct constructions: 1. Those which have walls cast in one mass of iron or steel or of some alloy of these metals. 2. Those having their walls built up of bars or plates of iron or steel secured together by bolts or rivets. The first class may be subdivided as follows, viz.: *a*. Safes in which the resistance to attack depends upon their form, and the extreme hardness and toughness of the cast metal used. Such are the spherical safes made from an alloy of iron and chromium. *b*. Safes having the cast metal of their walls re-enforced by a network of wrought-iron or steel rods, about which the molten iron or steel is poured, and which is solidly inclosed by the cast metal when it cools. The second class may also be divided in the following way, viz.: *c*. Safes made of bars or plates of homogeneous wrought iron or steel. *d*. Safes in which the bars or plates are composed of layers of iron and steel welded together. *e*. Safes made of layers of bars or plates of wrought iron or steel, between which are interposed one or more layers of bars of hard cast iron.

For most burglar-proof safes of recent construction great pains have been taken to conceal the heads of the bolts or rivets, and in some cases these have been made so short as to simply fasten each layer of plates to those adjacent, but in no instance extending through the whole thickness of the walls. The doors have also been fitted with the greatest accuracy in order to prevent the introduction of explosives.

Apertures through the doors of safes for the passage of spindles for operating bolts and locks have been found a source of insecurity, and therefore doors for burglar-proof safes have been contrived so that when shut they are fastened by bolts operated automatically, and they are provided with clockwork which can be so adjusted before the door is closed that at a certain hour the bolts are drawn by the release and action of powerful springs. W. F. Durfee.

Safety-lamp: a lamp so constructed as to be safely employed in an atmosphere so contaminated with fire-damp as to explode when a naked flame is exposed to it. Freshly exposed coal underground often gives forth one or more kinds of gas, such as carbon dioxide (CO_2), oxygen, nitrogen, and fire-damp (CH_4). To the latter other names applied are carburetted hydrogen, methane, and Marsh-gas (*q. v.*). From a single ton of anthracite coal more than 600 cubic feet of gas have been emitted, of which 93 per cent. was fire-damp. Bituminous coal, being softer and more porous, parts with its gas more easily, though the total amount per ton is not so large. If the atmosphere contain from 6 to 17 per cent. of fire-damp the mixture is dangerously explosive. Outside of these two limits it is still inflammable. It is of the utmost importance therefore that the ventilation of a coal mine shall be good enough to prevent contamination of the air with fire-damp. Since perfect ventilation is impossible, the miner needs a lamp for illuminating purposes that may be used in a slightly contaminated atmosphere, and the inspector needs the means of detecting such contamination, however slight.

Between 1812 and 1816 several forms of safety-lamp were devised, that of Sir Humphry Davy being the one which has remained most extensively in use. For any given fuel the temperature at which ignition begins is lower than that developed by the subsequent process of combustion; for example, the ignition-point of phosphorus is below the boiling-point of water, while the temperature due to its combustion exceeds that of red-hot iron. Davy discovered that in a quiet atmosphere a mere partition of wire gauze is enough to prevent the transmission of flame, the gauze absorbing and radiating enough heat to reduce the temperature below the ignition-point. To a small, cylindrical oil-lamp he attached a cylinder of iron-wire gauze about 6 inches long and less than 2 inches in diameter, which inclosed the flame. It was supported in a framework of small metal rods fitted into terminal flat brass rings. One of these enclosed the body of the lamp, while the other was covered with gauze and served for attachment of a handle. The meshes of the gauze permitted free access of air to the flame and transmission of part of its light. The standard adopted as a limit of safety was iron gauze with 784 meshes per square inch, the wire being about $\frac{1}{50}$ inch in thickness. When such a lamp is carried into an atmosphere contaminated with from 3 to 6 per cent. of fire-damp the flame becomes elongated and smoky, being surrounded by a zone of mixed gases less rich in oxygen than air is, and containing carbon and hydrogen, both of which are combustible. The flame therefore occupies an appreciably larger volume, and indicates the approach of danger before an actually explosive atmosphere is reached. Within a dangerous atmosphere the entire space within the cylinder of gauze becomes occupied with flame, but this may for some time fail to be transmitted through the gauze. Such transmission may occur after the gauze becomes red-hot, or if the lamp is exposed to a draught. The indication of danger should be sufficient to cause the withdrawal of the miner from such surroundings. Modifications of the Davy lamp have come into use, chiefly with a view to surrounding the flame with glass so as to increase the effective radiation of light; but in each case access and egress of air are effected through one or more thicknesses of wire gauze. Muesseler's lamp is extensively employed in continental Europe; besides the glass chimney it has a conical metallic chimney above the flame to increase the draught of feed-air.

Of late years electricity has been extensively applied in mining operations, and the most obvious application would naturally seem to be the substitution of the incandescent electric lamp for the miner's wire-gauze safety-lamp, since the former, if carefully handled, is quite safe in any atmosphere whatever. The difficulty attendant upon the attainment of effective insulation, suitable wiring, and the pre-

vention of rough usage by miners have thus far (1895) made the use of electricity for this purpose uneconomical, although large underground cavities have been satisfactorily illuminated with the arc-lamp.

Recent improvements in the safety-lamp have all been directed with a view to its use as a fire-damp indicator. Portable indicators have been based upon the heating of a platinum wire in contact with an atmosphere containing fire-damp when the wire is traversed by an electric current; but the transportation of the source of current is inconvenient. Better success has been attained in increasing the sensitiveness of the flame in the safety-lamp. Not only does the flame lengthen in an atmosphere containing fire-damp, but it is capped with an almost non-luminous aureole, the length of which indicates quite accurately the percentage of contamination. To measure its height best the luminous part of the oil-flame must be hidden or suppressed. Mallard and Le Chatelier, in 1881, showed that aureoles much larger and more easily visible are given by flames of alcohol and of hydrogen. Pieler, an Austrian engineer, soon afterward constructed a Davy lamp supplied with alcohol instead of oil, and furnished with a shade surrounding the flame. Any elongation of this is seen above the edge of the shade, and by this means as little as 0·25 per cent. of contamination becomes perceptible. Pieler's lamp is widely in use in Germany, but is unsafe. In 1892 important improvements were independently made by Chesneau in France and Clowes in England. In Chesneau's lamp methylic alcohol is used, with a small admixture of copper chloride ($CuCl_2$), which colors the flame green and the aureole takes a greenish blue. The construction of the lamp is more complicated than that of Pieler's, but it is quite safe, and the indications are delicate enough to reveal 0·10 per cent. of contamination. Clowes's invention consists in the attachment of a small steel cylinder of compressed hydrogen to a special but simple form of safety-lamp containing oil. On opening a valve a small quantity of the gas is discharged through a narrow copper tube which traverses the oil-reservoir and terminates at the side of the wick. The issuing jet of hydrogen is ignited, and the oil-flame is then turned down to extinction. The height of the aureole in the suspected atmosphere is then noted, and the corresponding percentage of fire-damp read from a scale. The sensitiveness of this indicator is nearly if not quite equal to that of Chesneau's, and it has the advantage of greater simplicity, in addition to the fact that it may be used for illuminating purposes and for the rough estimation of fire-damp with the luminous oil-flame before applying the more delicate test with the non-luminous hydrogen flame. The method is applied with equal success to the measurement of contamination with coal-gas, water-gas, and petroleum vapor, and is therefore useful in many other places besides coal mines.

W. Le Conte Stevens.

Safety-valve: See Steam-boiler.

Safflor: See Cobalt.

Safflower, or **Carthamus** [*safflower* is from O. Fr. *safleur* (by analogy of O. Fr. *fleur*, flower, and *safran*, saffron), from Arab. *usfūr*, safflower, deriv. of *safrā*, yellow]: the

The safflower.

flower of the *Carthamus tinctorius*, of the thistle tribe, indigenous to Egypt and the Levant, but now cultivated in France, Spain, Germany, Italy, Hungary, the southern Asiatic provinces of Russia, the East Indies, and South America. It was formerly used very extensively for producing pinks, reds, scarlets, and lilacs on cotton, flax, and silk, especially for dyeing red tape and for preparing pink saucers. It is still used in Lancashire for certain shades of pink for the Eastern market, though aniline colors have displaced it in many cases. Safflower contains two coloring-matters—one, yellow, is an acid, bitter, soluble in water, and useless; the other, *carthamine* or *carthamic acid*, red, insoluble in water, but soluble in alcohol and in alkalies, and valuable as a dye. The safflower colors on fabrics are very fleeting; light destroys the color rapidly, and goods dyed with it must be dried in the shade. Age is nearly as injurious as light, especially when the goods are damp. Sulphuretted hydrogen converts carthamic acid into colorless carthamous acid; hence this gas acts injuriously on goods dyed with safflower. The extract of safflower consists of the carthamic acid in suspension in water. The *rouge* used for the toilet is a mixture of carthamic acid with fine burned talc (French chalk). Pink saucers are coated with carthamic acid. See Calvert's *Dyeing and Calico-printing* (1876); Ure's *Dictionary*; Muspratt's *Chemistry*; Schützenberger, *Die Farbstoffe*. See also Saffranine.

Revised by Ira Remsen.

Safford, James Merrill, Ph. D., M. D.: geologist; b. at Zanesville, O., Aug. 13, 1822; graduated at Ohio University, and continued his studies at Yale; Professor of Chemistry, Natural History, and Geology in Cumberland University, Tenn., 1848–53; was elected to the chair of Chemistry in the medical department of the University of Nashville 1873; to the same position in Vanderbilt University 1874; and to the chair of Mineralogy, Botany, and Economic Geology in Vanderbilt University 1875. He became State geologist of Tennessee in 1854. His general report published in 1869 is the standard treatise on the geology of the State, as well as an important contribution to the geology of the U. S.

Revised by G. K. Gilbert.

Safford, Truman Henry: astronomer; b. at Royalton, Vt., Jan. 6, 1836; obtained in early boyhood celebrity for his wonderful mathematical powers; prepared an almanac at the age of nine years; calculated in 1850 the elliptic elements of the first comet of 1849; improved methods of astronomical calculation; graduated at Harvard 1854; was some years engaged in astronomical studies; became in 1863 adjunct observer in the Cambridge Observatory, acting director Feb., 1865, and director of the Chicago Observatory Dec. 28, 1865. His work at the Chicago Observatory included discovery of many new nebulæ, and the beginning of a zone for the international survey now nearly completed, but was cut short by the consequences of the Chicago fire. He then took part in Capt. Wheeler's surveys of the far West, and other astronomical work for different bureaus in Washington. In 1876 he was appointed Professor of Astronomy at Williams College; there completed vol. iv. of the annals of Harvard College Observatory, and a star-catalogue for the U. S. engineers; built a meridian observatory, mounted the instruments, and published a catalogue of polar right ascensions from his Williamstown observations, besides contributing frequently to astronomical and educational journals; and has earnestly labored for more modern ideas of instruction in mathematics.

Saffranine, Safranine, Aniline Pink, or **New Rose** [*safranine* is from Fr. *safran*, saffron]: a dye, which has to a large extent superseded safflower for dyeing silk and cotton, obtained by treating a mixture of toluylene diamine, $C_6H_3(CH_3)(NH_2)_2$, and toluidine, $C_6H_4(CH_3)(NH_2)$, with an oxidizing agent. $C_6H_3.CH_3(NH_2)_2 + 2C_6H_4.CH_3.NH_2 + 4O = C_{21}H_{20}N_4 + 4H_2O$. Saffranine has the composition $C_{21}H_{20}N_4$, and appears to be nearly related to Perkin's mauveine. For dyeing, the saffranine is dissolved in boiling water and carefully filtered, and a very little sodium carbonate added before it is put in the dye-beck. To dye wool a rose pink, proceed exactly as with the Aniline Colors (*q. v.*). To dye silk, add the solution of the color to the bath, in which some castile soap has been previously dissolved; keep the bath lukewarm. To dye cotton, it is a good plan first to soak, in a cold bath containing sodium hyposulphite, ¾ oz. to the pound of cotton, to destroy the last traces of chloride of calcium. For a rose pink, mordant the cotton in either of the following ways: (1) Soak cotton half an hour in the clear solution of acetate of aluminium, obtained by dissolving 2 lb. of alum and 1 lb. of acetate of lead in 2 quarts of water;

dry; soak half an hour in a cold fat-soap bath; dry; then dye lukewarm in the solution of saffranine. (2) Soak the cotton from four to six hours in a lukewarm bath to which the extract from ½ lb. of nutgalls has been added; wring; soak one hour in a cold bath containing for every pound of cotton ⅛ to ⅜ oz. of perchloride of tin crystals; wash; dye in a lukewarm bath to which the color is added in three or four installments to secure an even color. For a dark-rose or cherry color use the second method, doubling the quantity of nut-galls and increasing slightly the quantity of perchloride of tin. For ponceau and scarlet, first give the cotton, after treatment with hyposulphite, a bottom of turmeric (hot), then continue by the second method. To darken the shades, let the cotton soak in the gall-bath over night. Tannin may be used in place of nutgalls, ¾ oz. to the pound of cotton. Lastly, pass all cotton dyed with saffranine through a cold bath slightly acidulated with acetic acid.

Revised by IRA REMSEN.

Saffron [from O. Fr. *safran* (whence Germ. *safran*), from Arab. *za'farān*, saffron, deriv. of *safrā*, yellow]: a yellow substance, consisting of the stigmas, with part of the styles, of the saffron-crocus (*Crocus sativus*), a plant indigenous in Greece and Asia Minor, and extensively cultivated in Austria, France, and Spain, and formerly in England. Spanish saffron is the best. It is said that 100,000 flowers are necessary to produce 1 lb. of saffron. This dye is often adulterated with safflower, marigold, pomegranate, and other flowers. The stigmas of the true saffron are from 1 inch to 1½ inches long, narrow and roundish where they are attached to the style, but spreading and club-shaped near the extremity, which is truncated. They have an orange or brownish-red color, yellow in the narrower part, an agreeable aromatic, almost intoxicating, odor, and an aromatic bitter taste, and impart a yellow color to the saliva and to water, alcohol, and oils. Strong sulphuric acid colors them blue, then red, and finally brown. Saffron was formerly a favorite dye, but is now rarely used as such. It is employed in medicine for coloring tinctures and for liqueurs, varnishes, confectionery, and especially cakes in the west of England. The coloring-matter of saffron is a glucoside, to which the names saffranine, saffron-yellow, polychroite, and crocine have been given. Revised by IRA REMSEN.

Saffron of Mars: See IRON (*Medicinal Uses of Iron*).

Sa'fi: an Atlantic port of Morocco, Africa, well fortified, with a fair harbor (see map of Africa, ref. 1–B). It is visited occasionally by Hamburg and other steamers, but its former considerable trade has been largely captured by Mogador, S. of it. Pop. 9,000, one-third Jews.

Sa'gan: town and railway center in the province of Silesia, Prussia; on the Bober (see map of German Empire, ref. 4–H). It has a fine palace with a beautiful park, and extensive manufactures of woolen and cotton cloth. Pop. (1895) 13,183.

Sagar, saa-gŭr', or **Saugor**: an island in the delta of the Ganges, at the mouth of the Hugli; 23 miles long N. and S., and 2½ to 8 miles broad. It is celebrated for its disasters, and as a station for Hindu pilgrims. Its misfortunes are due to the storm-waves that sometimes sweep over it. According to the Calcutta *Review* 200,000 people were destroyed by the storm-wave of 1688. Before the cyclone of 1864 it had 5,625 inhabitants, of whom only 1,488 survived. It has few permanent inhabitants, but is visited annually, in January, by from 100,000 to 200,000 pilgrims. The celebration attended by them lasts only three days, but a certain proportion remain for weeks to take baths. The island contains a meteorological observatory, a lighthouse, and telegraph station. It is infertile, covered with jungles, and infested by wild beasts. MARK W. HARRINGTON.

Sagar, or **Saugor**: city of the Central Provinces, British India, and capital of a district of Sagar; lat. 23° 50′ N., long. 78° 49′ E.; on the border of the artificial lake Sagar (see map of N. India, ref. 7–E). The lake is about 4 miles in circumference, and is surrounded by temples with platforms for baths. The city is picturesque, well built, with wide streets. Near by is a large and old fort commanding the town, a prison, and a cantonment. Its chief commerce is in salt. Pop. (1891), 44,674.—SAGAR is also the name of a town in Mysore, and of one in Haidarabad. M. W. H.

Sagas: See ICELANDIC LITERATURE and SCANDINAVIAN LITERATURE.

Sagas'ta, PRÁXEDES MATEO: statesman; b. at Torrecilla de Cameros, Spain, July 21, 1827; studied at the School of Engineers in Madrid; was elected to the Constituent Cortes 1854; took part in the insurrection of 1856 and fled to France; returned to Spain on the proclamation of the amnesty and became professor in the School of Engineers in Madrid, and editor of *La Iberia*, the principal organ of the progressist party; after the unsuccessful insurrection of June, 1866, he again fled to France, but returned after the fall of Queen Isabella II.; member of Gen. Prim's first cabinet; Minister of State Jan., 1870; declared for the monarchy; Minister of State in the first cabinet of King Amadeus; successively Minister of Foreign Affairs, Minister of the Interior, and president of council, 1874, under Marshal Serrano; gave in his adherence to Alfonso XII. 1875; joined the new liberal party, 1880; came into power at the head of a coalition in 1881, which was superseded in 1883 by a cabinet formed from the dynastic left. On the death of Alfonso XII., Nov. 23, 1885, he again took charge of the Government at the request of the queen regent; but in 1890 the conservatives returned to power under Cánovas. Sagasta was in power 1893–95, being once more succeeded by Cánovas; and in Oct., 1897, two months after the death of Cánovas, he again took charge of the Government. C. H. T.

Sage [Fr. *sauge*]: a plant of the genus *Salvia* of the mint family (*Labiatæ*). *S. officinalis* is a familiar garden-herb. Its leaves are employed in flavoring meats and other dishes, and sage-tea, a decoction of its leaves, is a useful domestic remedy, having aromatic, stimulant, and tonic powers.

Sage, ALAIN RENÉ, le: See LESAGE.

Sage-brush: the popular name of species of bitter shrubs of the genus *Artemisia* (family *Compositæ*) growing upon the Great Plains and in the Rocky Mountains of North America. *A. tridentata* is from 3 to 6 or even 10 to 12 feet in height, and is the common large sage-brush of Idaho, Montana, Wyoming, and Colorado, extending also eastward to the plains. Among other common species are *A. cana* and *A. filifolia*. CHARLES E. BESSEY.

Sage-cock, or **Cock of the Plains**: a kind of grouse, the *Centrocercus urophasianus*. It is characterized, among the tetraonine forms which are feathered to the toes but with the toes themselves bare, by the tail being much elongated and cuneate, and the constituent feathers narrow and attenuated, and the shafts of the feathers on the lower part of the throat very spinous. The color above is brownish yellow, with blackish areas on the inner fields of the feathers; the wing has light-colored shafts to the feathers of the coverts; the lower portions of the breast are whitish, the abdomen marked with a broad black area. The male bird has very large, dilatable, naked, and yellow air-sacs on each side of the neck, bordered by stiff, scale-like feathers. The species is the largest American representative of the family, the male having an average length of over 30 inches, and the female about 21 or 22; but these dimensions are frequently much exceeded. It is confined to the arid plains of the western parts of the U. S., ranging from the Black Hills in the E. to California and Oregon in the W., and from British America in the N. to Arizona in the S. In those plains the sage-brush (*Artemisia*) grows in abundance, and the sage-cock feeds upon that plant, whereby a bitter flavor is imparted to the flesh; but it is said that if the bird is eviscerated at once after being killed this taint is not so marked. There is a simple muscular membranous bag, contrasting with the peculiarly developed gizzard of the ordinary species.

Revised by F. A. LUCAS.

Sag'enite: See QUARTZ.

Saghalien, săă-găă-leen', or **Sakhalin**, known as KARAFUTO by the Japanese and as TARAIKO by the natives: a long and narrow island off the east coast of Asia, stretching directly S. from the mouth of the Amur river, between lat. 45° 54′ and 54° 24′ N. Its length is 670 miles, breadth from 15 to 80 miles, its area 29,336 sq. miles, and it is traversed by parallel mountain chains, thickly wooded, the highest peak being Ktönspal (La Martinière), near the center of the island, 4,860 feet high. The chief productions are coal of good quality, furs, and timber; the climate and soil do not favor agriculture. At Dui on the west coast, and Mauka Cove farther S. are Government penal stations; the last is also a fishing center. Since 1875, when Japan ceded her rights over the southern portion of the island (see KURILES), Saghalien has been altogether Russian. Pop. (1897) 25,495. The natives, mostly of Ainu stock, number 3,200; a dictionary of their tongue was compiled by M. M. Dobrotvorski, and completed and published in 1876 by his brother Ivan. J. M. DIXON.

Sag Harbor: village; Suffolk co. (Long Island), N. Y.; on Gardiner's Bay (an inlet of the Atlantic Ocean), and the Long Island Railroad; 10 miles S. of Greenport, 100 miles E. by N. of New York (for location, see map of New York, ref. 8–G). It has a good harbor, considerable trade by rail and water, regular steamboat communication with New York, cotton and flour mills, and manufactories of leather, cigars, watch-cases, and tools. Many New York business men have costly summer residences here. There are a union school with high-school department, the Academy of the Sacred Heart of Mercy (Roman Catholic, opened in 1877), a State bank with capital of $25,000, a savings-bank, a private bank, and two weekly newspapers. Pop. (1880) 1,996; (1890) not separately reported; (1900) 1,969.

Sag'inaw: city; capital of Saginaw co., Mich.; on the Saginaw river, and Grand Trunk, the Père Marq., and the Mich. Cent. railways; 64 miles N. E. of Lansing, the State capital, 100 miles N. W. of Detroit (for location, see map of Michigan, ref. 6–J). It occupies a site about 30 feet above the river, which is navigable from Saginaw Bay on Lake Huron to this point, and is here crossed by several bridges, and is surrounded by a rich agricultural region. The city is provided with gas and electric light plants, sewerage, water-works, and street-railways, and contains 42 churches, 2 high schools, 22 public-school buildings, public-school property valued at over $450,000, 4 public libraries, 2 national banks with combined capital of $300,000, 2 State banks with capital of $250,000, 3 savings-banks with capital of $250,000, 1 private bank, and 2 daily and 8 weekly periodicals. Lumber, salt, and coal are the principal industries; soft coal in inexhaustible quantities have recently been discovered and is now being developed. Plate-glass and beet-sugar manufacture are recent industries. Malt-liquor plants are in operation, and another is being constructed. It has 98 incorporated business companies, with an aggregate capital of $21,727,000. The chief manufactures are wood, iron, and steel, 247 manufacturing establishments in 1890 employing 5,019 persons, paying $2,324,015 for wages and $6,260,849 for materials, and turning out products valued at $10,396,966. The wood and lumber output was valued at $5,431,555, and the foundry product at $814,098. There are 2 telephone companies and one street-railway system, with two suburban lines projected and one in operation. In 1900 the city had an assessed valuation of $20,000,000, and a net debt of $1,162,500. The present city of Saginaw was created by act of the legislature of March 3, 1890, which consolidated the former cities of Saginaw City and East Saginaw, on opposite sides of the river. Both cities had the Holly system of water-works, gas-plants, sewerage, street-railways, and excellent public schools. East Saginaw was the more important of the two cities, was located in 1847, was laid out by New York capitalists in 1849, and was chartered as a city in 1859. The development of the cities was rapid because of their superior railway and lake shipping facilities. Pop. (1880) Saginaw City, 10,525; East Saginaw, 19,016. The present city covers an area of nearly 13 sq. miles. Pop. (1890) 46,322; (1900) 42,345.

E. D. Cowles, editor of "Courier-Herald."

Saginaw River: a river in Michigan, formed by the junction of the Flint and Shiawassee rivers. It flows N. 30 miles to Saginaw Bay, and is navigable for 24 miles by steamers drawing 10 feet.

Sagit'ta: a genus of Chætognatha (*q. v.*).

Sagitta'rius [=Lat., archer, deriv. of *sagit'ta*, arrow]: the sign of the zodiac into which the sun enters about Nov. 22. There is also a constellation Sagittarius, corresponding to the sign Capricornus.

Sago [from Malay *sāgu*]: a variety of starch obtained from the medullary matter or pith of the stem of *Metroxylon rumphii*, *M. læve*, and various other palms. *M. rumphii* grows in low lands in the East Indies. It is a low tree, with a thick trunk, of which the woody part is but an inch or two in thickness, the whole cavity being filled, at a certain stage of its growth, with the farinaceous pith. This is mixed with water, which is passed through sieves, and the starchy matter is allowed to settle. There are several varieties: common sago, which is, like other varieties of starch, insoluble in cold water, but swells to a transparent jelly on boiling; and pearl-sago, which has been granulated and subjected to some process, probably involving heat, which causes it to be somewhat soluble, even in cold water. If potato-starch be mixed with sago for purposes of adulteration, the microscope will detect its granules, as they are larger and more regular.

Sago-cheese: a corrupt name given in the U. S. to Schabzieger cheese. See Cheese.

Sago-palm: a palm that yields sago; also, a cycad that yields a kind of sago. See Cycads and Palm Family.

Sagoyewatha: See Red Jacket.

Saguenay (săg-*e*-nā') **River**: one of the six great tributaries of the St. Lawrence, carrying the surplus waters of Lake St. John a distance of over 130 miles to the parent stream at Tadousac. For the first 36 miles of this distance its channel is narrow, and runs through an extensive forest region over waterfalls and rapids to the tidal limit near Chicoutimi. Besides the waters from Lake St. John (see St. John, Lake) the Saguenay river receives on the left bank the Shipshaw, the Bras du Canot, and the Marguerite, and on the right the Chicoutimi (which drains Lake Kenogami, fed by the waters of the river Upikauba) and the Mars. The whole region is famous for its bold and striking scenery, especially below the inlet of the Rivière à Mars, which widens out into the beautiful Ha Ha Bay. For 50 miles the river passes within the rugged highlands of the Laurentides, between banks that descend precipitously for 1,500 feet to the surface of the water, with here and there a more striking promontory rising even higher. Here the water is deep and flows slowly, the depth in some places being over 2,000 feet, the river being navigable for the largest vessels as far as Ha Ha Bay. The river and its tributaries are famous for their fisherics of salmon and trout. J. M. Harper.

Sagun'tum [= Lat. Cf. Gr. Ζάκυνθος]: an ancient town of Spain; in Hispania Tarraconensis; founded by Greek colonists from Zacynthus (modern Zante). It prospered and became very wealthy. In 219 B. C. it was besieged by Hannibal. After a year of energetic resistance against an army of 150,000 men the Saguntines, pressed by famine, set fire to their city, and while all the women and children perished in the flames, the men issued forth to battle and were killed. This conquest by Hannibal occasioned the second Punic war. The Romans afterward rebuilt the city and called it *Muri veteres* (the old walls), whence the name of the city, Murviedro, which occupies the site. A theater and a temple of Bacchus are still left of the ancient city, the former in comparatively good condition.

Sahagun', Bernardino, de: historian; b. at Sahagun, Spain, about 1499. He studied at Salamanca, joined the Franciscans, and from 1529 was a missionary in Mexico. Besides works on the Indian languages he wrote a *Historia universal de la Nueva España*, which was long used in manuscript by historians, but was first published at Mexico 1829–30, and by Kingsborough in 1830. The portion relating to Aztec history has been criticised as unreliable; the description of the conquest is valuable. D., probably at the convent of Tlaltelolco, Feb. 5, 1590. H. H. S.

Sahaptin Indians: See Shahaptian Indians.

Saha'ra [from Arab. *sahrā*, desert plain]: the great desert of Northern Africa, the largest on the earth and the principal member of the series of deserts which extends from Cape Verde through Africa, Arabia, Persia, and Turkestan, and ends in the great Shamo or Desert of Gobi in Mongolia. The Sahara extends on the N. to the Atlas and Algerian Mountains and in Tripolis to the Mediterranean Sea. On the W. it extends to the Atlantic, and on the S. it is limited by the margin of forest growth in the Sudan. The eastern boundary is artificial, but is usually taken to be the western margin of the basin of the Nile. Thus limited it has an area of 4,000,000 sq. miles. If the grassy southern versant of the northern mountains, the comparatively fertile oases, and the extensive pastoral steppes on the southern border are excluded, thus limiting the desert only to that part incapable of ordinary agriculture and grazing, the area is reduced to 2,400,000 sq. miles. Of this the area covered by dunes or moving sands is only 500,000 sq. miles—about one-eighth of the Sahara as a whole and one-fifth of the desert proper. These estimates are subject to the uncertainty due to incomplete knowledge of the desert. Two considerable areas are yet unknown—one to the N. of Lake Chad, the other the southern part of the Libyan desert.

Surface.—The Sahara is not a level plain, as usually imagined, but is much diversified. Its average elevation above the sea is estimated at 1,200 feet by Saint-Martin and at 1,500 feet by Chavanne. Only two small areas are known to be below the level of the sea. The first is a series of shotts in Southeastern Algeria and Central Tunis, W. of the Lesser Syrtis. Water could be admitted into this area from the

Mediterranean, but the resulting seas combined would not be as large as Lake Tanganyika or Lake Nyassa. The other depressed area is in the northern part of the Libyan desert (the oases of Araj and Siwah), nearly W. of Fayoum and 150 miles from the Mediterranean, from which it is separated by an elevated plateau.

A mountainous region stretches through the desert S. E. and N. W., extending from S. of Algeria to Darfur, dividing the eastern or Libyan desert from the Central and Western Sahara, and having its backbone in the Tassili and Tibesti Mountains. They make a nearly unbroken range 1,100 miles long, culminating in Mt. Tarso of Tibesti, about 8,000 feet high. To the W. of this range and connected with it are the mountain complexes of Ahaggar and Azjer, which occupy the geographic center of the Sahara, with elevations of from 4,000 to 5,000 feet. These, with areas of lower mountains to the N. and S., make an elevated band which crosses the Sahara nearly centrally from the Syrtis on the N. to Sokoto on the S.

The remainder is much diversified by plains, hills, and valleys, and is furrowed by the beds of streams, generally dry, but having, nevertheless, as well-defined basins as in other parts of the world. The surface is sometimes a shingly, denuded, arid plateau (*hamada* of the Arabs), drearily uniform, slightly undulating, but little intersected, from the surface of which the wind sweeps every particle small enough to be carried away. This may be succeeded by a region of ravines and valleys (*wadies*) which are sometimes simple coulées, sometimes extensive, with a full series of ramifications. With these are associated sharp escarpments, which are the edges of the higher plateaus, and sometimes isolated buttes (*gara*, plural *gour*, of the Arabs). Not rarely the wady ends in a closed basin (*sebkha*), which may be always dry or occasionally filled with water, making a temporary lagoon. The latter when dry are covered with a layer of saline efflorescence which, under favorable conditions, forms a veritable crust. Elsewhere are plains of sands heaped into dunes. The latter are grouped irregularly, and reach sometimes a height of 300 or 400 feet, but are not so subject to shifting by the wind as is sometimes represented. They remain fairly permanent from generation to generation, and, although heavy wind-storms may carry considerable quantities of sand, the trails are not generally obliterated nor the wells covered. These seas of sand have the name of *erg*, and of these four large ones are known (two in the Libyan desert and two at the W. and parallel to the Atlantic coast). Besides these there is a series of smaller ones from Southern Algeria to Fezzan, and some other isolated ones of small size.

A few of the rivers of the Sahara debouch into the Atlantic, the principal ones being the Draa and the Sakiet-el-Hamra, near the northwestern angle of the Sahara, the former with water, the latter without. Many smaller valleys debouch into the Syrtes of the Mediterranean. The Libyan desert has few of the wadies. The richest part of the Sahara for these stream-beds is the central elevated region of Ahaggar, Azjer, and Tassili. From this region radiate innumerable stream-beds, some of which are lost in the sand at lower levels, while others can be traced to the Mediterranean or to the basin of the Niger. Lake Chad has a similar but less extensive system. The existence of these stream-beds suggests that formerly the Sahara may have been a well-watered region. If so it was probably in late geological, certainly before historical, times. Perhaps they are due to the occasional filling which they undergo, which is due to the intense local storms (cloud-bursts), in which the rain comes when it comes at all. The stream is then filled with a torrent which advances with impetuous force and continues until lost in a lagoon, in the sand, or in some regular outlet, as Lake Chad. Such streams exert powerful erosive action, doing in a few hours the work which it would take a tamer stream years to perform. To such streams is probably also due the subterranean water which forms permanent or temporary wells, and whose existence renders possible commerce across the Sahara.

Geology.—The Sahara is geologically as diversified as other regions. The core of the elevated center about Ahaggar is formed of the early prefossiliferous crystalline rocks. About this core, with prolongations to the Atlas on the one side and Tibesti on the other, is found an enormous area where Palæozoic rocks come to the surface. The next in the series is a large development of the Cretaceous, which extends from Tunis to the Nubian desert and Kordofan. The Eocene and Miocene cover a large area in the northern part of the Libyan desert, and the Pliocene and Quaternary occupy the southern and central part of the Western Sahara. Evidence of volcanic action is found in the Ahaggar and Tibesti Mountains and to the E. of Fezzan.

Climate.—The mean annual temperatures of the Sahara are about those of Northern Mexico, passing from 68° F. at the north to 86° at the south. The January means vary from 40° at the north to 72° at the south. In summer it is hottest in the center, the July mean temperatures over a large part of the interior being 95° or more and falling to 86° at the margins. The mean annual range varies from 20° at the margins to 40° within. The true features of the temperature only appear when the extremes and the daily range are consulted. The difference between day and night often runs to 50° or more. In the northern and central parts of the desert winter temperatures below freezing are common. In summer temperatures of about 120° are not rare over the Sahara, and Rohlfs once recorded 127° F. in the shade. This record has been surpassed in the Colorado desert of Southern California, where a record of 128° F. was made in July, 1887.

In winter the desert surface is occupied by a part of the high-pressure band which surrounds the earth. The winds then flow gently out in all directions, except in the N. W., where an inflowing current from the N. W. enters by crossing the Atlas Mountains. In the summer the surface is occupied by an area of relatively low pressure. The winds then generally flow into the desert, but there become dry because of the high temperatures.

The moisture of the air is generally very slight. In many cases records of only 2 per cent. of relative humidity have been made, and in a few cases the instrument has failed to find an appreciable amount, making a record of 0 per cent. Under such conditions the sky is intensely blue, except when the air is loaded with fine dust, and mirages are common in the heat of the day. Dew and hoar frost are almost unknown. Yet there is probably no part of the desert where rain does not fall occasionally, but sometimes years intervene between showers. Beginning at the south, the rainfall on the parallel of 10° N. lat. is about 50 inches, and the rainy season is in middle and late summer. This is gradually reduced northward until, on the parallel 20° N., the amount is only from 5 to 8 inches annually. North of this, regular mid and late summer rains occur in the mountainous regions, but elsewhere the rainfall becomes irregular and occasional only, giving, however, an annual average of 5 inches or more. This condition continues to the Atlas Mountains on the W. and to the Mediterranean on the E., except that in Algiers the Mediterranean regimen of rainfall (spring and late autumn, with dry September) obtains over a narrow strip on the edge of the desert.

The winds that come from the Sahara and blow out over the neighboring regions are of a peculiar and sometimes destructive character. They have received many names—harmattan, leste, leveche, sirocco (of Sicily), chamsin, simoom. They are characterized by heat, dryness, and dust. The heavy winds of the interior, carrying much sand, are generally from the S.

Cause of Aridity.—This desert has continued from the earliest known times without material change, except a possible progressive (but slight) increase in aridity. From what precedes it appears that it is not due to solar heat (as thought by the ancients), nor to recent elevation above the sea, nor character of surface, nor is it due to the northeast trade wind, to which it was attributed by Humboldt. The aridity is a purely atmospheric phenomenon, due to the outflow of wind in winter, and to the great heat when the inflow takes place in summer. The direction of the winds again is due to the distribution of atmospheric pressure. As the details of the last are due to the distribution of land and water, the Sahara must have been a desert ever since the continents took on their present form.

Flora and Fauna.—The flora, though poor, is interesting because peculiar, and not formed by an intermingling of that of the Sudan and Mediterranean coast. It is rarely entirely lacking; even in the sandy deserts and the oases (comprising about 75,000 sq. miles) are true islands of verdure. Here the chief plant is the date-palm. The fauna is even poorer than the flora. In the *erg* or *hamada* one can travel for days without seeing an animal. In the mountains are jackals, wolves, antelopes, and sometimes lions and tigers. The birds are very few in species and number. The reptiles are relatively abundant, and permanent waters are stocked with fish and other water animals.

Population.—The central part of Sahara, from Tunis and Tripoli to the Central Sudan, is occupied by the Tuaregs,

divided into the northern and southern tribes. Although occupying nearly half of the area, they number only about 75,000. The Tibbus occupy the eastern part, having Tibesti as a center. They are probably of Negro affinities, and are estimated at 28,000. The Western Sahara is occupied by Moors—people of mixed race—Arab, Berber, and Negro in varying proportions.

The Sahara is crossed in all directions by trade-routes, properly trails, along which a considerable commerce has been conducted from the earliest times. The trade is one of transportation, except for salt, which is collected in the desert in large quantities, and carried to the Sudan. About two-thirds of the Sahara is now in the French sphere of influence, and about half of the remainder under Turkish authority.

Report); Schirmer, *Le Sahara* (1893); Reclus, *Nouvelle géographie universelle*, vol. xi.

Mark W. Harrington.

Saharanpur': a district and city of Meerut (*q. v.*), Northwest Provinces, British India. The district lies between 29° 35′ and 30° 21′ N. lat., and 77° 9′ and 78° 15′ E. lon., between the Ganges and the Jumna (see map of N. India, ref. 4–E). It is the northernmost portion of the Doab or alluvial plain, being bounded on the N. by the Siwalik range of hills. It is fertile, well watered, and devoted to cereals. Area, 2,221 sq. miles. Pop. about 1,000,000. The city is the administrative headquarters of the district; lat. 29° 58′ N., lon. 77° 35′ E.; 900 feet above sea-level. Among the buildings are an old Rohilla fort and a handsome Mohammedan mosque. The principal trade is in grain, sugar, molasses, and native cloth. Pop. (1891) 63,194. Mark W. Harrington.

Sahib, Tippoo: See Tippoo Sahib.

Saïda, saă-ĕĕ′da: town; in Syria, on the Mediterranean; 20 miles S. of Beyrout (see map of Palestine, ref. 3–D). Though its harbor is partly filled, it carries on an active trade in goatskins, oil, rags, silk, tobacco, and especially fruit, for which the adjacent country is noted. Its immense French Khan, formerly the main entrepôt of Syrian commerce, is a bazar, fortress, and city in one. Pop. 10,000, half of whom are Mussulmans. It occupies part of the site of ancient Sidon (*q. v.*). E. A. G.

Saïd Pasha, Viceroy of Egypt: See Egypt (*Modern*).

Saiga: See Saigidæ.

Saig′idæ, or **Saigi′næ** [Mod. Lat., named from *Saiga*, the typical genus, from Russ. *saĭga*, saiga]: a peculiar family of antelope-like ruminants, or perhaps a sub-family of the *Bovidæ*, distinguished by the peculiarly enlarged muzzle and the co-ordinated modifications of the nasal region of the skull. The form is that of the antelopes or sheep, and the horns are persistent, ringed, and somewhat lyriform. The olfactory organ is extremely expanded and inflated above, and the nasal bones are much shortened, directed upward, and entirely separated from the supramaxillaries, as well as the lachrymals, by the projection of the frontals between the lachrymals and the nasals; the supramaxillaries and intermaxillaries are reduced and attenuated forward; the posterior nasal cavity has its walls inflated outward. The form thus distinguished is represented by but a single species, the saiga (*Saiga tartarica*), which was made known by Pallas in 1777 under the name *Antilope saiga*. The saiga is an inhabitant of the plains of Northern Asia, especially in the region of Mt. Altai, but extends also into Eastern Europe as far as the Crimea. It is about the size of a small deer, and its body is yellowish above and whitish below. It associates in large herds. The flesh is very disagreeable, but is eaten in winter, although in summer it is rejected, because then there is found under the skin the larva of a gad-fly. See James Murie, *On the Saiga Antelope, Saiga tartarica*, in *Proc. Zoöl. Soc. London* for 1870, pp. 451–503.

Revised by F. A. Lucas.

Saigon, sī-gon′: capital of French Indo-China; situated in lat. 10° 47′ N., lon. 106° 42′ E., on the Saigon, a branch of the Donnai, 35 miles from its mouth in the China Sea (see map of East Indies, ref. 4–D). The Donnai, which here winds through a district of exuberant fertility, is navigable for large vessels at favorable tide, and forms at Saigon one of the finest harbors of the east coast of Asia, lined with stone quays and surrounded with dockyards, arsenals, and magazines, and various naval establishments. The town itself is well built, and carries on an active trade, exporting annually more than 8,000 tons of cotton, rice, sugar, indigo, and dyewoods. Pop., with suburbs, estimated at 65,000, of whom many are Chinese, who carry on the retail business of the place. See Cochin-China (*French*).

Revised by M. W. Harrington.

Sai′go, Takamo′ri or Kichinosuke, kĕĕ-chĕĕ-nos′ke: general and statesman; b. in Satsuma, Japan, in 1825; educated under the able lord of that province, who instilled into him imperialist notions and hatred of the Yedo shogunate, then in power. In 1857 he was placed under arrest as a political suspect, and spent several years in exile. His opportunity came in 1868, when the court, instigated by the southern clans, declared against the shogunate. As lieutenant-general in the imperial army, and later as its commander-in-chief, he was conspicuously associated with the complete triumph of his party. Accepting office in 1870 as councilor of state, he remained for a few years in co-operation with the new ministry. Growing dissatisfaction with the Europeanization of everything Japanese, and the desire for a more warlike policy in Korea, sent him into retirement, and the final result was the Satsuma rebellion. D. Sept. 24, 1877. In 1890 the ban of degradation was removed from his name, and posthumous honors were granted him. He is, to the Japanese mind the type of a brave warrior and thorough patriot. J. M. Dixon.

Saikio, sī′kyō [liter., Western capital = Chinese, *Si-king*]; the city of Japan usually known as Kioto (*q. v.*) and formerly known as Miaco (literally, "the capital").

Sail [O. Eng. *segel*: O. H. Germ. *segal* > Mod. Germ. *segel*, sail]: a sheet of canvas or other material used to propel a vessel through the water. The invention or origin of sails has not been determined, but their use is known to date from a very remote period. Sails are made by sewing cloths of canvas together with twine in a double seam, and binding the edges around with a *bolt-rope* to relieve the strain upon the canvas, the whole being so fitted as to present a flat surface to the wind. Bands of canvas are placed wherever additional strength is required or the sail is exposed to chafing, as the *reef-bands*, *buntline-cloths*, etc. Sails are in shape either quadrilateral or triangular. In all quadrilateral sails the upper edge is called the *head*, the lower edge the *foot*, and the sides *leeches*. When the head and foot are parallel, the upper corners are called the *head-earings*, and the lower ones *clews*. When the head and foot are not parallel, the foremost corner at the head is called the *throat* or *neck*, the after upper corner the *peak*, the forward lower corner the *tack*, and the after lower corner the *clew*. In triangular sails we find the head, tack, and clew. In all sails the foremost edge is called the *luff* or *fore-leech*, and the aftermost the *after-leech*. Sails are classed as *square sails* and *fore-and-aft sails*. The former, all quadrilateral, are those which make a large angle with the direction of the keel, and are spread by yards, as the principal sails of a ship, or by yards and booms, as the *studding-sails*. The latter, either quadrilateral or triangular, are those which make but a small angle with the line of the keel. The triangular are spread by a yard, as *lateen-sails*; by a stay, as *staysails*; or by a mast, as *shoulder-of-mutton sails*. The quadrilateral are extended by means of gaffs and booms, the head of the sail being attached to the gaff. In all fore-and-aft sails the luff is attached throughout its length to the yard, stay, or mast. The principal sails of a ship are *courses*, the lowest ones; *topsails*, next above the courses; *topgallant-sails*; *royals*; and, sometimes, *skysails*. These sails are attached by the head to their proper yards, and, excepting the courses, are spread by having their clews drawn out by ropes called *sheets* to sheaves in the ends of the yards below them. The clews of the courses are in like manner drawn to the *chesstrees* and *bumpkins* on deck. Studding-sails are set beyond the leeches of the foresail, foretopsails and maintopsails, and foretopgallant-sails and maintopgallant-sails, the head being extended by a studding-sail yard, and the foot by a boom run out beyond the end of the yard next below. Staysails are hoisted upon the stays between the masts, the foot being stretched out by a rope or whip called the *sheet*. All sails take their names from the mast, yard, or stay to which they are attached. Thus that upon the mainyard is called the mainsail, above which are the maintopsail, maintopgallant-sail, and mainroyal. Boats'

sails follow the rules given as to form and class, but have peculiar names. The most common are spritsails, standing lugs, dipping lugs, and sliding gunters.

Sailfish: any fish of the genus *Histiophorus*, having a remarkably long and high dorsal fin. The ventral fins are modified into elongated styliform appendages of two or three rays, and there are small persistent teeth. The species have an elongated sword, as in the swordfishes (*Xiphiidæ*), but are regarded as the type of a special family (*Histiophoridæ*), including also the spearfishes (*Tetrapturus*). They are inhabitants of warm seas, especially the Indo-Pacific, but *Histiophorus americanus* ranges N. to Cape Cod in summer. The dorsal fin, erected when the fish floats on the surface, has been likened to a sail. They are known also as banner-fishes and spikefishes.

Sailfish.

Sailing: See NAVIGATION and GREAT-CIRCLE SAILING.

Sainfoin [= Fr.; *sain* sound, wholesome (< Lat., *sanus*) + *foin*, hay (< Lat. *fœnum*)]: a perennial leguminous forage-plant, *Onobrychis sativa*, very valuable on dry, chalky lands, but not much raised in the U. S. It is prized as green forage, as hay, and as a crop to be plowed under.

Saint [viâ O. Fr. from Lat. *sanc'tus*, holy, sacred, (as noun) saint, transl. of Gr. ἅγιος, holy, saint]: in the New Testament a title of all Christians (Rom. i. 7; 1 Cor. i. 2; Eph. i. 1; Phil. i. 1, etc.), in the sense that they are called out of the world, regenerated by the Holy Spirit, and consecrated to God and to holiness. In the Apostles' Creed as now recited "the communion of saints" is one of the articles of faith, closely related to the preceding article on "the holy catholic Church," but the clause is not found in the earlier forms of that symbol. The oldest MS. copies of the Gospels bear simply the names of Matthew, Mark, Luke, and John, without "S." attached to them. After the fourth century the term began to be applied to particular persons of special eminence in piety and services to the Church, as the apostles, evangelists, and martyrs. It became the exclusive title of a spiritual nobility or aristocracy. Special honor was paid to their memory, which gradually assumed the character of a limited Christian hero-worship, called by the scholastic divines *doulia* or *veneratio* (as distinct from *latria* or *adoratio*, which is due to God alone, and *hyperdulia*, or a peculiar degree of veneration which is claimed for the Virgin Mary as the mother of our Lord and queen of saints). The Greek and Roman Churches, believing in the active intercession of the saints in heaven in behalf of the struggling Christians on earth, consider it proper and useful to pray to them; with this difference, that God is to be implored as the giver of all blessings, while the saints are to be implored as the friends of God, that through their advocacy may be obtained from him all necessaries of life (hence the form *Ora pro nobis*, Pray for us). Protestants reject the worship of saints, images, and relics as inconsistent with the first and second commandments and the exclusive worship of God, and hence they pray directly to God and to Christ.

Who are the saints was a question for a long time left to the public sentiment of the Christian people in the particular nation or province or monastic order to which the saint belonged. The voice of the people was regarded as the voice of God. But to prevent the immoderate increase of the number of saints, the popes since Alexander III. (A. D. 1170) have monopolized the right of canonization—i. e. of deciding and pronouncing a departed Christian to be a *saint*, and authorizing and prescribing his worship within the Roman Catholic Church. The act of canonization is preceded by a regular process of law, in which one acts as the accuser of the candidate, another as his advocate. The necessary qualifications for the honor are, besides the highest sanctity, the power of working miracles, either during their lifetime, or after their death through their pictures or relics or the invocation of their aid. An Italian proverb says it requires a miracle to prove a miracle. This is especially true after the lapse of several centuries, which usually intervene between the death of a saint and his canonization. In 1862 Pope Pius IX. solemnly canonized twenty-six Japanese missionaries and converts who died in a persecution in 1597, nearly 300 years before. See *Descrizione delle cerimonie che si celebrano nella Basilica Vaticana per le solenni Canonisazioni dei Santi* (Rome, 1862).

The Roman Catholic Church celebrates the memory of each canonized saint on the day of his death (which is regarded as his birthday in heaven). Its calendar of saints includes (1) the apostles, evangelists, and most eminent martyrs, fathers, schoolmen, and missionaries down to the Reformation, who are the general property of Christendom; (2) the specifically Roman saints who lived after the Reformation and zealously opposed Protestant doctrines (as Ignatius Loyola, Charles Borromeo); (3) a few popes. The last canonized pope was Pius V. (1566–72), who excommunicated Queen Elizabeth.

The biography of saints has given rise to an immense body of literature. The most learned and extensive work on the subject is the *Acta Sanctorum* of the Bollandists, begun in 1643, embracing 60 vols. fol., and not yet completed. A convenient abridgment is Alban Butler's *Lives of Saints* (in many editions, e. g. 12 vols., Dublin, 1866). Cf. Baring-Gould (Prot.), *Lives of the Saints* (17 vols., London, 1872–92); *Lives of the English Saints*, edited by Cardinal Newman (15 vols., 1844–45); R. M. Stanton (R. C.), *A Menology of England and Wales* (1888).

Revised by S. M. JACKSON.

St. Albans (anc. *Verulamium*): city; in Hertfordshire, England; on the Ver, a feeder of the Colne; 20 miles N. N. W. of London (see map of England, ref. 11–J). In commemoration of the martyrdom of St. Alban (303) Offa, King of Mercia, founded a Benedictine abbey here in 793, which obtained precedence over all other abbeys in England. The abbey-church was rebuilt by its abbot, Paul of Caen, after 1077, and consecrated in 1115. This, even after many alterations and additions, still remains the most important example of Norman architecture in England. It has been considerably restored by Sir Gilbert Scott and Sir Edmund Beckett (1871–85). Its extreme length outside is 548 feet, and the Gothic nave (284 feet) is the longest of its kind in the world. A feature of interest is the substructure of the shrine of St. Alban, pieced together from 9,000 fragments. The abbey gate-house, which alone remains of the monastic buildings, was converted from a jail in 1869 to the use of the grammar school. St. Albans is historically interesting from the two battles fought here during the wars of the Roses in 1455 and 1461. Straw-plaiting, boot-making, and silk-manufacture are carried on. Pop. (1891) 12,895. R. A. ROBERTS.

St. Albans: town (settled in 1763); capital of Franklin co., Vt.; on the Central Vt. Railroad; 3 miles E. of Lake Champlain, 32 miles N. of Burlington, 70 miles S. of Montreal (for location, see map of Vermont, ref. 2–B). It is picturesquely situated on a plain 375 feet above lake-level and 390 feet above sea-level, is surrounded by high hills, and is the center of a large agricultural and dairying region. It contains 8 churches, high school, public graded schools, academy, 2 convents, public library, hospital, a home for children, a national bank with capital of $100,000, a trust company with capital of $50,000, and a daily, a weekly, and a monthly periodical. The town is principally engaged in making butter and cheese, contains the headquarters of the Central Vermont Railroad, with offices, car and machine shops, and two roundhouses, and has manufactories of iron and steel bridges, viaducts, turn-tables, iron roofs, and marble and granite monuments. In 1864 the town was raided by a band of Confederates from Canada, and in 1866 was the rendezvous of Fenian invaders of Canada. Pop. (1890) 7,771; (1900) town, 1,715, city (organized since 1890) 6,239.

St. Andrews: town; in Fifeshire, Scotland; on a rocky plateau adjoining St. Andrews Bay; 42 miles N. N. E. of Edinburgh (see map of Scotland, ref. 10–I). The schools of St. Andrews were noted as early as 1120; and in 1411 the university, the first in Scotland, was founded. It has a museum, and a library with over 100,000 volumes. St. Andrews contains ruins of a cathedral (1160), a bishop's palace (1200), and many Celtic and prehistoric remains. It is a popular watering-place, and widely known as the headquarters of golf. Pop. (1891) 6,853. See *St. Andrews*, by Andrew Lang (London, 1893).

St. Andrews: a port of entry; capital of Charlotte County, New Brunswick; at the mouth of St. Croix river; on Passamaquoddy Bay; 66 miles by land W. of St. John; on the Canadian Pacific Railway (see map of Quebec, etc., ref. 6–G). It has a good harbor, a weekly newspaper, a marine hospital, a custom-house, a postal savings-bank, and various public buildings. It is an attractive place of summer resort. Pop. 1,800.

St. Anthony's Fire: See Erysipelas.

Saint-Aubain, săn'tō'băn', Andreas Nikolai, de (*Carl Bernhard*): novelist; b. in Copenhagen, Denmark, Nov. 10, 1798. He was a nephew of Fru Gyllembourg, and therefore a cousin of J. L. Heiberg (see Heiberg, Johan Ludvig), and in his writings shows the influence of the Heiberg school. In addition to a number of tales, written between 1836 and 1863, he was the author of several historical novels, of which the best is *Gamle Minder* (Old Memories, 2 vols., 1841), the scene of which is laid in the time of Struensee. Of no less interest are the close studies of later Copenhagen life contained in the tales. Among these one, *Et Löfte* (A Promise, 1839), is distinguished by a realistic force and modernity suggestive of Jacobsen. The others are simple, often sentimental stories of everyday life. D. Nov. 25, 1865. Complete works, 14 vols., Copenhagen, 1856–67. D. K. Dodge.

St. Augustine: city; capital of St. John's co., Fla.; on a narrow peninsula formed by the Matanzas and San Sebastian rivers, W. of the northern end of Anastasia island, and on the Jack., St. Aug. and Ind. Riv., and the St. Aug. and S. Beach railways; 38 miles S. E. of Jacksonville (for location, see map of Florida, ref. 3–K). The ancient city extended from the Franciscan convent (now St. Francis barracks) N. to the castle of San Marco (now Fort Marion), a distance of nearly a mile. From the castle W. to the San Sebastian river extended a moat and wall, which formed in that age a substantial defense against any encroachment from the mainland. The former may still be easily traced along Orange Street, but the only remaining evidence of the latter is the old city gateway—a most picturesque ruin—with 30 feet of the original wall on each side. The wall also extended S. along the San Sebastian river.

At an early period a sea-wall was built against the encroachments of the tide, extending from San Marco Castle to the Franciscan convent. It was rebuilt in a more substantial manner by the U. S. Government in 1837–43, and given a coping of granite 3 feet in width. This sea-wall has always been a popular promenade. As late as 1817 entrance to the city from the mainland was effected by means of a drawbridge. Midway between the fort and the barracks and commanding a view of the Matanzas river is the Plaza, a small public park. Fronting on this, to the W., is the custom-house and post-office, formerly the residence of the Spanish governors. The city extends about a mile N. and half a mile S. of its ancient limits. The principal streets run N. and S.; the cross-streets at right angles E. and W. St. George Street, the main thoroughfare, only 17 feet in width, runs through the center of the town to the city gateway. Beyond that point it is known as San Marco Avenue. Treasury Street, crossing St. George one block N. of the Plaza, narrows at the east end to only 7 feet in width. The hotels of St. Augustine are among the finest in the world. The Ponce de Leon, an edifice in the style of the Spanish Renaissance, is one of the most magnificent and interesting structures on the continent. The building and furnishings cost upward of $2,000,000. The mural decorations are most elaborate and significant, those of the loggia and dining-room furnishing a pictorial history of Florida and Spanish adventure in the New World.

A majority of the population are Roman Catholic, though the Episcopalians, Methodists, Presbyterians, and Baptists have churches. The Memorial Presbyterian church, of the Venetian Renaissance type, is the most remarkable building of the character in the city. There are two excellent graded schools, one for the white and one for the colored children. St. Joseph's Academy is a high-grade parochial school for young ladies, conducted by the Roman Catholic sisters. St. Augustine is also the seat of the Florida Institute for the Education of the Deaf and the Blind. The First National Bank of St. Augustine is the only bank. The manufacturing interest is confined to cigars, but this is considerable. There are 2 daily and 4 weekly periodicals.

St. Augustine is the oldest city in the U. S. Though Ponce de Leon in 1512 landed near its present site, the city was not founded till 1565, when Don Pedro Menendez de Avilés, with 1,500 followers, disembarked here and took possession in the name of Philip II. of Spain. The city acquired a population during the two centuries of Spanish rule of 3,000, besides a garrison of 2,500. At the time the British took possession, in 1763, there were about 900 houses of coquina (a natural concrete of broken shells cemented with shell-lime), a formation found on Anastasia island. The walls of the city, the fort, and sea-wall were also made of this material. The present Fort Marion is the most notable and best-preserved of the works of the Spanish reign, and is a fine specimen of the military engineering of that age. With the exception of a water-battery, which the U. S. Government added in 1842–43, and some few repairs, the fort is as completed in 1756. It was in course of construction over 100 years, and is said to have been built mainly by Indian prisoners and Mexican convicts. The old Roman Catholic Cathedral, begun in 1793, was burned in 1887; but the front wall remained almost intact, and in rebuilding it was carefully preserved and incorporated in the new structure. The old bell bearing the date 1682 was also preserved. In the Plaza is a shaft of marble erected in 1812–13 to commemorate the adoption of the Spanish liberal constitution of 1812. Upon its failure the inhabitants were ordered to destroy the monument, but the authorities were satisfied with the removal of the tablets denoting its object. These were later restored, and are still to be seen. Pop. (1880) 2,293; (1890) 4,742; (1900) 4,272. H. N. Felkel.

St. Barthol'omew, or **St. Bart**: an island of the Lesser Antilles, West Indies; crossed by lat. 17° 54′ 30″ N.; area, 8 sq. miles. It forms a part of the French colony of Guadeloupe. Pop. 2,835.

St. Bartholomew, Massacre of: See Bartholomew, St., Massacre of.

St. Bernard Dogs: See Dogs.

St. Bernard Pass: See Bernard, Great St.

St. Bernard, Little: a celebrated pass across the Graian Alps, on the frontier of Savoy and Piedmont, Italy, S. of Mont Blanc. It is 7,200 feet high, leads from the valley of the Isère into that of Dora Baltea, and has near the summit a convent for the relief of travelers, believed to have been founded by St. Bernard of Menthon. The pass is comparatively easy, and is supposed to have been the route taken by Hannibal in his invasion of Italy.

St. Boniface: town of Manitoba; suburb of Winnipeg, from which it is separated by the Red river (see map of Canada, ref. 9–H). It is a French-Canadian town as distinguished from Winnipeg, which is British, and is the headquarters for the Northwest of the Roman Catholic Church. It was originally known as *La Fourche*, because of the junction here of the Assiniboine and the Red rivers, but on the arrival of Bishop Provencher in 1818 the name was changed to St. Boniface. Here are schools for French-Canadians, and in the cemetery attached to the cathedral is the grave of Louis Riel, the half-breed rebel, looked on by his fellows as a martyr. Pop. 2,000. M. W. H.

St. Brendan, Brandan, or **Branda'nus**: an Irish monk famous for his sea-voyages, about which many legends have been handed down from the Middle Ages; flourished probably in the sixth century A. D. He was said to have gone on a nine years' voyage and visited unknown lands, which are described in the work *De fortunatis insulis*, published in the eleventh century in Latin and translated into French about 1120. Versions of his voyages appeared also in German, English, and Dutch. A popular tradition has identified the Fortunate islands of St. Brendan with America, and given to the Irish saint the credit that belongs to Columbus, but his claims have no historical foundation. See the versions of St. Brendan's travels by Wright (London, 1844), Schröder (Erlangen, 1871), Blommaert (in *Oudvlaemische gedichten*, Ghent, 1838–41), Michel (Paris, 1878). See also Jubinal, *La légende de Saint Brandaines* (Paris, 1836), and Briel, *Van Sinte Brandane* (Groningen, 1871).

St. Bride, or **St. Bridget**: See Bridget, Saint.

St.-Brieuc, săn'bri-ö': capital of the department of Côtes-du-Nord, France; on the Gouet; 93 miles E. of Brest (see map of France, ref. 3–B). It has an ancient cathedral, a lyceum with a library of 27,000 volumes, and a statue of Bertrand du Guesclin, and is engaged in the whale and cod fisheries. Pop. (1896) 21,665.

St. Catharines: city; capital of Lincoln County, Ontario, Canada; on the Grand Trunk and St. Catharines and Niagara railways; 12 miles N. of Niagara Falls (see map of Ontario, ref. 5–D). It is celebrated for its mineral artesian wells, which afford strongly saline waters with valuable tonic properties. There are several fine hotels, 3 daily and 3 weekly newspapers, a convent, a marine hospital, and important manufactures. The town is in a picturesque and fertile region. Pop. (1891) 9,170.

St.-Césaire, săn'sā'zăr' : town of Rouville County, Quebec, Canada; on Yamaska river; 33 miles E. of Montreal (see map of Quebec, etc., ref. 5–B). It has a large trade, a fine water-power, thriving manufactures, an astronomical observatory, a museum of mineralogy and zoölogy, and is the site of Ste. Croix College, a commercial school, and a Presentation convent. Pop. of parish, 5,200, almost all French-Canadians.

St.-Chamond, săn'shaă'mōn' : town ; in the department of Loire, France; at the confluence of the Gier and Ban; 7 miles by rail N. E. of St.-Étienne (see map of France, ref. 6–G). It has several silk-mills, iron-works, and manufactures of ribbons and lace. The vicinity contains rich coal mines. Pop. (1896) 14,463.

St. Charles : city; Kane co., Ill.; on the Fox river, and the Chi. and N. W. and the Chi. Gt. West. railways; 8 miles S. of Elgin, 38 miles W. of Chicago (for location, see map of Illinois, ref. 2–F). It is on both sides of the river, which furnishes good water-power, and contains foundries and machine-shops, malleable iron-works, manufactories of butter, cheese, flour and feed, and paper, a private bank, and a weekly newspaper. Pop. (1890) 1,690; (1900) 2,675.

St. Charles : city (settled in 1780, incorporated as a town in 1809, chartered as a city in 1849); capital of St. Charles co., Mo.; on the Missouri river, and the Burlington Route, the Mo., Kan. and Tex., and the Wabash railways; 20 miles N. W. of St. Louis (for location, see map of Missouri, ref. 4–J). The main business street extends along the river front, and the residence portion lies on and beyond a hill that rises a short distance back from the river. The river is here spanned by an iron railway and highway bridge 6,535 feet long, with approaches, completed in 1871, cost $1,750,000. St. Charles contains 9 churches, several public schools, Roman Catholic and Lutheran parochial schools, Lindenwood College for young ladies (Presbyterian, opened in 1830), Sacred Heart Academy (Roman Catholic, opened in 1818), St. Charles College (Methodist Episcopal, South, chartered in 1838), 4 libraries with about 11,000 volumes, a national bank with capital of $50,000, 2 savings-banks with combined capital of $100,000, and 2 daily and 5 weekly newspapers. There are 3 large flour-mills, a grain elevator with storage capacity of 50,000 bush., a tobacco-factory with annual capacity of 1,000,000 lb. of manufactured goods, 2 breweries, extensive car-works, brick-works, large corn-cob pipe factory, and other industrial plants. Pop. (1880) 5,014; (1890) 6,161; (1900) 7,982. J. H. ALEXANDER.

St. Christopher : See ST. KITTS.

St. Clair : city (settled in 1828); St. Clair co., Mich.; on the St. Clair river at the mouth of the Pine river, and on the Mich. Cent. Railroad; 12 miles S. of Port Huron, the county-seat, 45 miles N. E. of Detroit (for location, see map of Michigan, ref. 7–L). It is in an agricultural region, has ferry connection with Courtwright on the Canadian side of the river, and contains 6 churches, 3 public schools, Ladies' Library Association, Walker system of water-works, completed in 1886, a savings-bank with capital of $50,000, and a weekly newspaper. The manufactories include salt-works, brick-yards, breweries, iron-works, planing-mill, sash, door, and blind factory, foundry, tannery, and ship-yards. Pop. (1880) 1,923; (1890) 2,353; (1900) 2,543.

EDITOR OF "REPUBLICAN."

St. Clair : borough; Schuylkill co., Pa.; on Mill creek, and the Penn. and the Phil. and Reading railways; 3 miles N. of Pottsville (for location, see map of Pennsylvania, ref. 5–H). It has 10 churches, 4 public-school buildings, a parochial school, improved water-works, electric lights, electric railway to Pottsville, and 2 weekly newspapers, and is principally engaged in mining and shipping anthracite coal and manufacturing mining apparatus. Pop. (1880) 4,149; (1890) 3,680; (1900) 4,638. EDITOR OF "SPLINTERS."

St. Clair, ARTHUR : soldier; b. at Thurso, Caithness, Scotland, in 1734; was grandson of the Earl of Rosslyn; educated at the University of Edinburgh; entered the British army as an ensign May 13, 1757; served under Amherst at the taking of Louisburg July 26, 1758; became a lieutenant Apr. 17, 1759; was distinguished under Wolfe at Quebec; resigned his commission Apr. 16, 1762; settled in Ligonier Valley, Pa., 1764, erecting there a fine residence and several mills; was appointed colonel of the Second Pennsylvania Regiment Jan. 3, 1776; accompanied Sullivan in the expedition against Quebec; was appointed brigadier-general Aug. 9, 1776; joined Washington Nov., 1776; rendered valuable service in connection with the battle of Princeton Jan. 2, 1777; was for a short time adjutant-general; was appointed major-general Feb. 19, 1777; succeeded Gates in command at Ticonderoga Apr. 1; was forced to evacuate that post July 4, thereby incurring unpopularity and retirement from his command, but acted as a volunteer aide at the battle of Brandywine Sept. 11, 1777; was acquitted with honor by a court martial in 1778; was a member of the court martial on Maj. André; commanded at West Point from Oct. 1; distinguished himself in the Southern campaign which terminated at Yorktown, and subsequently in that under Greene; was a member of the Continental Congress 1785–87, being its president during most of the latter year; became first Governor of the Northwestern Territory in 1789 and retained the office till 1802; made the treaty of Fort Harmer with the Indian tribes 1789; became commander-in-chief of the U. S. army Mar. 4, 1791; made an expedition against the Indians of the Miami and the Wabash, and suffered a severe defeat near the Miami villages Nov. 4, 1791; was vindicated from blame by a committee of investigation appointed by Congress; resigned the command of the army May 5, 1792; was removed from the post of Governor by Jefferson Nov. 22, 1802, when he settled near Greensburg, Pa., where he passed his remaining years in poverty. D. near Greensburg, Aug. 31, 1818. He published a *Narrative of the Manner in which the Campaign against the Indians in the Year 1791 was conducted* (1812). See *The Life and Public Services of Arthur St. Clair* (Cincinnati, 1882).

St. Clair, Lake : the smallest of the Laurentian chain of lakes; receives the overflow of Lake Huron through St. Clair river, and discharges through Detroit river into Lake Erie. The lake is 30 miles in length from N. to S., 24 miles in maximum and 12 in mean breadth. Its area is 396 sq. miles, and its mean elevation above the sea 576 feet, or $5\frac{4}{10}$ feet lower than Lake Huron and 3 feet higher than Lake Erie. Its mean depth over a large central area is about 19 feet. Its bottom is of fine blue mud, covered in many places with a thin layer of sand and fine gravel, and is overgrown throughout with vegetation which supports an abundance of low forms of life. The northern part is exceedingly shallow, being filled with sediment from St. Clair river. See ST. LAWRENCE RIVER AND GULF. ISRAEL C. RUSSELL.

St. Clair River [originally named *Sinclair*, from Patrick Sinclair, a British officer, who purchased land along the river from the Indians in 1765] : the outlet of Lake Huron. It has a length of 41 miles, and a fall of $5\frac{4}{10}$ feet. The mean discharge is 225,000 cubic feet per second. The river has built a low-grade delta at its mouth, known as the St. Clair Flats, and divides into seven principal channels before reaching Lake St. Clair. In summer the delta has the appearance of a luxuriant prairie of grasses and rushes, which grow in a few inches of water. Several hotels and hundreds of summer cottages have been built on the flats, each house being supported on piles or on embankments formed by dredging neighboring canals. It is one of the most charming summer resorts in America. One of the branches into which the stream divides has been improved for navigation, and its course shortened by the dredging of a canal about $1\frac{1}{2}$ miles long, 300 feet wide, and with an original depth of 16 feet along a central area 200 feet broad. The embankments on either side are 40 feet wide, and 5 feet high above mean water-level. The available depth of water in the canal in 1893 was 18 feet, but contracts have been awarded by the U. S. Government for deepening it to 20 feet, this being one of the improvements necessary to complete the navigability of the route from Buffalo to Duluth for vessels of 20 feet draught. ISRAEL C. RUSSELL.

St.-Cloud, săn'kloo' : town ; in the department of Seine-et-Oise, France; on the Seine; 6 miles S. W. of Paris (see map of France, ref. 3–F). It derives its name from St. Clodoald, grandson of Clovis, who founded a monastery here in 551. The place was burned by the English in 1358, and again by the Armagnacs in 1411. In the palace of St.-Cloud, built in 1572, Henry III. was assassinated in 1589; and here the *coup d'état* of Nov. 10, 1799, which placed Napoleon Bonaparte at the head of the French Government, was effected. The capitulation of Paris in 1815 was signed here, and also the decrees of Charles X. in 1830 which caused the second Revolution. The Duke of Orleans, brother to Louis XIV., made extensive additions to the royal château. In 1870 the palace was seriously injured by fire, but many of the valuable works of art were preserved. Pop. (1896) 6,374.

St. Cloud: city; capital of Stearns co., Minn.; on the Mississippi river, and the Gt. North. and the N. Pac. railways; 3 miles S. of Sauk Rapids, 75 miles N. W. of St. Paul (for location, see map of Minnesota, ref. 8–C). It is on both sides of the Mississippi river, 2 miles below the mouth of the Sauk river; is in an agricultural and hard-wood timber region; has more than 20 granite-quarries in its vicinity; and derives good power for manufacturing from the river. There are 10 churches, public high school, graded schools, one of the State normal schools, 3 libraries (Public, High School, and State Normal School), a State reformatory for males (opened in 1889), a U. S. land-office, 3 national banks with combined capital of $300,000, a private bank, and 2 daily and 3 weekly newspapers. The city contains saw and grist mills, artificial-stone works, indurated-fiber works, several foundries and machine-shops, and large grain elevators, and is the commercial and manufacturing center of Northern Minnesota. Pop. (1880) 2,462; (1890) 7,686; (1900) 8,663. EDITOR OF "TIMES."

St. Croix: See SANTA CRUZ.

St. Croix (sānt-kroi') **River**: a part of the boundary between Maine and New Brunswick. It flows from Grand Lake in a general E. S. E. course, and falls into Passamaquoddy Bay. It is navigable to Calais, Me., above which it affords fine water-power. It is 75 miles in length. It is also called the *Schoodic*.

St. Croix River: a stream which rises in Douglas co., Wis.; flows S. W. to the Minnesota line; from this point southward, for more than 100 miles, it is the boundary between Wisconsin and Minnesota. It is some 150 miles long, and is navigable 54 miles to the Dalles or Falls of the St. Croix. After passing through Lake St. Croix it flows into the Mississippi at Prescott, Wis. At its falls it descends 50 feet in 300 yards. Half a mile below there is a picturesque cañon through which the river flows.

St. Cuthbert's Beads: See CRINOIDEA.

St.-Cyr, săn'seer': village of France; in the park of Versailles (see map of France, ref. 3–F). It is noted for the celebrated establishment which Madame de Maintenon founded here in 1686 for the education of 250 daughters of the French nobility. The building was erected by Mansard. In 1793 it was transformed into a military hospital, and in 1806 Napoleon removed the military academy from Fontainebleau to this place. Pop. (1896) 4,205.

St.-Denis, săn'de-nee': town; in the department of Seine, France; 4 miles N. of Paris, on the Great Northern Railway (see map of France, ref. 3–F). It is celebrated as the site of the ancient Benedictine abbey, the chosen place of burial of the Kings of France. The abbey of St.-Denis was founded by Dagobert I. in 613; a church begun by Pepin, the father of Charlemagne, was completed by the latter and consecrated in 775. This edifice was demolished during the reign of Louis VII., and a more imposing one erected in 1144, the porch and two towers of which yet remain; the rest of the present building was reconstructed by Louis VIII. Up to the time of the Revolution the remains of the kings and princes of France were deposited here. The Convention in 1793 ordered the removal of these bodies, and in 1795 the destruction of the building; the provisions of the latter decree, however, were not fully carried out. Napoleon I. restored the church, which has been further protected by subsequent governments, and is considered one of the most beautiful specimens of Gothic architecture existing in France. Pop. of the commune (1896) 54,432.

St.-Denis: capital of the French island of Réunion, formerly Bourbon; on the northeastern shore (see map of Africa, ref. 8–I). It has a college and a botanical garden, and carries on a considerable trade. Pop. of the commune (1889) 30,560.

St.-Die, săn'dee': town; in the department of Vosges, France; on the Meurthe; 50 miles by rail S. E. of Nancy (see map of France, ref. 4–H). It has a cathedral, a lyceum, and large breweries, cotton and flax spinning-mills, iron-works, tanneries, and dye-works. In the vicinity are several rich iron and copper mines, and much fine marble is quarried. Pop. (1896) 21,396.

St.-Dizier, săn'dee'ziā': town; in the department of Haute-Marne, France; on the Marne; 38 miles by rail S. E. of Châlons (see map of France, ref. 4–H). It has several iron-foundries, active ship-building, and a trade in iron and timber. Pop. (1896) 13,947.

St. Domingo: See SANTO DOMINGO.

Ste.-Anne-de-Beaupré, -bō'prā': village of Montmorency County, Quebec, Canada, containing a shrine to which many pilgrimages are made (see map of Quebec, ref. 4–D). The village is the terminus of the Quebec, Montmorency and Charlevoix Railway; about 25 miles N. E. of Quebec, at the mouth of the St. Anne river, a left-hand affluent of the St. Lawrence. The parish church contains relics of St. Anne, to which many miraculous cures have been attributed. The great day for pilgrimages is July 26, the feast-day of the patron saint. In the church is a fine painting by Le Brun, representing *St. Anne and the Virgin*, presented in 1666 by the Marquis de Tracey. About 3 miles distant are the beautiful falls of St. Anne, near which is good fishing for trout and salmon. MARK W. HARRINGTON.

Sainte-Beuve, săñt'böv', CHARLES AUGUSTIN: poet and critic; b. at Boulogne, France, Dec. 23, 1804; studied medicine in Paris; entered in 1824 on his literary career as a contributor to the *Globe*; published in 1828 his *Tableau historique et critique de la Poésie française au XVI. Siècle* (improved edition, 1843); removed after 1830 from the *Globe* to the *National* and *Revue des Deux Mondes*; received employment at the Mazarin Library in 1840 after publishing the first volume of his celebrated work, *Port-Royal* (3 vols., 1840–48; later much improved; 5th ed. 7 vols., 1888–91); became a member of the Academy in 1845; became in 1848 Professor of French Literature at Liège; returned to Paris in 1849 and held various positions under Napoleon III., contributing steadily to the *Constitutionnel* and the *Moniteur*; was made a senator in 1865. D. in Paris, Oct. 13, 1869. The various series of his *Critiques*, *Portraits*, *Galeries*, and *Causeries*, comprising over thirty volumes, contain some of the finest, most delicate, and most striking delineations of characters from history and literature which have ever been written. Selections have been translated into English: *Portraits of Celebrated Women* (Boston, 1868); *English Portraits* (1875). He also wrote a novel, *Volupté* (1834; 9th ed. 1877), and the collections of poems *Poésies et Pensées de Josephe Delorme* (1829); *Consolations* (1830); and *Pensées d'août* (1837). There are biographies of Sainte-Beuve by Haussonville (1875), Vattier (2d ed. 1892), and others.

Sainte-Claire Deville, HENRI ÉTIENNE: chemist; b. at St. Thomas, West Indies, Mar. 11, 1818; was educated at the Collège Rollin, Paris; was appointed dean of the faculty of science in Besançon 1844; in 1851 obtained the chair of Chemistry in the Normal School, Paris, and shortly afterward the similar post in the Sorbonne. D. in Paris, July 1, 1881. In 1850 he discovered anhydrous nitric acid; in 1855 he succeeded in making in mass aluminium, which before had been obtained only in globules; and with Debray he studied the six platinum metals. Along with Troost he experimented on the artificial production of minerals, and produced in this way the sapphire, ruby, and emerald. These and many other investigations were published in the *Comptes Rendus* and the *Annales de Chimie et de Physique*. His principal contribution to theoretical chemistry was his explanation of the phenomena of dissociation, of which he gave a complete account in a lecture delivered before the Chemical Society of Paris in 1866. He published *De l'Aluminium* (Paris, 1859) and *Métallurgie du Platine* (2 vols., Paris, 1863). R. A. ROBERTS.

St. Edmundsbury: See BURY ST. EDMUNDS.

Ste. Genevieve: city; capital of Ste. Genevieve co., Mo.; on the Mississippi river; 50 miles S. of St. Louis (for location, see map of Missouri, ref. 5–J). It is in an agricultural and stock-raising region, has mines of copper and quarries of sandstone in its vicinity, and is also largely interested in fruit-growing and wine-making. Pop. (1880) 1,422; (1890) 1,586; (1900) 1,707.

St. Elias, Mount: in Alaska; in lat. 60° 17′ 35·1″ and lon. 140° 55′ 47·3″. It has an elevation of 18,100 feet, as determined by the U. S. Coast and Geodetic Survey. It is not a volcanic mountain, as has been frequently stated, but the upturned border of a block of the earth's crust bounded by faults. It is covered with ice and snow from base to summit, and surrounded on all sides by glaciers. The timber-line has an elevation of 2,000 to 2,500 feet on the foot-hills at its southern base, but on the mountain itself there are no trees, and but slight traces of vegetation even at its base. Although its southern slope is exceedingly precipitous and avalanche-swept, the northern side is accessible and not too steep for mountaineers

to ascend. In 1891 an elevation of 14,500 feet was reached on its northern slope. Consult *Report on Second Expedition to Mt. St. Elias* in *Thirteenth Ann. Rep. U. S. Geol. Surv.* ISRAEL C. RUSSELL.

Ste.-Marguerite: See LÉRINS, THE.

Ste.-Marie: town of Beauce County, Quebec, Canada: on the river Chaudière: 30 miles S. of Quebec (see map of Quebec, ref. 4–D). It lies in a fertile region, has a fine Roman Catholic college, a spacious convent, a good trade, a large number of mills, and ores of copper and manganese. Pop. about 2,800.

Sainte-Maure: See BENOÎT DE SAINTE-MORE.

Saintes, sănt' (anc. *Mediolanum*): town; in the department of Charente-Inférieure, France; on the Charente; 28 miles by rail S. E. of Rochefort (see map of France, ref. 6–D). It has several interesting Roman remains, numerous breweries, distilleries, tanneries, and potteries, and an active trade in grain, hemp, leather, and wine. Pop. (1896) 20,285.

St.-Étienne, sănt'ā'ti-en': town; in the department of Loire, France; on the Furens, an affluent of the Loire; 36 miles by rail S. W. of Lyons (see map of France, ref. 6–G). It is situated in the center of rich coal-fields, from which over 3,000,000 tons are annually raised, and which have given to the city a most vigorous manufacturing impulse. It arose in an astonishingly short time; it had 49,614 inhabitants in 1851, and 136,030 in 1896. Its principal branches of manufacture are ribbons and firearms; looms, some of which (1895) are driven by electricity, employing about 40,000 persons are in operation, and produce ribbons to the value of nearly $19,000,000 annually, which are sent all over the world, and are unsurpassed in beauty of design and colors; 20,000 persons are employed in the ironworks, and produce, besides large quantities of cutlery, files, nails, etc., nearly all the rifles and revolvers for the army. The first railway in France, the Chemin de Fer de St.-Étienne à Lyon, was constructed to carry coal to Lyons.

St. Eusta'tius: an island of the Lesser Antilles, West Indies; crossed by lat. 17° 29′ N.; area, 7 sq. miles. It is little else than the summit of an extinct volcano, and has no running water. It now forms part of the Dutch colony of Curaçoa. Pop. (1892) 1,633. H. H. S.

Saint-Évremond: See ÉVREMOND.

St. Francis River: one of the six great tributaries of the St. Lawrence. It rises in Lake St. Francis, in Beauce County, Quebec, flows first in a southwesterly direction till it reaches Lennoxville, when it flows northwesterly and falls into the St. Lawrence at Lake St. Peter after a course of 120 miles. It is the principal river of the Eastern Townships. The tributaries are the Salmon, the Coaticook, the Massawippi, which drains the beautiful lake of the same name, and the Magog, which drains the magnificently picturesque Lake Memphremagog. The river runs through a fertile and well-cultivated territory, diversified with highlands and tracts of woodland. The towns and villages upon the river's banks are Angus, with its large paper-mill; Lennoxville, with its university; Sherbrooke, with its extensive manufactures; Windsor Mills, with its lumber and paper trade; Richmond, an important railway center; and Drummondville, the center of a rich farming district. Its course is frequently interrupted by shallows and rapids, and destructive floods are often caused by the blocking of the ice on or near these in early spring. The scenery amid which the river flows resembles in many places the character of an English landscape, more particularly in the vicinity of Richmond and Sherbrooke. J. M. HARPER.

St. Francis River: a tributary of the Mississippi, forming part of the boundary between Missouri and Arkansas. It rises in the Iron Mountain district of Southwest Missouri, and flows S. W. 450 miles, entering the Mississippi near Helena, Ark.; is navigable 150 miles, passes through a continuous swamp after entering Arkansas, and spreads into numerous lakes, one of which, 50 miles long by 20 wide, is supposed to have been produced by a sinking of the soil at the time of the great earthquake of 1811. It serves as an important backwater in overflows of the Mississippi river.
Revised by M. W. HARRINGTON.

St. Francis Xavier (zăv'i-*er*). **College of**: an institution of learning in New York, founded by the fathers of the Society of Jesus in Oct., 1847, and endowed with full collegiate powers by the regents of the University of the State of New York in Jan., 1861. The college buildings are located on Fifteenth Street, W. of Fifth Avenue, with a frontage of 275 feet and a depth of 200, extending to Sixteenth Street. The library contains 25,000 volumes. The regular course preparatory to the degree of Bachelor of Arts embraces the study of logic, metaphysics, and theodicy; English, Latin, and Greek; rhetoric, poetry, and elocution; mathematics and the natural sciences; history, geology; and mythology. The degree of Master of Arts is given to graduates who enter the post-graduate class, pass two examinations in ethics and sociology, and write three creditable dissertations on the subject-matter of the year. The president of the college is Rev. Thomas E. Murphy, of the Society of Jesus, and the teaching staff includes twenty members of the same society. The students number over 900: 200 in the post-graduate course, 150 in the collegiate, 400 in the grammar department, and nearly 200 in the preparatory department.
EDW. P. SPILLANE, S. J.

St.-Gall: canton of Switzerland; bounded E. by the Rhine and N. by the Lake of Constance. Area, 779 sq. miles. The surface exhibits a thoroughly alpine character—mountains covered with forests, pastures, and snow and ice, and valleys studded with vineyards, orchards, and grainfields. Agriculture, dairy-farming, and wine-making are the principal branches of industry. Pop. (June, 1894) 241,055, of whom more than half are Roman Catholics and the rest mostly Protestants.

St.-Gall: capital of the canton of St.-Gall, Switzerland; on the Steinach, in a valley at an elevation of 2,152 feet (see map of Switzerland, ref. 3–I). It was formerly fortified, but its walls and ramparts have been transformed into promenades. The town has a fine cathedral, many good educational institutions, two large public libraries, and extensive manufactures of woolen, linen, and cotton fabrics, especially fine muslins and printed calicoes. Pop. (1897) 34,025.

St. Gall: a saint of the Roman Catholic Church; a native of Ireland, and a pupil of St. Columban; originally named Cellach or Caillech; b. in 554; followed St. Columban to Switzerland in 590, and became the apostle of the Suevi and the Alemanni. In 614 he built his cell in a dense forest on the Steinach, in Switzerland, where now stands the flourishing city of St. Gall, and gathered around him a number of hermits, who lived together according to the rule of St. Columban. D. at Arbon, 15 miles S. E. of Constance, Oct. 16, 627. From this beginning gradually developed the famous monastery of St. Gall, one of the principal centers of learning during the Middle Ages. Abbot Otmar, 720–759, substituted the milder rule of St. Benedict for that of St. Columban, built a church, founded a hospital, organized a school, etc. Under Gozbert, 816–837, the monastery was made a free royal abbey, with right to elect its own abbot, and exempted from any episcopal control. Under Solomon III., 891–920, the institution reached the culminating point of its prosperity. The monks of St. Gall were celebrated not only for their learning, but also for their skill in music, in copying and ornamenting manuscripts, etc. The first check it suffered was the revolt of the city of St. Gall in 1415. The abbot was compelled to recognize its freedom and independence. After the Reformation it gradually fell into decay, but it retained its enormous revenues until the Revolution. It was secularized in 1798; its estates were confiscated, and its territory was formed into a bishopric. See Ildephons von Arx, *Geschichte des Kantons St. Gallen* (3 vols., St. Gall, 1810–13); Franz Weidmann, *Geschichte der Stiftsbibliothek St. Gallens* (1841); C. J. Greith, *Der heilige Gallus* (1865); and the edition by R. Shuli of Wahlafrid's original life of St. Gall (1890). Revised by S. M. JACKSON.

St. George: one of the PRIBILOF ISLANDS (*q. v.*) in Bering Sea. It is triangular, 30 miles around, with an area of 27 sq. miles. It is the highest of the group, reaching an elevation of 920 feet. M. W. H.

St. George, Cape: See CAPE ST. GEORGE.

St. George's: See BERMUDA ISLANDS.

St. George's: capital of the island of Grenada and of the British colony of the Windward islands, West Indies; on a bay near the south end of the island (see map of West Indies, ref. 9–M). The harbor is one of the best in the West Indies; the town, built in part on hills, is very picturesque; it has a considerable trade with the other islands and with Europe and the U. S. Pop. about 6,000. H. H. S.

St. George's Channel: a body of water connecting the Irish Sea with the Atlantic and separating Ireland from Wales. It is 100 miles long and 65 miles broad.

St.-Germain, or **St.-Germain-en-Laye**, săn'zhăr-măn'-ăăn-lā': town; in the department of Seine-et-Oise, France; on the left bank of the Seine; 8 miles W. of Paris (see map of France, ref. 3–F). The magnificent palace is used for barracks. Pop. (1896) 16,489.

St. Gotthard, Fr. pron. săn'gō'taar': central mountain mass of the Alps between the Swiss cantons of Uri and Ticino; the watershed of the rivers Rhine, Rhône, and Ticino. It is a ridge about 20 miles long, convex to the N., with a dozen peaks more than 8,750 feet in height, and culminating in Pizzo Rotondo, 10,490 feet high. It is best known from the St. Gotthard Pass, elevation 6,936 feet, between the head-waters of the Reuss, an affluent of the Rhine through the Lake of Luzern and the Aar, and of the Ticino, an affluent of the Po through Lake Maggiore. This pass has been traversed for many centuries, and until the St. Bernard, Simplon, and Splügen were made passable for vehicles, it was the chief route between the northern and southern slopes of the Alps. In 1872 a railway tunnel under the pass was begun, and in 1881 the first locomotive passed through. The tunnel is a little more than 9 miles long, 26 feet broad, 21⅓ feet high, and reaches an elevation of 3,786 feet at its culminating point, or 3,150 feet below the surface. The tunnel and its approaches formed the most important engineering work produced up to that time, and it permits of a ready and direct passage from Bavaria to Lombardy. The pass is of strategic importance and is fortified. MARK W. HARRINGTON.

St. Helena: a British island in the South Atlantic Ocean; lat. 15° 55′ S. and lon. 5° 44′ W. (for map, see map of Africa). It is 10½ miles long and 6½ broad, inclosing an area of 47 sq. miles. Pop. (1891) 4,116. St. Helena was discovered by Juan de Nova Castella, the Portuguese navigator, on May 21, 1501 (St. Helena's Day), but continued unknown to other nations until 1588, when it was observed by Capt. Cavendish. It remained uninhabited until the Dutch took possession of it. In 1673 it was taken from the Dutch by England, but soon after the East India Company was granted a charter by Charles II. for its possession. In 1834 it passed into the hands of the crown. The only good inlet is St. James's Bay, on the N. W. of the island, possessing a good harbor, where the chief town (Jamestown) is built. Though 700 miles from the nearest land, Isle of Ascension, and 1,140 miles from the nearest point of the African continent, it is one of the best known islands of the world, as being the place of exile and death of Napoleon Bonaparte. See NAPOLEON I.

St. Helena: town; Napa co., Cal.; on the S. Pac. Railroad; 8 miles S. of Calistoga; 60 miles N. of San Francisco (for location, see map of California, ref. 6–B). It is in a mountain valley noted for the extent and richness of its vineyards, and is principally engaged in grape-growing and wine-making. There are machine-shops, soda-works, foundry, a national bank with capital of $50,000, two State banks with combined capital of $110,000, and a weekly newspaper. Pop. (1880) 1,339; (1890) 1,705; (1900) 1,582.

St. Helens: town; in Lancashire, England; 12 miles E. N. E. of Liverpool (see map of England, ref. 7–F). Owing to the neighborhood of collieries and traffic facilities St. Helens has rapidly developed into a great center of industry. It is the principal seat in England of the manufacture of different kinds of glass, and has extensive alkali, copper-smelting, and iron works. A town-hall with a public library was opened in 1876. Since 1885 St. Helens has returned one member to Parliament. Pop. (1901) 84,410.

St. Helier: capital of the island of Jersey, on its southern coast, on the east side of St. Aubin Bay (see map of France, ref. 3–C). It has a good harbor, is fortified and defended by two citadels, and carries on an extensive trade. Pop. (1891) 29,133.

Saint-Hilaire, GEOFFROY: See GEOFFROY SAINT-HILAIRE.

Saint-Hilaire, JULES: See BARTHÉLEMY SAINT-HILAIRE.

Saint-Hilaire, săn'tēē'lār', MARCO, de: the pseudonym of Émile Marc Hilaire; b. about 1790; was educated as a page at the court of Napoleon I., but, left without any employment after the Restoration, took up literature merely as a means of living, writing biographies of the Duke of Berri and the courtesans of the Palais Royal, and commenced after 1830 to publish his books on Napoleon I., which were exceedingly popular: *Mémoires d'un Page de la Cour impériale* (2 vols., 1830); *Les Petits Appartements de Tuileries, de Saint-Cloud et de la Malmaison* (2 vols., 1831); *Souvenirs de la Vie privée de Napoléon* (2 vols., 1838); *Souvenirs intimes du Temps de l'Empire* (6 vols., 1838–40), and many more, none of which has any historical value. One of his later works was the *Histoire de Napoléon III.* (1853).

St.-Honoré-les-Bains, săn'tō'nō'rā'lā-băn': health resort, with thermal springs, in the department of Nièvre, France: 6 miles S. E. of Moulins-Engilbert, about 150 S. S. E. of Paris, and 5 from the nearest railway station (Vandemesse-Saint-Honoré). The thermal establishment utilizes five springs of waters with sodium sulphate in solution, having temperatures from 80° to 88° F. Roman remains have been found in considerable abundance, proving that this is the ancient *Aquæ Nisinæi*. Pop. about 1,700. M. W. H.

St. Hyacinthe: city; capital of St. Hyacinthe County, Quebec, Canada; on Grand Trunk Railway and the navigable Yamaska and Black rivers; 35 miles E. N. E. of Montreal (see map of Quebec, ref. 5–B). It contains a Roman Catholic college and seminary, three convents, a hospital, an academy, four large bridges, and numerous manufactories. Among the fine buildings are the bishop's palace, city-hall, and market. There is an active trade by rail and some by steamer. Pop. (1891) 7,016, nearly all French Canadians.

St. Ignace: the largest of the islands in the extreme north of Lake Superior, separating Nipigon Bay from the body of the lake; belongs to Ontario; area about 530 sq. miles; pop. about 200. It is separated from Black Bay Peninsula by a long passage less than a mile broad, but from 20 to 30 fathoms deep. Its highest elevation reaches an altitude of 1,440 feet, and is of basalt. M. W. H.

St. Ignace: city; capital of Mackinac co., Mich.; on the straits of Mackinac, and the Duluth, S. Shore and Atlantic Railway; opposite Mackinaw City, 45 miles N. of Petosky (for location, see map of Michigan, ref. 2–I). It is in an iron-mining and lumber region, has a beautiful harbor, and is a terminal port for several lines of steamers and a port of call for others. Six miles distant is the national park of Mackinac Island, a popular summer resort. The city contains four churches, of which the Church of St. Ignatius, founded by Jacques Marquette, is the oldest in Northern Michigan. It contains a famous old painting, *St. Ignatius Renouncing the World*. There are 3 graded union schools, a Roman Catholic academy, a national bank with capital of $50,000, and 2 weekly newspapers. The principal industries are those connected with iron mining and manufacturing and with lumbering. St. Ignace was the seat of an early Jesuit mission, which was the rendezvous of many exploring expeditions. Pop. (1880) 934; (1890) 2,704; (1900) 2,271.

St. Ignatius College: See the Appendix.

Saintin, săn'tăn', JULES ÉMILE: genre and portrait painter; b. at Lemé, Aisne, France, Apr. 14, 1829; pupil of Drölling, Picot, and Leboucher; medals, Salons, 1866 and 1870; chevalier of the Legion of Honor 1877; third-class medal, Paris Exposition, 1889. D. in Paris, July 14, 1894. He passed several years in the U. S., and painted, among other portraits, that of Stephen A. Douglas (1860). Two of his best-known works are *The Pony Express* (1863) and *Abandoned* (1880). He painted the portrait of Madame Carnot, wife of the president of the French republic, in 1891. His work is academic in style and without distinguishing qualities of color or drawing. W. A. C.

Saintine, săn'teen': the pseudonym of JOSEPH XAVIER BONIFACE, b. in Paris, France, July 10, 1798. He published a volume of poems, several novels, and (alone or in connection with Scribe, Duvert, Masson, and others) about 200 plays. He is best known for the sketch *Picciola*, which ran through forty editions, was translated into all European languages, and received the Montyon prize from the Academy. D. in Paris, Jan. 21, 1865.

St. Ives: town; in the county of Cornwall, England; on St. Ives Bay; 8 miles N. N. E. of Penzance (see map of England, ref. 15–B). It has a harbor, a pier, and a breakwater, and is the chief seat of the Cornwall pilchard-fishery. It is a favorite watering-place. Pop. (1891) 6,094.

St. Ives: town; in Huntingdonshire, England; on the Ouse; 5 miles E. of Huntingdon (see map of England, ref. 10–J). It has a parish church dating from the fifteenth century, and a six-arch stone bridge, built by the abbots of Ramsey, with an old chapel in the middle. Pop. (1891) 3,037.

St.-Jean d'Acre: See ACRE.

St. Jérôme, săn'zhā'rōm': town of Terrebonne County, Quebec, Canada; on the Rivière du Nord, and a branch of the Canadian Pacific Railway; 34 miles N. W. of Montreal

(see map of Quebec, ref. 5–A). It has a very fine water-power in the rapids of the river, which descend 300 feet in 3½ miles. The power is used for flour-mills, sawmills, and other factories. In the vicinity are mines of iron and plumbago. The climate is celebrated for its salubrity. Pop. (1891) 2,032, mostly French-Canadian. M. W. H.

St. John, West Indies: See ST. THOMAS.

St. John: the capital of Antigua, West Indies, and the seat of several military and civil authorities (see map of West Indies, ref. 6–L). It is beautifully situated and has a good and fortified harbor, which, however, is not accessible for large vessels. The town is generally well built, especially on the hills surrounding the port. It sometimes suffers greatly from lack of water, and it was seriously injured by the earthquake of Feb. 8, 1843. Pop. (1891) 9,738.
Revised by M. W. HARRINGTON.

St. John: city, seaport, and shiretown of St. John County, province of New Brunswick, Canada; on the St. John river at its entrance into the Bay of Fundy, and the Canadian Pacific, the Intercolonial and the Shore Line railways; 277 miles N. W. of Halifax, 481 miles E. of Montreal (for location, see map of Quebec, ref. 6–H). It has one of the finest harbors on the Atlantic coast, protected by a breakwater 2,250 feet long, and always free from ice. Partridge island, at its entrance, contains a fine lighthouse and a quarantine hospital. St. John river enters the harbor through a rocky gorge about 100 yards wide, and has a fall of 17 feet at low tide; but as the tides in the harbor rise from 25 to 35 feet, the waters of the river and harbor are at the same height twice daily, and then permit the safe passage of vessels either way. Including Carleton on the W. and the former city of Portland (annexed in 1889) on the N., the city has an area of about 6,000 acres, one-quarter of which is built up. It is laid out regularly with broad streets running N. and S. and E. and W., some of them hewn through 30 feet of solid rock, the principal ones laid with block pavement, the sidewalks generally being of asphalt. Water is supplied by gravitation from Little river, 5 miles distant. The plant is owned by the city, and in 1893 had cost $1,327,421. The city has a thorough system of sewerage and gas and electric-light plants.

Public Buildings.—Among the notable buildings are the custom-house, post-office, city building, General Public Hospital, Provincial Lunatic Asylum, Protestant and Roman Catholic orphan asylums, Home for Aged Females, Sailors' Home, Wiggin's Orphan Asylum for sons of seamen, Reformatory for Boys, Free Public Library, Mechanics' Institute, Masonic and Odd Fellows' halls, Dominion Savings-bank, and the railway station.

Churches, Schools, etc.—St. John contains 35 churches and 81 schools. The finest church buildings are the Roman Catholic Cathedral, and the Centenary Methodist, Trinity Episcopal, St. Andrew's Presbyterian, and the Germain Street Baptist churches. The school system is public and non-sectarian, and is ably maintained. The Victoria, Centennial, and Albert schools, the Mt. Pleasant Convent School (Roman Catholic), the Davenport School for Boys (Church of England), and the Madras School are of high grade. A reference library is maintained by the St. John Law Society, and there are 5 daily, 7 weekly, and 2 monthly periodicals.

Transportation.—The gorge is spanned by a suspension bridge for vehicles, and by a steel cantilever bridge (opened in 1885) for railways. The Intercolonial Railway connects the city with all parts N. and E.; the Canadian Pacific with all parts W., including the valley of the St. John; and the Shore Line with St. Stephen and Calais. There is regular steamship connection with Prince Edward Island, Nova Scotia, Boston, the West Indies, and European ports. A system of electric street-railway connects all parts of the city.

Business Interests.—The city has excellent facilities for manufacturing. Ship-building, once a great industry, has almost ceased since the introduction of iron and steel in the construction of vessels. The chief industries are the manufacture of lumber, cotton goods, rolled iron, nails, nuts and bolts, engines and boilers, furniture, lead pipe, paint, carriages, and sashes and doors. The exports in the fiscal year 1892–93 were valued at $3,943,867; the imports, $3,596,969. The seagoing tonnage entered in 1893–94 was inward, 513,296 tons; outward, 510,359; coastwise, inward, 270,552; outward, 287,429. Banking facilities are afforded by the banks of New Brunswick, Nova Scotia, Halifax, Montreal, and British North America, and there is a Dominion bank for savings.

Government and Finance.—The city is divided into thirteen wards, and is governed by a mayor with a board of fifteen aldermen, all elected by the city at large. The city and county return three members to the Dominion House of Commons and six members to the Provincial House of Assembly. In 1893 the revenue from taxes was $335,203, from other sources $201,117; assessed value of real and personal property, $24,256,700; debt, $3,592,007; assets, $4,051,804.

History.—The site was visited by de Monts in 1604; was occupied by the French as a fort under Charles de la Tour in 1635; passed under British rule in 1713 by the treaty of Utrecht; was settled by American loyalists, principally from New England, in 1783; and was incorporated by royal charter as a city in 1785. Pop. (1881) 26,127; (1891) 39,179.
ALFRED A. STOCKTON.

St. John, sin′jŭn or sānt-jon′, HENRY: See BOLINGBROKE.

St. John, JAMES AUGUSTUS: Orientalist and miscellaneous author; b. in Caermarthenshire, Wales, Sept. 24, 1801; acquired a good knowledge of languages, ancient and modern, including Arabic and Persian; was at an early age engaged as sub-editor of *The Oriental Herald*; started the London *Weekly Review* 1827; settled in Normandy 1829; traveled in Norway the same year; visited Egypt and Nubia, ascending the Nile to the second cataract; made several discoveries in physical geography and archæology, including that of the site of the tomb of Osiris on the Sacred Isle; explored Lake Moeris; followed the (supposed) track of the Israelites through the Desert of Sinai; gave an account of this journey in his *Egypt and Mohammed Ali* (1834), *Description of Egypt and Nubia* (1844), and *Isis, an Egyptian Pilgrimage* (1853); wrote at Chantilly, France, *The Hellenes, or the Manners and Customs of Ancient Greece* (3 vols., 1842), in which he was assisted by his son Bayle; published *The Nemesis of Power* (1854); the *History of the Four Conquests of England* (2 vols., 1862); a *Life of Sir Walter Raleigh* (2 vols., 1868); several novels; two religious treatises, *Philosophy at the Foot of the Cross* (1854) and *The Preaching of Christ, its Nature and Consequences* (1855); a biography of *Louis Napoleon, Emperor of the French* (1857); and a treatise on *The Education of the People* (1858). D. Sept. 22, 1875.

St. John, sānt-jon′, JOHN PIERCE: Governor of Kansas; b. at Brockville, Franklin co., Ind., Feb. 26, 1833; went to California in 1853; made voyages to South America, Mexico, and the Sandwich islands; removed to Charleston, Ill., in 1860 to study law; fought in the civil war, and was made colonel; settled in Kansas as a lawyer; was elected Governor of that State in 1878, and re-elected in 1880; was the candidate of the Prohibition party for President of the U. S. in 1884.

St. John, sin′jŭn, PERCY BOLINGBROKE: author; eldest son of James A. St. John; b. at Plymouth, England, Mar. 4, 1821; accompanied his father in his Eastern travels while a boy, and early devoted himself to literature; made a tour through the U. S., Texas, and Mexico about 1840; became Paris correspondent of *The North British Daily Mail* 1847; wrote the *Book of the War* (1853), for which he received the thanks of the Greek Parliament; wrote many novels and was a contributor to many magazines and literary periodicals. Among his best-known books are *The Young Naturalist's Book of Birds* (1844); *Three Days of the French Revolution* (1848); *Arctic Crusoe* (1854); *Quadroona* (1861); *The Creole Bride* (1864); *The Snow Ship* (1865); *Good as Gold* (1870); *The North Pole* (1875); and *A Daughter of the Sea* (1884). D. Mar., 1889. Revised by H. A. BEERS.

St. John, Sir SPENSER: diplomatist and Orientalist; son of James A. St. John; b. in London, Dec. 22, 1826; devoted himself to Oriental literature; became proficient in the Malay language; was appointed secretary to Sir James Brooke, rajah of Sarawak (Borneo), in 1848; was secretary to Brooke's mission to Siam 1850; was acting British commissioner and consul-general in Borneo 1851–55; was full consul-general 1855–62; published *Life in the Forests of the Far East, comprising Explorations of the Interior of Borneo, Sarawak, etc., with Illustrations* (2 vols., 1862); went to Haiti as *chargé d'affaires* 1863, and visited Spain in 1866 with his father, whom he assisted at Simancas in researches preparatory to the publication of the latter's *Life of Sir Walter Raleigh*. He was appointed minister resident to Peru in 1881, and minister plenipotentiary to Mexico in 1884. He was the author of *The Life of Sir James Brooke* (1879) and *Hayti, or the Black Republic* (1884). Revised by H. A. BEERS.

St. John (sānt-jon'), **Lake**: a large circular body of water lying about 200 miles N. of the city of Quebec, and forming the source of the river Saguenay. It is 28 miles long and 25 broad, and receives the waters of several large and navigable streams, namely, the Peribonca (the curious river), which is said to be over 400 miles long; the Mistassini (river of the big rock), 300 miles long; and the Ashuapmouchouan (river for moose-hunting), sometimes called the continuation of the Saguenay, over 250 miles long. Besides these there are the Metabetchouan with its falls of 236 feet in height at its mouth, and the Ouiatchouan, having its source near the head-waters of the St. Maurice. The lake lies in the center of a fertile plain of 31,000 sq. miles, which has been connected by the Lake St. John Railway with the city of Quebec. The principal settlements are along the shore of the lake, including Roberval, St. Jérôme, Hebertville, St. Gédéon, and Jonquière. The chief trade of the district is in lumber, firewood, and farm produce. Over twenty townships have been surveyed, and over 6,000 settlers have taken up their abode in them. The whole district abounds in game, while the lake and its streams teem with fish, including the ouananiche or lake-salmon. For the accommodation of settlers and sportsmen the Government has placed a small steamboat to run between Roberval and the river inlets or bays. J. M. Harper.

St. John of Jerusalem, Knights of the Order of, also known as **Knights Hospitallers**: a military and religious order that originated at the close of the eleventh century. Early in the eleventh century some merchants from Amalfi founded a hospital and hostelry for pilgrims in Jerusalem, and a confraternity of pilgrims took charge of the establishment, which subsequently increased much and was largely endowed. During the siege and capture of Jerusalem by the crusaders in 1099 this confraternity, under the direction of Pierre Gérard, excited general admiration by the heroism with which it administered help to all who suffered. Godfrey of Bouillon gave it a large endowment, and several knights joined it as Hospitallers. The confraternity was then organized as a monastic order with philanthropic purposes, Pope Paschal II. having formally sanctioned its establishment in 1113, and the members assumed the black Augustinian garment with a white cross. After Gérard's death in 1118, Raymond du Puy succeeded as provost of the order, and he immediately undertook a reorganization of the whole institution on a military basis, adding the defense of Christianity and war against the infidels as the new and the principal purpose of the order. Many celebrated knights joined it, great endowments were conferred on it from all Christian countries, brilliant exploits were achieved by it, and in a short time it rose to be one of the richest and most famous of the Christian orders. Soon it also began to exhibit the same signs of greed, intrigue, jealousy, and dissipation which characterized the other orders, and its quarrels with the Templars caused much scandal. After the conquest of the Holy Land by the Saracens the knights removed in 1291 to Limasol in Cyprus, and thence in 1309 to Rhodes where they acted as the bulwark of Christendom against the Turks. In the meanwhile their revenues were increased from the confiscated estates of their former rivals, the Templars, whose order had been suppressed by Philip the Fair. In 1479, while d'Aubusson was grand master, they repelled Mohammed II., who besieged them in the city of Rhodes with a force far superior to their own. Nevertheless, in spite of many brilliant exploits, they were compelled to surrender Rhodes to Suleiman II. in 1522, and at the same time they lost many of their possessions in England, Germany, and the Scandinavian countries. In 1530 Charles V. gave them the island of Malta, and here Suleiman II. attacked them in 1565 with an immense force. Under the grand master La Vallette they offered a most heroic resistance, and, to the astonishment and enthusiasm of all Europe, they finally succeeded in repelling the Turks. Soon after, however, the order began to sink into insignificance—less, perhaps, on account of any faults of its own than because the advancing spirit of the times had no more use for such an institution. During the Revolution the knights lost their large possessions in France. In 1798, on his way to Egypt, Napoleon drove them from Malta, and the British, who conquered the island in 1800, refused to reinstate them. In vain the last grand master, Hompesch, resigned his dignity and transferred it to Paul, Emperor of Russia. The pope would not recognize a man belonging to the Greek Church as grand master, and appointed an obscure Italian to the dignity. The exertions of the members to revive the institution by the aid of the Congress of Vienna failed, and since 1798 the order has existed only nominally. See Taaffe, *History of the Order of Malta* (London, 1852); Porter, *History of the Knights of Malta of the Order of St. John of Jerusalem* (London, 1883); and Delaville Le Roulx, *Archives de l'Ordre de St. Jean de Jérusalem* (Paris, 1883). Revised by F. M. Colby.

St. John River: of Maine and New Brunswick; rises on the boundary of Maine and Quebec, near the head of the Penobscot. For nearly 40 miles it is the boundary between the U. S. and Canada. It then traverses for 112 miles the wilds of Northern Maine, and is known as the Walloostook or Main St. John. Some 150 miles below its origin it joins with the St. Francis, and changes its northeasterly to a more easterly course. Below the mouth of the St. Francis it is the north boundary of Maine for about 75 miles. Below this part of its course it is wholly in Canadian territory, shortly after entering which its Grand Falls occur, 225 miles above its mouth. The river here falls 75 feet perpendicularly. From its mouth at St. John, New Brunswick, it is navigable by large steamers for 80 miles to Fredericton, and at high water to Woodstock, 145 miles, and by small steamboats, at good stages of water, even as high as the Grand Falls, above which it is again navigable some 40 miles. At the mouth of its estuary a singular phenomenon occurs. The water, compressed into a narrow channel, falls at low tide some 12 feet in order to reach the harbor, but at high tide the fall is reversed, and the waters of the Bay of Fundy flow into the estuary. Vessels can consequently pass from the river to the harbor, or from the harbor to the river, only at the turn of the tide. The total length of the river is 550 miles. Its drainage area is 26,575 sq. miles. Its navigation was made free to U. S. citizens by the Ashburton Treaty.
Revised by Israel C. Russell.

St. John's: city; the port of America nearest to Europe; capital of the colony of Newfoundland; on the Avalon peninsula and the Atlantic Ocean; 540 miles N. E. of Halifax, 1,640 miles W. by S. of Valentia, Ireland; lat. 47° 33′ 29″ N., lon. 52° 45′ 10″ W. from Greenwich (see map of Canada, ref. 7–P). It has a spacious and secure harbor, with 90 feet of water in the channel, and is accessible for the largest vessels at all periods of the tide. The entrance is through an opening in the rock-bound coast called the Narrows, which is 600 feet wide at its narrowest part. On the north side of the Narrows is Signal Hill, 510 feet above sea-level, and opposite is South Side Hill, which rises abruptly to a height of nearly 700 feet, and has the Fort Amherst lighthouse at its base. At the head of the harbor is a dry dock, completed in 1884 at a cost of $600,000, which is 600 feet long, 132 feet in extreme breadth, and 26 feet deep. The city is built on the north side of the harbor, on a moderately steep incline. On the south side a narrow strip between the water and the precipitous hills is utilized for oil-factories and warehouses. Water is supplied from Windsor Lake, 4½ miles distant, and 400 feet above the highest part of the city, the works being constructed originally at a cost of $400,000. The city is lighted by gas and electricity. Prior to the disastrous fire of 1846 nearly all the buildings in the city were of wood, but after that the stores and buildings on Water Street, the principal business thoroughfare, were rebuilt with stone or brick, as well as many others farther back from the harbor. The colonial board of works, which had charge of all civil affairs, was superseded in 1888 by a municipal council, under which many needed improvements were made. After the great fire of 1892 the streets were laid out on a new plan, and the principal ones widened and provided with fire-breaks.

Public Buildings.—The most conspicuous object in the city is the Roman Catholic Cathedral, on the highest ground, which, with its surrounding church buildings, cost $800,000. The colonial buildings include the Government house, House of Parliament, custom-house, hospital, penitentiary, poor-house, market-house, court-house, lunatic asylum (4 miles beyond the city), and the savings-bank.

Churches and Schools.—There are 11 churches—4 Wesleyan, 3 Church of England, 2 Roman Catholic, a Presbyterian, and a Congregational. Besides the colonial schools there are St. Bonaventura College (Roman Catholic), several convents, and Church of England, Methodist, and Presbyterian colleges.

Banks.—The banks of circulation were formerly the Union Bank, established 1854, capital in 1893 $450,000, and the

Commercial Bank, established 1857, capital in 1893 $306,000. All Government business was transacted through these banks. On Dec. 10, 1894, both were forced to suspend, causing heavy losses to shareholders and others, and creating a serious financial crisis, during which several of the oldest and most extensive mercantile establishments failed. They have since gone into liquidation, and three Canadian banks have opened branches in St. John's. The savings-bank is a Government institution, the Government controlling all its expenditures and the general revenue of the colony being liable for all its deposits. On Dec. 31, 1893, the amount of deposits was $3,068,288.

Transportation.—The city is connected by rail with Harbour Grace, Placentia, etc. The Allan line of steamships call at St. John's on their outward and inward passages, carrying mails and passengers. The service is weekly during nine months of the year, and fortnightly during three. The city has also steamboat communication with the principal ports N. and S. Steamers of two lines, plying between Liverpool and Halifax and between New York, Halifax, and St. John's respectively, call at intervals of about ten days.

Business Interests.—The people are engaged principally in business connected with the fisheries, which form the staple industry of the colony. Seal-oil and seal-skins are exported mainly to Great Britain, and codfish to Great Britain, Spain, Portugal, Italy, Brazil, and the West Indies. On Jan. 1, 1892, there were registered at the port of St. John's 2,222 vessels, of 94,583 tons. The imports in the preceding year aggregated in value $6,869,458, and the exports $7,437,158. The export of codfish was 1,244,834 quintals, valued at $4,864,525. The number of sailing vessels clearing from St. John's for the seal-fisheries was once very large, but these have been superseded largely by steamers. There are several sawmills, machine-shops, iron-foundries, furniture-factories, breweries, tobacco-factories, tanneries, and boot and shoe, and rope, twine, and net factories.

History.—Since 1855, when a responsible Government was granted the colony, the progress of the city has been rapid and substantial. In 1846 the city was visited by a fire which destroyed three-fourths of the buildings, and on July 8, 1892, by another, which laid waste more than one-half of the city. Nearly 1,800 buildings of all kinds, many of them built of stone and brick, were destroyed, causing a total loss of about $16,000,000, and two-thirds of the large mercantile establishments, with their stores, perished in the flames. Eleven thousand people were left homeless. The portion of the business part of the city which had been destroyed was rebuilt on a larger scale, and much finer shops and offices than the old sprang up. Pop. (1891) 29,007. M. Harvey.

St. Johns: *chef-lieu* of St. Johns County, Quebec; on the west bank of the Richelieu, and on the Grand Trunk, Canadian Pacific, and Vermont Central railways; 27 miles S. E. of Montreal (see map of Quebec, ref. 6–B). The principal manufacture is earthenware goods. There is also a silk-factory. The river trade includes exports of lumber and grain from the Lake Champlain district. The place is of some note in connection with the war of 1812, and near the barracks and military school there are still to be seen the remains of old fortifications. The river is spanned by three bridges, which connect Iberville with St. Johns. Pop. (1891) 4,722. J. M. Harper.

St. Johns: village; capital of Clinton co., Mich.; on the Detroit, Gr. Hav. and Mil. Railway; 22 miles N. of Lansing, 98 miles W. N. W. of Detroit (for location, see map of Michigan, ref. 7–I). It is in an agricultural region, and contains sawmills and grist-mills, foundry, carriage-shop, and one of the largest table-factories in the world. There are 2 State banks with a combined capital of $85,000, a national bank with capital of $100,000, a Ladies' Library Association, and 3 weekly newspapers. Pop. (1880) 2,370; (1890) 3,127; (1900) 3,388. Editor of "Clinton Republican."

St. Johnsbury: town; capital of Caledonia co., Vt.; on the Passumpsic river, and the Boston and Maine and the St. J. and Lake Champlain railways; 21 miles N. of Wells river, 34 miles E. N. E. of Montpelier (for location, see map of Vermont, ref. 4–D). It is noted for having the largest manufactory of scales and balances in the world, and contains also foundries, machine-shops, and agricultural-implement works. Among the notable institutions are the St. Johnsbury Academy, built and endowed at a cost of $200,000 by Thaddeus Fairbanks; the St. Johnsbury Athenæum, built and provided with a library of 10,000 volumes and an art gallery by Horace Fairbanks; and a museum of natural science. The town has 2 national banks with combined capital of $700,000, 2 savings-banks, and 2 weekly newspapers. Pop. (1880) 3,360; (1890) 3,857; (1900) 5,666.
Editor of "Caledonian."

St. John's College: an institution at Annapolis, Md. It originally existed as an institution of learning under the name of King William's School, which was founded in the year 1696, so that the continuity of its history would place it immediately after Harvard in regard to age. In 1784 the funds and library of the school were transferred to the infant college by special charter, and its name was changed to St. John's. It was formally opened Nov. 11, 1789. Among those who were active in promoting the welfare of the college in its infancy are to be found Rev. John Carroll, the first Roman Catholic archbishop of America, and the Rt. Rev. T. J. Claggett, Protestant Episcopal Bishop of Maryland. The college is non-sectarian, but receives a large share of its patronage from the Protestant Episcopal body. In Oct., 1900, there were about 160 students in attendance. The president is Thomas Fell, Ph. D., LL. D., and there are fifteen members in the faculty. The college receives annually from the State of Maryland about $15,000 for its support. It also has a small endowment. Thomas Fell.

St. John's Dance: a name given to the mediæval Dancing Mania (*q. v.*).

St. John's River: a stream which rises in the swamps of Brevard co., Fla., and after a course of nearly 400 miles reaches the Atlantic. It is regularly navigated by steamboats to Enterprise, 230 miles from its mouth, and small steamers have ascended some 60 miles above that point. It has but a slight fall and a very gentle current. Its banks are clad in rich half-tropical verdure, and for nearly two-thirds of its course it is nowhere less than a mile in breadth, and often expands into spacious lakes. Its lower course is nearly parallel with the coast and abont 20 miles from it. For nearly 100 miles from its mouth it forms a wide, sluggish sheet of water, more resembling a lagoon than a river, the distance from shore to shore in some places being fully 5 miles. It is fed by springs and by the sluggish overflow of swamps, and is but slightly influenced by freshets. After passing the bar at its mouth there is a depth of 14 or 15 feet to Jacksonville, 10 feet to Palatka, and 8 feet to Lake George. The minimum depth at mean low tide on the bar is 7 feet, with an average rise and fall of 5·4 feet.
Revised by Israel C. Russell.

St. John's University: an institution at Collegeville, Stearns co., Minn.; founded in 1857 by Very Rev. Demetrius Marogna, who was first president and died in 1869. It was chartered in 1857; empowered to confer university degrees in 1869; received from Leo XIII. in 1878 power to create doctors in theology, philosophy, and canon law; received title of university by act of Legislature 1883.
Revised by J. J. Keane.

St. Johnsville: village; Montgomery co., N. Y.; on the Mohawk river, the Erie Canal, and the N. Y. Cent. and Hud. River and the West Shore railways; 64 miles W. N. W. of Albany (for location, see map of New York, ref. 4–I). It is in an agricultural and dairying region, and contains manufactories of agricultural implements, paper, pianos, and woolen goods, a national bank with capital of $50,000, and a weekly newspaper. Pop. (1890) 1,263; (1900) 1,873.

St.-John's-wort Family: the *Hypericaceæ*, a small group of 240 species of choripetalous, dicotyledonous herbs, shrubs, and trees. The flowers are regular and hermaphrodite, with five sepals, five petals, many hypogynous polyadelphous stamens, and a one-celled many-ovuled ovary with from three to five carpels. The leaves are opposite and punctate-dotted. The forty species of North America, some of which are showy, belong mainly to the genus *Hypericum*. The common St.-John's-wort (*H. perforatum*) is a yellow-flowered perennial weed, naturalized in the U. S. from Europe, which is most difficult to eradicate from fields. C. E. B.

St. Joseph: island of the St. Mary's river, between Lake Huron and Lake Superior, belonging to Ontario and separated from the Canadian side by a narrow channel. It is about 45 miles long and half as broad, hilly, and fertile. It was early settled by French Canadians, and now contains a prosperous population of farmers and fishermen. There are three small towns, named St. Joseph, Hilton, and Pembroke, on the island. M. W. H.

St. Joseph: village; capital of Berrien co., Mich.; on Lake Michigan, at the mouth of the St. Joseph river, and on the

Chi. and W. Mich. and the Vandalia line railways; 2 miles S. W. of Benton Harbor, 22 miles N. N. W. of Niles (for location, see map of Michigan, ref. 8–G). It is in a rich fruit-growing region, especially for peaches; has a large trade in fruit and lumber; is noted as a summer resort; and has 2 State banks with combined capital of $50,000. several saw-mills and grist-mills, machine-shops, fruit-basket and package factory, a public-school library, and a daily and 2 weekly newspapers. Pop. (1880) 2,603; (1890) 3,733; (1900) 5,155.

EDITOR OF "PRESS."

St. Joseph: city; capital of Buchanan co., Mo.; on the Missouri river, and the Atch., Top. and Santa Fé, the Burlington Route, the Chi., Gt. West., the Chi., Rock Is. and Pac., the Mo. Pac., and the St. Jos. and Gr. Is. railways; 60 miles N. W. of Kansas City, 140 miles S. E. of Omaha (for location, see map of Missouri, ref. 2–D). It is the center of a fertile agricultural region, and is located on hilly ground that rises gradually from the river. The business portion is compactly built along the river front. The streets are laid out regularly, paved with brick, asphalt, and macadam, and lighted by electricity. There are 8 lines of electric street-railway, with 40 miles of track. The residence portion is on high ground, beautifully adorned, and many dwellings on the hills command fine views of the river. There are 5 public parks or squares, a large park given to the city by Henry Krug, where the city maintains greenhouses, and 4 smaller ones.

Public Buildings.—The city-hall and market-house is on a square donated by Joseph Robidoux in the original plat of the town; the county buildings are large and substantial; the U. S. Government building is a stone structure accommodating the post-office and customs departments; the Union Dépôt is of brick, and has hotel accommodations; an iron railway and wagon bridge across the river facilitates transportation; and the Free Public Library was established in 1890, contains 14,500 volumes, and has a yearly circulation of 105,000 volumes. There are 3 hospitals, one the property of the city; a Home for Little Wanderers, a Home for the Friendless, a Free Kindergarten for the children of the poor, and, within half a mile of the city, the Missouri State Insane Asylum No. 2.

Churches and Schools.—There are 75 churches, representing 25 denominations. The public-school system is liberally supported. There are 26 school-buildings, with a total enrollment of more than 28,000 pupils. The high school has a four years' term, and offers a choice of five different courses of study. There are 11 parochial and private schools, 2 medical colleges and 2 business colleges, and 6 daily and 8 weekly periodicals.

Business Interests.—In 1893 there were 181 manufacturing establishments, which employed 5,540 persons, paid $2,560,000 for wages, and had products valued at $14,150,000. The manufactories of men's shirts and overalls are said to be the largest in the U. S.; they employ from 2,500 to 3,000 persons. Other important manufactures are boots and shoes, harness, horse-collars, tinware, woolen goods, plows, pumps, stoves, and furniture. At the southern limits of the city are ample stockyard accommodations, with 1 packing-house for cattle and 3 for hogs. The receipts for the first 10 months of 1900 were: cattle, 338,061; hogs, 1,366,552. There are 5 flour-mills with a combined daily capacity of 1,750 barrels; elevator capacity, 400,000 bush. The grain shipments in 1893 were, corn, 11,787,700 bush.; wheat, 2,100,000 bush.; and oats, 570,500 bush. St. Joseph has a large jobbing trade, extending over the Western States and employing nearly 1,000 traveling salesmen.

Finances and Banking.—The total debt of the city in 1894 was $1,800,000, including $200,000 voted that year for the erection of a new high school and other public-school buildings; the assessed property valuation was $24,183,850, representing a cash valuation of nearly $60,000,000. There were in 1900 3 national banks with a capital of $350,000, 1 private and 5 State banks; the bank clearings for the first 9 months of 1900 were $160,420,120.89; and 6 building and loan associations with assets of more than $3,000,000.

History.—The city was founded by Joseph Robidoux, who for fifteen years was connected with the American Fur Company. In 1826 he left the company and established a trading-post here. He was the only white man in the region for many years. In 1834 what is known as the Platte purchase, including Buchanan County, was acquired by the Government from the Sac and Fox Indians, and opened for settlement. In 1837 several white families came to the Blacksnake Hills, as the site of St. Joseph was then called, and the building of the town began to take definite shape. In 1843 the original town was laid out and called St. Joseph; in 1846 it became the county-seat; in 1851 was made a city; and in 1885 a city of the second class, under a new charter. The growth from its founding until the outbreak of the civil war was large and steady. It was the principal outfitting point for parties crossing the plains in wagons for California before the building of the Pacific railways. It suffered severely, in common with all the border towns, during the war, but with peace came a new era of prosperity. There was a notable increase in population between 1880 and 1890, largely due to the efforts of the city board of trade, which has since been succeeded by the Commercial Club. Since the first plot was laid out by Mr. Robidoux there have been seventy-four additions thereto, and the corporation limits now include over 7 sq. miles and extend 2½ miles back from the river. Pop. (1880) 32,431; (1890) 52,324; (1900) 102,979.

Revised by J. M. WILLIS.

Saint-Just, săn′zhüst′, ANTOINE LOUIS LÉON, de: revolutionist; b. at Decize, department of Nièvre, France, Aug. 25, 1767; studied literature; published in 1789 a long poem, *Organt*; embraced the ideas of the Revolution with enthusiasm; wrote in 1791 *Esprit de la Révolution*; and entered the Convention in 1792 as a member for Aisne. As the firm supporter of Robespierre, he advocated the most extreme measures; became a member of the Committee of Public Safety, and was one of the most conspicuous leaders during the Reign of Terror. He became president of the Convention in Feb., 1794; brought Danton to the guillotine; attempted on the 9th Thermidor to defend Robespierre, but was arrested, and executed the next day, July 28, 1794. His *Œuvres politiques* were collected and published in 1834. His *Life* was written by Fleury in 1852 and by Hamel in 1859.

St. Kitts, or **St. Christopher**: an island of the British West Indies (Leeward islands colony); crossed by lat. 17° 18′ N. Area, 65 sq. miles. It is mountainous, though with no very high peaks; is fertile, well-watered, and has a salubrious climate. Nearly all the available land is planted with sugar-cane, and sugar and rum are the principal products and exports. Pop. (1891) 30,876. Capital, Basseterre. This town was devastated by a fire in 1807 and in 1880 by a flood from a mountain-stream, in which 200 persons perished. Dependencies of St. Kitts are the islands of Nevis, immediately S. E. of it (area, 50 sq. miles; pop. 13,087), and Anguilla, a little farther S. (area, 35 sq. miles; pop. 3,699). Their products are similar to those of the main island. H. H. S.

St. Lawrence Island: the northernmost great island belonging to the U. S.; in Bering Sea, just S. of Bering Strait, and nearer the Siberian than the Alaskan coast, extending E. and W., about 90 miles long by 30 broad. The coasts are generally low; in the northwest the hills reach a height of about 500 feet, and they are somewhat higher in the eastern part. The climate is arctic in character. There are no trees, though plenty of small shrubs; the bird fauna is rich. A few Eskimo live on the shores following the chase of the seal, walrus, and whale, and the trade with the mainland is in the products of these animals. Amber is sometimes found on the shores. The island was discovered by Bering in 1728, and fifty years after was taken to be two islands by Cook, who named them St. Lawrence and Clark.

MARK W. HARRINGTON.

St. Lawrence River and Gulf: The river St. Lawrence is the outlet of the Great Lakes of North America, and drains a total area of approximately 530,000 sq. miles, about two-thirds of which is in Canada and the remainder in the U. S. From the extreme head-waters of the St. Lawrence, W. of Lake Superior, to the mouth of its estuary, near Anticosti island, is about 2,200 miles. This vast drainage system is divided into three natural portions—(1) the lake-region, embracing the Great Lakes and the lands draining to them, above the outlet of Lake Ontario; (2) the river tract, from Lake Ontario to Quebec; (3) the estuary and gulf tract, from Quebec to the sea.

1. *The Lake-region.*—The principal lakes in this division are described in this cyclopædia under their respective names, and only such facts as pertain to them collectively are given here.

The combined water-surface of the Great Lakes and of their connecting rivers is 95,275 sq. miles; total land-area draining to the lakes, 174,800 sq. miles; total hydrographic basin above the outlet of Lake Ontario, 270,075 sq. miles.

The length of the shore-line of the Great Lakes and connecting rivers is 5,400 miles, or about equal to the Atlantic coast-line from Maine to the Isthmus of Panama. The discharge at the outlet of Lake Ontario is 300,000 cubic feet per second, or slightly less than half the estimated rainfall of the hydrographic basin, and nearly equal to one-half the discharge of the Mississippi. The total volume of the Great Lakes is estimated at 6,000 cubic miles, or sufficient to sustain Niagara Falls for 100 years. Evaporation from the surface of the Great Lakes is from 20 to 25 inches annually, and the average annual rainfall for the entire lake-region about 31 inches. For additional data, see *Chart of the Great Lakes*, by Charles Crosman (Milwaukee, Wis.); Report of U. S. Lake Survey, and Reports of the chief of engineers, U. S. army.

The geological history of the Great Lakes has not been fully studied, but the following conclusions are generally accepted: The basins which the lakes occupy are depressions principally in but slightly disturbed Palæozoic strata, due to erosion or the removal by mechanical and chemical agencies of the rock which once filled them. The last-formed rocks in the lake region, with the exception of the superficial deposits noticed below, belong to the Coal-measures, the youngest member of the Palæozoic. It is believed that between the close of the Palæozoic and the coming on of the Glacial period the region was a land-area in which streams excavated broad valleys similar to those which characterize the upper Mississippi region at the present day.

During the Glacial period the entire lake-region, in common with a vast surrounding area, was buried beneath ice which moved southward and greatly modified the previously formed topography. The changes in the relief of the region produced by the passage of glaciers over it, consist in part in the wearing down of prominences and the planing, grooving, and polishing of rock-surfaces. Still greater changes were made, however, by the deposition of ice-borne *débris*, consisting largely of bowlder-clay, a tenacious blue clay filled with angular and sub-rounded stones which are frequently striated, and bowlders, often 6 to 10 feet or more in diameter, that were carried southward and strewn over the country in great numbers. There are also vast deposits of gravel, sand, and clay that were washed from the ice by draining streams and deposited beneath the glaciers or about their retreating borders. In much of the lake-region this assorted material exceeds in volume the direct glacial deposits. Over vast areas the hard rocks which formed the surface before the Glacial period are buried from 100 to 200 feet deep by the deposits just referred to. The preglacial valleys were thus greatly obstructed, and on the melting of the ice new lines of drainage were initiated. Ancient river-valleys were thus dammed and lakes formed. In addition to the changes in the relief of the land thus produced, there were changes of level due to elevations and depressions affecting large areas which would have modified the drainage and converted the ancient river-valleys into basins had there been no obstructions produced by glacial deposits. The glaciers extended S. of the lake region to an irregular line passing through New Jersey, Pennsylvania, Ohio, etc., and the abundant streams produced by their melting had a free discharge southward so long as the slope of the land was favorable. When the southern margin of the glaciers retreated to the N. of the drainage divide running E. and W. through New York, Ohio, etc., the flow of the stream was obstructed by the northward slope of the land in front of the ice, and lakes were formed. This was the beginning of the Great Lakes. At first the lakes were small, and were retained at the N. by the glacial ice which still filled the northern part of the St. Lawrence basin. Their outlets were southward, through various channels, across the high lands which retained them. As the ice retreated the lakes expanded and became united one with another, and new and lower outlets were uncovered. Several of these ancient outlets have been discovered, and the courses of the draining streams traced. One outlet was at the south end of Lake Michigan, another at Fort Wayne to the W. of Lake Erie, and still another near Ithaca, N. Y. At a later stage the drainage was through the valley of the Mohawk. The beaches formed about these glacial lakes still remain, and have been traced in some instances for hundreds of miles. The highest of the ancient shore-lines about the southern and western borders of Lake Ontario, named the Iroquois beach, has an elevation at the W. of 116 feet, but increases in altitude toward the E., where it is 500 feet above the present lake. At the N. Lake Iroquois is supposed to have washed the foot of the retreating glaciers, and shore records are wanting. About the southern margin of Lake Erie the ancient shore-ridges are well defined, the highest having an elevation of 220 feet above the present lake. The Algonquin beach, to the E. of Lake Huron, has an elevation ranging from 618 to 875 feet above the sea, with other similar records both above and below it. The surface of Lake Huron is 582 feet above the sea, and at its southern end the Algonquin beach disappears beneath it. Around the northern shore of Lake Superior, from Duluth to Sault Ste. Marie, a series of beaches has been traced, the highest of which is about 600 feet above the lake surface. These records of abandoned shores were originally horizontal, and their present departure from that position is proof that movements of elevation or depression have taken place since the ancient lakes existed. The last chapter in the history of the drainage of the St. Lawrence basin began when the ice retreated to the N. of the present river-tract of the St. Lawrence, and the last and lowest outlet was established. The Great Lakes during their varied history spread sheets of sediment over their bottoms, in which bowlders were dropped from floating ice. These deposits are of broad extent, and are limited on their outer border by the ancient beaches. About Lake Superior the ancient lake-sediments are pinkish, finely laminated clays, and around the border of Lakes Erie and Ontario they are blue clays, covered in places by yellowish sands.

2. *The River-tract.*—The St. Lawrence river proper may be said to extend from the outlet of Lake Ontario to the island of Orleans below Quebec, a distance of 330 miles, where it becomes an estuary. Ocean steamers ascend to Montreal, 160 miles above Quebec, and the lowest rapids occur above that port; for these reasons the river-tract might be considered as ending where tide-water is reached, but the stream does not expand so as to have the characteristics of an estuary until after passing Quebec. Throughout this distance it is a surface-stream, for the reason that its clear waters have but little power to erode. It is obstructed by numerous islands and rapids, and at times expands into lakes several miles broad. There are no vertical falls. Steamers drawing less than 9 feet descend the rapids, but the return trip is made by a system of nine canals having a total length of 42 miles. The waters are pale blue, and carry 16 parts per 100,000 of mineral matter in solution, of which one-half is calcium carbonate (carbonate of lime). The volume of the river at its source, as already stated, is 300,000 cubic feet per second. Near Montreal it is joined by the Ottawa from the N. W., which adds about 90,000 cubic feet per second of clear, amber-tinted water. The Ottawa derives the most of its waters from areas of crystalline rock, and is much purer than the St. Lawrence; it carries but 6 parts in 100,000 of total solids in solution, of which about one-third is calcium carbonate. Before widening into an estuary, the St. Lawrence receives many other tributaries, the most important being the Richelieu, which drains Lake Champlain.

3. *The Estuary and Gulf Tract.*—Below Quebec the St. Lawrence loses its river-like character and becomes an estuary 250 miles long, which widens seaward until its shores are 35 miles apart; it then merges with a still greater estuary known as the Gulf of St. Lawrence. The estuary, together with a large part of the gulf, is really a submerged river-valley. There is unmistakable evidence in its physical features that a recent subsidence has taken place, which has allowed the sea to encroach on the lower course of the stream. This interesting fact is shown still more definitely by soundings that have been made. A submerged river-channel has thus been traced for 800 miles on the bottom of the estuary and gulf, to the submerged border of the continental plateau which lies about 100 miles beyond the present coast-line. The seaward position of the submerged river-valley is 3,600 feet below the present sea-level. When the St. Lawrence occupied its channel throughout and discharged at the true continental border, the land was elevated at least 3,600 feet higher than at present, and the rapid stream cut deeply into the rocks. Its tributaries were similarly affected, and were enabled to excavate deep cañons, as is shown by the Saguenay, which joins the St. Lawrence from the north in the central part of its estuary-tract. This remarkable river flows between precipitous rocky walls several hundred feet high, and has a depth of 840 feet. It is a river-channel modified slightly by glacial action, and is evidence that the land was high when it was excavated.

Observations show that after the Glacial period, but long before written history began, the valley of the St. Lawrence

was more deeply submerged than at present, and that the head of the estuary was then above Montreal. This great submergence is proven by clays and sands containing marine shells, which occupy the St. Lawrence and Champlain valleys up to an elevation of about 600 feet above the present level of the ocean. Ancient sea-beaches not yet fully studied confirm this conclusion.

The submergence of the lower portion of the St. Lawrence valley is not only an interesting phase of the history of the stream, but its effects on civilization and commerce are instructive. By reason of this submergence Montreal is now a seaport, and ocean vessels are enabled to reach a point which would be over 1,000 miles inland were the land elevated so that the river could occupy its former channel to the sea. ISRAEL C. RUSSELL.

St. Lawrence University: an academic and literary institution of the college grade, at Canton, N. Y.; founded in 1858. It comprised formerly three departments, but now consists of two, a college of letters, science, and arts, and a theological seminary maintained by the Universalist Church. The two departments are separate and independent in their government and funds, though under the direction of one board of trustees. On a conspicuous and beautiful site of 27 acres are four university buildings, besides gymnasium and society buildings. Both departments have been open to women and men on the same conditions from the beginning. A nearly equal number of women with men have been educated in the college, while not far from thirty women have studied in the seminary. The president of the college is (1901) the Rev. Almon Gunnison, D. D. Fourteen associate professors comprise the faculty. There are four resident and three non-resident professors in the seminary. There are in the college 130 students, and in the seminary 32. Tuition in the seminary is free. The college has invested funds to the amount of $350,000. The funds of the seminary amount to $154,041. The value of the buildings, grounds, libraries, etc., raises the total property of the university to a figure considerably in excess of $500,000. ISAAC M. ATWOOD.

St. Leonards, EDWARD BURTENSHAW SUGDEN, Baron: See SUGDEN, EDWARD BURTENSHAW.

St.-Lo, săn'lō': town of France, capital of the department of Manche: on the Vire; 158 miles W. by N. from Paris (see map of France, ref. 3–D). It has manufactures of druggets, flannels, serges, calicoes, and laces, several large printing establishments, and an active trade in cattle, horses, poultry, honey, wax, and butter. The Church of St. Croix was built in 805. Pop. (1896) 11,121.

St. Louis: capital of the French colony of Senegal, West Africa; on an island at the mouth of the river Senegal (see map of Africa, ref. 4–A). It is fortified, has a good harbor, and carries on an important trade; chief exports are fruits and grains, oils, gums, India-rubber, woods, and skins. The export of ivory, formerly important, is slight. Pop. 20,000.

St. Louis: city; Gratiot co., Mich.; on the Pine river, and the Detroit, Lans. and N. and the Toledo, Ann Arb. and N. Mich. railways; 8 miles N. of Ithaca, the county-seat, 33 miles W. of Saginaw (for location, see map of Michigan, ref. 6–I). It is in an agricultural region, has valuable water privileges, and contains several noted magnetic springs, a large sanitarium, sawmills, hoop-mills, flour-mills, and iron-works, 9 churches, 2 public-school buildings, commercial college, a national bank with capital of $50,000, a State bank with capital of $25,000, and a semi-weekly and 2 weekly newspapers. Pop. (1880) 1,975; (1890) 2,246; (1900) 1,989. EDITOR OF "REPUBLICAN LEADER."

St. Louis: city (separated from St. Louis County in 1876), port of entry, metropolis of Missouri; on the west bank of the Mississippi river, 20 miles below the mouth of the Missouri; ranking (1900) fourth city in the U. S. in population and manufactures (for location, see map of Missouri, ref. 4–J). It has an altitude of over 480 feet above sea-level; is built on rolling ground, rising at some points 200 feet above the level of the river; has a river-frontage of about 19 miles; and with annexed portions covers an area of 62½ sq. miles. Beyond the third terrace the surface spreads out in a picturesque plateau. The climate is temperate and healthful, and the mortality low. There are over 500 miles of streets, those in the business portion being paved with granite, while asphalt and telford are used in the residential parts. Local transit is facilitated by two systems of cable railway and by electric railways operating 465 miles of track. The water-supply is drawn from the Mississippi river, about 9 miles above the city, the inlet being but a short distance below the mouth of the Missouri; hence the water is essentially from the Missouri, and its great bulk is from the melting snow of the Rocky Mountains. The water is received in eight great settling basins, and is pumped thence into distributing reservoirs, the total capacity of the plant being 100,000,000 gal. daily.

Parks and Public Buildings.—St. Louis is noted for the number and beauty of its public parks, which have an aggregate area of 3,200 acres. The most prominent ones are Forest Park (1,374 acres); Tower Grove Park (267), containing bronze statues of Columbus, Humboldt, and Shakspeare; the Missouri Botanical Garden (50), containing an arboretum, fruticetum, herbaceous and floral gardens; labyrinth, museum, and botanical library; Carondelet Park (180); O'Fallon Park (160); Lafayette Park (30), containing a bronze replica of Houdon's Washington and a statue of Thomas H. Benton; and the Fair-grounds (83), with a race-course and large amphitheater. Tower Grove Park and the Missouri Botanical Garden adjoining were laid out and presented to the city by Henry Shaw. In the northern part of the city, and adjoining O'Fallon Park, are Bellefontaine (350 acres) and Calvary (415) cemeteries. Among the public buildings of note are the new city-hall, cost $2,000,000; the old court-house, now used by civil courts, built in the form of a Greek cross, with an iron dome 300 feet high in the center, cost $1,250,000; the Four Courts building, planned after the Louvre, and used for a prison, as police headquarters, and by the criminal courts; the exposition building, cost $500,000; State Insane Asylum, cost $900,000; U. S. Government building, cost $6,250,000; Chamber of Commerce, built of sandstone, in the Renaissance style, cost nearly $2,000,000; Emigrants' Home, Museum of Fine Arts, Mercantile Club, and the Public Education building.

Churches, Schools, etc.—The churches include a Roman Catholic Cathedral, Christ church (Protestant Episcopal), Grand Avenue Presbyterian church, Church of the Messiah (Unitarian), First Presbyterian, Pilgrim Congregational, and several synagogues, and number about 330. The public-school system originated in a grant of land within the district of St. Louis by Congress in 1812. In 1831 this grant was made effective by additional legislation; in 1833 the first public school-board was elected; and in 1846 the first public school was opened. In 1899 there were 78,684 pupils enrolled in the public schools; the income of the board was $2,089,478; expenditures were $1,958,752; and the value of school-buildings and land was $5,416,967. The system includes a central high school and a city normal school. Among the institutions for higher instruction are WASHINGTON UNIVERSITY (*q. v.*); St. Louis University (Roman Catholic, opened 1829); the College of the Christian Brothers (Roman Catholic, 1849); Concordia Theological Seminary (Lutheran, 1839); Theological Seminary of the German Evangelical Synod of North America (1850); St. Louis Medical School and Dental School; Beaumont Hospital Medical College (1886); Marion Sims College of Medicine; St. Louis College of Physicians and Surgeons (1879); Homœopathic Medical College of Missouri (1857); Missouri Dental College (1865); St. Louis College of Pharmacy (1866); St. Louis Training-school for Nurses (1884); the St. Louis Law School, and the St. Louis School of Fine Arts. The School of the Good Shepherd (Protestant Episcopal), Walther College (Lutheran), Academy of the Sacred Heart (Roman Catholic), Mary Institute, Hosmer Hall, Smith Academy, and the Manual Training-school (1880) are schools of high reputation. Among the institutions for dependents are a State School for the Blind, St. Louis Day School for Deaf Mutes, and a deaf-mute institute connected with the convent of Maria Consilia. In 1900 St. Louis had 28 libraries of 1,000 volumes and upward each. The Free Public Library has 120,000 volumes; Mercantile, 100,000; St. Louis University, 50,000; St. Louis Law School, 25,000; and the St. Louis Academy of Science, 20,000. In 1900 12 daily newspapers were published in the city, and the total number of journals and magazines, including dailies, was 333.

The *government* of St. Louis consists of a mayor elected for four years, a council of 13 members, a house of delegates of 28 representatives, one from each ward, and a board of public improvement, consisting of a president, a street commissioner, a water commissioner, a sewer commissioner, a park commissioner, and a harbor commissioner. The first three commissioners must be educated engineers. The bonded debt in 1900 was $18,916,278; assessed valuation of

real and personal property, $380,779,280; rate of taxation for municipal purposes, exclusive of the tax to pay interest on the bonded debt, limited to 1 per cent.; total tax within old limits of city (1900), $1.95 on $100. In 1900 there were 25 banks and trust companies in the city, which together had $42,285,538 capital and surplus, $156,054,512 deposits, and $173,361,043 in loans, currency, bonds, stocks, and real estate. The clearings of the year aggregated $1,688,849,494.

Manufactures.—Estimates for 1900 showed over 7,000 manufacturing establishments, with a combined capital of $300,000,000, paying $100,000,000 in wages, and turning out products valued at $340,000,000. The principal establishments, according to the value of products, were breweries, $25,000,000; tobacco-factories, $33,000,000; flour-mills and grist-mills, $6,350,000; slaughtering and packing houses, $18,000,000; foundries and machine-shops, $15,000,000; manufactories of men's clothing, $13,000,000; publishing houses, $10,600,000; shops for making and repairing steam-cars and street-railway cars, $7,300,000; and manufactories of boots and shoes, furniture, carriages and wagons, paints, saddlery and harness, iron and steel, brick and tile, and lumber.

Transportation.—The trade of the city, which depended a long time upon navigation by river, received great impulse from new railway connections, and the deepening of the channel of the Mississippi at its mouth, so as to admit sea-going vessels of the largest size, gave St. Louis further importance as a receiving dépôt for much of the grain of the Northwest consigned to Europe. There are 22 lines of railway, some of which are parts of extensive systems, comprising 30,609 miles of track, entering the city. The receipts of freight by rail aggregated 15,272,482 tons in 1899, and the shipments 8,469,598 tons. The city also commands over 6,000 miles of direct navigation by river, accessible to steamers and barges during a large part of the year. St. Louis is an interior port to which foreign merchandise can be transported without appraisement at the port of original reception, and during the year ending Dec. 31, 1900, it had imports valued at $4,100,544. Transportation by rail is facilitated by five bridges across the Mississippi and Missouri rivers and by a Union Station in the city. The most noted bridge, as well as the most noted structure in the city, is the lofty steel viaduct across the Mississippi for railway and highway traffic, designed and built by James B. Eads. (See ARCH and BRIDGES, *Arched Bridges.*) The Merchants' bridge, built of steel on the truss plan, and completed in 1890 at a cost of $3,000,000, crosses the same river 3 miles above the Eads bridge, and the Bellefontaine bridge crosses the Missouri river just above its junction with the Mississippi, and connects with the Alton bridge across the Mississippi, furnishing a new approach from the N. and the E. The Union Railway Station is used by 22 railways, has a train-shed of steel and glass covering 30 tracks, each accommodating 8 full-length cars, and with its site cost $6,500,000. Its electrical lighting plant furnishes 300 arc-lights and 5,500 incandescent lamps. Cupples Station, a regular railway station within the city and about a mile from Union Station, consists of seven tracks running into the center of a large block of buildings, in which eight of the largest commercial firms do business. The facilities for loading and unloading cars are perfect, and the speed with which the work is done is remarkable. There are 2,000 trucks, capable of holding 2 tons each, in use, and hydraulic elevators carry them to all floors.

History.—St. Louis was founded Feb. 15, 1764, by Pierre Ligueste Laelède as a trading-post, and named in honor of the patron saint of Louis XV. of France. In 1765 it was made the capital of Upper Louisiana, with Saint-Ange de Bellerive as governor. Although subject to the authority of Spain by the treaty concluded at Paris in 1763, St. Louis was practically under French control, and remained so until formal possession was taken by Don Pedro Pierras, Nov. 29, 1770. The transfer by France to the U. S. of the territory of Louisiana took place in St. Louis Mar. 9, 1804. The town was incorporated Nov. 9, 1809; the first brick building was erected in 1813; the first steamboat arrived Aug. 2, 1817; John Jacob Astor located the Western department of his company here in 1819; the town received a city charter in 1822; suffered fearfully from cholera in 1848; Carondelet was annexed to it in 1870; and the city was made independent of the county in 1876. During the civil war it was held for the Union through the foresight and courage of Gen. Nathaniel Lyon and Frank P. Blair. It was constantly occupied by troops, was a base of supplies for the army, and contained a large military hospital. The Western sanitary commission had its headquarters here, and at a single fair, lasting twelve days, $554,591 was realized for the commission. In 1900 Congress passed a bill authorizing St. Louis to hold an international exposition in 1903, to celebrate the Louisiana Purchase Centennial. A subsequent act of Congress appropriated $5,000,000 in aid of the exposition. The city of St. Louis issued bonds to the amount of $5,000,000, and raised $5,000,000 more by popular subscription, making $15,000,000 in all available for the promotion of the enterprise. The erection of buildings and improvement of the exposition grounds began in the summer of 1901. Pop. (1880) 350,522; (1890) 451,770; (1900) 575,238.

HOWARD L. CONARD.

St. Louis Series: a division of the Subcarboniferous or Mississippian group of rocks, typically exposed at St. Louis, Mo., whence its name, but occurring as an important deposit of limestone, sometimes oölitic or brecciated, and passing into calcareous shale in Missouri, Iowa, Illinois, Indiana, etc. The rocks are commonly from 200 to 250 feet thick, and yield a great variety of invertebrate marine fossils. Spergen Hill, Ind., is noted for the abundance and variety of fossils there obtained from rocks of this group. See *Correlation Papers—Devonian and Carboniferous*, by H. S. Williams, Bull. No. 80 U. S. Geological Survey.

ISRAEL C. RUSSELL.

St. Lu'cia: an island of the British West Indies (Windward islands colony); one of the Caribbee group, N. of St. Vincent. Area, 243 sq. miles. It is of volcanic origin, mountainous, and has a crater which emits sulphur fumes and, rarely, flames. The scenery is very picturesque, the mountains assuming strange forms, and having their sides clothed with tropical forests. The soil of the valleys is very fertile; sugar and cacao are the principal products and exports. This is one of the islands infested by the poisonous fer-de-lance; the climate is somewhat insalubrious. St. Lucia was long disputed by the French and British; the latter have held it permanently since 1803. Pop. (1891) 43,708. Capital, Castries, with about 5,000 inhabitants.

H. H. S.

St.-Malo, săn'mă'lō': town; in the department of Ille-et-Vilaine, France; near the mouth of the Rance, on a small island in the English Channel; connected with the mainland by a causeway 650 feet long (see map of France, ref. 3–C). The harbor, which is perfectly dry at ebb-tide, has from 40 to 50 feet of water at flood-tide, is large and safe, and defended by fortifications both on the mainland and on the island. Fishing for cod and herring in the Channel, and for seals and whales in the Arctic Ocean, trading along the coast and to foreign ports, ship-building, and the manufacture of sailcloth, ropes, etc., are vigorously carried on. Pop. (1896) 11,476.

Saint-Marc Girardin: See GIRARDIN, FRANÇOIS AUGUSTE SAINT-MARC.

St. Martin, săn'măr'tăn': an island of the West Indies, in the Caribbee chain; crossed by lat. 18° 4′ N. Area, 37 sq. miles. It is mountainous, but less than 1,400 feet high; is fertile, and has a salubrious climate. By an arrangement originally made in 1648, this island is nearly equally divided between France and the Netherlands: the French portion (pop. in 1887 3,445) is a dependency of Guadeloupe; the Dutch portion, pop. (1892) 4,023, is attached to Curaçoa.

Saint-Martin, ALEXIS: See BEAUMONT, WILLIAM.

Saint-Martin, LOUIS VIVIEN, de: See VIVIEN.

Saint-Martin, LOUIS CLAUDE, Marquis de: generally known under the name of LE PHILOSOPHE INCONNU, the name under which he published his writings; b. at Amboise, department of Indre-et-Loire, France, Jan. 18, 1743; served in the army until 1771, but afterward devoted himself to the study of theology and philosophy, especially the mystics Martinez, Pasqualis, Swedenborg, Jakob Böhme, and the dissemination of their teachings. He entertained very lofty views as to the incoming of a purely spiritual Christianity and as to the final restoration of all things through Christ. D. at Paris, Oct. 13, 1803. His writings, *Des Erreurs et de la Vérité, par un Philosophe inconnu* (Paris, 1775); *Tableau naturel des Rapports, qui existent entre Dieu, l'Homme et l'Univers* (1782); *Ecce Homo* (1796); *De l'Esprit des Choses* (1800); *L'Homme de Désir* (1790), etc., are all against sensualism and materialism. In France they made no great

impression, but most of them were translated into German. See Matter, *Saint-Martin, le Philosophe inconnu* (Paris, 1862). Revised by S. M. Jackson.

St. Martin's Summer: See Indian Summer.

St. Martinville: village; capital of St. Martin parish, La.; on Bayou Teche, and the S. Pacific Railroad; about 50 miles S. W. of Baton Rouge (for location, see map of Louisiana, ref. 10–D). It is in a cotton, corn, sugar-cane, and rice region, has direct steamboat communication with the Gulf of Mexico, and contains 5 churches, 5 public schools, cottonseed-oil mill, 2 cotton ginneries, several sugar refineries, a State bank with capital of $15,000, and two weekly newspapers. Pop. (1880) 1,606; (1890) 1,814; (1900) 1,926.
Editor of "Messenger."

St. Mary: village; Auglaize co., O.; on the Miami and Erie Canal, and the Lake Erie and West. Railroad; 10 miles W. of Wapakoneta, the county-seat (for location, see map of Ohio, ref. 4–D). The St. Mary reservoir, a mile W. of the village, is a feeder to the canal, covers an area of 17,560 acres, and is said to be the largest artificial body of water in the world. The village contains 7 churches, 2 public-school buildings, 2 opera-houses, 3 hotels, oil and natural-gas wells, 3 lumber-mills, 2 machine-shops, flour, woolen, linseed-oil, and tow mills, straw-board, chain, spoke, and carriage factories, a national bank with capital of $60,000, an incorporated bank with capital of $34,000, and 3 weekly newspapers. Pop. (1880) 1,745; (1890) 3,000; (1900) 5,359.
Publisher of "Argus."

St. Mary's: town of County Perth, Ontario, Canada; on the northwest branch of the river Thames; at the junction of the London branch with Grand Trunk Railway; 22 miles N. of London (see map of Ontario, ref. 5–C). It is a prosperous and well-built town, has a large trade in grain, quarries of fine limestone, two splendid railway viaducts, and important manufactures. Pop. (1891) 3,416.

St. Mary's Cape: See Cape St. Mary's.

St. Mary's River: a stream which flows from Lake Superior to Lake Huron, and has a length of about 40 miles; it divides into two main branches, which embrace large islands, and each branch expands so as to form lakes 4 or 5 miles broad. It receives the direct drainage of about 800 sq. miles of land, and has a water-surface of 150 sq. miles. The fall of the river is 20 feet, 16 feet of which is at St. Mary's rapids. The rapids, caused by an outcrop of Potsdam sandstone, are about a mile in length, and may be descended safely in canoes. At first there was a portage about the rapids for goods carried in canoes; later a tramway was built on the Michigan side to aid in making the transfer. In 1850 a grant of land was made to the State of Michigan by the U. S. Government to defray the cost of building a canal. Work was begun in 1853, and the canal opened to navigation June 18, 1855. The canal was 5,400 feet long and provided with two locks, each 350 feet long, 70 feet wide, and would allow the passage of vessels drawing 12 feet; cost, $1,000,000. In 1870 the U. S. Government began the enlargement of the State canal, and replaced the two locks originally constructed by a single lock, 515 feet long, 80 feet wide in the center and narrowing to 60 feet at the gates; depth, 39½ feet, with a lift of 18 feet and a depth of 17 feet of water on the sills; total length of canal, 7,000 feet; width, 180 feet; and depth, 16 feet; total cost, $2,150,000. The growth of commerce soon rendered this magnificent work inadequate, and still further enlargements were begun in 1887, and are (Jan., 1895) approaching completion. The new lock occupies the site of the old State locks, and enters the canal just above the lock described above. It is 800 feet long, 100 feet wide, with a depth of water on the sills of 21 feet, and a lift of 18 feet. Other improvements in St. Mary's river are in progress which supplement the great lock, and will enable vessels drawing 20 feet to pass from one lake to the other. A canal with a lock of equal dimensions with those built by the U. S. Government was later constructed on the east side of St. Mary's river, at the rapids, by the Canadian Government. The importance of these improvements to commerce is shown by the fact that during the year ending June 30, 1892, 11,557 vessels, carrying 10,107,603 tons of freight, passed through the St. Mary's Fall Canal, in 5,615 lockages. The freight passing through the Suez Canal is of less weight, although of greater value. Israel C. Russell.

St. Maurice River: one of the six great tributaries of the St. Lawrence, which it joins near the town of Three Rivers, not far from the expansion of the river into Lake St. Peter. It has a course of 360 miles and drains an area of 16,000 sq. miles. Its chief tributaries are the Matawin, the Bostonnais, the Croche, the Trenche, and the Manouan. The river is navigable for a considerable distance of its course below and between the interruptions of the Falls of Grand Mère and the Shawenagan Falls. From La Tuque, the Hudson Bay outpost, to Grandes Piles steamers can ply for a distance of 70 miles. The Shawenagan Falls, 30 miles from Three Rivers, are 130 feet high and form the center of an attractive landscape. The basin has an abundance of fine timber, with good water-power. Iron ore is found, and there are quarries of marble, granite, sandstone, and mica. Though the surface is generally hilly there are some level fertile stretches near the upper waters. J. M. Harper.

St. Michael: town: Talbot co., Md.; on a navigable inlet of Chesapeake Bay, and the Balt. and E. Shore Railroad; 12 miles W. of Easton, the county-seat, 22 miles S. E. of Annapolis (for location, see map of Maryland, ref. 4–F). It is in an agricultural region, is principally engaged in the oyster and fish trade, and in ship-building, and has a savings-bank and two weekly newspapers. Pop. (1880) 1,175; (1890) 1,329; (1900) 1,043.

St. Michaels (Portug. *São Miguel*): the largest of the Azores (*q. v.*); in lat. 37° 44′, lon. 25° 30′ W.; comprises an area of 300 sq. miles, with a population in 1881 of 125,669. It is the most fertile and best cultivated of the Azores, and exports annually to England alone 100,000 boxes of oranges. Grain is exported to Portugal, coarse linen and pottery to Brazil. Chief towns, Ponta Delgada and Ribeira Grande.

St. Michaels: the most important Alaskan station on Bering Sea, and the port at the mouth of the Yukon (see map of Alaska, ref. 3–D). It is a fair port, but shallow; the region is low, swampy, and subject to inundation. It was a station of the Russian fur company, by whom it was called *Mikhailovsk*. Pop. village (1900) 857. M. W. H.

St.-Nazaire, sănˊnăăˊzărˊ: town; in the department of Loire-Inférieure, France; at the mouth of the Loire, on the north side; has a large and commodious harbor (see map of France, ref. 5–C). As the navigation of the Loire has become difficult for large vessels on account of the amount of sand which it carries with it, St.-Nazaire has become the chief entrepôt of the great traffic of this river. Pop. (1896) 30,813.

St. Nicholas: See Nicholas, Saint.

St.-Nicolas, Fr. pron. sănˊnēcˊkōˊlaaˊ: town; in the province of East Flanders, Belgium; 12 miles by rail W. by S. of Antwerp (see map of Holland and Belgium, ref. 9–D). It has a large flax-market, and extensive manufactures of linen, woolen, cotton, and silk fabrics, hosiery, hats, soap, leather, salt, and tobacco. It is situated in one of the most fertile and most densely peopled districts of Belgium, and besides the exportation of its manufactured goods its home trade is very important. Pop. (1896) 29,452.

St. Nicolas: village; in Levis County, Quebec, Canada; on the south shore of the St. Lawrence; 15 miles above Quebec, with which it is connected by steamer (see map of Quebec, ref. 4–D). It has a large lumber-trade and many manufactories. Pop. of sub-district, 2,250.

St.-Omer, sănˊtōˊmărˊ: town; in the department of Pas-de-Calais, France; on the Aa; 26 miles S. E. of Calais by rail (see map of France, ref. 1–F). It is fortified and well built, and has extensive manufactures of salt, beetroot-sugar, soap, brandy, and clay pipes. Pop. (1896) 21,481.

Sainton-Dolby, Charlotte Helen: composer, singer, and vocal teacher; b. in London, May 17, 1821; in 1834 entered the Royal Academy of Music, and was subsequently elected king's scholar. Her first public appearance was on June 14, 1841; Mendelssohn dedicated to her his set of six songs, op. 57, and he wrote the contralto music in *Elijah* with a special view to her singing it. She sang in concert tours in France, Germany, and the U. S. with great success. In 1860 she was married to Prosper Sainton, and in 1870 retired from public life. In 1872 she opened a vocal academy. She was one of the finest contraltos England has produced. Besides a number of excellent songs she composed four cantatas, *The Legend of St. Dorothea*, produced June 14, 1876; *The Story of a Faithful Soul*, June 19, 1879; *Thalassa* (the poem by Joseph Bennett), Dec. 21, 1881; and *Florimel*, completed just before her death and performed posthumously. D. Feb. 18, 1885. D. E. Hervey.

St. Paris: village; Champaign co., O.: on the Ohio S., and the Pitts., Cin., Chi. and St. L. railways; 11 miles W. of Urbana, the county-seat, 15 miles E. of Piqua (for location, see map of Ohio, ref. 5–D). It contains a public high school, flour and planing mills, broom and carriage factories, a national bank, and two weekly newspapers; and ships large quantities of grain, flour, lumber, and live stock. Pop. (1890) 1,145; (1900) 1,222. EDITOR OF "ERA-DISPATCH."

St. Paul: the principal one of the Pribilof or Seal islands, in Bering Sea. It is the largest and the northernmost of the group, triangular in form. Area, 32 sq. miles. The highest point is Bogoslof, reaching about 650 feet above sea-level. Pop. about 300 Aleuts, devoted to the hunting of seals. The climate is severe. Potatoes and peas can be raised, and many swine are kept. M. W. H.

St. Paul, Fr. pron. săñ′pōl′: town of the French island of Réunion, on the western side of the island; has a good harbor and considerable trade. Pop. (of commune) 26,000.

St. Paul: city; port of entry; capital of the State of Minnesota and of Ramsey County; on both sides of the Mississippi; lat. 44° 52′ 46″ N., lon. 93° 04′ 54″ W.; 410 miles N. W. of Chicago (for location, see map of Minnesota, ref. 9–F). The city is mainly on the east bank of the river, and the two sections are connected by three substantial highway bridges. It is built on three plateaus, the lowest being the river flats; the second, the main plateau, on which the business portion and a part of the residence portion are built; and the higher, a range of irregular bluffs, on which are the principal residences. The city limits include 35,487 acres, within which lie the suburbs of Merriam, St. Antony, Union, Groveland, Macalester, and Desnoyer parks, Arlington Hills, and others. There are 45·49 miles of paved streets and 51 bridges, five of which cross the river, the others being built over ravines and tracks. The water-supply is obtained from a chain of lakes N. of the city, the daily consumption and supply being 8,000,000 gal.; length of conduit for water service, 4½ miles; sewers, 143·71 miles; water-mains, 227 miles. There are 24 parks, with a total of 450 acres, including Como Park,

State Capitol, St. Paul, Minn.

with 377 acres. The notable buildings are the State Capitol, city-hall, U. S. Government building (cost over $800,000), Pioneer Press, Manhattan, New York Life, Germania Life, Globe, and Endicott office buildings. There are 10 libraries, and 56 newspapers and periodicals.

Churches and Schools.—St. Paul contains 167 churches: Lutheran, 28; Methodist Episcopal, 26; Roman Catholic, 21; Congregational, 18; Baptist, 18; Presbyterian, 17; Protestant Episcopal, 16; Evangelical, 5; Jewish, 5; People's, 3; Unitarian, 2; and one each, Christian, Christian Science, Gospel Tabernacle, Salvation Army, Spiritualist, and Swedenborgian. There are 47 public schools with 545 teachers and an enrollment of 23,000 pupils. The public schools include a large and finely equipped manual training-school, a teachers' training-school, and 26 public kindergartens. The total annual expense (1900–01) is $720,000. There are 60 parochial and private schools, with an estimated enrollment of 8,000 pupils. The colleges are: Hamline University, for both sexes (Methodist Episcopal, established in 1854), endowment $175,000; Macalester College, for both sexes (Presbyterian, incorporated in 1874), endowment $200,000; St. Thomas's Seminary (Roman Catholic, established in 1885); St. Paul's Seminary (Roman Catholic, established in 1894), endowment $500,000; and Concordia College (German Lutheran, established in 1894).

Charitable Institutions.—These include two Roman Catholic orphan asylums, Protestant orphan asylum, Roman Catholic Infants' Home, Protestant Babies' Home, Day Nursery, Home for the Aged, Home for the Friendless, House of the Good Shepherd (Roman Catholic), Woman's Christian Home, St. Paul Bethel, and the Friendly Inn. Other benevolent institutions and societies are: Board of Control, Children's Home Society, Needlework Guild, Newsboys' Home Association, Parish Settlement, Free Dispensary, St. Vincent de Paul Society, Hebrew Relief Society, Society for the Relief of the Poor, Society for Prevention of Cruelty, St. Mary's Home, Young Women's Friendly Association, City and County Hospital, Bethesda Hospital, St. Joseph's Hospital, St. Luke's Hospital, and the Homœopathic Hospital.

City Finances.—The total bonded debt, Jan. 1, 1900, was $8,001,100, of which $2,460,000 was for the city water system. The revenues of the water department are now sufficient to provide for future extensions, pay interest on these bonds, and provide a sinking fund for their redemption at maturity. The floating debt was $235,000. The annual cost of the city government is about $2,000,000; assessed value of real estate is $78,523,015, of personal property $14,509,467, and the annual tax-rate 2 mills on the dollar.

Business Interests.—The manufacturing establishments reported in the census of 1890 number 1,442 (distributed among 61 industries), representing an invested capital of $22,501,211, employing 18,558 persons, paying $10,373,396 in wages and $15,865,573 for materials, and turning out products to the value of $33,035,073. St. Paul does a large jobbing business (about $150,000,000 annually), the available trade area, covering Minnesota, the Dakotas, Montana, Idaho, Washington, and Northern Oregon, being 582,164 sq. miles, with a population of 2,536,170. There are 22 banks, of which 5 are national, 5 savings, and 12 State; total capital, with surplus and undivided profits, $8,527,615.

Means of Communication.—St. Paul is an important railway center, from which extend seven eastern trunk lines and four transcontinental systems. It is connected with the East and South by the lines of the Chicago, Milwaukee and St. Paul, Chicago and Northwestern, Burlington and Northern, Chicago and Great Western, Wisconsin Central, and Minneapolis and St. Louis, now part of the Rock Island system. The "Soo" line, through its relation to the Canadian Pacific, gives an outlet to the East independent of the Chicago systems. To the West connection is made with the Pacific coast over the systems of the Northern Pacific, the Great Northern, Canadian Pacific, and Union Pacific, in combination with the line of the Chicago, St. Paul, Minneapolis and Omaha. The St. Paul and Duluth, now merged in the Northern Pacific, Eastern Minnesota, a part of the Great Northern Pacific, and the Omaha all have lines extending from St. Paul to the head of Lake Superior, and a very large part of the commerce between St. Paul and the East is over the lake route. The city has 103 miles of electric street-railway. An electric railway connects the city with Minneapolis, and another line connects it with Stillwater.

History.—The first house in St. Paul was built in 1838. The early settlers were principally French, and engaged in the fur and whisky trade. A Roman Catholic mission was begun in 1841, from which the city takes its name. The site was surveyed and plot recorded in 1847; the settlement was incorporated as a town and made the territorial capital in 1849, and became a city in 1854. St. Paul owes its early growth to its situation at the head of navigation on the Mississippi river. The assistance of the Federal Government has been secured in extending the navigable channel to Minneapolis, and a survey of practicable routes for a ship-canal to connect the city with Lake Superior has been authorized by the Government. Pop. (1880) 41,473; (1890) 133,156; (1895) 140,292; (1900) 163,065. J. G. PYLE.

St. Paul: city (founded in 1886); capital of Howard co., Neb.; on the Loup Fork of the Platte river, and the Burlington Route and the Union Pac. railways; 23 miles N. of Grand Island, 174 miles W. of Omaha (for location, see map of Nebraska, ref. 10–F). It is in a grain-growing and stock-raising region, and has 5 churches, a grammar school, several flour-mills, 3 national banks with combined capital of $150,000, and 3 weekly newspapers. Pop. (1880) 482; (1890) 1,263; (1900) 1,475. EDITOR OF "REPUBLICAN."

St. Paul de Loanda, or simply **Loanda** (more correctly *Luanda*, i. e. tribute): the first settlement of the Portuguese (1578) in Southwest Africa (see map of Africa, ref. 7–D). In early days the Zimbo tribe dug shellfish here and paid an annual tribute in shells to the King of Congo, whence the native name, which the Portuguese have perpetuated. Loanda is the capital of Angola, is favorably situated in Bengo Bay, near the mouth of the Bengo; in lat. 8° 48′ S. and lon. 13° 13′ E.; and is well adapted for commerce. It is the terminus of a railway extending eastward to Ambaca, 150 miles distant, and is the largest town on the west coast between Lagos and Cape Town. Pop. about 15,000. While Loanda saw its most thriving days when it was the center of the slave export trade to Brazil, the growth of legitimate trade has saved it from predicted ruin. About 150 ships and steamers visit the port every year, and the annual trade is about $3,000,000. The public buildings and European residences are well built of brazilwood, stone, or brick. Good water is brought for some miles from the Bengo river. Steamers connect the port with the rich plantations on the Cuanza river. C. C. Adams.

St. Peter: city; capital of Nicollet co., Minn.; on the Minnesota river, and the Chi. and N. W. and the Chi., St. P., Minn. and Omaha railways; 11 miles N. of Mankato, 75 miles S. W. of St. Paul (for location, see map of Minnesota, ref. 10–D). It is situated between a stretch of prairie land on the W. and one of timber land on the E.; is the seat of Gustavus Adolphus College (Lutheran, chartered in 1874) and of the State Hospital for the Insane (cost $500,000); and contains a high school, a national bank with capital of $60,000, a State bank with capital of $50,000, flour-mills, foundry and machine-shops, and a monthly and three weekly periodicals. Pop. (1880) 3,436; (1890) 3,671; (1900) 4,302.
Editor of "Herald."

St. Peter Port: capital of the island of Guernsey. It is an old and picturesque town with many interesting buildings. Among them are the Government house, the Elizabeth College, and the Hauteville House, where Victor Hugo spent his exile (1856–70). The harbor, formed by two piers which inclose 73 acres, is a favorite resort of pleasure-yachts. Pop. (of parish with garrison) 16,658. M. W. H.

St. Petersburg: government of European Russia, bordering N. on the Gulf of Finland and Lake Ladoga; area, 20,759 sq. miles. The ground is low and level, the climate damp and cold, the soil thin and little productive. Marshes and forests cover two-thirds of the surface; hemp, flax, and rye are the common crops; market-gardening is extensively carried on around the capital, the city of St. Petersburg. Pop. (1897) 2,104,511.

St. Petersburg: capital of Russia; the residence of the czar, and the seat of the Government; in lat. 59° 56′ 30″ N., lon. 30° 19′ E.; on the delta of the Neva, about 20 miles E. of its port, Cronstadt (see map of Russia, ref. 5–D). Its location is not very favorable. The climate is severe; the Neva is covered with ice for five months, and with a mean winter temperature of 18° the thermometer is known to have fallen to −38°. The elevation of the site above the river is so small that, although both the river arms and the canals are lined with high stone quays, destructive inundations have taken place, as in 1824. Nor is the ground itself salubrious; it is marshy and oozy, and, in spite of extensive draining, typhoid fevers are frequent. To form a sufficiently solid foundation for the Nikolaievski bridges three sets of piles had to be driven into the ground, one on the top of the other; and the foundation of the Church of St. Isaac is said to have cost $4,000,000. Nevertheless, Peter the Great, who founded the city in 1703, and declared it his capital in 1712, and Catherine II., who was very solicitous for its growth and prosperity, succeeded in building up here one of the most brilliant capitals of Europe, and forming a commercial and industrial center of great importance. The city consists of two parts—the Great Side (*Bolshaya Storona*), situated on the mainland, on the southern side of the Great Neva; and the Petersburg Side, situated on the numerous islands formed by the arms of the Neva, Vasili Ostrov, Volni, Petrovski, Citadel island, Aptekarski, Krestovski, Kamennoi, and Velaginski. Only one permanent bridge leads across the Great Neva—namely, the Nikolaievski, from the English quay in front of the admiralty building on the southern branch to the Vasili Ostrov shore. It is a magnificent structure of granite, 1,200 feet long, resting on seven elegant arches, and was completed in 1850. The other bridges across the Great Neva are all temporary, supported on boats and removed each autumn when the frost comes. The Annitchkoff bridge, across the Fontanka Canal, is also a splendid structure, 110 feet long, decorated with four groups of wild horses. About 150 bridges connect the islands with each other. The Great Side is the more elegant part of the city, containing a great number of palaces, churches, Government buildings, etc., all of which are of immense dimensions, generally gorgeously decorated, and often of a fine architectural effect. The Nevski Prospekt, leading in a southeastern direction from Admiralty Square, is one of the finest streets in Europe, 130 feet broad, 4 miles long, lined with palaces and planted with trees. The Petersburg Side is principally the seat of the commercial and industrial interests; some of the islands are occupied by villas and gardens. The most remarkable of the public buildings is the Church of St. Isaac, 330 feet long, 290 feet broad, 310 feet high, built in the form of a Greek cross, entered from each side through a magnificent peristyle composed of twelve or sixteen monolithic columns of polished granite 60 feet high and 7 feet in diameter at the base, and surmounted by a dome rising 120 feet above the peristyles, resting on thirty columns, covered with copper, and richly gilded. In the Church of St. Peter and St. Paul, whose elegant gilt spire rises 208 feet, and can be seen from all parts of the city, the Russian czars have been buried since the time of Peter the Great. In the Church of St. Alexander Nevski the body of this saint is preserved in a sarcophagus of solid silver. The Winter Palace, one of the largest palaces in the world, forms a square 455 feet long, 350 feet broad, contains immense wealth in its decorations and furniture, and is inhabited, when occupied by the czar, by 6,000 persons; it was burned down in 1837 and rebuilt in 1839. The Hermitage, built by Catherine II., and connected with the Winter Palace, contains a famous picture-gallery, rich especially in works of the Spanish school, collections of statuary, gems, vases, arms, a library of 120,000 volumes, a theater, etc. The Annitchkoff Palace was the residence of Nicholas I. Of the public squares, Admiralty Square is the largest. The Palace Square contains the Alexander column, 150 feet high, whose shaft is a monolith 80 feet high, of red granite. In Peter's Square stands a fine equestrian statue of Peter the Great. The educational and benevolent institutions are numerous. The Imperial Library contains about 1,100,000 volumes and 35,000 MSS. The Academy of Sciences, founded by Peter the Great, has a library of 300,000 volumes, an excellent ethnographic museum, large numismatic and anatomical collections, etc., and a botanical garden with the largest palm-house in Europe. The university, founded in 1819, is attended by over 2,000 students. The mining-school has an unsurpassed collection of minerals. Many special schools and gymnasia for girls are established, and a number of compulsory elementary schools were opened in 1873. A celebrated institution is the foundling hospital. The manufactures, imperial and private, comprise glass, porcelain, and malachite ware, Gobelin tapestry and embroidery, arms, surgical and optical instruments, linen, woolen, cotton, and silk goods, paper, soap, tobacco, etc. A maritime canal from Cronstadt permits vessels drawing 18 to 20 feet to reach the quays of the city. A system of fresh-water canals gives ready and inexpensive communication with the interior, and railways connect the city with Moscow, Warsaw, and Berlin. Pop. (Dec., 1889) 924,105; with the suburbs (1897) 1,267,923.
Revised by M. W. Harrington.

St. Petersburg Declaration: an agreement concluded Dec. 11, 1868, by delegates from sixteen European states and Persia, called together at the suggestion of the Emperor of Russia to "examine into the expediency of forbidding the use of certain projectiles in times of war between civilized nations." The principle governing the convention was that the use of weapons which "uselessly aggravate the sufferings of disabled men or render their death inevitable" is contrary to the laws of humanity. Accordingly the contracting parties engaged "mutually to renounce in case of war among themselves the employment by their military or naval troops of any projectile of a weight below 400 grammes (a little less than a pound) which is either explosive or charged with fulminating or inflammable substances." The magazine-rifle, the mitrailleuse, new explosives, mines, and similar inventions for carrying on war are not legislated against, but solely the small explosive ball, on the ground that the object of war is to disable the greatest number possible, but not to render recovery from wounds impossible or to increase their severity. This

prineiple of the St. Petersburg eonvention has been incorporated into later codes like that worked over by the Brussels Conferenee in 1874. The U. S. has never aceeded to it. The obligations of this St. Petersburg Declaration are reeiproeal only, so that its signatories if at war with the U. S. would not be bound by them. THEODORE S. WOOLSEY.

St. Peter's Church: See PETER'S, ST.

St. Peter's Sandstone: a deposit of friable white and yellow sandstone oecurring principally in Wiseonsin, but eoming to the surfaee in the adjaeent portions of Minnesota, Iowa, and Illinois; named from St. Peter's (now Minnesota) river, at the mouth of which it is well displayed. Its average thiekness is from 80 to 100 feet, with a maximum of 212. It is one of the minor divisions of the roeks deposited during the Cambrian period; it rests on Lower Magnesian limestone and is overlaid by Trenton limestone. By many geologists it is considered as the equivalent of the Chazy of New York, but is probably more nearly equivalent to the basal member of the Trenton. Fossils are rare, and eonsist of tubes made by worms when the sands were soft, impressions of seaweeds, and shells of *Lingulepis*. It is an important souree of artesian water. Consult *Geology of Wisconsin*, vol. i., by T. C. Chamberlin. ISRAEL C. RUSSELL.

St.-Pierre, sănˊpi-ărˊ: prineipal town and port of the island of Martinique, Freneh West Indies; on a bay of the west eoast (see map of West Indies, ref. 7–N). It has no harbor, properly speaking, but the roadstead is proteeted by the island itself exeept during hurricanes, when its exposed position makes it very dangerous. The town is partly on low and somewhat insalubrious lands, partly on pieturesque hills, where the residenees are eharmingly plaeed among trees and flowers. The botanieal garden is one of the finest in the West Indies. Pop. about 20,000. H. H. S.

St.-Pierre: town of the Freneh island of Réunion, formerly Bourbon; in the Indian Ocean; on the southern shore of the island. It has a good harbor and a rapidly inereasing trade. Pop. of commune, 24,500.

Saint-Pierre, JACQUES HENRI BERNARDIN, de: author; b. at Havre, Franee, Jan. 19, 1737; studied at first for the Church; went in 1750 to Martinique as a sailor, and on his return a few years later attended the sehool of engineering at Rouen, but in 1760 lost his position in the army on aeeount of insubordination. After unsueeessful ventures at several employments he went to St. Petersburg, and was appointed a eaptain in the engineering eorps of Finland, but failed to interest Catherine II. in his sehemes of a model republic. Leaving the eountry in 1766 he fought against the Russians in Poland, inspired by a Polish prineess; then again in Saxony against the Poles, to avenge himself on his former inspiration. After this he returned to Franee and reeeived a position as an engineer in the Isle de Franee, but settled in 1771 in Paris and devoted himself to literature, assoeiating much with Rousseau, who exercised a considerable influence both on his style and his ideas. He published in 1773 *Voyage à l'Isle de France*, etc.; in 1784 *Études de la Nature* (5 vols.), whieh gave him rank among the best French prose-writers; in 1788 *Paul et Virginie*, whieh beeame one of the most eelebrated books of the age and was translated into all European languages; in 1790 *La Chaumière indienne* and *Le Café de Surate*; and subsequently many other works, none of whieh attained sueh suceess as *Paul et Virginie*; was made director of the botanical garden in 1792, Professor in Morals at the normal sehool in 1794; reeeived a pension under the empire. D. at Eragny-sur-Oise, Jan. 21, 1814. Aimé Martin, who married his widow, published a eollected edition of his works in twelve volumes in 1813–20; his posthumous works, letters, and a biography in 1833–36.

St.-Pierre and Miquelon, -meekˊlōⁿ: a group of three islands and many islets at the mouth of the Gulf of St. Lawrenee, near the south eoast of Newfoundland, eonstituting a Freneh eolony; valuable only as a rendezvous for vessels engaged in the eod-fisheries, of whieh some 1,500 annually enter the port. Area, 91 sq. miles. Pop. (1889) 5,983. St.-Pierre, the eapital, has a population of 800.

St.-Privat, Battle of: See GRAVELOTTE, BATTLE OF.

St.-Quentin, sănˊkaănˊtănˊ: town; in the department of Aisne, France; on the Somme; 95 miles by rail N. E. of Paris (see map of Franee, ref. 2–F); has extensive manufaetures of eotton yarn, linen, tableeloths, laee, muslin, and gauze, besides large distilleries and soap-works. It eontains an aneient Gothie ehureh, and is surrounded by beautiful promenades oeeupying the site of its old fortifications. Pop. (1896) 48,868. A battle took plaee here on Aug. 10, 1557, between the army of Philip II. of Spain, assisted by an English eontingent, and the Freneh, in which the French were defeated. During the Franeo-German war, on Jan. 19, 1871, the Germans under von Goeben here defeated the French under Gen. Faidherbe; the former lost 3,000 men and captured 10,000 prisoners.

St. Regis Falls: village; Franklin eo., N. Y.; on the St. Regis river, and the N. Adirondack Railroad; 22 miles S. W. of Malone, the county-seat (for loeation, see map of New York, ref. 1–I). It has excellent water-power, large lumber trade, several manufaetories, and a weekly newspaper. Pop. (1880) not in census; (1890) 1,210; (1900) 879.

St. Roque, Cape: See CAPE ST. ROQUE.

Saint-Saëns, sănˊsaaˊăaⁿˊ. CHARLES CAMILLE: organist and composer; b. in Paris, Franee, Oct. 9, 1835. He showed a remarkable aptitude for musie in his ehildhood, and made rapid progress under his teachers; entered the Conservatory in 1847, obtained seeond organ prize in 1849, and first in 1851; eomposed his first symphony when sixteen years old; in 1853 beeame organist of the Chureh of St. Merri, and in 1858 organist of the Madeleine, which post he resigned in 1877. He has composed largely in almost every art-form. Among his operas *Le Timbre d'Argent*, *Étienne Marcel*, *Henry VIII.*, *Ascanio*, and *Phryné* may be specially noticed, as also *Samson et Dalila*, a sacred eantata. He has written four very popular symphonie poems for full orchestra, entitled respectively *Le Rouet d'Omphale*, *Phaëton*, *Danse Macabre*, and *La Jeunesse d'Hercule*. D. E. H.

Saintsbury, GEORGE EDWARD BATEMAN: eritie and literary historian; b. at Southampton, England, Oct. 23, 1845. He graduated at Oxford in 1867; was classieal master in Elizabeth College, Guernsey, 1868–74, and head master of the Elgin Edueational Institute 1874–76. Among his publications are a standard *Primer of French Literature* (1880) and *Short History of French Literature* (1882); a life of *Dryden* (1881) and of *Marlborough* (1885); *A History of Elizabethan Literature* (1887) and several volumes of selections, translations from the French, etc. H. A. BEERS.

Saints' Days: in the calendar of the Chureh, days set apart for the special eommemoration of any saint. In the Roman Catholie Chureh the number of saints is very great, and a considerable number of saints are eommemorated on eaeh day of the year; but it is the custom to assign to partieular eountries, districts, or dioeeses a eertain number of saints for speeial eommemoration. These saints' days eonstitute the ealendar for that distriet. Any day not a saint's day in the loeal ealendar, and not a festival nor a Sunday, is called a *feria* or vaeant day; other days are either holy days of obligation, doubles, semi-doubles, and simples, aeeording to the solemnity of the occasion and of the service for the day. See the *Ordo*, published annually. J. J. K.

St.-Servan, sănˊsărˊvaănˊ: town of Franee; department of Ille-et-Vilaine; at the mouth of the Ranee, opposite St.-Malo (see map of Franee, ref. 3–C). It has two good harbors and an aetive eommeree. It is fortified and much frequented as a watering-place. Pop. (1896) 12,240.

Saint-Simon, sănˊsēˊmōⁿˊ, CLAUDE HENRI, Comte de: founder of Freneh soeialism; b. in Paris, Franee, Oet. 17, 1760; received a military edueation and aided the American colonies in the Revolutionary war. Early eoneeiving the idea that a great destiny awaited him, he sought by every means to enlarge his knowledge of men and things by varied experienee. He gave up the military eareer and proposed a scheme for a Duteh and French expedition against the British East Indies, but neither this nor a subseqnent project for connecting Madrid with the sea by a eanal attracted the attention of the authorities. In the revolution he took no prominent part, but was imprisoned for nearly a year during the Reign of Terror. He speculated in the eonfiseated estates of the *émigrés* and realized a small fortune, but spent it all in a little more than a year. An unhappy marriage, dissolved by the mutual eonsent of the parties, eompleted his experiments. Reduced to absolute penury, he lived partly on the eharity of his friends and partly on the precarious results of the literary work to whieh he now devoted himself. The first of his writings was *Lettres d'un Habitant de Genève* (1803). This was followed by several seientifie and political writings which passed almost without notiee. His charaeteristic views were first propounded in *L'Industrie* (1817) and further developed in *L'Organisateur* (1819); *Du Système*

Industriel (1821); *Catéchisme des Industriels* (1823); and, most important of all, *Nouveau Christianisme* (1825). The last two works present his social philosophy in a systematic form. Despite their diffuse style and want of logieal arrangement his writings reveal a keen critical faculty and considerable constructive power, qualities which won over to his views some of the most brilliant young men of the day, as Comte and Thierry. D. in Paris, May 19, 1825.

The school of social or economic philosophy called after its founder Saint-Simonianism demands thorough application of the principle of assoeiation to production. The "exploitation of man by man" must give way to the exploitation of the globe by man associated with man. To do this all instruments of labor must be held as social and not as private property, the law of inheritance must be abolished, and a system of distribution based on the merit of the individual must be introduced. This idea of rewarding the laborer according to his merit was strongly insisted upon by the Saint-Simonians, who advocated the grading of the laborer in the new social system according to his capacity, and rewarding him according to his work. The new philosophy had little effect in the lifetime of the founder, but under the leadership of ENFANTIN and BAZARD (*qq. v.*) attracted much attention in the Revolution of 1830. The *Globe* became the organ of the society, which included many of the ablest young men of the time; but dissensions arose between the two leaders on aecount of the innovations favored by Enfantin, who tended toward mysticism and lax ideas with regard to the marriage relation. Bazard and many of the strongest members withdrew, and the sect represented by Enfantin was broken up in 1832. F. M. COLBY.

Saint-Simon, LOUIS DE ROUVROI, Duc de: memoir writer; b. Jan. 16, 1675; received a very careful edueation; entered the army in 1692; distinguished himself at the battle of Neerwinden, but left the army in 1702 for the court, where he acquired considerable influence, both under Louis XIV. and the regent, and developed a great activity, partly in futile intrigues, partly in diplomatic negotiations. He never attained a position of commanding influenee even under the regency of his friend and patron, the Duke of Orleans, though in 1721 he figured prominently as ambassador to the court of Spain. After his return he had little to do with public affairs, and on the death of the regent, in 1723, he retired to his family estate. D. in Paris, Mar. 2, 1755. This long term of leisure he employed to prepare his *Mémoires*, which were intended to be published by his grandchildren; but at his death the Government seized them, and a multitude of unauthentic extracts came into circulation and considerable curiosity was excited. At last Charles X. returned the manuscript to the family of the author, and an edition appeared in twenty-one volumes (1829–30). This was followed by one of twenty volumes edited by Chéruel, and in 1874 by an edition which was estimated to contain thirty volumes, of which the eighth volume appeared in 1891. The work, though marred by prejudice, is of great historical value and is considered the most remarkable collection of memoirs ever written. See Sainte-Beuve, *Causeries de Lundi*; Collins, *Saint-Simon* in *Foreign Classics*; and Cannan, *The Duke of Saint-Simon* (London, 1885). Revised by F. M. COLBY.

St. Stephen: port of entry of Charlotte County, New Brunswick; pleasantly situated on the east bank of St. Croix river, opposite Calais, Me., with which it is connected by a bridge (see map of Quebec, etc., ref. 6–G). It is on the Canadian Pacific and Shore Line railways, does a heavy business in manufacturing and shipping lumber, and has a custom-house and many fine residences. Pop. (1891) 2,680.

St. Thomas: an island off the western coast of Africa; in the Gulf of Guinea; in lat. 0° 27′ N., lon. 6° 3′ E. Area, 359 sq. miles. The island, which belongs to Portugal, is high, of volcanic origin, exceedingly fertile, but extremely unhealthful. Sugar was formerly the principal product; coffee is more extensively cultivated. Forests abound, yielding excellent timber and the finest varieties of wood. Pop. 18,000, of whom 1,200 are white. Chief town, St. Thomas.

St. Thomas: one of the Virgin islands, West Indies; E. of Puerto Rico; area, 23 sq. miles. It belongs to Denmark. The surface is mountainous; portions are fertile, but very little land is cultivated. The importance of the island is entirely due to the free port of Charlotte Amalie, where most of the inhabitants are gathered. Formerly much of the commerce of the West Indies centered here; the place still has much trade with the other islands, and is an important port of call and coaling-station. It is occasionally visited by severe epidemics of yellow fever. The harbor is good and ordinarily very safe; but the island is frequently visited by hurricanes, and when these blow from the S. the anchorage is very dangerous. In 1867 every vessel in the harbor was wrecked by an earthquake wave, which also swept part of the town. In 1870 President Grant secured the purchase of the island for the U. S. for $7,500,000, but Congress refused to ratify the treaty. Pop. (1890) 12,019. Dependencies of St. Thomas are SANTA CRUZ (*q. v.*) and St. John's (area, 21 sq. miles; pop. 984), islands near it. HERBERT H. SMITH.

St. Thomas: capital of Elgin County, Ontario, Canada; on London and Port Stanley and Canada Air-line railways; 9 miles N. of Port Stanley, on Kettle creek (see map of Ontario, ref. 5–B). It has a large grain-trade and two weekly newspapers. Pop. (1891) 10,370.

St. Ubes: See SETUBAL.

St. Vincent: an island of the Windward islands colony, British West Indies; between St. Lucia and the Grenadines. Area, 133 sq. miles. It is mountainous, with fertile valleys, and half the surface is still covered with forest. Near the northern end is a quiescent volcano, the Soufrière, with two craters, one of which is occupied by a deep lake; the other was formed by the great eruption of Apr. 27–May 1, 1812, which devastated part of the island and darkened Barbados, 80 miles to windward, with a shower of ashes. The principal exports of St. Vincent are sugar and arrowroot. The island was the last stronghold of the West Indian Caribs, who were finally conquered by the British in 1795–96, and transported to Ruatan in the Bay of Honduras; a few returned and now have a small reservation. Pop. (1891) 41,054; nearly nine-tenths are colored. Capital, Kingstown, with 4,547 inhabitants. The Grenadines, except Carriacou, are dependencies. HERBERT H. SMITH.

St. Vincent, Cape: See CAPE ST. VINCENT.

St. Vincent, EARL OF: See JERVIS, SIR JOHN.

St. Vitus's Dance: (1) a disorder of the Middle Ages akin to tarantism (see DANCING MANIA); (2) another name for CHOREA (*q. v.*).

Saird: See SEURT.

Sai'vas: worshipers of SIVA (*q. v.*).

Sajous, CHARLES EUCHARISTE: See the Appendix.

Sakhalin: See SAGHALIEN.

Sakḳarah: See SAQQARAH.

Sakyamuni: the "Sakya Sage," a name frequently given to Gotama or Gautama, the historical BUDDHA (*q. v.*). *Shih-kia-mu-ni* is the Chinese form of the name, and *Shaka-muni* the Japanese. See also GAUTAMA.

Sala, GEORGE AUGUSTUS HENRY: journalist and author; b. in London, England, in 1828; educated as an artist, but at an early age devoted himself to literature as a constant contributor to Dickens's *Household Words* and other periodicals, especially *The Illustrated London News* and *The Cornhill Magazine*; visited the U. S. 1863–64 as correspondent of *The Daily Telegraph*, and published *America in the Midst of War*; represented the same paper in Algeria 1864 and again 1875, at the Paris Exposition 1867, on the Continent during the Franco-German war 1870–71, and in Spain, Morocco, and Venice 1875. He published several novels (*Quite Alone*, *Captain Dangerous*, etc.), works of travel, etc., including *Paris Herself Again* (1881); *America Revisited* (1882); *London Up to Date* (1894); *Life and Adventures of George Augustus Sala* (1895); and was the founder and editor of the *Temple Bar* magazine. He visited the U. S. in 1885, and lectured in its principal cities on his way to Australia, which he visited as correspondent of *The Daily Telegraph*. In 1892 he started *Sala's Journal* in London. D. at Brighton, Dec. 8, 1895. H. A. BEERS.

Salaam [from Arab. *salām*, peace, safety]: the Oriental salutation, of which there are various forms, mostly accompanied by the words meaning "Peace be with you!" and sometimes by an inclination of the body. Strict Mohammedans never give the salaam to an unbeliever.

Salado, Rio, ree′ō-saă-laa′dō: a river in the northern part of the Argentine Republic; rising in the Andes of Salta and flowing with a general southeasterly course to the Paraná, it coincides nearly with the southwestern side of the region called the GRAN CHACO (*q. v.*). Length about 1,000 miles. After entering the plains the Salado is partly lost in great marshes and salines, and becomes impregnated with salt. It is shallow and not navigable. H. H. S.

Sal Aëra'tus [Mod. Lat., aërated salt; *sal*, salt + *aëratus*, Latinization of aërated, from Lat. *a'er*, air]: a somewhat impure and imperfectly carbonated bicarbonate of potash, made by exposing a concentrated solution of neutral potassic carbonate to an atmosphere of carbon dioxide proceeding from fermentation or other source; hence the name. The finely granular form of the commercial article is probably a result of agitation during the absorption of the carbonic acid. Medicinally, a purer crystalline bicarbonate of potash is used, which is, or should be, fully charged with 2 equivalents of carbonic acid for 1 of potash. Sal aëratus was at one time extensively used as an article of domestic consumption, but has been chiefly displaced by the cheaper and better compound bicarbonate of soda, known as cooking-soda, sometimes as soda saleratus. Revised by Ira Remsen.

Sal'ahdin (*Yusuf-ben-Ayub-Salah-ed-Din*): Sultan of Egypt and Syria; b. in 1137 at the castle of Tekrit, on the Tigris, of which his father, the Kurdish chieftain Ayub, was governor. His uncle Shir-koh in 1163 was sent by Nur-ed-din Mahmud, Sultan of Syria, to Egypt to reinstate the dispossessed Emir Shaour. Salahdin accompanied him, and in the subsequent campaign showed great courage and military ability. Shaour became suspicious of his protectors and joined the crusaders, but was defeated and beheaded. Thereupon Shir-koh became governor of Egypt as Nur-ed-din's representative and on his death was succeeded by Salahdin, who manifested remarkable capacity as a civil ruler. On the death of Nur-ed-din (1174) he became independent Sultan of Egypt, to which Syria was speedily added, his title to both being confirmed by the Caliph of Bagdad. The Christian knights in Palestine constantly violated their treaties, attacking and plundering the Mussulman caravans. To end these outrages Salahdin invaded Palestine and destroyed the Christian army at the battle of Tiberias (July 4, 1187), where the King of Jerusalem, Guy of Lusignan, was taken prisoner. The capture of Jerusalem followed (Oct. 8, 1187). The king and inhabitants were treated kindly, but the knights of the various orders were put to death as violators of their treaties. Excitement at the fall of Jerusalem caused the third crusade (1189), and after a siege of two years Acre was captured by the Christians. The contest between Richard Cœur de Lion and Salahdin was really a species of tournament, wherein the most brilliant exploits were performed on both sides, with little gain by either. A three years' truce was concluded (Sept. 2, 1192) whereby the coast from Tyre to Jaffa was ceded to the Christians. Salahdin died at Damascus, Mar. 3, 1193. His estates were divided among his seventeen sons and his brother Malek-el-Adil. His fame was deservedly great. Magnanimous and just, skillful and intrepid in war, judicious and far-sighted in civil affairs, the founder of a vast and wisely administered empire comprising Egypt, Syria, Mesopotamia, Palestine, and Arabia, he is the hero of Mussulman chivalry.

E. A. Grosvenor.

Sal Alem'broth, or **Salt of Wisdom**: a compound of corrosive sublimate and sal ammoniac, once used in medicine, but now discarded.

Salaman'ca (Rom. *Salamantica* or *Elmantica*): town of Spain; capital of the province of the same name; on the right bank of the Tormes, which is here crossed by a magnificent bridge of twenty-seven arches (see map of Spain, ref. 14–D). It is surrounded with old walls, but several portions within the walls have been in ruins since the occupation of the city by the French in 1812. The streets are mostly steep, narrow, crooked, and dark, but they are often lined with lofty edifices most interesting in architectural respects. The university was founded in 1200. It is the first institution of its kind in Spain, and enjoys a high reputation all over Europe. Pop. (1887) 22,200.

Salamanca: a town of the state of Guanajuato, Mexico; on the river Lerma and the Mexican Central Railway; 34 miles S. of Guanajuato (see map of Mexico, ref. 6–G). It has manufactures of cotton cloths. Pop. about 10,000.

Salamanca: village; Cattaraugus co., N. Y.; on the Alleghany river, and the Erie, the Buffalo, Roch. and Pitts., the W. N. Y. and Penn., and the N. Y., Penn. and O. railways; 34 miles E. of Jamestown, 60 miles S. of Buffalo (for location, see map of New York, ref. 6–C). It contains 7 churches, union graded school with three buildings, 2 Roman Catholic schools, public-school library, sewerage, natural-gas and electric-light plants, gravity system of water-works, 2 national banks with combined capital of $100,000, 2 weekly newspapers, railway-shops, sole-leather tannery, 4 saw and planing mills, 3 cigar-factories, 2 grist-mills, wire-mattress factory, foundry, and embroidery factory. It was incorporated as a village in 1878. Pop. (1880) 3,498; (1890) 3,692; (1900) 4,251. Editor of "Cattaraugus Republican."

Salamander [viâ O. Fr. from Lat. *salaman'dra* = Gr. σαλαμάνδρα; cf. Pers. *samander*, salamander]: any one of numerous forms of tailed amphibians, especially the species of Salamandridæ (*q. v.*). These are small and of lizard-like form, and are terrestrial as distinguished from the aquatic newts of the same family. They inhabit damp, shady places, and feed mostly on worms, slugs, snails, insects, etc. *Salamandra maculosa* is the common spotted salamander of Central and Southern Europe. The black salamander (*S. atra*) is Alpine, and in this species the larvæ attain the air-breathing stage within the body of the mother. The salamander has been popularly identified with the fabulous animal of that name formerly supposed to be able to live in or to extinguish fire. The salamander of Marco Polo was asbestos. The animal locally known in the southern parts of the U. S. by the name is a pocket-gopher (*Geomys tuza*), a rodent.

Salaman'dridæ [Mod. Lat., from Lat. *salaman'dra*, salamander. See Salamander]: an Old World family of amphibians of the order Urodela (*q. v.*), including the typical salamanders and newts. They have posterior palatine processes, with teeth on their inner margins; the parasphenoid toothless; no post-frontosquamosal arch or ligament; and opisthocœlian vertebræ.

Sal'amis (modern *Kolouri*): Greek island; in the Gulf of Egina; 8 miles W. of Athens. Area, 36 sq. miles. Pop. (1889) 6,254. It is arid, rocky, mountainous, and well wooded; produces cotton, olives, and wine. The village of Ambelaki occupies the site of the ancient city of Salamis. In the strait, hardly over a mile in width, between Salamis and Attica, the Greeks under Euribiades utterly defeated the Persian fleet (Oct. 20, 480 B. C.). E. A. G.

Sal Ammoniac: See Ammonia.

Salamstone: See Corundum.

Salaverry, saä-laä-ver-ree', Felipe Santiago, de: soldier; b. at Lima, Peru, May 3, 1806. He was a student at Lima, and with several classmates ran away and joined the patriot army in 1821; served through the revolution; was lieutenant-colonel under Lamar; headed revolts against Gamarra 1833, and was general of division in the campaign against him 1834; declared against Orbegoso Feb. 23, 1835, seized Lima, and proclaimed himself supreme chief of Peru. In the confused condition of affairs most of the people of the republic adhered to him. Orbegoso invoked the aid of Santa Cruz, president of Bolivia, who marched into Peru; Salaverry was defeated, captured, and shot at Areqnipa, Feb. 19, 1836. He was a brilliant and popular leader and a writer of some note. H. H. S.

Saldanha Oliveira e Daun, saäl-daan'yaä-ō-lĕe-vā'i-raä-ā-down', João Carlos, Duke of Saldanha: statesman and soldier; grandson of the Marquis of Pombal; b. at Lisbon, Nov. 17, 1791; fought against the British and was taken prisoner, but was soon permitted to join the Portuguese court at Rio de Janeiro, where he served in the army and held important official positions. When Brazilian independence was declared he returned to Portugal, and afterward as a moderate constitutionalist and supporter of Dom Pedro took part in the war against Dom Miguel. At first unsuccessful, he was again forced to leave the country, but returned in 1832, and after repeated successes received the capitulation of Dom Miguel at Evora 1834. He became Minister of War and president of the council May 31, 1835, but resigned in November of the same year. Having taken part in the unsuccessful conservative revolution of 1836, he lived abroad until recalled by the queen in 1846. In the following year he formed a ministry; was replaced by the second dictatorship of Costa Cabral 1849; overthrew that administration by force of arms 1851; conducted the government until the accession of Pedro V. (1856), when he became again the head of the opposition; was minister at Rome 1862–64, and again 1866–69; went to Paris as minister Mar., 1869; instigated a revolution in the palace May 19, 1870, in consequence of which he again became Prime Minister, but resigned in August, and was sent to London, where he died Nov. 21, 1876. F. M. Colby.

Sale (of goods): the transfer by the seller of the general property in goods to the buyer, pursuant to contract, for a

money consideration. If a speeial property only is transferred, the transaction may be a BAILMENT (*q. v.*) or a lease, but is not a sale. A part-owner's interest in goods is a general property. When goods are transferred for goods or serviees the transaetion is not a technical sale, but a barter, although for most purposes, except that of eommon-law pleading, the rules governing the two transaetions are the same. An agreement to sell is one whose performanee is to result in the transfer of the general property in goods at a future time or on the fulfillment of some eondition.

Quasi-sale.—The property in goods may be transferred for a priee without a contraet between the parties. This happens where the owner sues for trespass to or conversion of goods and recovers and eolleets a judgment for their full value. It has been called an involuntary sale. Title does not pass until the judgment is paid; but there is eonsiderable authority in the U. S. for the doctrine that upon payment of the judgment the quasi-purchaser's title, as against the judgment creditor, relates back to the original conversion. *Smith* vs. *Smith*, 51 N. H. 571.

Subject-matter.—This, in the case of a present sale, is goods then owned by the seller, but in the case of an agreement to sell it may be goods thereafter to be procured or produced. Aecording to the common law, the owner of property can make a valid present sale of its product, growth, or increase; for example, the offspring of his animals, the wool of his sheep, the milk of his cows, the crops to be grown on his land. Such future goods are treated as having a potential existenee, and, as soon as they come into aetual existence, become the property of the buyer. A eontraet purporting to be a present sale of property which has neither actual nor potential existence can operate only as an agreement to sell. In such a case the legal title will not pass to the purchaser until the goods are delivered to him by the seller, or until he takes possession of them under authority derived from the seller. The rule in equity is somewhat different. It is stated as follows in the leading English case of *Holroyd* vs. *Marshall* (10 House of Lords Cases 191): "A man can not in equity, any more than in law, assign what has no existence. A man can contract to assign property which is to come into existence in the future, and when it has come into existenee equity, treating as done that which ought to be done, fastens upon that property, and the contract to assign thus becomes a complete assignment." It should be borne in mind that even under this doctrine the purchaser gets only the equitable interest and not the legal title, so that his claim to the property may be defeated wholly by the seller's transferring it to another purchaser for value without notice. This equity rule is not aecepted in all jurisdictions. See *Blanchard* vs. *Cooke*, 144 Mass. 207.

Where parties agree for the sale and purchase of a particular thing whieh, without their knowledge, has perished, there is no contract, for there is no subject-matter. Where they agree to sell and to buy a particular thing which perishes without fault of the seller before the property passes, the agreement is avoided. In such a ease the contract is conditional on the performance remaining possible.

The Price.—This is generally determined by the agreement between the parties. It may be left, however, to be fixed in the future, as by reference to the price then eurrent, or even by the valuation of a third party. In the latter case, if the third party can not or does not make a valuation, the contract is avoided, but if the buyer has appropriated any of the goods, he is bound to pay a reasonable price therefor; and if the third party's failure is caused by the fault of either contracting party such one will be liable to the other in damages. Where goods are sold without any statement or provision as to price, the purchaser is bound at common law to pay a reasonable price; that is, the price which the jury shall decide to be reasonable. While the market price is treated ordinarily as reasonable, it may be highly unreasonable owing to a corner, a pool, or a trust.

Condition and Warranty.—A brief statement of the leading principles of these important and diffieult topics must suffice. A condition is a material term of the eontract of sale, the breach of whieh gives the other party the right to treat the eontract as repudiated. It may be expressed by the parties or implied by law. Some of the implied eonditions in sales are the following: That the seller has a right to sell the goods; that goods sold by description shall correspond with the description; that the bulk of goods sold by sample shall correspond with the sample in quality, and that the buyer shall have a reasonable opportunity to compare them. A stipulation as to time of payment is not treated as a condition ordinarily, although in several of the U. S. it has been held that a sale of speeific goods for eash is eonditional, and that title does not pass until such payment is made or waived.

In the law of sales a warranty is not a term of the sale eontraet, but is an agreement respecting the goods subsidiary and eollateral to the sale contraet, the breaeh of which does not give the other party the right to treat the contraet as repudiated, but only the right to damages. Sueh at least is the doctrine established by the English courts, and declared by the Sale of Goods Act of 1893 (56 and 57 Viet., c. 71) to be the law of England and Ireland. The same statute provides that in Scotland a breaeh of warranty by the seller may be treated by the buyer as a breaeh of condition, and that the latter may within a reasonable time after delivery rejeet the goods and treat the eontract as repudiated. This doetrine obtains in some of the U. S. (See *Smith* vs. *Hale*, 158 Mass. 178.) Warranties are either express or implied. The word warrant is not necessary to an express warranty, nor is actual intention to warrant on the part of the seller essential. If the language employed eontains an assertion, as distinguished from a mere opinion, that the subject of the sale has certain qualities or will answer eertain requirements, and the assertion is relied upon by the buyer in making the purchase, there is an express warranty. An example of an implied warranty is found in a sale by sample—that the goods shall be free from any defect, rendering them unmerchantable, which is not apparent on a reasonable examination of the sample.

Transfer of Property.—This, in the ease of aseertained or specific goods, is determined by the intention of the parties. Frequently they fail to disclose their intention, and the courts have found it necessary to establish rules, more or less arbitrary, for the decision of sueh cases. These rules are formulated as follows in the British Sale of Goods Act (*supra*): Rule 1. When there is an unconditional contract for the sale of specific goods, in a deliverable state, the property in the goods passes to the buyer when the contraet is made, and it is immaterial whether the time of payment or the time of delivery, or both, be postponed. This rule is modified in some of the U. S. by the doetrine that in eash sales the property does not pass until payment. Rule 2. Where there is a contraet for the sale of speeifie goods, and the seller is bound to do something to the goods for the purpose of putting them into a deliverable state, the property does not pass until such thing be done, and the buyer has notiee thereof. Rule 3. When there is a contract for the sale of specific goods in a deliverable state, but the seller is bound to weigh, measure, test, or do some aet or thing with referenee to the goods for the purpose of ascertaining the price, the property does not pass until such aet or thing be done, and the buyer has notice thereof. If the buyer is to do the weighing, etc., or the goods are delivered to the buyer before weighing, etc., property passes at onee. In the U. S. there is authority for the view that, if the goods are aseertained, property will pass, although weighing, ete., may be necessary in order to arrive at the total price. (*Sanger* vs. *Watterbury*, 116 N. Y. 371.) Rule 4. When goods are delivered to the buyer on approval, or "on sale or return" or other similar terms, the property therein passes to the buyer when he signifies his approval or aceeptanee to the seller, or does any other act adopting the transaction; if he does not signify his approval or acceptanee to the seller, but retains the goods without giving notiee of rejeetion, then, if a time has been fixed for the return of the goods, on expiration of sueh time, and if no time has been fixed, on the expiration of a reasonable time. What is a reasonable time is a question of fact. In the U. S. it is held generally that a contract "of sale or return" of ascertained goods vests the property in the buyer at once, with an option to return.

In ease of an agreement to sell goods of a particular deseription, as distinguished from a present sale, property will pass when goods of that deseription and in a deliverable state are appropriated uneonditionally to the contract. The assent of both seller and buyer to the appropriation is neeessary, but either party may give his assent in advanee, and the assent may be express or implied. "The seleetion of the goods by the one party, and the adoption of that act by the other, converts that which was before a mere agreement to sell into an actual sale, and the property thereby passes." (*Rhodes* vs. *Thwaites*, 6 Barnwell and Cresswell 388.) Where the buyer orders goods to be sent to him by the seller, implied assent is given by the purchaser to the seller to make the appropriation; and the appropriation is complete upon

the delivery of the goods to the buyer, or to a third person for transmission to the buyer. If such appropriation is unconditional, and the goods conform to the order, property passes. But the seller may appropriate the goods conditionally. In such case property does not pass until the imposed conditions are fulfilled. For example, the seller may take a bill of lading of the goods in his own name, attach thereto a draft for the purchase price, and require payment of the draft as a condition of the buyer's acquiring the property. Where the condition is expressly imposed the rights of the parties are clear. Frequently the language and acts of the parties are equivocal, and the question whether the seller intended to appropriate the goods absolutely to the contract or to reserve to himself the right to their disposal becomes a difficult one. This is exemplified by the case of *The Calcutta Company* vs. *De Mattos* (32 *Law Journal*, Queen's Bench 322; 33 *ibid.* 214), the judges of the lower court being equally divided as to the intention of the parties, and, on appeal, two of the judges entertaining a third view.

Where a contract is made for the manufacture and delivery of an article, the property therein does not pass, according to the English decisions and those of many of the U. S., until delivery and acceptance, or until the article is ready for delivery and approved by the buyer. In some of the States it is held that the buyer assents in advance to the appropriation of the finished article to the contract, and that title passes upon the seller's tendering it.

Whether a contract for the sale of a part of a larger bulk of goods, of uniform kind and quality—e. g. 1,000 bush. of wheat from a grain elevator, or 100 gal. of oil from a tank, or 50 barrels of flour from a car-load—is one for a present sale of specific goods, or one for the sale of goods thereafter to be ascertained, is a question upon which the authorities are divided. The English view, which has been adopted in many of the U. S., is that the contract can not be more than an agreement to sell, and that property can not pass until the portion contracted for has been separated from the bulk. It is said there is no individuality until it is divided; the law knows no such thing as a floating right of property, which may attach itself either to one parcel or the other, as may be found convenient afterward. (*Golder* vs. *Ogden*, 15 Penn. St. 528.) On the other hand, it is maintained by many State courts that the subject-matter of such a contract is ascertained or specific goods, where it is a designated quantity out of a specified mass of uniform quality (*Kimberly* vs. *Patchin*, 19 N. Y. 330); and that the property in such designated quantity will pass, upon making the contract, if the parties so intend. This doctrine seems to accord with commercial usage. In some States it has been adopted wholly or in part by statute. See Mass. Pub. Stat., c. 72, § 7.

Risk of Loss.—This, unless otherwise agreed, passes from the seller to the buyer with the property in the goods, without regard to their possession. If delivery has been delayed through the default of either buyer or seller, the goods are at the risk of the party making default as regards any loss which would not have occurred but for such default. Sale of Goods Act, § 20.

Transfer of Title.—At common law a person can give no better title to goods than he possesses, unless he acts as the true owner's agent, or unless the true owner's conduct respecting the goods has estopped him from denying such person's authority to sell them. (See ESTOPPEL.) In England this rule does not apply to sales in MARKET OVERT (*q. v.*), and there, as well as in most of the U. S., it has been modified by Factors' Acts and similar statutes. The chief feature of this legislation is the power it confers on agents or consignees, who are intrusted by the owner with goods or with documentary evidence of title thereto, such as a bill of lading, warehouse certificate, delivery order, or the like, to give a perfect title to *bona-fide* purchasers. See *Lee* vs. *Butler* (1893), 2 Queen's Bench 318; *Goodwin* vs. *Mass. Company*, 152 Mass. 189; *Soltau* vs. *Gerdau*, 119 N. Y. 380, applying such legislation.

As delivery is not necessary to the transfer of ownership of goods, it should follow that one who has sold goods to A can not give title to them to B, although they are allowed by A to remain in his possession. Such is the general rule. In a few of the U. S. the courts have held that a seller who has never delivered the goods to the first purchaser may confer a perfect title upon a second *bona-fide* buyer. (*Huschle* vs. *Morris*, 131 Ill. 587.) The adoption of this doctrine in the British Sale of Goods Act, § 25, is "the result of a long struggle between the mercantile community on the one hand and the principles of the common law on the other."

We have seen that the owner of goods may deliver them under a contract that the title shall remain in him, until the performance of some condition by the buyer, such as the full payment of the price. Here the common law does not recognize any power in the conditional vendee to pass any greater interest than he possesses. (*Harkness* vs. *Russell*, 118 U. S. 663.) A different rule has been declared by the Pennsylvania courts, and statutes have been passed in many jurisdictions requiring contracts for conditional sales to be in writing and recorded, in order to be effectual against the buyer's creditors and *bona-fide* vendees.

Seller's Duties.—The most important is that of delivery. If the contract specifies the time, place, and manner of delivery, its terms must be followed. In the absence of agreement or custom, the seller must deliver the goods upon payment or tender of the price; the place of delivery is the seller's place of business, or residence, or their place of deposit at the time, according to the subject-matter of the sale; or, if the seller is to send the goods to the vendee at a distance, the place of their receipt by the common carrier; delivery must be made at a reasonable hour; the exact quantity agreed upon must be delivered. Any expense incidental to putting the goods into a deliverable state must be borne by the seller. He is also bound, when delivering goods to a carrier on behalf of the buyer, to make a reasonable contract for their transportation, and to give accurate directions for their delivery to the buyer. If the buyer has not had an opportunity to inspect the goods, the seller must afford him a reasonable opportunity for inspection so that he may ascertain whether they are in accordance with the contract.

Buyer's Duties.—The buyer is bound to accept and pay for the goods, and, if the terms of the contract require it, he must send for them. While the buyer is under no obligation to accept a different quantity of goods from that which he ordered, if he does accept it he must pay therefor at the contract rate. In case the buyer rightfully rejects goods tendered to him by the seller, he is under no duty to return them; he need only inform the seller of his rejection. The courts have experienced much difficulty in some cases in determining whether the buyer has accepted the goods. Perhaps no better rule can be framed on this subject than the one laid down in the British Sale of Goods Act, § 35. "The buyer is deemed to have accepted the goods when he intimates to the seller that he has accepted them, or when the goods have been delivered to him, and he does any act in relation to them which is inconsistent with the ownership of the seller, or when, after the lapse of a reasonable time, he retains the goods without intimating to the seller that he has rejected them."

Seller's Remedies.—If the property in the subject-matter of the sale contract has passed to the buyer, or if the buyer has agreed to pay the price on a day named, the seller can maintain an action for the purchase price. In other cases the buyer's breach of his contract will give the seller the right to maintain an action for damages for refusal to accept and pay for the goods. (See DAMAGES, MEASURE OF.) According to English decisions, the refusal of the buyer to take and pay for goods, the property in which has passed to him, does not divest him of such property, unless by the terms of the contract such a result is stipulated for, and with slight modifications such is still the rule under the Sale of Goods Act (§§ 39 and 48). The doctrine which generally obtains in the U. S. is as follows: "The vender of personal property, in a suit against the vendee for not taking and paying for the property, has the choice ordinarily of either one of three methods to indemnify himself: (1) He may store or retain the property for the vendee, and sue him for the entire purchase price; (2) he may sell the property, acting as the agent for this purpose of the vendee, and recover the difference between the contract price and the price obtained on such resale; or (3) he may keep the property as his own, and recover the difference between the market price at the time and place of delivery and the contract price." (*Dustan* vs. *McAndrew*, 44 N. Y. 72.) Other remedies of the seller are discussed under STOPPAGE IN TRANSITU (*q. v.*).

Buyer's Remedies.—These are an action for damages for breach of the seller's contract, or for CONVERSION (*q. v.*), or for SPECIFIC PERFORMANCE (*q. v.*).

Other topics connected with sales of personal and real property are presented in the articles on DEED and FRAUDS, STATUTE OF (*q. v.*).

Authorities.—Benjamin on *Sales*; Blackburn on *Sales*; Campbell on *Sales*; Newmark on *Sales*; Williston, *Cases on Sales*; Bingham, *Executory Contracts for the Sale of Real Property*; Clerke and Humphrey, *Sales of Land*; and Sugden, *Vendors and Purchasers.*

Francis M. Burdick.

Roman and Modern European Law of Sale.—The contract of sale imposes upon the vendor and vendee obligations substantially identical with those of the English common law. The chief points of difference are as follows: (1) The vendor impliedly warrants that the vendee shall not be disturbed in his possession of the thing sold (*rem habere licere*); and this warranty is not a collateral or subsidiary obligation, but a part of the contract. Many of the modern codes have changed this warranty of quiet possession into a warranty of title; but since, as a rule, no liability is incurred by the vendor until the purchaser is deprived of possession, the change is of theoretical rather than practical importance. (2) The vendor impliedly warrants that the thing sold is what it appears to be. If important defects are discovered, which were not obvious, and of which the vendee was unaware, he has his choice between a rescission of the sale and a suit for the difference between the price paid and the real value. The fact that the vendor was also ignorant of the defects is no bar to either action; but the fact that he knew the defects and did not mention them may make him liable on the ground of fraud.

As far as the reciprocal obligations of the vendor and vendee are concerned, the Roman law draws no distinction between the executory and the executed contract. It has, indeed, no technical terms to express this distinction. As far as the passing of title is concerned, sale is treated simply as a form of conveyance (*traditio*), and the rule is, as in other conveyances, that title passes only with delivery of possession. The French code declares, indeed, that title passes with the conclusion of the contract; but since this rule does not affect honest third parties, the change is rather apparent than real. The German codes retain the Roman rule. A further rule of the Roman law of sale is that title does not pass with delivery until the price is paid, unless it be expressly or impliedly agreed that the price is not to be paid at once. This rule is generally discarded in the modern codes.

It is a rule of the Roman law that with the conclusion of the contract the property sold is at the risk of the vendee. If, therefore, the thing sold is destroyed or damaged before delivery, without fault on the part of the vendor, the vendee is still bound to pay the full price agreed upon. This rule is certainly inconsistent with the theory that title does not pass before delivery, and it has been discarded in the Prussian and Austrian codes, and in the German draft code.

Among the more recent treatises are those of Couëtoux (Paris, 1874), Bernhöft (Jena, 1874), and Bechmann (Erlangen, 1884). Munroe Smith.

Sale, George: Orientalist; b. probably in Kent, England, about 1690; educated at King's School, Canterbury; became a lawyer; wrote the Oriental biography and criticism for Dr. Thomas Birch's translation of Bayle, entitled *A General Dictionary, Historical and Critical* (10 vols. fol., London, 1734–41), and executed a still unrivaled translation of the *Koran* (1734), to which he prefixed a scholarly *Preliminary Discourse* upon Arabian history, manners, customs, and religion before Mohammed. The liberal manner in which Sale spoke of Mohammed fastened upon him the reputation of heresy. D. in London, Nov. 14, 1736.

Sale, Sir Robert Henry, K. C. B.: soldier; known as the hero of Jellalabad; b. in England in 1782; son of Col. Sale of the East India Company's service; entered the army at the age of thirteen; was engaged in the storming of Seringapatam 1799, at the storming of the Travancore lines 1809, at the capture of Mauritius 1810, and in the Burmese war of 1824–25. He was appointed in 1838 to the command of the first Bengal brigade in the army on the Indus, which constituted the advance guard of the expedition against Afghanistan; commanded the storming party at Ghazni July 23, 1839, on which occasion he was severely wounded; was knighted and promoted to the local rank of major-general the same year; subdued the Kohistan country Sept., 1840; captured several fortresses; defeated Dost Mohammed Khan at Purwan, obliging him to surrender. In evacuating Afghanistan in 1841 he had to fight his way through the Khurd, Cabul, and Jagdalak passes and other strongholds, but was compelled to retreat upon Jellalabad, where he was besieged by Akbar Khan from Nov. 12, 1841, to Apr. 9, 1842, when he attacked and utterly routed the Afghans, capturing guns, ammunition, and camp—a feat which procured him the thanks of Parliament and the highest military reputation; took part in the general action of Tezen and the recapture of Cabul; and in the Punjaub campaign of 1845 as quartermaster-general, but was mortally wounded at the battle of Mudki Dec. 18, 1845, and died Feb. 28, 1846.—His wife, Lady Florentia Wynch Sale, b. in England, was a witness of much of her husband's career in India, and wrote *A Journal of the Disasters in Afghanistan in 1841–42* (1843). She also furnished descriptions of the plates to a folio volume entitled *Sale's Defense of Jellalabad* (1846), and supplied materials to Rev. G. R. Gleig for his book, *Sale's Brigade in Afghanistan* (1846).

Sale, Bill of: See Bill of Sale.

Salem (native *Selam* or *Shelam*): town of British India; capital of a district of the same name in the Presidency of Madras; on the Toiromanni, at an elevation of 1,070 feet above sea-level (see map of S. India, ref. 6–E). The town has a railway station and is well built, and has important cotton and silk manufactures. Pop. (1891) 67,710. M. W. H.

Salem: city; capital of Marion co., Ill.; on the Balt. and Ohio S. W. Railway; 16 miles N. E. of Centralia, 71 miles E. of St. Louis (for location, see map of Illinois, ref. 9–E). It is in an agricultural and coal-mining region; grows, evaporates, and ships large quantities of fruit; and contains a national bank with capital of $50,000, and three weekly newspapers. Pop. (1880) 1,327; (1890) 1,493; (1900) 1,642.

Editor of "Republican."

Salem: town; capital of Washington co., Ind.; on the Louisv., New Alb. and Chi. Railway; 35 miles N. N. W. of New Albany (for location, see map of Indiana, ref. 10–E). It is in an agricultural region; has quarries of oölitic limestone, 3 sawmills, 2 planing-mills, steam-tannery, and chair-factory, and contains 5 churches, high school, 2 public-school buildings, Eikosi Academy, water-works, electric-light plant, a State bank with capital of $25,000, a private bank, and 3 weekly newspapers. Pop. (1880) 1,615; (1890) 1,975; (1900) 1,995. Editor of "Leader."

Salem: city; chief county seat of Essex co., Mass.; on Massachusetts Bay, and the Boston and Maine Railroad; 16 miles N. E. of Boston (for location, see map of Massachusetts, ref. 1–I). It is on a peninsula between two arms of the sea, with an excellent drive along the North shore; is irregularly laid out, but compactly built; and has a commodious, sheltered harbor, which is a refuge for coasting vessels in storms. There are three public parks—Washington Square, of 8 acres, in the center of the city; Mack Park, in North Salem; and The Willows, of 30 acres, a mile E. on the Neck Shore. The city is a modern Mecca for historical pilgrims and antiquaries, and an important center of trade and shopping for a large district which is connected by an elaborate system of electric street-railways. It contains many fine residences, two court-houses, a U. S. custom-house (see introduction to Hawthorne's *Scarlet Letter*); city-hall, jail, water-supply from Wenham Lake, 4 miles distant, and gas and electric-light plants.

Churches and Schools.—Salem has 21 churches: 3 Unitarian, 3 Congregational, 3 Baptist, 4 Roman Catholic, 2 Protestant Episcopal, 2 Methodist Episcopal, and one each Swedenborgian, Friends, Universalist, and Advent. The public-school system comprises a State normal school for girls, a high school, 5 grammar schools, 12 primary schools, 4 kindergartens, 2 evening schools, and a drawing and an industrial school. In 1900 there was a public-school enrollment of 4,987 pupils, and the cost of maintenance was $117,000. There are 3 large Roman Catholic parochial and many private schools.

Charitable and Benevolent Institutions.—With the exception of the city alms-house and the administration expenses of the public library, all scientific, literary, and charitable institutions are maintained by private trusts and subscriptions. The city holds, in addition, trust funds for charitable and educational purposes amounting to $110,000. The principal institutions are 3 free hospitals, Old Men's Home, Old Ladies' Home, two homes for children, a farm school for boys, a Woman's Friend Society, and the Fraternity.

Finances and Banking.—The public expenditures in 1900 were $666,819; receipts, $170,000; the assessed valuations,

$28,995,000, of which $18,910,900 was on real estate; and the net debt, Jan. 1, 1901, was $777,896. There are 6 national banks with combined capital of $2,000,000, 2 savings-banks with combined deposits of $12,000,000, and 3 mutual insurance companies.

Business Interests.—Salem merchants early established fishing industries; in 1670 sent vessels to the West Indies and Europe; and immediately after the Revolutionary war opened trade with China, India, Java, Sumatra, the Philippine islands, Arabia, Cape of Good Hope, Russia, South America, and other foreign parts. For many years the city was noted for its large foreign trade, and at one time had almost the monopoly of the East India and China trade; but it no longer has a foreign commerce. There is a large coasting trade, and an immense tonnage of coal is here landed for transshipment to interior cities. The manufactories comprise a cotton-mill with 160,000 spindles, a lead-factory, and several tanneries, machine-shops, and shoe-factories.

Notable Buildings.—There are a few buildings typical of the period of 1634–1700. The public library (established in 1889) contains 40,223 volumes; the Essex Institute (society established in 1848) has a library of 40,000 volumes, and 100,000 pamphlets on science, art, local history, and music, a large collection of historical relics and portraits, and the frame of the Puritan meeting-house of 1634; the Peabody Academy of Science has a museum of ethnology (including an East India marine museum dating from 1799) and zoölogy, and special collections of Essex County zoölogy, botany, and archæology; and the Athenæum has a library of 20,000 volumes.

History.—Salem was settled by Roger Conant and the "Old Planters" in 1626. Endicott, with a second charter, came in 1628. Banished by the magistrates, against the wishes of his people, Roger Williams went from Salem to settle Rhode Island in 1636. In 1692, as the result of the witchcraft delusion in Salem village (Danvers), nineteen persons were hanged by order of the court, appointed by the royal governor, sitting in Salem. Here, too, the awakening first occurred, and in 1693 all convicted and accused persons were set free. In the Revolution the first provincial assembly sat here in 1774; the first armed resistance to British authority (Leslie's Retreat) occurred at the North bridge Feb. 26, 1775; and Salem furnished large numbers of troops and 158 armed privateers. The U. S. frigate Essex was built in Salem in 1799. In the war of 1812–15, 40 of the 250 American armed vessels went from Salem, and in the war of 1861–65 the city furnished 3,000 men and gave 200 lives to the Union cause. Pop. (1880) 27,563; (1890) 30,801; (1900) 35,966.

WINFIELD S. NEVINS.

Salem: city (founded in 1854); capital of Dent co., Mo.; on the St. L. and San Fran. Railway; 127 miles S. W. of St. Louis (for location, see map of Missouri, ref. 6–I). It is in an agricultural, stock-raising, and iron-mining region; and contains 7 churches, Salem Academy, 5 roller-process flour-mills, 3 steam planing-mills, several sawmills, 2 State banks with combined capital of $40,000, and 4 weekly newspapers. Pop. (1880) 1,624; (1890) 1,315; (1900) 1,481.

EDITOR OF "MONITOR."

Salem: city; capital of Salem co., N. J.; on the Salem river, and the W. Jersey Railroad; 14 miles S. E. of Wilmington, Del., 34 miles S. W. of Philadelphia (for location, see map of New Jersey, ref. 6–B). It is in a rich agricultural region, has regular steamboat communication with Philadelphia, and contains 13 churches, high school, several public schools, Friends' School, public library (founded in 1804), 4 hotels, 2 national banks with combined capital of $250,000, and 3 weekly newspapers. There are 6 canneries for fruit and vegetables, 3 iron-foundries, 3 manufactories of glass, machine-shops, mills, hosiery, and hollow-ware and oilcloth factories. Pop. (1880) 5,056; (1890) 5,516; (1900) 5,811.

W. H. CHEW, EDITOR OF "STANDARD."

Salem: village; capital of Washington co., N. Y.; on the Delaware and Hudson Railroad; 25 miles S. of Whitehall, 41 miles N. E. of Troy (for location, see map of New York, ref. 4–K). It is in an agricultural, dairying, and slate-quarrying region, is a popular summer resort, and contains Washington Academy (opened in 1791), St. Paul's Hall (Protestant Episcopal, opened in 1885), Raleigh School, 2 national banks with combined capital of $100,000, 2 weekly newspapers, cheese-factory, several mills, and railway repair-shops. Pop. (1880) 1,410; (1890) not separately returned; (1900) 1,391.

Salem: city (founded by Moravians in 1766); Forsyth co., N. C.; on branches of the Norfolk and Western and the Southern railways; adjoining Winston, the railway station and banking-place; 112 miles W. of Raleigh (for location, see map of North Carolina, ref. 2–F). It was the center of important movements in the early Indian and the Revolutionary wars, and was visited by Union and Confederate armies in the war of 1861–65. It is the seat of Salem Female Academy (Moravian, founded in 1802), which retains its original name, although it has become one of the leading colleges for women in the Southern States and has collegiate and post-graduate courses, schools of music, art, and languages, and commercial and industrial departments. The manufactories comprise cotton and woolen mills, tobacco-factories, and iron-works. Pop. (1880) 1,340; (1890) 2,711; (1900) 3,642.

JOHN H. CLEWELL.

Salem: city; Columbiana co., O.; on the Salem and the Penn. railways; 70 miles W. of Pittsburg, Pa. (for location, see map of Ohio, ref. 3–J). It contains 7 churches, 3 graded public schools, a public high school, 2 national banks with combined capital of $300,000, 2 private banks, 2 daily and 2 weekly newspapers, and manufactories of machinery, engines, sheet-iron, church-organs, wire nails, pumps, stoves, furniture, and other articles, art-works, church-furniture works, tile-works, and brick-works. Pop. (1880) 4,041; (1890) 5,780; (1900) 7,582.

EDITOR OF "DAILY NEWS."

Salem: city; capital of the State of Oregon and of Marion County; on the Willamette river, and the Southern Pac. Railroad; 53 miles S. of Portland (for location, see map of Oregon, ref. 3–C). It is in an agricultural and fruit-growing region; is laid out with streets 100 feet wide, and blocks 330 feet square, with 16-foot alleys; and is one of the handsomest cities on the Pacific coast. It has communication with Portland twice a day by railway and once a day by steamboat. Water for manufacturing purposes is brought to the city from the Willamette and Santiam rivers by a canal 18 miles long. In 1900 over $1,500,000 was invested in manufacturing industries, which included several large flour-mills, a woolen-mill, foundries and machine-shops, tanneries, tobacco-factories, plants for fruit-drying and canning, carriage and wagon factories, brick-kilns, and agricultural-implement works. The city contains 2 public parks, 20 churches, a public high school and 5 grammar schools, a State, a Masonic, and 2 educational libraries, Willamette University (Methodist Episcopal, opened in 1844), the Academy of the Sacred Heart (Roman Catholic, opened in 1860), a Friends' Institute (opened in 1892), a national bank with capital of $75,000, an incorporated bank, 2 private banks, and 4 daily, 4 weekly, and 2 other periodicals. The reformatory and charitable institutions comprise the State Penitentiary, Reform School, Deaf Mute School, Institute for the Blind, Insane Asylum, and Orphans' Home. The city is an important business center, and is very progressive. A Methodist mission was established 9 miles below the present city in 1834; the city was incorporated in 1853, and became the State capital in 1860. Pop. (1880) 2,538; (1890) 4,515; (1900) 4,258.

S. T. RICHARDSON.

Salem: town; capital of Roanoke co., Va.; on the Roanoke river, and the Norfolk and Western Railroad; 60 miles W. by S. of Lynchburg, 180 miles W. by S. of Richmond (for location, see map of Virginia, ref. 6–E). It is in an agricultural and tobacco-raising region, is the seat of ROANOKE COLLEGE (*q. v.*), has good water-power, and contains a graded public school, a national bank with capital of $75,000, a State bank with capital of $67,300, a loan and trust company with capital of $50,000, and a weekly and a monthly periodical. Pop. (1880) 1,759; (1890) 3,279; (1900) 3,412.

Saleratus: See SAL AËRATUS.

Saler'no; chief town of the province of Salerno, Italy; 33 miles by rail S. E. of Naples, on the Gulf of Salerno (see map of Italy, ref. 7–F). The chief object of interest is the old Norman cathedral (1084), injuriously restored in 1768, but still the most imposing specimen of Norman architecture in Southern Italy, and containing, besides rich marbles and mosaics, twenty-eight magnificent granite and porphyry columns from the temples of Pæstum. Tradition asserts that the body of St. Matthew was brought from the East in 930 and deposited in the crypt of the cathedral. Salerno was originally a Roman colony; it became the capital of a principality in the ninth century, and in 1077 it was taken by Robert Guiscard, who made it his capital. The

great boast of mediæval Salerno was its celebrated medical school. Its great reputation drew to it during many centuries invalids and pupils of all classes and nations. The *Schola Salernitana*, a set of hygienic rules drawn up in Latin at this school in the twelfth century, and dedicated to the King of England, was translated into many European languages, and published in numerous editions soon after the invention of printing. The *Erbario*, a still earlier medical work, also emanated from Salerno, and was widely circulated throughout Europe. Pop. of the commune (1892) about 39,000. Revised by M. W. HARRINGTON.

Sales, FRANCIS de: See FRANCIS DE SALES.

Saleyer (sā'lī'er) **Islands**: a group of about 30 small islands situated to the S. of the island of Celebes in the East Indies; area, 265 sq. miles; pop. 57,000, consisting of Mohammedan Malays, ruled by native chiefs, but subject to the Netherlands. Cotton, coffee, sugar, pepper, and mustard are cultivated; also maize and *botta* (a kind of millet), but not rice, on account of certain superstitious ideas of the natives. Fine timber, both sandal and teak, abounds.

Salford: city; in Lancashire, England; on the west bank of the Irwell (see map of England, ref. 7–F). It practically forms one town with MANCHESTER (*q. v.*) on the east bank of the Irwell. It is connected with Manchester by 16 bridges as well as by several railway viaducts. Salford covers an area of 8 sq. miles; has 4 public parks, 4 public libraries, and a museum. It returns three members to Parliament. Pop. (1891) 198,139; (1901) 221,015.

Salians: See FRANKS.

Salica'ceæ, or **Salicin'cæ**: See WILLOW FAMILY.

Sal'icin [from Lat. *sa'lix*, *sa'licis*, willow]: a bitter crystalline principle contained in the bark of all the willows and of some poplars. Its composition is $C_{13}H_{18}O_7$. It has no alkaloid properties, like quinine, strychnine, and some other crystalline bitter principles, but is a glucoside. By the action of hot dilute acids or of the ferment EMULSIN (*q. v.*) or synaptase it breaks up into glucose and another compound called saligenin:

$$\underset{\text{Salicin.}}{C_{13}H_{18}O_7} + H_2O = \underset{\text{Glucose.}}{C_6H_{12}O_6} + \underset{\text{Saligenin.}}{C_7H_8O_2}.$$

Salicin has valuable medicinal virtues in the treatment of intermittents, though much less efficient than quinine.

Salic Law [transl. of Lat. *Lex Salica*]: the law of the Salian Franks, who established a Frankish kingdom in Gaul in the fifth century; especially that provision of the Salic code which prevents women from inheriting any landed estate which is not an acquired but inherited possession in the family. This principle was appealed to in France in the controversy between Edward III. and Philip of Valois, with respect to the inheritance of the crown; and in Spain, where previously the Visigothic law prevailed recognizing the succession of women, it was introduced by the Bourbon, Philip V., in 1713, but abolished by Ferdinand VII. in 1830 in favor of his daughter Isabella. In accordance with a similar law the crowns of Great Britain and Hanover became separate in 1837. See *Lex Salica: the Ten Texts with the Glosses and the Lex Emendation* (London, 1880).

Salicyl'ic Acid (formula $C_7H_6O_3$; *oxybenzoic* and *para-oxybenzoic* acids have the same formula): an organic acid existing in the flowers of *Spiræa ulmaria*, and in combination as acid methylsalicylate, forming the essential oil of wintergreen (*Gaultheria procumbens*).

History.—It was discovered by Piria in 1838, who formed it by oxidizing salicylol (essential oil of *Spiræa ulmaria*) with chromic acid; in 1844 Cahours obtained it from oil of wintergreen; and in 1860 Kolbe and Lautermann discovered the mode of making it from phenol (carbolic acid). In 1874 Kolbe modified and improved his original process for the manufacture from phenol, and thereby cheapened the article so much that it could be brought into use in medicine and as an antiseptic. Some chemists—Fleck, Feser, and Friedberger—have made experiments with it, in which they call in question the claims made for it as an antiseptic. *Arch. f. Wissensch. u. prakt. Thierheilkunde*, 1875, Heft. 2, 3, and 4.

Formation.—Salicylic acid may be obtained in several ways—as (1) by treatment of salicylol with an oxidizing agent, as chromic acid; (2) by fusing salicylol with caustic potassa; (3) by treating oil of wintergreen with strong potash lye, or (4) with gaseous hydriodic acid; (5) by heating a mixture of indigo and caustic potash to 300°; (6) by treating phenol (carbolic acid) with sodium and carbon dioxide, (7) with sodium and ethylchlorocarbonate, (8) with acid potassium carbonate, or (9) with caustic soda, the mixture being heated and carbon dioxide passed into it.

Preparation.—For use, salicylic acid is made from oil of wintergreen or from phenol. In making it from the former the oil is simply heated with strong potash lye until methyl alcohol ceases to be evolved. The resulting product is potassium salicylate, from which hydrochloric acid precipitates salicylic acid. This is filtered off, washed, and purified by dissolving and recrystallizing from alcohol. To prepare it from phenol, the phenol is dissolved in caustic soda, the exact equivalence of each being used (an excess of one or the other having a considerable effect on the yield obtainable), and the solution is evaporated to dryness. The mass is then placed in a retort and heated gradually, and a current of carbon dioxide passed through it at a temperature between 120° and 140° C. under pressure; or, better, the sodium compound of phenol is mixed with liquid carbon dioxide at a low temperature in an autoclave and heated to the temperature 120° to 140° C. The mass left in the retort consists of sodium salicylate, which is dissolved in water and precipitated by hydrochloric acid. It is usually brownish, on account of a resinous impurity, which may be more or less perfectly removed by resolution and recrystallization or passing the solution through bone-black.

Properties and Uses.—Salicylic acid when pure crystallizes in white four-sided prisms, which fuse at 155°–156° C. It has a sweetish-sour taste, reddens litmus strongly, is slightly soluble in cold water (in proportion of 1 part to 1,000 of water), more so in hot, still more so in alcohol, ether, and oil of turpentine. By heating with strong hydriodic or hydrochloric acid or with dilute sulphuric acid it decomposes into phenol and carbonic acid. It is a dibasic acid, forming acid and neutral salts. In very small quantities it acts as an antiseptic, and experiments have shown its efficiency in preserving wines, beer, milk, eggs, and other articles of food from the changes which unfit them for use. It can not, however, be used for milk and butter, as it gives them a peculiar taste. Experiments in the preservation of meat gave unsatisfactory results. Its action as a disinfectant is not so powerful as that of carbolic acid. When acting as an antiseptic it appears to undergo no chemical change. Its salts have no disinfecting or antiseptic properties. On account of its being odorless and less irritating than carbolic acid, and not poisonous, it has been used with advantage in surgical treatment, where it can be used for every purpose for which carbolic acid is used, except for the cleansing of instruments. In medicine, salicylic acid is used as an antipyretic, and as an internal factor as antiseptic in cases of diphtheria. The dose is from 7 to 45 grains. It is frequently dispensed in solutions of alkaline phosphates, in which it is more soluble than in pure water. Its use has been proposed in the manufacture of glue, leather, etc., of perfumery, and as a dye in connection with iron salts, with which it gives a fine purple. It has been used with great success as a remedy in the case of certain diseases that affect bees. It has come into extensive use in the manufacture of dyestuffs. Certain azo-colors obtained by its use are much prized as yellow and orange dyes. Revised by IRA REMSEN.

Sali'da: city; Chaffee co., Col.; on the Denver and Rio Grande Railroad; 56 miles W. of Cañon City, 97 miles N. by W. of Pueblo (for location, see map of Colorado, ref. 4–D). It is in a region in which gold, silver, copper, lead, and iron are mined, and marble, onyx, and lime are quarried; has large stock-raising interests; and contains 6 churches, the Rio Grande General Hospital, extensive railway-shops, a public high school, Salida Academy (Presbyterian, opened in 1884), a national bank with capital of $50,000, and a semi-weekly, a weekly, and a monthly periodical. Pop. (1880) not in census; (1890) 2,586; (1900) 3,722.

EDITOR OF "MAIL."

Salien'tia [Mod. Lat., from Lat. *sa'liens*, neut. plur. *salien'tia*, pres. partic. of *sali're*, leap]: that order of BATRACHIA (*q. v.*) which contains the frogs and toads, and which, from the fact that in the adults the tail is lacking, is better known as *Anura*. In the larval (tadpole) stage gills and tail are present, while legs are absent. With growth the gills and tail are absorbed (the tail is not dropped as is often supposed), and the legs grow out, the fore legs being the first to form, although owing to the fact that they are covered by a fold of the skin they do not appear until after the hinder pair. With the loss of the gills the lungs begin to function, and these are supplemented by the skin. In the

adult the following skeletal peculiarities may be mentioned: Ribs as a rule are lacking, their place being taken by the transverse processes of the few (usually ten) vertebræ. The caudal vertebræ have been replaced by a bony rod (urostyle). The skull is very complex; the ethmoid bone is in the shape of a girdle (*os en ceinture*) around the cerebrum, and the quadrato-jugal arch is usually complete. Teeth never occur in the lower jaw, and they may be lacking from the upper one. Pectoral and pelvic girdles are always present, and the two halves of the former may either be firmly united or they may play one over the other, differences seized upon by Prof. Cope to divide the otherwise homogeneous order into two subdivisions. The skin is naked (i. e. without plates or scales), but it is not infrequently "warty," from the presence of large defensive glands which secrete an acrid fluid. In all except a few tropical forms a tongue is present, and is used in capturing the prey, which consists to a large extent of insects.

Some of the *Salientia* are aquatic (frogs), some (toads) are terrestrial, going into the water only for the purpose of oviposition in the spring, and still others (tree-toads) live in trees and bushes, and have the tips of the toes modified into sucking-disks to insure a firm hold upon the branches upon which they dwell. All of the *Salientia* have vocal organs, but these are most exercised at the time of reproduction. Most interesting are some of the reproductive habits. The eggs are laid in gelatinous strings or masses, usually deposited freely in the water. In the case of the obstetrical toad of Europe the male wraps the egg-strings around himself. In the members of the genus *Nototrema* of South America the skin of the back becomes folded into a sac in which the eggs are carried until hatched. In the Surinam toad (*Pipa*) the eggs are received upon the back of the male, the skin of which grows up around the separate eggs until each is inclosed in a cup and covered with a lid of skin. In these cups the eggs develop until they have obtained the adult form, when they escape to begin free life.

None of the *Salientia* is marine. Their great home is in the tropics. The typical toads are especially developed in tropical America, Africa, and Asia; the true tree-frogs and related forms are most abundant in Australia and tropical America; and the typical frogs are most numerous in tropical Asia and Africa, while they are entirely excluded from Australia. Comparatively little is known of their geological history, but frogs and toads have been found in the Upper Eocene of Europe.

LITERATURE.—Ecker, *Anatomie des Frosches* (1864–82); Boulenger, *Catalogue of the Batrachia Salientia in British Museum* (London, 1882); Cope, *Batrachia of North America* (1889).

J. S. KINGSLEY.

Saligenin: See SALICIN.

Sali'na: city; capital of Saline co., Kan.; on the Smoky Hill river, and the Ateh., Top. and S. Fé, the Chi., Rock Is. and Pac., the Mo. Pac., and the Union Pac. railways; 47 miles W. of Junction City, 118 miles W. of Topeka, the State capital (for location, see map of Kansas, ref. 5–G). It derives power for manufacturing from the river, has 5 grain elevators, flour-mills, paper-mills, and planing-mills, foundry and machine shops, gas, water, and electric-light plants, and street-railways, and contains 16 churches, 5 public schools, Kansas Wesleyan University (Methodist Episcopal, chartered in 1885), Normal University, St. John's School (Protestant Episcopal), 3 national banks with combined capital of $250,000, a State bank with capital of $50,000, and a daily, 5 weekly, and 3 monthly periodicals. There are valuable salt-springs and gypsum-quarries in the vicinity. Pop. (1880) 3,111; (1890) 6,149; (1900) 6,074.

EDITOR OF "REPUBLICAN JOURNAL."

Salina Group: an American geological formation of Upper Silurian age, otherwise known as the Onondaga salt group. It consists of red and green shales and impure limestone, containing large masses of gypsum, and is best developed in Central New York, where it is about 1,000 feet thick and forms an east-and-west belt averaging about 10 miles broad, passing through Syracuse. It is the source of brine from which 8,000,000 to 12,000,000 bush. of salt are made annually.

I. C. R.

Sali'nan Indians: a linguistic stock of North American Indians deriving its name from the Salinas river, California, in the main and tributary valleys of which, in Monterey and San Luis Obispo Counties, they formerly resided. It is represented by a single known tribe, the Chalone, whose villages were Aspasniagan, Chulare, Ekgiagan, Eslanagan, Gocharone, Ichenta, and Yumanagan. These settlements supplied the neophytes of the missions of San Antonio and San Miguel, established by the Spanish padres in 1771 and 1797 respectively. A large proportion of the natives connected with the Soledad mission, founded in 1791, also belonged to this family, and some of the Aspasniagan were neophytes of the mission of San Carlos.

In their general habits and customs the Salinan Indians resembled the Costanoan, Esselenian, Mariposan, and other southern Central California tribes. By Galiano, in 1792, they were described as of medium size, dark color, and as being the ugliest and filthiest of the natives of America. They led in part an agricultural and pastoral life. Their houses were circular and were constructed of stones or adobes and roofed with thatch.

Though the San Antonio and San Miguel tribes were probably never very populous, the missions bearing those names when first established contained respectively 1,400 and 1,200 Indians. In 1884 only a dozen Indians of the Salinan group were known to survive.

Powell, *Indian Linguistic Families*, seventh report Bureau of Ethnology (Washington, 1891). See INDIANS OF NORTH AMERICA.

F. W. HODGE.

Sali'nas: city; capital of Monterey co., Cal.; on the Southern Pacific Railroad; 94 miles S. E. of San Francisco (for location, see map of California, ref. 9–C). It is in an agricultural, stock-raising, and wool-growing region, and has 6 churches, a public high school, 2 State banks with combined capital of $420,000, 2 agricultural-implement factories, a large beet-sugar refinery, electric lights, and 2 daily and 2 weekly newspapers. Pop. (1880) 1,854; (1890) 2,339; (1900) 3,304.

EDITOR OF "JOURNAL."

Saline'ville: village; Columbiana co., O.; on the Penn. Railroad; 30 miles S. S. E. of Alliance, 63 miles W. N. W. of Pittsburg (for location, see map of Ohio, ref. 3–J). It is in a coal-mining region, and contains a private bank and a weekly newspaper. Pop. (1890) 2,369; (1900) 2,353.

Salinometer: a form of HYDROMETER (*q. v.*) for measuring the amount of salt in a given solution.

Salisbury, sawlz'berry, or **New Sarum**: capital of Wiltshire, England; in a valley near the confluence of the Avon, Bourne, Wily, and Nadder; 84 miles W. S. W. of London (see map of England, ref. 13–H). It has a magnificent cathedral, which is the purest and richest specimen of the Early English style. The main building was constructed 1220–58 in the form of a double cross. The cloisters and chapter-house were added in 1270, and the spire, the highest in England (400 feet), was erected about 1330; it leans over 2 feet toward the S. It is 449 feet long and 81 feet high in the interior; the length of the great transept is 203 feet. It was much damaged by injudicious restoration (1782–91), but this has been considerably remedied by a restoration begun by Sir Gilbert Scott in 1863, and continued afterward by Street and Sir Arthur Blomfield. Old Sarum (*Sorbiodunum*), in Roman times a camp of importance, stood about a mile N. of the present city. It consists of a conical hill encircled with intrenchments. Salisbury returns one member to Parliament. Pop. (1891) 17,362.

R. A. ROBERTS.

Salisbury: township (settled about 1720, organized in 1740); Litchfield co., Conn.; on the Housatonic river, and the Phila., Reading and New Eng. Railroad; 63 miles N. W. of Hartford (for location, see map of Connecticut, ref. 7–D). It contains the villages of Salisbury, Lakeville, and Lime Rock, 7 churches, public schools, kindergartens, a parochial school, Scoville Memorial Library, Connecticut School for Imbeciles, St. Mary's Convent, Hotchkiss School, a savings society, and a private bank. It is picturesquely located and has 6 large lakes and a variety of mountain scenery. Salisbury contains iron mines (yielding the widely known Salisbury ore), blast furnaces, car-wheel works, and cutlery and cutlery-handle factories. The assessed valuation of the township is about $1,800,000. Pop. (1880) 3,715; (1890) 3,420; (1900) 3,489.

DONALD T. WARNER.

Salisbury: town; capital of Wicomico co., Md.; on the Wicomico river, and the Balt. and E. Shore and the N. Y., Phila. and Norfolk railways; 95 miles S. E. of Annapolis, the State capital, 140 miles S. E. of Baltimore (for location,

see map of Maryland, ref. 4–G). It has a large coasting and inland trade; exports lumber, grain, fruit, and vegetables; and has several saw and planing mills, the largest yellow pine box-factories in the U. S. (using 50,000,000 feet of lumber annually in making cases for petroleum oil), flour-mills, and a wool-carding mill. It has a national bank with capital of $50,000, a State bank with capital of $50,000, and a monthly and two weekly periodicals. Pop. (1880) 2,581; (1890) 2,905; (1900) 4,277. EDITOR OF "ADVERTISER."

Salisbury: city; capital of Rowan co., N. C.; on the Southern Railway; 44 miles N. N. E. of Charlotte, 131 miles W. of Raleigh, the State capital (for location, see map of North Carolina, ref. 3–E). It is in an agricultural and mining region, is the seat of Livingstone College (African Methodist Episcopal Zion, chartered in 1879), and of a State normal school for colored pupils, and has a national bank, a State bank, a monthly and four weekly periodicals, several tobacco-factories, tanneries, foundries and machine-shops, the workshops of the Southern Railway, a woolen-mill, etc. Pop. (1880) 2,723; (1890) 4,418; (1900) 6,277.

Salisbury, EDWARD ELBRIDGE, LL. D.: philologist; b. in Boston, Mass., Apr. 6, 1814; graduated at Yale College 1832; studied theology there; studied Oriental languages in Paris and Berlin; Professor of Arabic and Sanskrit in Yale College 1841–54, and of Arabic alone for several years later; was one of the founders of the American Oriental Society, editor of and leading contributor to its *Journal*, and endowed the professorship of Sanskrit in Yale College.

Salisbury, MARQUISES OF, EARLS OF, VISCOUNTS CRANBORNE (1604), and BARONS CECIL (1603): a prominent family of the British nobility. The earldom of Salisbury was first held by William Longespée, a Norman noble (d. 1226), afterward by the Montacute family, of which Thomas, the fourth and last earl, was distinguished in the wars against France (d. 1428). The title was conferred anew upon Sir Richard Neville on his marriage to Alice Montacute, daughter of Thomas (1442). This nobleman was a prominent Yorkist leader, gained the victory of Bloreheath 1459, and was beheaded at Pontefract Jan. 1, 1461, by order of Queen Margaret, the day after the battle of Wakefield, in which he was taken prisoner. Subsequently, the title was borne by Margaret Plantagenet, mother of Cardinal Pole, who was beheaded as a pretender to the crown 1541.—ROBERT CECIL: the famous Secretary of State to Queen Elizabeth; b. in 1550; continued the policy of his father, Lord Burleigh, devoting much attention to the domestic interests of the country, and in foreign affairs striving to prevent Spain from gaining an undue ascendency. He is noted as the enemy of Essex and of Raleigh, and seems to have felt an unworthy jealousy of his cousin, Lord Bacon. He was made Earl of Salisbury May 4, 1605, and the title still remains in his family, the marquisate having been added in 1787.

Salisbury, ROBERT ARTHUR TALBOT GASCOYNE CECIL, Marquis of, K. G.: statesman; b. at Hatfield, England, Feb. 10, 1830; educated at Eton; graduated at Oxford; sat in Parliament for Stamford, first as Lord Robert Cecil, and later as Viscount Cranborne, from Aug., 1853, until his accession to the marquisate Apr. 12, 1868; became Secretary of State for India in Earl Derby's third administration July, 1866; resigned Mar. 2, 1867, in consequence of unwillingness to support the Reform Bill, and accepted the same post in Disraeli's second administration Feb., 1874; succeeded Lord Derby as Minister of Foreign Affairs in May, 1878; was one of the British plenipotentiaries at the Congress of Berlin. For the next six years he maintained a vigorous opposition to Gladstone and succeeded in checking the Liberals in their Irish policy. From June to Nov., 1885, he was Prime Minister and Secretary of State for Foreign Affairs, and again from Aug., 1886, to Aug., 1892, when the question of Irish Home Rule wrecked both the ministry and the party. On the defeat of the Roseberry Government in June, 1895, the premiership fell once more to Lord Salisbury, who formed a strong coalition ministry, in which many prominent Liberal-Unionists found places. A vigorous foreign policy and a strict enforcement of the law in Ireland as elsewhere have characterized all his administrations.

Sa'lishan Indians [*sälst*, from which the term Salish is derived, is the Okanagan term for "people"]: name originally applied to a division of a linguistic family of the northwestern coast of North America, but subsequently employed in the more comprehensive family sense. They are also (wrongly) called Selish or Salish, and Flatheads.

Tribes.—Very little is known of the social and political divisions of this stock. There appears to have been nothing among them answering to the extensive political leagues and confederacies of eastern American Indians. A tentative list of the divisions contains the names of fifty-eight tribes, including the Bellacoola or Bilqula, Calispel, Chehalis, Colville, Cowlitz, Lummi, Nanaimo, Nestucca, Nisqualli, Okanagan, Puyallup, Skagit, Skitsuish or Cœur d'Alene, Spokane, and Tillamook.

Habitat.—Recent investigations establish the habitat of the Salishan stock as follows: The most southern outposts of the family, the Nestucca and Tillamook, were on the coast of Oregon about 50 miles S. of Columbia river, where they were separated from their northern kindred by Chinookan tribes. Beginning on the northern side of Shoalwater Bay, Salishan tribes held the entire northwestern part of Washington, including all the Puget Sound region save a few insignificant spots. Eastern Vancouver Island to about midway its length was also held by Salishan tribes, while the great bulk of their territory lay on the mainland opposite and including much of the upper Columbia. On the S. they were hemmed in mainly by the Shahaptian tribes. On the E. they dwelt to a little beyond the Arrow Lakes and their inlet, one of the extreme north forks of the Columbia. On the S. E. tribes of this family extended into Montana, including the upper Columbia drainage. On the N. E. Salishan territory extended to about lat. 53° N.; in the N. W. it did not reach the Chilcotin river, except in an isolated spot occupied by the Bilqula on Dean Inlet and Bentinck Arm. See INDIANS OF NORTH AMERICA.

General Characteristics.—The widespread bands of the Salishan people show many varieties of character, as might be expected in the septs of that which Hale says "is evidently a mixed race." The majority are industrious, and readily adapt themselves to the new conditions of their present life. The language is split into a great number of dialects, many of which are doubtless mutually unintelligible. Evidences of radical affinity between this family and the Wakashan have been discovered by Boas and Gatschet.

Population.—The total Salishan population of British Columbia is 12,325. Most of the Salishan tribes in the U. S. are on reservations in the State of Washington. They number about 5,500. JAMES OWEN DORSEY.

Saliva [from Lat. *sali'va*, slime, spittle, saliva; cf. Gr. σίαλον, spittle, and Sanskr. *kṣiv-*, spit. The Latin word is possibly a folk-etymological corruption of **kṣīvala*]: the liquid secretion of the mouth. It comes from several glands secreting different liquids. Though numerous interesting facts are known about it, its chemistry can not be regarded as completely studied. It has an alkaline reaction, and contains an albuminoid ferment called ptyaline, which has the power of converting starch into sugar, thus assisting in its digestion. For this reason it is claimed that young infants, whose lack of teeth renders mastication impossible, and who swallow their food without admixture with saliva, should not be fed upon starchy food, such as arrowroot, which to them proves indigestible. On the other hand, it is asserted that ptyaline acts only in alkaline liquids, and that in the acid liquid of the stomach it is therefore inert. Saliva, very curiously, contains sulphocyanide of potassium in minute proportion, but readily detectable by a ferric salt. It contains about 1 per cent. of solid matter, of which as much as one-fifth in some cases is made up of saline substances. The amount of saliva secreted *per diem* varies widely in different persons and in the same person at different times. Revised by IRA REMSEN.

Salivary Glands [*salivary* is from Lat. *saliva'rius*, slimy, deriv. of *sali'va*, slime, spittle]: the glands which secrete saliva. In man they are essentially three in number on each side: (1) the parotid, the largest, situated beneath the integument and immediately below the ear; (2) the sub-maxillary, beneath the lower jaw; (3) the sub-lingual, under the tongue. These glands are composed of a number of sections or lobes of polygonal shape and flattened sides, the result of coaptation and pressure. The structure is termed *racemose*, from its resemblance to that of a bunch of grapes. (See HISTOLOGY, *The Digestive Organs.*) The tree or stem-like framework upon which the glandular lobes are set is a system of excretory tubules, which take up the saliva secreted by the gland, and the trunk is a common duct conveying it through the deep tissues to the surface of the mouth. The names of eminent anatomists are commemorated in the designation of these ducts, which they

discovered. The parotid has one large duct, the duct of Steno; the sub-maxillary, the duct of Wharton; the sublingual—from eight to twenty minute ducts opening independently beneath the tongue—the ducts of Rivinius; and a few uniting to form a single duct, the duct of Bartholine, which joins that of Wharton. These ducts, their branches, and the interior of the glands are lined with epithelial cells. The process of secretion, more or less constant, is most active during the mastication of food; then saliva is abundantly formed and poured into the mouth. The salivary glands are the seat of disease—mumps or parotiditis, a specific inflammation (see MUMPS) of the parotid; inflammation and abscess of the parotid in low fevers; deposits of diphtheritic infiltration in some cases of that disease; not infrequently concretions of chalky matter form in the glands. Revised by W. PEPPER.

Salivation [from Lat. *saliva'tio*, deriv. of *salivare*, *saliva'tus*, to spit, salivate, deriv. of *sali'va*]: a specific irritation of the salivary glands, mouth, and throat. Though most frequently due to mercury, it may be caused by other drugs, as iodine, and may occur in certain diseases. In former years mercury, in heroic doses, ranked as a remedy second only to bloodletting. Salivation, though now rare, was then a frequent occurrence—intentionally produced in many cases, in others the accidental result of large doses and individual susceptibility. Children will endure large doses of mercurials without salivation; adults are relatively susceptible. An active state of the skin, kidneys, and bowels, and a healthy state of the mouth, favor immunity from salivation, even when the mercurial taken is considerable; reversely, if opium or any remedy which checks the functional excretions be taken before or at the same time, even small doses of mercury may salivate. Salivation is manifested by a coppery or metallic taste, by soreness of the gums, tenderness of the jaws and teeth when pressed together or closed with force, excessive secretion and flow of saliva, even dribbling from the mouth; swollen, red, ulcerated gums; swollen, coated, salvy tongue, taking the imprint of the teeth; and a foul "mercurial" breath. In grave cases, spongy, bleeding, sloughing gums, loosened teeth, swelling of the face and neck, and even gangrene of the mouth, may result. There is accompanying constitutional depression, fever, pain, and sleeplessness. Revised by W. PEPPER.

Sal'lust (*Gaius Sallustius Crispus*): historian; b. 86 B. C. at Amiternum, in the country of the Sabines, of a wealthy plebeian family; elected *tribunus plebis* in 52; expelled from the senate in 50 by the censors on account of the dissipated and scandalous life he led; reinstated in the senatorial dignity in 49 by being elected quæstor by the aid of Cæsar, to whose party he belonged, and whom he as prætor accompanied to Africa in 46; was appointed proconsul of Numidia, and returned to Rome loaded with riches; formed the magnificent *Horti Sallustiani* on the Quirinalis, and lived in luxurious retirement, devoting himself to the study of history. D. at Rome, 34 B. C. Of his *Historiarum Libri Quinque* only fragments are extant, but his *Bellum Catilinarium* and *Bellum Jugurthinum* have been preserved, and are much appreciated. Editions by Gerlach (3 vols., Basel, 1823–31), Dietsch (2 vols., Leipzig, 1859), Kritz (3 vols., 1828–53); English translations by Sir H. Steuart (1806), by Watson (1852), and by J. R. Mongan (1864). New fragments of the histories were discovered in 1886 by E. Hauler in an Orleans palimpsest; see *Wiener Studien* (viii., p. 315, and ix., p. 25), and the edition of H. Jordan (Berlin, 1887); also *Sallusti historiarum reliquiæ*, ed. B. Maurenbrecher (fasc. i., Leipzig, 1891; fasc. ii., 1893).
Revised by M. WARREN.

Salma'sius, CLAUDIUS (*Claude de Saumaise*): classical scholar; b. at Semur-en-Auxois, Côte-d'Or, France, Apr. 15, 1588; studied at Paris and Heidelberg; embraced Protestantism; was appointed professor at the University of Leyden in 1631. The ambition of his wife, theological controversies, and above all the scandal caused by his *Defensio regia pro Carolo I.* (1649), which called forth the memorable reply of Milton, induced him to accept a flattering invitation from Queen Christina of Sweden (1650). The climate did not agree with him, and the inhabitants of Leyden urged him to return, because "their university could as little be without him as the universe without the sun." He left Stockholm in 1651, but died Sept. 3, 1653, at Spa. Salmasius is one of the great encyclopædists of his time, the high esteem in which he was held being well attested by Balsac's famous saying, "Non homini sed scientiæ deest quod nescivit Salmasius"; but, unlike his illustrious contemporaries, Scaliger, Casaubon, and Lipsius, his immense erudition was not kept under control, and in consequence his numerous works present a confused mass of learned detail, accumulated without regard to methodical arrangement and clearness of exposition. As a text critic, Salmasius never occupied any high rank. In 1606 he discovered in Heidelberg the Greek *Anthology* of Kephalas, only the so-called *Anthologia Planudea* having been known up to that time. His most famous works are his *Plinianæ exercitationes in Solinum* (1629) and a critical edition of the *Scriptores Historiæ Augustæ* (1620), to which may be added the learned treatises *De lingua hellenistica* (1643), *De usuris*, and *De re militari Romanorum* (1657). See Fr. Crenzer, *Opuscula II.* (pp. 65–75); Saxe, *Onomasticon IV.* (pp. 1888 ff.).
ALFRED GUDEMAN.

Salmon [viâ O. Fr. from Lat. *sal'mo*, *salmo'nis*, salmon; cf. *sali're*, to leap]: a name given to several species of the genus *Salmo* of the Atlantic, characterized by anadromous habits (that is, by their ascending from the sea into fresh waters to breed), as well as to the species of the genus *Oncorhynchus* of the Pacific. The species belonging to the genus *Salmo* have only about eleven rays to the anal fin,

The Atlantic salmon.

while those of the genus *Oncorhynchus* have fourteen to eighteen. All of these agree essentially in habits. Their natural home is the salt water, for there they obtain their food and rapidly increase in size; toward autumn they ascend rivers, as near as possible to the source, to spawn. During their sojourn in fresh water they almost entirely abstain from food and alter considerably in appearance; this divergence from the normal form is most apparent in the male. The snout becomes attenuated and more or less hooked, and the lower jaw is modified in a similar manner; the body becomes emaciated, and the skin decked with glowing hectic colors. In the salmon of Europe and Eastern America this is temporary, and the males in considerable proportion descend to the sea, revive, and assume their pristine vigor and form. Some of the species of the genus *Oncorhynchus* of the Pacific coast become so abnormally developed that after spawning they die, and their carcasses are left by myriads in the waters they have traversed.

Salmo salar is common to the cold waters of Europe and North America. In the U. S. it is nowhere abundant except in some rivers of Maine, although in British America there are a number of streams in which it is found in large numbers. It is generally believed that in former times, and when the country was discovered by Europeans, the species was found farther S., and Hendrik Hudson, in the journal of his ascent of the river which bears his name, records "great stores of salmon in the river." It is tolerably certain, however, that the fish called by him *salmon* was the weakfish (*Cynoscion regalis*), of the family *Sciænidæ*, having no relation to the *Salmonidæ*. The salmon-rivers of Canada are controlled by the Government and let for private use.

The extreme young is banded, and also has red spots. In this state it was long known under the name of *parr*, and supposed to represent a distinct species of the family. Other names are samlet, salmon-fry, and pink. When about a year old, and when the spots have disappeared and it becomes of a bright silvery color before going to the sea, it is called a *smolt*; after its return from the sea into fresh water it is designated as a *grilse*; and finally, on its second return from the sea, it is known as a *salmon*.

Oncorhynchus quinnat is the common salmon, king-salmon, or quinnat, of California and farther N.; it is a much deeper fish than the Eastern species, and is, further, at once distinguishable by the greater number of anal rays—fifteen or sixteen generally. This species will live and flourish in much

warmer waters than the Eastern species, and attempts have been made to introduce it into the streams of the Eastern U. S. It has also been attempted, on a small scale, to introduce the Atlantic species into Pacific waters. The humpback (*O. gorbuscha*) and the blueback (*O. nerka*) are also commercially important. An extensive business has been developed in the canning of these salmon, and this is conducted on a large scale on the Columbia river and in Alaska. For statistics of salmon-fishing, see FISHERIES. See also FISH-CULTURE and PISCICULTURE. Revised by J. S. KINGSLEY.

Salmon, GEORGE, D. D.: mathematician and theologian; b. in Dublin, Ireland, Sept. 25, 1819; was educated in Trinity College, Dublin, and graduated in 1839; became a fellow in 1841; took orders in 1844; was made Regius Professor of Divinity in 1866, and was appointed provost of Trinity College in 1888. He is a fellow of the Royal Society, has obtained honorary degrees from Oxford, Cambridge, and Edinburgh Universities, and is a correspondent of the academies of Berlin and Copenhagen, and of the Institute of France. Besides a number of memoirs in the mathematical journals, he has written treatises on *Conic Sections*, *The Higher Plane Curves*, *Modern Higher Algebra*, and *The Geometry of Three Dimensions*. These have passed through many editions and been translated into the principal European languages. In theology Dr. Salmon has written *College Sermons* (1861); *The Reign of Law* (1873); *Non-miraculous Christianity* (1881); *Gnosticism and Agnosticism* (1887); *Introduction to the New Testament* (4th ed. 1890); and *Infallibility of the Church* (1888). R. A. ROBERTS.

Salmond, STEWART DINGWALL FORDYCE, D. D.: educator; b. at Aberdeen, Scotland, June 22, 1838; educated at the University and Free Church College of Aberdeen and University of Erlangen, Bavaria; Assistant Professor of Greek in the University of Aberdeen 1861–64, and examiner in Classics 1864–67; minister of the Free Church, Barry, Forfarshire, 1865–76; since 1876 Professor of Systematic Theology and New Testament Exegesis in Free Church College, Aberdeen. Besides contributing frequently to periodicals, Dr. Salmond translated with notes for the Ante-Nicene Library the writings of *Hippolytus* (Edinburgh, 1868–69); *Julius Africanus*, *Theognostus*, and minor writers (1869); *Thaumaturgus*, *Dionysius of Alexandria*, and *Archelaus* (1871); two volumes of *Augustine's Works* (1873), all the above revised and re-edited in New York; *Commentary on the Epistle of Peter* in *Schaff's Popular Commentary* (Edinburgh and New York, 1883); *Commentary on the Epistle of Jude* in *Pulpit Commentary* (London and New York, 1889); edited the *Bible Class Primers*, for which he wrote *The Life of the Apostle Peter*, *The Shorter Catechism*, *The Life of Christ*, *The Parables of our Lord*, *Our Christian Passover*, *The Sabbath* (Edinburgh, 1880–94); wrote *The Christian Doctrine of Immortality* (Edinburgh, 1894); since 1891 has been editor of *The Critical Review of Theological and Philosophical Literature* (Edinburgh).
C. K. HOYT.

Salmo'neus (in Gr. Σαλμωνεύς): in Grecian mythology, son of Æolus, the founder of the Æolic race. He emigrated from Thessaly to Elis, where he founded the city Salmone. He boasted himself the equal of Zeus, usurped his functions, and attempted to imitate the thunder and lightning. He was therefore slain by the bolt of Zeus, who also destroyed Salmone. J. R. S. S.

Salmon'idæ [Mod. Lat., named from *Sal'mo*, *Salmo'nis*, the typical genus, from Lat. *sal'mo*, salmon. See SALMON]: one of the most important families of fishes, containing the salmon, trout, whitefishes, etc., alike famous for their gameness and for their food qualities. All have an elongate, fusiform body covered with moderate or small cycloid scales, and having a distinct lateral line. The head is conical in outline, lacks barbels, and is covered with a naked skin. The upper jaw is composed of inter-maxillary and supra-maxillary bones, and the teeth are large and conical in the *Salmones*, small or wanting in the whitefishes (*Coregonus*). The branchiostegal rays are numerous, and pseudobranchiæ are present. The true dorsal fin is at about the middle of the body, and a small adipose dorsal occurs far behind. The caudal fin is square or concave on the end, never convex. The stomach is siphonal, and 15 to 200 pyloric cæca are present; the large simple air-bladder is connected with the alimentary canal. No oviducts are present, but the eggs are discharged into the body-cavity, from which they are directly extruded through the porus genitalis.

The family thus limited contains about eighty species arranged in ten genera, of which *Salmo*, *Oncorhynchus*, *Salvelinus*, and *Coregonus* are the most important. The first three mentioned form the *Salmones* of the older authors, and contain the forms commonly known as salmon, trout, and charr, the limitations of the genera being upon minute characters, and those of the forms to which the common names are given extremely vague. The genus *Oncorhynchus* includes the Pacific coast salmon, five species in all. The genus *Salmo* includes the salmon of Europe and Eastern North America, and the true trout as well, while *Salvelinus* contains the red-spotted trout or charr. *Oncorhynchus* and *Salmo* agree in most features, notably in having the whole vomer covered with teeth, while they differ in that *Salmo* has fourteen or less rays in the anal fin, while in the Pacific salmon the number is greater than fourteen. *Salvelinus*, of which the brook-trout of North America may be taken as an example, has teeth only on the head of the vomer. Those members of the genus *Salmo* which normally live in fresh water are the true trout. J. S. KINGSLEY.

Salmon-trout: See TROUT.

Salm-Salm, FELIX, Prince: soldier; b. at Anholt, Prussia, Dec. 25, 1828; educated at the cadet school in Berlin; became an officer in the Prussian cavalry, and subsequently served in the Austrian army; served in the U. S. army during the civil war; was at one time in command of a regiment, and afterward post-commander at Atlanta, Ga., with the rank of brigadier; went to Mexico at the close of the war; became aide-de-camp and chief of the household to the Archduke Maximilian, with whom he was captured at Querétaro; was released soon after the execution of the latter; entered the Prussian service as major of the Fourth Regiment of grenadiers of the royal guard, and was killed at the battle of Gravelotte, France, Aug. 18, 1870.—He married in 1862, Mlle. AGNES LE CLERCQ, a native of Baltimore and an actress by profession. She accompanied him in Mexico, and acquired celebrity by her heroic efforts to procure the pardon of Maximilian or to effect his escape. She accompanied her husband during the Franco-German campaign up to his death. She published portions of her own and of her husband's diaries in Mexico, and issued in 1875 an interesting volume, *Ten Years of My Life*.

Saloff, BASILE, de: civil engineer; b. in Russia, Oct. 21, 1839; graduated in 1858 from the Institute of Ways of Communication, and entered directly the Russian Corps of Engineers of Ways of Communication; was engaged upon the construction of the railways of the Grande Company until 1862; was then sent abroad and took the course at the École des Ponts et Chaussées in Paris. From 1863 to 1871 he was Professor of the Course of Seaports in the Institute of Ways of Communication; in 1872 became president of the technical commission on railways; in 1873 councilor of state and member of the jury of the Universal Exposition of Vienna; in 1877 was elected director of the Grande Company of Russian Railways and president of the Maritime Canal of St. Petersburg, which position he held until the completion of the canal in 1885. In 1887 he became director-general of railways; in 1889 member of the councils on railways and of the council of engineers.
WILLIAM R. HUTTON.

Salol: a substance sometimes called the salicylate of phenol, introduced into medicine in 1886. It is a compound of salicylic and carbolic acids in the proportion of 60 per cent. of the former to 40 per cent. of the latter. It occurs as a white, crystalline powder, with a faint odor and a slightly soapy taste, and when taken in the body is not dissolved in the stomach, but in the alkaline pancreatic juice of the duodenum. It has been used in the treatment of rheumatism and allied affections with some success, and also as an intestinal antiseptic in cholera and other disorders of the alimentary canal. H. A. HARE.

Salomon', LOUIS ÉTIENNE FÉLICITÉ: general and politician; b. at Aux Cayes, Haiti, 1820. He was a Negro; was one of Soulouque's ministers, and commanded his army from 1855 to 1859, when Soulouque was deposed and Salomon fled from the island. After various attempts to incite revolts he returned to Haiti in 1879, and was elected president, governing until Aug., 1888, when he was deposed by a revolution. The republic during this period was unusually prosperous. D. in Paris, Oct. 19, 1888. H. H. S.

Salomon Islands: See SOLOMON ISLANDS.

Salo'na: the ancient capital of the Roman province of Dalmatia, and a city of great importance in both commercial

and military respects. The Emperor Diocletian was born here, and 3 miles to the S. W. he built in 303 A. D. the famous palace, covering 8 acres, to which he retired after his abdication. The city and the palace were destroyed in 641 by the Avars, but on the site of the palace and out of its ruins arose the modern town of Spalato—*Salonæ Palatium*. See SPALATO. Revised by M. W. HARRINGTON.

Saloni'ca [Turk. *Selanik*, anc. Θεσσαλονίκη, Thessalonica, whence the modern name]: city; capital of the Ottoman vilayet of Saloniea, which nearly corresponds to the ancient Macedonia (see map of Turkey, ref. 4–B). It occupies a most advantageous site on the Ægean, rising amphitheatrically on Mt. Kortiaseh from the northeast shore of a fine harbor of the Gulf of Salonica. It was rebuilt on the site of a city named Therma by Cassander, who named it Thessaloniea in honor of his wife, the sister of Alexander the Great; after the battle of Pydna (168 B. C.) it became capital of the Roman province of Macedonia; 15,000 citizens were massacred by order of Theodosius (390); it was pillaged by the Saraeens (904); taken by the Marquis of Montferrat (1204), who founded the empire of Salonica; and conquered by the Ottomans (1430). The massacre of two foreign consuls by a Mussulman mob on May 6, 1876, contributed to bring on the Russo-Turkish war. As the chief station on the Via Egnatia, which connected the eastern provinces with Rome, it was to St. Paul a center for the dissemination of Christianity, and to it he addressed two epistles. It was called for centuries the Orthodox City, and was largely instrumental in the conversion of the Bulgarians and Slavonians. Along its narrow and crooked streets many architectural monuments are seen. Among them are a hippodrome; a colonnade built by Nero; an arch of triumph with the names of the seven politarchs; an arch of Constantine, erected after his victory over Licinius; many churches, little subsequent to Constantine, exceedingly rich in mosaics, as St. George or the Rotunda (Orta Sultan Osman Djami), St. Demetrius (Kassim Djami), St. Sophia or the cathedral (Aya Sophia); also the mediæval city walls, built on cyclopean foundations. Salonica is the terminus of a trans-European railway, of several highways which traverse the entire vilayet, and, next to Constantinople, is the chief outlet to the commerce of European Turkey. Many European and Ottoman steamship lines touch here regularly. The bazaar is a rambling, antique building, but the scene of great activity. Pop. (1890) 122,000, of whom more than half are Jews, the rest being chiefly Greeks and Ottomans. The inhabitants are industrious and enterprising, and maintain good schools, literary societies and clubs, and a museum. Saloniea has manufactories of morocco leather, silk and cotton, and it exports grain, cotton, wool, hemp, skins, opium, wine, and especially tobacco, that called Yenidji being esteemed the finest raised in Turkey.

E. A. GROSVENOR.

Salop: See SHROPSHIRE.

Salpa [Mod. Lat., from Lat. *sal'pa* = Gr. *σάλπη*, a kind of stockfish]: a genus of *Tunicata* in which the body is barrel-shaped, with an opening at either end. They are found floating freely in the ocean. In the life-history there is an ALTERNATION OF GENERATIONS (*q. v.*), first noticed by the poet Chamisso. In one generation the individuals are free, and inside of each grows a long coil of embryos. This escapes later, and, remaining entire, forms the chain stage in which the salpæ, placed side by side, form a chain or band, each individual containing an egg which is to grow into one of the single or solitary forms. For structural features, see TUNICATA. See also Brooks, *The Genus Salpa* (Baltimore, 1893). J. S. KINGSLEY.

Salset'te: an island of British India (area, 240 sq. miles; pop. about 110,000), connected with the island of Bombay by a causeway and a stone bridge, and famous for the immense rock-cut cave-temples found at Kenery in the center of the island and at several other places. There are many rice-fields and palm-trees. The island was held by the Portuguese from early in the sixteenth century till 1739.

Salsify, Oyster-plant, or **Vegetable Oyster** [*salsify* is from Fr. *salsifis* < O. Fr. *sercifi*; cf. Ital. *sassefrica*; *sasso* (< Lat. *sa'xum*), rock, stone + Lat. *frica're*, rub]: a European plant (*Tragopogon porrifolius*) of the family *Compositæ*. It is cultivated for the roots, which are long, tapering, and have, when properly cooked, a taste somewhat like that of the oyster. The root is highly nutritious. The plant is frequently known as vegetable oyster. The goat's-beard (*T. pratensis*), with yellow flowers, is an introduced weed in eastern parts of the U. S. Revised by L. H. BAILEY.

Sal Soda: See SODA.

Salt [O. Eng. *sealt*: O. H. Germ. *salz* (> Mod. Germ. *salz*): Goth. *salt*; cf. O. Bulg. *solĭ*, O. Ir. *salann*, Lat. *sal*, Gr. ἅλς, salt]: chloride of sodium (NaCl). The salt of commerce contains various saline admixtures, due to the peculiarities of the source used for manufacture; their quantity depends also on the method of manufacture. Natural sources of pure salt are unknown; crystals of pure salt may be obtained from a well-developed rock-salt. The presence of common salt in the water of the ocean, of various lakes and springs, as well as its occurrence as an exudation of the soil in several localities of the Orient, is mentioned in the earliest historical records, although under different names.

The idea regarding the chemical constitution of pure salt has changed during the progress of chemistry. The present view was for the first time experimentally demonstrated by Sir Humphry Davy in 1810: he produced pure salt by burning sodium in chlorine gas. Chemically pure salt is usually produced by neutralizing pure sodium carbonate with pure hydrochloric acid, evaporating the solution to dryness, and fusing the residue. Its use is chiefly confined to the chemical laboratory. The salt of commerce is obtained from sea-water, brines, and rock-salt.

Sea-water.—The water of the ocean is a weak and, comparatively speaking, impure brine. It contains from 3½ to 4 per cent. of saline matter, of which about three-fourths is chloride of sodium and about one-fourth other salts, viz.: chloride of magnesium and the sulphates of calcium, magnesium, sodium, and potassium. Sea-water varies little in composition and concentration. It represents the main source of supply for the manufacture of salt in France, Portugal, Spain, Italy, the West Indies, and Central and South America, and a small portion of the supply for the U. S.; it is also largely used for the production of salt in Holland, Belgium, and England, being frequently employed for the solution of rock-salt of an inferior color.

Rock-salt.—Whenever, during the geological epochs, a larger or smaller body of salt water was cut off from the main ocean, and was subsequently placed under favorable climatic conditions for its evaporation and the subsequent preservation of its saline residue, then a salt-deposit, commonly called rock-salt, was produced. Sometimes several independent deposits occur, one above the other, interstratified with the rocks of the same geological basin. The celebrated salt-deposit of Stassfurt, Germany, is worthy of special notice on account of the large quantities of potassium compounds within its surface layers. The various saline constituents of the ocean are arranged in this deposit in an order which corresponds closely with the degree of their solubility in water. The majority of rock-salt deposits consist only of part of the constituents of the ocean which served for their production. The rock-salt occurs either in densely aggregated masses of cubical crystals, or in compact masses having a conchoidal fracture. It is in some instances colorless and transparent, yet more frequently either red, yellow, or blue, rarely green. Its most common admixtures are either sulphate of calcium and the chlorides of calcium and magnesium, or the sulphates of calcium, magnesium, and sodium, and the chloride of magnesium. Rock-salt deposits consist frequently of alternating layers of salt and gypsum. These various layers are due to successive periods of evaporation. Colorless and dry rock-salt deposits, when easy of access, are directly mined with advantage, and the salt obtained by that process is subsequently brought into a desirable form for domestic use. Colored salt-deposits, or those which suffer from an excess of water, or which contain a large percentage of the above-mentioned foreign saline admixtures or clay, or finally those which are located at great depths, are usually dissolved while in the mine, and their solutions treated like brine for the manufacture of salt. Rock-salt deposits have been noticed in every part of the globe. Among those recently discovered in North America are those upon Petite Anse island, Vermilion Bay, Louisiana, at Goderich, Province of Ontario, Canada, in Western New York, and in Michigan.

Brines.—Brines are either artificial or natural; that is, they are prepared either by dissolving rock-salt or they are the natural or chance solutions of saline deposits by means of subterranean currents of water. Natural solutions of rock-salt furnish brines at Saltville, W. Va., Goderich, Ont., and in New York and Michigan. The value of a brine for the manufacture of salt does not entirely depend on either the concentration or relative proportion of pure salt and of

foreign saline admixtures, but on the kind of the impurities; sulphate of calcium and sodium, within proper limits, are far less objectionable than a corresponding amount of the deliqueseent and bitter-tasting ehlorides of ealcium and magnesium. The salt manufaetured in the U. S., with the exception of that obtained from sea-water, is produced from artificial and natural brines.

A sample of salt which contains from 1 to 1½ per eent. of foreign saline admixtures, consisting almost exelusively of sulphate of calcium, may be regarded as of very fair quality; while if it contains but half that amount of the chlorides of ealeium and magnesium, or of the carbonates of calcium and magnesium, it would be considered objeetionable, at least for table and dairy purposes. The peculiar fitness of any kind of salt for the different domestic applications—meat-paeking, dairy, or table use—depends not only on a fair ehemieal eomposition, but also in some degree on its suitable physical or mechanical eondition.

There are two kinds of eommon salt in commerce—(1) coarse salt, ineluding salt made by solar heat and rock-salt crushed to suitable size, and (2) eommon fine or boiled salt, obtained by artifieial heat, and thus by more rapid evaporation. Both have their speeial eommercial value.

Coarse Salt.—The coarse qualities of salt are manufaetured from sea-water and from brines. In Franee, Spain, Portugal, Italy, the West Indies, and along the North Amerieau shores of both the Atlantie and Paeifie Oceans, nearly all the coarse salt made from sea-water is produeed in basins along the seashores; several of them plaeed at different levels are conneeted to admit of a systematie working of the saline solutions in their different stages of concentration. In Ohio, Virginia, Miehigan, New York, Nebraska, and Kansas, where coarse salt is obtained from natural brines, wooden vats, protected by wooden covers, are used; for the frequency of rain-showers throughout the more favorable portion of the year and the low temperature at night during the spring and autumn interfere seriously with the successful evaporation, and thus with the economical manufacture in open basins. A short description of the extensive coarse-salt works at Onondaga, N. Y., may serve as an illustration. The brine in its fresh state, colorless and highly charged with carbonic acid, is filled into shallow vats, and kept there until most of the carbonic acid has eseaped and the protoxide of iron has been fully oxidized and settled down as brown sesquioxide of iron. The saline liquid is then drawn off to a lower set of vats, where it is left for evaporation until crystals of salt appear; during this period the excess of sulphate of calcium is separated. The brine, completely saturated with salt, is ready for salt-making, and consequently removed from the separated impurities to another lower set of vats, where, by mere solar heat, the separation and accumulation of a coarsely crystallized salt takes plaee. The salt is from time to time gathered, while the remaining mother liquor is discharged as soon as it reaches a concentration of 28°–30° Baumé. A good coarse or solar salt must be of a neutral reaction, hard, large, white or colorless, and produce a clear solution in water. Its use is largely confined to the packing of pork and beef for the general market.

Common Fine Salt, or Boiled Salt.—The finer granulated qualities of salt are obtained by direct or indirect application of artificial heat to iron pans, iron kettles, or wooden vats. In Europe almost all the fine salt is manufactured in systems of large shallow iron pans. These pans are usually from 15 to 17 inches deep, and vary in size from a length of 20 feet and a width of 16 feet to a length of 60 feet and a width of 35 feet. In many of the salt-works of the U. S. hemispherical cast-iron kettles, of from 120 to 150 gal. capacity, are used. The better class of brines may be successfully worked in cast-iron kettles. Inferior brines—particularly those which eontain larger percentages of the ehlorides of ealcium and magnesium—as a general rule give the best results by a slow process of evaporation, for the salt-crystals are produced in that case at a slower rate, more perfeetly developed, and less liable to inclose much of the inferior mother liquors. The European system of manufacturing eommon fine salt and the American mode of produeing it in wooden vats by means of steam-heat aim at the removal of certain impurities in a separate vessel and the making of the salt in another, while in the kettle system the entire operation is earried out in one vessel. In the European system the saturation of the brine is at first carried on at a moderate heat in an open pan, eommonly called the fore-heater. As soon as the salt begins to appear, and the iron and a part of the sulphate of lime have been separated, the clear salt-piekle is drawn into a lower pan for the manufaeture of salt. In the kettle system from fifty to sixty kettles are placed in a double row along flues with two independent fireplaces and one eommon chimney. The kettles near the fireplaees are protected by suitable interrupted arches against exeessive heat, while high chimneys, supported by blowers, aid in eonveying the heat along the row of kettles. The brine, before being turned into the kettles, has been kept in large wooden tanks for settling. An iron pan with an upright handle, eovering the central bottom part of the kettles, remains in each one of them until the salt begins to form, when the pans are carefully withdrawn. On the skillful handling of the pan, which contains the separated gypsum and oxide of iron, depends largely the eolor and, to some extent, the general quality of the finished produet. The salt formed is well stirred by means of a long-handled iron ladle, and thereby washed in the remaining pickle before it is removed into baskets, whieh rest for effieient drainage upon sticks over one part of the kettles. The ehemieal eomposition of the fine salt depends largely on the quality of the mother liquor from which it has been gathered and the degree of drainage it has had. The general physical eondition, as size, hardness, etc., depends in part on the eharaeter of the brine which served for its production, and on the rate of boiling during its manufaeture; the lower the temperature and the less motion of the piekle, the larger the erystals. The normal size of the salt-crystals obtained from any brine is readily redueed by adding either quicklime, glue, fat, rosin, or soap in small quantities to the boiling water. This praetiee is not to be eommended, as an entire removal of these substanees is praetieally impossible. A good common fine salt ought to be of a neutral reaction, clear white, of a pure agreeable saline taste, of a gritty feeling between the fingers, and soluble in from five to six parts of water without leaving a residue. The common fine salt, being in an advantageous mechanical eondition and readily soluble in water, finds a general application for family requirements.

Salt a Promoter of Animal Life.—Its value in this respeet was always well reeognized; the oldest writings, saered and profane, refer to it by using its name frequently in a figurative sense; it had entered as an ingredient, with an emblematical meaning, in the Jewish dispensation; heathen authors spoke in praise of it; Pythagoras calls it a substanee dear to the gods; Homer calls it divine; Plutareh speaks of it as a symbol of the soul. The Arabs use it as an emblem of hospitality, and the Abyssinians earry pieees of salt with them to offer for tasting to those they wish to meet as friends. Numerous analyses have established the fact that the sodium compounds, and chloride of sodium in partieular, represent the main portion of the soluble inorganic substanees of the ashes produeed in the combustion of a mammal's body. It has been proved that the human system in its normal eondition contains a certain amount of salt, and that the same is true of every domestieated animal. It has also been aseertained that salt forms an important part of the soluble saline inorganic compounds of various secretions, as perspiration, mucus, and urine, and that the kidneys in particular are the organs which dispose of any excess eonsumed. As salt furnishes by far the largest portion of the sodium eompounds which the higher animals eonsume, it is believed that the main portion of these compounds found in the animal system is derived directly from the salt consumed. It is believed that the chloride of sodium is partly deeomposed in the animal system, for the stomaeh in its normal eondition contains always some free hydroehloric aeid. The serum of the blood of herbivorous animals resembles closely human blood in its mineral eonstituents; it contains at least three parts of sodium to one of potassium, although these animals live on a food in whieh potassium largely predominates; the bile contains almost exelusively sodium eompounds; while the juiee of the flesh of herbivorous as well as earnivorous animals contains almost exclusively chloride of potassium. It is under these circumstances, most likely, that the potassium of the vegetable food eontinually decomposes the chloride of sodium by forming chloride of potassium, which is subsequently constantly and eopiously secreted, partieularly in the urine, while the sodium combines with the phosphoric aeid and the various peculiar organie aeids, which are previously combined with potassium, etc., or were formed in the course of the assimilation of the food. The benefieial effect of eommon salt as an ingredient of the diet of live stock, eows, sheep, etc., is fully recognized, in consequence of earefully conducted experi-

ments by leading agricultural chemists. Boussingault proved that those cows which had been fed with an addition of salt to their food did not yield more milk, or contain more fat, or show increase in weight of flesh, yet they looked more healthy and vigorous; in fact, their whole exterior had been highly improved as compared with animals which had been fed with the same food without an addition of salt. Liebig came to the same result; he found in the case of two oxen which were to be stall-fattened, one of which received its food with the addition of a dose of 1 oz. of salt per day, while the other one did not receive any, that the latter soon looked bristly, dull, inactive, and sickly, while the former remained smooth-skinned, lively, and vigorous. The well-recognized superior quality of meat from the cattle and sheep raised upon the marsh-meadows along the seashores of Northern Germany, Holland, Belgium, England, and other countries has been ascribed in a large degree to the fact that their food—the marsh-grasses—is frequently salted by the spray of the oceanic waters.

Salt a Promoter of Vegetable Growth.—The use of common salt as a manure for promoting the growth of farm-crops originated at an early date in the history of agriculture. Modern researches do not prove common salt to be valuable as a general fertilizer, but point out its various modes of action, and thereby tend to restrict its use to special kinds of soil and of crop, for it has been noticed that the use of salt frequently exerts not only a decided influence on the chemical composition and physical condition of the soil, but also on the character, i. e. composition, of the plants raised under its influence. All recommendations of careful observers agree in advising the use of but small quantities at a time (from 300 to 400 lb. per acre), applied in a well-diffused form, and only at intervals of years. Numbers of analyses of current farm-crops have shown that a large majority of species of plants growing along the seashores or in the vicinity of saline springs contain much smaller quantities of sodium than potassium compounds. As a natural disintegration of rocks and soil renders, in all probability, sodium as well as potassium compounds accessible as plant-food, there is far less reason, as a general rule, to expect an exhaustion of the soil in sodium compounds as soon as in potassium compounds. These circumstances explain the position which sodium compounds, and chloride of sodium, its most diffused form in lands under cultivation, occupy in a rational system of supplying plant-food to farm-crops. They are considered of secondary importance as plant-food. Nessler has shown that the presence of salt in the soil interferes with a ready combustion of tobacco-leaf, favoring its charring; in the case of the beetroot it has been proved (Grouven) that it increases the percentage of soluble saline compounds in the juice to a considerable degree, and thus reduces their value for the manufacture of sugar. The fact that larger quantities of salt destroy the common flora, and that it merely supports a vegetation of its own, becomes at once manifest to those who glance at the vegetation in the immediate vicinity of salt-springs and marine inlets. Its reputation as a valuable aid in the production of farm-crops rests largely on its action on the physical and chemical condition of the soil. It increases the capacity of the soil to absorb and retain moisture by imparting to it in some degree its own high hygroscopic quality, an influence most desirable in a dry season. An application of from 400 to 500 lb. per acre as a top-dressing on dry grasslands and pasture is frequently followed by good results. It aids in diffusing the existing resources of plant-food (potash and phosphoric acid). Exhausted and worn-out lands derive but little benefit from its periodical use beyond an increased power to retain moisture. Its use is largely confined to the raising of forage-crops.

Salt for Meat-packing.—The object of the meat-packer consists not only in securing the preservation of pork and beef for a reasonable time, but also in securing its palatable condition and as far as possible in retaining its natural color. Practice recommends the use of the coarse and hard qualities of salt for meat-packing for the following reasons: They dissolve gradually and contract the meat by degrees to a desirable firmness; they keep the salt pickle within a moderate concentration; they can not enter mechanically into the meat and thus overcharge it, and may therefore be applied in sufficient excess, so as to compensate for the losses of pickle by leakage, etc., without endangering the tenderness and flavor prematurely. Common fine salt answers for a short period of keeping very well, and is consequently used in the packing of meat for immediate consumption. Fifty to fifty-six pounds of coarse salt are usually taken for salting down one barrel of meat: the bottom and the top of the barrel are always carefully covered with a layer of coarse salt. The purer the salt the better the quality of the meat. A salt which contains large quantities of foreign saline admixtures, particularly of chloride of calcium and chloride of magnesium, imparts a pungent and disagreeable taste, and injures also the color of the meat, for these saline compounds have an unpleasant taste, and, being at the same time in a higher degree hygroscopic, they cause a more copious discharge of juice from meat, which renders the latter of a paler color and of a harder texture; the color of packed meat is frequently improved by an addition of niter, which if used on a small scale is harmless. In the U. S. the coarse salt made from brines and from sea-water is used, besides the English coarse and fine salt, the salt from Turk's island, and other localities in the West Indies. Texas meat-packers are trying the superior rock-salt of Petite Anse, La. A good rock-salt is well fitted for the purpose, yet on account of its great hardness it has to be broken up in smaller pieces than common solar salt. For the packing of fish a fine grade of coarse salt is used.

Salt for the Dairy Business.—The dairy business has attained such commanding proportions that the amount of salt required in its operations amounts to millions of bushels. The peculiar nature of the dairy products of the U. S. calls for the best qualities of salt in the markets. A good dairy salt ought to be of a neutral reaction and of a pure saline taste, free from pungent after-taste; it ought to be of a properly reduced granulated size, dissolving readily in water, free from any offensive odor, without any stain in color, and, what is of not less importance, free from colored specks. The better qualities of the English "common fine salt," "Ashton's brand," etc., were at first used almost exclusively by the dairymen of the U. S., partly because the exporters of provisions in the seaport-towns dealt also largely in foreign salt.

A common fine or boiled salt is in every instance the result of more rapid evaporation, and thus most liable to be affected in its composition by the retention of impure mother-liquors. Washing processes have been devised by which fine salt designed for dairy purposes is freed from its obnoxious features. Dairy salt is manufactured in the U. S. from the coarse (or solar) and from common fine salt; if made from the former kind, it must be ground finer, for both ought to be in such a state of division as to readily dissolve when worked into the butter or the curd; both kinds ought to be used by weight and not by measure. The English brand is somewhat more bulky than the brands of the U. S., and that portion of the product of the U. S. which has been obtained from boiled salt is lighter than that produced from solar salt; in composition there need be scarcely any difference if made with equal care. The quantity of dairy salt that ought to be used in butter and cheese depends somewhat on the amount of moisture retained by either substance when ready for salting; to have a fully saturated solution of salt left is the real object. The best authorities advise the use of 1 oz. of salt (the best dairy) to 1 lb. of butter, and 1 lb. of it for every 100 lb. of curd.

The Uses of Salt in the Industrial Arts.—Chloride of sodium is the most prominent source of the supply of both of its constituent elements, sodium and chlorine, for industrial purposes. It furnishes directly or indirectly the main bulk of soda called for in the various branches of chemical manufacturing industries of the world. On a liberal supply of common salt rests largely the success of the chemical industries of any country. Cheap salt in connection with an ample supply of coal and sulphur is the foundation of the great alkali-trade of England and of other European countries. This circumstance is in a controlling degree due to the important discovery of Leblanc, a French scientist, at the close of the eighteenth century. He pointed out the means by which common salt can be converted into carbonate of sodium, soda-ash, and sal-soda. His process consists in the conversion of chloride of sodium by means of sulphuric acid into sulphate of sodium, and the subsequent treatment of the latter with coal and carbonate of calcium at a high temperature. The successful introduction of this process by James Muspratt and others since 1823 caused improvements in the economical manufacture of sulphuric acid and the production of large quantities of hydrochloric acid as a cheap by-product. A more recent discovery aims at the direct conversion of chloride of sodium by means of bicarbonate of ammonium into bicarbonate of sodium and chloride of ammonium (Schloessing, Solvay, etc.). Both processes are successfully in operation. The comparatively low cost of the soda obtained by these methods, as compared with that of potash, has caused in many instances the substitution for the latter of the cheaper sodium carbonate in the interest of economy. The cheaper soda-ash obtained from chloride of sodium has taken the place of the more costly soda-ash obtained formerly from the ashes of sea-plants. Soap-manufacture, paper-manufacture, and glass-manufacture are among its largest consumers. As a cheap source of hydrochloric acid common salt furnishes the means for a more economical production of the chlorides of the heavy metals, as iron, zinc, tin, etc., so important in various directions. Chloride of sodium and sulphuric acid in connection with dioxide of manganese serve for the production of the element chlorine used for the manufacture of bleaching materials, as hypochlorite of calcium (bleaching-lime), hypochloride of sodium, etc., substances noted also for their value as disinfectants.

The total salt product of the U. S. in 1893 was 11,816,772 barrels of 280 lb., as against 11,698,890 barrels in 1892. The value in 1893 was $4,054,668, against $5,654,915 in 1892, the decrease being due to the decline in price. The total production of 1898 was as follows: Table and dairy, 2,198,339 barrels; common fine, 8,583,128; common coarse, 873,671 barrels; packers', 379,635; solar, 3,077,024; rock, 2,183,801; milling, 156,579 barrels; other grades, 160,457; total, 17,612,634 barrels. CHARLES A. GOESSMANN.

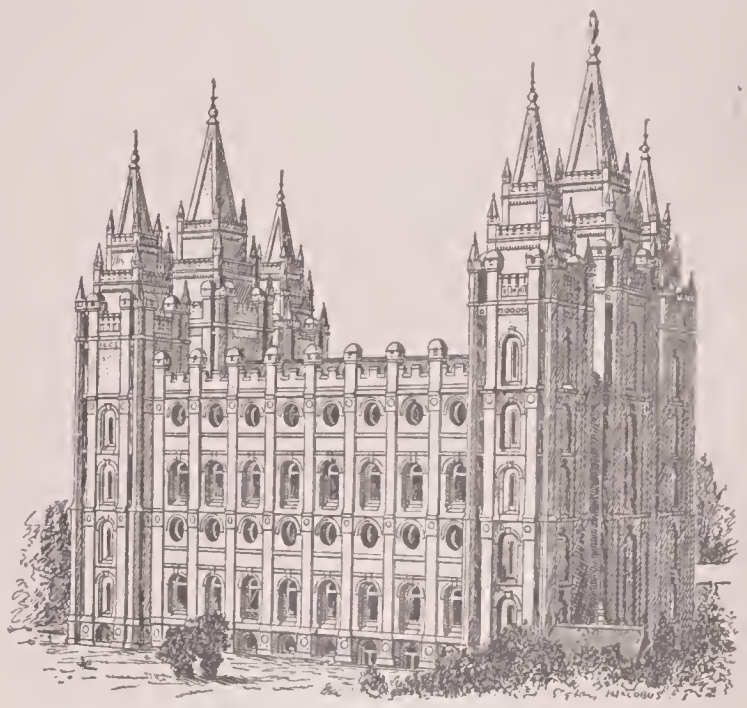
Salta: a northern province of the Argentine Republic, bordering on Bolivia and Chili, and nearly inclosing the province of Jujuy. Area, 45,000 sq. miles. The western part is traversed by the Andes and their sub-ranges, with intervening fertile valleys; the eastern part is included in the plains of the Gran Chaco. Agriculture is the principal occupation; the most important crops are maize and sugar-cane. Silver, copper, etc., exist, it is said, in large quantities, but are little mined. Earthquakes are often destructive. Pop. about 118,000.—Salta, the capital, is in a valley, 3,900 feet above the sea (see map of South America, ref. 7–D). It was founded in 1582, is well built, and has a national college and other public institutions; the trade with Bolivia is important. Pop. about 17,000. H. H. S.

Saltillo: sȧl-teel'yō: capital of the state of Coahuila, Mexico; situated in a valley, 5,204 feet above the sea; on the Mexican National Railway, near the boundary of Nuevo Leon (see map of Mexico, ref. 4–F). The trade of the state centers here, and the town has important manufactures of cotton cloths. Pop. about 20,000. H. H. S.

Salt Lake: See GREAT SALT LAKE and LAKES.

Salt Lake City: city; capital of Utah and of Salt Lake County; on the Great Salt Lake and Hot Springs, the Rio Grande Western, the Union Pac., and the Utah Cent. railways; 712 miles W. of Denver, Col., 931 miles E. of San Francisco, Cal.; altitude, 4,335 feet (for location, see map of Utah, ref. 3–M). It is in the Salt Lake valley, at the base of the Wasatch Mountains; has an area of 12 sq. miles; is laid out in blocks 660 feet square, and contains about 100 miles of streets 132 feet wide. These streets are bordered by streams of water brought from the mountains, and with many varieties of shade-trees. Liberty Park, containing 110 acres, is the principal park, but the city owns also 6,000 acres, a large part of which is suitable for park purposes. Other attractive suburban localities are Fort Douglas, 3 miles distant, and Calders Park, both reached by electric railway. Hot and warm springs of valuable curative properties are within the city limits. The chief natural attraction of the locality is GREAT SALT LAKE (*q. v.*), 11 miles distant. There are 85 miles of electric railway.

Notable Buildings.—The city is the headquarters of the Mormon Church or Church of Jesus Christ of Latter-day Saints. The church buildings of this sect occupy 10 acres



The Great Temple, Salt Lake City.

in the heart of the city, and consist of the Great Temple (a massive structure of gray granite; forty years in course of construction; estimated to have cost $4,000,000; dimensions, 186 by 99 feet; tallest spire, 220 feet in height, surmounted by the *Angel Moroni*, a hammered copper figure 12½ feet high), the Tabernacle (cost $300,000: a vast auditorium seating close upon 7,000; roof egg-shaped, and self-supported; has in certain places remarkable acoustic properties; contains one of the largest organs in the world, now, April, 1901, in process of rebuilding), and the Assembly

Tabernacle, Salt Lake City.

Hall (a granite structure of attractive architecture; seats, 2,500; used for overflow meetings, Sunday-school work, and general purposes). Other interesting buildings are the Lion, Bee-hive, and Guardo houses (former residences of Brigham Young, and now used for church offices and the residence of President Lorenzo Snow); the Salt Lake theater, erected in 1862; city and county building, completed in 1894, at a cost of $900,000; the Commercial, McCornick, Dooly, Mercantile, Progress, Scott-Auerbach, Wasatch, and Zion's Co-operative Mercantile Institution blocks; ten large and fine school-houses; the Templeton and Knutsford hotels; and two large private hospitals and the Utah peniten-

tiary. A fine large block is now building for church offices, on corner south of Temple block.

Churches, Schools, etc.—All leading religious denominations are well represented, and many fine church edifices have been erected. The public-school system is equal to any in the U. S.; 15 public-school buildings, aggregating in cost $750,000, were erected in 1893–94–96. In 1891 the city contained 8 libraries with 37,000 volumes, and in 1901 there were 3 daily, 3 semi-weekly, 9 weekly, 4 semi-monthly, and 7 monthly periodicals.

Finances and Banking.—The receipts of the city government from all sources during 1900 were $857,664.54; expenditures, $646,729.35. The city tax rate is 7¼ mills; the assessed valuation in 1900 was $32,000,000. The city has gas and electric light works, and owns a water system valued at $2,000,000. The bonded municipal debt in 1901 was $2,798,000. In 1901 there were 3 national banks with combined capital of $1,100,000, 3 State banks with capital of $550,000, 4 private banks, 1 foreign bank with a capital of $500,000, and 3 savings-banks with capital of $450,000.

Business Interests.—Manufacturing is extensively carried on. The city is headquarters for mining men, and is the mining center of Utah and adjoining States. It is the dépôt for agricultural products, and the distributing-point for a large agricultural area under a perfect system of irrigation. The census returns of 1890 showed 149 manufacturing establishments (representing 45 industries) with a combined capital of $2,658,676, employing 1,997 persons, paying $1,276,219 for wages and $1,665,877 for materials, and turning out products valued at $3,864,402.

History.—The city was founded by Brigham Young (*q. v.*) July 24, 1847. Until 1870 the population was almost entirely Mormon, but the development of mining and other industries induced a large immigration. The beauty of the city and its environment, the presence of hot springs and the Great Salt Lake, and the rare climatic and scenic advantages, make Salt Lake City an attractive place for tourists. Pop. (1880) 20,768; (1890) 44,843; (1901) 53,531.

William Nelson.

Salto: a town of Uruguay; on the river Uruguay, at the head of navigation for large vessels; opposite Concordia in the Argentine Republic (see map of South America, ref. 7–E). It is connected by railway with Montevideo and the Brazilian frontier; is the shipping-port for the trade of the upper Uruguay, including the western part of Rio Grande do Sul; and is the center of a rich grazing district. Pop. about 12,000. It is the capital of the department of Salto, which has an area of 4,940 sq. miles and a population of 32,000, almost entirely employed in the grazing industry.

H. H. S.

Salton Lake: a temporary lake, caused by an overflow of the Colorado river into a depressed area in the Colorado Desert. The bed of the lake is N. and a little W. from the head of the Gulf of California, and W. of the Colorado river in California, and probably was once occupied by the Gulf waters. The lake was formed in the early summer of 1891, when the river was unusually high, and remained fairly constant several months, when it began to shrink slowly. The spot has large deposits of salt, which changed the fresh waters of the river into salt water in the lake. See Colorado Desert.

M. W. H.

Sal'tonstall, Gurdon: Governor of Connecticut; great-grandson of Sir Richard Saltonstall; b. at Haverhill, Mass., Mar. 27, 1666; graduated at Harvard 1684; ordained minister of New London, Conn., Nov. 25, 1691; was distinguished as an orator, and took so active a part in politics that he was made Governor of Connecticut 1707, and held that post until his death Sept. 20, 1724. He bequeathed £1,000 to Harvard College to educate students for the ministry.—His son, Gurdon, b. at New London, Conn., Dec. 22, 1708, graduated at Yale College 1725; became brigadier-general of Connecticut forces 1776; was cashiered for misconduct in the Penobscot expedition 1779; died at Norwich, Sept. 19, 1785. —Dudley, nephew of Gen. Saltonstall, b. at New London, Sept. 8, 1738, became a commodore in the Continental navy, and died in the West Indies in 1796.

Revised by G. P. Fisher.

Saltonstall, Sir Richard: colonist; b. at Halifax, England, in 1586; nephew of Sir Richard, who became lord mayor of London 1597; emigrated to Massachusetts as assistant governor to Winthrop 1630; was associated with Phillips in the foundation of Watertown 1630, but went back to England the following year, and never returned to Massachusetts. In 1651 he wrote a letter to the Massachusetts ministers Cotton and Wilson remonstrating against the persecution of the Quakers. D. in England about 1658. Through his sons, who settled in Massachusetts, he was ancestor of the Saltonstalls of New England.—Richard, b. at Woodsome, Yorkshire, England, in 1610, was matriculated at Emmanuel College, Cambridge, 1627; was an early settler of Ipswich, Mass.; was assistant governor 1637; befriended the regicides Goffe and Whalley, and protested against the introduction of Negro slavery into the colony. He returned to England in 1670. D. at Hulme, Apr. 29, 1694.

Saltonstall, Richard: jurist; b. at Haverhill, Mass., June 14, 1703; graduated at Harvard 1722; was a representative from Haverhill as early as 1728; was frequently a member of the general court and of the executive council; was a scientific and practical farmer, and also learned in the law; was chairman of the commission for settling the boundary-line between Massachusetts and New Hampshire 1737, and was judge of the superior court nearly twenty years (1736–55). D. Oct. 20, 1756.

Saltpeter, or **Nitre** [*saltpeter* is (by analogy of *salt*) from Fr. *salpêtre*, from Lat. *salpe'træ*, liter., rock-salt; *sal*, salt + *pe'træ*, gen. of *pe'tra*, rock, stone]: a compound in chemistry called potassium nitrate (KNO_3), that has long been known and occurs widely distributed in nature, though in relatively small quantities. When refuse animal matter undergoes decomposition in the soil under proper conditions, the nitrogen contained in it passes into the form of a nitrate, and as potassium is generally present, the particular nitrate formed is saltpeter. The change is brought about by the action of certain microbes which exist in the soil, and are especially abundant and efficient in warm countries. It is in such warm countries that saltpeter earths are found. In Bengal the saltpeter earth of the villages is collected by a special caste, the Sorawallahs, into loosely aggregated heaps. From these the salt is obtained by scraping off the uppermost layers, which show a white efflorescence. The process of nitrification is carried on artificially on a large scale in the so-called "saltpeter plantations." In these, refuse animal matter, more especially manure, is mixed with earthy material, wood-ashes, etc., and piled up. These piles are moistened with the liquid products from stables. After the action has continued for two or three years the outer crust is taken off and extracted with water. The solution thus obtained contains, besides potassium nitrate, calcium and magnesium nitrates. It is treated with a water-extract of wood-ashes or with potassium carbonate, by which the calcium and magnesium are precipitated as carbonates. Much of the saltpeter in the market is made from sodium nitrate by treating it with potassium chloride, advantage being taken of the fact that sodium chloride is less soluble in water than potassium nitrate. Saltpeter crystallizes in long rhombic prisms of a salty taste. When dissolved in water it causes a lowering of temperature. It is used in the manufacture of fireworks. Its chief use, however, is in the manufacture of gunpowder.

Ira Remsen.

Saltpeter, Chili: a salt known in chemistry as sodium nitrate ($NaNO_3$). It is also called cubic nitre, because it crystallizes in rhombohedrons resembling a cube. It occurs abundantly in Northern Chili, especially in Tarapaca, and to some extent in Southern Peru. The natural salt contains, besides the nitrate, sodium chloride, sulphate, and iodide. Sodium nitrate is very similar to potassium nitrate, but it can not be used in place of the more expensive potassium salt in the manufacture of gunpowder, because it becomes moist in the air, and does not decompose as quickly as potassium nitrate. It is used extensively in the manufacture of nitric acid and of potassium nitrate; it is also the most important source of iodine. In commerce the salt is known simply as nitrate. It is largely exported from Chili to Europe for use as manure. In 1900 the total product was estimated at 1,475,000 tons. For this purpose the native salt is rendered marketable by a process of solution and crystallizing. In its action it is comparable with calcium or potassium nitrates.

Ira Remsen.

Salt Range, or **Kalabagh Mountains**: a mountain group of the Punjaub, India; extends westerly from the west bank of the Jhilam to the Suleiman Mountains, with a break in its continuity where it yields a passage to the Indus. It is only 2,500 feet high, but its bold peaks and steep, wild precipices, consisting of granite, gypsum, and layers of almost perfectly pure rock-salt (which has been mined from

time immemorial), are completely without vegetation, and present a forbidding aspect. Alum, iron ore, coal, gypsum, and limestone abound, and gold-dust is found in the sands of the rivers. Revised by M. W. HARRINGTON.

Salt Rheum: See ECZEMA.

Salt River: a Kentucky affluent of the Ohio. Defeated politicians are said to be "sent up Salt river," from an incident in the life of Henry Clay, who in 1832 heard the news of his defeat for the presidency as he landed from a passage up this stream. See *American Notes and Queries*, vol. i., pp. 8–9. M. W. H.

Salts: in chemistry, a large class of compounds formed by the action of acids upon bases. The general character of this action, and the relation of the salts to the acids and bases are discussed under the titles ACID (*q. v.*) and BASE (*q. v.*).

Normal Salts.—The simplest salts are those formed by the substitution of one atom of a univalent element for one atom of hydrogen. Such salts are sodium chloride, NaCl, silver chloride, AgCl, potassium chloride derived from hydrochloric acid, HCl, potassium nitrate, KNO_3, sodium nitrate, $NaNO_3$, silver nitrate, $AgNO_3$, derived from nitric acid, HNO_3. The next class of salts includes those which are formed by the substitution of one atom of a bivalent base-forming element for two atoms of hydrogen. Examples are calcium chloride, $CaCl_2$, zinc chloride, $ZnCl_2$, magnesium chloride, $MgCl_2$, from hydrochloric acid, HCl; barium nitrate, $Ba(NO_3)_2$, calcium nitrate, $Ca(NO_3)_2$, mercuric nitrate, $Hg(NO_3)_2$, all derived from nitric acid, HNO_3. In each of these cases the salt is plainly formed from two molecules of the acid:

$$\begin{matrix}\mathrm{HCl}\\ \mathrm{HCl}\end{matrix} + \mathrm{Mg}\!<\!\begin{matrix}\mathrm{OH}\\ \mathrm{OH}\end{matrix} = \mathrm{MgCl_2} + 2\mathrm{H_2O},$$

$$\begin{matrix}\mathrm{HNO_3}\\ \mathrm{HNO_3}\end{matrix} + \mathrm{Ba}\!<\!\begin{matrix}\mathrm{OH}\\ \mathrm{OH}\end{matrix} = \mathrm{Ba(NO_3)_2} + 2\mathrm{H_2O}.$$

Next come salts formed by the substitution of one atom of a bivalent base-forming element for two atoms of hydrogen in a dibasic acid, such as sulphuric acid, H_2SO_4. Examples are calcium sulphate, $CaSO_4$, copper sulphate, $CuSO_4$, etc. Similarly, there are salts containing trivalent elements such as aluminium, iron, etc. Examples of this kind of salts, derived from monobasic acids, are aluminium chloride, $AlCl_3$, ferric chloride, $FeCl_3$, ferric nitrate, $Fe(NO_3)_3$; from dibasic acids, aluminium sulphate, $Al_2(SO_4)_3$, ferric sulphate $Fe_2(SO_4)_3$; from tribasic acids, aluminium phosphate, $AlPO_4$; ferric phosphate, $FePO_4$, derived from phosphoric acid, H_3PO_4. All the salts mentioned thus far are alike in this respect—they contain no hydrogen. The substitution of the base-forming element for the hydrogen is complete in each case. Such salts are called *normal salts*, and sometimes, though less correctly, *neutral salts*.

Acid Salts.—If the substitution of the base-forming element or elements for hydrogen is not complete, then plainly some of the hydrogen of the acid must remain and the product may in such case be both acid and salt. It may be called either a *salt-acid* or an *acid salt*; the latter, however, is the name adopted by chemists. Monobasic acids can not form acid salts. Thus if a certain quantity of hydrochloric be divided into two equal parts, one of the halves exactly neutralized with, say, sodium hydroxide, and the other half added, it will be found that the only substances present in solution are sodium chloride and hydrochloric acid. By evaporation the hydrochloric acid and water can be driven off, and the residue will consist of the sodium chloride which was formed by neutralizing half of the hydrochloric acid. Similar results would be obtained if nitric instead of hydrochloric acid were used. If, however, to a certain quantity of sulphuric acid only half the quantity of a base required for its neutralization be added, a product is formed which is quite different from that formed when the neutralization is complete. This new product is an acid salt. Thus if the base be potassium hydroxide, the acid salt is acid potassium sulphate, or mono-potassium sulphate. Its composition is represented by the formula $HKSO_4$, and it is derived from sulphuric acid by the substitution of one atom of potassium for one atom of hydrogen. It has acid properties, and has therefore the power to form salts in the same way as an acid. By further action of potassium hydroxide, the remaining hydrogen atom is replaced by potassium, and the normal salt is thus formed. Or this second hydrogen atom may be replaced by a different base-forming element, and thus a mixed normal salt formed, as, for example, sodium-potassium sulphate, $NaKSO_4$. Other acid salts are acid sodium carbonate, $HNaCO_3$, commonly called bicarbonate of soda; acid calcium phosphates, $HCaPO_4$ and $Ca(H_2PO_4)_2$, which are contained in the preparation known as Horsford's acid phosphate, etc. An acid salt is therefore one that is formed from a polybasic acid by the substitution of a base-forming element for one or more, but not all, of the hydrogen atoms.

Basic Salts.—These are, as the name implies, the opposite of acid salts. A basic salt is both base and salt. Bases are monacid and polyacid, as acids are monobasic and polybasic. When a monacid base, as potassium hydroxide, is neutralized, the act is complete as far as that part of the base is concerned which is acted upon. With a polyacid base the case is different. Thus bismuth hydroxide, $Bi(OH)_3$, is a triacid base, and it can be neutralized in three stages by treatment with an acid. The action with nitric acid is represented in the three following equations:

$$\mathrm{Bi}\!\left\{\begin{matrix}\mathrm{OH}\\ \mathrm{OH}\\ \mathrm{OH}\end{matrix}\right. + \mathrm{HNO_3} = \mathrm{Bi}\!\left\{\begin{matrix}\mathrm{NO_3}\\ \mathrm{OH}\\ \mathrm{OH}\end{matrix}\right. + \mathrm{H_2O}.$$

Basic salt.

$$\mathrm{Bi}\!\left\{\begin{matrix}\mathrm{OH}\\ \mathrm{OH}\\ \mathrm{OH}\end{matrix}\right. + 2\mathrm{HNO_3} = \mathrm{Bi}\!\left\{\begin{matrix}\mathrm{NO_3}\\ \mathrm{NO_3}\\ \mathrm{OH}\end{matrix}\right. + 2\mathrm{H_2O}.$$

Basic salt.

$$\mathrm{Bi}\!\left\{\begin{matrix}\mathrm{OH}\\ \mathrm{OH}\\ \mathrm{OH}\end{matrix}\right. + 3\mathrm{HNO_3} = \mathrm{Bi}\!\left\{\begin{matrix}\mathrm{NO}\\ \mathrm{NO_3}\\ \mathrm{NO_3}\end{matrix}\right. + 3\mathrm{H_2O}.$$

Normal salt.

The salts obtained in the first two reactions represented are still basic, a part of each molecule of the base used being unacted upon. These products are basic salts. There are many such salts known. Thus white lead (see LEAD) is a basic carbonate.

Double Salts.—This name is given to compounds formed by the union of two ordinary salts. Thus there are double chlorides formed by the union of two chlorides, as potassium-platinum chloride, $PtCl_4 2KCl$; double fluorides, as potassium-silicon fluoride, $SiF_4.2KF$; double sulphates, as alum or potassium-aluminium sulphate, $K_2SO_4.Al_2(SO_4)_3.24H_2O$, etc. It appears probable that some of these double salts are in fact derived from acids more complex than is assumed in the ordinary formulas. Thus it is known that the so-called double fluorides are derived from an acid of the formula H_2SiF_6, called fluosilicic acid, and that potassium-platinum chloride is derived from a similar acid of the formula H_2PtCl_6, called chlorplatinic acid, and probably all the other double chlorides and fluorides, and the analogous double bromides and iodides, are to be referred to similar acids. Double sulphates are generally derived from two molecules of sulphuric acid. Thus alum is formed from sulphuric acid by the substitution of one atom of trivalent aluminium for three atoms of hydrogen in two molecules of the acid, the remaining hydrogen being replaced by potassium, as shown in the formula—

$$\begin{matrix}\mathrm{SO_4}\!<\!\begin{matrix}\mathrm{H}\\ \mathrm{H}\end{matrix}\\ \mathrm{SO_4}\!<\!\begin{matrix}\mathrm{H}\\ \mathrm{H}\end{matrix}\end{matrix}$$

Two molecules of sulphuric acid.

give

$$\begin{matrix}\mathrm{SO_4}\!<\!\mathrm{K}\\ \mathrm{SO_4}\!<\!\Big\}\,\mathrm{Al.}\end{matrix}$$

One molecule of alum.

The prevailing theory in regard to the constitution of chemical compounds is competent to explain most of the double salts now known.

Haloid Salts.—This name is given to salts like sodium chloride, NaCl, or common salt, and is derived from ἅλς, sea-salt. The haloid salts, also called halides, are the chlorides, bromides, iodides, and fluorides, with which, further, the cyanides are frequently classed. IRA REMSEN.

Salt Sea: See DEAD SEA.

Saltus, EDGAR EVERTSON: novelist; b. in New York, June 8, 1858. He was educated at Yale College and in Europe and at the Columbia Law School. He has published a life of *Balzac* (1884); *The Philosophy of Disenchantment* (1885); and *The Anatomy of Negation* (1886), a popular statement of the pessimistic philosophy of Schopenhauer and Hartmann; also *Mr. Incoul's Misadventure* (1887), *The Pace that Kills*, and other novels. H. A. B.

Salutes [from Lat. *saluta're*, wish health to, greet, salute, deriv. of *sa'lus*, *salu'tis*, safety, health; cf. *sal'vus*, safe, sound, well]: in the army and navy, honors paid to officers

of higher rank or authority by raising or touching the hat, dropping the point of the sword, presenting arms, firing cannon or small-arms, manning yards, dipping the colors, etc. In the personal salute with cannon the number of guns fired depends upon the rank of the person saluted. In the U. S. the President receives 21 guns, the Vice-President 19, the members of the cabinet, the chief justice, the Speaker of the House of Representatives and Governors within their own State or Territory, 17 guns. The general receives 17 guns, lieutenant-general or major-general commanding 15, major-general 13, and brigadier-general 11 guns. Besides these personal salutes there are the national salute of 21 guns, the salute to the Union of one gun for each State, and the old Federal salute of 13 guns. These are fired in honor of certain days and occasions.

In the personal salutes is seen the survival of the custom of the saluter placing himself unarmed in the power of the saluted. The touching or removal of the cap, dropping the point of the sword, presenting arms, firing cannon and small-arms, manning yards, etc., symbolize the removal of the helmet, giving up the weapon, unloading the firearms, exposing the crews, abandoning the guns, etc.

JAMES MERCUR.

Saluzzo, saă-loot'sō: town; in the province of Cuneo, Italy; 42 miles by rail S. by W. of Turin (see map of Italy, ref. 3–B). The cathedral, semi-Gothic and of the fifteenth century, the Church of St. Martin and St. Bernard, of St. Domenico, etc., all contain objects of interest. In one of the public squares there is a fine monument erected to Silvio Pellico, who was born here. The ancient castle of the Marquises of Saluzzo is used as a prison. Saluzzo manufactures silk, leather, and hats. Pop. 9,716.

Revised by M. W. HARRINGTON.

Salvador, Span. pron. saăl-vaă-dor' (often, but incorrectly, called *San Salvador*, from its capital): a republic of Central America; bounded N. W. by Guatemala, N. and N. E. by Honduras, and S. by the Pacific, the Gulf of Fonseca separating it from Nicaragua on the E. Area, 7,255 sq. miles; pop. (1891) estimated, 777,895; it is thus the smallest but the most thickly settled republic in America. The main Cordillera of Central America runs along the northern frontier. Parallel to this, and about 30 miles farther S., another mountain chain, attaining nearly 8,000 feet, crosses from E. to W., and is continued into Nicaragua; this chain is entirely of volcanic origin, and contains nearly thirty active or quiescent craters. The space between the two mountain ranges is an irregular basin or plateau, 2,000 feet in average elevation, and varied by low mountains; this is the finest and most thickly settled part of Salvador. S. of the volcanic range a strip of low land, partly alluvial, fringes the Pacific. The coast is about 200 miles long, partly rocky, but not high. The only very good harbor is formed by the Gulf of Fonseca; the commercial ports are La Union on the gulf, La Libertad, and Acajutla. The principal river is the Lempa, which drains the plateau and is partly navigable; there are several beautiful lakes, including Cuija, on the Guatemala frontier, and Ilopongo. Volcanic and seismic disturbances are very frequent; in the central range eruptions from one or more peaks are almost constantly going on. Slight earthquakes are so common as to be hardly noticed, and severe ones occur at intervals; San Salvador has been ruined no less than eight times. The climate is hot and often unhealthful on the coast, warm on the plateau, temperate in regions above 3,000 feet, where most of the towns are located. Rains are less abundant than in other parts of Central America, though the climate is by no means dry. The rainiest months are from May to October, and in July and August there are frequent torrential showers and thunder-storms. Considerable tracts of forest remain, and are rich in cabinet woods, balsam, etc. The land, especially that formed by disintegrated volcanic tufa, is very fertile, and most of the inhabitants are engaged in agriculture. The most important crops are coffee, indigo, tobacco, sugar, and, for home consumption, maize, beans, and rice. Large herds of cattle are pastured in some districts. Gold and silver are mined on a small scale. About 5 per cent. of the population are classed as whites, 55 per cent. as Indians, and the remainder as mixed races, with a few Negroes; some of the Indians retain their own language and customs, but all are submissive and, nominally, Roman Catholics. As elsewhere in Central America, the educated and intelligent class is small, but controls all the wealth and power. The government is a centralized republic; the president is elected for four years, and congress consists of a single house elected for one year. The fourteen departments are essentially governed from the capital. The state religion is the Roman Catholic; other creeds are tolerated, but are almost unknown. There are about 900 public and private schools, with 35,000 pupils; the state maintains a university with faculties of sciences, arts, law, medicine, etc. The only railway runs inland from Acajutla (53 miles in 1893), but others are planned; the common roads are nearly all bad. There is a fairly good telegraph system, and cable communication with the U. S. The principal exports, in the order of their importance, are coffee (about half of the total), indigo, sugar, and silver; the average annual value of the exports in 1894 was about 6,000,000 *pesos*. The value of the recorded imports is little over half as much, but the figures are probably defective. Nearly one-third of the entire trade is with the U. S.—principally California—and the proportion is increasing. The monetary standard is the silver *peso* or dollar, equal to $96\frac{4}{10}$ cents of U. S. silver in intrinsic value. Few national coins are in circulation; those of Europe, the U. S., Mexico, Peru, etc., are freely used. The metric system of weights and measures is legalized, but the old Spanish ones are still in general use. The external debt, payable in gold, was in 1893, about $1,500,000, and the interest is promptly met; the internal debt, partly funded, is about 7,500,000 *pesos*. Salvador or Cuscutlan was conquered by Jorge de Alvarado in 1528, and during the colonial period it was a province of Guatemala. From 1823 to 1839 it was a state of the Central American Confederation. By a treaty made at Amapala, June 20, 1895, Salvador united with Nicaragua and HONDURAS (*q. v.*) to form the "Greater Republic of Central America." See SALVADOR in the Appendix. See Guzman, *Topografía física de la República del Salvador*; Squier, *The States of Central America* (1858); Reyes, *Vida de Morazán* (1883); Bancroft, *History of the Pacific States: Central America* (1882–87).

HERBERT H. SMITH.

Salvage [from O. Fr. *salvage*, liter., a saving, deriv. of *salver* > Fr. *sauver* < Lat. *salva're*, save, deriv. of *sal'vus*, safe]: the compensation due for the relief of a vessel, or of property or persons therein, from an impending peril of the sea, by the voluntary exertions of those who are under no legal obligation to render assistance, resulting in the ultimate safety of the object of such relief.

It is not necessary that the peril be immediate. It is enough that it is probable, as where the motive power of a steamer ceases, or a sailing vessel is dismasted. Fire, endangering a vessel afloat, is a marine peril. Recapture from pirates or the public enemy is relief from a sea peril, and, if lawful, will be rewarded with salvage. Recapture by a ship of a neutral power is unlawful.

The crew or passengers of the relieved vessel are not entitled to salvage, as a rule, because in case of a common danger it is the duty of every one on board the ship to give every assistance he can, by the use of all ordinary means in working and pumping the ship, to avert the danger. Yet if one of the passengers or crew renders services outside and beyond his legal duty he may recover salvage. (*The Connemara*, 108 U. S. 352.) Members of a fire department, who act in the performance of a legal duty in saving a vessel, are not entitled to salvage.

The services must be successful to some extent, for if the property is not saved, or in case of capture is not retaken, no salvage is earned. More than one set of salvors, however, may contribute to the result; and all who materially contribute to the saving of the property are entitled to share in the reward, in proportion to the nature, duration, risk, and efficiency of the service rendered.

The amount of salvage to be awarded is largely a matter of fact and discretion in each case; and an appellate court rarely varies the amount given upon the trial. In determining salvage compensation, admiralty judges consider (1) the labor expended by the salvors; (2) the promptitude, skill, and energy which they display; (3) the value of the property employed by the salvors, its risk, and their personal risk in rendering the service; (4) the value of the property saved and its risk. Salvage is not to be confounded with PRIZE (*q. v.*). The latter is more like a gift of fortune, conferred without regard to the loss of the owner, who is a public enemy, while the former is a reward for saving the property of the unfortunate, and should not exceed what is necessary to insure the most prompt, energetic, and daring effort of those who are able to furnish relief.

(*Murphy* vs. *Ship Suliote*, 5 Fed. R. 99.) All property relieved by the salvors' services must contribute to their compensation in proportion to its value; and they have a first lien on such property, which may be enforced by proceedings In Rem (*q. v.*), or they may proceed *in personam* against the owners.

In apportioning the salvage among those engaged in rendering the relief service, regard will be had to the risk incurred and the responsibility borne by the various claimants. For example, if the cargo of the salving vessel was not exposed to danger, its owner will not be entitled to share; while the master of such vessel will be compensated generously, as it is his duty to plan and direct the services. After the ship-owner and master are provided for, the balance is divided generally among the navigating members of the salving crew, in proportion to their wages. In a recent case, however, non-navigating members, such as stewards and cooks, were allowed half-shares according to wages, although they had not taken an active part in the relief service, on the ground that they were bound to take such part if ordered by the master. *The Spree*, 1893, Probate 149.

Salvage service may be rendered under a contract. If this is fairly entered into, the parties are bound by its terms. Under such a contract the salvage may be payable, although the services have been fruitless. See Marvin, *Wreck and Salvage* (Boston, 1858); Newson, *Salvage, Towage, and Pilotage* (London, 1886). Francis M. Burdick.

Salvandy, săl'văn'dee', Narcisse Achille, Comte de: politician and author; b. at Condom, Gers, France, June 11, 1796; was in the army 1813–14; wrote, besides a number of political articles, *Don Alonzo, ou l'Espagne* (1824; 7th ed. 1858); *Islaor* (1824); *Histoire de Pologne avant et sous le Roi Jean Sobieski* (1827–29; 5th ed. 1855). After the Revolution of 1830 he sided with the Doctrinaires; was made ambassador to Madrid (1841–43) and Turin (1843–45), and Minister of Public Instruction 1837–39 and 1845–48. D. at Graveron Castle, Eure, Dec. 15, 1856.

Salvatierra, săl-vă-ti-ăr'ră: a town of the state of Guanajuato, Mexico; on the river Lerma; about 23 miles by rail S. of Celaya (see map of Mexico, ref. 6–G). It has cotton-factories of some importance, and is growing rapidly. Pop. (1889) 10,300.

Salvation: See Christianity and Atonement.

Salvation Army: a religious body with a military organization, now perhaps the largest and most powerful missionary agency in existence. It comprises 7,296 stations and outposts and 15,300 officers in 47 countries. It circulates 50,000,000 copies of its 55 weekly and monthly journals, and the annual circulation of its books and pamphlets is estimated at 4,000,000. The total sum raised annually by the army is about $5,000,000.

The object of the army, in the words of its general, is "to effect a radical revolution in the spiritual condition of the enormous majority of the people of all lands; . . . to alter the whole course of their lives, so that instead of spending their time in frivolity and pleasure-seeking . . . they shall spend it in the service of their generation and in the worship of God." It had its beginning in the work of the Rev. William Booth, later its general, as an evangelist among the degraded poor of the East End of London. In 1865, having severed his connection with the Methodist body in order more fully to devote himself to revival work, absolutely alone, unaided by any individual or fund, attracted only by the misery and need of the people, he began work by holding open-air meetings—the first one under cover being in a tent in the Friends' burial-ground in Whitechapel. This tent was subsequently destroyed in a gale, but the East London Mission was then sufficiently well established to warrant the renting of a hall. The work began to attract the attention of wealthy philanthropists, Samuel Morley, M. P., being conspicuous among its earliest and most constant friends. The rapidity with which the work extended was unparalleled, and its local character was soon lost. In 1869 its name was changed to the Christian Mission, and branches were formed in various parts of England, Scotland, and Wales. In 1880, with the opening of France, it began its international career. The devoted band of volunteer workers has been rewarded by accounts of remarkable conversions, and of reformations of vile and reckless characters who could not have been reached by any other existing agency. In some cases whole communities were reclaimed. In organizing the mission Mr. Booth had naturally followed Methodistic lines—converts were formed into classes, with leaders; these into leaders' and elders' meetings, with secretaries, treasurers, etc. Stations were united under evangelists, and local councils manipulated the funds. Conferences were composed of these materials, and in the speed of the movement time was wasted in calling the body together, and then its action was often too slow. After much deliberation it was unanimously decided by the conference to place the directing, controlling power in the hands of one man—Mr. Booth. In 1878 the name of the mission was changed to the Salvation Army, and a complete military system adopted. Military titles superseded the churchly nomenclature, and a deed-poll enrolled in the British High Court of Chancery constitutes the general of the army the trustee of its entire funds and property in Great Britain. In this deed-poll "only those doctrines were included that appeared necessary to salvation, only those regulations which should serve as a skeleton for whatever additions differences of time and nationality might demand. Only those fundamental objects were enacted which were to be the unchangeable pursuit of the Salvation Army so long as a single sinner remained to be saved." Thus its theology is of the simplest. The work in hand is "to subdue a rebellious world to God." This is to be accomplished by the instrumentality of holy men using the means used by the first apostles, and these means will be made effective by the cooperation of the Holy Ghost, given through and because of the atonement of Jesus Christ. On these lines the ranks are recruited from converts whose frequent lack of scholarship does not debar them from positions of usefulness and trust. Among the early features of the movement were training-homes, from which have graduated some of the most efficient officers. There are upward of forty of these training-homes in existence. With only these objects in view it appears strange that in each of the countries occupied by the army it has had to face universal prejudice and antipathy, which have found expression in systematic restriction and persecution. Through these it has invariably made its way to a position of respect. Nowhere has it had more bitter opponents than in its own home, England. From some of the roughest mobs there, however, army-corps have been recruited. Undoubtedly the apparently irreverent methods pursued by the army are frequently the cause of this opposition, as those in command hesitate at nothing in order to win the attention of the class they aim to reach, displaying wonderful ingenuity in their devices. In Sweden, to gain the students in the University of Upsala, a sensation poster in Latin was circulated with fine effect; while in a district in London a woman officer hired a cab, filled it with musical instruments, trimmed it and herself with streamers, and mounted to the top with a tambourine. Naturally a large number followed to the barracks. In foreign countries the soldiers adopt, so far as possible, the ways of the people, and their ordinary garb conforms to the customary dress of the poorest native. A decided feature from the beginning has been the army's music. It appropriates with the utmost freedom tunes with which all are familiar; and all sorts of musical instruments are used in the meetings and in the open-air parades.

In the army women are not barred by their sex from any position. They compose about half the officers in charge of corps. Though the discipline is strictly military the service is entirely voluntary, any one being at liberty to retire at any time. Having given satisfactory evidence of conversion and signed the articles of war, in which he promises, for love of Christ, to live for God and the army, be obedient to lawful orders, and lead a pure life, a recruit is expected to become an active worker. His tastes, circumstances, and adaptations are well considered, and scope is given for all his talents to find employment. The principle of self-support is applied to every corps, division, and territory. No salaries are guaranteed, and no officer receives more than is required for the supply of actual wants. Gen. Booth's private income is derived from other sources, and he has never drawn any salary or allowance from the army funds.

The memoir of Mrs. Booth, "the mother of the Salvation Army," *The Life of Catherine Booth* (New York and London, 1893), contains a history of the movement which embodied her life's work. All her children are actively engaged in "the war." William Bramwell, the eldest son, is chief of staff at the international headquarters, 101 Queen Victoria Street, London, England. Emma, the second daughter, is joint commander of the forces in the U. S., with headquarters in New York; Herbert, the third son, is

in charge of the Australasian forces. The eldest daughter, Catherine, is in charge of the Dutch work, with the title of *La Maréchale*, and two daughters, Eva and Lucy, are in command of Canada and France respectively. Other notable names identified with the army's progress are those of Commissioners Booth-Clibborn, Booth-Tucker, Booth-Helberg, Railton, Hanna Ouchterlony, Howard Carleton, Cadman, Coombes, Ridsdell, Higgins, and Dowdle.

The auxiliary league is composed of persons who, not necessarily indorsing every method used by the army, yet sympathize in its desire to reclaim the fallen and to save the lost, and who are precluded from taking any other part in it by pressure of other duties or ill health. Many persons of influence and position in this way assist in removing prejudice and encouraging the work.

In Oct., 1890, Gen. Booth published *In Darkest England, and the Way Out*, a book in which he dealt with and solved the problem of destitution and crime from the standpoint of the Salvation Army, through which alone it would be practicable to carry out such a scheme as he proposed. Five million dollars would be required, by the general's estimate, to put the whole in working order, but half a million would be sufficient to start it. On Jan. 30 following Gen. Booth publicly signed a deed of trust for the half million dollars, and two parts of the plan—the City Colony and the Farm Colony—are in successful working order and self-supporting, and negotiations are well under way (1894) for the third—the Over-the-sea Colony. Should the plan be fully carried out, the general declares that in England in twenty years no man or woman willing to work would be unemployed. Perhaps in no country has the Salvation Army made more rapid strides, or taken deeper hold, than in the U. S. On Mar. 10, 1880, Commissioner George Scott Railton, in company with seven illiterate yet earnest young women, landed at Castle Garden, New York. After a time the work was very prosperous, but unfortunately, owing to the unfaithfulness of one in its command, a secession took place in Oct., 1884, which resulted in the loss of the official organ, property, and many officers. Commissioner Frank Smith followed in office and was in command some three years, during which a hard struggle was experienced. Commander and Mrs. Ballington Booth took command of the work in the U. S. in Apr., 1887, and since 1890, in particular, the progress of the movement has been rapid. In the early part of 1896 Mr. and Mrs. Ballington Booth, having been ordered from headquarters in London to another field of operations, refused to obey, resigned their commissions, seceded from the army, and started an independent "American" movement of their own. In Mar., 1900, the army was established in 620 cities and towns, having 735 corps and outposts. Five-eighths of the officers are by birth or naturalization citizens of the U. S. In Mar., 1900, there were 2,709 officers. The official organ is the *War Cry*, and there is a monthly magazine known as *The Conqueror*.

Revised by F. DE L. BOOTH-TUCKER.

Salvator Rosa: an anglicized form of the name. See ROSA, SALVATORE.

Salvia'nus: presbyter of Marseilles: an important Christian writer of the fifth century; b. probably at or near Treves; author of several works, of which the following are extant: 1. *Ad Ecclesiam*, in four books, a tractate against avarice, published under the pseudonym of *Timotheus*; 2. *De Gubernatione Dei*, composed between 439 and 451, in eight books, in defense of God's constant providence; 3. Nine letters. Salvianus's Latinity is excellent for the period, and bears evidence of a study of Lactantius, but he is diffuse and very rhetorical. Of the vices of his time he gives a most vivid picture. Best editions by C. Halm (Berlin, 1877), and F. Pauly (Vienna, 1883). M. WARREN.

Salvini, săl-vee'nĕ, TOMMASO: tragedian; b. in Milan, Italy, Jan. 1, 1830. His father and mother were actors. Young Salvini showed a rare talent for acting, and he was placed under the tuition of Gustave Modena, and about 1847 joined the Ristori troupe, and achieved success. In 1849 Salvini took an active part in the war of Italian independence, and became the friend of Mazzini, Garibaldi, and Saffi, with whom he was taken prisoner at Genoa. Retiring to Florence he devoted a year to professional study, preparing among others the *rôles* of Othello, Saul, Hamlet, and Orosmanes. His theatrical tours in Italy, Spain, and Portugal were a series of ovations. In 1872 Salvini visited South America, where he was received with equal enthusiasm, and in 1873–74 he made a tour of the U. S., giving 128 performances, as well as twenty-eight in Havana, Cuba. In 1881–82 he again visited the U. S., and made a third tour in 1885–86, since which he has retired from the stage, and lives in Florence. Salvini also acted in Great Britain, Germany, Austria, and Hungary, producing everywhere a profound impression. B. B. VALLENTINE.

Salzburg: capital of the duchy of Salzburg, Austria; 195 miles by rail W. by S. of Vienna (see map of Austria-Hungary, ref. 5–D). It is picturesquely situated at the foot of the Noric Alps, on both sides of the Salza, which here rushes forth from a narrow defile and winds through the city toward the Inn. The city is old, with crooked and narrow streets, but it contains many fine monuments and edifices built of white marble. It is surrounded with walls pierced by twenty gates, of which the most remarkable is the Sigismund Thor, 425 feet long, hewn through the Mönchsberg. It has a fine cathedral (1614–34), a Benedictine monastery with a library of 65,000 volumes and 900 MSS., a botanical garden, a college, a theological seminary, a medical school, a museum of antiquities, and a public library with 82,000 volumes and 1,400 MSS. After 798 Salzburg was the seat of archbishops who became noted for their ecclesiastical severity. In 1498 the Jews were expelled, and in 1732 30,000 Protestants were compelled to leave their homes. Salzburg has manufactures of paper-hangings, musical instruments, lead-pencils, mirrors, and type, several oil-mills and factories for spinning and weaving cotton, and carries on an active trade with Vienna and Bavaria. Pop. (1891) 27,644.

Salzkam'mergut: district of the Austrian province of Upper Austria, between Salzburg and Styria; remarkable for the beauty of its scenery and for its salt-works. It comprises an area of 255 sq. miles, with 19,000 inhabitants. On account of the alpine character of the district, agriculture is almost impracticable; the inhabitants are mostly engaged in cattle-rearing and dairy-farming, and in the manufacture of salt. The most striking feature of the scenery is the lakes, inclosed by forest-clad mountains. The highest peak, Hoher Priel, reaches an elevation of 7,931 feet. The most celebrated of the lakes is Traun, formed by the river Traun. The richest salt-works are those of Ischl and Hallstadt.

Salzmann, CHRISTIAN GOTTHILF: See the Appendix.

Samana' Bay: a deep indentation in the eastern end of the island of Santo Domingo (Dominican Republic), West Indies. It is 37 miles long and 12 wide, with two entrances, which could be easily defended by forts; it forms a very large and fine harbor, perfectly safe except in the rare event of a cyclone from the E. The principal ports are Sabana la Mar on the south side and Santa Bárbara de Samaná, on the north. Although it lies near the route from New York to the Isthmus of Panama, the U. S. Congress refused to ratify a treaty for its purchase in 1870.

HERBERT H. SMITH.

Samar: one of the Visaya group, Philippine islands, East Indies; area, 5,167 sq. miles; pop. (1887) 185,386 inhabitants, most of whom are mestizoes. The mountains of this island are higher and wilder than those of the other islands. The capital is Catbalonga, on the west coast. The principal articles in which trade is carried on are wax, cabinet woods, palm oil and mat-work. Revised by M. W. HARRINGTON.

Samara, să-mă'ră: government of European Russia; bounded E. by the Kirghiz steppes and W. by the Volga. Area, 58,321 sq. miles. It is very fertile and well adapted to agriculture, but thinly peopled. Pop. (1897) 2,761,851.

Samara: capital of the government of Samara, European Russia; on the Volga (see map of Russia, ref. 7–H). It has an extensive trade in grain, fish, caviare, tallow, and hides. Pop. (1897) 91,659.

Samarang': town of Java, East Indies; the capital of the Dutch residency of Samarang; on the northern coast of the island, at the mouth of the river Samarang (see map of East Indies, ref. 8–D). It is tolerably well built, and has an important trade, though its climate is unhealthful and its harbor shallow, and in the wet season even unsafe. Sugar, rice, and pepper are extensively cultivated in its vicinity, and it is the entrepôt for the products of the central part of the island. Pop. 71,440, of whom 3,600 are Europeans.

Sama'ria [from Lat. *Samari'a*=Gr. Σαμάρεια, from Heb. *Shōmᵉrōn*]: an ancient city of Central Palestine, 6 miles N. W. of Shechem, and about half-way between the Mediterranean and the Jordan. It was founded 923 B. C. by Omri, the sixth of the nineteen kings of the northern kingdom of Israel, who

made it his capital, and called it after the name of the man (Shemer) of whom he bought the hill on which the city was built (1 Kings xvi. 24). This hill, oblong and flattened, swells up to the height of some 300 feet out of a basin about 5 miles in diameter, surrounded on every side by mountains still higher. The Mediterranean is in full view from the top of the hill. "It would be difficult," says Dr. Robinson, "to find in all Palestine a situation of equal strength, fertility, and beauty combined. In all these particulars it has very greatly the advantage of Jerusalem." The city shared in the stormy fortunes of the upper kingdom. Twice it escaped capture when besieged by the Syrians. In 722 B. C., after a siege of two years, begun by Shalmaneser of Assyria, it was taken by his successor, Sargon, who put an end to the kingdom of the ten tribes. Repeopled by Esarhaddon, it was next captured by Alexander the Great (332 B. C.), and again by John Hyrcanus (109 B. C.). It was splendidly rebuilt by Herod (40–4 B. C.), who named it *Sebaste*, in honor of his patron, the Emperor Augustus. The modern Arabic *Sebustieh* is simply a corruption of the Greek name. Nearly 100 limestone columns still standing attest the magnificence of the Herodian city. The partially ruined church of St. John, now a mosque, dated probably from the twelfth century. In the fourth century it was claimed that John the Baptist had been buried there, as well as the prophets Elisha and Obadiah. The modern village, on the southeast shoulder of the hill, contains about sixty houses. The people (from 400 to 500) are noted for their rudeness and insolence to travelers. Samaria was also the name of one of the three provinces into which Western Palestine was divided by the Romans. Its boundaries are given by Josephus (*J. W.*, iii., 3, 4). Revised by S. M. Jackson.

Samar'itans [from Lat. *Samarita'nus*, Samaritan, a Samaritan, from Gr. Σαμαρείτης, a Samaritan, deriv. of Σαμάρεια, Samaria]: the ancient inhabitants of the province of Central Palestine. After the destruction of the kingdom of Israel in 722 B. C., in the first year of Sargon, King of Assyria (2 Kings xvii. 6; xviii. 11), Central Palestine was left desolate and uninhabited except by a remnant of the poorer classes and fugitives (2 Chron. xxxiv. 6, 9: Jer. xli. 5), until the removal thither by Sargon in 722, and again in 715 B. C. (2 Kings xvii. 24), and Esarhaddon in 680 (Ezra iv. 2–10), of colonists from Babylon, Syria, Arabia, and other Eastern lands. Hence the people became an exceedingly mixed race, the main body, however, being of the Aramaic stock. Every tribe at first worshiped its own god, but being plagued by the wild beasts, they united in the worship of the God of the land, being instructed thereto by a priest sent to them from the exiles by the King of Assyria, who restored the worship at Bethel (2 Kings xvii. 24–41). When the Jews returned to Jerusalem (536 B. C.), the Samaritans desired to unite with them in their work, but were rejected by Zerubbabel, owing to their corrupt religion and their mixed or heathen origin (Ezra iv. 3). Henceforth, the Jews and Samaritans entertained the most bitter hatred of each other. This was intensified by the secession of one of the sons of Joiada, the son of Eliashib, the high priest (Neh. xiii. 28), son-in-law of Sanballat, the Samaritan governor (called by Josephus, *Ant.*, xi., 7, 2, Manasseh, the brother of Jaddua, the high priest). Under the leadership of this priest and others of the Jews, who with him were expelled on account of their refusal to separate themselves from their heathen wives, the worship was reorganized (409 B. C.) on the basis of a copy of the Pentateuch that Manasseh carried with him. Gerizim was made the center of worship, in accordance with the tenth commandment added by the Samaritans to Ex. xx. and Deut. v., and a temple was erected there, probably in the time of Alexander the Great, which continued until it was destroyed by John Hyrcanus (129 B. C.; Josephus, *Ant.*, xiii., 9, 1). The Samaritans shared the fortunes of Palestine during the constant wars between Egypt and Syria, and also under the Roman dominion. They were severely chastised by Pilate for their rebellious spirit, then again by Vespasian and others, until finally, in the reigns of Zeno and Justinian, on account of outrages committed against Christians, they were almost totally destroyed. A remnant clung to their holy place, dwelling in Nablus, the successor of the ancient Shechem, or dispersed in Alexandria, Cairo, Damascus, Aleppo, etc., where they retained the religion of their fathers. And thus they continued during the Mohammedan rule, dwindling until at present they are limited to a community of from 100 to 200 souls at Nablus. They were lost sight of by the learned world until the sixteenth century, when Joseph Scaliger opened a correspondence with them. They then gained an interest that they have since retained, owing to their ancient copy of the Pentateuch, and their religious rites and doctrines, as well as their language and literature.

The Samaritan Pentateuch.—The original MS. is in the synagogue at Nablus. This, it is claimed, was received by tradition from Abisha, the great-grandson of Aaron, whose name is inscribed upon it. It is mentioned by Cyril of Alexandria, Eusebius, Jerome, Procopius of Gaza, etc., among the Fathers, but was lost sight of subsequently until 1616, when Pietro della Valle procured a copy of it at Damascus, which was then published in the Paris Polyglot of 1645, and subsequently in Walton's Polyglot of 1657. At once a hot dispute arose as to its value, which continued for two centuries—Morinus, Houbigant, Poncet, and Hassencamp exalting it above the Masoretic text; Hottinger, Ravius, J. D. Michaelis, and Tychsen advocating the superiority of the latter. Gesenius, in his work *De Pent. Sam. Origine* (1815), was the first to compare the two texts thoroughly. His results have been generally accepted by modern scholars—that while the text is an independent one in its origin, it has yet been improved by the Samaritans in order to avoid obscurities and in the interest of their own religion, at times betraying an ignorance of Hebrew grammar and exegesis. It has many features of resemblance to the LXX. (Gesenius calculates them at more than 1,000), which have attracted the attention of scholars, so that on the one side Hottinger, Hassencamp, Eichhorn, and Kohn have contended that the LXX. had been translated from the Samaritan, and on the other side Grotius, Usher, etc., that the Samaritan was made from the LXX. But these views are impossible, and have been abandoned by most recent scholars, who give the text an independent authority. It was, then, either with the LXX. derived from a common older MS. of Jerusalem, as Gesenius, Nutt, and others, or, as the differences between them are quite numerous, they are based on independent original MSS., the original of the Samaritan text having been brought from Jerusalem by Manasseh. The text has been published since Walton by Blayney (Oxford, 1790) in Hebrew square characters, and the variations from the Masoretic text have been noted in the appendix to Petermann's *Versuch einer hebräischen Formenlehre nach der Aussprache der heutigen Samaritaner* (Leipzig, 1868; also *Deutsch. Morg. Gesells.*, v. 1). The text has been discussed in Smith's *Bib. Dict.* by Deutsch, and in Kitto's *Cyclop.* (3d ed.) by Samuel Davidson, as well as by those mentioned above.

The Samaritan religion is based on the Pentateuch, and differs from that of the Jews in the rejection of the rest of the Old Testament, and in their regarding as the tenth commandment the obligation to worship God on Mt. Gerizim. Their religion is monotheistic, the name יהוה being lost, and *Shéma* (the name) substituted for it. They believe in the existence of good and evil spirits, עזאזל (Lev. xvi. 10) being interpreted as a "devil," and the נְפִילִים of Gen. vi. 4 as "evil spirits." They believe in the Messiah (John iv. 25), on the basis of Deut. xviii. 15, as a prophet, who is like Moses, but not greater than Moses, who remains for all time the greatest. The Shiloh passage, Gen. xlix. 4, they refer to Solomon, in whose time the seepter departed from Judah. The Messiah will appear 6,000 years after the creation, and enter into judgment of the world on Mt. Gerizim. Here they find all the sacred places of the past and future. Here Adam was created; here the ark rested; here Adam and Noah erected their altars, Abraham offered Isaac, and the heavenly ladder appeared to Jacob, etc. They do not offer sacrifices, on account of the destruction of the temple, but keep the feasts of the Pentateuch, circumcise their boys on the eighth day, and observe the Sabbath in their synagogues like the Jews. The Samaritans had their sects after the analogy of the Jewish sects, called Essenes, Sebuæans, Gorthenians, and Dositheans, mentioned by Epiphanius, *Adv. Hæres.*, i., 11, fourth century. For these, and a full description of their present customs in the keeping of the feasts, see Petermann, art. *Samaria*, Herzog's *Realencyklopädie*; Stanley's *Jewish Church*; and Nutt's *Samaritan History, Dogma, and Literature* (London, 1874).

The Samaritan language is a mixture of the Aramaic and Hebrew, in many cases having side by side the two forms; e. g. the article of the Hebrew and emphatic state of the Aramaic; the relatives אֲשֶׁר and ד; the Niphal and Ithpe'el, Aphel, and Hiphil; the plurals in ים and ין, ות—

and ֫—. The letters are twenty-two in number, their order being the same as in Hebrew, but their *form* is like the ancient Hebrew and Phœnician, and not like the square character adopted by the Jews subsequent to the Exile. In pronunciation they are the same as Hebrew, except the gutturals, which are all quiescent and interchange readily with one another, being exceedingly weak. The vocabulary is essentially the same as the Hebrew and Chaldee, although many words have been introduced from Arabic, Latin, and Greek. See Uhlemann, *Inst. ling. Samarit.* (Leipzig, 1837); Nicholls, *Grammar of the Samaritan Lang.* (London, 1858); Petermann, *Brevis Ling. Samarit. Gr.* (Berlin, 1873).

The Samaritan literature is limited in extent. (1) The *Samaritan Targum* is ascribed by tradition to Nathanael the high priest, who died 20 B. C. There is no reason to doubt that it was composed about the same time as the Targum of Onkelos, with which it has many points of agreement, although certainly an entirely independent version. The translation is exceedingly literal and close, even where the sense was not clear to the translator. (Cf. Winer, *De Versionis Pent. Samaritanæ indole* (Leipzig, 1817); Petermann, *Pent. Samarit.*, fasc. i. Genesis (Berlin, 1872); Brüll, *Samarit. Targum zum Pent.* (Frankfort, 1875), in Hebrew square characters. Cf. also *Fragments of a Samaritan Targum*, with an introduction by Nutt (London, 1874), and *Krit. Studien über manuscript. Frag. des Sam. Targ.*, von Brüll (Frankfort, 1875).) This Targum is also printed in the great Paris and Walton Polyglots. The Samaritans had also a Greek version, mentioned by some of the Fathers as τὸ Σαμαρειτικόν, which has been lost; also an Arabic version, which they still possess. (2) *Chronicles.*—First in importance is the Samaritan Chronicle, or book of Joshua, composed probably in the thirteenth century, taking some of its material from the Hebrew book of Joshua, but adding thereto much of a legendary character, showing that the Jews were from the time of Eli apostates and their oppressors, continuing the narrative until about 350 A. D., where it concludes abruptly. It was published by Juynboll (Leyden, 1848), with Latin translation and commentary. There is also the chronicle *El Tholodoth* (The Generations), professedly by Eleazar ben Amram (1142 A. D.), and then continued by many others until 1859, giving the calculation of sacred times, the age of patriarchs, list of high priests until the present. It was published by Neubauer in *Journal asiatique* (1869). Then comes the chronicle of Abulfath, in the middle of the fourteeenth century, a digest of the two previous works, with fresh legendary material, published by Vilmar (Gotha, 1865). Other minor works, corresponding with the Jewish Hagada literature, are found. (3) *Liturgies and Hymns.*—Nutt (p. 143) says that there are nineteen volumes of these in the British Museum, besides those known in the *Carmina Samarit.* of Gesenius (Halle, 1824) and *Karme Shomeron* of Kirchheim (Frankfort, 1851.) Petermann publishes specimens in his *Gram.* and *Chrest.* The present Samaritans have two collections, called *Durrân* (String of Pearls) and *Defter* (Book). These hymns and prayers belong to widely different periods. The earliest are ascribed to the angels. Heidenheim has published many of them in his *Vierteljahrsschrift.* (4) There are also commentaries, theological tracts, and a few recent grammatical works, written in Arabic. See the article *Samaria* in Herzog's *Realencyk.*, by Petermann; Smith's *Dict.*, by Deutsch; Kitto, *Cyclop.* (3d ed.), by Davidson; and Nutt, *Samaritan Hist., Dogma, and Literature* (London, 1874). C. A. Briggs.

Samarkand', or **Samarcand** (probably the ancient *Maracanda*): capital of the province of Serafshan; comprising the southern part of Russian Turkestan; situated at an elevation of 2,154 feet above the level of the sea, 8 miles S. of the river Serafshan (see map of Asia, ref. 4–D). By the Arabian poets of the Middle Ages it is described as a paradise on account of its beautiful surroundings, and under the dynasty of the Sassanides (833–1000 A. D) it flourished as a home for learning and all the arts of peace. It lost much by the occupation of Genghis Khan in 1219, but it rose again toward the close of the fourteenth century, when Timur made it the capital of his immense empire, and adorned it with architectural monuments of all kinds—the tomb of Kasim-bin-Abbas, the mosque of Timur, the citadel, Timur's tomb, the Medresse, etc. By the Mohammedans of Central Asia the city is still considered the principal seat of Mohammedan learning, and its eighty-six mosques and twenty-three colleges attract numerous pilgrims and students. In 1868 it was seized by Russia, with the whole district of the Serafshan. The Transcaspian Railway has been completed to Samarkand. Pop. in 1889, according to Curzon, 40,000, of whom 6,000 were in the European quarter; pop. (1897) 54,900. Revised by M. W. Harrington.

Samar'rah: town; in the vilayet of Mesopotamia; on the left bank of the Tigris; 62 miles N. W. from Bagdad (see map of Turkey, ref. 7–J). It was founded by the Caliph Motassem (836) with frightful extravagance. The stables of the caliph could contain 100,000 horses. The city is revered by the Shiïte Mussulmans, and annually attracts great numbers of pilgrims. Pop. 8,000. The ruins of ancient Opis and of the Median wall, which extends for several miles along the river, are close by. E. A. G.

Sambation [through Heb. from Gr. σαββατικὸς πόταμος]: a river said by Oriental folk-lore to flow during the week, but to rest on the Sabbath. It is first mentioned by Pliny (*Hist. Nat.*, xxxi., 2). Josephus (*Bell. Jud.*, vii., 5, 1) reverses the order, and says it flows only on the Sabbath. In the Midrash and later Jewish saga it is connected with the reported dwellings of the ten lost tribes (*Jew. Quart. Rev.*, i., p. 20, *seq.*). It is useless to attempt to identify the river, but the belief had its origin in the many intermittent springs in Palestine, and in the wish to make nature witness to the holiness of the Sabbath. There existed another saga on a river which flowed sand and stones (Bar Hebræus, in *Mittheil. d. Acad.-Orient. Ver. zu Berlin*, iii., 38), which, because of its name (*Nahar ḥōl*, Sand or Week river), was confounded with the Sambation (*All. Zeit. d. Judenth.*, May 20, 1892, p. 247; *Zeit. f. Assyr.*, viii., p. 273). Similar traditions exist in the East. See also Neubauer, *Geogr. du Talmud* (1868, p. 33); Brüll, *Jahrbücher f. Jüd. Gesch.* (i., p. 64); *Zeit. f. Volkskunde* (ii., p. 297). Richard Gottheil.

Sambre, sänbr: a small river of Europe which rises in the department of Aisne, France, flows in a N. E. direction, and joins the Meuse at Namur in Belgium after a course of about 100 miles. It is navigable for a great part of its course, and forms an important part of the system of canals in Northern France and Belgium.

Sam'isen [Jap., liter., the three pleasing threads]: the most popular of Japanese musical instruments. It consists of a neck or finger-board 2½ feet long, and a square drum (7¾ by 7 inches), rounded off at the corners and covered with parchment. There are three strings of silk, which the player strikes with a broad pecten, 8¼ inches long, of wood, ivory, or tortoise-shell. The parchment covering the drum is of cat-skin, and is double at the point where the player strikes. The instrument is held by the left hand, close to the left shoulder, transversely, so that the drum comes under the right arm. The drum receives the first blow from the pecten or *bachi*, and thus two vibrations are set up. In the fingering the nails are made to press the strings. The instrument is said to have been introduced from Loochoo about 1560. J. M. Dixon.

Sammon'icus, Quintus Serenus: a Roman poet of the third century A. D., whose didactic poem, *De Medicina*, in 1,115 hexameters, is a collection of medical receipts drawn largely from the elder Pliny; correct in versification, but dull and prosaic. Edited by Ackermann (Leipzig, 1786), and in Baehrens's *Poet. Lat. Minores*, vol. iii., pp. 102–158. M. W.

Sam'nites [from Lat. *Sam'nis*, plur. *Samni'tes*, a Samnite, deriv. of *Sam'nium*, for older *Sabi'nium*, name of their country, deriv. of *Sabi'nus*, Sabine]: a people of Sabine origin occupying Samnium, the territory of Central Italy S. of the Sabines (*q. v.*). Like the latter, they were a confederation of tribes, but their organization seems to have been more perfect than that of the parent race. They gradually moved beyond the natural boundaries of their territory, and occupied points on the Adriatic, and in the territory of Campania and Lucania, coalescing with the Oscan peoples who inhabited this region. In the northern part of Campania they came in contact with the Romans, and thus was inaugurated the long series of wars which resulted in Rome's conquest of the whole of Southern Italy (272 B. C.). The Samnites probably found the Oscan language in the original territory which they occupied, as well as in Campania, but as their own (the Umbro-Sabellian dialect) was so closely related to it, the mingled product does not seem to have differed much from the original Oscan.

G. L. Hendrickson.

Samnium: See Samnites.

Samo'a: group of fourteen volcanic islands of Polynesia, N. E. of the Fiji islands; lying nearly E. and W. between

the parallels 13° 31′ S. and 14° 30′ S. and lon. 172° 45′ W. and 168° 9′ W. It consists of three larger islands—Savaii (area, 659 sq. miles, Upolu (340 sq. miles), and Tutuila (54 sq. miles)—and the smaller Manua group to the eastward. Total area, 1,701 sq. miles. Pop. 34,000. Upolu is the most populous, containing 16,600 inhabitants, and on its northern shore is Apia, the principal port and capital of the group. The volcanoes are quiescent, though native tradition relates an eruption on Savaii, and in 1866 Olosenga, one of the eastern group, had a submarine explosion close to its shores, accompanied by a shower of ashes. The climate is tropical, the rainfall (occurring in December to April) reaches sometimes 135 inches, the soil is very fertile, the vegetation luxuriant, the aspect picturesque. The natives are of pure Polynesian race, gay, kind, pleasure-loving, indolent, fairly intelligent, devoted to agriculture and fishing. They are all nominal Christians, about two-thirds being Protestants, the remainder Roman Catholics. In 1891 there were 235 British-born subjects on the islands, about 90 Germans, and a few of other nationalities. The chief products are copra, cotton, and coffee. In 1892 considerable plantations of cacao were made. U. S. coins are the recognized medium of exchange. The archipelago was discovered in 1722 by Roggeveen. Bougainville visited the islands in 1768 and named them Navigator Islands. They are in direct steam-communication with New Zealand, Australia, and California. The dates used on the islands, formerly derived from the East, were in 1892 changed to those from the West, July 5 of that year being changed to July 4.

Formerly the islands, with the exception of Tutuila, which had independent chiefs, were governed by the royal houses of Malietoa and Tupua. In July, 1881, by an agreement between Germany, Great Britain, and the U. S., Laupepa became king of all Samoa, and Tamasese vice-king. These two chiefs frequently changed places until, Aug. 25, 1887, the Germans proclaimed Tamasese king, and Laupepa was deported to the Cameroons. Mataafa, the chief of the loyalist party and a relative of the exiled king, made war against Tamasese. The Germans, after an encounter (Dec. 13, 1888) resulting from an attempt to disarm Mataafa's forces, proclaimed martial law. A truce was finally arranged with Mataafa pending diplomatic negotiations. At a conference in Berlin between representatives of Germany, Great Britain, and the U. S., Samoa was declared (June 14, 1889) independent and neutral; the Samoans were secured in their right to elect their king and govern themselves according to their native laws and customs; and a supreme court was created to secure the rights of foreigners. Laupepa was re-elected king by the people Nov. 9, 1889. By the treaty signed Apr. 19, 1890, Apia was converted into a municipal district, or international port, and placed under a municipal magistrate. By the Anglo-German agreement of 1899, accepted in Jan., 1900, by the U. S., Great Britain and Germany renounced in favor of the U. S. all rights over the island of Tutuila and the other islands E. of 171° lon., the islands W. of that meridian being assigned to Germany. See Robert Louis Stevenson, *A Footnote to History, Eight Years of Trouble in Samoa* (1892). MARK W. HARRINGTON.

Samos: a mountainous island of the Ægean Sea; separated by the Strait of Kutchuk Boghas, 1¼ miles wide, from the promontory of Mt. Mycale, at whose foot the fleet of Xerxes was defeated on the day of the battle of Platæa (479 B. C.). It is 34 miles long, 13 miles broad, with area of 289 sq. miles. The island is exceedingly fertile, producing in abundance wheat, olives, grapes, and fruit of superior quality, but its orange, lemon, and pomegranate groves were almost ruined by the rigorous winter of 1849, and have been only partially restored. The mountains, lined with forests of oak, cypress, and pine, are rich in marble and silver, lead and copper ores. Mt. Kerki, the loftiest peak, is 5,223 feet high, the summit usually covered with snow. In grand picturesqueness and variety of scenery, Samos is unsurpassed among the Ægean islands. The tunnel, mentioned by Herodotus, which supplied the ancient seaport with potable water, exists in good preservation. In all ages the Samian sailors have been famous for intrepidity and skill. In classic days the island was wealthy and flourishing. Sometimes independent, but constantly attacked, it often changed masters, until in 1453 it was conquered by the Ottomans, and the inhabitants exterminated. Abandoned during a century, it was repopulated in 1587. It took an heroic part in the Greek revolution (1821–27), and asserted its independence, but was handed over to the Ottomans by the allied powers on conclusion of peace. Since Dec. 11, 1832, it has been a principality, paying an annual tribute of 30,000 piasters, and governed by a Christian prince appointed by the sultan. The inhabitants, almost exclusively Greeks, are industrious, enterprising, and ambitious. Vathy, the real capital (pop. 7,675), was among the first places in the East to introduce the electric light. Chora, the residence of the governor, is a miniature European town. The annual exports, mostly agricultural products, amount to $4,000,000. Pop. of the island (1889) 43,901, residing in thirty-one towns and villages. E. A. GROSVENOR.

Sam'othrace: island in the Ægean Sea; N. W. of the Dardanelles; belongs to Turkey. Destitute of harbors, it is really a wooded mountain, 30 miles in circuit, rising to the height of 5,240 feet. Its peak, Mt. Saoce, whence, according to Homer, Neptune watched the battles of the Greeks and Trojans, is visible from the plain of Troy. The island was the center of the ancient Cabiric worship, monuments of which are still seen. An earthquake, Feb. 14, 1893, destroyed most of the buildings on the island and many lives. Pop. 1,800. E. A. GROSVENOR.

Samoyeds': a people of Northern Russia, in Europe and Asia, from the White Sea on the W. to Cape Chelyuskin on the E., along the Arctic Ocean, and to a considerable but varying distance inland. They appear to be allied to the Lapps and Finns, but are more degraded than either. They are small, filthy, indolent, and much addicted to intoxication, but peaceable and harmless. The herding of reindeer and the collection of fish and furs afford them subsistence. They are said to number 20,000, of whom one-fourth are European. They speak several dialects. Their country is one of the coldest and most desolate of inhabited lands. They are nominal Christians, but preserve much of their old worship. Revised by M. W. HARRINGTON.

Samphire [for earlier *sampire*, from O. Fr. *Saint Pierre* in *herbe de Saint Pierre*, samphire, liter., Saint Peter's grass]: an umbelliferous plant, *Crithmum maritimum*, growing on cliffs near the sea in Europe. It is a choice salad-herb and makes a very fine pickle. It is extensively raised in English market-gardens. The golden samphire is *Inula crithmoïdes*, a composite seacoast plant resembling samphire, growing in the same situations and having the same uses. Marsh-samphire is *Salicornia herbacea*, a chenopodiaceous salt-marsh plant of Europe and North America. Revised by CHARLES E. BESSEY.

Sampi: an ancient Greek numeral sign (ϡ) for 900. In form it undoubtedly represents the so-called "Dorie *sam*" (Ϻ), a symbol inherited from the Phœnician alphabet, and originally indicating a sibilant distinct from *sigma*. The old Greek local alphabet seldom made use of both signs, but generally decided in favor of one or the other. Some of the Asiatic-Ionic towns, notably Halicarnassus and Teos, used the *san* in the form Ϸ to denote the sound *ts* (or *sh*), otherwise commonly written with double sigma (*-σσ-*). That the symbol was generally regarded even in Asia Minor as a supernumerary is shown by its place after *omega* (800) in the scale of numerals which originated in Miletus. The name *sampi* is due either to the fancied resemblance of the later form to the letter *pi* (π), or, if the name is really old, more probably to the position of the letter after *pi* in the original (Phœnician) alphabet. BENJ. IDE WHEELER.

Sampson, EZRA: clergyman and editor; b. at Middleborough, Mass., Feb. 12, 1749; graduated at Yale College 1773; became pastor of the Congregational church at Plympton, Mass., Feb., 1775; was chaplain in the army at Cambridge 1775–76; removed to Hudson, N. Y., 1796; was there associated with Harry Croswell in the editorship of *The Balance*, one of the first literary journals established in the U. S., 1801–04; contributed essays for many years to *The Connecticut Courant*, which he edited 1804; became judge of Columbia County 1814, but soon resigned. D. in New York, Dec. 12, 1823. Author of *Beauties of the Bible* (1802); *The Sham Patriot Unmasked* (1803); *The Historical Dictionary* (1804), which passed through several editions; and *The Brief Remarker on the Ways of Man* (1817; new ed. 1855). Revised by G. P. FISHER.

Sampson, WILLIAM T.: See the Appendix.

Samson [from Heb. *Shim'shōn*, liter., like the sun, deriv. of *shemesh*, sun]: one of the Hebrew judges, whose history is related Jud. xiii. 2–xvi. 31. Few narratives in the Bible have been studied so carelessly as this. The opening formula (Jud. xiii. 2) shows that it is a story like those in

Jud. xvii.–xviii. and xix.–xxi. The author took pains to divide the story into two parts. The first part (xiii. 2–xv. 20) gives an account of the birth and the wild youth of Samson, up to the time when, after the battle of Lehi, "he became judge of Israel, in the days of the Philistines, twenty years." The second part (xvi.) gives an account of the last few weeks or months of his life, when he relapsed into folly, and perished thereby, "he having been judge of Israel twenty years." Samson is the son of the Danite Manoah of Zorah (xiii. 2), living in Mahaneh-Dan (xiii. 25, xvi. 31; comp. xviii. 11–12). To his mother, long barren, the birth of a son was announced by an angel (comp. Luke i. 7, 13). He is a Nazirite by birth (xiii. 5, 7, xvi. 17; comp. 1 Sam. i. 11), a different thing from being a Nazarite temporarily by vow (Num. vi. 2–21). Through his passion for a Philistine woman, he providentially becomes involved in a series of personal quarrels with the Philistines. In these, though he is not blameless, he has the sympathy of the reader. One exploit leads to another, until he becomes judge. No details of his career as judge are given. In his youth, however, the Philistines ruled Israel (xiv. 4), and Israel, judging by the conduct of the men of Judah (xv. 10–13), was in an abject condition; while in his later years the Philistines kept their own side of the border (xvi.). The inference is inevitable that the twenty years of his administration were a success, and fulfill the promise made before his birth (xiii. 5). Many imagine that he was merely a local judge, but, if language means anything, the statement that he "judged Israel" indicates that he was chief magistrate of the nation. Ussher assumes that the twenty years of Samson followed the forty years of Eli, and dates them B. C. 1140–1120. It is more probable that Samson belongs to the time of Philistine oppression, some decades earlier (Jud. x. 7). Revised by W. J. Beecher.

Samson, George Whitefield, D. D.: theologian and critic; b. at Harvard, Mass., Sept. 29, 1819; graduated at Brown University 1839, at Newton Theological Institute 1843; was for many years pastor of a Baptist church at Washington, D. C., and president of Columbian College, 1859–71; president of Rutgers Female College, New York, 1871–86. D. in New York, Aug. 8, 1896. He traveled in Europe and the East 1848, publishing a series of letters and essays on Italy, Egypt, Palestine, and Sinai; was also author of several theological pamphlets and critical essays on art; *To Daimonion, or the Spiritual Medium* (1852), reissued in an enlarged form under the title *Spiritualism Tested* (1860); *Outlines of the History of Ethics* (1860); *Elements of Art Criticism* (1866); *Physical Media in Spiritual Manifestations* (1869); *The Atonement as assumed Divine Responsibility* (1878); *Bible Revisers' Greek Text* (1880); *Bible Wines* (1883); *Idols of Fashion and Culture* (1887); *Tested Truths as to Relations of Capital and Labor* (1890); *Guizot's Harmony of Historic, Philosophic, and Religious Instruction in French Colleges* (1891); *Classic Test of Authorship, Authenticity of Authority applied to the Old and New Testament Scriptures* (1893).

Samsun' (anc. *Amisus*): town; in vilayet of Trebizond, Asia Minor; a port of large importance on the Black Sea; northern terminus of several trans-Anatolian commercial routes (see map of Turkey, ref. 4–G). It exports wool, silk, sheepskins, goatskins, wax, gums, opium, grain, fruit, wine, valonea, and tobacco. Pop. (1889) 14,500. E. A. G.

Samuel [from Heb. *Sh^{e}mū'ēl*, for *sh^{e}mū^{ac}a'ēl*, heard of God]: a Hebrew judge, lawgiver, and prophet, whose history is recorded in the first of the two biblical books of Samuel; b. at Ramathaim Zophim, in Mt. Ephraim, probably in the twelfth century B. C.; was consecrated by his mother, Hannah, to the service of Jehovah as a Nazirite before his birth; brought up in the household of the chief priest, Eli, at Shiloh; received in childhood a divine message foreboding the downfall of the family of Eli; assumed the judgeship of Israel about twenty years after the death of Eli, at which time he headed a successful expedition against the Philistines; resided at Ramah (probably the same as Ramathaim Zophim); visited annually the three principal sanctuaries, Bethel, Gilgal, and Mizpeh, and made his sons deputy judges, but in consequence of their misconduct was commissioned by Jehovah to accede to the popular clamor for a king; to which end he anointed Saul as first monarch of Israel, and on his disobedience to a divine command anointed the youthful shepherd David in his place. He died shortly before the close of the reign of Saul, and his spirit was successfully invoked by the "witch of Endor" to announce to Saul the fatal result of the battle in which he lost his life. Samuel is regarded as the father of prophecy. This does not mean that there had been no prophets before him, but that he gave organized form and increased power to the prophetic activity in Israel. The "companies" of prophets of his own time and the "sons of the prophets" of later times probably owed their origin to him. In connection with prophetic training he gave an impetus to literary and musical culture, thus making possible the great development of these that characterized the reigns of David and Solomon.

The chronology of the life of Samuel is obscure, and great differences of opinion exist. Probably, however, he was a grown man at the death of Eli (1 Sam. iii. 19–iv. 1); then for twenty years he made his influence felt as a prophet, neither he nor Samson, nor any other man, being at that time judge of Israel (vii. 2); then for perhaps eighteen years he was judge (vii. 6, *seq.*), chief magistrate of Israel; then Saul was made king, and Samuel, being thus outranked, was no longer chief magistrate, though he continued to be judge till his death (vii. 15). His administration was brilliantly successful, though the accounts of it are very brief. Israel became independent of the Philistines (vii. 13–14). He settled the Amorite question, which had been a source of trouble from the time of Joshua (vii. 14). He organized the administration of justice (vii. 16–17). Though his sons failed to walk in his footsteps, he handed over to his successor a strong and prosperous nation.

Revised by W. J. Beecher.

Samuel, The Books of: called in the LXX. and Vulgate the first and second books of Kings. The books of Judges and Samuel, either with or without Ruth, are a connected whole, evidently formed, to a large extent, by the process of combining earlier writings. The Talmud attributes the series to the prophet Samuel, with supplementary work by the prophets Nathan and Gad. This can not be correct in the sense that Samuel personally wrote the larger part of these books, but it is probably correct in the sense that the work was initiated by him, and dominated throughout by his spirit. In 1 Chron. xxix. 29 we are told that the affairs of King David, first and last, "with all his reign and his might, and the times which passed over him and over Israel and over all the kingdoms of the countries," are written "upon the words of Samuel the seer, and upon the words of Nathan the prophet, and upon the words of Gad the observer." Evidently, the sources thus described are either a collection of the writings whence the present series, Judges, Ruth, and Samuel, was compiled, or else that series itself, the second alternative being the more probable.

Scholars hold various opinions as to the time when the books of Samuel were composed in their present form, but really there is no reason for dating them later than the lifetime of Nathan, that is, some time in the reign of Solomon. All the many alleged reasons for assigning to them a later date fade out when closely examined.

In any case, the books of Samuel are not continuous, as a literary work, with the books of Kings, though the latter take up the history at the point where the former leave it. The author of Kings habitually names his sources (1 Kings xi. 41, xiv. 19, e. g.), passes a sentence of formal approval or condemnation on each ruler (2 Kings xvi. 2, 3, e. g.), gives his chronology in a formulated system, while the author of Samuel habitually does none of these things. And many additional particulars might be cited to show that the authors of the two series were men very dissimilar in their point of view and their literary habits.

In their contents the books of Samuel are a history of David and his reign, with a preliminary account of the calamities that preceded Samuel, the brilliant administration of Samuel himself, the establishing of the kingdom, the reign of Saul, and especially Saul's relations to David.

Samuels, Arthur Warren: See the Appendix.

Samurai, sȧ'mo͝o-rī' (literally, guard): the name given to Japanese warriors under the feudal *régime*. Before the Tokugawa shogunate the name included even the shogun and daimios. The samurai were a class apart, numbering in 1870 about 400,000 families, intermarrying among themselves, and having a peculiar code of honor, etiquette, and morality. The privilege of wearing two swords, withdrawn in 1876, gave them the name of "two-sworded men." The modern police and gendarmerie and the officers of the army and navy are of samurai stock. J. M. Dixon.

Sanaa': city; capital of the Ottoman vilayet of Yemen, in Arabia. It is situated 7,120 feet above the level of the

sea, and is surrounded by arid mountains (see map of Persia and Arabia, ref. 10–E). The climate is healthful, though the air is exceedingly rare and dry. It seldom rains, sometimes not for several years, but excellent and abundant water is supplied by wells. Snow falls in winter. The city is inclosed by brick walls, is well built with stone houses, two, three, and four stories high, and has public squares and a fine hospital. The bazaars are well stocked, and a thriving trade is carried on in coffee, indigo, gum arabic, aloes, and skins. Mohair and camel's-hair carpets are made. Sanaa was important before the time of Mohammed, its temple rivaling the Kaaba. Since 930 it has been the capital of Yemen. In 1872, being hard pressed by the Bedouins, it entreated the protection of the Ottomans, and has since formed part of their empire. Pop. 50,000, of whom 35,000 are Arabs and 11,000 Jews (1889). E. A. Grosvenor.

San An'gelo: town; capital of Tom Green co., Tex.; on the Concho river, and the Gulf, Col. and S. Fé Railway; 227 miles W. of Temple, 446 miles N. W. of Galveston (for location, see map of Texas, ref. 3–F). It has an elevation of 2,000 feet above sea-level; is the center of the stock-raising and wool-growing region of the State; is surrounded by irrigated farms on which much celery is raised; and is a sanitarium for consumptives. There are 3 national banks (combined capital $300,000) and 3 weekly papers. Pop. (1890) 2,615; not returned separately in 1900. Editor of "Standard."

San Anto'nio: city; capital of Bexar co., Tex.; on the San Antonio and the San Pedro rivers, and the International and Gt. N., the San Ant. and Aransas Pass, and the S. Pac. railways; 75 miles S. W. of Austin, 250 miles N. by W. of Brownsville (for location, see map of Texas, ref. 5–G). It is the largest city in the State; is on a level and fertile plain with a range of limestone hills near by; has an abundant supply of water for manufacturing and domestic purposes from the rivers, the old Spanish acequias, and several artesian wells; and is the site of a U. S. military post, permanently established in 1875. It has an excellent climate, with a remarkably even temperature, and a dry air. The city has over 150 miles of water-mains, over 125 miles of cement sidewalks, over 75 miles of paved streets, and over 75 miles of electric street-railway. There are 13 iron and 4 wood bridges over the river, several large public parks, a U. S. Government building, new county court-house (cost nearly $1,000,000), several hospitals, gas and electric-light plants, and a number of fine halls belonging to secret societies and social clubs.

Churches and Schools.—San Antonio contains 40 church buildings, the most imposing of which is the Roman Catholic Cathedral of San Fernando (present building erected 1868–73, and incorporating parts of an earlier church edifice, where Santa Anna had his headquarters in 1836). The largest Protestant church is St. Mark's (Protestant Episcopal). The city is the seat of a Roman Catholic bishopric and of the Protestant Episcopal bishopric of Western Texas. San Antonio has public-school property valued at $1,000.000, a school population of over 12,000, 8 public-school buildings for white pupils and 3 for colored, and over 30 private schools. Besides its share in the great public-school fund of the State, the city has a fund of its own of over $100,000. There are two academies for boys, St. Mary's College, St. Mary's Hall, Wolfe Memorial School, Ursuline convent and school, a young ladies' school, young ladies' seminary, and two business colleges.

Finances and Banking.—Since 1890 there has been a marked increase in the assessed valuations, which has enabled the city to undertake extensive public improvements. In 1894 the assessed property valuation was $32,000,000. The city revenue 1894–95 was $328,376; expenditure, $329,-402; bonded debt, $1,763,500 (of which $500,000 was for a new sewer system); floating debt, $225,000. In Sept., 1900, there were 5 national banks with combined capital of $825,-000, 5 private banks, and an incorporated bank.

Business Interests.—In 1890 the census returns showed 43 manufacturing establishments (representing 25 industries), with a combined capital of $1,648.392, employing 907 persons, paying $615,125 for wages and $831,185 for materials, and turning out products valued at $2,152,266. The industrial works include 9 carriage and wagon factories, 7 candy-factories, 6 soda and mineral water establishments, 5 mattress-factories, 4 brick and tile works, 4 cement-works, 4 tanneries, 3 breweries, 3 machine-shops, 3 ice-factories, and 3 marble-works. The city also has large interests in stock-raising and the shipment of cotton, wool, and hides.

History.—The city was founded in 1714. Among the points of special interest are the mission of San Antonio de Valero, better known as the Alamo, founded in 1720, for many years used as a fort, and the scene of Santa Anna's massacre of Texan patriots in 1836; the First or Mission Concepcion, founded in 1716, and the scene of a battle between Mexican and Texan troops in 1835; the Second or Mission San José de Agnayo, founded in 1720, and decorated by the Spanish artist Huica; and the Third or Mission San Juan Capistrano, founded in 1716, and the rendezvous of the Texans prior to their capture of San Antonio in 1835. The Alamo is the property of the State and is open to visitors. Pop. (1880) 20,550; (1890) 37,673; (1900) 53,321.

J. D. Whelpley, editor of "Daily Express."

San Antonio River: a stream that rises in Bexar co., Tex., flows S. E. 200 miles, and falls into the Gulf of Mexico at Espiritu Santo Bay. The city of San Antonio and the village of Goliad are upon its banks.

Sanball'at [Heb.; LXX. Σαναβαλλάτ, Σαναβαλάτ; from Assyr. *Sin-uballit*, the god Sin gives life]: in the book of Nehemiah, the head of the opposition which Nehemiah encountered in rebuilding the walls of Jerusalem. He is called a Horonite, and his daughter is said to have married the son of a high priest. Josephus (*Ant.*, xi., 7, 8) mentions an officer in Samaria bearing the same name, whose daughter was married to Manasse, brother of the high priest Jaddua, and founder of the schismatic temple on Mt. Gerizim. But Josephus places this Sanballat at the time of Alexander the Great, and has evidently confused the biblical person with some other. Richard Gottheil.

San Bernardi'no: city; capital of San Bernardino co., Cal.; on the Southern Cal. Railway; 60 miles E. of Los Angeles (for location, see map of California, ref. 12–G). It is in an agricultural, fruit-growing, and mining region, the center of the great San Bernardino basin and of the citrus belt. It has mountains on three sides and commands a fine view of Mt. San Bernardino, the loftiest peak of the Coast Range. The city is laid out attractively, with broad streets well paved and intersecting at right angles, and has an abundant supply of artesian water. The climate is mild and equable; malaria is unknown; fogs are seldom seen. Among the public buildings are a new court-house, cost $350,000, the Hall of Records, the public high school, St. Catharine's Academy, several commodious churches and public schools, and 4 hotels. There are 2 national banks with combined capital of $200,000, 2 State banks with capital of $110,000, a private bank, 2 building and loan associations, and 2 daily and 3 weekly newspapers. The city has important steam and street-railway communications, and contains the large shops of the Southern California Railway. Pop. (1880) 1,673; (1890) 4,012; (1900) 6,150. W. J. Beaver.

San Blas: town and port of the territory of Tepic, Mexico; on the Pacific coast, in lat. 21° 32′ 24″ N. (see map of Mexico, ref. 6–E). A sheltered bay just W. of it admits vessels drawing from 9 to 12 feet, according to the season; larger ships anchor in the open roadstead, and freight is discharged on lighters. This is the most frequented port between Acapulco and Mazatlan; a railway to Guadalajara is (1898) in course of construction. Intermittent fevers are prevalent after the rains, but yellow fever is nearly unknown. Pop. about 4,000. H. H. S.

San Blas, Cape: See Cape San Blas.

San Blas, Gulf or **Bay of**: a bay on the northern side of the Isthmus of Panama, which here (lon. 79° W.) has its narrowest part, forming the sub-isthmus of San Blas. This is only 31 miles wide, and the navigable estuary of the river Banyano reduces the distance to 18 miles. The proposed "San Blas Route" for a ship-canal was across this neck, but repeated surveys have shown that the high mountains render it impracticable. H. H. S.

San Bonifacio de Ibagué: See Ibagué.

Sanborn, Franklin Benjamin: author and philanthropist; b. at Hampton Falls, N. H., Dec. 15, 1831; graduated at Harvard; was prominent in the anti-slavery cause before the civil war; has been secretary of the American Social Science Association and of the Concord Summer School of Philosophy. In 1868 he joined the staff of *The Springfield Republican*. He published a *Life of Thoreau* (1882), and *Life and Letters of John Brown* (1885).

Sanborn, John Benjamin: See the Appendix.

Sanborn, Katharine Abbott: See the Appendix.

San Buena (bwā′nă) **Ventu′ra**: city; capital of Ventura co., Cal.; on the Pacific Ocean, and the S. Pac. Railroad; 60 miles W. N. W. of Los Angeles (for location, see map of California, ref. 12–E). Its legal name, as above given, is derived from a famous old Spanish mission; its post-office designation is Ventura. It contains the ancient mission building, public high school, 2 grammar schools, public library and reading-room (founded in 1874), Y. M. C. A. building, electric light, street-railway, water, and sewer plants, several hot springs, a State bank with capital of $100,000, a private bank, and a daily and 4 weekly newspapers. The principal industries are agriculture and fruit-growing. The equable climate and springs have made it a popular resort for invalids. Pop. (1880) 1,370; (1890) 3,869; (1900) 2,470.

EDITOR OF "VENTURIAN."

Sanchoni′athon [Gr. Σαγχουνιάθων, Σαγχωνιάθων = Phœnician, *Sakkūn-yāthōn*, Sakkūn has given]: name of a mythical Phœnician, who is said to have lived before the Trojan war, and to have written a history of the Phœnicians. Philo Herenius of Byblos (Gebal), b. 64 A. D., pretends to have translated this book into Greek, under the name Φοινικικὴ ἱστορία, or Τὰ Φοινικικά. Fragments of this work have been preserved by Eusebius (*De Prepar. Evang.*, bk. i., chaps. ix. and x.; bk. iv., chap. xvi.) and the Neo-Platonic philosopher Porphyry (*De Abstin.*, ii., 56). Sanchoniathon is also mentioned by Athenæus (*Deipnosophist.*, bk. iii., ch. c.), Theodoret (*Adv. Gentiles*, Disput. ii.), and Suidas (Müller, *Frag. Hist. Græc.*, iii., p. 561). The statement of Philo has been accepted by Grotius, Mignot, Ewald, Renan, Spiegel, and Thiele, but rejected by Dodwell, Meiners, and Hissman. Lobeck stands alone in assuming that the falsification is due to Eusebius. Modern scholars, while denying the existence of a Phœnician writer by the name of Sanchoniathon, believe that Philo has embodied in his work traditions which were current in his native city (Bunsen, Movers, Duncker, Rawlinson, Baudissin), though the whole has more or less a pseudepigraphic character (Baudissin, Pietschmann, von Gutschmid). The fragments extant seem to show that Philo culled from various sources. They contain two different so-called Phœnician cosmogonies, one beginning with πνεῦμα and χάος, the other with κολπία and βάαυ. Then follows an account of the rise of the human race (φῶς, πῦρ, φλόξ, giants, mankind), and of the beginnings of culture, drawn from three different sources. To this is added the mythical history of the city of Byblus. A still further fragment is preserved by Eusebius on τὰ ἐπιγραφόμενα Θωθείων ὑπομνήματα (according to Gutschmid's correction), which probably treated of the writings of the mythical Egyptian Thoth. The tendency of Philo's work, which contains Egyptian, Grecian, Phœnician, and Hebrew elements, is undoubtedly euhemeristic, and in its syncretism endeavors to prove the Phœnician origin of Greek religion. In 1836 Wagenfeld astonished the learned world with excerpts from what he claimed to be a newly found MS. of the whole of Philo's translation, *Sanchuniathons Urgesch. der Phönizier* (Hanover, 1836), but the whole was soon recognized as a fraud. See *Jahrb. für Theol.*, vii., pp. 95, *seq.*

LITERATURE.—The text is published in C. Müller, *Fragmenta Hist. Græcor.* (iii., p. 561, *seq.*); Orelli, *Sanchoniathonis Fragmenta* (Leipzig, 1826); transl. in Cory's *Ancient Fragments* (London, 1876, p. 1); Lenormant, *Beginnings of History* (New York, 1882, p. 524). See also Movers, *Die Phönizier* (i., pp. 117, *seq.*); Ewald, in the *Abhand. der Königl. Gesell. der Wiss. zu Göttingen* (1853, vol. v., p. 3); Renan, *Mémoires de l'Académie des Inscriptions* (1858, vol. xxiii., p. 241); Thiele, *Egyptische en Mesopotamische Godsdiensten* (Amsterdam, 1872, p. 440); Duncker, *Gesch. des Alterthums* (1874, vol. i., p. 259); Ed. Meyer, *Gesch. des Alterthums* (1884, vol. i., § 206); Baudissin, *Studien zur Semit. Religionsgesch.* (1876, vol. i., pp. 3, *seq.*); Pietschmann, *Gesch. der Phönizier* (1889, p. 136); Rawlinson, *Hist. of Phœnicia* (1889, p. 385); von Gutschmid, *Kleine Schriften* (1890, vol. ii., pp. 21, *seq.*); Gruppe, *Die Griech. Cultur und Mythen* (Leipzig, 1887, p. 347). RICHARD GOTTHEIL.

San Cristo′bal de los Llanos, or **Las Casas**: formerly *Ciudad Real*; capital of the state of Chiapas, Mexico; on a plain, about 6,700 feet above the sea (see map of Mexico, ref. 9–J). It was founded in 1528 on the site of an Indian village; subsequently it was famous as the residence of Las Casas when he was Bishop of Chiapas. Pop. (1892), with the immediate vicinity, 16,050. H. H. S.

Sancroft, WILLIAM, D. D.: archbishop; b. at Fressingfield, Suffolk, England, Jan. 30, 1616; educated at Bury School and at Emmanuel College, Cambridge, where he became fellow 1642; was deprived of his fellowship by the Long Parliament 1649; became chaplain to Bishop Cosin of Durham 1660, in which year he assisted, privately, in the revision of the Prayer-book; obtained from that prelate the rectory of Houghton-le-Spring and was prebendary in Durham Cathedral; was elected master of Emmanuel College, Cambridge, 1662; was promoted successively to the deaneries of York 1663, and of St. Paul's, London, 1664; spent large sums on the repair of St. Paul's Cathedral; was presented by Charles II. to the archdeaconry of Canterbury 1668, and to the archbishopric of Canterbury 1677. He attended Charles II. on his deathbed, and wrote the petition presented to James II. in 1687 against the Declaration of Indulgence. This petition was signed by himself and by six other prelates, for which they were committed to the Tower June, 1688, tried for misdemeanor before the king's bench, and acquitted June 29, 1688. Notwithstanding his grievances, he did not take part in the conspiracies against James; refused to take the oath of allegiance to William and Mary; was deprived of his see Feb., 1691; refused to recognize his deposition; retired to his native place, and attempted, with the aid of the numerous nonjuring clergy, to maintain an episcopal succession. D. at Fressingfield, Nov. 24, 1693. He was the author of several volumes of sermons, letters, and political essays. Many of his unedited MSS. are in the Bodleian Library, Oxford. Revised by W. S. PERRY.

Sanctification [from Lat. *sanctifica′tio* (deriv. of *sanctifica′re*, sanctify; *sanc′tus*, holy + *fa′cere*, make), trans. of Gr. ἁγιάζειν, hallow, make holy, deriv. of ἅγιος, holy]: the work of God's grace by which those who believe in Christ are freed from sin and built up in holiness. In Protestant theology it is distinguished from justification and regeneration, both of which lie at its root, and from neither of which is it separable in fact; inasmuch as the term justification is confined to the judicial act or sentence of God, by which the sinner is declared to be entitled, in consideration of what Christ has done in his behalf, to the favor of God, and of which sanctification is the efficient execution; and the term regeneration is confined to the initial efficient act by which the new life is imparted, of which sanctification is the progressive development. Both regeneration and justification are momentary acts, and acts of God in which the sinner is passive; sanctification, on the other hand, is a progressive work of God, in which the sinner co-operates.

The nature of sanctification, as well as its method and the relation of the divine and human factors in its prosecution, is differently conceived by the several types of theology.

1. The *Pelagian and Rationalistic view* excludes the action of the Holy Spirit altogether; and makes sanctification to be nothing more than continued right action, in the native powers of the free moral agent, by which he gradually conquers evil tendencies, and builds up a holy character.

2. The *Mediæval and Roman view* refuses to distinguish between justification and sanctification; and makes both justification and sanctification to be the cleansing from sin, and the infusion of gracious habits by the Holy Ghost for Christ's sake by the instrument of baptism, upon which subjective change the removal of guilt and the divine favor is conditioned. (*Counc. Trent*, sess. 6, can. 7.) It is therefore held to be progressive, and to be advanced by good works, which possess real merit, and deserve and secure increase of grace (*Counc. Trent*, sess. 6, can. 32); as well as by penances, prayers, fastings, etc., which satisfy God's justice and purify the soul. (*Counc. Trent*, sess. 14, ch. viii.; sess. 6, cans. 29 and 30.) If the believer dies before the process of deliverance from sin is perfected, he must complete it in purgatory, the pains of which are expiatory and purifying; and there he may be assisted by the prayers and masses and dispensing power of the Church on earth. (Bellarmin, *Purgator.*, ii., 9.) But it is possible, even before death, for a believer perfectly to conform to all the demands of God's law as graciously adjusted to this life (*Counc. Trent*, sess. 6, ch. xvi., can. 25); and it is even possible, out of love, to perform supererogatory service by obedience to the councils of Christ, which are advisory but not obligatory until voluntarily undertaken. These are voluntary poverty, celibacy and obedience to monastic rule; and they merit more than the mere salvation of the person, and contribute to the "treasury of merits" at the disposal of the Church, which is imputable at the discretion of those holding the jurisdiction to believers on earth or in purgatory not yet fully justified. Bellarmin, *De Monachiis*, chaps. vi. and vii.

3. The *Mystical* view of sanctification, though never embodied in any Church creed, has existed as a doctrine and as a tendency in all ages and among all Christian denominations. Christian mysticism more or less depreciates the dependence of the soul for light upon the objective revelation of the word of God, and the necessity of the means of grace and human effort, and emphasizes spiritual intuition, the regulative value of religious feeling, the physical communion of the soul with the substance of God, conditioned on quiet and passivity of mind. Such views gained great currency in the Church through the writings of the Pseudo-Dionysius, which were published in Greek in the sixth century, and translated into Latin by John Scotus Erigena in the ninth century. They qualified the teaching of many eminent evangelical Schoolmen, such as Bernard of Clairvaux, Hugo and Richard of St. Victor, and subsequently Thomas à Kempis. They were taught with great influence among the early Protestants by Schwenckfeld (1490–1561), Paracelsus (1493–1541), Weigel (1533–88), and Jacob Böhme (1575–1620); and among the Roman Catholics by St. Francis of Sales (1567–1622), Molinos (1640–97), Madame Guyon (1648–1717), and Archbishop Fénelon (1651–1715). The original Quakers held similar views, as is seen in the writings of George Fox (d. 1691), William Penn (d. 1718), and Robert Barclay (1648–90). A mystical conception is present whenever sanctification is conceived, not as the goal of effort, but as an immediate gift to the waiting soul.

4. *The evangelical doctrine of sanctification common to the Lutheran and Reformed Churches* includes the following points: (1) The soul after regeneration continues dependent upon the constant gracious operations of the Holy Spirit, but is, through grace, able to co-operate with them. (2) The sanctifying operations of the Spirit are supernatural, and yet effected in connection with and through the instrumentality of means: the *means* of sanctification being either *internal*, such as faith and the co-operation of the regenerated will with grace, or *external*, such as the word of God, sacraments, prayer, Christian fellowship, and the providential discipline of our heavenly Father. (3) In this process the Spirit gradually completes the work of moral purification commenced in regeneration. The work has two sides: (*a*) the cleansing of the soul from sin and emancipation from its power, and (*b*) the development of the implanted principle of spiritual life and infused habits of grace, until the subject comes to the stature of perfect manhood in Christ. Its effect is spiritually and morally to transform the whole man, intellect, affections, and will, soul and body. (4) The work proceeds with various degrees of thoroughness during life, but is never consummated in absolute moral perfection until the subject passes into glory.

In opposition to this doctrine a *theory of perfect sanctification in this life* has been taught from several distinct points of view, e. g.:

1. According to the principles of *Pelagianism*, a man is perfect who obeys the laws of God to the measure of his present natural ability, since the moral law is a sliding scale, adjusting its demands to the varying ability of its subject; and this is possible to every man.

2. According to the *Mystical* idea, perfection consists in absorption in the Divine essence, or, in a less extreme form, in the absorption of human desires and will into the divine will, in a disinterested love; and this may be attained by any one through persistent detachment from self and meditation on God.

3. According to the *Roman* or *Ritualistic* theory, perfection consists in perfect conformity to the law of God, graciously for Christ's sake adjusted to the capacities of the regenerated man in this life; and this perfection is attained by means of meritorious works and penances, prayers, fasts, acts of voluntary self-denial, and ecclesiastical obedience. Not only is this within the reach of men, but so is even the rendering of supererogatory service in the way of extra-legal self-denial from a principle of evangelical love.

4. The *Wesleyan* theory of perfection conceives that the satisfaction and merit of Christ have made it consistent with divine justice to offer salvation to men on easier terms than the old Adamic law of absolute perfection; and that perfection is attained when these lower terms have been complied with. "Christian character is estimated by the conditions of the gospel; Christian perfection implies the perfect performance of these conditions, and nothing more." Wesley's tract on *Christian Perfection*: *Methodist Doctrinal Tracts*; Dr. George Peck's *Christian Doctrine of Perfection*.

A. A. Hodge. Revised by B. B. Warfield.

Sand [O. Eng. *sand*: O. H. Germ. *sant* (> Mod. Germ. *sand*): Icel. *sandr* < Indo-Eur. *samdho-*. Cf. Gr. ἄμαθος, and perhaps Lat. *sa'bulum*, sand]: granular detritus with texture coarser than clay and finer than gravel. The name gravel is given only to accumulations of rock-fragments that have been rolled by currents until their angles are worn away, but sand-grains may be angular or rounded; in other respects a gravel is merely a coarser sand, and a sand a finer gravel. Sands are derived primarily from the disintegration of crystalline rocks; secondarily from the disintegration of sandstones which were themselves formed by the consolidation of pre-existent sands. As the grains which result from the breaking up of various rocks are transported by currents of water or air, they jostle against one another, and some of the blows thus given produce fracture. Some of the grains are also attacked by various reagents and gradually decomposed or dissolved. The blows tend to convert angular fragments into round and to reduce all fragments to smaller size. As large fragments strike harder blows than small, they are more rapidly reduced and more rapidly rounded, and the tendency to convert gravel into sand is correspondingly stronger than the tendency to comminute sand. Sand-grains whose material is hard and resists decomposition are practically indestructible. Streams, shore-waves, and winds—the principal agents for the transportation of sand—accomplish also its separation from gravel and clay. The best-rounded sands are those found upon deserts, where they are shifted to and fro by the winds. The most abundant material in sand is quartz, and next to it stands feldspar. Hornblende, magnetite, and garnet are of frequent occurrence, and sands freshly derived from crystalline rocks contain all the constituents of the parent rocks. Of the many industrial uses of sand, probably the most important are for the manufacture of mortar and artificial stone. For these purposes angular grains are preferable. See Rocks and Sandstone.

G. K. Gilbert.

Sand, George: the pseudonym under which Amantine Lucile Aurore Dupin (*Madame Dudevant*) published her celebrated novels and dramas. She was born in Paris, July 5, 1804, and educated first at the Château de Nohant, department of Indre, by her grandmother, Madame Dupin, a natural daughter of Marshal Saxe, and afterward (1817–20) in an Augustinian convent in Paris. In 1822 she married Baron Dudevant, formerly an officer in the army of Napoleon, to whom she bore two children, but in 1831 separated from him, determined to support herself by literary work; removed to Paris with her daughter, and assumed male dress in order to move about with greater freedom. In connection with Jules Sandeau she wrote *Rose et Blanche*, which was published in 1831 under the pseudonym *Jules Sand*, and the reception it found offered her an opportunity of publishing immediately after a novel written by her alone, *Indiana*, under the pseudonym *George Sand*, which she afterward retained. In 1832 *Valentine* made her name celebrated, and in 1833 her celebrity rose to sensation with *Lélia*. The book touched in a somewhat peculiar manner the very delicate question of love and conjugal fidelity. In company with Alfred de Musset she then made a journey to Italy, but at Venice they parted, and in 1836 he published *Confessions d'un Enfant du Siècle*, to which she answered in 1859 with *Elle et Lui*, which produced an immense sensation. The violent movement into which her mind was thrown by her relation to Musset is very apparent in her *Lettres d'un Voyageur* and *Jacques* (1834), and is still more visible in *André* and *Léone Léoni* (1835); but by degrees it subsided. In 1836 she was divorced from Baron Dudevant, and both her children went to live with her. About the same time began her intimate friendship with Chopin, which lasted until 1847, and to which are due the many beautiful passages on music which are found in her later books. To this period of her life (1835–41) belongs a series mostly consisting of minor novels—*Le Sécrétaire intime*, *Lavinia*, *Métella*, *Mattéa*, *La Marquise*, *Mauprat*, *La Dernière Aldini*, *L'Uscoque*, *Pauline*, etc.—in which her wonderful talent of artistic representation appears perfectly developed and in its full ripeness. They were published in the *Revue des Deux Mondes*, but in 1841 she quarreled with the editor, and *Horace* was rejected. She in the meantime had made the acquaintance of Lamennais, Michel the republican, Pierre Leroux the socialist, and influenced by them she became the spokesman of very advanced social and political, moral and religious views, which were promulgated in *Lettres à Marcie* (1837), *Spiridion* (1838), *Les Sept Cordes*

de la Lyre (1840), and especially *Horace* and *Consuélo* (1842), *La Comtesse de Rudolstadt* (1843), *Le Meunier d'Angibault* (1845), *Le Péché de Monsieur Antoine* (1846), etc. In *Jeanne* (1844) she returned to the purely artistic novel without any tendency, and there followed some of her most beautiful productions—*La Petite Fadette* (1849), *La Mare au Diable* (1846), *François le Champi* (1848), etc.—but in 1848 she plunged with enthusiasm into the very midst of the Revolution—wrote proclamations and founded newspapers. After the Revolution she wrote during a long period chiefly for the theaters, and some of her plays were very successful. They are, nevertheless, nothing but dramatized novels, without any genuine dramatic effect. She was most successful with the novel, more especially the descriptive and reflective novel, and in this genre even her latest books, *Mlle. la Quintinie* (1863), *Le Marquis de Villemer* (1864), *La Confession d'une Jeune Fille* (1865), *Cadio* (1868), are brilliant and powerful productions. D. June 8, 1876. Her collected works contain *Romans et Nouvelles* (84 vols.); *Mémoires, souvenirs, impressions, voyages* (8 vols.); *Théâtre* (4 vols.); *Théâtre de Nohant* (1 vol.); *Correspondance* (10 vols., 1882–84). Revised by A. G. Canfield.

Sandal-wood [*sandal* is from Arab. *çandal*, from Sanskr. *candana*, sandal-tree]: the agreeably aromatic and precious wood of several trees belonging to the genus *Santalum* and of one or two other trees. The original sandal-wood of India is yielded by *Santalum album*, a tree 25 feet high, with a trunk a foot in diameter. Three kinds or hues were known in Europe as early as the eleventh century—white, yellow, and red, of which the last-named may have been confounded with the inodorous wood of red sanders or Santal-wood (*q. v.*). After the discovery of the Sandwich islands a large part of the supply of the sandal-wood of commerce came from two or three species of *Santalum* peculiar to those islands, and later from *S. yasi* of the Fiji islands and from *S. austro-caledonicum* of New Caledonia: also from *Fusanus spicatus*, a tree of Western Australia of the same family. The high price this wood brings has caused the reckless extirpation of the tree from the more accessible stations, but in India the original sandal-wood tree is protected by the Government. It is employed as a perfume and for the fabrication of small articles—glove-boxes, caskets, etc. Much is consumed in India in the celebration of sepulchral rites and for medicinal purposes, where the powder, made into a paste with water, is used for making the caste-mark. The principal market is China, where it is most largely used for incense in temples, etc. The Malabar sandal-wood there brings three or four times the price of that of the South Sea islands. The wood yields 1 per cent. of a peculiar essential oil, on which the characteristic fragrance depends. This oil, largely extracted in some parts of India from the fresh wood, has been used in medicine as a substitute for copaiba. The famous and richly carved gates of the temple of Somnauth, supposed to be 1,000 years old, are of sandal-wood. See Sandalworts and Dyestuffs.
Revised by Charles E. Bessey.

Sandalworts: the *Santalaceæ*, a small family of apetalous dicotyledonous plants widely distributed over the world. It is most nearly related to *Loranthaceæ*, but incompletely, if at all, parasitic, according with that family in having its ovules and seeds destitute of integuments. The sandal-woods (see Sandal-wood) are far the most important representatives of the family. The European species are all herbs, as are the members of *Comandra*, the commonest North American representative; but the Alleghanies have two shrubby genera; one of these, *Pyularia*, oil-nut, has a large kernel abounding with acrid oil. The quandang-nut of Australia, however, is bland and edible. The Australian cherry (so called), with the stone on the outside, is the nut of an exocarpus, supported on an apparent succulent red berry, which is formed by an enlargement of the tip of the flower-stalk. Revised by Charles E. Bessey.

Sandarach [viâ O. Fr. from Lat. *sandaʹraca* = Gr. σανδαράκη, sandarach, realgar, an Eastern word, probably borrowed ultimately from India. Cf. Sanskr. *sindūra-*]: a gum-resin from a small coniferous tree, *Thuja articulata*, which grows in Barbary. It occurs in pale-yellow oblong grains or tears, covered with a fine dust, is transparent and brittle, with a vitreous luster on the fracture. According to Unverdorben and Johnston, it consists of three resinous acids. The α-resin forms a white or yellow powder slightly soluble in alcohol and not easily fusible, and is present in but small quantities. The β-resin forms about three-fourths of the whole, is light yellow, softens at 212° F., and is readily soluble in cold alcohol. The γ-resin is a light-yellow powder, soluble in boiling alcohol, and melts with difficulty, decomposing at the same time. In medicine, sandarach was formerly given internally, and used in making ointments and plasters. It is used as an incense and in varnishes. Its powder is rubbed on writing paper where erasures have been made, to prevent the spreading of ink. Ira Remsen.

Sanday, William: See the Appendix.

Sand Beach; now Harbor Beach: village; Huron co., Mich.; on Lake Huron, and the Flint and Pere Marquette Railroad; 70 miles N. of Port Huron, 120 miles N. by E. of Detroit (for location, see map of Michigan, ref. 6–L). Its site rises from the lake by a series of terraces; it has excellent natural drainage and a good system of waterworks; contains valuable mineral springs and large bath-houses; and has considerable dairy, salt, flour, lime, and lumber interests. The U. S. Government has constructed a costly harbor of refuge for the shipping of the Great Lakes. The village has a private bank and two weekly newspapers. Pop. (1890) 1,046; (1900) 1,149.
Editor of "Huron Times."

Sand-blast: a stream of sand propelled by the pressure of air or steam and used for cutting and engraving glass, stone, and other solid substances. The process was invented by Gen. Benjamin C. Tilghman, and was suggested by the well-known effect of wind-blown sand in destroying the transparency of glass. In practice, two kinds of work are performed by the sand-blast, called, respectively, heavy and light work. For the former a high pressure and a correspondingly great velocity are required; for the latter the pressure is light and the velocity low. Ordinarily, for light work, the necessary velocity is given to the sand by means of an air-blast produced either by a rotary fan or positive blower, or by the pressure of the atmosphere acting toward a vacuum maintained by a fan or a steam-jet. For simply depolishing glass or making the so-called ground glass, the current of air is conducted into a rectangular trough of any desired length, narrowed at the bottom to an opening an inch wide, and having its top perforated by small tubes for the admission of the sand. The glass is carried slowly across the opening of this jet, and about an inch below it, by means of a traveling apron. By this process glass is obscured with great rapidity, almost as soon as it is held in position. In order to engrave a design upon the glass, the parts which are to remain bright have to be protected with a composition or by blotting-paper, soaked in glycerin and glue, from which the desired pattern has been cut out.

For heavy work either air or steam may be used; but steam is more readily employed, and, as it cuts twice as fast as air under the same pressure, is generally preferred. The steam is used in a jet, technically called the blast-pipe or gun. As shown in the accompanying sectional drawing, it consists of a hollow bronze cylinder of about 1½ inches external diameter, having a lateral opening near its upper end (by which the steam enters), and tapering somewhat at its lower. Through the top of this cylinder an iron tube passes, secured by a stuffing-box. This is called the sand-tube; its exterior diameter is somewhat less than that of the opening through the cylinder, and it tapers with it at its lower end, though somewhat less rapidly, thus leaving a narrow concentric aperture for the passage of the steam. The exterior cylinder is prolonged beyond this concentric opening to form a socket for a supplementary or directing tube called the nozzle-tube (seen separately on the right). This tube, being the only portion of the blast-pipe which is exposed to wear, is made of sheet-steel, or sometimes of chilled iron. The sand used should be sifted so as to be of uniform size, and should be clean, hard, sharp, and dry.

Sand-blast.

The action of the gun is as follows: As soon as the steam is let on, it issues with great velocity from the annular opening in the jet, producing a partial vacuum in the sand-tube which it incloses, and consequently in the rubber tube which connects it with the sand-box above. On opening a sliding valve in the bottom of this sand-box a stream of sand is drawn through the tube into the jet of steam, and is forced by it through the nozzle-tube, striking at a high velocity the stone to be cut, which is placed about an inch distant from it. The waste steam, together with the fragments of the stone and sand, escape laterally, and if the gun be at rest a conical hole is gradually cut into the material. The angle which the sides of this cone make with each other varies, increasing with the hardness of the stone and diminishing with an increase of pressure in the blast. If it is desired to have the sides of the cut parallel, the gun is slightly inclined and slowly revolved about a vertical axis. The angle of inclination varies of course with the hardness of the stone and with the pressure of the steam employed.

For purposes of ornamentation in stone the sand-blast process has no rival. The method employed is simply to protect those portions of the stone which are not to be cut away with a suitable mat or template of rubber or other elastic material. Revised by R. A. Roberts.

Sand-crack: See Farriery.

Sand-dollar: See Cake-urchin.

Sandeau, sāṅ′dō′, Léonard Sylvain Jules: novelist and playwright; b. at Aubusson, department of Creuse, France, Feb. 19, 1811; studied law at Paris, but devoted himself subsequently to literature; wrote his first novel, *Rose et Blanche* (1831) in connection with George Sand, and published it under the pseudonym of *Jules Sand*. In 1853 he was appointed keeper at the Mazarin Library, and in 1858 was elected a member of the Academy. His most successful novel was *Mlle. de la Seiglière* (1848; as a drama 1851). His best comedy is *Le Gendre de M. Poirier*, written in connection with Émile Augier (1854). His novel *La Maison de Penarvan* (1858) has been transformed into a drama (1863). D. in Paris, Apr. 24, 1883. Revised by A. G. Canfield.

Sand-eel, or **Sand-lance**: any fish of the family *Ammodytidæ*. They are elongated, with a pointed snout, forked tail, and silvery body; they burrow in the sand, and are sometimes extensively employed as bait for other fishes. Species are found on the northern shores of all countries. The common American species is *Ammodytes americanus*. Revised by F. A. Lucas.

Sand′eman, Robert: religious leader; b. at Perth, Scotland, in 1718 or 1723; studied at Edinburgh; became a linen-draper; married a daughter of Rev. John Glas (or Glass), the founder of a sect called the Glassites; became an elder in the congregation; established in 1762 a congregation of the new sect at London, where they became known as Sandemanians; went to North America and established a society 1764, and settled in the following year at Danbury, Conn., where he died Apr. 2, 1771. He wrote a number of theological and controversial treatises. The Sandemanian Church maintains a feeble existence, chiefly at Dundee, Edinburgh, and Danbury, Conn., the membership not exceeding 2,000 persons. Among their leading peculiarities, besides several ascetic practices, are the weekly love-feast, eaten on Sunday, and the "kiss of brotherhood"; the washing of feet, formerly one of their practices, has been discontinued. They abstain from blood and everything strangled, and practice a kind of communism, so far as the members hold their property subject to the call of the church. Their ideas may best be learned from the writings of Sandeman. See also Andrew Fuller, *Strictures on Sandemanianism*, in twelve letters to a friend (Nottingham, 1810; 2d ed. London, 1811). See Glassites. Revised by S. M. Jackson.

Sandemanians: See Sandeman.

Sanderling: a species of sandpiper (*Calidris arenaria*), distinguished by the absence of a hind toe, occurring throughout the greater part of the world. It is 7½ to 8 inches long, of a very light gray above, white beneath, with the top of the head, during the breeding season, rufous. F. A. L.

Sanders: See Santal-wood.

Sanders, George Nicholas: b. at Lexington, Ky., Feb. 21, 1812; grandson of Col. George Nicholas Sanders, the proposer of the "Kentucky resolutions" of 1798; became at an early age an efficient Democratic orator and politician; was appointed by President Pierce to a European consulship, and by President Buchanan navy agent at New York; was a prominent supporter of Douglas in the campaign of 1860; resided in Europe during the civil war as a commissioner of the Confederate States, associated with Mason and Slidell; took part with Messrs. Clement C. Clay and James P. Holcomb in the peace conference with Horace Greeley at Niagara Falls July, 1864, and after the war settled at New York, where he died Aug. 12, 1873.

Sanders, or **Saunders**, Nicholas, D. D.: polemical writer; b. at Charlewood, Surrey, England, about 1527; educated at Winchester School and at Oxford, where he became fellow of New College 1548 and Shaggling Professor of Canon Law 1557; left England on account of the religious innovations of Elizabeth; was ordained priest at Rome 1560; accompanied Cardinal Stanislaus Hosius to the Council of Trent, where he gained great renown by his skill in disputation; went to Poland with Hosius; resided several years in Louvain, where he published (1571) his work *De visibili Monarchia Ecclesiæ*. In 1572 he was called to Rome by Pius V., and sent in the following year to Madrid, where he was for a long time active in organizing an expedition for the purpose of restoring Catholicism in England. This expedition he accompanied as papal nuncio in 1579. The undertaking failed, and Sanders, pursued by the English, died, in the early part of 1581, in a wood near Limerick, "of an Irish ague." (Hamilton, *State Papers*, ii., 306.) Sanders was styled by Anthony à Wood "the most noted defender of the Roman Catholic cause in his time." He was the author of *The Supper of our Lord* (Louvain, 4to, 1565), a work in defense of the "real presence," in reply to Jewell's *Apology* and Nowell's *Challenge*, and in turn answered by the latter in his *Confutation*; *The Rocke of the Churche* (Louvain, 1566), *A Treatise of the Images of Christ* (1567), directed against Jewell, and of several other polemical works, of which the best known was a Latin treatise against the English Reformation—*De Origine ac Progressu Schismatis Anglicani* (Cologne, 1585), which was several times reprinted and translated into French, and into English by David Lewis—*Rise and Growth of the Anglican Schism* (London, 1877). Revised by J. J. Keane.

Sanderson, John: author; b. near Carlisle, Pa., in 1783; became a teacher in, and subsequently one of the proprietors of, Clermont Seminary; prepared with the aid of his brother, James M., the first two volumes of the *Biography of the Signers of the Declaration of Independence* (1820); resided in Paris 1835–36; wrote an amusing and instructive work, *Sketches of Paris, in Familiar Letters to his Friends* (1838), which was republished in London under the title *The American in Paris* (1838), and translated by Jules Janin into French (1843); began a similar work, *The American in London*, of which portions were published in *The Knickerbocker Magazine*, and on his return to the U. S. became Professor of Latin and Greek in the Philadelphia High School (1836–44). D. in Philadelphia, Apr. 5, 1844. See Griswold's *Prose-writers of America*. Revised by H. A. Beers.

Sanderson, John Burdon: physiologist; b. at Newcastle-on-Tyne, England, Dec. 21, 1828; studied medicine in the Universities of Edinburgh and Paris, graduating M. D. at the former 1851; became a fellow of the Royal College of Physicians, London, 1863; practiced medicine in London from 1857 to 1870, where he was assistant physician and lecturer at Middlesex Hospital, and physician to the Brompton Consumption Hospital; in 1871 was made professor at the Brown Institute; in 1874 was elected Professor of Physiology in University College, and in 1882 accepted a call to the same chair in the University of Oxford. He is the author of numerous monographs on physiological subjects. S. T. Armstrong.

Sanderson, Robert, D. D.: bishop; b. at Rotherham, Yorkshire, England, Sept. 19, 1587; educated at Lincoln College, Oxford, where he became fellow 1606 and reader in logic in 1608; published lectures upon that subject, *Logicæ Artis Compendium* (1615), which passed through several editions; took orders in the Church of England 1611; became in 1619 rector of Boothby Pennell, Lincolnshire, which post he retained more than forty years; became prebend of Lincoln 1629 and rector of Muston 1633; was indebted to his great reputation as a casuist for the appointment of chaplain to Charles I. 1631, by whom he was made D. D. 1636, Regius Professor of Divinity at Oxford and canon of Christ Church 1642; was named by Parliament one of the Assembly of Divines convoked at Westminster 1643, but refused to sign

the Covenant, and had his living sequestered; attended the king as ecclesiastical councilor at Oxford, at Hampton Court, and in the Isle of Wight; was ejected from his professorship 1648, but restored 1660, and shortly after made Bishop of Lincoln, and took part in the Savoy Conference 1661. D. at Lincoln, Jan. 29, 1663. He was the author of several Latin treatises on cases of conscience, the obligation of an oath, etc., written for the guidance of Charles I., and other tracts, collected in his *Works* (Oxford, 1854; 6 vols.), edited by Bishop Jacobson. His *Life* was written by Izaak Walton. His sermons are masterpieces.

Revised by W. S. Perry.

Sanderson, Sybil: opera-singer; b. at Sacramento, Cal., in 1864; passed her childhood in San Francisco, and took her first lessons in singing under local teachers. In 1881 she went to Paris and entered the Conservatory; studied later under Jules Massenet, the opera-composer. On May 15, 1889, made her *début* in Paris in Massenet's *Esclarmonde*, which was composed for her. In the previous year she had appeared at The Hague as a test under the name of Ada Palmer. In 1890 she sang in Brussels, in 1891 in London, and in 1892 in St. Petersburg. In 1893 she created the *rôle* of Phryne in Saint-Saëns's opera of that name. In 1894 she was engaged for the Metropolitan Opera-house, New York, appearing there first on Jan. 16, 1895, in Massenet's *Manon*. Her voice is a clear, brilliant, high soprano. D. E. Hervey.

Sandersville: city; capital of Washington co., Ga; between the Oconee and the Ogeechee rivers, and on the Augusta Southern Railroad; 64 miles N. by E. of Macon, 135 miles N. W. of Savannah (for location, see map of Georgia, ref. 4–I). It is the center of a large cotton-growing region. Pop. (1880) 1,279; (1890) 1,760; (1900) 2,023.

Sand-grouse: a name applied on account of their habitat to the birds of the family Pteroclidæ (*q. v.*).

Sandham, Alfred: See the Appendix.

Sandham, Henry: See the Appendix.

Sandhopper, or **Beach-flea**: names given, in allusion to their power of leaping, to various amphipod crustaceans found under sea-wrack near the high-tide mark. Most of the many known species belong to the genus *Orchestia*, as the common species of the New England coast, *O. agilis*. They are known also as sand-fleas and shore-jumpers.

Orchestia agilis (magnified).

Sandhurst: village; in Berkshire, England; 33 miles W. S. W. of London (see map of England, ref. 12–J). It is the seat of the Royal Military College and the Staff College. See Military Academies.

Sandhurst, or **Bendigo**: city of Victoria, Australia; third in size in the colony; 90 miles N. of Melbourne, on Bendigo creek, 760 feet above the sea-level; an important railway junction (see map of Australia, ref. 8–H). It is well built, and contains many public edifices, a fine botanic garden, and five large reservoirs of water. It is in the center of a rich gold-bearing region, and the district produces highly esteemed wines and considerable quantities of cereals, especially barley. The mining industry gives employment to about 7,000 persons, and one of the mines, the Lansell, has reached a depth of over 2,500 feet, the deepest on the continent. The climate is hot and variable; a maximum temperature of 126° F. in the shade has been observed. The mean annual rainfall is 24 inches. Pop. (1891) 37,238.

Mark W. Harrington.

San Diego, -di-ā′gō: city; port of entry; capital of San Diego co., Cal.; on San Diego Bay and the National City and Otay, the San D., Cuyamaca and East., and the S. Cal. railways; lat. 32° 41′ N., lon. 117° 13′ W.; 480 miles S. E. of San Francisco (for location, see map of California, ref. 13–G). The bay, discovered by Cabrillo in 1542, is pronounced next in excellence on the Pacific coast to that of San Francisco. The first settlement was made in May, 1769, when Father Junipero Serra established here the first of the California missions, that of San Diego; but the present city dates in growth from 1867, when the new town was begun on the water front of the bay. The climate is mild and uniform, and the city is a popular resort for invalids. San Diego County is the principal honey-producing county in the State, and markets in the city large quantities of wheat, wool, honey, fruit, and live stock. The principal industry of the region is fruit and nut culture, inaugurated in 1869, and represented by over 2,000,000 trees. The city contains 3 public parks, one with 1,400 acres; U. S. custom-house; free public library (founded in 1882); public-school district library; county hospital; 16 public-school buildings; public-school property valued at about $300,000; Academy of Our Lady of Peace (Roman Catholic); board of trade and chamber of commerce; gas and electric lights; electric street-railways; water-works; 2 national banks with combined capital of $250,000, 3 State banks with capital of $280,000, and a private bank; and 3 daily, 5 weekly, and 4 monthly periodicals. There are flour and planing mills, large salt-works, factories for carriages and wagons, foundry and machine-shops, a tannery, and other industries. The assessed property valuation is about $14,000,000, and a bonded indebtedness, incurred for a water system and improved sewerage, of $868,500. On the peninsula on the opposite side of the bay and connected with the city by steam ferry is Coronado Beach, costing nearly $1,000,000. Pop. (1890) 16,159; (1900) 17,700.

A regular line of freight and passenger steamers plies between San Diego, Hongkong, and Yokohama. The Government has expended half a million dollars fortifying the bay, has established a marine quarantine station, and completed a stone breakwater more than a mile long. L. A. Wright.

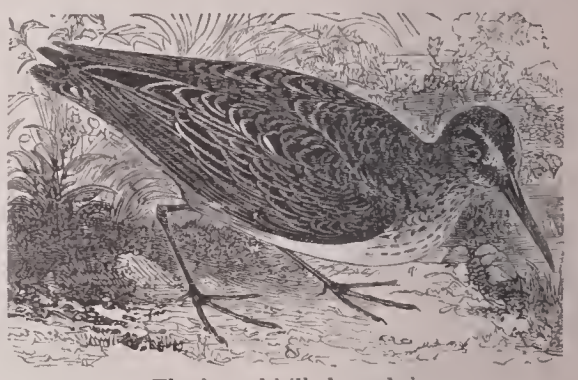
Sand-lance: See Sand-eel.

San Domingo: See Santo Domingo.

Sandpaper: paper one side of which is covered with glue, upon which sharp sand or powdered glass has been evenly sifted and is held by the glue when dry. It is made of many grades and degrees of fineness, and is used in smoothing the surface of wood, by the carpenter and joiner, when giving it its final finish.

Sand Piles: See Foundation.

Sandpiper: any one of several small birds of the family *Scolopacidæ*, that frequent sandy shores and utter a piping note. They have a bill about equal to the head in length, covered with a soft skin; the toes, four in number, except in *Calidris*, the hindmost being very small. They can mostly be distinguished from the true snipes by their shorter bills and uniformly colored tail-feathers. They are mainly birds of the northern hemisphere, and breed far north, occurring at times in great flocks during their fall migrations. They feed along the shore, picking up small crustaceans, molluses or insects, or probing for them in the mud. There are about twenty-five species, some of wide range, twenty of which occur in North America, although one or two, like the ruff (*Machetes pugnax*) and the spoon-bill sandpiper (*Eurynorhynchus pygmæus*), are stragglers from other regions. Among the most common is the spotted sandpiper (*Actitis macularia*), familiarly known as tip-up, which breeds in many parts of the U. S., often at some little distance from the water, and is not so gregarious as most species. The broad-billed sandpiper (*Tringa platyrhyncha*) is an Old World species. F. A. Lucas.



The broad-billed sandpiper.

Sands, Benjamin Franklin: rear-admiral U. S. navy; b. in Baltimore, Md., Feb. 11, 1811; entered the navy as a midshipman Apr. 1, 1828. Served on the east coast of Mexico during the war with that country; commanded the steamer Fort Jackson in both the Fort Fisher fights in the civil war; promoted rear-admiral 1871. He was long identified with the building up of the U. S. Naval Observatory. He served as an assistant in the very earliest days of that institution, and it was through his earnest efforts that it was equipped with what was then the largest telescope in the world. During his superintendency the observatory ranked among the highest of similar institutions. See Report No. 726, House of Representatives, 52d Congress, first session, Naval Observatory. D. at Washington, D. C., June 30, 1883. Revised by C. Belknap.

Sand-star: a name sometimes given to species of starfishes, of the orders *Asterioidea* and *Ophiuroidea*.

Sandstone: a rock consisting of grains of sand held together by some cementing material. Commonly the grains are chiefly of quartz; sometimes they are almost exclusively quartz; in a few instances feldspar predominates. The cementing material is usually calcite, iron oxide, clay, or silica. It may merely coat the grains or may fill all interstices. Sandstones are generally composed of parallel layers more or less readily separable, and a thick layer is sometimes divided by oblique planes, an arrangement known as cross-bedding or false bedding. The name *arkose* is applied to sandstone derived from the disintegration of granite or gneiss, with little rounding or sorting. Sandstone grades imperceptibly into *conglomerate* or cemented gravel, and into *breccia*, in which the cemented fragments are large and angular. A sandstone easily quarried and wrought is called a *freestone*, and sandstones are otherwise characterized, according to the nature of the cement, as calcareous, ferruginous, argillaceous, and siliceous. A quartzite is a siliceous sandstone with the interstices completely filled. Sandstone is one of the most important of all building materials, and is extensively employed in the manufacture of grindstones, whetstones, etc. See BUILDING-STONE, FLEXIBLE SANDSTONE, and ROCKS.

G. K. GILBERT.

Sandus'ky: city; port of entry; capital of Erie co., O.; on Lake Erie at the mouth of the Sandusky river, and on the Balt. and O., the Cleve., Cin., Chi. and St. L., the Columbus, Sand. and Hocking, the Lake Erie and W., and the Lake Shore and Mich. S. railways; also western terminus of Cleveland and Lorain and Sandusky and Interurban Electric Railway, and northern terminus of the Sandusky, Norwalk and Southern Electric Railroad; 61 miles W. of Cleveland (for location, see map of Ohio, ref. 2–F). The city is laid out regularly with broad streets, has one of the best land-locked harbors on the Great Lakes, and is supplied with gas, electric light, electric railways, sewerage, and water-work plants, the latter on the stand-pipe system. Steamboats connect the city with Cleveland, Detroit, Toledo, and the islands in Lake Erie. There are two popular summer resorts, Cedar Point, called "the Coney Island of the West," and Johnson's island, on which many Confederate prisoners were confined during the civil war. Put-in-Bay, Kelley island, Gibraltar, and Middle Bass and Pelee islands are easily accessible by water, and are favorite resorts for fishing-parties. The city contains 21 churches, 8 public-school buildings, 5 parochial schools, 4 national banks with combined capital of $550,000, and 3 daily and 4 weekly papers. The public buildings include a U. S. Government building, bonded warehouse, court-house, county infirmary, jail, Public Library, and the Ohio State Soldiers' and Sailors' Home, comprising 37 buildings of blue limestone (cost, exclusive of ground, $700,000) with accommodations for 1,600 inmates. Many of the public, business, and residence buildings are built of limestone from local quarries.

Sandusky is noted for its fresh-fish industry, which has an annual value of over $1,500,000; its wine production, which exceeds 2,000,000 gal. per annum; and for its extensive cultivation and shipment of grapes and peaches. It has large receipts of coal by rail and of iron ore, lumber, and fish by water. The principal manufactures are spokes, hubs, handles, carpenters' tools, engines, boilers, threshing-machines, cement, baskets for the grape and peach trade, and casks for wine shipments. There is also considerable shipbuilding. The fish industry is promoted by a large U. S. hatchery at Put-in-Bay. The city has important trade relations with Canadian ports, and exports large quantities of caviare, smoked sturgeon, isinglass, and fish oil. In 1900 the city had an assessed property valuation of $7,010,370; bonded debt (1901), $623,400. Pop. (1880) 15,838; (1890) 18,471; (1900) 19,636.

JNO. T. MACK.

Sand-wasp: a hymenopterous insect that digs in the sand, as of the families *Pompilidæ* and *Sphegidæ*. See HYMENOPTERA.

Sandwich: a seaport of Kent, England; at the mouth of the Stour, 2 miles from the sea; 12 miles E. of Canterbury (see map of England, ref. 13–M). It is one of the Cinque Ports, is surrounded by ancient fortifications, is irregularly built, and has several notable mediæval structures. In the eleventh century it was the most famous of all the English ports. The principal import is coal; principal exports, agricultural products. It forms with Deal a parliamentary borough. Pop. (1891) 2,796.

Sandwich: county-seat of Essex County, Ontario, Canada; on Detroit river, nearly opposite Detroit (see map of Ontario, ref. 6–A). It has a convent and Roman Catholic college, and mineral springs which make it a favorite place of resort. It is the oldest place in this part of Canada. French soldiers allied to the Algonquins and Hurons were stationed here as early as 1615. Actual colonization began in 1700 or 1701 under Mothe-Cadillac, and the place was then called Pointe de Montréal. Pop. about 1,200.

M. W. H.

Sandwich: city (incorporated in 1873); De Kalb co., Ill.; on the Chi., Burl., and Quincy Railroad; 58 miles S. W. of Chicago (for location, see map of Illinois, ref. 2–E). It contains a public high school, 2 private banks, and 2 weekly newspapers, and is chiefly engaged in the manufacture of agricultural implements. Pop. (1880) 2,352; (1890) 2,516; (1900) 2,520.

Sandwich: town; Barnstable co., Mass.; on Cape Cod Bay, and the N. Y., N. H. and Hart. Railroad; 60 miles S. of Boston (for location, see map of Massachusetts, ref. 5–K). It lost a large part of its original territory in 1884 by the setting off of the town of BOURNE (*q. v.*). It is a popular summer resort, and contains 10 public schools, a public library, a weekly newspaper, and manufactories of glass, jewelry, braids, and tags. Its banking business is done in Wareham or Yarmouthport. Pop. (1880) 4,242; (1890) 1,819; (1900) 1,448.

EDITOR OF "OBSERVER."

Sandwich Islands: the name given by Capt. Cook, after Lord Sandwich (fourth earl), to the group now called the Hawaiian islands. See HAWAII-NEI.

Sandy Hill: village; Washington co., N. Y.; on the Hudson river, and the Del. and Hudson Railroad; 52 miles N. of Albany, the State capital (for location, see map of New York, ref. 4–K). It derives good power from the river for manufacturing, has large lumbering interests, and contains stone-quarries, paper-mills and sawmills, iron furnaces, machine-shops, large bag-factory, wall-paper print-works, two national banks with combined capital of $100,000, a union school library (founded in 1867), and a weekly newspaper. Pop. (1880) 2,487; (1890) 2,895; (1900) 4,473.

EDITOR OF "HERALD."

Sandy Hook: a low, sandy peninsula in Monmouth co., N. J.; between the Atlantic Ocean and Sandy Hook Bay; beginning at the Navesink Highlands and extending N. about 6 miles; 20 miles S. of Manhattan (for location, see map of New Jersey, ref. 3–E). The sea has a few times cut through the neck, converting Sandy Hook temporarily into an island. Sandy Hook is less than a mile in extreme width, and has a beacon-light on its northern extremity and a light-house, 90 feet high, less than a mile S. It was formerly the terminus of a steamboat line which there connected with a railway to Long Branch, but it is now used exclusively for U. S. Government purposes. Here is the proving-ground where ordnance and armor-plate are tested, and here is also Fort Hancock, with batteries of modern rifled guns and mortars for defending the entrance to New York harbor.

Sandys, EDWIN, D. D.: archbishop; b. at Hawkshead, Lancashire, England, in 1519; graduated from St. John's College, Cambridge, 1539; took orders in the Church of England; embraced the principles of the Reformation; became vicar of Haversham and master of St. Catharine's College 1547, prebendary of Peterborough 1549 and of Carlisle 1552; vice-chancellor of Cambridge University 1553; preached a sermon in favor of the royal claims of Lady Jane Grey; was consequently deprived of the vice-chancellorship in July of the same year; was imprisoned in the Tower and the Marshalsea for refusing to proclaim Queen Mary; was liberated and allowed to proceed to the Continent May, 1554; returned at the coronation of Elizabeth 1558; was made Bishop of Worcester Dec. 21, 1559, and of London 1570, and Archbishop of York 1576; was one of the translators of the Bishops' Bible 1568. A malicious plot (1582) charged him with infamous conduct, but its author, Sir Robert Stapleton, was detected and punished. D. at the archiepiscopal palace of Southwell, July 10, 1588. A volume of his *Sermons* was published 1585, was repeatedly reprinted, and was edited for the Parker Society, with a *Biography*, by Rev. John Ayre (1841).

Revised by W. S. PERRY.

Sandys, Sir EDWIN: statesman; b. at Worcester, England, about 1561; studied at Christ Church, Oxford, under Richard Hooker; traveled extensively over Europe; was a supporter of the dynastic claims of King James I., by whom he was

knighted 1603 and employed in several important commissions; was a leading member of the second Virginia Company, of which he became treasurer 1619; was instrumental in securing a charter for the Pilgrims of the Mayflower and in establishing representative government in the colony of Virginia, thereby becoming obnoxious to the "Spanish party" at court, and was imprisoned, along with Selden, 1621, for having opposed the royal projects in Parliament. D. at Northborne, Kent, in Oct., 1629. He founded a lectureship on metaphysics at Oxford, and wrote at Paris, in 1599, *Europæ Speculum, or a Survey of the State of Religion in the Western Part of the World*, which passed through many editions. A volume of *Sacred Hymns* (1615), containing translations of 50 select Psalms, is attributed to him.

Sandys, George: English traveler and author; b. at Bishopsthorpe, York, in 1577; educated at St. Mary's Hall and Corpus Christi College, Oxford; traveled through various parts of the Turkish empire 1610–12; published a *Relation* of his journey (1615), with illustrations, often reprinted, and considered of great value by Orientalists; went to Virginia as colonial treasurer 1621; completed at Jamestown a translation of Ovid's *Metamorphoses* (1626), of which the first five books had previously appeared; built the first water-mill, and promoted iron-manufacture and ship-building in Virginia; returned to England 1624; printed poetical paraphrases of several books of the Old Testament, and translated from the Latin of Grotius the tragedy of *Christ's Passion* (1640); was for some years gentleman of the privy chamber to the king, and passed his latter years at Bexley Abbey, Kent, where he died in Mar., 1644. A *Life* was published by Rev. H. J. Todd, prefixed to a *Selection from Sandys's Metrical Paraphrases* (1839), and a complete edition of his poetical works, with introduction and notes, was published in 1872 by Rev. R. Hooper.

San Felipe de Linares: usually called Linares (*q. v.*).

San Felipe de los Andes, -fā-lee′pā-dā-lōs-aan′dās, or **de Aconcagua**, dā-ăă-kōn-kaa′gwăă: capital of the province of Aconcagua, Chili; in a valley at the foot of the Andes; 50 miles N. N. E. of Santiago, with which it is connected by railway (see map of South America, ref. 8–C). It has a considerable trade over the Andes with the Argentine Republic. Pop. (1895) 11,313. H. H. S.

San Fernan′do, formerly **Isla de Leon**: fortified maritime city of Spain; 9 miles by rail S. E. of Cadiz; on the low island of Leon (see map of Spain, ref. 20–C). It is a modern town with an arsenal, an observatory, hospitals, and barracks for troops. The population consists chiefly of Government employees, and the only industry is the extraction of salt from the neighboring tidal marshes. Pop. about 27,000. M. W. H.

Sanford: city; Orange co., Fla.; on Lake Monroe, an enlargement of the St. John's river, and the Jack., Tam. and Key W., the San. and Ind. Riv., the San. and St. Petersb., and the Sav., Fla. and West. railways; 125 miles S. of Jacksonville (for location, see map of Florida, ref. 4–J). It is at the head of large steamer navigation on the river; is an important shipping-point for oranges and for early vegetables and fruit consigned to Northern markets; and contains 10 churches, 2 public schools, railway car-shops, machine-shops, wood-turning mills, cigar and fruit-preserving factories, a national bank (capital $50,000), an incorporated bank (capital $31,000), and a weekly paper. It was founded by Gen. H. S. Sanford in 1870. Pop. (1890) 2,016; (1900) 1,450.
Editor of "Gate City Chronicle."

San Francis′co: city, metropolis, and chief seaport of California; coextensive with San Francisco County; on the end of a peninsula 6 miles wide and 20 miles long, separating the south arm of San Francisco Bay from the Pacific Ocean, and on the N. Pac. Coast, the San Fran. and N. Pac., and S. Pac. railways (of which only the last named has a line running directly into the city); lat. 37° 48′ 26·6″ N., lon. 122° 24′ 39·6″ W. (see map of California, ref. 7–B).

Site, etc.—Its area is 42 sq. miles, including, besides the entire end of the peninsula across to the ocean, Goat island, with 141 acres, 2 miles E. of the peninsula; Alcatraz island, with 30 acres, 1 mile N. of the peninsula; and the Farallones, six rocky islets, 24 miles off shore in the ocean. Nearly half the area consists of high rocky hills, rising in several points to 800 feet above the sea. The site has much level land, but a large part of this has been supplied by art, the original inequalities of the surface having been graded away. The harbor is part of a bay 50 miles long and 5 miles wide, deep, landlocked, and most beautiful. The city water-supply is from Pilarcitos and Calaveras creeks, from 20 to 40 miles distant, where it is caught in large reservoirs; and artesian water is found at depths varying from 120 to 160 feet, though from many wells water must be raised by pumping. The city is laid off in rectangular blocks, separated by wide streets, which in the north run with the cardinal points of the compass, and in a portion of the south with the semi-cardinal points. Market Street, which separates the two main surveys, 125 feet wide and 3 miles long, is one of the most important and imposing business streets in the world. Among remarkable features are the peninsular position, fronting to the W. on the Pacific Ocean, to the E. on the bay, and to the N. on the Golden Gate; the wooden architecture in the residence district; the hilly site; the excellent system of cable and electric cars in every direction; Chinatown; the fruit-market, wonderful in variety and abundance of its supplies; the wharf for Italian fishing-boats; the Seal Rocks, with their sea-lions at the entrance of the harbor; Sutro Heights, a pleasure-garden kept open to the public by Adolph Sutro; the Sutro bath-house; the numerous large hotels; and the peculiar climate, which permits the fuchsia and geranium to blossom in the open air of midwinter while it compels the wearing of overcoats in midsummer. Golden Gate Park has an area of 1,050 acres, with abundant evergreen vegetation of beautiful form and color, excellent drives, commodious and elegant buildings for public entertainment, creditable statuary, a highly varied site, a steep hill 900 feet high on the S., and a magnificent ocean beach and surf at its west end.

Climate.—There is almost unbroken coolness of temperature by breezes fresh from the ocean every day. The annual death-rate for each 1,000 inhabitants is 20, a proportion exceeded in most other seaport cities of equal size.

Buildings.—The city-hall, a fine-looking structure, with a high dome, has cost over $5,000,000. It is the largest building of the city in ground plan. Its material is brick, covered in front with stucco. The branch mint has an imposing front of gray limestone in the Greek style of architecture. The Palace Hotel, of brick, seven stories high, cost with its site $3,000,000, and is one of the largest and most famous hotels of the world. Other notable buildings are the Academy of Sciences, the Pioneer Hall, both endowed by James Lick; the Cooper Medical College and Lane Hospital (in adjoining buildings); the Hopkins Art Institute, given to the State by E. F. Searles; the Mills building, twelve stories, of brick and stone, with a framework of steel, erected at a cost of $1,000,000; and several other high buildings of similar construction. The prevalent style of architecture is highly ornamental, with a great multitude of bay-windows designed to catch as much sunlight as possible. Many of the houses, recently built or now in process of construction, are of beautiful stone.

Institutions.—As an important seaport San Francisco has a large custom-house, a national marine hospital, a national military post (the Presidio), and on the northern border of the peninsula, and also on Alcatraz and Goat islands, extensive fortifications. The city has a large number of churches and educational and philanthropic institutions. The Mechanics' Institute has property valued at more than $1,000,000; the Academy of Sciences had an endowment of about $600,000 from the estate of James Lick, and the Lick Mechanical Art School one of $540,000.

Government.—The city council (consisting of a board of eighteen members, known as the board of supervisors) and the chief executive officers, including mayor, auditor, treasurer, assessor, sheriff, recorder, county clerk, public administrator, and coroner, act under a new charter. The expense of the municipal government for the fiscal year ending June 30, 1901, was officially estimated at $5,692,985, including $1,160,000 for schools, $799,000 for police, $758,718 for the fire department, and $892,190 for repairing and lighting streets and other public work. The funded debt is only $250,000; the assessed value of city property for 1900 $410,425,840; the total taxation $1.62½ on each $100 of assessed valuation.

Manufactures.—The city has numerous large manufacturing establishments, including a rolling-mill, machine-shops, foundries, shipyards, wire-works, ropewalk, planing-mills, sugar-refineries, and factories for carriages, furniture, boxes, shoes, clothing, tinware, etc. The gross value of the products manufactured in 1900 is estimated at something more than $100,000,000, including very large quantities of refined sugar, clothing, and shoes, furniture and other wood-

work, foundry and machine work of every description, ship building and repairing. The value of the ships constructed and under construction amount to about $7,600,000.

Commerce.—The winds are strong and constant, but rarely violent. Between mean tides the difference is only about 6 feet, so that ships can always load and discharge at the wharves. A large stone dry dock and floating dock give facilities for repairs. By possession of a central position on the west shore of the continent; the only secure deep harbor between San Diego and the Columbia river, which are 1,000 miles apart; a situation at the outlet of the only navigable rivers and large valleys of California; the natural end on the Pacific Ocean of all the transcontinental railway routes of the United States; and by the large extent of tributary territory and its great agricultural and mineral resources, San Francisco has a high metropolitan character. The merchandise imports in 1900 were valued at $394,424,435; exports for the same year at $41,419,679; coinage at the San Francisco mint for 1900, $57,446,634; customs receipts, $7,893,342; resources of savings-banks, $134,498,940; of commercial banks, $76,543,241; and bank clearances, $1,029,582,595. The shipping that entered the harbor in 1900 was 1,487,816 tons, of which 836,480 was in foreign bottoms.

History.—The first settlement of white men was made in Oct., 1776, by Spaniards, who then established a military post and a mission of Franciscan friars, who devoted themselves to the conversion of the Indians. After the country passed to the dominion of Mexico, a small village called Dolores, inhabited by Mexicans, grew up about the mission. Another village, called Yerba Buena, was laid off near the best anchorage, 3 miles N. E. of the mission, in 1835. The occupation of California by the naval forces of the U. S., with an official announcement of permanence, stimulated the growth of Yerba Buena. In Jan., 1847, the name was changed to San Francisco, and a census showed a population of 450. In 1848 the discovery of gold in the Sierra Nevada brought a flood of people from remote countries of the world. Among the notable events of San Francisco were five great fires in 1849, 1850, and 1851; the formation of vigilance committees which, in 1851 and 1856, executed criminals by extra-judicial processes; the Fraser river fever in 1858, when the market value of real estate fell more than 50 per cent. because of the large migration to British Columbia; and the sand-lot agitation in 1878 and 1879.

Population.—(1880) 233,959; (1890) 298,997; (1900) 342,782, of whom some 130,000 are foreign born, making together a cosmopolitan aggregate. Many different languages are heard spoken every day on the streets.

Bibliography.—See the *Municipal Reports*, published annually by the city since 1861; John S. Hittell, *History of San Francisco* and *Resources of California*; Theodore H. Hittell, *History of California*; Hubert H. Bancroft, *History of California*. Theodore H. Hittell.

San Francisco de la Selva de Copiapó: See Copiapó.

San Francisco Mountain: the loftiest mountain in Arizona; lat. 35° 27′ N., lon. 111° 40′ W.; altitude, 12,800 feet. It stands alone, rising abruptly from the Colorado plateau to a height of 5,000 feet, and is a conspicuous landmark from all directions. Near it are the lesser cones of Bill Williams, Kendrick, and Sitgreaves. Its base is 10 miles across, and its crest takes the form of a crescent, with the concavity turned to the east. Geologically, it is partly a mountain of eruption and partly a mountain of circumdenudation. Its upper part is composed of lava, which was extruded before the plain had been degraded to its present level. The tough lava opposed a more stubborn resistance to the agents of erosion than did the sedimentary rocks of the plain, and not merely held its own while the latter were worn away, but protected and preserved that portion of the strata which it covered. As erosion proceeded, fragments of the volcanic rock fell down upon the sedimentary escarpment, and so nearly covered it that it can be detected at a few points only. The strata preserved under the lava are of Triassic age; the bed which constitutes the surface of the plain is the upper member of the Carboniferous formation. So the mountain is an insular table of Triassic sandstone, standing on a Carboniferous floor, and capped by a volcanic cone. Since the removal of the Triassic strata new fissures have opened in the plain, and basaltic lava has flowed out, spreading over the surface in broad black sheets and throwing up hundreds of low cones. From the summit of San Francisco one can look down into the throats of more than a hundred volcanoes. G. K. Gilbert.

Sangal'lo, Giuliano, da: architect; b. in Florence, Italy, in 1443. He studied engraving, and then became an engineer. His first work as architect was the cloister of the Carmelites of Santa Maddalena dei Pazzi in Florence. He built the palace of Poggio Imperiale for Lorenzo the Magnificent, and the Church of the Madonna delle Carceri, of which Lorenzo laid the first stone in 1492. He restored the fortifications of the city of Ostia by order of Cardinal Giuliano della Rovere. On his return to his masters in Florence, he built a monastery for the hermit monks outside the Porta Sangallo, and received the surname of *da Sangallo* from this work. At Milan he began the splendid palace for the Duke Moro which war interrupted, and at Loreto the cupola of the Church of the Madonna. He restored the roof of Santa Maria Maggiore at Rome, under Alexander VI.; this he is said to have gilded with the first gold from America. He constructed the cloister of the Santi Apostoli in Rome, and designed the beautiful façade of the Church of the Florentines. The Gonfalonier of Florence, Pietro Sodevini, made use of Sangallo at the siege of Pisa, where he constructed an ingenious bridge and the fortress and the gate of St. Mark. He was called again to Rome by Leo X., who asked him to undertake the direction of the building of St. Peter's, but, being ill, he returned to his own city. D. in 1517. W. J. Stillman.

San German: See the Appendix.

Sangha, or **Samgha** [Sanskr. *saṅgha*, assembly or congregation]: the monastic brotherhood, community, or order founded by the Buddha. It consists of men who have renounced all family ties and all worldly desires, and are pledged to devote themselves to meditation, the recital of the law, self-restraint, and the accumulation of merit in order that they may find deliverance from the round of birth and death. The order is open to men of all ranks, provided they are over twenty, have the consent of their parents, are free from disease or bodily defect, are not soldiers or in the service of the state, and are not debtors, slaves, or criminals. They are pledged to celibacy and mendicancy, and depend for support on unsolicited alms. The term sangha is sometimes rendered "church" and sometimes "priesthood," but erroneously in both cases, as, except in Tibet, Buddhism has no ecclesiastical organization and no religious rites or ceremonial observances. The sangha is also the third member of the *Triratna*, or Buddhist trinity. See Triratna.

San Gil: See San Jil.

Sangir, or **Sangi, Islands**: a chain of islands connecting Celebes and the Philippine islands, lying between the Sea of Celebes and the Pacific Ocean, belonging to the Netherlands. Area, 323 sq. miles. The largest island is Great Sangir, on which is the celebrated Gunong (or volcano) Abu, a superb pyramid, subject to frequent explosions. That of 1856 caused the death of 2,800 people; another eruption was contemporaneous with that of Krakatoa. The islands produce woods, cocoa, sago, rice, trepang, and turtles. The inhabitants are Alfurus, pacific, industrious, in part Christian and Mohammedans, in part pagans. Pop. (1888) 76,387. The Taluat Islands to the N. E. are sometimes included in the Sangir group. They have a somewhat greater area, and a population estimated at 5,000. Mark W. Harrington.

Sangkoi: chief river of Tonquin. See Songkoi.

San'greal, **Sangraal**, or **Holy Grail** [*Sangreal* is from O. Fr. *saint*, holy + *greal*, grail: O. Span. *grial*: Portug. *gral* < Lat. **crata'lis*, deriv. of *cratus*, *crater*, bowl]: according to mediæval legends, the cup of emerald which held the wine at the first celebration of the Lord's Supper. St. Joseph of Arimathea, it is related, received some of the blood of the Lord in this cup at the crucifixion. In the earliest form of the legend, *Le petit Saint Graal*, composed about 1160 and ascribed to Robert de Boron, the brother-in-law of Joseph of Arimathea carries this communion chalice to the West. In *Le grand Saint Graal* and *La queste del Saint Graal*, ascribed to Walter Map, a gentleman of the court of the English Henry II., it is Joseph himself who brings the Graal to England. These romances connect the legend with the stories of King Arthur, several of whose knights undertake its quest, an adventure finally achieved by the maiden knight Galahad. Galahad takes it back to the East, and on his death it ascends to heaven. In the *Conte del Graal* of Crestien de Troyes (about 1190), and the *Parzival* of his German continuator Wolfram von Eschenbach, Percival is substituted for Galahad as the hero of the Graal legend.

The fragment of a Graal romance, *Joseph of Arimathea*, exists in English alliterative verse of the fourteenth century, and has been edited for the Early English Text Society by Rev. W. W. Skeat (1871). H. A. Beers.

Sangster, Charles: poet; b. near Kingston, Ontario, Canada, July 16, 1822, and educated there; was editor of the Amherstburg *Courier* and Kingston newspapers for fifteen years, and in 1868 became attached to the Post-office Department, Ottawa, from which he was retired in 1886. He published *The St. Lawrence, The Saguenay, and other Poems* (1856), *Hesperus and other Poems and Lyrics* (1860).

Sangster, Mrs. Margaret E.: See the Appendix.

Sanguina'ria: a genus of plants containing one species, *S. canadensis*. See Blood-root.

San'hedrin, incorrectly **Sanhedrim** [from Heb. *sanhedhrīn*, from Gr. συνέδριον, assembly; σύν, with, together + ἕδρα, seat]: either of two councils of the ancient Hebrews.

A. *The Great Sanhedrin.*—The Jewish tradition traces its origin to the seventy councilors appointed by Moses (Num. xi. 16–25; comp. Ex. xviii. 13–26), and asserts, without proof, its existence at all periods of the nation's history until after the destruction of Jerusalem by the Romans. The earliest reliable trace of its existence is under the Maccabees (2 Macc. i. 10; iv. 44; xi. 27; 1 Macc. xii. 6). It was in full activity at the time of Herod (Joseph., *Ant.*, xiv., 9–4), and we find constant mention of it in the New Testament (Matt. xxvi. 59; Mark xiv. 5, xv. 1; Luke xxii. 66; John xi. 47; Acts iv. 15, v. 21, 27, 34, vi. 12, 15, xxii. 30, xxiii. 1, 6, 15, 20, 28). It was the supreme "privy council" of the Jews; not only their court of final appeal and last resort, but also an executive and legislative assembly, shaping the general polity of the nation. Its power in matters civil and religious was practically unlimited. It decided all cases brought upon appeal from the lower courts: it had authority over kings and high priests; in it was vested the trial of heresy, idolatry, false prophecy (hence the active part it took against our Lord); and it alone had power to pronounce sentence of death. Its active jurisdiction was confined to Judæa, but the Jews in all parts of the world seem in some degree to have recognized its authority. Owing to the inability to check the constant disorders during the last years of the Jewish commonwealth, its power was greatly curtailed by the Romans, and three years before the death of Christ the right of executing sentence of death was denied, save when confirmed by the Roman authorities (John xviii. 34). In the unsettled condition of affairs attending the fall of Jerusalem it found itself unable to execute civil authority, and from that time until its extinction in the third century its power was merely nominal.

It had seventy-one members chosen from those who were distinguished in birth, learning, or position. In the New Testament are mentioned (1) priests (ἀρχιερεῖς), chiefs of different orders of priests; (2) elders (πρεσβύτεροι), those venerable from age or position; (3) scribes (γραμματεῖς), those learned in the law and tradition. Its officers were president (*Nasi*, chief); first vice-president (*Ab-beth-din*, father of the court); second vice-president (*Hhakam*, judge); besides a force of secretaries and court officers (Luke xxii. 52). The members sat in a semicircle in a room immediately adjoining the temple, called לִשְׁכַּת הַגָּזִית (hall of squares). Their meeting in the house of the high priest for the trial of our Lord does not seem to have been legal. After the fall of Jerusalem they removed to Tabneh, and finally to Tiberias, where the Sanhedrin became extinct A. D. 425.

B. *The Lesser Sanhedrin.*—A court of twenty-three members appointed by the Great Sanhedrin, sitting in all towns of over 120 households, with jurisdiction over local, civil, and criminal matters. See Matt. v. 22, x. 17; Mark xiii. 9.

Literature.—Selden, *De Synedriis et Præfecturis Juridicis Veterum Ebræorum* (1650), a mine of learning and the great source from which all knowledge of this subject is drawn, but containing a mass of irrelevant matter; Ugolini, *Thesaurus*, vol. xxv.; Lightfoot gives much valuable information, derived from the Talmud and Mishna (see *Works*); cf. Schürer, *The Jewish People in the Time of Christ*, Eng. trans., second division, i., pp. 163–195.

Revised by S. M. Jackson.

Sanitary Commission, The United States: an organization formed during the civil war for the purpose of distributing relief to the soldiers of the Union army. On Apr. 15, 1861, the day of President Lincoln's call for 75,000 men, the women of Bridgeport, Conn., organized a society with the somewhat vague idea of affording relief and comfort to the volunteers. In Charlestown, Mass., on the same day, and at Lowell a few days after, the women of those cities formed similar societies. On Apr. 19 the ladies of Cleveland, O., organized an association for the care of the families of volunteers. The Women's Central Relief Association (founded at a public meeting in the Cooper Union, New York, Apr. 29, 1861) sent a committee to Washington to confer with the medical bureau and the War Department in order to learn more definitely in what way, with least embarrassment to the Government and most help to the army, the women could serve the volunteers. They presented to the Government their plan, based very much on the sanitary commission of Great Britain, asking for the appointment of a scientific board, to be commissioned with ample powers for visiting all camps and hospitals, advising, recommending, and, if need be, enforcing, the best-known and most approved sanitary regulations in the army.

The Government not unnaturally dreaded the possible collision of such a body with the medical and military authorities, and required that the consent of the medical bureau should be obtained before such a commission was appointed. This consent was denied. The best that could be secured was the appointment of a doubtful semi-official commission, with the privilege of advising with the medical bureau, of visiting the army in the field, and of recommending to the War Department sanitary regulations and reforms. A few things soon became obvious, and guided their course:

1. The great object of such a commission must be to develop, strengthen, and support the regular medical and military authorities and methods—to stimulate the departments having the supply of food, transportation, camp equipage, drainage, and incite them by kind and wholesome criticism and counsel, and by the force of public opinion, to do their utmost to prevent pestilence and the spread of scurvy, and the lessening of needless exposures of every kind.

2. The Sanitary Commission became very early in its history thoroughly convinced that to prevent evils to the health of the army was greatly more important and serviceable than to attempt to cure them after they appeared. It accordingly gave its attention chiefly to prevention, by a system of camp-inspection and the promulgation of counsels touching the choice of camp-sites, the importance of drainage and police, and the character and cooking of food. By the appointment of skilled medical inspectors it established at once an advisory and tolerably friendly relation with the surgeons in the field.

Among the policies of the Sanitary Commission was the prevention of incompetency, inefficiency, and contracted ideas in the medical bureau. Another preventive measure which it inaugurated was the erection from its own models of pavilion hospitals, designed to make contagion and pestilence less easy and fatal. Its plans became the type of the great general hospitals which were erected at the base of the Union armies.

One of the earliest services of the Commission was the establishment of soldiers' homes at the chief places where new regiments were concentrating, to take care of the sick and supply the defects in the unperfected arrangements of the quartermaster's bureau for receiving them.

As soon as the capture of Fort Donelson the Commission, finding the Government transportation of the sick to hospitals very rude and inadequate, began to organize a system of hospital steamers. These boats, supplied with every comfort, with surgeons and nurses, plied between the ports nearest to the seats of war and the nearest general hospitals, and transported in comparative comfort tens of thousands of sick and wounded men. The cars in which the largest portion were transported were places of torture to wounded men. The Commission devised a sort of hospital-car, in which the common stretcher upon which the wounded man was carried from the field could be converted into a hanging bed in the car. The car was so hung on gutta-percha springs as to obviate jolting.

The wants of the hospitals and camps very early in 1861 had exhausted 60,000 articles which had been forwarded to the Commission. By September of that year it became plain that a demand for extra food and extra clothing was going to exceed anything that the unorganized and intermittent beneficence of the people would furnish. The organization of over 7,000 aid societies, which offered opportunities to millions of women to take some active share in the war, was one of the Commission's best services. On Sept. 5, 1861,

dépôts of supplies were established at New York, Boston, Philadelphia, Washington, Cincinnati, and Wheeling. Central aid associations were in existence at Boston for New England, at New York for the State and part of New Jersey, at Philadelphia for Pennsylvania, Delaware, and Western New Jersey; in Cincinnati, Columbus, Cleveland, in Chicago, in Iowa, and Wisconsin, for the great Western States, which throughout the war were animated by the greatest zeal and liberality. These and other centers had each hundreds of town and village tributaries.

Battle-field Relief.—The medical department, having no independent transportation, often suffered from the inevitable preoccupation of the quartermaster's department with the more urgent duty of forwarding military stores. The Sanitary Commission, as one of its chief means of usefulness, had wagons and horses of its own—often forty four-horse teams at a time—and this enabled it at periods when transportation of medical stores was most embarrassed to forward medical and sanitary supplies to the seats of immediate battle far in advance of the medical department. After Antietam (Sept. 17, 1862) nearly 10,000 wounded Union soldiers, besides many Confederate soldiers, were left, an immense proportion of the whole, shelterless in the woods and fields, without any adequate supply of surgeons, and with not a tenth part of needed medical stores, which were locked up in the block of the railway between Baltimore, the base of supply, and the battle-field. A wagon-train loaded with medical stores had, however, been sent forward from the Sanitary Commission daily for some time to meet this anticipated difficulty. For four days the medical director received no Government supplies, and the wounded were mainly dependent meanwhile on the stores of the Commission.

Special Relief Service.—Early in the war new regiments, often under incompetent officers, arrived at Washington and other centers with sick men and exhausted soldiers, compelled to walk many miles to their camps, with no Government provision of food for them at the dépôts. The Sanitary Commission at once established near the principal dépôts soldiers' homes, where weak and sick men could be temporarily received, restored to health, and forwarded to camp. Forty soldiers' homes and lodges, in short, were sustained by the Sanitary Commission in its broad field, reaching from Washington to Brownsville, Tex., and from Louisville, Ky., to Port Royal, S. C.

The Hospital Directory.—This was an organized effort to tabulate and keep the run of the names of all private soldiers who passed through the general hospitals, so that a soldier's friends could follow him, know where he lay, if he lived or died, and what became of him when out of hospital. The central office at Washington was opened to the public Nov. 27, 1862; branches were soon established at Philadelphia, Louisville, and New York.

Pension Bureau and War-claim Agency.—This agency, free of all cost to soldiers, was designed to obviate the ignorance or inefficiency, or want of strength to win their own way or to secure correct papers, among soldiers passing through the homes and lodges of the Commission.

Special inspection of hospitals was one of the duties undertaken by the Sanitary Commission. It organized a corps of sixty physicians and surgeons of assured position, under Dr. Henry G. Clark, of Boston, as inspector-in-chief, who visited all the general hospitals in the country, and reported in a thorough and exhaustive manner (in 2,500 folio pages) to the medical committee of the Sanitary Commission. The object was to attain such information in regard to the practical management of the hospitals as might furnish suggestions to the surgeon-general for improvements in the system.

Bureau of Vital Statistics.—The most scientific and permanently valuable part of the work of the Sanitary Commission was its effort to collect, tabulate, and turn to account such returns as a system of careful inspection could supply touching the effects of applied or neglected hygiene, of diet, of long marching and heavy equipment, of tent and fixed hospitals; the mortality of young recruits; the influence of climate, age, drill, nationality, of previous occupations, or state of education upon soldiers; the height, weight, strength, and force of the enlisted men.

Financial History of the Commission.—The earliest call for aid published by the Commission was June 21, 1861, in two brief papers—one addressed to the people at large, the other to life-insurance companies. In Mar., 1862, it looked as if the Sanitary Commission must disband for want of funds, but its board were determined not to abandon the experiment. The first large contribution received was $100,000, by telegraph dated San Francisco, Sept. 19, 1862. Supplies had been coming in out of all proportion to the money necessary to move and distribute them. This splendid gift from distant California awoke a general enthusiasm. From that date, after every great battle, money and supplies came pouring in from other quarters, but with each of them came a still greater drain on the stores and the treasury. In the beginning of 1864 a series of great fairs was inaugurated, either by officers of the Commission or by its friends, in aid of its treasury or of the independent treasuries of its branches. They occurred at Chicago, Cincinnati, Cleveland, Pittsburg, Albany, Baltimore, Boston, Brooklyn, New York, Philadelphia, and many other towns and cities. The net product reached $2,736,868.84. The total amount in money received from the people by the Sanitary Commission up to May 1, 1866, was $4,962,014.26; but at least $2,000,000 more was raised and expended in its interest by its branches. Free transportation by railway and express companies and communication by telegraph lines saved the Commission at least two-thirds of the cost in these departments of its work. The aggregate value of the services rendered by the public to the Commission has been estimated at $25,000,000.

Internal Organization.—The original board consisted of nine persons, with power to add as many more associates as they deemed necessary. The order of the Secretary of War creating the Commission was dated June 9, 1861. The board had a general supervision of the work, the defining of its policy and measures, which were committed to secretaries, heads of bureaus, and agents for execution. To them was presented by the general secretary a sketch of the work founded on the reports of the heads of the various bureaus. The pressure and complexity of the business compelled the board to appoint from its members a standing committee charged with all the responsibility of the Commission during the intervals between its sessions. This committee consisted of Rev. Dr. Bellows, Dr. W. H. Van Buren, Prof. Wolcott Gibbs, E. T. Strong, and Dr. C. R. Agnew, and C. J. Stillé was afterward added. It was necessary that this standing committee should be constituted of gentlemen living near each other, as their meetings were held necessarily daily, and New York thus became their headquarters. For further details see Moss's *History and Work of the Sanitary Commission.* Abridged by C. K. Adams.

Sanitary Engineering: See Drainage, Plumbing, and Sewerage.

San Jacin'to: a river of Texas, which rises in Walker co., and flows S. E. 120 miles to San Jacinto Bay, an arm of Galveston Bay; navigable 45 miles. On its banks, 2 miles S. W. of the junction of the river and Buffalo bayou, the closing battle of the war of Texan independence was fought Apr. 21, 1836. Gen. Houston, in command of the Texan forces, had been gradually falling back eastward, toward San Jacinto river and bay, before the advance of the Mexican army under Gen. Antonio Lopez de Santa Anna from the W. The armies were marching on parallel lines, Houston's object being to reach the river and hold the ferry at its mouth; Santa Anna's to cut off his retreat and capture him. They reached the bay boundary almost simultaneously, and took position within a mile of each other. On the 20th some skirmishing took place, with but little result. On the 21st, with the cry, "Remember the Alamo!" the Texans made a sudden charge, and at the expiration of an hour Santa Anna had fled, and the whole of his army not slaughtered in the action had surrendered. The force of the Mexicans was 1,536; that of the Texans about 700. The latter had 8 men killed and 25 wounded.

San Jil, Sanjil, or **San Gil,** -heel': a town of the department of Santander, Colombia; 35 miles S. S. W. of Bucaramanga, in a narrow valley, 3,600 feet above the sea. It is the center of an agricultural district (sugar-cane, cotton, and tobacco), and manufactures Panama hats. Pop. about 10,000. H. H. S.

San Joaquin (wăă-keen') **River:** a stream which rises at the foot of a small glacier near the summit of Mt. Lyell, on the eastern border of the Sierra Nevada, California, flows S. W. for nearly 100 miles, then turns N. W. and traverses the magnificent valley of the same name, and at last, joining with the Sacramento, enters Suisun Bay. The discharge to the sea is through the Golden Gate. At high water the outflow of the Tulare system of lakes is discharged by the San Joaquin, which is navigable to Stockton for large steamers for a good part of the year. The river is some 350 miles long. Revised by I. C. Russell.

San'jo Saneyosh'i: statesman; b. at Kioto, Japan, in 1836, of an old princely family. He early began to take a prominent position in state matters. His efforts were directed to the restoration of the imperial power, and his cooperation at court was invaluable to Saigo and the other leaders of the malcontents in the provinces. After the restoration in 1868 he became vice-premier, and in July, 1871, premier, a position which he held until 1886, when he became chancellor. D. Feb., 1891. J. M. D.

San José, -hō-sā': capital of Costa Rica (since 1823) and of the province of San José; in a valley at the foot of a chain of volcanic mountains; 95 miles by rail from the port of Limon on the Caribbean Sea, and 60 miles by mixed route from Puntarenas (see map of Central America, ref. 8–J). It is the commercial center of the republic, and lies in one of the richest agricultural districts; has a cathedral, national library, university, various Government buildings, and two fine parks. San José is about 4,000 feet above the sea, and consequently has a temperate climate; the water-supply is good, but there is no drainage. Owing to the frequency of earthquakes, all the buildings are low, and the churches are without towers. San José was founded about 1750. Pop. 25,000. H. H. S.

San José: city; capital of Santa Clara co., Cal.; on the Southern Pacific Railroad; 8 miles S. E. of San Francisco Bay, 47 miles S. of San Francisco (for location, see map of California, ref. 8–C). It is in the heart of the beautiful Santa Clara valley, and is connected with San Francisco by three lines of railway and a waterway through the bay, and with the Pacific Ocean at Santa Cruz and Monterey by rail. The city is laid out in the form of a parallelogram, with streets ranging from 60 to 100 feet in width. There are four public parks—Washington Square, 28 acres, containing the State Normal School (cost $200,000); the Plaza, 4 acres, containing the new city-hall (cost $150,000); St. James's Park, 2 blocks in the center of the city, opposite the court-house and Hall of Records (cost $500,000); and Alum Rock Park, 7 miles E. of the city, 400 acres, containing numerous mineral springs, and connected with the city by a beautiful boulevard and by railway. The city contains a U. S. Government building that cost $200,000.

Churches and Schools.—San José contains a Roman Catholic Cathedral and 2 other Roman Catholic churches, 7 Methodist Episcopal, 4 Presbyterian, 4 Baptist, 3 Lutheran, 2 Protestant Episcopal, 2 Christian, and one each Congregational, Friends, Jew, Seventh-day Adventist, and Unitarian. There are also a Young Men's Christian Association, Young Men's Institute, Union Chapel, Spiritual Union, Salvation Army barracks, Theosophical Society, Christ's Rescue Mission, and Florence Night Mission. The public-school system comprises a high school, 6 grammar schools, and 6 kindergartens, with an enrollment of 4,000 pupils and an annual cost of maintenance of over $90,000. The Roman Catholic Church maintains Notre Dame College, St. Joseph's College, Notre Dame Academy, and St. Aloysius's School, and the Methodist Episcopal Church the University of the Pacific, half a mile N. of the city. There are 2 commercial colleges, 4 private schools, a public library, and 4 daily, 9 weekly, and 5 monthly periodicals. The charity institutions include the O'Connor Sanitarium (Roman Catholic), the Pratt Home for Old Ladies, and the Home of Benevolence, maintained by the Ladies' Benevolent Association.

Finances and Banking.—The city has annual receipts and expenditures of about $275,000, net debt of $300,000, and a property valuation of $17,800,000. Unassessed realty belonging to the city, parks, reservations, etc., estimated, $1,000,000. In 1900 there were 6 State banks with combined capital of $1,590,000, and a national bank with capital of $300,000.

Business Interests.—The dominant industry is the preparation and handling of the fruit product. The output of agriculture and horticulture of the valley amounts to about $6,000,000 annually. There are three large canneries, one the largest in the world, numerous packing-houses and shipping firms, a large woolen-mill, and an extensive yard for granite-polishing and marble-cutting.

History.—The pueblo of San José was established in 1782 by the Spaniards. Under the first constitution of California the State capital was located here. The completion of the overland railway in 1869 greatly promoted the prosperity of the city. Pop. (1890) 18,060; (1900) 21,500.

CHARLES H. ALLEN.

San José de Cucuta: See CUCUTA.

San Juan, -hoō-aan': a western province of the Argentine Republic, between Chili, Rioja, San Luis, and Mendoza. Area, 29,700 sq. miles. A great part of the surface is covered with mountain-chains, parallel to the Andes, and 7,000 to 13,000 feet high. In the west there are arid tablelands, and in the east extensive *travesias* or dry deserts, which could be reclaimed by irrigation. Most of the inhabitatants are gathered in the three fertile valleys of Tulán, Jacal, and Fértil. Cattle and sheep are raised and exported to Chili, but agriculture is the principal occupation. There are extensive vineyards, and the wines of San Juan, resembling Malaga, are noted. Until 1864 the province was frequently devastated by civil wars. Pop. (1895) about 84,000. San Juan, the capital, on the San Juan river, was founded in 1561, and has a population of about 11,000. On Oct. 27, 1894, it was partly destroyed by an earthquake.

HERBERT H. SMITH.

San Juan Bautista, -bow-tees'tăă: capital of the state of Tabasco, Mexico; on the west or left bank of the river Grijalva, which is navigated by small steamers to this point (see map of Mexico, ref. 8–J). It is built on flat land, has few public or private buildings of any pretension, and is hot and somewhat unhealthful. It controls the trade of the upper Grijalva and portions of Chiapas. Pop. (1895) 27,036. H. H. S.

San Juan de Fuca, Strait of: the entrance to Puget Sound and the Gulf of Georgia; lies S. of Vancouver's Island and N. of the State of Washington. Its entrance is in lat. 48° 23′ 30″ N., lon. 124° 43′ 48″ W.

San Juan del Norte: See GREYTOWN.

San Juan del Rio: a town of the state of Querétaro, Mexico; 28 miles E. S. E. of Querétaro; 6,500 feet above the sea (see map of Mexico, ref. 7–G). It owes its importance principally to rich silver mines in the vicinity. The place is beautifully situated and surrounded by gardens. Pop. about 10,000. H. H. S.

San Juan del Sur: a port of Nicaragua; on a bay of the Pacific, where the coast is nearest to Lake Nicaragua (see map of Central America, ref. 7–H). The harbor is good and safe. This was the Pacific terminus of the Central American transit route, now abandoned; it is the only cable-station on the Pacific side, and the commercial port of Southwestern Nicaragua. The proposed interoceanic ship-canal will terminate just N. of this place. H. H. S.

San Juan de Nicaragua: See GREYTOWN.

San Juan de Puerto Rico: capital and most important city and port of the island of Puerto Rico, West Indies; on a bay of the northern coast (see map of West Indies, ref. 5–J). The city is built on the western extremity of a low coral island which shelters the bay; the latter forms one of the safest and most commodious harbors in the West Indies, but the entrance is somewhat difficult, requiring a pilot. San Juan was founded by Ponce de Leon in 1511; subsequently it was strongly fortified and repulsed several attacks by English fleets. The most important exports are coffee and sugar. Pop. (1899) 16,225.

San Juan River, Nicaragua: See NICARAGUA.

Sankey, IRA DAVID: evangelist; b. at Edinburgh, Lawrence co., Pa., Aug. 28, 1840; in business at New Castle, Pa., 1855–70, when he joined Dwight L. Moody in evangelistic work in Chicago, Ill. They labored together in Great Britain 1873–75, and again in 1883. Mr. Sankey is the author of several popular sacred tunes, and has published a compilation entitled *Sacred Songs and Solos.*

Sānkhya [Sanskr. *sāṁkhya*, enumerative (see below), from *saṁkhyā*, number]: the name of the oldest one among the products of Indic speculation that was elaborated into a complete system. For the names of the other five systems, see SANSKRIT LITERATURE. Native tradition makes the Sānkhya system older than Buddha (older, say, than 500 B. C.), and maintains that Buddha in the establishment of his doctrines was greatly influenced by it; and this tradition is supported by many correspondences between the two systems. The origin of the rationalistic Sānkhya is to be sought in the reaction from the idealistic monism of the Upanishads (see VEDĀNTA), and is to be localized in the same region that brought forth also Buddhism. Originally the system must have maintained an open hostility to the Brahmanical system, as appears indeed from its polemics against Brahmanical ceremonialism. But in the first pre-

Christian centuries, the Brahmans began to make friends with the Sānkhyans and to treat their doctrines as not irreconcilable with those of the Vedānta. Later, the Sānkhyans acquiesced in a nominal recognition of the infallibility of the sacred Brahmanical literature; and their system, in turn, was received into the number of the six "orthodox" systems. Indeed, Sānkhyan doctrines pervade the whole classical Sanskrit literature (so far as it concerns itself with religio-philosophical ideas) from Manu's law-book and the *Mahā-bhārata* down to the Purāṇas.

The accounts of Kapila, the founder of the system, and of his alleged pupil Āsuri, are wholly unhistoric. It is not even probable that the first Sānkhya teacher composed any works. The oldest authority of whom we can speak with any certainty is Panchaçikha, who flourished a little after the beginning of our era, but of whose writings only scanty fragments are left. The full bloom of the system belongs in the first centuries after Christ, a time when commerce between Alexandria and India was active; so that the Indic system was not without influence upon the Gnostic systems and Neoplatonism. The oldest extant complete treatise on the system, however, is probably of as late date as the fifth century; this is Içvarakrishna's *Sānkhya-kārikā*. The two chief expositions thereof are the *Sānkhya-comment* of Gauḍapāda (about 700 A. D.) and Vāchaspati-miçra's *Moonlight of Sānkhya Truth* or *Sānkhya-tattva-kāumudī* (about 1100 A. D.). Later than this, but before the sixteenth century, is the *Tattva-samāsa*, a brief compendium of the system, and the basis of many comments and supercomments. Next to the *Kārikā* in importance is the *Sānkhya-sūtra*, ascribed to Kapila, but most probably dating from about 1400 A. D. The important comments upon it are by Aniruddha (1500), Vijnāna-bhikshu (after 1550), and Vedāntin Mahādeva (about 1700). The *Sānkhya-kārikā* was translated by Colebrooke (1823), Lassen (1832), Pauthier (1833), Windischmann (1834), and with elaborate explanations by Barthélemy Saint-Hilaire (1852), and John Davies (1881); and with Gauḍapāda's comment by Wilson (1837). The *Tattva-samāsa*, with a comment, was translated by Ballantyne (1850), and the *Sānkhya-sūtra*, with extracts from the comment, also by him (3d ed. by Fitzedward Hall, 1885). Dr. Hall treats of the history of the Sānkhya literature with acuteness and great learning in his introduction to the *Sānkhya-sūtra* (Calcutta, 1862). Recently complete translations of the *Sānkhya-tattva-kāumudī* and of the commentaries to the *Sānkhya-sūtra* have been published by the present writer (Garbe), whose edition of the text of the *Sūtra* and of Vijnāna-bhikshu's commentary appears in Lanman's *Harvard Oriental Series* (Cambridge, 1895). By Garbe also, finally, *Die Saṁkhya-Philosophie*, an exhaustive treatise upon the system, its literature, history, and contents, was published at Leipzig in 1894.

The designation "enumerative philosophy" was applied to the system because of the great importance attached by the Sānkhyans to the establishment of their twenty-five principles and to their numerical classifications in general. The name has reference accordingly to externals and not to the essence of the system. Its fundamental doctrine is consistent pessimism. Conscious life is suffering. Pleasure, the lot of comparatively few, is mixed with pain, and leads only to sorrow. This is all closely connected with the widespread belief in the transmigration, with its horrible sequence of death after death. The cycle of birth, life, and death (*Saṁsāra*) has no beginning; and, for those beings who hang upon the things of this world, it has also no end. In only one way—on this point all the Indic systems are agreed—can one escape the necessity of rebirth: namely, by the recognition of the highest truth. One of the preliminaries to this recognition is a life of complete renunciation. In one other point the Sānkhya system agrees with the general Indic views: namely, in not attempting to subvert the conceptions of the popular religion, the gods, demigods, and demons, the heavens and the hells. All these supernatural beings, however, stand, as do we, within the *Saṁsāra*; unless they attain to the recognition of the highest truth and thereby to release from existence, they too are still under the power of death, and must keep changing their bodies; and are thus on a lower plane even than the man who has attained the highest aim. There is no place in the Sānkhya for an actual god (*īçvara*), who, as others suppose, created the world and maintains and governs it. The decisiveness with which the existence of such a god is denied is one of the characteristic features of the genuine early Sānkhya; which is, accordingly, properly called atheistic (*nirīçvara*).

The Sānkhya recognizes two eternal entities, matter and souls. The world of matter is, for the Sānkhya system, in contrast with the Vedānta, real; and is derived from a final cause by a genuinely philosophical method. The Sānkhya doctrine proceeds from the principle that the effect is nothing else than the cause in a certain phase of development; that from the phase which is physically perceived by us the preceding phases are each to be inferred, one after another, until we arrive at a principle which has only the character of cause, and not also that of effect. The last inferable principle is the primeval material (*prakṛti*, often inappropriately translated by "nature"), out of which, in accordance with law, the world is evolved. The originator of the Sānkhya doctrine believed that he recognized in the world of matter three substances or constituents (*guṇas*, usually and very erroneously rendered by "qualities"), unequal and mingled in varying proportions: of which the first exhibits the characteristics of lightness, of light, and of delighting; the second, those of mobility, of excitation, and of pain-causing; the third, those of heaviness, of obstruction, and of stupefaction; and to which respectively he gave the names of *sattva*, *rajas*, and *tamas*. And he set up the theory that the primeval matter consisted of these three constituent substances. The undeveloped primeval matter is accordingly the condition of equilibrium of the three *guṇas*.

It is in consequence of a disturbance of this equilibrium that the world enters upon a course of development. First arises the *buddhi*, the fine substance of that internal organ to which belong the functions of determining, discriminating, and judging. From the *buddhi* proceeds the *ahaṁkāra*, the fine substance of that internal organ whose function it is to put things into relation to the ego or soul. Since these internal organs correspond to what we mean by the nerve-system, we should say in modern phrase that the Sānkhyans look upon the nerve-substance as the first and finest development of the primeval matter. The *ahaṁkāra* produces the organs of sense and the subtile elements; from which proceed in turn the five gross elements (ether, air, fire, water, earth), that is, the visible world in all its manifoldness.

When the time of its persistence is at an end, the universe is dissolved; and in such wise that each product or set of products, beginning with the gross elements and proceeding in the reverse order, resolves itself into the material cause from which it was developed. By this process of reabsorption, finally, the three *guṇas* at last attain again their original condition of equilibrium. The primeval matter is again precisely the same and in the same state as it was in the time before its evolution; and so it persists until the dawn of a new period of a new world-evolution. This cycle of becoming, existing, and passing away never had any beginning and will never have any end.

As for the physiological side of the system, it is to be observed that the higher and lower corporeal organisms—whether of supernatural beings, of men, or of beasts—are composed of like constituents and do not differ in principle. Besides the gross-material perishable body, each organic being possesses a fine or inner body (*liṅga çarīra*), which, with the soul, passes from one gross body into another. The fine body is composed of the inner organs (*buddhi* and *ahaṁkāra*), the internal sense (*manas*), and the external senses (*indriya*), and the five fine elements; it is not only the basis of the metempsychosis, but also the bearer of the personality, since it alone is concerned with all those conditions and processes which we term psychic. The functions of the senses and of the inner organs, perception, feeling, thinking, willing, are in the first instance, according to the Sānkhya system, purely corporeal mechanical processes, and would remain unknown did not the soul (*ātman* or *purusha*), which is of purely spiritual nature, make them known by its "illuminating" power. This is the sole function of the *ātman*.

The Sānkhya system—again in sharp contrast with the Vedānta—teaches that there is an endless plurality of souls, which have existed from all eternity, are individual, and yet wholly like each other. Each one of these souls by itself is all-pervasive and infinitely great, like matter; but, for the rest, essentially different from all material principles. The souls are unchangeable; are unconcerned spectators of the processes that go on whether within or without the body; are unaffected by pleasure or pain; and, albeit incapable of any activity, willing, or wishing, they yet exert by their mere presence an excitant influence upon the dispensation of nature. Matter—that is, not only external

things, but also our inner organs—is likened to a dancer that executes a dance before the soul as spectator.

The purpose of the Sānkhya is to bring us to understand the absolute difference of the soul from matter; and, especially, even from the finest modifications of matter as exemplified in the inner organs: forasmuch as the intelligent recognition of this difference releases the soul from the bonds of matter and puts an end to the series of rebirths. And hereby is attained that absolute deliverance from sorrow which every wise man is to strive for. All other means for doing away with sorrow—because their effect is only transitory—are worthless. An offshoot of the Sānkhya system is the Yoga philosophy. See YOGA. R. GARBE.

Translated by C. R. LANMAN.

San Laz'zaro: a small island of the Venetian lagoons, first mentioned in the twelfth century, when a hospital for lepers was established there. After the disappearance of leprosy it was used for other hospital purposes, until the Venetian republic ceded it to Peter Mechitar and his Armenian followers who had fled before the Turks. The Armenian church and convent contain many objects of interest.

San Leandro, -lā-aan'drō: town; Alameda co., Cal.; on the S. Pac. Railroad; 9 miles S. E. of Oakland, the county-seat; 15 miles E. of San Francisco (for location, see map of California, ref. 7–C). It is in an agricultural and fruit-growing region, and has manufactories of agricultural implements and hardware, a State bank with capital of $25,000, and two weekly newspapers. Pop. (1900) 2,253.

San Lucar de Barrame'da (anc. *Ebora*): fortified port and town of Spain, in the province of Cadiz; on the Guadalquivir, near its mouth; 15 miles N. by W. of Cadiz (see map of Spain, ref. 19–C). It exports large quantities of wines and fruit. It is a popular summer resort for sea-bathing. Pop. (1887) 22,667.

San Lucas, Cape: See CAPE SAN LUCAS.

San Luis, -lōō-ees': an interior province of the Argentine Republic; surrounded by Mendoza, San Juan, La Rioja, Córdoba, and the territory of La Pampa. Area, about 18,000 sq. miles. In the north much of the surface is mountainous; the Salinas desert separates the province from La Rioja. The southern part is a plain included in the Pampas, but partly taken up by arid salines. Owing to the dryness of the climate little of the land is available for agriculture without irrigation, but cattle and sheep are raised in large numbers and exported both to Buenos Ayres and to Chili. The mountain region is rich in gold, silver, copper, graphite, etc. The inhabitants suffered greatly during the civil wars. Pop. (1895) about 81,500. San Luis, the capital, is a town of 10,000 inhabitants, on a plateau 2,502 feet above sea-level; from this point nearly the whole province and the distant Andes can be seen. It is an important station on the railway from Buenos Ayres to Chili. HERBERT H. SMITH.

San Luis Obis'po: city (incorporated in 1874); capital of San Luis Obispo co., Cal.; on the Southern Pacific Railroad; 9 miles N. of San Luis Obispo Bay, with which it is connected by railway to Port Harford, and 90 miles N. W. of Santa Barbara (for location, see map of California, ref. 10–D). It is in an agricultural, dairying, and stock-raising region, and contains 5 State banks with combined capital of $720,000, the Academy of the Immaculate Heart of Mary (Roman Catholic), and a daily and 2 weekly newspapers. Pop. (1880) 2,243; (1890) 2,995; (1900) 3,021. EDITOR OF "TRIBUNE."

San Luis Potosí: an interior state of Mexico; bounded by Coahuila, Nuevo Leon, Tamaulipas, Vera Cruz, Hidalgo, Querétaro, Guanajuato, and Zacatecas. Area, 24,446 sq. miles. In the central and northern parts there are extensive high plains included in the Mexican plateau; these are varied by mountains and hills. The eastern and southern portions are on the mountainous border of the table-land, and are exceedingly varied in scenery and climate. Agriculture is the most important industry, the principal crops being maize and wheat on the plateau, sugar-cane, cotton, and coffee in the warm valleys, and maguey, used for the manufacture of pulque and the spirituous liquor called mezcal. The mines (of silver, gold, lead, etc.) are among the most valuable in Mexico; salt is obtained from salines on the plateau. In the western part the grazing industry occupies much of the land. The manufactures are increasing in importance, and altogether this is one of the richest and most progressive of the Mexican states. Pop. (1895) 570,814; a large proportion are of Indian or mixed race.

HERBERT H. SMITH.

San Luis Potosí: capital of the state of the same name; in a valley on the mountainous border of the plateau, 6,200 feet above the sea; 362 miles by railway N. N. W. of Mexico (see map of Mexico, ref. 6–G). It is regularly laid out with wide streets and numerous small squares ornamented by trees; the outskirts have so many gardens and trees that, from a distance, only the higher towers can be seen. The cathedral and many churches are richly ornamented. San Luis has a university, school of engineering, mint, etc., with considerable manufactures; it is an important railway center and has a large and increasing trade. The silver mines (discovered in 1583), which first gave importance to the place, are nearly abandoned. The climate is dry and temperate. Pop. (1895) 69,676, including a number of suburban villages.

HERBERT H. SMITH.

San Marcos: town; capital of Hays co., Tex.; on the San Marcos river, and the International and Gt. Northern, and the Mo., Kan. and Tex. railways; 31 miles S. of Austin, the State capital (for location, see map of Texas, ref. 5–H). It is in an agricultural region, and contains 2 national banks with combined capital of $130,000, Coronal Institute (Methodist Episcopal, South, chartered in 1879), public-school building (erected in 1890, cost $10,000), a U. S. fish-culture station, grounds of the Texas Chautauqua Association, water-works, electric lights, several steam-ginneries and cottonseed-oil mills, an interesting group of boiling springs, and 3 weekly newspapers. Pop. (1880) 1,232; (1890) 2,335; (1900) 2,292.

ISAAC H. JULIAN, EDITOR OF "PEOPLE'S ERA."

San Mari'no: the oldest and smallest independent republic in the world, situated in eastern Central Italy (see map of Italy, ref. 4–E). It is governed by a legislative senate of sixty members elected for life, an executive council of twelve, two-thirds of whom go out every year, and two presidents elected for six months. This has been the form of government since 1847, when the constitution was considerably changed. Area, 32 sq. miles, embracing five small villages, with a population of about 8,500. The capital, of the same name, is perched on the crest of a mountain 2,635 feet above the sea. It is said to have been founded early in the fourth century by St. Marinus, a converted stone-mason, who fled from Rimini (12 miles N.) during the Diocletian persecution. Borgo, 500 feet lower down, is the residence of the principal inhabitants. The other three villages are Serravalle, Faetano, and Monte Giardino. There is a standing army of thirty-eight officers and 950 men, and an annual revenue of about 227,000 lire. The principal products are fruit, silkworms, and wine, and there is some good pasturage. Gunpowder is manufactured. See histories of the republic by Melchiorre Delfico (Milan, 1804) and Cazeneuve (Paris, 1887).

San Martin, saan'maar-teen', José, de: general: b. at Yapeyú, Misiones (now in the Argentine Republic), Feb. 25, 1778. His father was governor of Misiones, but returned in 1785 to Spain, where young San Martin early entered the army as a cadet. He distinguished himself in the wars with France, attaining the rank of lieutenant-colonel. Meanwhile he had adopted republican ideas; in 1811 he resigned and went to London, where he was associated with Miranda and other noted Spanish-American republicans. In 1812 he and other young officers sailed for Buenos Ayres with the object of offering their services to the patriot junta of that colony. On his arrival San Martin was commissioned to organize a regiment of cavalry. This force, the Mounted Grenadiers, was distinguished throughout the war for independence. About Aug., 1812, San Martin and his friends organized the secret society called the Lautaro Lodge; this speedily became the most important political influence in the country, and most of the subsequent successes were directly or indirectly due to it. At the end of 1813 San Martin succeeded Belgrano as commander of the patriot forces in Upper Peru or Bolivia. By the reverses of 1814 the patriots were practically driven out of all the South American colonies except those in the basin of the Plata. The patriots of the Plata basin had repeatedly attempted to attack the central Spanish power in Peru by way of La Paz and Lake Titicaca, but they had always been driven back, the mountain region being unfavorable for cavalry. San Martin conceived the idea of opening a new line of attack by crossing the Andes into Chili; this scheme he was able to carry out through the support of Pueyrredon, director of Buenos Ayres, and the secret influence of the Lautaro Lodge. He drilled and organized his army during two years, and on Jan. 17, 1817, began his march with 4,000 men,

crossing by the Uspallata pass, which is 12,300 feet above the sea, or 4,000 feet higher than St. Bernard where Napoleon made his celebrated passage. The Spaniards were defeated at Chacabuco, Feb. 12, and Santiago was occupied three days after. San Martin was immediately nominated supreme director of Chili, but declined, and the office was given to O'Higgins. On Feb. 12, 1818, the independence of Chili was proclaimed. The Spaniards, strongly re-enforced from Peru, won the battle of Cancha Rayada Feb. 19; but they were overwhelmingly defeated by San Martin at Maipo Apr. 5, 1818, their power in Chili being essentially ended. Meanwhile San Martin had been busily engaged in the second part of his great plan—the invasion of Peru by sea. A fleet was organized and placed under command of Lord Cochrane; and, after several brilliant naval exploits, San Martin's army of 4,500 men was transported to the Peruvian coast in Aug., 1820. By skillful manœuvering the Spaniards were forced to evacuate Lima, which was occupied by San Martin July 9, 1821; three weeks later the independence of Peru was proclaimed, and San Martin was chosen supreme protector. At this time another patriot army under Bolivar was approaching from the north, and Peru was threatened with a rivalry between the two patriot leaders. San Martin magnanimously sacrificed his own ambition to the cause. After an interview with Bolivar at Guayaquil July, 1822, he resigned his office to the Peruvian congress (Aug. 22, 1822), and in September sailed for France; there he passed the remainder of his life in comparative poverty. D. at Boulogne, Aug. 17, 1850. The final triumphs of the war were achieved by Bolivar and his generals, but the independence of South America was largely due to San Martin. See Mitre, *Vida de San Martin*; an English abridged translation by Pilling, entitled *The Emancipation of South America* (1893); and *Memoirs of Gen. Miller* (1829). See also La Serna é Hinojosa.

Herbert H. Smith.

San Miguel, -mēĕ-gel′: a town of Salvador; capital of a department of the same name; in the eastern part of the republic; on the river San Miguel (see map of Central America, ref. 6–F). It is the center of a rich agricultural region (indigo, etc.). The climate is warm and insalubrious. Pop. about 12,000. The San Miguel volcano, 10 miles to the S. W. of the town, is 6,000 feet high, and one of the most active in Salvador. H. H. S.

San Miguel de Allende: See Allende.

Sannaza′ro, Jacopo: poet; b. in Naples, Italy, July 28, 1458; educated at the academy of Pontano; traveled much, and early received great favor from King Frederick III. of Naples as a reward for his poems; followed the king into exile in 1501, when he was driven from the throne by the Spaniards, and did not return until after his death. D. in Naples, Apr. 27, 1530. A collected edition of his Italian poems appeared at Padua in 1723. The best known is *Arcadia* (Venice, 1502; Turin, 1888), which is a series of idyls, partly in prose, partly in verse, and hence one of the earliest of prose pastorals. His Latin poems comprise *De Partu Virginis* (1526; also Leipzig, 1826), *Eclogæ*, and epigrams, among which is the famous poem in praise of Venice, which gained a reward of 600 ducats from the senate.

San Nicolas′ de los Arro′yos: a town of the province of Buenos Ayres, Argentine Republic; on the river Paraná, close to the boundary of Santa Fé. It is built on a high bluff overlooking the river; is the center of a rich grazing district (cattle and sheep), and of agricultural colonies settled by Italians. There are steam flouring-mills, a meat-freezing establishment, etc. San Nicolas is a port of call for ocean steamers, and is an important railway center. Pop. (1892) 19,000, and growing rapidly. H. H. S.

San Pier d'Arena, or **Sampierdarena**, sāăm-pi-ār-dāă-rā′nāă: town; in the province of Genoa, Italy; occupying a tongue of land about 2½ miles W. of Genoa (see map of Italy, ref. 3–C). Though it is a suburb of Genoa, it has a distinct city organization. The churches contain some valuable works of art, and there are some noticeable public buildings as well as private palaces. There is much commercial and manufacturing activity. Pop. (1886) 22,960.

San Rafael: town; capital of Marin co., Cal.; on the Strait of San Pablo, and the N. Pac. Coast and the San Fran. and N. Pac. railways; 15 miles N. of San Francisco (for location, see map of California, ref. 7–B). It is in an agricultural, dairying, and stock-raising region at the base of Mt. Tamalpais, is a widely known resort for invalids, has hourly communication with San Francisco by two railways and by ferries, and contains six churches, a public high school, San Rafael Institute (opened in 1881), St. Vincent's Male Orphan Asylum, a library, a private bank, and two weekly newspapers. Pop. (1880) 2,276; (1890) 3,290; (1900) 3,879.

Editor of "Marin County Journal."

San Remo: town; in the province of Porto Maurizio, Italy; 26 miles by rail E. N. E. of Nice; railway station on the line from Genoa to Nice (see map of Italy, ref. 4–B). It is picturesquely situated on a slope descending to the sea, with rich olives behind it, and surrounded by luxuriant orchards of lemons and oranges. There is an old town with steep and narrow streets. The new town is a favorite resort of invalids, for whom ample accommodation is provided, and is preferred by many to either Nice or Mentone, as being more sheltered than the former and less confined than the latter. Pop. 16,330.

San Roque, -rō′ke: town; in the province of Cadiz, Spain; on the Bay of Gibraltar; 8 miles N. by W. of Gibraltar (see map of Spain, ref. 20–D). It was built by the Spaniards after the loss of Gibraltar. It produces great quantities of fruit and vegetables, in which it carries on a considerable trade with Gibraltar. Pop. (1887) 8,730.

San Salvador′, or **Banza Congo**: town of the province of Loanda, Portuguese colony of Angola, Western Africa; in the basin of the Congo river; lat. 6° 20′ S., lon. 14° 47′ E. (see map of Africa, ref. 6–D). It is the ancient *Ambassi*, capital of an indigenous kingdom, but destroyed about 1550. In the seventeenth century it revived under Portuguese influence, and became an important center of trade and religion, but it has again fallen into decay. It is of importance only as a center for mission-work. Pop. 700, with a dozen or score of whites. M. W. H.

San Salvador: capital and largest city of the republic of Salvador, Central America; on a branch of the river Lempa, and at the southeastern base of the extinct volcano of San Salvador; 2,270 feet above sea-level (see map of Central America, ref. 4–E). It was founded in 1528 and removed to its present site in 1539. This locality seems peculiarly subject to earthquakes; over sixty have been recorded in a single year, and occasionally they are very destructive. The city was more or less completely overturned in 1575, 1593, 1625, 1656, 1798, and 1839. On Apr. 16, 1854, it was reduced to a heap of ruins by a succession of severe shocks. An attempt was then made to found a new capital at Nueva San Salvador, 8 miles distant; but the old city, having been rebuilt, regained its supremacy, and was again destroyed, with the neighboring villages, Mar. 19, 1873. As rebuilt, all the houses and public edifices are low and surrounded by wide grounds; the cathedral and many other buildings are of wood. San Salvador has a university, national palace, normal college, national theater, etc. It is the center of a rich agricultural district, and has a thriving trade. Pop. with the suburbs, about 35,000; of the city proper, about 25,000. Its port is La Libertad, connected with it by a road which is passable for carts only during a part of the year; a railway is projected. Herbert H. Smith.

San Salvador Island: See Bahama Islands.

Sans-Culottes, sāăn′kü′lot′ [=Fr., liter., without breeches; *sans*, without + *culotte*, breeches]: a name bestowed early in the first French Revolution upon the lower classes of the populace from the fact that they wore pantaloons instead of knee-breeches, the latter garment distinguishing the dress of the bourgeoisie and nobility.

San Sebastian: capital of the province of Guipuzcoa, Spain; on a peninsula in the Bay of Biscay; surrounded with strong walls and defended by a citadel (see map of Spain, ref. 12–G). Its harbor, though not safe, is frequented by large vessels. A large import trade in French and English goods is carried on, and during the summer the town is much resorted to as a watering-place. Pop. (1887) 29,047.

San Seve′ro: town; in the province of Foggia, Italy; 18 miles by rail N. W. of Foggia and 141 N. E. of Naples (see map of Italy, ref. 6–F). The district is fertile in grain and fruit, and not lacking in pasturage. The town, of mediæval origin, has suffered severely from earthquakes on several occasions. Pop. 20,380.

Sanskrit Language: the literary language of the Aryan inhabitants of India. Two principal reasons have led to its study: the intrinsic interest attaching to the very extensive Sanskrit literature, which reveals the thought and life of a large and highly endowed part of the human race; and,

second, the fact that, of all the Indo-European languages, the Sanskrit has, on the whole, best conserved the pristine features of their common parent-speech—a consideration appealing with especial force to most of the cultivated European races, inasmuch as their languages are descended from this parent-speech. The application of the comparative method to the study of genetically related tongues is due in largest measure to the study of Sanskrit, which has thus proved to be the most important factor in the revolutionizing of some parts of classical philology and in the creation of Germanic philology. Moreover, with the broadening of the conception of philology, the conception of comparative philology has also grown broader; instead of being confined to phonology and to the morphology of word and of sentence (comparative grammar), it includes the whole intellectual life of a people, as that life is manifested not only in its language, but also in its literature, its antiquities, its customs and laws, its religion, its philosophy. These subjects when treated comparatively form chapters of comparative philology; and these are the very subjects which receive and are yet to receive especial illumination from ancient India.

The languages of India may be divided primarily into Aryan and non-Aryan (see *Ethnology* under INDIA, and especially DRAVIDIAN LANGUAGES, and Constable's *Hand Atlas of India*, plate 10); the Aryan constitute, with the IRANIAN LANGUAGES (*q. v.*), the Indo-Iranian group of the Indo-European family of languages. For the relation of this group to the others, see INDO-EUROPEAN LANGUAGES. The Aryan languages of India show three principal stages of development: (1) Old Indic or Sanskrit; (2) Middle Indic or Prākrit (see PRĀKRIT LANGUAGES); and (3) New Indic or Bhāshā. The old Indic belongs locally to the Punjaub and the Indo-Gangetic plain. The name Sanskrit is applied to the ancient and sacred language of India, the tongue in which the Vedas, Brahmanas, Upanishads, epics, etc., are written. It is difficult to say just how long it was a true vernacular; but, under the influence of learned writers and grammarians, it has maintained for 2,000 years a more or less artificial existence as a means of communication, spoken and written, for the learned of India. The word Sanskrit is a Sanskrit word meaning "elaborate," and it doubtless connotes a certain antithesis to Prākrit, which means the "ordinary" or "vulgar" (idioms). It is in its broader sense that the term Sanskrit is applied to the language of the widely different periods of Sanskrit literature; in a narrower sense, it is often used as the equivalent of "classical Sanskrit," the language of the later classical works as distinguished from the archaic dialects of the Veda and Brahmanas.

There is, properly speaking, no Sanskrit alphabet. The Hindus of the different parts of India write the language usually each in his own vernacular alphabet. The alphabet which prevails in Hindustan proper is the one called *Nāgarī*, or *Deva-nāgarī*; and this, of all the Indic alphabets, is the one adopted by Occidental editors of Sanskrit works. It is written from left to right. Alberuni (in his *India*, written about 1030 A. D., chap. xvi.) mentions among the principal alphabets the *Nāgara* of Malwa. *Nāgara* means "of the city," and refers perhaps to the very famous city of Ujjain, once the capital of Malwa. The alphabet is probably derived from a Semitic source. By far the most important discussion of this subject is that of G. Bühler, *Indian Studies*, No. 3 (Vienna, 1895).

The system of sounds, in the native order of arrangement, is as follows: Vocalic: *a*, *ā*, *i*, *ī*, *u*, *ū*, *ṛ*, *ṝ*, *ḷ*, *e*, *āi*, *o*, *āu*; the breathing *ḥ* and nasalization *ṁ*; consonantal:

Mutes.	Surd.	Surd asp.	Sonant.	Son. asp.	Nasal.	Semivowels.	Sibilants.
Guttural	*k*	*kh*	*g*	*gh*	*ṅ*	..	..
Palatal	*c*	*ch*	*j*	*jh*	*ñ*	*y*	*ç*
Lingual	*ṭ*	*ṭh*	*ḍ*	*ḍh*	*ṇ*	*r*	*ṣ*
Dental	*t*	*th*	*d*	*dh*	*n*	*l*	*s*
Labial	*p*	*ph*	*b*	*bh*	*m*	*v*	..

and the sonant guttural aspirate *h*. The vowels are written with different characters according as they are long or short. The *a*, *i*, and *u* vowels are pronounced as in Italian, save that the short *a* has the value of the neutral vowel in *but*. The *ḷ* is like the common English *l*-vowel in *ankle*, and the *ṛ*-vowels are simply untrilled *r*-sounds with vocalic value in syllable-making. Of the mutes, the unaspirated surds and sonants and the nasals of the guttural, dental, and labial series are familiar: the surd aspirates *kh*, *th*, *ph* are like the simple surd with following breathing, as in *blockhead*, *pot-hook*, *uphill*; and the sonant aspirates are rendered in practice as in *abhor*, etc., though their strict value is matter of question. The whole palatal series is secondary, and derived by modification of original gutturals (see PALATALIZATION: pronounce *c* and *j* as in *dolce*, *jar*). The linguals are pronounced with the tip of the tongue reverted upward to the dome of the palate. A most striking peculiarity is the prevalence of the *a*-sounds, which make up over one-quarter (28 per cent.) of all the sounds of any ordinary piece of text. And since original *e*, *o*, and *a* (cf. δέδορκα = *dadárça*), often also vocalic *n* and *m*, have all been leveled in Sanskrit to one uniform *a*, it is not strange that short *a* aggregates about one-fifth of all Sanskrit sounds. The word-accent is a pitch-accent, not a stress-accent. For the phonetic relations of Sanskrit to the parent-language, see Brugmann's *Comparative Grammar of the Indo-Germanic Languages*.

For the phonetic changes of the language, reference must be made to the grammars. Several general statements may be made, however: hiatus is avoided; when a surd is concurrent with a sonant, either the surd is changed to a sonant or else the sonant to a surd (assimilation, regressive or progressive); consonant groups are abbreviated. The laws of phonetic combination (*saṁdhi*) wear indeed an artificial aspect in the classical period; yet even there the *rationale* of many or most of them is discernible; and in the Vedas the case is quite otherwise, and the *saṁdhi* quite simple.

As for morphology, the Sanskrit surpasses, on the whole, all the cognate tongues in transparency of structure, thus contrasting sharply with the Latin, which has been likened, morphologically, to "a venerable ruin." Its words invite analysis and are, for the most part, easily analyzable into roots, suffixes of derivation, and inflectional endings. This feature of the language is exhibited incidentally with wonderful clearness and completeness by Whitney in his *Roots, Verb-forms, and Primary Derivatives of the Sanskrit Language* (Boston, 1885). The Sanskrit roots come nearer in form and meaning to their Indo-European prototypes than do the roots of any other of the related languages. It was this conservation of old material, coupled with its surpassing transparency of structure, that made the study of Sanskrit so fruitful in results and so suggestive of new and rigorous methods to be pursued in etymologizing and in the science of language generally.

In the noun three numbers, singular, dual, and plural, are distinguished; and the dual is actually used probably to a larger extent than in any other Indo-European language. There are the usual three genders, the feminine themes ending prevailingly in a long vowel. The cases are eight: nominative, accusative, instrumental, dative, ablative, genitive, locative, and vocative; and their proper uses are so precisely like those of the Indo-European case-system that it suffices, in lieu of a general description of them, to refer to INDO-EUROPEAN LANGUAGES. The declension of adjectives is essentially the same as that of substantives. The pronouns are of course of three persons, and except in the first and second persons show three genders. Their inflection is peculiar, but offers striking parallels to the facts of the cognate tongues (with *sa-s*, *sā*, *ta-d*, cf. *δ*, *ἥ*, *τό*, Ang.-Sax. *se*, *seō*, *ðæ-t*; with *i-d*, cf. Lat. *i-d*, Eng. *i-t*). The numerals agree well with those of the parent-speech (thus *trī* = three; *nava* = nine). See INDO-EUROPEAN LANGUAGES.

The verb shows, as in Greek, etc., the distinctions of voice, tense, mode, number, and person. The voices are active and middle. In the present system there is a special passive inflection; elsewhere the middle serves also as passive. There are four tense-systems, present, perfect, aorist, and future. The modes are indicative, subjunctive (mostly Vedic), optative, and imperative. There are three numbers and three persons. There are also secondary conjugations, passive, intensive, desiderative, and causative. Most important is the distinction between verbs without the thematic *a*-vowel and verbs with it (*-μι* verbs and *-ω* verbs). The retention of ancient accentual conditions is very remarkable, and in general the whole system of conjugation casts floods of light upon innumerable inflectional forms of the related languages.

The syntax is very bald and simple: partly because of the ample number of case-forms for the expression of all the most important logical relations; and partly because, in the case of the verb, although there is an abundant wealth of mode and tense forms, the Hindus never came to turn them to account, as did the Greeks, for the nice expression of modal and temporal relations.

The most comprehensive historical grammar is W. D. Whitney's *Sanskrit Grammar, including both the Classical Language, and the Older Dialects, of Veda and Brahmana* (2d ed. Boston, 1889). The Vedic noun-inflections have been fully treated by Lanman, *Journal of the American Oriental Society*, x., 325–601. The verbs are treated with great completeness in Whitney's *Roots, Verb-forms*, etc. For the syntax, see J. S. Speyer's *Sanskrit Syntax* (Leyden, 1886). The best dictionary is the great Sanskrit-German *Wörterbuch* of Böhtlingk and Roth (7 vols., St. Petersburg, 1852–75). Of very moderate size and cost, and yet comprehensive, are the Sanskrit-English dictionaries of A. A. Macdonell (New York, 1893) and Carl Cappeller (Boston, 1891). There is a *Sanskrit Grammar for Beginners*, by Max Müller, abridged by Macdonell (New York, 1886). Lanman's *Sanskrit Reader with Vocabulary and Notes* (Boston, 1888) is a companion volume to Whitney's grammar, and is made with especial regard for the needs of such as study the language without a teacher. For comparative study may be recommended Victor Henry's *Short Comparative Grammar of Greek and Latin* (New York, 1890). An English manual in which Sanskrit is made the primary subject, to be illuminated by the related tongues, is a desideratum; such a work has appeared in Dutch, C. C. Uhlenbeck's *Handboek der Indische klankleer, in vergelijking met die der Indogermaansche stamtaal* (Leyden, 1894).

CHARLES R. LANMAN.

Sanskrit Literature: one of the several bodies of literary products of ancient India. (Compare PĀLI and PRĀKRIT.) In its broader sense, the term Sanskrit literature includes the Vedas (which are the oldest literary monuments of our part of the human race, the Indo-European family) and the post-Vedic literature. In its narrower sense, it means post-Vedic literature only. The hither terminus of the post-Vedic period is not clearly definable; indeed, literary works were written in Sanskrit all through the Middle Ages, and are still so written even to-day. Aufrecht's *Catalogus Catalogorum*, an orderly assembling of the contents of the various catalogues of Sanskrit manuscripts, enumerates some 20,000 titles of Sanskrit works. This great quantity is of measurable variety in style and contents. In quality it is, upon the whole, distinctly inferior to the Greek. Nevertheless, the Vedas have a very high degree of importance from the light they shed on the history of religions; the Gṛhya-sūtras are of great interest to the student of private antiquities; the Dharma-sūtras, to the student of the history of law; the Upanishads and their sequels, to the student of the history of philosophic speculation; the beast-fables, to the student of popular tales; the critical history of the epics illuminates many aspects of the problems concerning the genesis of popular epics; the Hindu dramas are interesting both in themselves and often on account of their relations to the legendary material on which they are based; and the grammar, rhetoric, music, medicine, mathematics, and astronomy of the Hindus, like their philosophic speculations, may no longer be ignored by writers upon the history of the several sciences.

The history of Sanskrit literature is divided into two periods, the Vedic period and the classical period. These overlap, as is elsewhere often the case. But in all this history there is very little like a fixed chronology. The Hindus are the antipodes of the record-loving Egyptians, as indeed we might expect from the Indic views of life that go with the popular belief in transmigration and with pessimism. On the other hand, it is possible to determine the relative age of very many works, and this relative chronology offers many interesting and not insoluble problems.

A. THE VEDIC PERIOD. 1. *Mantras.*—The Sanskrit word *veda* means "knowledge," and especially the "sacred knowledge," handed down in the triple form of *ṛc*, *sāman*, and *yajus*, and including the well-known collections called Rigveda, Sāmaveda, and Yajurveda, which bodies of text are often alluded to as the *trayī vidyā*, or "triple knowledge." An *ṛc* is a hymn of praise, and especially a stanza of praise that is spoken as distinguished from one that is sung (*sāman*), or from a sacrificial formula (*yajus*). The Hindus hold that the Vedas have existed from all eternity and survive the periodic dissolutions of the universe, and that they have no human authors, but are "seen" by the Rishis or "seers," to whom they are from age to age "revealed." The Atharvaveda is of later date and canonicity than the others. These four collections, called *Saṁhitās*, consist of sacred texts, mostly metrical, called *mantras*. They embody only a part of the great mass of Mantra material which originated and was handed down by memorial tradition orally from generation to generation long before the existence of the collections. Of the Mantras not now extant in any collection we find remnants scattered about in various books. To each of these collections is attached a body of subordinate works called *Brāhmaṇas*, and yet another of works called *Sūtras*. A cross-division is thus involved, so that the oldest Indic books are classed, first, according to the Veda to which they belong, and, second, according to their character as Mantra, Brāhmana, or Sūtra.

2. *Brāhmaṇas, Upanishads.*—The Brāhmanas are the oldest Indo-European connected prose extant. In the texts of the old Yajus Sanhitās the sacred formulas are commingled with prose passages, explanatory, prescriptive, and legendary. A single such passage is a *Brâhmaṇa*, "the dictum of a *brahmán* or priest," "a priestly discourse." The separate collections of Mantras naturally suggested a similar treatment of these priestly discourses. Such a collection of discourses is itself also called a Brāhmana, and is practically a compendium of the wisdom of a priestly school. The older Brāhmanas contain descriptions of the sacrificial ceremonies, accounts of their origin, and legends to illustrate their efficacy. Conscious philosophic speculation plays a subordinate part. In the later Brāhmanas the descriptions of the ritual are relegated to systematic treatises; the theosophic and philosophic passages become, with the growth of asceticism and hermit-life, more lengthy and important, and receive—as containing matter appropriate for the meditations of the forest-hermits—the special name of *Araṇyakas*, or Forest-treatises, and *Upanishads*. From the hand of O. Böhtlingk are the best editions of the two most important Upanishads: the *Bṛhad-āraṇyaka-upanishad* (St. Petersburg, 1889); and the *Chāndogya-upanishad* (Leipzig, 1889), both in text and in German translation. Vols. i. and xv. of Max Müller's *Sacred Books of the East* contain versions of the principal Upanishads. W. D. Whitney translated the *Kaṭha-upanishad* (*Transactions of the American Philological Association*, 1890, vol. xxi.).

3. *Sūtras.*—The Brāhmanas presuppose a thorough acquaintance with the details of the sacrifice. When the ceremonies had grown to tremendous length and complexity, it became necessary to have systematic treatises for the use of the celebrants. Such works are the "Rules for the Sacrifices" or *Çrāuta-sūtras*, so called because they stand in intimate relation to the Veda or "sacred texts" (*çruti*) and continually cite those texts, and serve as rubrics to them, prescribing the manner and the occasions of their employment with the various ceremonies.

Usage and observance, crystallized into sacred ceremony, invest the whole life of an Aryan Hindu—nay, even his prenatal and *post-mortem* existence. The books that describe these observances are called *Gṛhya-sūtras*, or "Rules of Domestic Usages." Vols. xxix. and xxx. of the *Sacred Books* contain translations of the most important ones. The proper subjects of these rules are the "sacraments" (*saṁskāras*—such as name-giving, investiture with the sacred cord, marriage) and the "simple sacrifices" (*pāka-yajñas*) of the householder.

There is a third class of Sūtras, called *Dharma-sūtras*, which prescribe rules for the everyday life of those who would conform to the example of the virtuous, and of which the legitimate subjects are much more varied than those of the Gṛhya-sūtras. They embrace all sorts of injunctions and restrictions relating to etiquette, to eating and sleeping, to purification and penance, and to the details of the daily life of the student and householder and hermit, and even extend to the duties of the king and to the beginnings of civil and criminal law. The most important Dharma-sūtras are Englished in vols. ii. and xiv. of the *Sacred Books*. Out of these were developed the *Dharma-çāstras* or metrical law-books like those of MANU (*q. v.*).

These Sūtras embody the *Kalpa* or "ceremonial," and constitute one of the six classes of works which have to do either with the conservation and interpretation of the Vedic texts or else with their practical application; and they are accordingly styled *Vedāṅgas*, "limbs or members of the Veda." Their names are enumerated in the memorial verse,

çikṣā kalpo vyākaraṇaṁ niruktaṁ chando jyotiṣam,

that is, "phonetics, ceremonial, grammar, etymology, metrics, astronomy." The above are the principal general divisions of the Vedic literature.

4. *The Rigveda* is, of the several collections, the most im-

portant. It consists of 1,017 hymns, each containing on an average about ten double lines, so that the text is somewhat less than that of the two Homeric poems together. Its more significant division is into books, hymns, and stanzas (*maṇḍala*, *sūkta*, *ṛc*). There are ten books. Of these, books ii.–viii. are called "Family-books," as containing each the hymns ascribed to a single family or clan in which they doubtless originated and by which they were handed down as a sacred inheritance. Thus book iii. contains the hymns of Viçvāmitra and his tribe; book vii., those of Vasishtha; and so on, the names being those of the most famous sages or eponym heroes of Indic antiquity. The hymns of book ix. are addressed to the deified drink Soma. The tenth comprises hymns ascribed to very different authors, while the first consists of fifteen groups, each attributed to some ancient poet-sage. The soma is the juice of a plant believed to be of the milkweed family, and now classed as *Sarcostemma brevistigma*; and the Soma sacrifice appears to have been an exceedingly important feature of the Vedic religion. Certain principles of arrangement within the books are discernible: thus in books ii.–vii. the hymns to the fire-god Agni (*ignis*) come first; then those to Indra, the Jupiter Pluvius; and so on. The oldest hymns may have originated as early as 1200 or 1500 B. C., but it is not feasible to assign a precise date. Geographically, the early Vedic Aryans may be referred to the land of the Punjaub and Indus. Their religion is a worship of the anthropomorphized forces of nature, and is in many ways most instructively primitive. The best works on this subject are E. W. Hopkins's *The Religions of India* (Boston, 1895) and H. Oldenberg's *Die Religion des Veda* (Berlin, 1894).

The Brāhmanas of the Rigveda are the *Aitareya* and the *Çāṅkhāyana* or *Kāuṣītaki*; and each of these is supplemented by an Aranyaka of similar designation; and part of each Aranyaka forms an Upanishad (translated, *Sacred Books*, vol. i.). To this Veda further belong Açvalāyana's Çrāuta-sūtra and Çāṅkhāyana's Çrāuta-sūtra, both edited in the *Bibliotheca Indica* (Calcutta): and also Açvalāyana's Gṛhya-sūtra and Çāṅkhāyana's Gṛhya-sūtra, edited and translated, the first by A. F. Stenzler, and the second by H. Oldenberg.

5. *The Sāmaveda* is a Veda of *sāmans*. A Sāman is properly a tune, not a text; but the word *sāman* came to be used of the text to which a given tune was sung, a stanza of the Rigveda modified for chanting. Of the 1,549 stanzas of the Sāmaveda (edited and translated by T. Benfey, Leipzig, 1848), 1,474 occur also in the Rigveda.

6. *The Black Yajurveda* belongs to the period of the highly developed ritual. At least five schools of the older Yajurveda possessed special Sanhitās, of which four are extant. Of these, the *Tāittirīya* has been published by A. Weber (Berlin, 1872) and the *Māitrāyaṇīya*, by L. von Schröder (Leipzig, 1881–86). In all these older texts sacred formulas are confusedly mingled with prose passages. To remedy this confusion a new school, called Vājasaneyins, arranged a Sanhitā of "clear formulas," that is of formulas clear of Brāhmana passages. The word for "clear" (*çukla*) means also "bright" or "white"; and it is perhaps with reference to this double meaning that the older Yajus texts were called "Dark" or "Black." The Brāhmana of the White Yajurveda or *Vājasaneyi-Saṁhitā* is the *Çatapatha*, much of which has been Englished by J. Eggeling, *Sacred Books*, vols. xii., xxvi., and xli. *Saṁhitā*, *Brāhmaṇa*, and *Çrāuta-sūtra* (Kātyāyana's) have all been published by A. Weber (Berlin, 1852–59).

7. *The Atharvaveda* Sanhitā, as compared with that of the *Rigveda*, represents a lower plane of life and thought. It contains magic incantations for the warding off of the most diverse malign influences, and prayers and charms for success in the various affairs of life, as love, gaming, quarrels, journeys, etc. The text was published by Roth and Whitney (Berlin, 1856), and Whitney has left the manuscript of a translation, in course of publication (1895) in Lanman's *Harvard Oriental Series*.

8. *Vedic Bibliography.*—The first complete edition of the Rigveda was issued by T. Aufrecht in Roman letters (Berlin, 1861–63; 2d ed. Bonn, 1877). Max Müller's great six-volumed quarto edition, in Nāgarī letters, with native commentary, etc., was begun in 1849 and completed in 1874 (London). A new edition of this in four volumes quarto was issued in 1892 (London). Octavo editions, also in Nāgarī, were issued by Müller in 1873 and 1877. The greatest achievements in Vedic exegesis are those made by Roth, and contained chiefly in the St. Petersburg lexicon. H. Grassmann has published a *Wörterbuch zum Rigveda* (Leipzig, 1875), and a complete translation (Leipzig, 1877). For a succinct sketch of the Vedic literature, with numerous references to other sources of information, see A. Kaegi's *Rigveda* (Englished by R. Arrowsmith, Boston, 1886), notes 1–26, or Lanman's *Sanskrit Reader*, pp. 352–59.

B. The Classical Period. 1. *Epos.*—The most important works of this period are the great epics. These are treated separately. See Mahā-bhārata and Rāmāyana.

2. *The Purāṇas.*—These are pseudo-historical works, often in prophetic tone, and in metrical form. Their name means "old," but the extant Purāṇas are held to be not over a thousand years old. The *Bhāgavata-Purāṇa*—or most of it—was published and translated by E. Burnouf (Paris, 1847). Of the *Viṣṇu-Purāṇa*, H. H. Wilson gave an analysis and translation (2d ed., enriched with notes, by Fitzedward Hall, 6 vols., London, 1864–77). Of this and other Purāṇas, as the *Agni-Purāṇa*, the *Mārkaṇḍeya-Purāṇa*, there are cheap Hindu editions. The *Viṣṇu* treats of the evolution and dissolution of the universe, of the *yugas* or ages, of mythical geography, the heavenly bodies, and the origin of the castes; gives many ancient legends, accounts of the Vedic literature, the dynasties of kings, the history of the god Krishna, etc. The Purāṇas are in fact a kind of encyclopædic digest of Indic knowledge, but in many ways quite untrustworthy.

3. *The Artificial Epics.*—These are called *Kāvyas*, and the oldest are referred to the fifth or sixth century of our era. They take their material from the great popular epics, but can never themselves have been popular, since only the learned could understand them. In them the epic element gives place more or less to the lyric and descriptive, and they are often not without real poetic merit and genuine feeling. There are six of them that the Hindus call "great Kāvyas"; and among the six the most noted are the *Raghuvaṅça*, or "The Ancestry and Deeds of Rāma," and the *Kumāra-sambhava*, or "Birth of the War-god," both ascribed to the famous Kālidāsa, and both edited and translated by A. F. Stenzler, the latter translated also by R. T. H. Griffith into English verse. See especially the masterly fifth canto.

4. *The Drama.*—The real beginnings of the drama may be seen in the Rigveda, where there are not a few hymns in the form of genuine dramatic dialogue. In the Mahābhārata, too, are passages of similar character. And the public recitations of the epics were in fact really dramatic performances. The earliest direct allusion to this subject is made by Pāṇini, probably in the fourth century B. C., who speaks of "rules for actors" (*naṭa-sūtras*). The word *naṭa*, with many derivatives, including *nāṭya*, Anglo-Indian *nautch*, and *nāṭaka*, "drama," comes from the root *nart* or *nṛt*, "to dance," and perhaps warrants the inference that the Hindu drama originated in pantomime. From the statement of Patanjali (about 143 B. C.), who mentions the slaying of Kansa by Krishna as a subject of dramatic representation, it would seem that the oldest performances were of a kind like to the mediæval mysteries. There has been much debate (A. Weber, E. Windisch) as to whether the Greek drama influenced that of the Hindus. The question is unsettled. The Hindu play is divided into acts, with benediction in place of a prologue, with prelude and with interacts; and it is peculiar in that the women and inferior characters speak not Sanskrit but Prākrit. The dialogue is in prose, with lyrics interspersed. Lévi enumerates the titles of some 375 dramatic works; of the extant dramas hardly more than fifty are of considerable literary value.

The *Mṛcchakaṭikā*, or "Earthen Toy-cart," is held to be the oldest. It is ascribed to King Çūdraka, and the scene is laid at Ujjain. It is a love-story with political underplot. The Sanskrit work most famous as literature is the *Çakuntalā* of Kālidāsa (about 550 A. D. ?). For this and his dramas *Vikramorvaçī* and *Mālavikā*, see Kālidāsa. To Çri Harshadeva—apparently the King of Kanauj at the time of Hiuen-tsang (*q. v.*), about 630 A. D.—are ascribed the *Ratnāvalī* and the *Nāgānanda*. Bhavabhūti is said to have flourished at this same court of Kanauj about 700 A. D. He was author of the *Mahāvīra-carita*, or "Life of the Great Hero," and *Uttara-rāma-carita*, or "Later Life of Rāma," which together form a dramatized version of the Rāmāyana, and of the *Mālatī-mādhava*, a domestic drama. These are held in high esteem by the Hindus, but Bhavabhūti, as compared with Kālidāsa, is more artificial, more under bondage to the rules of the writers on dramatic composition. Bhaṭṭa Nārāyaṇa's *Veṇī-saṁhāra*, or "The Seizing of the

Hair-braid," is a dramatization of part of the story of the MAHĀ-BHĀRATA (*q. v.*), including the scene where Draupadī, having been lost at dice by her husband Yudhishṭhira, is rudely seized by one of the Kuru princes and dragged by the hair. The *Mudrā-rākṣasa* of Viçākhadatta is a political intrigue piece connected with the most famous period in ancient Indic political history, the time of Chandragupta or Σανδράκοττος, 315–291 B. C. The *Prabodhacandrodaya*, or "Rise of the Moon of Intelligence," is an allegorical philosophical drama, "the reconciliation of science with faith." Its characters are the Primal Spirit, Reason, Activity (Reason's wife), Faith, Peace (her daughter), Hypocrisy (as a Brahman), etc., as in the old Moralities or in Bunyan.

For translations and abstracts of the principal plays, see H. H. Wilson's *Theatre of the Hindus* (2 vols., London, 1871). Sylvain Lévi's *Le théâtre indien* (Paris, 1890) is a very full account of the native dramatics and of the history of the Sanskrit drama, and gives an abundant bibliography. See also Monier-Williams, *Indian Wisdom*, lecture xv.

5. *Lyric, Descriptive, and Didactic Poetry.*—Lyrics are found interspersed in the dramas. Religious lyrics occur in the Purāṇas, e. g. the verses chanted by Earth in the *Viṣṇu-Purāṇa* (bk. iv., chap. xxiv.). The *Megha-dūta*, or "Cloud-messenger," of KĀLIDĀSA (*q. v.*), and his *Ṛtu-saṁhāra*, or "Seasons," are the most famous descriptive poems. In the former, a demi-god in exile sends to his wife in the Himālaya a love-message by a cloud, whose journey across India is described. The Sanskrit is rich in didactic poetry, mostly in epigrammatic form—proverbs and moral maxims. The oldest collection is ascribed to Chandragupta's minister Chāṇakya. A most admirable collection of over 7,600 has been made by O. Böhtlingk, *Indische Sprüche* (St. Petersburg, 1870–73), with critical text, German translation, and bibliography. Excellent collections are published in India: notable is K. P. Parab's *Subhāṣita-ratna-bhāṇḍa-āgāra*, or "Treasure-house of the Jewels of Bons-mots" (over 10,000 —Bombay, 1886).

6. *Fables and Narratives.*—Based on the common Indic stock of folk-lore are the Buddhist Jātakas (see PĀLI LITERATURE), and the famous beast-fables contained, for example, in the PANCHATANTRA (*q. v.*) and Hitopadeça. For an account of the latter works, see Lanman's *Sanskrit Reader*, pages 310–316. The best collection of stories, fairy tales, and the like, is the *Kathā-sarit-sāgara*, a recast by the Kashmirian poet Somadeva, about 1070 A. D., of Guṇādhya's *Bṛhatkathā* of the sixth century. (See *Sanskrit Reader*, pages 331–334.) Text of Somadeva, by K. P. Parab (Bombay, 1889); complete translation by C. H. Tawney in the *Bibliotheca Indica* (Calcutta, 1884). We may mention also Daṇḍin's *Daçakumāra-carita*, or "Adventures of the Ten Princes"; text by Bühler and Peterson (Bombay, 1887 and 1891); Englished by P. W. Jacob in *Hindoo Tales* (London, 1873).

7. *Law.*—The genetic relations of the law books to the Vedic literature were explained above. The Dharma-sūtras were prose rules, apparently intended to be learned outright and to be explained by the teacher. Scattered among them are occasional brief metrical passages, a kind of easily remembered *regulæ juris*. These couplets, it would seem, proved so convenient to the schools that their use was extended until they covered all the subjects of the older prose treatises and eventually displaced them. These metrical recasts of the Dharma-sūtras are called *Dharma-çāstras* or *Smṛtis*. The principal one is the *Mānava-dharma-çāstra*, either the "Law Book of the Mānavans" or the "Laws of Manu." A full account of the best recent opinion on their history, with bibliography, is given in *Sanskrit Reader*, pages 340–345. The best text edition is J. Jolly's (London, 1887); English translations by Burnell and Hopkins (London, 1884); and by G. Bühler, *Sacred Books*, vol. xxv. Next to Manu in importance is Yājñavalkya; text and translation by A. F. Stenzler (Berlin, 1849). The comment thereon, called *Mitākṣarā* (translated by H. T. Colebrooke), is a comprehensive, important, and highly esteemed work. The *Viṣṇu-smṛti* and the *Nārada-smṛti* were edited by Jolly, and translated by him, *Sacred Books*, vols. vii. and xxxiii.

8. *Philosophy.*—The orthodox systems are six: SĀNKHYA and YOGA; (*Pūrva-*) MĪMĀṄSĀ and *Uttara-mīmāṅsā* or VEDĀNTA; NYĀYA and VAIÇESHIKA. (See the articles under the above headings.) An admirable conspectus of the systems (except Vedānta) is given by the *Sarva-darçana-saṁgraha*, or "Summary of all the Systems," edited in the *Bibliotheca Indica* (1858), and translated by E. B. Cowell and A. E. Gough (London, 1882). This also deals with the "heretical" systems of the Chārvākas, or materialists, and of the Buddhists and Jains. For further details, recourse may be had to H. T. Colebrooke's *Essays*, vol. i. (London, 1873), and to Paul Deussen's *Allgemeine Geschichte der Philosophie* (Leipzig, 1894).

9. *Grammar, Lexicography, etc.*—The conservation of the meaning and precise form of the sacred Vedas turned the attention of the Hindus at an early date to grammatical studies. We still have ancient collections of synonyms and hard words (γλῶσσαι), called *Nighaṇṭavas*, the oldest Vedic glossary; and to the ancient sage Yāska is ascribed a comment thereon called *Nirukta* (ed. by R. Roth, 1852), the oldest extant work of formal Vedic exegesis. Even this acknowledges a number of predecessors. PĀṄINI (*q. v.*) and Patanjali (the author of the *Mahā-bhāṣya*, or "Great Comment" on Pāṇini) represent the culmination of Indic grammatical science. Lexicography was sedulously cultivated by the ancient Hindus, although, strange to say, the simple idea of alphabetic arrangement was never made use of by them. The most famous dictionary is the *Amara-koça* (ed. by A. Loiseleur-Deslongchamps, 1845). For an account of native lexicography, see H. H. Wilson's *Essays*, vol. iii. For metrics, see A. Weber, *Indische Studien*, vol. viii.

10. *Rhetoric, Music, Mathematics, etc.*—One of the most important works on poetics, the *Kāvyādarça*, was edited and translated by Böhtlingk (Leipzig, 1890). The *Sāhityadarpana*, or "Mirror of Composition," was edited and translated in the *Bibl. Indica*. Respecting music, see Sourindro Mohun Tagore's *Hindu Music* (Calcutta, 1875). For their arithmetic and algebra, the reader may consult H. T. Colebrooke's *Algebra, with Arithmetic and Mensuration from the Sanskrit* (London, 1817), and his *Essays*, vol. ii. For their astronomy, see W. D. Whitney, *Journal of the Am. Oriental Society*, vol. vi., and his *Oriental and Linguistic Studies*, 2d series (New York, 1874). Of the oldest medical treatise, *Caraka-saṁhitā*, a translation is now appearing in Calcutta.

GENERAL BIBLIOGRAPHY.—Collected *Essays* of H. T. Colebrooke and of H. H. Wilson and of W. D. Whitney (*Oriental and Linguistic Studies*, 2 series); A. Weber's *History of Indian Literature* (English, London, 1882); Monier-Williams's *Indian Wisdom* (London, 1876); L. von Schröder's *Indiens Literatur und Cultur* (Leipzig, 1887); Sylvain Lévi's *Le théâtre indien* (Paris, 1890); John Muir's *Original Sanskrit Texts . . . Collected, Translated, and Illustrated* (5 vols., London, 1868–84); the literary historical introductions contained in the notes to Lanman's *Sanskrit Reader*; Theodor Aufrecht's *Catalogus catalogorum* (Leipzig, 1891); E. Haas's *Catalogue of Sanskrit and Pali Books in the British Museum* (London, 1876; continued by C. Bendall, 1893).

CHARLES R. LANMAN.

Sanson, saăn'sōn', NICOLAS: cartographer; b. at Abbeville, France, Dec. 20, 1600; was teacher of geography to Louis XIII., afterward royal geographer, and prepared a great number of maps of the Roman empire, etc. D. in Paris, July 7, 1667. His two sons, Adrien (d. 1708) and Guillaume (d. 1703), succeeded him as royal geographers, and after them followed his grand-nephew, Robert de Vaugondy.

Santa Ana: a city of Salvador; 36 miles W. N. W. of San Salvador (see map of Central America, ref. 4–E). It is nearly or quite equal to the capital in importance, is the center of the finest agricultural region in the republic, and controls most of the sugar-trade. Santa Ana is on the high road from San Salvador to Guatemala, and is connected with the port of Acajutla by railway. Pop. about 22,000. The volcano of Santa Ana, or Lematepec, 11 miles S. W., is one of the highest in Salvador (6,614 feet), and has recently been in eruption.

H. H. S.

Santa Ana: city; capital of Orange co., Cal.; on the S. Pac. and the S. Cal. railways; 6 miles S. of Anaheim, 33 miles S. E. of Los Angeles (for location, see map of California, ref. 12–G). It is in a rich fruit-growing and wine-making region, and contains 13 churches, 5 public and 2 private schools, business college, a national bank with capital of $150,000, 2 State banks with combined capital of $120,000, and a daily and 4 weekly newspapers. The city was founded in 1869. There are extensive peat-beds in the vicinity. Pop. (1880) 711; (1890) 3,628; (1900) 4,933.

EDITOR OF "BLADE."

Santa Anna, originally **Santa Ana**, ANTONIO LOPEZ, de: general and politician; b. at Jalapa, Mexico, Feb. 21, 1795. He entered the Spanish army as a cadet in 1810, served against the early revolutionists, and attained the rank of captain. In 1821 he supported Iturbide, swearing allegiance

to him as emperor; but later he went over to the republicans, and by heading a revolt at Vera Cruz Dec. 2, 1822, was the chief instrument of Iturbide's downfall. During the presidency of Guadalupe Victoria, 1824–28, Santa Anna lived in retirement; but the political struggles of 1828 brought him again into prominence. By a pronunciamento in favor of Guerrero he materially aided him to attain the presidency, and was rewarded by high commands in the army. In 1829 he was sent against the Spanish army, which had invaded Mexico under Gen. Barradas; the latter was forced to capitulate at Tampico Sept. 11, and this success added immensely to Santa Anna's popularity. In 1832 he headed the revolt by which Bustamante was overthrown and Gomez Pedraza, the constitutional president, was restored for the remainder of his term. Santa Anna himself became a presidential candidate, and was elected for the term beginning Apr. 1, 1833. He assumed the executive only at intervals and for short periods. At first the chair was occupied by Vice-President Gomez Farias, an enlightened statesman who instituted many reforms. These excited violent opposition in the Church and army, secretly fomented by Santa Anna, who, whenever he acted as president, posed as the champion of religion and order. By such intrigues he obtained the support of the reactionists, had Farias banished in 1835, abolished the federal constitution, and became practically dictator, though commonly acting through vice-presidents who were his subservient tools. Texas seceded in 1836. Santa Anna marched against the rebels, stormed the Alamo, and massacred its garrison Mar. 6, 1836, but was defeated and captured by Houston at the battle of San Jacinto Apr. 21–22. To obtain his release he recognized the independence of Texas in a treaty which was repudiated at Mexico; all his popularity was lost, and when he returned to Jalapa he signified his intention of retiring to private life. The French invasion of Vera Cruz in 1838 brought him out again; he was given command of the army, defeated the French Dec. 5, and, having lost a leg in the engagement, became at once a popular hero and martyr. In 1839 he supported Bustamante against the federalist revolts, and was for a short time acting president. In 1841, partly by intrigue and partly by open rebellion, he deposed Bustamante and caused himself to be chosen president with dictatorial powers, increased by the new constitution of June 12, 1843. This led to fresh revolts. In Dec., 1844, his opponents seized the capital during his absence; he was defeated, captured, and banished, taking up his residence in Havana. Fresh changes brought his party again into power; he was recalled in 1846, and in December of that year was again elected president, but, as usual, only assumed the executive at intervals. During the war with the U. S. he commanded the Mexican army, and was repeatedly defeated by Taylor and Scott (see TAYLOR, ZACHARY, and SCOTT, WINFIELD); after the capture of Mexico he resigned and left the country. In 1853 he was recalled by a conservative revolution, was made acting president, and on Dec. 16, 1853, declared himself perpetual dictator, with the title of supreme highness. But the liberals, under Alvarez and Comonfort, speedily excited a civil war. After a vain attempt at conciliation Santa Anna fled from the capital Aug. 9, 1855, and soon left the country. In his absence he was tried and condemned for treason and his estates were confiscated. He was never again prominent in Mexican affairs, though he kept up a series of intrigues in the U. S. and elsewhere, and vainly offered his services to the French invaders and to Maximilian. In 1867 he made an attempt to enter the country, but was captured and exiled. After the amnesty of 1874 he returned, but lived in obscurity. D. at Mexico, June 20, 1876. HERBERT H. SMITH.

Santa Bar'bara: city; capital of Santa Barbara co., Cal.; on Santa Barbara channel, and the S. Pac. Railroad; 14 miles E. of Elwood (for location, see map of California, ref. 11–D). There is regular steamer communication with San Francisco, San Diego, and San Pedro. Santa Barbara is in a sheltered nook of the shore, is protected on the N. by the Santa Ynez Mountains, and from its dry, equable climate has become one of the most noted midwinter health resorts on the Pacific coast. The temperature ranges from 50° to 55° in winter, and from 65° to 70° in summer. The city has beautiful surroundings, with luxuriant roses and tropical plants, many attractive residences, a Spanish and a Chinese quarter, and an excellent bathing-beach. There are a public high school, primary and grammar schools, St. Vincent's School, manual-training school, free kindergarten, collegiate school, commercial college, College Hospital, 2 national banks with combined capital of $200,000, 2 State banks with capital of $60,000, 3 libraries (Public, Franciscan Mission, and Natural History), and 2 daily and 3 weekly newspapers. The Spanish Mission, founded by Junipero Serra in 1786, is within a mile of the city; it includes a church with two towers, a refectory, a dormitory, and a garden, and is still in charge of Franciscan monks. Other points of interest are the springs containing sulphur, sulphuretted hydrogen, iron, alumina, and potash; the Parra Grande, or great grapevine, which annually yields about 8,000 lb. of fruit, at Montecito, 4 miles distant; and numerous avenues of magnolias, bananas, and date-palms, fields of pampas grass, groves of walnut, orange, prune, olive and loquat trees, and interesting Chinese vegetable gardens. The city is in an agricultural and stock-raising region, and has large wool, olive oil, asphaltum, petroleum oil, and fruit-growing interests. It has received the popular name of the American Mentone. The harbor was first visited by Sebastian Vizcaino in 1603. The presidio established by Gov. Felipe Neve in 1782 was maintained till the arrival of Gen. Frémont. Pop. (1880) 3,460; (1890) 5,864; (1900) 6,587.
G. E. THURMOND.

Santa Cathari'na: an island of the state of Santa Catharina. It is 34 miles long by 3 to 5 miles wide, and is separated from the mainland by a channel which forms an excellent harbor. The surface is partly hilly. On the western side is the capital of the state, sometimes called Santa Catharina, but properly DESTERRO (*q. v.*). H. H. S.

Santa Catharina: a maritime state of Brazil, bounded by Paraná, the Atlantic, Rio Grande do Sul, and the Argentine Republic. Area, 28,627 sq. miles. A low coast belt lies between the ocean and the Coast Range, which here rises to 5,000 or in parts to 6,500 feet. This range is succeeded by an irregular plateau which falls gradually westward. The coast belt and mountains are covered with forest, araucaria predominating above 3,000 feet. The plateau is occupied in part by open grass-lands, in part, especially toward the W., by tracts of forest. The principal rivers are the Pelotas or upper Uruguay, on the southern boundary; the Iguassú, a branch of the Paraná, on the northern boundary; and the Itajahy, flowing to the Atlantic. The climate is essentially tropical on the coast, temperate on the plateau. Santa Catharina, though it has a fertile soil and other natural advantages, has developed very slowly. Agriculture and grazing are almost the only occupations. There are considerable agricultural colonies of German and Italian immigrants. A little coal is mined. Pop. (1888) estimated, 236,346. H. H. S.

Santa Clara: town (founded in 1852, received new charter in 1867); Santa Clara co., Cal.; on the S. Pac. Railroad; 3 miles W. by N. of San José, and 48 miles S. S. E. of San Francisco (for location, see map of California, ref. 8–C). It is in the center of the beautiful and rich agricultural valley from which the town takes its name, and contains a State bank with capital of $125,000, a public high school, Santa Clara College (Roman Catholic, opened in 1851), Academy of Our Lady of Angels (Roman Catholic), convent school, a library, and two newspapers. The University of the Pacific (Methodist Episcopal, opened in 1852) is about midway between Santa Clara and San José. Pop. (1900) 3,650.

Santa Clara, Cuba: See the Appendix.

Santa Cruz, or **St. Croix**: an island of the Danish West Indies; in the Virgin islands group; 37 miles S. of St. Thomas. Area, 83 sq. miles. The surface is hilly, with considerable plains near the coast; the soil is fertile and well watered. Sugar and rum (known as Santa Cruz rum) are the principal products and exports. The common language is English. Santa Cruz was discovered by Columbus in 1493, was occupied in turn by Spanish, English, and French adventurers, and was sold by the French to a Danish company in 1733. Chief town, CHRISTIANSTED (*q. v.*). H. H. S.

Santa Cruz: a territory of the Argentine Republic; occupying the southern part of Patagonia S. of lat. 46° S., and bounded S. and W. by Chili. Area, 111,000 sq. miles. The greater part is a terraced plateau, which, especially near the Andes, contains good pasture-land. Some of this has been taken up by sheep-farmers, but the civilized population does not exceed 2,000. There are a few roving Indians, who sell guanaco-skins to the traders. Capital, Gallegos. The Santa Cruz river, from which the territory takes its name, has its sources in several beautiful lakes on the western slope of the Andes; it is navigable for small craft, and its estuary forms the port of Santa Cruz. H. H. S.

Santa Cruz: an eastern department of Bolivia, bordering on Brazil. Area, 126,317 sq. miles. Spurs of the Andes, and plateaus or terraces bordering them, occupy a comparatively small area in the western part; all the rest is a plain, varied only by a few hills and including in the eastern part portions of the flood-plains of the river Paraguay, which flows just beyond the frontier. Most of the drainage, however, is northward to the Mamore and Guaporé. The plains have few inhabitants except Indians, and are very imperfectly known; they include considerable tracts of forest and great areas of open land known as the llanos de Chiquitos, from the Chiquitos Indians. A little-used road crosses to the Brazilian frontier. The civilized population is gathered in the mountain region, which has a rich soil and valuable gold mines. Pop. 97,185. Capital, Santa Cruz de la Sierra.
HERBERT H. SMITH.

Santa Cruz: city; capital of Santa Cruz co., Cal.; on Monterey Bay, at the mouth of the San Lorenzo river, and the Southern Pacific Railroad; 75 miles S. of San Francisco (for location, see map of California, ref. 8–C). The surface rises gradually from the sea in circling plateaus, covered with handsome villas, to the mountains, which shelter the city from the N. winds. With an average winter temperature of 55° and summer temperature of 62°, a magnificent bathing-beach, attractive drives of 10 miles along the sea-cliffs, and good roads through mountain scenery to the famous Big Tree grove, 5 miles distant, Santa Cruz is a favorite health resort all the year. The San Lorenzo river and its branches are spanned by eight bridges within the city limits, and furnish fresh-water bathing and boating-places. The city has bitumen-covered streets, a public park of 200 acres overlooking the city and bay, several public plazas, water-works, electric-light plant, street railways (operated in part by electricity), and several large hotels. There are 14 churches, 7 public-school buildings with 1,500 pupils, public-school property valued at $136,400, School of the Holy Cross (Roman Catholic), a business college, and a Free Public Library containing 15,000 volumes. The banking interests comprise 6 State banks for savings and loans, with a combined capital of $302,000; the industrial establishments include tanneries, foundries, soap and glue works, and planing-mills; and the trade reports show large shipments by rail and water of powder, lime, and bituminous rock. There are 3 daily, 3 weekly, and 2 monthly periodicals. In 1895 the city had an assessed property valuation of $12,200,000. The city is built on the site of the Santa Cruz Mission, founded by the Spaniards in 1791. Pop. (1880) 3,898; (1890) 5,596; (1900) 5,659. LUCY UNDERWOOD MCCANN.

Santa Cruz (Span. pron. saan'tăă-krooth'), ANDRES: general and politician; b. at La Paz (now in Bolivia) about 1794. He was of mixed white and Indian blood. He entered the Spanish army and attained the rank of colonel; but being captured by the patriots in Dec., 1820, went over to them, rose to be general, and led an invasion of Upper Peru in 1823. Under Bolivar he was acting president of Peru from Sept., 1826, to June, 1827. Gen. Sucre, president of Bolivia, having been deposed, Santa Cruz was elected president of that republic for the term of ten years beginning Jan. 1, 1829; at the same time he received the military title of grand marshal. His internal policy was progressive and the country was very prosperous; but almost from the first he conceived the idea of uniting the Pacific coast republics. Peru at this time was agitated by civil wars, and there were several claimants to the presidency. Orbegoso, who had been deposed, appealed for aid to Santa Cruz, who marched into the country (1835), successively defeated Gamarra and Salaverry, and in Oct., 1836, proclaimed the Peruvian-Bolivian confederation. This consisted of the states of North Peru, South Peru, and Bolivia, each with a president, Santa Cruz himself being the chief executive, with the title of protector. His execution of Salaverry excited general horror. A Chilian army invaded Peru, and after many months of fighting Santa Cruz was finally defeated at the battle of Yungay, Jan., 1839. He resigned and left the country, and the confederation was at once dissolved. Santa Cruz subsequently held diplomatic posts for Bolivia in Europe, a politic means of keeping him out of the country. D. at St.-Nazaire, France, 1865. HERBERT H. SMITH.

Santa Cruz de la Sierra: capital of the department of Santa Cruz, Bolivia; on a tributary of the Guapay, or upper Mamore. As its name indicates, it was originally founded in the highlands, but was removed to its present site in the lowlands in 1590 (or 1575?). As the frontier town in this direction it has a considerable trade with Brazil and with the half-civilized Indians of the plains. Most of the men are engaged in trading, etc., at distant points; hence the permanent population (about 10,000) is largely composed of women. H. H. S.

Santa Cruz de Santia'go, or **de Teneriffe**: capital of the Canary islands; on the northeast coast of Teneriffe. It has an excellent harbor, making the city the chief commercial port of the islands. Wine, brandy, cochineal, tobacco, and agricultural produce are exported. The town and harbor are strongly fortified. Pop. of commune, 16,610.

Santa Cruz Islands: an archipelago of Melanesia, between the Solomon islands and the New Hebrides, between parallels 8° 31′ S. and 11° 40′ S., and meridians 165° E. and 168° E.; under British protectorate, but claimed by the French, and very little known. They consist of a dozen volcanic islands and many islets, with a total area of about 360 sq. miles, and an estimated population of 5,000. The largest island is the Santa Cruz or Nitendi, with an area of 215 sq. miles. The inhabitants present a mixture of the Melanesian and Polynesian types, the former prevailing, and differ much from island to island. They have uniformly proved hostile to visitors, and even missionaries have as yet got no foothold on the islands. MARK W. HARRINGTON.

Santa Fé, Span. pron. saăn'taă-fā': a province of the Argentine Republic; on the west side of the river Paraná; between Chaco on the N., Corrientes and Entre Rios on the E., Buenos Ayres on the S., and Córdoba and Santiago del Estero on the W. Area, 18,000 sq. miles. The surface is level, and the greater part is included in the open pampas, but in the north there are extensive forests. The climate is mild and healthful, and Santa Fé is one of the most favored provinces in being generally free from floods and droughts. Its progress, especially since 1864, has been wonderfully rapid, mainly owing to the influx of immigrants and the establishment of agricultural colonies. The level surface has facilitated the construction of a network of railways, and the Paraná is a safe channel for seagoing vessels. In the construction of public works a heavy provincial debt has been contracted, and the finances are in bad condition. Grazing and wheat-raising are the principal industries; maize, flax, lucerne, and, in the north, sugar-cane are largely cultivated. There are extensive flouring-mills and other manufactures. Pop. about 400,000, over one-third of foreign birth. ROSARIO (*q. v.*) is the principal city and river-port. Santa Fé, the capital, is on the Santa Fé river, an arm of the Paraná. It was founded in 1573, and has a thriving trade. The port does not admit large vessels, except when the river is flooded. Pop. about 25,000. H. H. S.

Santa Fé: city; capital of New Mexico and of Santa Fé County: on the Atch., Top. and S. Fé, and the Den. and Rio Grande railways, being the New Mexico terminus of the latter; 20 miles E. of the Rio Grande, 64 miles N. E. of Albuquerque (see map of New Mexico, ref. 10–S). Next to St. Augustine it is the oldest settlement in the United States. Among the old archives is found a census taken in 1605, which gives a population of 1,708 inhabitants. In the older portions of the city the streets are narrow and crooked, but in the modern portions they are wide and regularly laid out. Many of the buildings are of adobe, or sun-dried brick, but many new modern structures have been erected during the past 15 years. The principal open space is the plaza, containing a soldiers' memorial monument, and having on one side a long, one-story structure known as the Governor's Palace. The city is the seat of a Roman Catholic archbishop. It is in an agricultural, stock-raising, and mineral region, which contains gold, silver, copper, lead, zinc, coal, marble, a variety of building-stone, clay, and gypsum. The city has a national bank with a capital of $150,000, 3 libraries, and 1 daily and 4 weekly newspapers.

Public Buildings.—The Governor's Palace, built during the early Spanish *régime*, has been used continuously as the official residence of the chief executive, under whatever title and superior authority he has served. One end of it contains the quarters and priceless treasures of the New Mexico Historical Society, and the other the post-office. The capitol is an attractive building of cream-colored sandstone and pressed brick, and cost $200,000. Other buildings of note are the penitentiary (cost $150,000), New Mexico School for the Deaf and Dumb (opened 1885), U. S. Government building, county court-house, St. Vincent's Hospital, and a Roman Catholic orphan asylum.

Churches and Schools.—The oldest church in the city.

also said to be the oldest in the U. S., is San Miguel, built about 1605, destroyed by the Indians, and rebuilt in 1710. The cathedral of San Francisco, of light brownstone, is built around a former cathedral whose history dates back to 1622. The educational institutions comprise one high school and 4 ward schools, St. Michael's College (Roman Catholic), the Presbyterian Academy (opened 1881), Academy of Our Lady of Light (Roman Catholic), and a Catholic school for Indian boys and girls; also, a Government Industrial Indian School.

History.—In prehistoric times the place existed as an Indian pueblo or town. About 1605 it was occupied by the Spaniards, who gradually reduced the Indians to slavery and opened and worked the rich mines of gold, silver, turquoise, copper, and iron in south Santa Fé County. In 1680 the Indians revolted, expelled the Spaniards, closed up and obliterated all traces of the mines, and burned all the Spanish archives and church ornaments. The Spaniards under Vargas recaptured the pueblo in 1692, and the territory was held by Spain till 1821, when Mexico declared its independence. In 1846 U. S. troops under Gen. S. W. Kearny took possession of the city; in 1848 the territory was ceded to the U. S.; in 1851 Congress created the Territory of New Mexico, with Santa Fé as its capital. Pop. (1890) 6,185; (1900) 5,603. MAX. FROST, EDITOR "NEW MEXICAN."

Santa Fé de Bogotá: See BOGOTÁ.

Santala'ceæ: See SANDALWORTS.

Sant-Aldegonde: See MARNIX, PHILIPP, VAN.

Santal-wood, Sanders, or **Saunders**: the heart-wood of a tree, *Pterocarpus santalinus*, found in the East Indies, Ceylon, and Madagascar, and on the coasts of Coromandel and Malabar. It occurs in large billets, compact, hard, and of a dull murky red. Its coloring-matter is supposed to be similar to, if not identical with, that of barwood. It is only developed by age, and, while it is abundant in the trunks, is not found in the young branches. Weidel isolated two peculiar bodies from santal-wood: (1) *Santal* ($2C_8H_6O_3H_2O$), colorless crystals, tasteless, odorless, insoluble in water, bisulphide of carbon, benzene, and chloroform, and slightly soluble in alcohol and ether. Its alkaline solution is yellow, but becomes rapidly red in the air, and gives red precipitates with lime and baryta. Its alcoholic solution assumes a dark red with ferric chloride. He obtained 3 parts from 1,000 of wood. (2) *Santaline* ($C_{15}H_{14}O_5$), which is a magnificent scarlet, with a green metallic irideseence, is insoluble in water, slightly soluble in alcohol and ether, and imparts a reddish purple to alkaline solutions. Santal-wood is used chiefly on the Continent to give a bottom to woolen cloth to be subsequently dyed with indigo, yielding by this combination a fine blue (*bleu de Nemours*), which is purple blue by reflected light. It also imparts a dark red to woolen and cotton goods, which assumes a rich brown on passing through a bath of bichromate of potash; with sumac it gives a dark brown, with fustic a light brown. Revised by IRA REMSEN.

Santa Maria: a name for PUERTO DE SANTA MARIA (*q. v.*).

Santa Maria: town (settled in 1874); Santa Barbara co., Cal.; on the Santa Maria river, and the Pacific Coast Railway; 13 miles from the ocean, 31 miles S. of San Luis Obispo (for location, see map of California, ref. 10–D). It is in an agricultural, fruit-growing, and stock-raising region, and contains 4 churches, 3 public-school buildings (high school cost $15,000), 4 hotels, State bank with capital of $25,000, and 2 weekly newspapers. Pop. (1880) 300; (1890) 900; not returned separately in 1900.

Santa Maria, DOMINGO: statesman; b. at Santiago, Chili, Aug. 4, 1825. He graduated at the University of Santiago; was admitted to the bar in 1847; held minor Government offices, and early became known as a pronounced liberal. Being involved in the insurrection of 1851–52, he was banished for a year to Peru; was elected to congress on his return, and became widely known for his brilliant oratory; and during the political struggles of 1858–59 was again banished, traveling in Europe. President Perez recalled him, and made him Minister of Finance 1863–64. During the war with Spain he negotiated a treaty of alliance with Peru. In 1868 he was appointed judge of the Supreme Court. He supported the administration of President Pinto, was his Minister of Foreign Affairs and of the Interior, and finally Minister of War during the second year of the contest with Bolivia and Peru. His vigorous measures won him great popularity, and he was elected to succeed Pinto Sept. 18, 1881–Sept. 18, 1886. The war was brought to a successful end in 1883, and in the same year the Araucanian Indians were finally subdued. Subsequently he was president of the senate. D. at Santiago, 1890. H. H. S.

Santa Maria di Capua: See CAPUA.

Santa Marta: capital and port of the department of Magdalena, Colombia; on a bay of the northern coast; 40 miles E. N. E. of the mouths of the Magdalena (see map of South America, ref. 1–B). It was founded by Rodrigo de Bastidas in 1525, as the capital of the province of the same name, which corresponded in part to the modern department. During the colonial period it was very important as a port and center of conquest; Quesada, marching from this place, conquered the plateau of Bogotá. The town was repeatedly attacked by Indians, and taken and sacked by English and French corsairs; the ruins of the Spanish forts erected for its defense may still be seen. The harbor is one of the best on the coast; a short railway runs to Cienega, and (1895) is projected to Cerro de San Antonio on the Magdalena. Santa Marta is an episcopal see, and has a cathedral, seminary, hospital, etc. Pop. about 6,000. HERBERT H. SMITH.

Santa Marta, Sierra Nevada de: an isolated group of mountains in Northern Colombia (department of Magdalena), near the coast, and immediately S. E. of the town of Santa Marta. Brettes and Nuñez, who first scaled the highest peak in 1891, found it to be 17,018 feet above sea-level; other estimates make it higher. From the sea the snow-crowned summits present a magnificent sight. The group is completely separated from the Andean system, and has a different geological structure. H. H. S.

Santa Maura, saan'tăa-mow'răă, or **Leuca'dia**: one of the Ionian islands: formerly a peninsula, but since the seventh century B. C. separated from Western Greece by a strait about a mile wide. Area, 180 sq. miles. Pop. 25,000. Its history has been mainly that of the other IONIAN ISLANDS (*q. v.*). Hills traverse it from north to south, terminating in white cliffs, whence its ancient name *Leucas* (Gr. λευκός, white). One of these cliffs served as a place of execution of criminals. This is still called Rock of Sappho's Leap, from the tradition that the poetess and other unhappy lovers cast themselves hence into the sea. E. A. G.

Santa Mon'ica: city; Los Angeles co., Cal.; on the Pacific Ocean, and the S. Cal. and S. Pac. railways; 17 miles W. of Los Angeles, the county-seat (for location, see map of California, ref. 12–F). It is a popular summer resort, is engaged in ostrich-farming, lumbering, and milling, and contains one of the longest ocean wharves in the world (extending 4,700 feet into Santa Monica Bay), 7 churches, graded grammar and high school, public library, water-works, electric lights, 2 State banks with combined capital of $115,000, and a weekly newspaper. The Pacific branch of the National Home for Disabled Volunteer Soldiers is here. Pop. (1880) 417; (1890) 1,580; (1900) 3,057. EDITOR OF "OUTLOOK."

Santa'na, PEDRO: general and politician; b. at Hincha, Santo Domingo, June 29, 1801. He was a lawyer and wealthy landowner until 1844, when he headed the revolution by which the eastern part of the island became independent of Haiti; was president of the Dominican Republic, then formed, 1844–48; repulsed the invasion of Soulouque 1849; deposed Jimenes, and was president for a short time; was president by regular election 1853–57, and again defeated Soulouque in 1855 and 1856. After the deposition of Baez, Nov., 1858, Santana again assumed the presidency, but, despairing of bringing about order, he ceded the republic to Spain in Mar., 1861. He was appointed lieutenant-general in the Spanish army, and quelled an insurrection in Azua. D. at Santo Domingo, June 14, 1864. H. H. S.

Santander': capital of the province of Santander, Spain; on a promontory in an inlet of the Bay of Biscay, where a spacious and perfectly safe harbor is formed by two moles and provided with convenient quays and docks (see map of Spain, ref. 12–F). The surrounding hills are beautiful, covered with vineyards and forests, and rich in mineral springs and iron and copper ores. The rivers and the sea teem with fine fish. There are several good manufactories. Wheat and ores are the principal exports. Pop. (1887) 41,829.

Santander: an interior department of Colombia, on the east side of the river Magdalena; surrounded by Magdalena, Venezuela, Boyacá, Antioquia, and Bolivar. Area, 16,291 sq. miles. It is traversed by the Eastern Cordillera of the Andes, and two-thirds of the surface is essentially mountainous. Near the Magdalena and in the eastern part there are extensive plains. The river Sogamoso divides the

mountain region by a deep gorge, flowing to the Magdalena. The drainage of the northern part is to Lake Maracaibo. The soil, climate, and natural productions embrace nearly everything found in Colombia; but the roads are mere mule-tracks, and the difficulty of communication has prevented the development of the department. The principal occupation is agriculture, the most important crops being coffee, cacao, and tobacco. Gold, silver, emeralds, etc., are mined on a small scale. There is a considerable trade with Venezuela. Pop. (1885) estimated, 600,000. Capital, Bucaramanga. HERBERT H. SMITH.

Santander, FRANCISCO DE PAULA: general and statesman; b. at Rosario de Cúcuta, New Granada, Apr. 2, 1792. He was a student at Bogotá when the war for independence broke out in 1810; joined the patriots, and served through the subsequent campaigns; was with Bolivar in the llanos 1817–18; commanded an advance division in the invasion of New Granada, and, by his opportune union with the main army, enabled Bolivar to gain the victory of Boyacá Aug. 7, 1819. Santander was promoted general of division on the field, was appointed vice-president, or governor, of Cundinamarca, and on Sept. 7, 1821, was elected vice-president of Colombia under Bolivar. During the latter's campaigns in the south and Peru, 1822–27, he governed the republic with wisdom and energy, completely cleared it of hostile Spaniards, obtained the recognition of foreign powers, and sent more than 6,000 men to re-enforce the liberator. He was re-elected vice-president in 1827. After Bolivar's return in that year he led the federalist opposition to him, though he did not openly revolt; and when Bolivar assumed dictatorial powers in 1828 Santander was deposed. Soon after he was arrested and condemned to death on a charge (never proved) of conniving at an attempt to assassinate Bolivar. The sentence was commuted to banishment and loss of rank, and he went to Europe. In 1831, after the dissolution of the republic of Colombia, Santander's honors were restored, and he was invited to return. Before his arrival he was elected president of New Granada Mar. 9, 1832, and he held the post until the beginning of 1837. Subsequently he was an active member of congress. D. at Bogotá, May 5, 1840. Santander was one of the ablest statesmen of his country and time, and he is properly regarded as the founder of New Granada, the modern Colombia. H. H. S.

Santa Paula, -pow'lăă: town; Ventura co., Cal.; on the S. Pac. Railroad; 16 miles N. E. of San Buena Ventura, the county-seat, and 65 miles N. W. of Los Angeles (for location, see map of California, ref. 11–E). It is the center of a rich agricultural region, the place of residence of many of the wealthiest farmers in the Santa Clara valley, and a noted health resort. The valley is surrounded by mountains abounding in excellent water, petroleum, asphaltum, and valuable building-stone and timber. It has the largest bean-fields in the country (yielding an average of a ton per acre), prolific orange and lemon groves, and a great honey industry. The town contains 11 churches, 3 public-school buildings, a national bank with capital of $75,000, and 2 weekly newspapers. The principal industries are the refining of petroleum, and the manufacture from it of over fifty articles of commerce, the manufacture of printing-inks, the shipment of building-stone and asphaltum, and the drying of fruit and beans. Pop. (1880) 188; (1890) 1,047; township (1900) 3,583. EDITOR OF "CHRONICLE."

Santarem, săăn-tăă-reń': a town of the state of Pará, Brazil; on the river Tapajós, 3 miles above its junction with the Amazon (see map of South America, ref. 3–F). It is the most important river-port between Manáos and Pará; is the center of an agricultural and grazing district; and controls the rubber-trade of the Tapajós. Near it is an agricultural colony, partly composed of immigrants from the Southern U. S. Pop. about 9,000. H. H. S.

Santarem, MANUEL FRANCISCO DE BARROS E SOUSA, Viscount of: politician and historian; b. at Lisbon, Portugal, Nov. 18, 1791. His father was a courtier. He accompanied the royal family to Brazil in 1807, held diplomatic positions in Europe from 1814, and was minister of Portugal to Denmark 1819–20. From 1823 to 1827 he was director of the archives of Portugal. Under the regency and Dom Miguel he was Minister of State 1827–33. After the fall of Miguel he retired to Paris, where the remainder of his life was spent. His numerous works in French and Portuguese are rather collections of historical material than well-arranged histories, but they are very valuable. Among them are *Recherches sur Améric Vespuce* (1842); *Essai sur l'histoire de la cosmographie et de la cartographie pendant le moyen âge* (3 vols., 1849–52; continued by Mendes Leal); and *Quadro elementar das relações politicas e diplomaticas do Portugal* (10 vols. by Santarem; continued by Rebello da Silva). D. in Paris, Jan. 18, 1856. H. H. S.

Santa Ritta Durão, -rit'tăă-dŏŏ-rowń', JOSÉ, da: poet; b. near Marianna, Minas Geraes, Brazil, 1737. He studied in Rio de Janeiro and at Coimbra, and became Doctor of Theology at the University of Coimbra, Dec. 24, 1756. After a sojourn in Rome, where he made the acquaintance of his compatriot, Basilio da Gama, and felt powerfully the influence of the Italian poets, he became professor at Coimbra (before 1778). Here he pronounced an elegant and truly interesting Latin oration (*Josephi Durani, Theologi, Conimbricencis O. E. S. A. pro annua studiorum instauratione oratio* (Coimbra, 1778). Here also he wrote his epic, *Caramurú* (Lisbon, 1781), an account of the discovery and settlement of Bahia, by Diogo Alvares (called *Caramurú* by the aborigines.) The poem has been several times printed, but the best edition is in Varnhagen, *Epicos brasileiros* (Lisbon, 1845). D. in Lisbon, Jan. 24, 1784. A. R. MARSH.

Santa Rosa: city (located in 1854); capital of Sonoma co., Cal.; on the San. Fran. and N. Pac. and the S. Pac. railways; 51 miles N. of San Francisco (for location, see map of California, ref. 6–B). It is widely known for its roses, which bloom all the year in the open air, and is the center of a region peculiarly adapted to fruit-culture, hop and grain growing, hay-making, and dairying. The city is laid out on a site nearly level, with wide streets and broad sidewalks bordered with trees. There are nine churches; one, the Baptist, was built entirely from a single tree, a giant redwood from the Guerneville forest. The educational institutions comprise the public schools with 1,500 pupils, the Santa Rosa Seminary and the Ursuline Academy (Roman Catholic), the Santa Rosa Ladies' College (non-sectarian), and the Pacific Methodist College (Methodist Episcopal South, opened in 1861). The court-house is an imposing structure, and, with adjacent county buildings, cost $200,000. The city has an excellent gravity water-supply, gas-works, two electric-light plants, several flour-mills, and extensive fruit-drying and canning works. There are a national bank with capital of $150,000, 3 State banks with combined capital of $620,000, and 2 daily and 3 weekly newspapers. In 1894 the city had receipts of $40,318, and an assessed property valuation of $3,822,632. Pop. (1880) 3,616; (1890) 5,220; (1900) 6,673. JAMES W. OATES.

Santa Rosa de los Osos: a town of the department of Antioquia, Colombia; 26 miles N. N. E. of Medellin; on a plateau of the Andes; 8,560 feet above sea-level. It owes its importance to rich gold-deposits in the vicinity; there are over forty regular works, but the methods of washing are antiquated. The climate is cold for Colombia (mean, 57·7° F.), and very salubrious. Pop. (1892) 10,059. H. H. S.

Santa Rosali'a: city of Southern Chihuahua, Mexico; on the Mexican Central Railway; 325 miles S. of El Paso (see map of Mexico, ref. 3–E). It is celebrated for its hot sulphur springs, long known to be curative by the natives and much resorted to by invalids. They are especially useful in inflammatory rheumatism. Pop. estimated at 8,000. M. W. H.

Santa Tecla, or **Nueva** (noŏ-ā'văă) **San Salvador:** a town of Salvador; 8 miles S. W. of San Salvador; beautifully situated in a valley on the south side of the San Salvador volcano. After the destruction of San Salvador by the earthquake of 1854 an attempt was made to remove the population to this place, which was officially declared to be the capital in 1855. The latter arrangement was never carried out, but the newly founded city has prospered. Pop. (1890) 13,715. H. H. S.

Santee' Indians: See SIOUAN INDIANS.

Santee River: a stream formed in South Carolina by the union of Wateree and Congaree rivers. It is 150 miles long and is navigable throughout for steamboats. Its lower course is through pine-forests and low rice-lands. It reaches the Atlantic through the North and the South Santee.

Santerre, săăń'tăr', ANTOINE JOSEPH: revolutionist; b. in Paris, Mar. 16, 1752; was a brewer by trade, and acquired influence by his wealth and generosity. His brewery in the Faubourg Saint-Antoine became a frequent meeting-place for the Jacobins. As commander of a battalion of the national guard, he took part in the storming of the Bastile July 14, 1789, and played a conspicuous part in the riots of the Champ de Mars, the attack on the Tuileries (June 20,

1792), and the insurrection of Aug. 10. He was appointed commander-in-chief of the national guard of Paris, with the rank of general of division, and governor of the Temple during the imprisonment of the king, whom he escorted to the scaffold. In the summer of 1793 he was made a general of division and sent to the Vendée at the head of an army of 20,000 men, but was beaten at Coron Sept. 18, 1793; recalled and arrested as an Orleanist, he did not regain his liberty till after the fall of Robespierre. After this he withdrew into private life. D. Feb. 6, 1809. See Carro, *Santerre, sa vie politique et privée* (Paris, 1847).

Santi, saan'tĕe, Giovanni: painter; father of Raphael Sanzio; b. at Castello di Colbordolo, in the duchy of Urbino, Italy, about the middle of the fifteenth century. His master in painting is unknown, but he seems to have formed his style from that of Melozzo da Forlì and other great painters of his time. Giovanni Santi's best-known work is the fresco in the Dominican church at Cagli (1482). There is a *Visitation* at Fano, and a *Madonna with Saints* in Sta. Croce there. A *St. Jerome* in San Bartolo at Pesaro; an *Enthroned Madonna with Four Attendant Saints*, at the Pieve of Gradara; a *St. Sebastian*, in the oratory of that saint at Urbino, besides a votive picture of the Buffi family in the Franciscan church there, and a fresco of a *Madonna and Child* in Raphael's house in Urbino are recognized as Santi's work. The Brera at Milan and the National Gallery in London possess examples of his art. He was also a poet; a MS. in the Vatican Library (*Codex Ollobonianus*, 1305), consisting of 344 folio leaves in *terza rima* exists, celebrating the virtues of Duke Federigo di Monte Fettro, and is interesting, as it contains allusions to the artists of the time and Giovanni Santi's sentiments and opinions on art. D. in 1494. W. J. Stillman.

Santiago, or **Santiago de Chile**, săan-tĕe-aa'gō-dā-cheelā: capital and largest city of Chile; on a plain by the little river Mapocho; 68 miles E. S. E. of Valparaiso, its port (116 miles by rail); 1,755 feet above sea-level (see map of South America, ref. 8–C). It is the most populous city on the Pacific slope of America except San Francisco; is the center of Chilian wealth, fashion, and culture, and exhibits more luxury and taste in building than any other capital of South America. The situation, on the plateau called the valley of Chile, is very fine. The plain, naturally dry, has been improved by an elaborate system of irrigation which keeps the city gardens and parks always green. The snow-capped Andes, including the giant of the range, Aconcagua, are in plain view on the E., contrasting with the barren rocks of the Coast Range on the W. A single rocky hill, Santa Lucia, rises within the city limits, and has been transformed by private munificence into a beautiful park and pleasure-ground. The Alameda, a very wide street, crosses the city and is its main artery; it is ornamented by four rows of trees, with a central promenade and two driveways, and is set at intervals with statues, some of them spoils of the Peruvian war. Many of the finest public and private buildings and retail stores are on this street. The cathedral, municipal buildings, etc., face the old Plaza de Armas, now the Plaza de la Independencia. Among other public edifices may be mentioned the Hall of Congress, fronting a fine square, the mint, the opera-house, said to be the finest in America, and the Exposition Hall. Nearly all the better class of buildings are of stone, and many show great architectural taste. The residences are generally of two or at most three stories, and set in extensive grounds ornamented with orange-trees, etc.; for this reason the city occupies a very large area in proportion to its population. Dwellings are furnished with taste, often with great luxury. There are several public parks, and a well-stocked botanical garden. As a center of learning Santiago has a renowned university and various other institutions of higher education; a national library with 70,000 volumes and 40,000 manuscripts; a museum, academy of fine arts, observatory, etc. It is connected by railway with the northern and southern provinces, and with the coast. Commercially it yields in importance to Valparaiso. Santiago was founded by Valdivia, the conqueror of Chile, in Feb., 1541. Earthquakes are frequent, but have never been very destructive. The climate is changeable, ranging from 23·9° to 91·1° F. Pop. (1885) 189,332; (1895) 256,403. The province of Santiago, of which the city is also the capital, has an area of 5,223 sq. miles, and a population of about 425,000. Herbert H. Smith.

Santiago de Compostela, -dā-kom-pōs-tā'laă: city; in the province of Corunna, Spain; at the confluence of the Sar and the Sarela; 33 miles S. by W. of Corunna (see map of Spain, ref. 12–B). It is the see of an archbishop, and has a magnificent cathedral, a university, and several educational and religious establishments, from which it chiefly derives its importance. The cathedral is said to contain the bones of the patron of Spain, the apostle James. It was built in the eleventh century in the form of a cross, 270 feet long and 204 feet broad, and contains six naves formed by beautiful Gothic pillars. Before the Reformation this church was annually visited by great crowds of pilgrims, but the number of visitors has since decreased and the city decayed. There are manufactures of linen, silk, leather, and paper, and the vicinity is rich in cereals, vegetables, fruit, and wine. Pop. (1887) 24,302.

Santiago de Compostela: the name given to James (*q. v.*), the son of Zebedee, as the patron saint of Spain.

Santiago de Cuba, -dā-koo'băă, or simply **Cuba** (in old books often called *St. Jago de Cuba*): city; on a bay near the eastern end of Cuba (see map of West Indies, ref. 5–E); capital of the province of Santiago de Cuba. The harbor is one of the finest in the West Indies, but it is separated from the interior by rugged mountains which retard communication; hence the port is only the third in Cuba in importance. The city, surrounded on three sides by mountains, is very picturesque, but hot and subject to epidemics of yellow fever. It has several fine squares and public gardens. Short railways run to the interior. Santiago is the center of the Cuban copper region. Sugar, rum, coffee, cacao, fruits, and copper ore are exported. On July 3, 1898, a Spanish squadron was destroyed by U. S. war-ships off Santiago harbor; and on July 17 the Spanish surrendered Santiago to a U. S. army. Pop. (1899) 43,090. Herbert H. Smith.

Santiago del Estero, -dāl-ās-tā'rō: an interior province in the northern part of the Argentine Republic; surrounded by Santa Fé, Córdoba, Catamarca, Tucumán, Salta, and the territory of El Chaco. Area, 31,500 sq. miles. It is a plain, the greater part included in the region of mingled forests and open lands called the Gran Chaco; in the southern part there are true open pampas. The principal rivers are the Salado and Dulce, neither of which is navigable. Nearly all the civilized population is gathered in the region S. of the Salado, about 18,000 sq. miles in extent. Grazing, grain-planting, and timber-cutting are the only important industries. Pop. (1890) about 250,000 (including wild Indians). Santiago del Estero, the capital, on the Dulce, was founded in 1552, and (disregarding the first settlement of Buenos Ayres) is the oldest town in the republic. It is much decayed, and has frequently suffered from overflows of the river. Pop. 8,000. Herbert H. Smith.

Santiago de los Caballeros, -dā-lōs-kăă-băăl-yā'rōs, or **de la Vega**: town of the Dominican Republic, West Indies; in the central plain called the Vega Real; 85 miles N. N. W. of Santo Domingo, on the road to Puerto Plata (see map of West Indies, ref. 5–H). This is the most beautiful and fertile part of the island, and is free from the heat and fevers of the coast. The town is the most populous in the interior of the republic, and has a thriving trade, especially in tobacco. Pop. about 10,000. H. H. S.

Santillana, săan-tĕel-yaa'năă, Inigo Lopez de Mendoza, Marquis of: soldier and poet; b. at Carrion de los Condes, Spain, Aug. 19, 1398; son of the grand admiral of Castile; was created Marquis de Santillana by Juan II. of Castile for his services in wars against Aragon and the Moors, and after the battle of Olmedo against the King of Navarre in 1445 received the title of Conde del Real de Manzanares. Upon the death of Juan in 1454 Mendoza retired from public life and devoted himself to literature. His best-known work is *Los Proverbios*, or *Centiloquio* (1496), a collection of 100 proverbs in rhyme. He wrote also *Diálogo de Bias contra Fortuna* (1448); *Doctrinal de Privados* (1453); the *Comedieta de Ponza* (a dramatic poem); and *serranillas*. D. at Guadalajara, Mar. 25, 1458. His works have been edited by Amador de los Rios (Madrid, 1852).

Santley, Charles: baritone singer; b. in Liverpool, England, Feb. 28, 1834; studied at Milan under Gaetana Nava and under Garcia on returning to England. He sang the part of Adam in Haydn's oratorio *The Creation*, at St. Martin's Hall in London, Nov. 16, 1857. In 1859 he appeared in the opera of *Dinorah* with the Pyne and Harrison Company at Covent Garden theater; and in 1862 made his *début* in Italian opera. He made a tour in the U. S. in 1871. In London he sang in *Zampa* and *The Waterman*, with the

Carl Rosa Company in *The Flying Dutchman*, and for many years at musical festivals and concerts. In 1889 he made a tour in Australia, and passed through New York in 1890 in returning to England. B. B. VALLENTINE.

Santo Domin'go, or **Haiti** (incorrectly *San Domingo*, and formerly *Española*, or *Hispaniola*): an island of the Greater Antilles, West Indies; between the Caribbean Sea and the Atlantic; separated from Cuba on the W. N. W. by the Windward Passage, and from Puerto Rico on the E. by the Mona Passage. Length from E. to W., 403 miles. Area, 29,823 sq. miles, divided between the republic of Haiti (about one-third) in the west and the Dominican Republic in the east. From the sea it appears to be a mass of mountains; in reality there are several east and west ranges, separating extensive plains, such as the beautiful Vega Real in the Dominican Republic and the plain of Artibonite in Haiti. The scenery everywhere is very fine, some of the mountain-peaks rising to 6,000 or 7,000 feet. The island is abundantly watered and one or two of the rivers are navigable for short distances. The most important streams are the Artibonite in Haiti, and the Yaqui, Yuna, and Ozama in the Dominican Republic. In the southwest there are two considerable lakes, Enriquillo in the Dominican Republic and Fondo in Haiti. The coasts, broken by deep indentations, form several good harbors; the largest of these is Samaná Bay, but the principal commercial ports are Port-au-Prince, Cape Haytien, Santo Domingo, and Puerto Plata. The soil of the valleys and plains is very fertile and the mountain forests contain many cabinet-woods and dye-woods. The island does not appear to be rich in minerals. A little gold is obtained, and silver, platinum, coal, etc., are reported. The climate is hot and occasionally unhealthful in some of the coast towns, mild and salubrious in the interior, the temperature varying with the elevation. The wet season, from April to October, is characterized only by a higher temperature and more abundant rains. Hurricanes are occasionally destructive from July to October. Several severe earthquakes are recorded. The island has no volcanoes.

History.—Santo Domingo, called Haiti by the natives, was discovered by Columbus and Pinzon at the end of 1492, and was the first part of the New World settled by the Spaniards. (See COLUMBUS.) The natives, a mild race of Arawak stock, were at first very friendly; later they rose against their oppressors, but were beaten in several wars by Columbus and his successors, and were reduced to the semi-slavery of the *encomiendas*; they soon disappeared and their blood can only be traced in the mixed races. Gold-mining, even with enforced Indian labor, was never very profitable, and agriculture became the chief occupation. Negro slaves were introduced as early as 1502, and later great numbers were brought, especially to the western part of the island. Santo Domingo (founded in 1496) became the chief city, and until about 1520 was the capital of Spanish America. The island was the point from which subsequent discoveries and conquests were made. From it were settled Cuba (and hence Mexico and California), Darien (and hence Peru, Chili, and Ecuador), Santa Marta, and New Granada, Puerto Rico and Florida, Venezuela, and Jamaica. But after the rich discoveries on the mainland, the island was neglected and partly depopulated, and it became the prey of the buccaneers. About 1630 some French buccaneers from Tortuga formed permanent establishments which soon increased in strength; and by the treaty of Ryswick (1697) the western part of the island was definitely ceded to France. This French colony became very prosperous; but the Negro slaves were ten times as numerous as the whites, and the free mulattoes, who were debarred from legal rights, were very discontented. The French Revolution of 1789 was quickly followed by a revolt of the mulattoes; both they and the whites appealed to the slaves, and in 1791–92 a terrible Negro insurrection broke out in the French part of the island. The blacks, under different chiefs, massacred the planters or drove them out; royalist and republican, white, black, and mulatto factions strove for supremacy; and in 1793 the distracted colony was invaded by the British and Spanish. The French Assembly conciliated the blacks by an edict of emancipation (1795); under their favorite leader, Toussaint Louverture, they resisted the British, who were driven out in 1798. Meanwhile, in 1795, Spain had ceded the eastern part of the island to France; it was occupied by Toussaint, who was appointed general-in-chief of the island forces in 1797, but in reality was dictator. He governed, nominally in the name of France, until 1801, when he practically declared independence. In 1802 Bonaparte sent a large force under Leclerc to subdue him. After some resistance he was conquered and sent a prisoner to France. Dessalines, Christophe, and others headed fresh rebellions, and the French were finally driven out in Dec., 1803. On Jan. 1, 1804, Dessalines declared the independence of Haiti, then including the whole island; soon after he proclaimed himself emperor; but he was assassinated in 1806. His successor, the Negro Christophe, proclaimed himself king, but could hold only the northwestern part of the island. The southwestern part formed a republic under Pétion, and the eastern part was seized by Spain. On Christophe's death (1820), Boyer, the successor of Pétion, annexed his domains; in 1821 the eastern part rebelled against Spain and formed a republic under the protection of Colombia, but was shortly after conquered by Boyer; thus the whole island was united in the republic of Haiti, and this was the most prosperous period of its history. Boyer was overthrown in 1843, and in 1844 a revolution in the east resulted in the formation of the Dominican Republic. For subsequent history, descriptions of the two countries, and bibliography, see HAITI and DOMINICAN REPUBLIC.

HERBERT H. SMITH.

Santo Domingo: capital and most important city and port of the Dominican Republic, island of Santo Domingo, West Indies; on a bay of the south coast; at the mouth of the river Ozama (see map of West Indies, ref. 5–H). It was founded by Bartholomew Columbus in 1496, and is the oldest existing town of European origin in the New World. Many of the buildings and the fortifications date from a very early period, and some of them are associated with the history of Columbus. A fine statue of the discoverer adorns the principal square. The cathedral is a large but bare and rather unsightly building; in it is shown a crypt supposed to contain the remains of Columbus. They were certainly brought from Spain and buried in this cathedral, and it is claimed that the bones transferred to Havana in 1796 were those of another member of the family. Santo Domingo is the principal emporium of the southern part of the republic, and exports coffee, sugar, cabinet-woods, etc. The harbor is exposed to south winds, and is in fact little more than an open roadstead. Pop. about 25,000. H. H. S.

Santon: See DERVISHES.

San'tonin: a crystallizable principle obtained from the drug *Santonica*, or Levant wormseed. Santonin occurs in flat, quadrilateral, colorless prisms, is inodorous and nearly tasteless, and practically insoluble in water. In overdose it is poisonous to the animal system, producing convulsive tremblings, dilatation of the pupils, and enfeebling of the functions of the heart and lungs. It also causes the urine to acquire an unnatural yellow, and, what is very singular, it produces yellow vision by staining the humors of the eye, the field of view appearing as if seen through a yellow-tinted medium. Santonin is exceedingly poisonous to the round-worm, *Ascaris lumbricoides*, a parasite infesting the intestines in man, and is consequently used in medicine as an anthelmintic or vermifuge. From its poisonous properties it must be given with care. Revised by H. A. HARE.

Santorin, săn-tō-reen', or **Thera**, thā'răă: Greek island in the Ægean Sea; the most southern of the Cyclades. It is crescent-shaped, being the eastern portion of the circumference of a vast crater. Geologically, it is intensely interesting on account of the volcanic phenomena which have taken place in it. Sometimes land in the immediate vicinity has risen from the sea and formed islets, some of which still exist. A prodigious eruption began in Jan., 1866, and continued two years. On its cessation the inhabitants, who had fled in terror, returned to the island. Apparently Santorin was inhabited from earliest antiquity. On some of the rocks may be seen the most ancient specimens of Greek writing known. Pop. (1889) 22,000. Capital, Thera. See Virlet in *Bulletin de la Société géologique de France*, vol. iii.; also Fouqué in *Mission scientifique à l'île Santorin*, *Arch. des Missions*, second series, vol. iv., 1867.

E. A. GROSVENOR.

Santos, saan'tōs: city and principal port of the state of São Paulo, Brazil; on a low peninsula (formerly an island) fronting the Bay of Santos; 40 miles by railway S. of São Paulo (see map of South America, ref. 7–F). The harbor is one of the best in Brazil, and vessels load directly at wharves. The city has many large warehouses and some good public buildings; but the climate is hot, and, owing to the yearly

epidemics of yellow fever, Santos is the most unhealthful port in Brazil. It is the outlet of the greater part of São Paulo, and exports more coffee than any other port in Brazil except Rio de Janeiro. Great numbers of immigrants pass through it. Santos was founded in 1539. Pop. about 20,000. Six miles S. of it is the small town of São Vicente, the oldest permanent settlement in Brazil (founded 1532), and until 1681 capital of the captaincy of the same name. H. H. S.

Sanzio, Raphael: See Raphael.

São (sowñ) **Carlos**: See Campinas.

São Francisco River: a river of Brazil, rising in Minas Geraes near lat. 20° 30′ S., flowing N., then N. N. E., and finally curving to E. S. E., and entering the Atlantic in lat. 10° 29′ S. Length about 1,800 miles. It traverses the states of Minas Geraes and Bahia, and below its great bend separates Bahia and Sergipe on the S. from Pernambuco and Alagoas on the N. Among the great rivers of South America, the São Francisco ranks in length with the Orinoco; but, unlike the Orinoco, Amazon, and Paraguay, it is essentially a highland river, the greater part of its course being over the surface of the Brazilian plateau; and it is nowhere bordered by extensive forests. Its most remarkable feature is its division into an upper and a lower course by a series of rapids and a great cataract. These mark its descent from the plateau, after it has attained its full volume, only 200 miles from the sea. The cataract of Paulo Affonso is sometimes called the Niagara of Brazil, and it approaches Niagara in grandeur though differing greatly in appearance. The great river is here forced through a narrow gorge—in one place only 51 feet wide—and after rushing down a slope, forms three successive falls, with a total depth of 265 feet. The torrent is churned into a mass of foam, producing an effect of indescribable grandeur. Above this fall there are several rapids, and below it an unnavigable space where the river forms a deep cañon; the total obstructed portion is about 190 miles long. Below it the river is freely navigable from Piranhas to the sea, 148 miles; at Penedo, 30 miles above the mouth, it is nearly a mile wide. The bar, at high water, admits vessels of 15 feet draught. Above the falls there is a navigable space from Pirapora to Sobradinho, 984 miles. Of the numerous affluents the most important are the Paraupeba and Rio das Velhas on the right and the Paracatú, Urucuya, Carinhanha, Corrente, Rio Grande, and Rio Preto on the left. All of these are navigable for greater or less distances. The São Francisco was opened to free navigation in 1867, but no foreign commerce has been attracted to it. Brazilian steamers ply regularly on the upper course, which is connected with Bahia by railway; the Rio das Velhas is also navigated. The principal industry of the basin is cattle-raising, but it contains much agricultural and mining land. See Burton, *Exploration of the Highlands of Brazil* (1869); Halfeld, *Relatorio concernente á exploração do Rio de S. Francisco* (1858) and *Atlas e Relatorio* (1860); Roberts, *Relatorio sobre o exame do Rio S. Francisco* (1880); Wells, *Three Thousand Miles through Brazil* (1886).

Herbert H. Smith.

São Gonçalo, Rio: See Lagoa dos Patos.

São João (-zhō-owñ′) **da Barra**, or **da Parahyba**, -daa-paă-raă-ee′baă (formerly *Parahyba do Sul*): city and port of the state of Rio de Janeiro, Brazil; on the right bank of the Parahyba river, near its mouth. Formerly it was the commercial center of the lower Parahyba valley, but its importance has decreased since Campos has been united to the Bay of Rio de Janeiro by a railway. It is a port of call for coasting steamers, and exports sugar. The bar is passable only during spring tides; at other times vessels anchor in the roadstead. São João has an important sugar-factory. Pop. about 7,000. H. H. S.

São João d'El Rei, -del-rā′ĕĕ: a town of the state of Minas Geraes, Brazil; 66 miles S. W. of Ouro Preto (see map of South America, ref. 6–G); is connected with Sabará and Rio de Janeiro by railway, and is the commercial center of a large district. It was founded about 1670, and was long famous for its gold and diamond mines. Cattle and hogs are raised in the vicinity, and hides, lard, and the favorite Minas cheeses are exported. Pop. about 10,000. H. H. S.

São Leopol'do: a town of the state of Rio Grande do Sul, Brazil; on the Rio dos Sinos, a branch of the Guahyba or lower Jacuhy; 20 miles N. of Porto Alegre (see map of South America, ref. 7–F). The first German colony in Brazil was established here in 1824, and the town is the center of a thriving agricultural region almost entirely peopled by Germans or their descendants; it has railway and steamboat communication with Porto Alegre. German is the common language. Pop. about 7,000. H. H. S.

São Luiz: See Maranhão (the city).

São Miguel: See St. Michaels.

Saône, sōn: a river of France which rises in the department of Vosges, at an elevation of 1,299 feet above the level of the sea; flows S. and joins the Rhône at Lyons. Its entire length is 282 miles; it is navigable for a distance of 170 miles below the city of Gray, department of Haute-Saône. It is joined by the Doubs on the left side.

Saône-et-Loire, -ā-lwăăr: department of France; between the rivers Saône and Loire, and mostly occupied by the mountains of Côte-d'Or. The mountains are low, and rich in coal and iron, and on their slopes is produced the celebrated Mâcon wine. On the pastures along the rivers large herds of cattle and horses are reared. Iron plates and rails, machinery, etc., are manufactured in Creusot and other towns. Area, 3,302 sq. miles. Pop. (1896) 621,237.

Saône, Haute: See Haute-Saône.

São Paulo, sowñ-pow′lō: a southeastern maritime state of Brazil; bounded by Minas Geraes on the N. and E., Rio de Janeiro on the E., the Atlantic on the S. E., Paraná on the S., and Matto Grosso on the W. and N. W. Estimated area, 112,330 sq. miles, but the boundary with Minas Geraes is unsettled. The Brazilian Coast Range, here divided by the Parahyba valley into two parallel chains, traverses the southeastern part, and is separated from the ocean by a narrow strip of lowland. Back of the mountains the surface is an irregular plateau, varied by hills and by the deep valleys of rivers which flow westward to the Paraná. The coast-strip mountains and a wide tract back of them were originally covered with forest, and this is the most fertile and thickly settled portion of the state. Bordering the Paraná and its branches there are other extensive forests inhabited only by a few roving Indians. The river Paraná forms the western boundary, and its branch, the Paranapanéma, separates São Paulo from Paraná. The Pardo, Tieté, and Aguapehy are important branches of the Paraná, obstructed by falls near their mouths, but partly navigable in their upper courses. On the Atlantic side the only important river is the Parahyba. The principal harbors are the Bay of Santos and the channel formed by the island of São Sebastião. The climate of the plateau is mild and salubrious; some coast towns, as Santos, are hot and unhealthful. A little gold is washed in the river-beds, and there are deposits of excellent iron, marble, etc. The forests are rich in cabinet woods. São Paulo is the most populous and thriving of the Brazilian states and the most important coffee-producing region of the world; the coffee zone includes the Parahyba valley and the forest strip back of the mountains; sugar-cane is extensively planted, especially in the coast belt; and on the plateau the grazing industry is important. The people, called Paulistas, have always been noted for their enterprising spirit. During the colonial period they discovered the mines of Minas, Goyaz, and Matto Grosso, settling all those regions and the southern province; and their slave-hunters were long a terror to the Indians of Paraguay. Of late they have covered a large part of the state with railways, encouraged exploration and settlement toward the Paraná, and developed manufactures; and they have given some of the best statesmen, authors, and engineers to Brazil. The captaincy of São Paulo, originally called São Vicente, was formed in 1534, with its capital at São Vicente, on the Bay of Santos; this was changed to São Paulo in 1681. The captaincy originally included all of Southern Brazil; Rio de Janeiro, Minas Geraes, Santa Catharina (with Rio Grande do Sul), Goyaz, Matto Grosso, and Paraná were successively cut off from it. Pop. (1888) estimated, 1,386,242; the calculated annual increase is 3·5 per cent. There are many German and Italian immigrants. H. H. Smith.

São Paulo: capital and principal city of the state of São Paulo; on a small branch of the river Tieté; 236 miles W. S. W. of Rio de Janeiro (370 miles by railway), 38 miles from its port of Santos (see map of South America, ref. 6–G). Owing to its situation on the plateau and near the Tropic of Capricorn, it has a mild and very agreeable and healthful climate. It is well built, and has the aspect rather of a European than of a Brazilian town; there are a number of public gardens and parks. The old Jesuit college is used as the state-assembly building; other notable edifices

are the São José theater, city-hall, episcopal palace, and many churches, including some of Protestant denominations. The law school is the most famous in Brazil, and many of the most noted Brazilian statesmen are among its graduates. There is a large and well-equipped hospital. Besides its railway connections with Santos and Rio de Janeiro, São Paulo is the center of the extensive state-railway system, and it has a large and constantly increasing trade. The city was founded as a mission station (Piratininga) in 1554 by the Jesuit Anchieta. It became the capital in 1681. Pop. (1894) about 75,000. H. H. S.

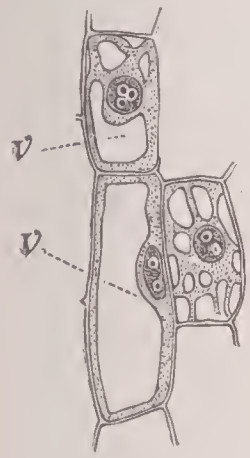
São Pedro do Rio Grande do Sul: See Rio Grande do Sul.

São Salvador, or **San Salvador**: city of Brazil. See Bahia.

São Sebastião: an old name of Rio de Janeiro (*q. v.*).

São Vicente: See Santos.

Sap [O. Eng. *sæp* : O. H. Germ. *saf* > Mod. Germ. *saft*, sap, juice; cf. Sanskr. *sabar*, nectar, Lat. *sapio*, but the Teutonic words may be borrowed from Lat. *sapa*]: the water contained in living plants, together with the substances dissolved in it. All active plant-cells have more or less water in their protoplasm, and when there is a surplus it is in the form of drops or masses in cavities (vacuoles) in the protoplasm (see illustration). Intercellular spaces and the cavities of inactive internal cells also may contain water, holding various substances in solution.



Cells of a fritillaria with sap-cavities (*v*) in the protoplasm (× 500).

In terrestrial plants this water is absorbed by the roots from the water of the soil, and carries with it the substances dissolved in it. In the plant it is absorbed from cell to cell, suffering in each a loss of such substances as are appropriated by the protoplasm, and gaining such as are soluble.

It thus contains many substances, some of which are organic, e. g. sugar, inulin, etc., and others inorganic, e. g. salts of lime, potash, etc. By puncturing (as in the maple), crushing (as in the cane), or slicing and diffusion (as in the sugar-beet), the sap is obtained in large quantities, and on evaporation yields much sugar, with many other substances.

For the details as to the movement of water in the plant, see the article Physiology, Vegetable. There is no such thing as crude sap or elaborated sap, as commonly understood, nor is there a circulation of sap, one current going up and another coming down. The popular notion that the sap goes down into the roots of trees in the fall and rises again in the spring is erroneous. Charles E. Bessey.

Sapajou: a name corrupted from a South American term, and applied to New World monkeys of the family *Cebidæ*, having a prehensile tail whose under surface is naked and callous toward the tip; the throat is not dilated. It is applied to the small monkeys of the genus *Cebus* and to the spider-monkeys, *Ateles*. Revised by F. A. Lucas.

Sapan-wood: a red dyewood obtained from the *Cæsalpina sappan*, exported from Siam, Japan, the East Indies, etc.

Sap-green: a coloring-matter obtained by boiling down the juice of the berries of the buckthorn (*Rhamnus catharticus*), after adding lime to prevent change by acid fermentation, which would turn the color red. The buckthorn is a native of Europe, but has made its way to the U. S., and grows wild in some parts. It is a shrub 6 or 8 feet high, with branches that terminate with thorns. The berries contain four seeds, are about the size of a pea, black and shining, with green pulp, of disagreeable odor and nauseous bitter taste. They constitute an active purgative medicine, seldom used, as it causes griping pains. Sap-green is used chiefly as a water-color pigment. It is not permanent.

Sapodil'la, or **Naseberry**: the fruit of *Achras sapota*, a West Indian tree of the family *Sapotaceæ*. It is highly valued as a dessert fruit.

Saponification: See Soap.

Sap'onin [from Lat. *sa'po, sapo'nis*, soap], or **Stru'thiin** [from Mod. Lat. *Stru'thium*]: an uncrystallizable substance obtained from the soapwort or bouncing-bet (*Saponaria officinalis*). It is also contained in *Gypsophila struthium* and many other plants. Bley discovered it; Bussy first obtained it pure; and Bucholz found 34 per cent. in the dry soapwort root, which makes with water a lather like soap. By first extracting the root with water and evaporating, then treating the extract with alcohol, a solution of saponin is obtained nearly pure. On evaporation the saponin appears brown, though white when pure; hard, brittle, and sweetish in taste, followed by persistent acrimony. When inhaled in powder it produces violent sneezing. It is said to be poisonous, and to produce an extraordinary local paralysis of the muscles, without acting through the general nervous system, when injected into the cellular tissue of animals. For its composition the following is assigned, but deemed questionable: $C_{19}H_{30}O_{10}$. Revised by Ira Remsen.

Sapota'ceæ: See Star-apple Family.

Sappers, Miners, and Pontoniers: engineer troops. (See Engineers, Corps of.) Among the great improvements in the attack and defense of fortifications introduced by Vauban, not the least was the establishment of regularly organized companies of sappers and of miners. The duties of these troops had previously been performed in a desultory manner by soldiers detailed from the artillery and infantry. The first company of sappers was organized about 1690 as a free company, under the command of Vauban himself. It was armed and drilled as infantry, and was instructed in all the works appertaining to sieges. The men were taught to make gabions, fascines, hurdles, etc., to trace lines and trenches, to drive the various kinds of saps (see Siege), to descend into and pass the ditch, to destroy the enemy's obstacles, to drain the trenches, to take care of the tools, to put up the various kinds of revetments, to post and superintend working parties, and were expected also to serve in the mines when required. In the defense they were taught to adjust and sod the slopes, to place the various obstacles, such as palisades, fraises, etc., and to repair the defenses when injured by the enemy's artillery. All of these duties are still performed by sappers. Three engineers, Goulon, Esprit, and Mesgrigny, organized in 1679, 1695, and 1705, respectively, each a company of miners, whose duties were the construction and service of mines and countermines. By the year 1705 these companies, as well as the sappers, had been attached to the artillery. They naturally belonged to the engineer service, but convenience of transportation and personal influence kept them with the artillery until 1759, when they were placed under the engineers. In 1760 they were returned to the artillery, where they remained until 1793, when they were finally attached to the engineers. The duties of pontoniers, or constructing temporary military bridges, had up to this time (1793) been performed by "artillery-workmen." The necessity of a better organization was evident, and companies of pontoniers were organized, continuing, however, to form part of the artillery. The numbers of these troops were increased from time to time as the necessities of the service demanded; the present force in France, including the artillery pontoniers, is about 16,100.

In Great Britain the Corps of Royal Sappers and Miners was established in 1812. It performed the duties of pontoniers, as well as those indicated by its title. It was composed entirely of enlisted men, the officers being detailed from the Royal Engineers. In 1856 the two corps were consolidated under the name of the Corps of Royal Engineers. The force comprises about 7,550 men.

In Prussia a company of pontoniers was created in 1715, and placed under the orders of the artillery. In 1742 Frederick the Great organized two companies of miners, which were at first attached to a regiment of pioneers, and afterward formed an independent corps. Previously to 1810 there were no regular sappers in the Prussian army, but in that year the pontoniers and miners were placed under the engineers and took the name of pioneers, a part of their duties being those of sappers. The force is about 13,300 men.

In the U. S. a company of "bombardiers, sappers, and miners" was attached to the Corps of Engineers by the act of Congress of Apr. 29, 1812, but was discontinued in the reorganization of 1821. In 1846 a company of "sappers, miners, and pontoniers" was organized as part of the Corps of Engineers, and was sent to Mexico with the army of invasion. It took part in the siege of Vera Cruz, in the attack at Cerro Gordo, and formed part of the storming parties at Contreras, Churubusco, and Molino del Rey. At Chapultepec it was engaged in the construction of batteries, occa-

sionally fighting with muskets, and at the Garita San Cosme it did excellent service as infantry. After the war it was stationed at West Point to assist in the instruction of cadets at the U. S. Military Academy. In 1853 a detachment accompanied Stevens's survey of the Northern Pacific Railroad. In 1858 the company formed part of the Utah expedition, returning to West Point in the fall of the same year. In the fall of 1858 a detachment was sent to the Pacific coast, where it was engaged until 1861 in opening and repairing roads, constructing bridges, and in fortifying San Juan island at the time of the boundary dispute. In 1861 this detachment proceeded to Washington, where it was engaged upon the defenses and in the instruction of volunteer troops in the preparation of siege-material. The main portion of the company was engaged during the summer of 1861 in the defense of Fort Pickens. In the fall of 1861 it joined the Army of the Potomac. An act of Congress of Aug. 6, 1861, added three companies, of 150 men each, to the engineer troops, and authorized one company of topographical engineers. In 1863 the Corps of Engineers and of Topographical Engineers were merged into one, and the strength of the battalion of engineers thus became five companies. One of these was not organized, however, until 1865. From the fall of 1861 until the end of the civil war the battalion formed part of the Army of the Potomac, and its services were invaluable. Under Capt. Duane (afterward brigadier-general and chief of the Corps of Engineers) the original company had been thoroughly instructed in pontoniering, sapping, and mining. This instruction quickly pervaded the battalion, and it was thus enabled to give lessons to the volunteers which could be obtained from no other source. A number of volunteer regiments were organized as engineer troops, and in addition to these many infantry and artillery troops served as engineer soldiers when occasion required, the high character and intelligence of the volunteers rendering it an easy matter to find men capable of being quickly instructed in these duties. For mining at Vicksburg and Port Hudson practical miners were selected from the different regiments, and temporarily organized as military miners. The sapping at these sieges was done by details from the infantry, as it had been in the seventeenth century, before the time of Vauban. In all cases these troops served under the engineers when on engineer duty.

The most remarkable feats in this branch of the service during the war were, in mining, the Petersburg mine (July, 1864); in sapping, the siege of Fort Wagner before Charleston, July to Sept., 1863; and in pontoniering, the bridge across the James river at Charles City Court-house. The latter was over 2,000 feet long in pontons, besides 200 feet of trestle-work. It was built by the regular battalion of engineers, two companies of the Fifteenth New York and part of a company of the Fiftieth New York, in all about 450 men, in about five hours on the evening of June 15, 1864, the approaches having previously been prepared by the First New York Engineers. The stream was rapid and deep, in some places 85 feet. This was the longest floating bridge ever constructed by an army in the field. Another long bridge was built by the same troops over the Chickahominy in 1862. That stream was a less difficult one, and a large portion of the bridge was built on trestles and cribwork.

Upon the reduction of the army in 1870 the number of enlisted men in the battalion of engineers was limited to 354, one company being reduced to a skeleton of ten sergeants and ten privates; and in 1875 the number was further reduced to 200. In 1884 the number was increased to 450 and in 1889 to 500. One company of 100 men is stationed at the Military Academy at West Point, engaged in the instruction of cadets in practical military engineering. The others are stationed at the engineer school of practice at Willets Point, N. Y. They are kept thoroughly drilled as infantry, and are well instructed in field fortification, sapping, mining, pontoniering, field-sketching, and the service of submarine mines. The officers of the battalion are temporarily detailed from the Corps of Engineers, usually serving with it four or five years.

Napoleon I. considered the proper proportion of engineer troops to infantry to be 1:40. Since his day the advances in the art of war have largely increased this proportion. It should be especially large in a country like the U. S., where the army is rather a magazine of military knowledge than a force capable of resisting a powerful enemy. In France the proportion is about 1:21; in Great Britain, 1:20; in Germany, 1:25; in Russia, 1:18; in Austria-Hungary, 1:19; and in the U. S., 1:25. O. H. Ernst.

Sappey, săăp′pā′, Marie Philibert Constant, M. D.: anatomist; b. at Bourg, department of Ain, France, Aug. 10, 1810; graduated M. D. from the Paris School of Medicine in 1843; in 1844 passed the *concours* for associate professor of surgery; in 1868 was appointed Professor of Anatomy. He is a member of many French and foreign medical and scientific societies, and an officer of the Legion of Honor. His great work is his *Traité d'anatomie descriptive* (1847–63, numerous editions). S. T. A.

Sapphire [from O. Fr. *saphir* < Lat. *sapphi'rus* = Gr. *σάπφειρος*, from Heb. *sappīr*, sapphire]: a gem, among the purest forms of corundum. However, it is not usually called sapphire by dealers in gems unless blue, the red stones being called rubies, the yellow ones Oriental topaz, the green Oriental emeralds, and the purple Oriental amethyst, industrially used for wire draw-plates, watch-jewels, phonograph points, etc. *Asteria* is a variety of sapphire which when cut round shows a star of bright rays, due to its crystalline structure. See Corundum, Ruby, Topaz, and Precious Stones.
Revised by Geo. F. Kunz.

Sappho, săf′ō (Gr. Σαπφώ): the world's greatest poetess; b. at Eresos or at Mytilene in Lesbos, toward the latter part of the seventh century B. C., contemporary of Alcæus and Solon. In consequence of political troubles she had to take refuge in Sicily, but returned to Lesbos in course of time and there she died. The literary mythmongers of antiquity made up stories out of supposed allusions in her verses. Of this order is the romance of her hopeless love for the fair youth Phaon, and of her leap from the Leucadian rock. But the poetess of love fared worse with the comic poets of Athens, who could not understand the Lesbian songstress and who wrought their wicked will on her memory. To them Sappho was a courtesan; to them the school of maidens whom she trained in the service of the Muses and to whom she addressed her burning verses was a school of vice. Nowadays few are found to controvert the thesis that Sappho was a lofty as well as an ardent soul, to whom all lovers of true womanhood as well as of true art must do homage. Her poems, written in the Æolic dialect, "few but all roses," were arranged in nine books after the number of the nine Muses and according to the measures employed. Of these only two poems remain entire or nearly so, and there are besides a number of fragments, enough at all events to show her ardor, her tenderness, her playfulness, her love of art, her love of nature. In the handling of the language and of the metrical form she was a supreme artist, and if nothing else remained, the Sapphic strophe would be a monument of her genius. Editions of her poems have been published by Neue (Berlin, 1827); by Bergk, *Poetæ Lyrici Græci*; by Wharton, with English translations (2d ed. 1887). See the elaborate work by Cippolini, *Saffo* (1890).
B. L. Gildersleeve.

Sapporo, or **Satsŭporo**, săăp′pō-rō: a town in Yezo, Japan, and once the capital of the island; in a plain about 20 miles from the mouth of the Ishikari river (see map of Japan, ref. 3–E). When the colonization department (*Kaitakushi*) began its work in 1871, Sapporo became a center of activity. Planing-mills, silk-factories, an agricultural college with model farm attached, a brewery, etc., were organized. A mission from the U. S., with Gen. Horace Capron at its head, was located here, and professors from the U. S. were intrusted with the organization of the college. Since the breaking up, in 1881, of the very expensive colonization department, Sapporo has been merely chief town of one of the three prefectures of the island. Its port is Otaru, 22 miles distant, with which it is connected by a railway which extends inland 40 miles to the coal mines of Poronai.
J. M. Dixon.

Sap′rophytes [Gr. *σαπρός*, rotten + *φυτόν*, a plant]: plants which live upon the organic matter of dead plants or animals, or at least on their dead parts, as distinguished from Parasites (*q. v.*), which live upon and obtain their food from living plants or animals. They are all colorless plants, or at least they are not green, and have suffered a greater or less structural degeneration of their vegetative organs, as in the case of parasites. In fact the effect of saprophytism upon the plant appears to be essentially the same as that of parasitism, a result to be anticipated, since in some cases a parasite may become saprophytic, while in others a saprophyte may become parasitic.

Saprophytes occur in four of the six great branches of the vegetable kingdom. Thus of the protophytes, some of the bacteria are saprophytes. Of the phycophytes, the black

moulds (*Mucoraceæ*) and the water-moulds (*Saprolegniaceæ*) contain many saprophytes. In the carpophytes there are thousands of species of saprophytes, in many of the families of the fungi of the great classes *Ascomycetes* and *Basidiomycetes*, the latter well represented by the toadstools, puff-balls, etc. The *Bryophyta* and *Pteridophyta* contain no saprophytes, and in anthophytes there are few if any species which are strictly saprophytic. The Indian-pipes (*Monotropa*) and their relatives are doubtfully saprophytic, and the same may be said of a few of the orchids. On the other hand, many farm and garden plants under cultivation are partially saprophytic, obtaining much of their food from the decaying organic matter used for enriching the soil. The saprophytes in the vegetable kingdom are estimated at from 20,000 to 30,000 species, the greater portion of which are carpophytes. CHARLES E. BESSEY.

Sap-rot: See DRY ROT.

Sapsago Cheese: a corrupt name used in the U. S. for Schabzieger cheese. See CHEESE.

Sapsucker: the yellow-bellied woodpecker (*Sphyrapicus varius*) of North America, so named on account of boring into maple or other sweet-sapped trees to obtain the sap. It is readily recognized by its black throat and decidedly yellow under parts. F. A. L.

Sapwood: See ALBURNUM.

Saqqa'rah, or **Sakḳarah** [cf. Egypt. *Sokar, or Seker*]: a village of Egypt, W. of the site of Memphis, which has given its name to a group of pyramids and to the ancient necropolis of Memphis. The necropolis was in use from the remotest dynasties down to Roman times. The earliest monuments are the pyramids and mastabas and the latest the tombs of the Apis bulls. The whole region is honeycombed with subterranean funereal chambers. The mastabas are rich in representations of scenes of ordinary life in the fifth and sixth dynasties, and some of the pyramids are inscribed with religious texts. The most notable objects at Saqqarah are the Step Pyramid (see PYRAMIDS), the tombs of the Apis bulls (see SERAPEUM), and the tombs of early nobles, such as Ti and Ptahhotep, of the fifth dynasty. (See MASTABA.) From Saqqarah came the oldest mummy in the world, that of a son of Pepi I. of the fifth dynasty, probably above 6,000 years old. C. R. G.

Saracen'ic Art: the art of the countries ruled by the SARACENS (*q. v.*). The Arabs who followed Mohammed and his earlier successors had little industry of the finer sort and no fine art. With the singular ability they possessed of inspiring others with their enthusiasm, making them reverence Mohammed, talk Arabic, and fight for Islam, they absorbed into one empire the far more artistic races on the Mediterranean. The Byzantine style became their type in architecture. The workmen of Syria and Egypt developed new fashions under the new dominion, as has been shown under MOHAMMEDAN ART (*q. v.*). Saracenic art therefore includes the earlier work of Syria, Egypt, Asia Minor, the islands, such as Cyprus and Rhodes, and, in its largest extension, of the North African coast and of Southern Spain, all from about 700 to 1400 A. D. Turkish art would thus be excluded by its date and Persian by its eastern situation. R. S.

Sar'acens [from Lat. *Sarace'nus*, Saracen, a Saracen, from Arab. *sharqī*, Oriental, eastern, deriv. of *sharq*, east, deriv. of *sharaqa*, rise]: a name originally applied to a tribe or tribes inhabiting the eastern slopes of the Serāt, the great mountain chain of Arabia which reaches from Syria to Yemen (Glaser, *Skizze der Gesch. und Geogr. Arabiens*, Berlin, 1890, p. 230). Later Greek and Latin authors used this local name to designate the troublesome Bedouin tribes on the southern frontier of the empire, or even the Arabians as a whole (Ammianus xiv., 4; xxiii., 6, 13). After the rise of Islām, the use of the word was further extended, and included the followers of the new faith, wherever they might be. It has also been used as a synonym for *infidel* (gypsies, pagan Prussians, etc.). See also A. Sprenger, *Die Alte Geogr. Arabiens* (Bern, 1875, § 328); C. Snouck Hurgronje, *Het Mekkaansche Feest* (Leyden, 1880, p. 196). See MOORS. RICHARD GOTTHEIL.

Saragos'sa (Span. *Zaragoza*, anc. *Cæsarea Augusta*): capital of the province of Saragossa, Spain; on the Ebro; 212 miles by rail N. E. of Madrid (see map of Spain, ref. 14–H). It was founded by the Phœnicians. Under the Romans and Moors it was a flourishing city, and reached the culmination of its prosperity when (in 1118) it became the capital of the kingdom of Aragon. After the union of Aragon and Castile, when Madrid became the royal residence, Saragossa lost some of its splendor, and in 1809 it was nearly destroyed by the French, by whom it was twice besieged during the Peninsular war. The first siege lasted from June to Aug., 1808; the second began on Dec. 20, and the bombardment continued till Jan. 27, 1809, when the city was entered by general assault. The inhabitants offered a determined resistance, and it was not until Feb. 20 that the place capitulated; 60,000 lives were lost during the siege, mainly by disease. Of the two cathedrals, one is an old building in Gothic style and the other is a highly ornamented edifice of the seventeenth century, which contains a pillar upon which, it is said, the Virgin descended from heaven, A. D. 40. The university (1474) is attended by about 800 students. Saragossa has also an academy of sciences, a library with 18,000 volumes, a law school, and a medical school. Cloth, chocolate, silk, soap, and hats are the principal industrial products. Pop. (1887) 92,407.

Saragossa, Maid of: See AGUSTINA.

Saraiva, săă-rī'văă, JOSÉ ANTONIO: statesman; b. in Bahia, Brazil, 1823. He graduated in law 1846; was president successively of Piauhy, Alagoas, São Paulo, and Pernambuco; entered the lower house of parliament 1855, and became senator 1869; was sent on a special mission to the Rio de la Plata 1864, and was prominently connected with the events which led to the wars with Uruguay and Paraguay. As early as 1857 he formed part of a liberal ministry; later he became the leader of the moderate liberals, and from 1880 to 1887 was several times premier. H. H. S.

Sarajevo, să-răă-yee'vō, **Serajevo**, or **Bosna Seraï**, bos'năă-se-rī': town; on the river Miliatzka, near its junction with the Bosna; 122 miles S. W. of Belgrade (see map of Austria-Hungary, ref. 10–G). It was formerly capital of Bosnia, and is now of the Austro-Hungarian district of Serajevo. Because of its picturesque appearance and fine situation it is called by the Mussulmans the Damascus of the North. It has iron-works and manufactures side-arms, and is the commercial entrepôt of the province. Pop. (1885) 26,268. To the east, on a cliff 350 feet above the Miliatzka, is the imposing castle, built in the thirteenth century by the Hungarian general Castroman, which has given the name to the town.
EDWIN A. GROSVENOR.

Sarakhs, or **Serakhs**, sā-raaks': fort and town of military importance at the northeast angle of Persia; on the plain to the left of the Tajand or lower Heri-rud, where this stream enters the Turcoman plains. The fort is large but ill-provided, the town small and poor. Water is supplied by a canal 10 miles long to a point on the Tajand, where the water flows throughout the year. Opposite the town the stream has water only in the spring or after heavy rains. Sarakhs is of high strategic importance, and the numerous ruins of forts in the vicinity attest that this has long been recognized. Two or three miles to the E., on the other side of the river, is the Russian frontier post of Sarakhs, which is rapidly growing. M. W. H.

Sarasa'te, PABLO MARTIN MELITON: violinist; b. at Pamplona, Spain, Mar. 10, 1844; entered the Paris Conservatory Jan. 1, 1856, and gained the first prizes for solfeggio and violin; studied harmony in Reber's class, and soon started on a successful career as a concert violinist. He has traveled through Europe and the U. S., playing with the greatest success. He has a very large repertory and has composed much for the violin. D. E. H.

Sarasva'ti (i. e. River of pools): the name of several streams of India. The principal one is a string of pools 125 miles long (losing itself in the sand several times and often dry in places), which rises in the Siwalik hills in the Southeast Punjaub and empties into the Ghuggur, which lower down loses itself in the Bikanir desert. It is the sacred river of the *Rig-Veda*, where it is referred to as a powerful stream, "the finest of the seven sisters," "the first in beauty and abundance." Many shrines and sacred places are scattered along its course. M. W. H.

Saratoff': government of Russia; W. of the Volga, and S. of Penza and Simbirsk. Area, 32,624 sq. miles. Although a large portion of the government consists of desert steppes, much rye, wheat, and oats is exported, bees and silkworms are extensively reared, and fisheries, distilleries, and many kinds of manufactures are in operation. Pop. (1897) 2,419,756, among whom are about 120,000 Protestant Germans.

Saratoff: city of Russia; capital of the government of Saratoff; on the Volga; 500 miles by rail S. E. of Moscow (see map of Russia, ref. 8–F). It has many fine public build-

ings of stone, 2 cathedrals, 30 churches, and a museum with a fine-art gallery and a library. It manufactures cloth, linen, tobacco, leather, earthenware, rope, etc., has large breweries, distilleries, vinegar-factories, and foundries, and carries on an extensive trade in grain, cattle, and fish. Pop. (1897) 133,116.

Sarato'ga, Battle of: a decisive battle of the Revolutionary war in the North American colonies. Burgoyne, in command of the British forces, had crossed the Hudson Sept. 13 and 14, 1777, and encamped his army on the heights and plains of Saratoga. Gates, who commanded the Americans, had in the meantime moved his army up to Stillwater and taken possession of Bemis's Heights, to the S. of Saratoga, near the river—a strong position—which he fortified. On Sept. 19 Burgoyne attacked the left wing of the American army under Benedict Arnold, and succeeded in holding the field, though he sustained a loss of over 500 men, that of the Americans falling below 400. Burgoyne then discovered that he had a dangerous foe in his front. He also learned of the capture of his fleet of boats laden with supplies by Lincoln's militia in his rear, and the destruction of his communications with Canada; but, receiving promise of aid from Sir Henry Clinton from below by way of the Hudson, he fortified his position and awaited the latter's coming. As Clinton did not arrive, Burgoyne, finding himself in danger of being cut off from retreat, and his supplies being nearly exhausted, determined to risk a battle, and on Oct. 7 advanced at the head of 1,500 men, with six pieces of artillery. His right was at once attacked by a New Hampshire brigade and Morgan's riflemen. Arnold, who had been relieved from command after the battle of Bemis's Heights owing to some misunderstanding with Gen. Gates, and acting without orders, placed himself at the head of the troops, and with great daring and recklessness led them into action. The British lines were repeatedly broken and Burgoyne with difficulty regained his camp, but with the loss of his able second, Gen. Frazer. Gen. Arnold was also severely wounded in the leg. Renewing the assault, the Americans gained a lodgment in the camp, when darkness put an end to the conflict. During the night Burgoyne retreated and took possession of the heights in his rear. Afraid of being surrounded, he continued his retreat next day to Saratoga. As he received no aid from Clinton, and as every line of retreat was closed to him, it was decided in council to propose a cessation of hostilities while terms of capitulation were being negotiated. Gates at first demanded an unconditional surrender, which Burgoyne refused, but on the 17th terms were agreed upon—the British to march out with the honors of war, and be permitted to embark for England, on condition of not serving against the U. S. again during the war. The number of prisoners surrendered was 5,752. Gates's army numbered upward of 10,000. The terms of the surrender were not ratified by Congress, Burgoyne's army being retained as prisoners until the close of the war. Burgoyne and several other officers, however, were permitted to depart; forty-two guns, between 4,000 and 5,000 muskets, and a large supply of ammunition were among the valuable captures.

Revised by F. M. Colby.

Saratoga Springs: village (incorporated in 1826); Saratoga co., N. Y.; on the Adirondack, the Del. and Hudson, the Boston and Maine, and the Sar., Mt. McGregor and Lake George railways; 38 miles N. of Albany, 182 miles N. of New York (for location, see map of New York, ref. 4–J). It is in the foot-hills of the Adirondack Mountains, has a small valley running through its center, is one of the most famous summer resorts, and is noted for the number and variety of its mineral springs. It is also widely known for the political conventions that have been held here. The village has the Holly system of water-works, supplied from mountain springs; efficient fire department; electric street lights; 3 public parks, Woodlawn, Yaddo, and Congress; and a large number of costly summer residences. It has wide, clean streets and extensive drives.

There are nearly forty mineral springs, of which the best known are the Congress, Vichy, Hathorn, Arondack, Victoria, High Rock, Re-Me-Ho, Red, Columbian, Royal, Magnetic, Geyser, Patterson, Favorite, Excelsior, Empire, and the Star. They are alterative, diuretic, cathartic, and tonic (see also Mineral Waters), and the waters are shipped to all parts of the world. Four miles E. is Saratoga Lake, a favorite place for regattas, with a straight-away course 3 miles long and wide enough to accommodate eight racing sculls abreast. The Saratoga Racing Association has grounds near the village, with a mile-track and a grand stand accommodating 5,000 persons.

The principal public buildings are the new Convention Hall, seating 5,000 persons (cost $100,000); the town-hall, containing the courts and theater; and the armory of Company L (Twenty-second Separate Company), N. G. S. N. Y. Of hotels, the largest are the Grand Union, the United States, and Congress Hall. These, with eight other large, and numerous small ones, have accommodations for 40,000 guests. During the summer season they expend $40,000 for orchestral music.

There are 2 Presbyterian, 2 Baptist, 2 Methodist Episcopal, and Congregational, Protestant Episcopal, 6 Roman Catholic, Grace Pentecostal, and Christian Science churches. The educational institutions comprise seven public schools, including an academic and central grammar school, with enrollment of 2,500, and annual cost of $40,000, and the Temple Grove Female Seminary, with accommodations for 200 pupils. The charitable institutions include the Children's Home, the Saratoga and St. Faith's hospitals, and Home of the Good Shepherd, and St. Christina's Home. There are three libraries (Athenæum, Temple Grove Seminary, and Union Free School) with about 10,000 volumes, and a monthly, 1 daily, and 4 weekly periodicals. The annual receipts and expenditures of the village are about $125,000 each; bonded debt, $200,000; property valuation, $8,401,088. In 1901 there were two national banks, with combined capital of $225,000 and surplus of $175,000. The principal industries are the bottling of mineral waters and the manufacture of medical supplies.

The name Saratoga is derived from the Indian, meaning "Hillside of the Great River." The territory was deeded by the Indians to the Dutch in 1684. Rip van Dam was the first white owner of the original springs, and Sir William Johnson was the first who thoroughly tested their efficacy. The first hotel was established in 1774. Some of the mineral waters have been bottled and exported to various parts of the world since 1826. The Saratoga battle-field, where Gen. Burgoyne surrendered to Gen. Gates on Oct. 17, 1777, is 12 miles S. E. of the village. Pop. (1880) 10,820; (1890) 13,171; (1900) 12,409.

Philip S. Wakeley,
City Editor, "The Daily Saratogian."

Sarawak': a British dependency on the northwest coast of Borneo. It was granted in 1842 to Sir James Brooke, with the title of rajah, by the Sultan of Brunei. He was succeeded in 1868 by his nephew, Sir Charles Brooke, and in 1888 the state was placed under the protection of Great Britain. Area, 50,000 sq. miles. Pop. about 300,000, consisting of native races—Malays, Dyaks, Tayans, and Muruts, as well as some Chinese. The capital, Kuching, has about 25,000 inhabitants, and carries on a large and steadily increasing trade in timber, edible birds' nests, gutta-percha, sago, antimony ore, and rice, in exchange for which it imports European manufactures and tobacco. The revenue for 1893 was $457,122; expenditure, $478,198.

Revised by M. W. Harrington.

Sarcocol'la [= Lat. = Gr.; *σάρξ, σαρκός*, flesh + *κόλλα*, glue]: a nauseous gum-resin produced by *Penæa sarcocolla*, *P. mucronata*, *Sarcocolla vulgaris*, etc., evergreen shrubs of the order *Penæaceæ*, ranging from the Euphrates to the Cape of Good Hope. It is seldom used in civilized regions.

Sarcoph'agus [= Lat., from Gr. *σαρκοφάγος*; scil. *λίθος*, liter., flesh-consuming stone; *σάρξ, σαρκός*, flesh + *φαγεῖν*, eat]: primarily a limestone found in Assos in the Troad, used for making coffins which were supposed to have the property of destroying the corpse within a brief period. The name came thus to be applied to all stone coffins, and loosely also to any large coffin of other material. The earliest specimens are those of Egypt, which were made of granite, basalt, limestone, alabaster, and jointed wood. In the course of time the forms underwent considerable change. The earliest are from the fourth dynasty and are rectangular, with a flat or curved cover, with little or no ornamentation, and in the shape of an Egyptian house. From the Middle Kingdom the specimens are mainly of wood, the tops being intersected by lines of inscriptions, with figures of gods in the open spaces. Outside they were painted and adorned with false doors, while the interiors were adorned with sacred texts. In the New Kingdom both stone and wood were used, and a more artistic form employed. Sacred texts were placed on papyrus rolls instead of on the coffins, so that the flat sides were no longer needed for this purpose. As a consequence a

human shape was given to the coffins, and the deceased was thus represented lying at full length. In the latter dynasties the rectangular shape was again employed, and in Roman times the wooden coffin was customary. Among other peoples the sarcophagus has been more or less employed and various beautiful forms have been discovered, but their great cost has been an effectual bar to their general use. The name in its etymological significance has nothing to do with the Egyptian conception of the sarcophagus; rather the two are diametrically opposed. CHARLES R. GILLETT.

Sarcoplasm: See HISTOLOGY (*Muscular Tissue*).

Sar'cosine [from Gr. *σάρξ, σαρκός*, flesh]: a product of the decomposition of CREATINE (*q. v.*), the crystalline constituent of juice of flesh, discovered by Chevreul. It forms colorless crystals, soluble in water with ease, but insoluble in ether and with difficulty in alcohol. It is neutral in reaction, though it forms salts with acids, which react acid. Sarcosine is obtainable from other sources than from creatine, as by the action of methylamine on chloracetate of ethyl. Revised by IRA REMSEN.

Sard: See CHALCEDONY.

Sardanapa'lus [Latin form of the Assyrian name]: according to an inaccurate classic tradition, the last King of Assyria. He was noted for effeminacy and voluptuousness, and in order to escape falling into the hand of the besiegers of Nineveh ended his worthless life by burning himself in his palace. It seems certain that the original of Sardanapalus is Asshurbanipal, King of Assyria, 668–626 B. C. His brother, King of Babylon, who made war against him, was burned alive, and this may be the source of the story that Asshurbanipal was burned. It is also possible that one of his weak successors on the Assyrian throne met this fate, especially the one reigning at the time of the capture and destruction of Nineveh. Asshurbanipal's large harem was chiefly a matter of statecraft, a form of alliance with the kings of many other countries. The story related by late classic writers of the tomb erected for himself, with an epitaph stating that there is nothing of life beyond eating and drinking, had its rise, of course, in one of those triumphal monuments which Assyrian kings were accustomed to set up in conquered lands, like the one of Sargon, Asshurbanipal's great-grandfather, found on Cyprus in 1845. Asshurbanipal's title to fame and gratitude is the library of clay books in the cuneiform character which formed part of his palace treasures at Nineveh. Many thousands of these books are now in the British Museum. Cf. Carl Bezold's *Catalogue of the Cuneiform Tablets in the Kouyunjik Collection of the British Museum* (3 vols., London, 1889–93). Many of the best Assyrian bas-reliefs have likewise come from the palace of Asshurbanipal. D. G. LYON.

Sardes: See SARDIS.

Sardine [from Lat. *sardi'na* = Gr. *σαρδήνη*, kind of tunny caught near Sardinia, deriv. of *Σαρδώ*, Sardinia]: a name applied to a number of fishes belonging to the family *Clupeidæ*, and especially to those preserved in oils and inclosed in tin boxes. The true sardine of the Mediterranean and contiguous ocean is the *Pomolobus* or *Clupea pilchardus*, and a very near relative of this species (*Pomolobus sagax*) is found on the Californian coast. The sardine of the Mediterranean is dressed, salted, and partly dried, then scalded in hot oil, and finally hermetically sealed in tin boxes with hot salted oil or oil and butter. The spare space in each box is filled up with oil, and, the lid having been soldered on, the box is exposed for a short time to the action of steam or hot water. These cured sardines are largely exported to various countries, where they are esteemed as a delicacy. The real sardine is something like a small pilchard; but many of the fish cured as sardines, especially those prepared on the Atlantic coast of France, are sprats, pilchards, or small herrings. The sardines of the U. S. and British North America are small herrings, and even the menhaden (*Brevoortia menhaden*). See FISHERIES. Revised by F. A. LUCAS.

Sardin'ia: an island belonging to Italy in the Mediterranean Sea, nearly midway between Spain and Italy and between Europe and Africa; and S. of Corsica, from which it is separated by the Strait of Bonifacio, 7½ miles wide. It is divided into the two provinces of Cagliari and Sassari. Area of the island, 9,294 sq. miles. Pop. (1893) 741,362. A range of mountains—whose highest peak, Gennargentu, situated nearly in the center of the island, rises 6,233 feet—traverses the island from N. to S., and sends out branches to both sides. These mountains are in some places completely naked and barren, but in others they are covered with forests or with fine pastures, and almost everywhere they contain marble, alabaster, lead, copper, iron, rock-crystal, etc., though mines and quarries are not much worked. Between the offshoots of the central range lie large table-lands or slightly sloping valleys, in which sandy and stony districts alternate with tracts of fertile soil. Along the coasts, which are in most places steep and rugged, are found extensive salt-marshes and lagoons, which are very unhealthful owing to malaria. Some improvement, however, is being effected by drainage-works. Agriculture takes the first place among the occupations of the inhabitants, in spite of backward farming and heavy taxation. Wheat, maize, and beans, wine, olives, figs, and oranges, tobacco, linseed, cotton, hemp, cheese, butter, and wool are raised in large quantities. Horses are extensively bred, and considerable numbers of cattle, sheep, etc., are kept. The fisheries along the coasts, especially of tunny, anchovies, and sardines, are valuable, but are mostly in the hands of foreigners. Salt is the only manufacture of any importance. In 512 B. C. the island was conquered by the Carthaginians, from whom it was wrested by the Romans in 238 B. C. For several centuries after the time of Tiberius it prospered greatly, and was one of the principal granaries of the Roman empire. While owing allegiance to the Eastern empire and the popes it was overrun by the Goths, Vandals, and Saracens. In 1406 it came into the possession of Aragon, and, after a brief period of Austrian rule, in 1720 was given to the house of Savoy, under which it was long neglected. Old forms of society kept the majority of the population in ignorance and indolence, while feudal tenure and feudal jurisdiction were not finally abolished until 1856. Revised by R. A. ROBERTS.

Sardinia, Kingdom of: a former kingdom, comprising Savoy, Piedmont, Genoa, and Sardinia, with a total area of 28,769 sq. miles, and a population of over 5,000,000. It was formed Aug. 24, 1720, by a treaty between Austria and Victor Amadeus II., Duke of Savoy. The house of Savoy began to make itself felt in the history of Europe as early as the eleventh century, partly by the fidelity and vigor with which its members supported the emperors against the popes, partly by the shrewdness with which they managed to profit by the wars between Germany and France, in which they could not help being implicated. In 1111 Amadeus III. was created Count of Savoy by the Emperor Henry V., and in 1416 Amadeus VIII. was created Duke of Savoy by the Emperor Sigismund. In the war of the Spanish Succession (1700–13) Duke Victor Amadeus II. (1675–1730) was a claimant for the Spanish throne, and by the treaty of peace at Utrecht (1713) he received the island of Sicily and the title of king. Sicily he was compelled to yield to Austria in 1720, but as a compensation he received the island of Sardinia, from which he took his title of king, and thus was formed the kingdom of Sardinia. In 1831 the elder line of the house of Savoy failed, and the younger line ascended the throne with Charles Albert (1831–49). In his foreign policy Charles Albert was rather unsuccessful, but his interior administration was prudent and vigorous. The material resources of the country were developed with great sagacity, and the state was brought to a most prosperous condition. In 1848 he granted a free constitution, and the whole of Italy looked naturally to Sardinia and Charles Albert as the leaders in a war for liberty and independence. Charles Albert declared war against Austria, but on Mar. 23, 1849, was thoroughly defeated at Novara. He resigned the crown to his son, Victor Emmanuel II., who succeeded in the task of uniting the scattered Italian nation into one free state, for a history of which see ITALY.

Sar'dis, or **Sardes** [= Lat. = Gr. *Σάρδεις*; Turk. *Sart*]: ancient city of Asia Minor; capital of Lydia; situated at the foot of Mt. Tmolus, on the river Pactolus. Under Cræsus and its subsequent masters, the Persians, it was one of the wealthiest and most magnificent cities of Asia Minor. Declining under the Romans, and utterly destroyed by earthquake during the reign of Tiberius, it was rebuilt but never regained its former importance. In 1401 it was razed to the ground by Tamerlane, and its site has been almost abandoned ever since. Among its ruins a theater, stadium, gymnasium, the temple of Cybele, and two early churches may be distinguished. One of the "seven churches of Asia" was at Sardis (Rev. iii. 1–5). E. A. GROSVENOR.

Sardonyx: See CHALCEDONY.

Sardou, sär'doo', VICTORIEN: dramatist; b. in Paris, Sept. 7, 1831; studied medicine, then history; gained his liveli-

hood as a teacher and by writing for papers, magazines, and cyclopædias; tried his fortune as a dramatist in 1854 with the *Taverne des Étudiants*, which failed; tried again in 1860 with *Candide* and *Monsieur Garat*, which succeeded: and then wrote a number of plays with a rapidity almost unparalleled: *Les Pattes de Mouche*, *Piccolino*, *Les Femmes fortes*, and *Nos Intimes* in 1861; *Les Ganaches*, *La Papillonne*, and *Les Premières Armes de Figaro*, in 1862; *Bataille d'Amour* and *Les Diables noirs* in 1863; *Don Quichotte* and *Les Pommes du Voisin* in 1864; *Les Vieux Garçons* and *La Famille Benoîton* in 1865; *Nos Bons Villageois* and *Maison neuve* in 1866, etc. Most of these plays made a great and decided success, and the author took rank by general consent as the first playwright of his age, ruling the stage wherever there is one. The most prominent of his later works are *Séraphine* (1868); *Patrie* (1869); *Fernande* (1870); *Divorçons* and *Daniel Rochat* (1880); *Odette* (1881); *Fédora* (1882); *La Tosca* (1887); *Cléopâtre* (1890); *Thermidor* (1891); *Gismonda* (1894). He received the decoration of the Legion of Honor in 1863, and was received as member of the French Academy May 23, 1878. Revised by A. G. Canfield.

Saree′: town; in the province of Mazanderan, Persia; on the Tejen, 18 miles from its mouth in the Caspian Sea (see map of Persia and Arabia, ref. 2–H); center of a rich and fertile country; is an old place, mentioned by Firdausī, but long ago lost its importance. In 1836 cholera destroyed nearly the whole population, and since that time it has been rising very slowly. Pop. estimated at 8,000.

Sargas′so Seas [*Sargasso* is from Span. *sargazo*, seaweed]: areas in the North Atlantic, North Pacific, and other oceans, having an abundance of the seaweed *Sargassum bacciferum*. The best known is that in the North Atlantic, which is the central area of a whirl of currents, and is a region of light winds. It extends from the Azores to the Antilles, and from lat. 16° N. to lat 38° N., but the sargasso is most abundant W. of lon. 45° W. The seaweed is found in the Gulf Stream and neighboring waters, and is often cast upon the shores of the West Indies and Florida. In the Sargasso Sea it is in streaks, often scores of feet long, or in islands which may cover many acres, but the outlines of which are constantly changing. It forms a thin superficial layer and offers no resistance to ships. There are twenty to twenty-five plants, on the average, to each square mile, and each plant when pressed together makes from a pint to a quart when wet, or about one-eighth of this when dry. The plant vegetates freely on the Sargasso Sea, but has not been found fructifying there. Its color is greenish olive, varying with age from yellowish to whitish, and bears many berry-like lumps or floats. The patches of seaweed have a veritable fauna of fish, crustaceans, and molluscs numbering sixty or seventy species, several of which have developed marked features of protective imitation. One remarkable fish (*Antennarius marmoratus*), 2 to 4 inches long, can be distinguished from the plant only by close inspection. The Sargasso Sea has remained substantially in the same place and with the same characteristics for the 400 years since Columbus's first voyage. Mark W. Harrington.

Sargent, Aaron Augustus: U. S. Senator; b. at Newburyport, Mass., Sept. 28, 1827; was in early life a printer and editor; emigrated to California in 1849; studied law while editing *The Nevada Journal*; was admitted to the bar 1854; was district attorney of Nevada County 1855–56; vice-president of the Republican national convention at Chicago 1860; M. C. 1861–63 and 1869–73, and U. S. Senator for the term 1873–79. Became U. S. minister to Germany 1882; resigned in 1884. He was the author of the first Pacific railway act passed by Congress. D. in San Francisco, Cal., Aug. 14, 1887.

Sargent, Charles Sprague: arboriculturist; b. in Boston, Mass., Apr. 24, 1841; graduated at Harvard College 1862; from that time served in the Union army until the close of the civil war, attaining the rank of major; then traveled in Europe; appointed director of the Arnold arboretum and botanic garden of Harvard College in 1872, holding that position six years; in 1878 appointed Arnold Professor of Arboriculture in Harvard College; in 1879 became special agent of the tenth census to collect statistics in regard to the forests of the U. S.; became head of the forest division of the northern transcontinental survey; in 1888 became editor of *Garden and Forest*; has written many papers for scientific and other journals on botany, forestry, etc. He is the author of *Report on the Forests of North America* (being vol. ix. of the *Reports of the Tenth Census of the United States, 1883*); *The Woods of the United States, with an Account of their Structure, Qualities, and Uses* (1885); *The Silva of North America* (begun in 1891); and *Notes on the Forest Flora of Japan* (1894).

Revised by Charles E. Bessey.

Sargent, Epes: journalist and author; b. at Gloucester, Mass., Sept. 27, 1813; educated at the Boston Latin School and Harvard College; was editorially connected at different times with the Boston *Advertiser* and *Atlas* (1837), the New York *Mirror* (1839) and *New Monthly Magazine* (1843), and the Boston *Evening Transcript* (1846). In 1847 he settled at Roxbury, near Boston, and devoted himself entirely to literary work. He was an industrious compiler of readers and speakers for schools; edited many reprints and collections, and wrote a number of successful plays, such as the *Bride of Genoa* (1836) and *Velasco* (1837), besides tales for the young, poems, and novels, some of which were once popular, but are mostly forgotten. Some of his songs were spirited and were set to music. The best known of them is *A Life on the Ocean Wave*. Perhaps his *Life of Henry Clay* (1842) and his *Songs of the Sea* (1847) have the best title to remembrance among his original writings. D. in Boston, Dec. 31, 1880. H. A. Beers.

Sargent, John Singer: portrait and figure painter; b. in Florence, Italy, of American parents, in 1856; pupil of Carolus Duran, Paris; honorable mention, Paris Salon, 1878; second-class medal, Paris Salon, 1881; medal of honor, Paris Exposition, 1889; Legion of Honor, 1889. He was one of the greatest modern portrait-painters. His works are distinguished by consummate technical skill, and are excellent in the representation of character. He painted many portraits in Paris, London, New York, and Boston. He lived in Paris for a number of years, from about 1872 to 1885, then went to London. He visited the U. S. in 1888, 1889, and 1891. His picture of a Spanish dancer, *La Carmencita*, first exhibited in New York in 1890, was bought by the French Government in 1892. He was a member of the Society of American Artists (elected 1880), an associate of the National Academy, a member of the Société Nationale des Beaux-Arts, Paris, and a member of the Royal Academy (1897). D. Apr. 13, 1900. W. A. C.

Sargent, Winthrop: soldier; b. at Gloucester, Mass., May 1, 1753; graduated at Harvard 1771; became captain of one of his father's ships 1775; navy-agent at Gloucester 1776; served at the siege of Boston as captain of artillery, and subsequently in the Long Island, New Jersey, and Pennsylvania campaigns, attaining the rank of major; was connected with Gen. Rufus Putnam's Ohio Company; was made by Congress surveyor-general of the Northwest Territory 1786; became its secretary 1787; was its Governor 1798–1801; was adjutant-general of St. Clair's expedition against the Miami Indians 1791, and in Wayne's expedition 1794–95, being wounded in the former; was a member of the American Academy of Arts and Sciences and of the Philosophical Society, and an original member of the Society of Cincinnati as delegate from Massachusetts; aided Dr. Benjamin S. Smith in preparing his *Papers Relative to certain American Antiquities* (1796); published *Boston*, a poem (Boston, 1803); was Governor of Mississippi Territory 1790, and again 1801. D. in New Orleans, June 3, 1820.

Sargent, Winthrop: author; grandson of Maj. Winthrop Sargent; b. in Philadelphia, Pa., Sept. 23, 1825; graduated at the University of Pennsylvania 1845, and at Cambridge Law School 1847; practiced his profession in Philadelphia, and subsequently in New York; edited from original MSS., with a valuable introductory memoir, *The History of Braddock's Expedition against Fort Duquesne* (Philadelphia, 1855); edited *The Loyalist Poetry of the Revolution* (1857) and several reprints of curious Revolutionary tracts: and was author of *The Life and Career of Major John André, Adjutant-General of the British Army in America* (Boston, seventy-five copies only, 1861), a work of extraordinary research. He wrote largely for *The North American Review* and other magazines; was an accomplished bibliographer; was for many years engaged in preparing a *catalogue raisonné* of books relating to America (unfinished). D. in Paris, France, May 18, 1870.

Sar′gon [Assyr. *Sharru-kenu*, the true king]: King of Assyria 722–705 B. C.; founder of the last and most illustrious Assyrian dynasty 722–606 B. C. He appears to have been a usurper, though probably of royal stock. Numerous records

of his reign, written on clay cylinders and prisms and on alabaster tablets, are extant, and give a full picture of the royal activity. He was a great general and waged successful wars with the Chaldæans, Egyptians, Philistines, Hebrews, and many other peoples. In his first year he took Samaria, carried the leading inhabitants of Israel into exile, repeopled the land by captives from Babylonia and elsewhere, and thus put an end to the kingdom of Israel. But for the monuments, one might suppose (from 2 Kings xvii.) that this was done by Shalmaneser, the predecessor of Sargon. In the closing years of his reign he built a new palace at *Dûr-Sharru-kenu*, near Nineveh, where he was murdered 705 B. C. (See ASSYRIA and ASSYRIAN EXPLORATIONS.) In *Die Keilschrifttexte Sargons* (vol. i., Leipzig, 1889) Hugo Winckler has given all accessible Sargon inscriptions in transliteration and German translation. The preface to this volume gives the earlier bibliography; vol. ii. (Leipzig, 1889) gives the inscriptions in the cuneiform. D. G. LYON.

Sarma'tia (in Gr. Σαρματία): the ancient name for the vast regions extending from the Baltic to the Black Sea, and from the Vistula to the Volga.

Sarmiento, sär-mi-en'tō, DOMINGO FAUSTINO: statesman and educator; b. at San Juan (now in the Argentine Republic), Feb. 15, 1811. He was poor, and from his sixteenth year engaged in teaching, for which he showed a great aptitude; the idea of promoting popular education became a passion with him even while his own studies were hampered by lack of means. In 1829 he fought against Rosas and Quiroga, and was forced to fly to Chili. Returning to San Juan in 1836, he established a newspaper; this, though not a political sheet, was seized, and after suffering imprisonment he again fled to Chili. Encouraged by Manuel Montt and others, he was able to carry out some of his educational schemes, established a normal school at Copiapó, and from 1844 to 1847 traveled in Europe and the U. S., studying school systems. The results of these studies were embodied in 1847 in a report to the Chilian Government, which was published and had a wide circulation. In 1852 he took part in the overthrow of Rosas. From that time, aided by the Government, he devoted himself to the cause of popular education in Buenos Ayres and the provinces. In 1856 he organized the department of public instruction, of which he became the chief. He was Minister of Public Instruction 1860, and of the Interior 1861; subsequently was governor of San Juan and minister to the U. S., and while occupying the latter position was elected president of the Argentine Republic. During his term, Oct. 12, 1868, to Oct. 12, 1874, the Paraguayan war was brought to a successful close, and an insurrection was put down. The president was indefatigable in promoting education; schools and colleges were founded in all parts of the country; American and European teachers were invited to Argentina, and a national observatory was established. At the same time railways and other improvements were rapidly pushed forward. Dr. Sarmiento was debarred from re-election only by the constitutional provision. Among his numerous published works are biographies of Lincoln and Quiroga, and *Civilización y barbarie*. D. at Asuncion, Paraguay, Sept. 11, 1888. HERBERT H. SMITH.

Sarmiento de Gambo'a, PEDRO (often written *Pedro de Sarmiento Gamboa*): navigator; b. in Galicia, Spain, about 1530. He was long prominent on the Peruvian coast, and was with Mendaña in the discovery of the Solomon islands, 1568. In 1579 he was sent from Callao with a fleet of eleven vessels to explore the Strait of Magellan and intercept Drake, who was expected to return that way; Drake crossed the Pacific and returned by the Cape of Good Hope; but Sarmiento explored the coasts of the strait and returned in 1580 to Spain, where he submitted a report of his voyage (since published). Philip II. resolved to fortify the strait; for this purpose he dispatched Sarmiento, toward the end of 1581, with twenty-four vessels and 2,500 men; Diego Flores Valdez was associated with him. Eight vessels were lost in a storm, and at the entrance of the strait Valdez deserted with twelve more. In Jan., 1583, Sarmiento established a colony of 300 men at San Felipe (afterward called Port Famine), and returned to Europe, but was captured by an English cruiser and kept a prisoner until 1588. Nearly all the colony died of starvation; a survivor was rescued by Cavendish in 1587, and another by Meriche in 1589. Sarmiento died soon after his release. HERBERT H. SMITH.

Sar'nia: a port of entry; capital of Lambton county, Ontario, Canada; is situated at the head of Lake St. Clair, and opposite the Michigan town of Port Huron, and is the terminus of a tunnel under the St. Clair river (see map of Ontario, ref. 5–B). Point Edward (formerly Port Sarnia) is a northern suburb of the town. Sarnia has thriving manufactures, and extensive commerce by rail and steamers. Pop. (1891) 6,693.

Sar'no: town of Southern Italy, province of Salerno, about 12 miles N. of the city of Salerno (see map of Italy; ref. 7–F). It is situated on the western slope of the spur of the Apennines which divides the valley of the Volturno from that of the Sarno. Silk, cotton, linen, and hempen fabrics are manufactured and exported. Besides the more common products of Southern Italy, cotton is grown extensively in the vicinity. Pop. 11,680.

Sarpe'don (in Gr. Σαρπήδων): in Grecian mythology, son of Zeus and Laodamia, grandson of Bellerophon, Prince of Lycia. He fought on the side of Troy in the Trojan war, and was slain by Patroclus. His body was carried back to Lycia by the brothers Sleep and Death, where it was given honorable burial by his kinsmen. The story is told in the *Iliad* of Homer. J. R. S. S.

Sarpi, saar'pĕe. PIETRO, commonly known under his monastic name, Fra PAOLO: ecclesiastic and historian; b. at Venice, Aug. 14, 1552; entered the order of the Servites in 1565; became provincial in 1579 and procurator-general in 1585. As such he resided at Rome, where he enjoyed great favor at the papal court, and kept up constant intercourse both with leading churchmen like Bellarmine and with the foremost scientists of the day. While his eagerness for knowledge was thus stimulated, his faith seems to have been weakened and he was regarded with suspicion. In 1588 he returned to Venice and devoted himself for some years to the study of mathemathics, physics, astronomy, and medicine. Several important discoveries—that, for instance of the circulation of the blood—have been ascribed to him, but the evidence in his favor is insufficient. In 1606 the republic chose him her counselor and theologian in the controversies with Pope Paul V. concerning the relations between Church and state. Sarpi opposed the papal claims with great energy, and wrote several works against the censures pronounced by Rome, and especially against the interdict under which the Venetian republic was placed. At different times attempts were made upon his life, and, in spite of his caution, he was dangerously wounded Oct. 5, 1607. After his recovery he was offered a private residence by the government, but he preferred to spend the rest of his days in his monastic cell, where he died Jan. 14, 1623. His chief work, the *Istoria del Concilio Tridentino*, was published in London in 1619, through the agency of Marco Antonio de Dominis, and under the pseudonym *Pietro Soave Polano*. It was translated into English in 1629 and 1676. It was ably written, but its partisan spirit and erroneous statements called forth several rejoinders, the principal one being Pallavicini's work on the same subject (1656). A collected edition of his works, including his letters, appeared at Venice in 6 vols. in 1677. His *Life* was written by Bianchigiovini in 1836 and by Miss A. G. Campbell in 1875. See also T. A. Trollope, *Paul the Pope and Paul the Friar* (London, 1860), and *Fra Paolo Sarpi, the Greatest of the Venetians*, by Rev. Alexander Robertson (London, 1894). These accounts are favorable. On the other side, see Giusto Fontanini, *Storia Arcana della Vita di Pietro Sarpi* (1863); C. Cantu, *Gli Eretici d'Italia* (1870); and the *Civiltà Cattolica*, sixth series, vol. xii. (1867). J. J. KEANE.

Sarrace'nia [Mod. Lat., named in honor of Dr. Sarrasins, of Quebec]: a genus of North American herbs of the family *Sarraceniaceæ*, remarkable for the expanded petal-like style, and especially for the hollow pitcher-shaped leaves (see PITCHER-PLANTS), usually half full of water, and containing many drowned insects. Of the six species *S. purpurea* is the commonest. Its roots, and those of *S. variolaris*, at one time had a great reputation as a remedy in smallpox.
Revised by CHARLES E. BESSEY.

Sarsaparilla [from Span. *zarzaparrilla*; *zarza*, bramble, and probably Parillo, the name of a physician]: the dried roots of certain species of smilax, indigenous in the northern part of South America and in Central America, especially *Smilax officinalis* and *S. medica*. The medicinal species of smilax are climbers, growing from a large woody rootstock, from which long fleshy roots grow horizontally in all directions. These vary in thickness from that of a quill to that of the little finger, and consist of a thick cortical portion covered with a thin epidermis of various colors, a

thin ligneous layer, and a central medulla, which often abounds in starch. The roots have scarcely any smell, but when chewed produce a disagreeable acrid impression in the mouth, which persists for some time. Sarsaparilla contains a crystallizable principle called parillin, upon which such medicinal virtues as the drug possesses most probably depend. There are various sorts of sarsaparilla, obtained from different localities, which are most easily grouped into the mealy and non-mealy, according to the proportion of starch they contain. Of the mealy are Honduras, Guatemala, and Brazilian or Lisbon sarsaparilla, and of the non-mealy Jamaica, Mexican, and Guayaquil. Sarsaparilla was at one time held in high esteem as a medicine, principally as a remedy for syphilis, but it is now accorded but feeble power, and where used is prescribed simply to assist the action of more potent drugs. Revised by H. A. Hare.

Sarsfield, Patrick, Earl of Lucan: Jacobite soldier; b. in Ireland about 1645; served on the Continent in the English Life Guards, under the Duke of Monmouth, and against him at Sedgmoor 1685; was at the Revolution a member of the Irish Parliament; adhered to the cause of King James; fought at the battle of the Boyne July 1, 1690; compelled William III. to raise the siege of Limerick Aug., 1690; commanded the Irish reserve at the battle of Aughrim July 12, 1691; exhibited great gallantry in the second defense of Limerick; retired to France with a corps of Irish volunteers; distinguished himself at Steenkirke Aug., 1692, and was killed at the battle of Landen July 19, 1693.

Sartain', Emily: See the Appendix.

Sartain, John: engraver, designer, and literary editor; b. in London, England, Oct. 24, 1808; became an engraver; and did some important work, including some of the plates for William Young Ottley's works on early Italian prints. He removed to the U. S. in 1830, and settled in Philadelphia. He is generally thought to have introduced mezzotint engraving into America. He also practiced oil-painting and miniature-painting on ivory and vellum. Afterward he was editor and proprietor of *The Foreign Semi-monthly Magazine*, and having bought *The Union Magazine* renamed it, making it *Sartain's Union Magazine*. He designed several public monuments, among which is that to Washington and Lafayette in Monument Cemetery, Philadelphia. His *Reminiscences of a Very Old Man* was published in 1899. D. in Philadelphia, Oct. 25, 1897. Revised by Russell Sturgis.

Sartain, Samuel: See the Appendix.

Sartain, William: See the Appendix.

Sarthe, särt: department of France, extending on both sides of the Sarthe; comprises an area of 2,396 sq. miles. The surface is mostly level, and the soil often light and sandy. Wheat and wine are produced, but the rearing of cattle, poultry, and bees is the chief occupation. The manufactures comprise iron, glass, porcelain, and faïence. Capital, Le Mans. Pop. (1896) 425,077.

Sarti, Giuseppe: composer; b. at Faenza, Italy, Dec. 28, 1729; received his musical education in Bologna; composed his first opera in 1752, *Pompeo in Armenia*, which had success; was director of the opera at Copenhagen 1756–65; visited London in 1769–70; was chapel-master at the Cathedral of Milan 1779–84; went in that year to St. Petersburg as director of the opera. D. in Berlin, July 28, 1802. He composed over thirty operas, of which none, however, made any great impression, but of his church music his terzetto, *Amplius Lava Me*, is still remembered. He was the teacher of Cherubini.

Sarto, Andrea, del; properly Andrea d'Agnolo, named *del sarto*, or [son] of the tailor, from his father's calling: painter; b. probably at Gualfonda, in Tuscany, in 1487. It is commonly stated that his family name was Vannuechi. He was apprenticed to a goldsmith, then to Giovanni Barile, a Florentine painter of no eminence, and finally to Piero di Cosimo, an artist of ability, with whom Andrea remained for some years. He was still a very young man when he painted the frescoes at the convent of the Servi, in Florence, on the square of the Annunziata, and those of the convent of the Scalzo in the old Via Larga, now Via Cavour. By the time he was twenty-five he was one of the best fresco-painters in Florence, and also a consummate painter in oil. From that time until his death he was the generally accomplished artist, capable of any kind of work, and incapable, in a sense, of error, as his nickname, *Andrea senza errore*, suggests. Without great elevation of style or much originality of conception, he was still a painter of delightful pictures, the color of which is especially to be enjoyed. In 1518 he went to the court of France and painted for King Francis I., and the story is told that the king intrusted money to him to be used in the purchase of pictures in Florence, and that Andrea misappropriated it. He was certainly in Florence again in 1521, and never left Italy, and rarely Florence, after that time. D. in Florence, Jan. 22, 1531. Of his numerous frescoes, those in the convent of the Servi represent scenes in the legendary *Life of St. Philip*, a *Birth of the Virgin*, in which a lovely female figure is asserted to be a portrait of the artist's wife, and a *Procession of the Magi*. In a cloister adjoining is the noble fresco of the Holy Family called *La Madonna del Sacco*, because St. Joseph is leaning on a large full sack. The frescoes in the Scalzo convent are in monochrome, a series of biblical subjects with ornamental borders. At Poggio a Caiano is a very important fresco of *Cæsar receiving Tribute*. Of his easel-pictures one of the finest is in the Louvre, *Charity*. There are also there two pictures of the *Holy Family* and an *Annunciation*. In the London National Gallery is a valuable portrait of himself. In the Pitti Palace there are two *Annunciations*, a *Deposition from the Cross*, the portraits of himself and wife, and a dozen other pictures of value. In the Uffizi Gallery is the *Madonna di San Francesco*. Very many other paintings are to be seen in public and private galleries throughout Europe. Russell Sturgis.

Sarto'ris, Adelaide (*Kemble*): See Kemble.

Sarts: a name applied to the sedentary natives, as distinguished from the nomads, in Turkestan and neighboring parts of Central Asia, whatever their ethnic relations, but sometimes limited to the sedentary population of Turkish language and relationship in Russian Turkestan. As thus limited they number about 700,000, are homogeneous, devoted to trade, are Mohammedans, and have a considerable sacred literature. M. W. H.

Sartwell, Henry Parker, M. D., Ph. D.: botanist and physician; b. at Pittsfield, Mass., Apr. 18, 1792; surgeon in the U. S. army during the war of 1812–15; settled at Bethel, Ontario co., N. Y., 1821, and at Penn Yan 1832; for more than forty years was an enthusiastic botanical collector, forming an herbarium of 80,000 species, owned by Hamilton College, Clinton, N. Y. About 1846 he devoted his whole time to the study of the genus *Carex*, and brought out *Carices Americanæ Septentrionalis Exsiccatæ* (2 parts, New York, 1848; part iii. unfinished). D. at Penn Yan, Nov. 15, 1867.

Saskatch'ewan: district of the Northwest Territories of Canada, between lats. 52° N. and 55° N., with Keewatin and Manitoba on the E. and Alberta on the W. Area, 107,092 sq. miles. It is a well-watered and wooded country, thickly scattered with lakes, especially in the northern half, and is crossed from W. to E. by the Saskatchewan river. It is generally level or gently rolling, but a series of lofty hills follow along the south bank of the river just named. A large part of it is considered suitable for colonization, and it is made accessible by a railway extending from Prince Albert southward to Regina on the Canadian Pacific Railway, and by the Saskatchewan, which is navigable. The population in 1891 was 11,150, of whom over half were Indians and nearly one-fourth half-breeds. The latter are mostly of French descent, and, with a few of pure French race, are for the most part settled about Batoche on the South Saskatchewan. The agricultural products are yet small, and include live stock, wheat, barley, oats, peas, and potatoes. There is also a considerable production of pelts, mostly musk-rat. The chief settlements are Battleford and Prince Albert. Mark W. Harrington.

Saskatchewan River: a river which rises on the eastern slope of the Rocky Mountains in two main branches, flows eastward for about 1,200 miles, and empties into Lake Winnipeg. A few of the minor branches of the South Saskatchewan have their sources in the U. S. It is a part of the drainage system that reaches Hudson Bay through Nelson river, which is one of the great hydrographic basins of North America. From the junction of the North and South Saskatchewan to Lake Winnipeg the river flows through the deserted bed of Lake Agassiz. The sources of the north and south branches are stated by Dr. Hector to be but a few miles apart, in a nucleus of lofty summit-glaciers about lat. 51° 40′ N., lon. 117° W., near Mt. Hooker, 15,700, and Mt. Brown, 16,000 feet in height, where the Rocky Mountains are 200 miles in breadth. Thence diverging 300 miles apart midway, they unite at 550 miles in direct distance eastward,

the course of the north branch being about 836 miles, the south branch about 903 miles. At 260 miles up the latter it receives Red Deer river, about 445 miles long, on the left. About 177 miles up the north branch it receives on the right Battle river, nearly 400 miles long. Measured in August, the volume of water flowing in the north branch was 25,264, and in the south branch 34,285 cubic feet per second, or very little more than the mean of the Rhine. A little below their junction it measured 59,667 cubic feet per second. At 333 miles farther it enters Cedar Lake, 30 miles long; at 20 miles from which it enters Lake Winnipeg, descending 60 feet, 43½ of which is in the Grand Rapid, 2¾ miles long, commencing 5 miles from the mouth. The last 2 miles are swift waters. The Saskatchewan is narrow, varying from 220 to 660 yards in width below the forks. In the south or lesser branch navigation is obstructed at low water by shoals and shifting sandbars. By warping up two rapids, steamboats can easily ascend from the head of the Grand Rapid to Fort Edmonton on the north branch, 850 miles, and probably very nearly to Rocky Mountain House, 160 miles higher. The average ascent in the 894 miles is 15 inches per mile. Revised by I. C. Russell.

Sassafras [= Fr. from Span. *sasafras*, sassafras < Lat. *saxifraga*, saxifrage. See Saxifrage]: the *Sassafras officinale*, a tree of the family *Lauraceæ*, common in the eastern parts of the U. S., from Massachusetts to Iowa, Kansas, and southward. Its leaves are aromatic and highly mucilaginous, and the bark of the root is a powerful stimulant, with a pleasant taste and smell. It has considerable use in medicine, but is employed principally for flavoring.
Revised by Charles E. Bessey.

Sassafras-nuts: See Pichurim Beans.

Sassafras, Oil of: a highly fragrant essential oil, obtained from the root of the sassafras-tree, which contains from 1 to 2 per cent. of it. It is heavier than water; boils at 430° F. Saint-Evre gives as its composition $C_{20}H_{20}O_4$.

Sassan'idæ: name of a celebrated Persian dynasty. It was founded in 226 by Ardshir, or Artaxerxes, son of Sassan, who overthrew the Arsacidæ and reigned as Shahinshah, king of kings, till 240; it ended in 651. The reign of the Sassanidæ was a period of national glory and prosperity. The boundaries of their empire were extended and its resources developed, though engaged in almost ceaseless struggle with the Romans or the Byzantines. Sapor I. (240–273) defeated the Emperor Valerian at Edessa, took him prisoner, and, having flayed him alive, hung up his skin in a temple. Sapor II. (310–381) conquered Armenia and defeated the Romans in eight battles, in one of which, at Ctesiphon, the Emperor Julian was slain (363). Chosroes I. the Great (531–579) ruled from the Indus to the Mediterranean, from the Jaxartes to Egypt and Arabia. The dominions of Chosroes II. (591–628) reached the Thracian Bosphorus, but he was overcome by Heraclius I. Yesdigerd III. (632–651) was defeated at the battle of Cadesiah, after which Ctesiphon was destroyed and the Persian royal crown sent to the Caliph Omar at Medina. E. A. Grosvenor.

Sas'sari: town of Sardinia; capital of the province to which it gives its name, in the northwest portion of the island, about 12 miles from the seashore (see map of Italy, ref. 7–B). The commerce of Sassari is almost entirely carried on by the Genoese. The principal exports are oil, grain, and cheese. It formed an independent republic from 1294 to 1323. Pop. (1893) 41,200.

Sassy-bark: one of the ordeal drugs of Western Africa. It is the bark of the *Fillæa suaveolens* or *Erythrophlœum guineense*, a large tree of the order *Leguminosæ*. Like the Calabar bean, it is a very poisonous narcotic, administered in Africa to supposed witches. Its properties are not well understood.

Sas'tean Indians: a linguistic stock formerly inhabiting Siskiyou co., Cal., in Shasta and Scott river valleys, and along the Klamath from beyond Bogus creek to the hills above Happy Camp, and extending into Oregon as far as Ashland. Their southeastern limit was Mt. Shasta. The stock comprised three divisions: the Autiré of Shasta valley, with nineteen villages and about 1,140 souls in 1851; the Édohwe, with twenty-four villages containing about 1,440 inhabitants on Klamath river, where a few of them still remain; and the Iruwai of Scott valley, with a population of about 420 in seven villages. The Sastean Indians had a reputation of being skilled in warfare, and in 1855 they and the Rogue river Indians participated in the rebellion of the Oregon tribes. This revolt ended in their subjugation, and most of their number have since been placed on Grande Ronde and Siletz reservations, Oregon, where in 1885 they numbered about sixty-seven, including seventeen half-bloods. Although commonly called Shasta, or Shastika, the more correct form of the name is Sásti, a term probably containing the Palaihnihan word *tchastl*, signifying three. They have also been called Saiwash, but their aboriginal appellation is Kútikĕkanaí. The Sastean language seems to show a slight affinity with that of the Palaihnihan Indians. See Powers's *Tribes of California* (in *Contributions to North American Ethnology*, iii., Washington, 1877). F. W. Hodge.

Satan [= Lat. = Gr. Σατᾶν = Heb. *Sātān*, liter., adversary, deriv. of *sātān*, be adverse, persecute]: a name which occurs only three times in the later books of the Old Testament as the proper name of a power or personality: in Zach. iii. 1, as opposing the heavenly purification of Joshua, the high priest; in Job i. 6–9, 12; ii. 1–4, 6, as one of the heavenly court and as the tempter of men; and in 1 Chron. xxi. 1, as leading David astray to number the people. It is true that the popular fancy pictured the waste places to be full of malignant spirits (Sēīrīm, Shēdhīm, Līlīth, Azazel, etc.); but the idea of God was conceived of by the prophets as too high to admit of any power being able to oppose or even to complement his power. With increased theological speculation on the problem of evil, however, the malignant spirits were developed into *a* malignant spirit. The change is readily seen in 1 Chron. xxi. 1. In the parallel older narrative (2 Sam. xxiv. 1) it is God himself who leads David astray. It seems probable that the philosophical dualism of Zoroaster had some influence upon this development. In the *Avesta*, Ahriman (Auro-Mainyu), as the principle of evil, is coeval, coequal, but not coeternal with Ahura-Mazda. The parallelism becomes more complete in the later development of this idea in the Zoroastrian doctrine on the one hand, and in the Jewish and Christian on the other. Ahriman is called the arch-devil (Devāna Devo); he has under him a whole army, spreads lies, and is the origin of evil, death, and darkness; but, in the end, right will triumph and evil be destroyed. In the Apocrypha we find only two mentions of Satan: Sirach xxi. 27; and Wisdom ii. 24, where he is said to be the author of death. In Talmudic theology Satan is represented as the chief of all hurtful influences, is identified with the serpent, is said to have been born at the same time as Eve. He not only excites evil inclinations, but is identified with them. In order to lead man astray he takes on various forms. He then becomes his denouncer (κατήγορος). He is also, at times, the angel of death. In the New Testament we find the fullest development of this idea. Satan appears there under the names of Σατανᾶς, διάβολος, ἀντίδικος, ἔχθρος, ἀντεκείμενος, κατήγωρ, ὁ δράκων ὁ μέγας, Βεελζεβούλ, Βελίαρ, as the personification of evil, exciting to sin, and sowing lies. He is a supernatural being, who sinned even before creation, and attempts to lead men astray by all manner of guile. He stands at the head of a host of beings like unto him who enter into the physical body of man and beast, producing all manner of sickness. He has also power to bring death. But over Christ he has no power, for he has come to destroy the work of Satan: and as far as man becomes like Christ—without sin—in so far Satan has no power over him. At the end of this æon he will reign for a short time, only to feel again the power of Christ. The early Church endeavored to soften this apparent dualism (cf. Marcionites, Manichæans) by supposing that Satan was a fallen angel, an idea found also in Talmudic theology. See Devil and Zoroaster; also Cheyne, *Origin and Rel. Contents of the Psalter* (New York, 1891, p. 282); Kohut, *Jüd. Angel. und Daemonologie* (Leipzig, 1866, p. 62); *Real-Encycl. für protest. Theol. und Kirche* (Leipzig, 1885, vol. xv., p. 358); Weber, *Syst. der altsyn. Theol.* (Leipzig, 1880, p. 243). Richard Gottheil.

Sata'ra: ancient town of British India; capital of a district of the same name, in lat. 17° 41′ N., lon. 74° 1′ E. (see map of S. India, ref. 3–C). It has a fort, and is noted as one of the most salubrious and pleasant stations of the Deccan. Pop. (1891) 29,601. The district of Satara, with an area of about 5,000 sq. miles, and 1,075,000 inhabitants, came into the hands of the British in 1848, the rajah who had reigned under British authority dying without heirs.

Satellites: See Solar System, Jupiter, Mars, Moon, Neptune, Saturn, and Uranus.

Satin [from O. Fr. *satin*, from Ital. *setino*, deriv. of *seta*, silk < Lat. *sæta*, hair, whence Germ. *seide* and Fr. *soie*]:

a smooth and lustrous fabric of silk, of Chinese invention. Of the warp threads only one in every five or ten is raised to allow the shuttle to be passed, but each thread is raised in regular succession as the shuttle is thrown. It is woven with the right side uppermost.

Satin Bower-bird: See BOWER-BIRD.

Satinet: a coarse fabric, of which the warp is cotton and the weft woolen; originally, an inferior variety of satin.

Satin-spar: a fibrous variety of carbonate of lime, of snowy whiteness, found in England, Scotland, and elsewhere, which when polished has a luster resembling that of satin. A fibrous kind of GYPSUM (*q. v.*), also called satin-spar, is softer than the above, and is frequently made into ornaments resembling cat's-eye.

Satin-wood: a name given to several kinds of ornamental wood. The best is from Guiana, and is the wood of *Ferolia guianensis*, now included in the genus *Parinarium*. Florida satin-wood is from *Xanthoxylum floridanum*, a kind of prickly-ash tree. The West India satin-wood is from different trees, some of it of the very best and others of the poorest quality. The rich and fragrant satin-wood of India is usually of good quality. It comes from the *Chloroxylon swietenia*, a cedrelaceous tree which yields a sort of wood-oil. Satin-wood is used in making workboxes, hair-brushes, and cabinet-work. Revised by L. H. BAILEY.

Satire [viâ O. Fr. from Lat. *sa'tira*, *sa'tura* (sc. *lanx*, dish), a dish filled with various kinds of fruits, food composed of various ingredients, a mixture, medley, liter., fem. of *satur*, filled with food, sated]: a form of composition, which, as an attack on the weakness and wickedness of humanity, belongs to all mankind and to universal literature. Prose is at its service as well as poetry; it may take the shape of sermon as well as song. It may be dramatic, as in comedy, mask, and mummery. It may be epigrammatic, as in lampoon and pasquinade. It may be indirect, as in parody and travesty. It may be a formal diatribe; it may be an informal skit. Satire is older than comedy, for the *silli* of XENOPHANES (*q. v.*) were satirical and every phase of satire was represented in Greek literature. But the great models of satirical art are found in Roman literature. Whenever satire as literature is mentioned Horace and Persius and Juvenal come up to the mind, and the satire is assuredly most congenial to the Italian temperament, ancient and modern. Nor were the Romans slow to claim satire as their especial province. *Satura quidem*, says Quintilian (x., 1, 93), *tota nostra est*, and the loss of the Greek forerunners has enabled the Romans to make good their claim here as in the whole field of didactic poetry to which satire stands related as does the application to the sermon. The first appearance of *satura* in Roman literature is in the *saturæ* of ENNIUS (*q. v.*), where it is evidently a medley in verse; the *Saturæ Menippeæ* of VARRO (*q. v.*), of which we have considerable fragments, are in prose and verse, as is the so-called *Satiricon* of PETRONIUS ARBITER (*q. v.*).

The subjects of Ennius and of Varro covered a wide range, and their miscellaneous character corresponds to the original meaning of the word. In the hands of Lucilius the *satura* was largely used as an instrument for personal attack on the characters of those who had stirred the poet's indignation, and, though the fragments of Lucilius show that motley was the wear of his muse also, still the Lucilian satire has narrowed the range of the word, just as the mocking epigram has prevailed over all the other Greek forms, and just as elegiac has become synonymous with plaintive. In its function, then, the satire was assimilated to that especial form of the Old Attic comedy which dealt with personal abuse, the form known as the ἰαμβικὴ ἰδέα; and when the native historians of Roman literature followed the established fashion of paralleling Roman with Greek and tried to adjust the growth of Roman comedy to Aristotle's schemes for Greek comedy, the *satura* naturally took the place of the Old Attic comedy, and the resemblance was emphasized by Horace and Persius themselves. Cratinus, Aristophanes, and Eupolis were claimed as brothers of the same guild. In view then of the largely doctored accounts given by the Romans, both of their history and their literature, scholars may be forgiven for questioning the very existence of the dramatic *satura*, which is said to have been a manner of acted lampoon, akin to the rude *versus Fescennini* of the populace; and it has been recently maintained that this is only another Roman adaptation, another reconstruction of early Roman literary history after Greek models, just as so much Roman political history has been reconstructed after Greek models. Still it is not to be denied that there is a dramatic element in the classic satires of Rome. It comes out in sundry of the satires of Horace and is awkwardly conspicuous in Persius, but perhaps both these poets are simply living up to a theory. In Juvenal, the third of the great Roman satirists, the dramatic element is not a marked feature, and his declamatory rhetoric has had more influence on modern satire than Horace's *bonhomie*, or the priggish wisdom of Persius. By concentration, then, and crystallization the satire proper came to be as we still have it. Poetry became the medium and the hexameter the form, and though the satirical spirit might manifest itself in prose-fiction with interlarded verse, as in Petronius, or in the various measures employed by Catullus and Martial, satire as such had received its type, and that type is still potent. The accepted satire is in verse and that verse the heroic verse of the nationality—in French the alexandrine, in English the decasyllabic. French satire is represented by Boileau, English satire by Dryden and Pope, for Dryden and Pope are the models, not Butler—*Absalom and Achitophel* and the *Dunciad*, not *Hudibras*. Of course, if the term satire is widened to meet the definition given at the outset of the article it will be necessary to include a vast body of literature: Lucian and Apuleius, *Reynard the Fox*, *Tyll Eulenspiegel* (*Howleglas*), the *Piers Plowman* of Langland, the *Epistolæ Obscurorum Virorum*, and so on, down through moralists, essayists, and novelists without number, of all nationalities and of every century. Momus, the spirit of mockery and fault-finding, the son of Night, appears early in the list of Greek divinities, and his worship and his influence are universal. B. L. GILDERSLEEVE.

Satire Ménippée, să'teĕr'mā'neĕ'pā': a famous French satire, so called from the Greek philosopher Menippus, who used in his works the form of prose interspersed with verse, in which it is composed. It is due to the collaboration of Pierre Le Roy, Jacques Gillot, Nicolas Rapin, Jean Passerat, Florent Chrestien, and Pierre Pithou, and appeared in 1594, after having circulated privately in manuscript. It was aimed against the league, and its fuller title was *De la Vertu du Catholicon d'Espagne et de la tenue des Estats de Paris*. It reflects the temper of the bourgeoisie, worn out by the civil strife, and putting the peace and unity of their country above party. Good editions are those of Ch. Read (1876) and C. Labitte (1880). A. G. CANFIELD.

Satisfaction: See ACCORD AND SATISFACTION, JUDGMENT, MORTGAGE, PAYMENT, and RELEASE.

Satow, să'ō, Sir ERNEST MASON, K. C. M. G.: scholar and diplomatist; b. in London in 1842. Appointed student interpreter in Japan in 1861, he was present at the action at Kagoshima, Sept., 1863, and acted as interpreter at the bombardment of Shimonoseki, Sept., 1864. In 1876 he was promoted to be second secretary of legation at Tokio, and in 1883 received the decoration of the cross of St. Michael and St. George. During this period he had obtained a profound acquaintance with the language, history, and antiquities of Japan. In 1884 he was transferred to Siam as agent and consul-general at Bangkok, and became minister resident in the following year. He was transferred to Montevideo in 1888, and in 1893 became envoy extraordinary and minister plenipotentiary to Morocco, and in 1895 to Japan. He has published an English-Japanese dictionary, and has contributed valuable articles to the *Transactions of the Asiatic Society of Japan*. J. M. DIXON.

Satpura, săt-poo'răă [from Sanskr. *çata-*, hundred + *pu'ra-*, castle, fortified town]: a name originally restricted to the mountains which divide the Nerbudda and Tapti valleys, Northern India, but now generally applied to the great range or table-land which, commencing E. of the famous Amarkantak plateau, runs nearly up to the western coast. Accepting Amarkantak as the eastern boundary, the Satpuras have a range from E. to W. of about 600 miles, and in their greatest depth exceed 100 miles from N. to S. The shape of the range is almost triangular; from Amarkantak, 3,328 feet above the level of the sea, an outer ridge runs S. W. to a point in the Bhandara district. The average height at the crest of the chain is but little under 2,000 feet above the sea; the highest peak, Dhupgarh, in Hoshungabad, rises as high as 4,454 feet. Nearly the whole range consists of trap; toward the W. a series of craggy peaks is met with.

Satrap [viâ O. Fr. from Lat. *sa'trapes* = Gr. σατράπης, from O. Pers. *khṣatrapāvā*; *khṣatra-*, rule, power + *pā-*,

protect]: the ruler of a satrapy or province of ancient Persia. On the decline of the old kingdom some of the satrapics became independent monarchies.

Sat'suma: a province of Japan, at the southern end of the island of KIUSHIU (*q. v.*); chief town KAGOSHIMA (*q. v.*). The ruling family of Shimadzu has been represented during the nineteenth century by men of singular ability. Under them was reared a race of soldiers and statesmen who contributed the chief element in the downfall of the shogunate, and have, with the clan of Choshu, ruled Japan ever since. Satsuma ware owes its origin to Korean settlers, transported at the close of the sixteenth century. The art reached its perfection about 1840. This ware is of a cream color, and has a crackled surface.

Satsŭporo: See SAPPORO.

Satterlee, HENRY YATES: See the Appendix.

Satterlee, WALTER: See the Appendix.

Saturday [O. Eng. *Sæterdæg*, *Sæterndæg*, *Sæternesdæg*, liter., Saturn's day; Lat. *Satur'nus*, Saturn + O. Eng. *dæg*, day]: the seventh and last day of the week. It is the Jewish Sabbath, and is called *Dies Sabbati* in the Roman Catholic breviary.

Saturn (Lat. *Saturnus*): the ancient Latin god of planting and sowing, and hence of agriculture in the widest sense, the discovery of which was ascribed to him. He was conceived of as a mythical King of Latium, under whose peaceful reign the blessings of agriculture were first disclosed to the human race. His memory was cherished most faithfully by the laboring people and was perpetuated in the great popular festival of the SATURNALIA (*q. v.*), the observances of which were suggestive of the old Saturnian reign of plenty and equality. In later Roman mythology he was identified with the Greek Cronos. G. L. HENDRICKSON.

Saturn: the sixth planet in order of distance from the sun, and the third of the superior planets. It travels at a mean distance of 887,000,000 miles from the sun. Saturn circuits its orbit in a period of 10,759·2198 days, or 29 years 167·2 days. Its synodical period, or the interval between successive oppositions, exceeds a year by about 12¾ days on the average. Its volume exceeds the earth's about 700 times, but the mean density is so small that its mass exceeds the earth's only about 93 times. In fact the mean density is less than that of any other member of the solar system (except, of course, the comets), being only ·13 when the earth's is taken as unity; if the density of water be taken as the unit, that of Saturn is about ·73, or less than the density of mahogany. Its mean diameter is about 70,000 miles, its compression about $\frac{1}{10}$, so that the polar diameter is about 3,500 miles less, and the equatorial diameter about 3,500 miles greater. Saturn is distinguished among all the planets by the remarkable complexity of structure and by the number of subordinate bodies of which it is the center. The gigantic orb is girt by a mighty system of flat rings, visible even in a very small telescope, the span of which from outside to outside amounts to 167,000 miles, or more than six times the circumference of the earth. There are two chief bright rings, the outermost nearly 10,000 miles in width, the innermost about 17,500 miles in width, while between them there is a gap about 1,500 miles across. Inside the system of bright rings there is a dark ring (discovered by the elder Bond, of Harvard Observatory), which has a breadth of about 8,700 miles. Between this ring and the planet intervenes a space more than 10,000 miles in breadth. After a careful investigation, in which Laplace, Peirce, Bond, and Clerk Maxwell have taken part, astronomers have been led to the conclusion that the rings are not continuous bodies, but consist of multitudes of small satellites, mixed probably with vaporous matter, traveling in flat flights around the central orb. This is, in fact, the only possible interpretation of the actual existence and continuance of the rings; for no system of continuous rings could continue to travel in dynamical equilibrium around Saturn, or bear the strains to which the tremendous attractive power of Saturn would subject them. The globe of Saturn is marked, like that of Jupiter, by belts, but they are less distinct. The tint of the planet as a whole is yellowish, but the belts show considerable variety of color. An equatorial belt, nearly always seen, is a creamy white; the dark belts on either side are commonly cinnamon-colored; while the polar regions show a faint tinge of azure. As in the case of Jupiter, the conclusion to which we are led by the careful study of these belts and of the probable condition of Saturn's globe is, that we do not see a solid or liquid orb, but only the outer parts of a deep and cloud-laden atmosphere. In fact, the general evidence in Saturn's case is identical with that of Jupiter, and there are some points which afford even more convincing evidence as to the condition of these planets.

Satellites—Saturn is attended by eight satellites, which move in orbits outside the ring. All but the outer one move in the plane of the ring. The brightest of all is Titan, which was therefore the first discovered, having been found by Huyghens as far back as 1656. The faintest satellite is Hyperion, next outside of Titan, which was discovered by Bond, of Cambridge, Mass., and two days later by Lassell, in England, in 1848. This satellite exhibits a remarkable peculiarity in its perturbations by Titan, resulting in a revolution of its pericenter occurring in less than twenty years, and in a curious libration between the two bodies. These perturbations form a very interesting chapter in celestial mechanics, which has so far defied the efforts of the best mathematicians to work out a complete and satisfactory solution.

The outer satellite of all is Iapetus, which has the remarkable peculiarity of being much brighter on one side of the planet than on the other, showing that it performs a revolution on its axis in the same time that it revolves around the planet, and that it is much whiter on one side than on the other.

The positions of the satellites of Saturn can be found at any time from a diagram given annually in *The American Ephemeris*. The following is a list of these satellites, with their times of revolution:

ELEMENTS OF SATURN'S SATELLITES.

NAME.	Sidereal revolution.	Distance in radii of Saturn.
	d. h. m.	
Mimas	0 22 37	3·360
Enceladus	1 8 53	4·312
Tethys	1 21 18	5·339
Dione	2 17 41	6·839
Rhea	4 12 25	9·552
Titan	15 22 41	22·145
Hyperion	21 7 7	28·000
Iapetus	79 7 53	64·359

S. NEWCOMB.

Saturna'lia [= Lat., liter., neut. plur. of *Saturna'lis*, pertaining to Saturn, deriv. of *Satur'nus*, Saturn]: the old Latin festival of the god Saturn, celebrated in ancient Rome with feasting and mirth. Slaves were permitted freedom of speech and act, and all classes threw off care and toil. During the republic it was celebrated on Dec. 17; Augustus made it embrace the 17th, 18th, 19th, but popularly it included seven days. Of these seven days, the first two were the true Saturnalia, and the three following were the Opalia, in honor of Ops, while the last two were called Sigillaria, from the *sigilla* or clay toys exchanged as presents at that time. The Christian Christmas festival has retained in many parts of the world traces of the observances of the Saturnalia.
Revised by G. L. HENDRICKSON.

Saturnian Verse: See METRES.

Sat'yr-drama: in Greek literature, the fourth play of the tetralogy, which was made up of a tragic trilogy and this afterpiece. It received its name from the chorus, which was regularly composed of satyrs. The action was taken from mythology and not from everyday life, and the tone was merry. The satyr-drama held most faithfully, of all dramatic forms, to the original character of the Dionysiac festival, and may be regarded as a survival of the time preceding the perfected organization of tragedy. It was, in fact, a tragedy drunk with new wine, and in the Æschylean stage of the trilogy the subject of the satyr-drama was so chosen as to burlesque the fundamental theme and thus relieve the tension of the spectators. Æschylus, whose tragic strain often comes perilously near the line of travesty, was the greatest master of the satyr-drama, but the only extant specimen of a complete satyr-drama is the *Cyclops* of Euripides, made familiar to English readers by the translation of Shelley, who was attracted to it by the spirit of revolt.
B. L. GILDERSLEEVE.

Satyrs [from O. Fr. *satire* < Lat. *sa'tyrus* = Gr. *σάτυρος*, satyr]: in Grecian mythology, the companions of Dionysus, dæmons of the forest, akin to the mountain nymphs and the

dancing Kuretes. In their earliest form they were caricatures of the elder or bearded Dionysus: they were half-animal, and were depicted in early vase-paintings with long sharp-pointed ears, long horse-tails, long hair, and long, pointed beards. They were half-animal, not only in form, but in character: they were lustful and sensual, and vase-paintings represent them as ravishers of the nymphs and Bacchantes, and even of Iris. This antique type of satyr was supplanted by a less sensual type, which was created by Praxiteles in his famous statue, and has remained the norm of the Satyr. In the Satyr of Praxiteles we have the Puck of antiquity, the figure of a lusty youth, in which the animal nature is brought out by the goat-ears, the teat-like protuberances (*oscilla*) on the neck, the animal cast of countenance, stump nose, bristly hair, thick lips, cynical smile, and diminutive tail. In some cases sprouting horns on the forehead indicate a transition stage between the Satyr and Pan and Panisks. The Satyr must be carefully distinguished from Pan and Silenus, and especially from the Faunus of the Romans, a creation that arose from their confounding the Satyrs and Pans. J. R. S. Sterrett.

Saugerties, saw'ger-teez: village: Ulster co., N. Y.: on the Hudson river at the mouth of Esopus creek, and on the West Shore Railroad: 12 miles N. of Kingston, the county-seat (for location, see map of New York, ref. 7–J). It is in an agricultural region, has good water-power for manufacturing, and ships large quantities of bluestone, limestone, and agricultural products. There are 7 churches, 4 graded schools forming Union Free School District No. 10, a parochial school, a Young Men's Christian Association with library and reading-room, a national bank with capital of $200,000, a state bank with capital of $125,000, a savings-bank, manufactories of paper, blank books, brick, and wood-pulp, and a daily, a monthly, and 2 weekly periodicals. Pop. (1880) 3,923; (1890) 4,237; (1900) 3,697.

Editor of "Daily Post."

Saugor: island and town of India. See Sagar.

Sauk Center: city (founded in 1857): Stearns co., Minn.: on the Sauk river, and the Gt. North. and the N. Pac. railways: 117 miles N. W. of St. Paul, the State capital (for location, see map of Minnesota, ref. 8–C). It is in an agricultural region, has several flour-mills and other manufactories, and contains 10 churches, public graded and high schools, private academy and training school, a national bank with capital of $50,000, 2 private banks, and 2 weekly newspapers. Pop. (1880) 1,201; (1890) 1,695; (1900) 2,220.

Editor of "Herald."

Sauk Rapids: village (located in 1850): capital of Benton co., Minn.: on the Mississippi river, and the Gt. North. and the N. Pac. railways: 75 miles N. W. of St. Paul, the State capital (for location, see map of Minnesota, ref. 8–D). It has excellent water-power and extensive quarries of fine granite, is engaged in farming and dairying, and contains 6 churches, high school, German Lutheran school, steam sawmill, planing-mill, feed-mill, and 2 weekly newspapers. Pop. (1880) 598; (1890) 1,185; (1900) 1,391.

Editor of "Sentinel."

Saul [from Heb. *Shā'ūl*, liter., asked for]: the first King of Israel, a son of Kish, of the tribe of Benjamin; was anointed by Samuel; fought with great success against the Philistines, Moabites, Ammonites, Edomites, and Amalekites, and governed well in the earlier part of his reign, but afterward became possessed of "an evil spirit from the Lord," committed great cruelties, and fell, together with three of his sons, in the battles of Mt. Gilboa against the Philistines, about 1055 B. C. The history of the latter part of Saul's reign is simply a part of the history of David. For further details concerning Saul, see the articles David and Jews.

Saulcy, sō see', Louis Félicien Joseph Caignart, de: numismatist and Hebraist: b. at Lille, France, Mar. 19, 1807; studied at the École Polytechnique; was appointed Professor of Mechanics at the military school of Metz in 1838, and shortly after keeper of the museum of artillery; gained celebrity first as a numismatist by his *Essai de Classification des Suites monétaires byzantines* (1836); studied Assyrian and Celtic inscriptions, and wrote *Les Campagnes de Jules César dans les Gaules* (1850), but devoted himself more especially to Hebrew antiquities; visited the Holy Land in 1850, and wrote *Voyage autour de la Mer morte et dans les Terres bibliques* (2 vols., 1852–54); *Études sur la Numismatique judaïque* and *Histoire de l'Art judaïque* (1858); *Voyage en Terre-Sainte* (1865); *Les Derniers Jours de Jérusalem* (1866); *Histoire d'Hérode* (1867); *Étude chronologique des Livres d'Esdras et de Néhémie* (1868); and *Sept Siècles de l'Histoire judaïque* (1874). D. in Paris, Nov. 4, 1880.

Saulsbury, Willard: U. S. Senator; b. in Kent co., Del., June 2, 1820; educated at Delaware and Dickinson Colleges; was admitted to the bar 1845; was attorney-general of Delaware 1850–55, and U. S. Senator 1859 to 1871, when he was succeeded by his brother Eli (b. Dec. 29, 1817; d. Mar. 22, 1903), who was re-elected for third term Jan. 16, 1883. In 1874 Willard Saulsbury was appointed chancellor of Delaware. D. at Dover, Apr. 6, 1892. Another brother, Gove, was Governor of Delaware 1865–71.

Sault Sainte Marie, soo sānt-mā ree. Fr. pron. sō sānt-maā ree: village; port of entry; district of Algoma, East Ontario, Canada; on the St. Mary river, the St. Mary Falls Ship-canal, and the Canadian Pac. Railway; opposite the city of the same name in Michigan; 622 miles W. of Montreal (see map of Ontario, ref. 6–H). It has a water-power canal, electric-light plant, a pulp and paper mill operated by water-power (cost over $1,000,000), branches of the Imperial Bank of Canada and the Canadian Bank of Commerce, schools for Indian boys and girls, and two weekly newspapers. The village is in an agricultural and mineral region, is a popular summer resort, and is the seat of the Anglican Bishop of Algoma and of the Roman Catholic Bishop of Northern Canada. Pop. (1891) 2,414. Chase S. Osborn.

Sault Sainte Marie: city; capital of Chippewa co., Mich.; on the St. Mary river, near the outlet of Lake Superior, the ship-canal around the rapids, and the Duluth, S. Shore and Atlantic, and the Minneapolis, St. P. and S. Ste. Marie railways (for location, see map of Michigan, ref. 2–I). It is connected with a village of the same name on the Canadian side by an international railway bridge, 1¼ miles long, which cost $1,000,000. Navigation between Lakes Superior and Huron is facilitated by a lock and canal, which cost about $1,000,000. The U. S. Government is building a second lock, which will be the largest in the world, and will cost with improved approaches $5,000,000. The annual tonnage passing through the canal is greater than that of the Suez Canal. The city has direct connection by the bridge with the Canadian Pacific railways. There are 6 churches, 6 public-school buildings, public-school property valued at $75,000, parochial-school property valued at $8,000, 2 national banks with combined capital of $150,000, a State bank (savings) with capital of $50,000, a building and loan association, a monthly and 2 weekly periodicals, water and sewer plants, electric lights and street-railways, and an assessed valuation of $1,600,000. The industrial establishments include 23 sawmills, 2 cigar-factories, 2 brick-yards, 2 machine-shops, foundry, flour, shingle, and planing mills, shipyard and marine railway, and a branch of the State fish hatchery. Pop. (1880) 1,947; (1890) 5,764; (1900) 10,538. Chase S. Osborn, editor of "News."

Saumaise: See Salmasius.

Saumur, sō mūr': town of France, department of Maine-et-Loire: on the Loire: 30 miles S. E. of Angers: is famous for its rosaries made of cocoanut-shells, has manufactures of linens and cambrics, and trades in wine, corn, hemp, and spirits (see map of France, ref. 5–D). It was the seat of the celebrated Protestant academy founded in 1598 by the national synod of Montpellier, and suppressed by a royal edict of Jan. 8, 1685. That academy developed the first fertile school of criticism in modern theology. Pop. (1896) 16,440.

Saunders: See Santal-wood.

Saunders, Alvin: See the Appendix.

Saunders, Frederick: author; b. in London, Aug. 14, 1807; established himself in the publishing business in New York in 1836, and subsequently was for some time an assistant editor of the New York *Evening Post*. In 1859 he received the appointment of assistant librarian of the Astor Library, which office he continued to hold until the beginning of 1876, when he was made chief librarian or acting superintendent. He has published *Memories of the Great Metropolis* (1852); *Salad for the Solitary* (1854); *Salad for the Social* (1856); *Pearls of Thought* and *Mosaics* (1858); *Festival of Song* (1865); *About Women, Love, and Marriage* (1868); *Evenings with the Sacred Poets* (1871); a revised and illustrated edition of *Salad for the Solitary and the Social* (1872; new ed. 1883); *The Story of some Famous Books* (1887); and *The Story of the Discovery of the New World by Columbus* (1892).

Saunders. ROMULUS MITCHELL: jurist: b. in Caswell co., N. C., Mar. 3, 1791: studied at the University of North Carolina, but did not graduate: resided some years in Tennessee, where he was admitted to the bar 1812: returned to North Carolina; was a member of the Legislature 1815–20, and Speaker of that body two years: member of Congress 1821–27 and 1841–45: attorney-general of North Carolina 1828: president of the board of commissioners on claims against France 1833: judge of the Supreme Court of the State 1835–65, and deposed by Gov. Holden: minister to Spain 1846–50: again a member of the Legislature, and took a leading part in promoting the construction of railways in North Carolina. D. at Raleigh, Apr. 21, 1867.

Saunders. THOMAS BAILY: See the Appendix.

Saunders. THOMAS WILLIAM: legal writer: b. in England, 1813 (or 1814): entered the Middle Temple in 1832; called to the bar 1837: was employed as a revising barrister 1840–60: recorder of Bath 1860–78. He was a magistrate of the Thames police court from 1878 until within a few weeks of his death, and was remarkable for the leniency of his sentences. D. at Bournemouth, Hants, Feb. 28, 1890. He wrote numerous works, among the more important of which are *Law and Practice of Municipal Registration and Election* (2d ed. 1873): *Law and Practice of Orders of Affiliation, and Proceedings in Bastardy* (9th ed. 1888): *Practice of Magistrates' Courts* (5th ed. 1882): *Treatise on the Law of Warranties and Representations upon the Sale of Personal Chattels*: and *Treatise upon the Law Applicable to Negligence*. F. STURGES ALLEN.

Saunderson. NICHOLAS: mathematician: b. in Thurlestone, Yorkshire, England, in 1682: lost his sight by an attack of smallpox in infancy, but was carefully instructed by his father: learned Latin and Greek at academies: was taught the higher mathematics by private tutors, and displayed such mastery of all the allied sciences, including optics, that in 1707 he lectured upon them at the University of Cambridge, and on the recommendation of Sir Isaac Newton was in 1711 chosen to succeed Whiston as Lucasian Professor of Mathematics. D. Apr. 19, 1739. After his death appeared his *Elements of Algebra* (1740), to which was prefixed a biographical sketch by his son John. His *Method of Fluxions* appeared in 1756.

Sauppe, sowp pe, HERMANN: classical scholar: b. in Wesenstein, near Dresden, Saxony, Dec. 9, 1809: studied philology in Leipzig: was appointed professor at the University of Zurich in 1838, director of the gymnasium in Weimar in 1845, and professor at the University of Göttingen in 1856, where he remained till his death, Sept. 15, 1893. He edited (with Baiter) *Oratores Attici* (2 vols.): Philodemi, *De vitiis*, lib. x.: Plato's *Protagoras*, with German notes: Eugippi, *Vita S. Severini* for the *Monumenta Germaniæ* (1877). He is also the author of the famous *Epistola critica ad Godofredum Hermannum* (1841), and wrote numerous valuable articles on Greek epigraphy. His library was purchased by Bryn Mawr College, Pennsylvania. See Wilamowitz, *Nachrichten der Göttinger Gesellschaft der Wissenschaften* (1894), pp. 36–49.

Sauret. EMILE: See the Appendix.

Sau'ria [Gr. *σαῦρος*, lizard]: the group of reptiles commonly known as lizards. See LIZARD.

Saurin, *sō răn'*, JACQUES: preacher: b. in Nimes, France, Jan. 6, 1677: removed to Geneva after the revocation of the Edict of Nantes: studied theology; was chosen pastor of the Walloon church in London in 1701, and in 1705 of the Walloon church in The Hague, where he died Dec. 30, 1730. He was a powerful preacher, and several collections of his sermons have been often reprinted and translated into German and English. His *Discours sur les Événements les plus mémorables du Vieux et Nouveaux Testaments* (1720) also became very popular under the name of Saurin's Bible. There are English translations of his sermons, e. g. 2 vols., New York, 1860. See his *Life*, by E. A. Berthault (Paris, 1875). Revised by S. M. JACKSON.

Saurop'sida [Mod. Lat.: Gr. *σαῦρος*, lizard + *ὄψις*, look, appearance]: a group of vertebrates containing the reptiles and birds, which are thus united on account of many structural peculiarities which mark them off from the mammals on the one hand and from the fish-like forms (*Ichthyopsida*) on the other. In their development they have both amnion and allantois. (See EMBRYOLOGY.) In the adult the lower jaw is united to the skull by a quadrate bone: a parasphenoid bone is lacking: there is a single occipital condyle for articulation with the neck: and the cornoid bone, except in limbless forms, is well developed. They are either oviparous or ovoviviparous. Both have a tendency to develop scales on the surface of the body. Though birds and reptiles are seemingly very different, in the Mesozoic age there were many structural resemblances between them. J. S. K.

Sauru'ræ [Mod. Lat.: Gr. *σαῦρος*, lizard + *οὐρά*, tail]: a sub-class of birds characterized by a tail of many vertebræ, each vertebra bearing a single feather on either side. The digits of the hand are free from one another and clawed: the jaws furnished with teeth: the pelvis not ankylosed with the sacrum: the sternum small. The only known member of the group is the *Archæopteryx lithographica*, from the Jurassic slates of Solenhofen, Bavaria. See ARCHÆOPTERYX. F. A. L.

Saury, Saury-pike, or Skipper: a fish (*Scomberesox saurus*) of the family *Scomberesocidæ*. These fishes go in great shoals and are very active, leaping far above the surface of the water. Although small, they are esteemed for the table.

Sausali'to: town: Marin co., Cal.: on San Francisco Bay, and the N. Pac. Coast Railroad: 6 miles N. of San Francisco (for location, see map of California, ref. 7–B). It is a yachting, fishing, and bathing resort, and is principally engaged in agriculture, dairying, and stock-raising. A fine walk, leading around the promontory by way of Lime Point to Point Bonita, the north horn of the Golden Gate, affords good views of the entrance to San Francisco Bay. The town is the southern terminus of the railway, and has regular steamboat connection with San Francisco. Pop. (1880) 478; (1890) 1,334; (1900) 1,028.

Saussier. FÉLIX GUSTAVE: See the Appendix.

Saussure, *sō sür'*, HORACE BÉNÉDICT, de: physicist and geologist: b. in Conches, Switzerland, Feb. 17, 1740: studied under his uncle, Charles Bonnet, and under Haller, and was appointed Professor of Physics and Philosophy at the University of Geneva in 1762. In 1765 he began a series of scientific mountain excursions, crossing the Alps fourteen times by eight different routes, ascending Mont Blanc in 1787 and Monte Rosa in 1789, encamping for seventeen days on the Col du Géant, and visiting the Jura, Vosges, and Auvergne Mountains, Germany, England, Scotland, and Italy. The result was a multitude of the most valuable observations on the minerals, botany, geology, and meteorology of the countries he visited. These were published in his *Voyages dans les Alpes* (4 vols., Geneva, 1779–96). Among his minor works are *Sur l'Hygrométrie* (1783) and *De l'Eau* (1771). In 1786 he resigned his chair, but after the annexation of Geneva to France was appointed Professor of Natural History in the central school of the department of Léman. D. in Geneva, Jan. 23, 1799.

Sauzet. MARC: See the Appendix.

Savage. JAMES, LL. D.: antiquary: b. in Boston, Mass., July 13, 1784: graduated at Harvard 1803: was active in politics for a few years, after which he devoted himself to literary work. Besides publishing many pamphlets on historical and political subjects, he edited several works of importance relating to New England history. He compiled on the basis of Farmer's *Register* a Genealogical *Dictionary of the First Settlers of New England, showing Three Generations of those who came before May, 1692* (Boston, 4 vols., 1862–64), a work of great value, displaying extraordinary industry and research, but confused in plan, unequal in execution, and disfigured by the exhibition of spleen against many of the parties to the colonial controversies of the seventeenth century. D. in Boston, Mar. 8, 1873.

Savage. MINOT JUDSON: clergyman and author: b. in Norridgewock, Me., June 10, 1841: educated at Bowdoin College and Andover Theological Seminary, where he graduated in 1864: was a Congregational missionary in California: pastor of churches in Framingham, Mass., and Hannibal, Mo.: in 1873 became a Unitarian and took charge of a church in Chicago: and pastor of the Church of the Unity, Boston, 1874–80, when he succeeded Dr. Robert Collyer as pastor of the Church of the Messiah, New York. Among his numerous works are *Christianity the Science of Manhood* (Boston, 1875): *The Religion of Evolution* (1876): *Life Questions* (1879): *Poems* (1882): *Beliefs about the Bible* (1883): *My Creed* (1887): and *Evolution of Christianity* (1892).

Savage. RICHARD: poet: claimed to be the illegitimate son of Anne, Countess of Macclesfield, by Richard Savage,

Earl Rivers, alleging that he was born in London, Jan. 10, 1698; was reared in poverty. He obtained a tolerable education in a grammar school at St. Albans, and was afterward apprenticed to a shoemaker; but having displayed literary tastes, he went to London about 1716, where he obtained the patronage of Steele, and of Wilks and Mrs. Oldfield, the actors, and assumed the name of his alleged father. In 1717 he translated from the Spanish a play, *Woman's a Riddle*, which had a run of twelve nights; produced in 1723 a successful tragedy, *Sir Thomas Overbury*; in 1726 a volume of *Miscellaneous Poems and Translations*; in 1728 *The Bastard, a Poem*, which speedily ran through five editions; and in 1729 his best work, *The Wanderer, a Moral Poem*. In 1727 he was condemned to death for killing a man in a tavern brawl, but was pardoned in opposition to the wishes of his alleged mother; was then taken into the house of Lord Tyrconnel, but soon quarreled with his protector; subsisted thereafter upon money subscribed by Pope and his literary circle; obtained from Queen Caroline an annual stipend of £50 in consequence of some verses he had written on her birthday; resided several years at Bristol, where he was thrown into prison for debt Jan., 1743. D. there Aug. 1, 1743. He is now best remembered by the pathetic *Life* written by his friend Johnson. For an exposure of the improbability of Savage's story, see W. Moy Thomas in *Notes and Queries* (1858). Revised by H. A. Beers.

Savanilla: See Sabanilla.

Savan'na [from Span. *sábana*, large cloth, sheet, savanna (in this sense also *sabana*, with accent on second syllable) < Lat. *sa'banum* = Gr. *σάβανον*, linen cloth, towel]: a grassy plain in a tropical region, yielding pasturage in the wet season, and often having a growth of under-shrubs. It corresponds to the prairie of more northern latitudes. The word is chiefly used in tropical America.

Savanna: city; Carroll co., Ill.; on the Mississippi river, and the Chi., Mil. and St. P., and the Burlington Route railways; 10 miles W. of Mt. Carroll, the county-seat (for location, see map of Illinois, ref. 2–D). It is an important shipping-point, and has several manufactories, a State bank, and two weekly newspapers. Pop. (1890) 3,097; (1900) 3,325.

Savan'nah: city; port of entry; capital of Chatham co., Ga.; on the Savannah river and the Central of Ga., Seaboard Air Line, Plant System, and Southern railways, with regular lines of steamships to Baltimore, Phila., New York, and Boston; 18 miles above the mouth of the river (see map of Georgia, ref. 5–K). It has an excellent landlocked harbor, which has been improved by the U. S. Government since the war of 1861–65 by an expenditure approximating six millions of dollars, with 26 feet of water between the city and the bar. The city is built on a bluff 40 feet above the level of the river; has an area of 6 sq. miles; was laid out on a plan original with the founder, and is adorned with a large variety of ornamental trees and shrubbery. It has a thorough system of sewerage and drainage, and a water system supplied by 30 artesian wells.

Streets and Buildings.—The streets are laid out at right angles to each other, are lighted with electricity, and have over 25 miles of electric railway. There are 120 miles of streets and lanes, 27 miles being paved. There are fine shell and chert roads radiating from the city in all directions to the suburban resorts. Among the principal public buildings are the city-hall, erected in 1799; court-house; U. S. custom-house; U. S. court-house and post-office, built entirely of marble; Telfair Academy of Arts and Sciences, on the site of the residence of the Governor in colonial days; Hodgson Hall, in which are the library and collections of the Georgia Historical Society; the Independent Presbyterian church, the armories of the First Regiment of Georgia Infantry, First Regiment of Georgia Cavalry, Savannah Volunteer Guards, and the Chatham Artillery, next to the oldest artillery organization in this country; the Cotton Exchange and Board of Trade buildings; and the Savannah Theater, erected in 1818.

Parks and Resorts.—Savannah has 31 public squares and parks, with a total area of 63 acres. The principal park, located in the heart of the city, is Forsyth Park, 10 acres, noted for its beautiful fountain and the variety of its trees and flowers. Adjoining it is the Parade-ground, 21 acres, in the center of which stands a Confederate monument. The Parade-ground is used for military and other displays. Johnson Square contains a monument to Gen. Nathanael Greene, of Revolutionary fame, and fronting it is Christ Church, which John Wesley founded. Court-house Square contains a monument to William W. Gordon, the first president of the Central of Georgia Railway, erected by the railway, and a memorial to the Indian chief Tom-o-chi-chi, erected by the Colonial Dames. In Madison Square stands a granite and bronze monument to Sergt. Jasper, of Revolutionary fame. Monterey Square contains a tall marble shaft to Count Pulaski. The principal seaside resort is Tybee island, at the mouth of the river, fronting the ocean, with a beach extending five miles. At the northern extremity of the island is Fort Screven, one of the most extensive fortifications on the South Atlantic coast. Bonaventura, 4 miles S. E. of the city, one of the four cemeteries, is famed for its avenues of ancient live oaks, whose branches are draped with the gray Spanish moss.

Churches and Schools.—The city is the seat of a Roman Catholic bishopric, and contains 41 churches of various denominations. On the site of Christ Church, the oldest Protestant Episcopal edifice, John Wesley founded the first Sunday-school in America. The city has enrolled in the public schools 10,500 pupils; it has a public high school, 12 public-school buildings, and school property valued at over $400,000. There are three libraries; 15 charitable institutions; 20 or more social and literary clubs; 6 hotels; and 2 daily and 3 weekly newspapers and 2 monthly periodicals.

Finances and Banking.—In 1900 the city had a net debt of $3,196,350, and an aggregate assessed valuation of $37,108,077. There are 2 national banks with a combined capital of $800,000; 6 State banks with a capital of $2,250,000; 1 savings and trust company with a capital of $125,000, and 16 building and loan companies.

Business Interests.—Savannah is the third largest cotton-shipping port in the U. S., and is the largest naval-stores shipping port in the world. Besides cotton and naval stores it exports largely lumber and rice, and ships large quantities of fruit and vegetables to the Northern markets. In 1900 its exports of domestic merchandise aggregated in value $49,530,225 foreign, and $45,399,100 coastwise; and its imports of foreign goods, $512,456. Its principal manufactures are fertilizers, cotton-seed oil, soap, railroad cars, beer, yarn, rice-cleaning, foundry, machine, and boiler works. The city has over 200 manufacturing establishments, with a capital of over $4,000,000, and employing over 5,000 persons.

History.—The city was settled by Gen. James Edward Oglethorpe in 1733; repelled a British attack in 1776; was captured by the British in 1778; was besieged by Americans and French, 1779; and was held by British until the close of the war of the Revolution. It received a charter in 1789. In 1796 and 1820 it suffered severely by fire. At the beginning of the war of 1861–65 the forts in the harbor were seized by the State authorities, and during the war the city was a Confederate military post. General Sherman invested the city in Dec., 1864; the Confederates evacuated it and the Union army took possession on Dec. 21. Pop. (1880) 30,709; (1890) 43,189; (1900) 54,244.

Savannah: town; capital of Andrew co., Mo.; on the Chi., Gt. West. and the Burlington Route railways; 14 miles N. E. of St. Joseph (see map of Missouri, ref. 2–D). It is in an agricultural, fruit-growing, and stock-raising region, and contains 8 churches, a graded public school with high-school department, 2 State banks, 4 newspapers, a large flour-mill, and a creamery. Pop. (1890) 1,288; (1900) 1,886.

Editor of "Republican."

Savannah River: a stream which forms the boundary-line between Georgia and South Carolina. From its source to its mouth on Tybee roads its channel is 450 miles long, while the distance in a direct line is only 250 miles. With its tributaries it drains an area of over 8,000 sq. miles. The Savannah is a turbid stream, and the current in the upper portion of the river and its tributaries is rapid and carries a great deal of silt, particularly during the season of freshets. Bars are therefore formed in the broader portions of the river where the current is less rapid. At Savannah the mean rise and fall of tide is 6½ feet. The tidal wave ordinarily ascends to a point about 28 miles above Savannah. The river is navigable to Savannah for vessels drawing 26 feet of water, and by small vessels to Augusta, 231 miles.

Savart Wheel: See Recording Apparatus, Psychological, in the Appendix.

Savary, sȧȧ'vȧȧ'ree', Anne Jean Marie René, Duke of Rovigo: general; b. at Marcq, department of Ardennes, France, Ap. 26, 1774; entered the army in 1790; served on the Rhine, and in Egypt; was raised to the rank of colonel after the battle of Marengo, and in 1803 became general of brigade,

having in the meanwhile shown his skill as an administrator while head of the secret police. In 1804 he presided, as commander of the troops of Vincennes, over the execution of the Duke of Enghien. His greatest military exploit was the victory at Ostrolenka (Feb. 16, 1807) over the Russians, for which the emperor gave him a great dotation and made him Duke of Rovigo. His greatest diplomatic success was his intrigue at the Spanish court in 1808, which resulted in Joseph Bonaparte's ascending the throne of Spain. From 1810 to 1814 he was minister of police. After the fall of Napoleon he wished to accompany him to St. Helena, but was arrested on board the Bellerophon and kept in captivity at Malta. He escaped, went to Smyrna, returned in 1819 to Paris, and was finally reinstated in his titles and honors. In 1823 he again left France, and took up his residence in Rome, having fallen out with the French court on account of his *Sur la Catastrophe de Mgr. le Duc d'Enghien*, in which he made Talleyrand accountable for the execution of the duke. Louis Philippe recalled him, and made him, Dec. 1, 1831, commander-in-chief of Algeria, where he showed great activity. D. in Paris, June 2, 1833. His *Mémoires* (8 vols., 1828) give a history of the First Empire. F. M. C.

Savary, Nicolas: traveler and Orientalist; b. at Vitré, Brittany, France, in 1750; studied at Rennes and Paris; spent three years (1776–79) in Egypt and two years (1779–81) among the Greek islands; afterward lived in Paris till his death Feb. 4, 1788. Published *Letters on Egypt* (3 vols., Paris, 1781–85) and the *Koran* in French, with a *Life of Mohammed* (2 vols., Paris, 1783). Though an able scholar, he sacrificed clearness and accuracy to elegance and style, and his translation of the Koran is inferior to that of Kasimirski. E. A. Grosvenor.

Save, saav: a river of Austria; rises in the province of Carniola, flows through Croatia, forms the boundary between Slavonia and Bosnia, and joins the Danube at Belgrade after a course of 660 miles; navigable for 200 miles.

Savigny, sää'vēēn'yee', Friedrich Karl, von: jurist; b. at Frankfort-on-the-Main, Germany, Feb. 21, 1779; studied jurisprudence at Marburg, Göttingen, Leipzig, Halle, and Jena; was appointed professor at Marburg in 1800, at Landshut in 1808, at Berlin in 1810; was made a member of the court of cassation in Berlin in 1809; member of the council of state 1817; member of the revision of the Rhine province 1819; minister of justice in 1842; retired in 1848. D. in Berlin, Oct. 25, 1861. He was the leader of the historical school in jurisprudence, and exercised a great influence, both on the study of law and on legislation in Germany. His lectures on Roman law attracted large audiences, although his views of the Roman law system as the highest standard and most consummate model, and of our time as incapable of developing the idea of right in adequate forms, are considered extravagant. His principal writings are *Das Recht des Besitzes* (1803); *Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft* (1814); *Geschichte des römischen Rechts im Mittelalter* (6 vols., 1815–31); *System des heutigen römischen Rechts* (8 vols., 1840–49); *Das Obligationenrecht* (2 vols., 1851–53), besides a number of minor essays, mostly historical, collected in his *Vermischte Schriften* (5 vols., 1850). Much of his writings has been translated into English. His biography was written by Rudorff (Berlin, 1863). Revised by F. Sturges Allen.

Savile, sāv'il, Sir Henry: scholar; b. at Over Bradley, near Halifax, England, Nov. 30, 1549; educated at Brasenose and Merton Colleges, Oxford becoming fellow of the latter and lecturer on mathematics; traveled on the Continent in 1578, and on his return became Greek and mathematical tutor to Queen Elizabeth 1578. He was made warden of Merton 1585, provost of Eton 1596; was knighted by James I. 1604, and founded at Oxford the Savilian professorships of geometry and astronomy 1619, giving his library for their use. D. at Eton College, Feb. 19, 1622. He translated the *History* and the *Agricola* of Tacitus (1581), edited the *Latin Chronicles* of English history (1596), and brought out a magnificent edition of the complete works of Chrysostom (8 vols., 1610–13).

Saville, George: See Halifax, Marquis of.

Savin [O. Eng. *safinæ*, *savine*, from Lat. *sabi'na*, savin, shortened from *Sabi'na her'ba*, savin, liter., Sabine herb]: a berry-bearing evergreen shrub, *Juniperus sabina*, of the order *Coniferæ*, growing on rough lands of Europe and Asia, and found also in Canada, but rarely in the U. S. It has a strong, almost fœtid scent, which frequently causes headache. Its leaves abound in an acrid essential oil isomeric with turpentine oil. Savin oil and tops are sometimes used by abortionists, but, if effectually, only at the utmost peril of the patient's life. It is sometimes useful in chronic rheumatism, amenorrhœa, and other diseases. H. A. H.

Savings-banks: institutions for receiving and securely investing the moderate savings of industry, under provisions for their repayment on demand or at short notice. They are managed as a rule by persons having no interest in the profits of the business, which are divided at stated intervals among the depositors.

Origin and Early History.—The first savings-bank appears to have been founded at Brunswick, Germany, in 1765. In the latter part of the eighteenth century several banks of this kind were established in different parts of Germany and Switzerland. They were introduced to the notice of the English public by Jeremy Bentham, who in 1797 proposed a well-devised system of "frugality banks," to constitute a branch of the pauper system of the Government. In 1798 the Rev. Joseph Smith, of Wendover, proposed to the poor of his parish to receive from them during the summer sums as small as twopence, which he would return to them in the winter season with an addition of one-third as a reward for their providence. Of course this was more benevolence than banking. The scheme of Mrs. Priscilla Wakefield, of Tottenham, inaugurated in 1799, embraced the deposit of moneys by women and children only, to whom pensions were to be granted when they reached a certain age. Moneys were allowed to be withdrawn only in exceptional cases. In 1801 the scheme was somewhat expanded, and a savings-bank incorporated as a feature. A more practical organization of this effort was effected in 1804. An undertaking was organized at Bath in 1808, under the patronage of Lady Isabella Douglas, for the benefit of domestic servants only, which approached more nearly the ideal of savings-banks, as subsequently defined and understood, than those previously considered.

The first savings-bank of the modern type in Great Britain was organized by the Rev. Henry Duncan, of Ruthwell, Scotland, in 1810. Its success, as compared with previous efforts, was marked and decisive, and the fame given to it through the writings and labors of Dr. Duncan directly promoted the organization of savings-banks upon a similar plan in various parts of the kingdom. The Edinburgh savings-bank, though claiming an earlier origin, appears to have been established in 1814. It adopted a less complex and more popular form of organization and procedure than that of Dr. Duncan, and this became the model upon which savings-banks were organized thereafter.

The period of exclusively voluntary or unincorporated organization in the establishment of savings-banks in Great Britain terminated in 1817, when two acts were passed by Parliament designed to encourage, protect, and regulate these institutions in Ireland and England. These acts were virtually, if not in terms, repealed in 1828 by a new act, which was thereafter recognized as the "governing statute" concerning savings-banks. This statute was modified and amended from time to time until 1863, when an entire revision and consolidation of the laws relating to savings-banks was effected. The course and character of the legislation affecting this interest may be briefly but sufficiently outlined as follows: Trustees have at all times been prohibited from deriving any profit from the transactions. The moneys received were to be deposited in the Bank of England or of Ireland to the credit of the commissioners for the reduction of the national debt, and by them were to be invested in 3 per cent. bank annuities. The Government guaranteed to the trustees a specific rate of interest on the moneys deposited by them to the credit of the commissioners. This rate, under the acts of 1817, was £4 11*s.* 3*d.* per cent., but was subsequently reduced to £3 16*s.* 0½*d.*, and finally to £3 5*s.* per cent. per annum. The rate of interest to be paid to depositors was at first left to the discretion of the trustees, but was afterward limited so as not to exceed £3 0*s.* 10*d.* per cent. The rate paid has varied in different institutions, and still varies from the limit fixed by law to as low as £2 10*s.* per cent. Deposits were limited originally to £100 the first year, and £50 in any year thereafter; this was afterward changed, and the limit fixed at £30 in any year and £150 in all, or £200 including interest. Depositors were also prohibited from keeping an account in more than one savings-bank, but might transfer an account from one bank to another. The significance of these restrict-

ive provisions will be seen in the fact that in the years from 1817 to 1872 the interest paid by the Government to savings-banks exceeded that which it had received from investments on their account by the sum of £4,169,427 10*s.* 5*d.* As an incentive to industry and economy, and a check to pauperism, the Government could afford to bestow this bounty upon savings-banks, but only upon terms that would tend to exclude from any considerable share in it the opulent classes, whom the liberal interest allowed and the security afforded by savings-banks would naturally attract. Trustees in England are made liable only for their own personal malfeasance, but in Ireland they are made liable for losses, unless by their rules they limit their liability to a fixed sum, which is not to be less than £100. The Government has never conceded its liability to make good the losses sustained by savings-banks, though in one instance of exceptional hardship Parliament appropriated £30,000 as a partial restitution to depositors.

The following table gives the number of depositors and the balance to the credit of savings-banks, including interest, on the books of the national debt commissioners in quinquennial periods from 1817 to 1882. The year 1861 is also included, as marking the highest limit reached by savings-banks before their decadence. This began under competition with the post-office savings-banks, from which, however, the savings-banks afterward recovered:

Year ending Nov. 20.	Number of depositors.	Amount to credit of savings-banks.	Year ending Nov. 20.	Number of depositors.	Amount to credit of savings-banks.
1817.....	*9,291	£231,028	1857.....	1,366,560	£35,255,722
1822.....	*204,584	6,546,690	1861.....	1,609,103	41,790,783
1827.....	*395,000	14,188,708	1862.....	1,558,189	40,809,578
1832.....	440,861	14,416,885	1867.....	1,385,782	36,792,912
1837.....	636,339	19,711,797	1872.....	1,425,147	40,000,462
1842....	875,086	25,406,642	1877.....	1,509,847	44,238,686
1847.....	1,096,086	30,236,632	1882.....	*1,552,983	*44,594,451
1852.....	1,209,934	31,912,413	1887.....	.....	*47,262,222

* Partly estimated.

Since 1887 the deposits of trustee savings-banks have been decreasing, while those of the post-office savings-banks have been rapidly growing.

Post-office Savings-banks.—In 1861 a system of post-office savings-banks was established, which, however, was little more than an expansion and adaptation to existing conditions of the scheme of Patrick Colquhoun, made prominent by Whitbread in 1807. No arbitrary interference with the existing system of savings-banks was attempted, but these were left to hold their own in competition with the new system as best they could. The practical operation of the latter may be briefly stated: Certain post-offices throughout the United Kingdom are designated at which sums of not less than one shilling or some multiple thereof will be received for transmission to the central office in London. Not exceeding £30 in one year, or £150 in all, or £200 including interest, is received from any one person. The depositor receives a book in which his deposits are entered, and a receipt for each deposit is also forwarded to him in due course from the central office. The moneys are invested in the public funds, and deposits of not less than £1 or multiples thereof receive interest at the rate of 2½ per cent. per annum. The Government is responsible for the repayment of all moneys received, thus affording to depositors perfect security. A depositor may apply at any post-office savings-bank in the kingdom for the purpose of withdrawing money, and may direct payment of the same to be made to him at that or at any other post-office savings-bank. His order is forwarded to the Postmaster-General, by whom a warrant for the designated amount is drawn upon the postmaster where payment is to be made, which is forwarded to the depositor, who presents the same, together with his book, and receives his money.

The system was inaugurated by opening in England and Wales 301 postal savings-banks, which number was increased before the close of the year to 1,629. The system was extended in the following year to Ireland and Scotland. In 1866 the number of postal savings-banks in the United Kingdom was 3,369, or more than five times the highest number under the old system; on Mar. 31, 1882, the number was 6,645, and on Mar. 31, 1891, it was 10,063. In the ten years from Sept., 1861, to Sept., 1871, there had been deposited, including interest, £44,198,743, withdrawn £28,044,539, leaving due depositors £16,154,204. During the calendar year 1881 there was deposited £11,345,957; interest credited, £826,990; withdrawn, £9,469,668; balance due depositors Dec. 31, £36,194,495. In 1892 the number of postal savings-banks was 21,940, the amount deposited was £42,145,981, and the total amount due depositors £130,118,605.

Penny savings-banks, military savings-banks, and savings-banks for seamen have been established as auxiliaries of the general system, for the purpose of meeting the special needs of classes for which the ordinary savings-banks did not hold out adequate inducements or facilities. The penny savings-banks have commonly been tributary to the larger institutions, making them the depositories of their aggregate accumulations. The military and seamen's savings-banks have been conducted independently. Their statistics are unimportant, and fail to exhibit any distinctive features concerning the thrift of the classes they represent, for large numbers of these prefer to deposit in the regular institutions.

Savings-banks in the U. S.—Shortly after the successful inauguration of savings-banks in Great Britain upon a popular and practical plan these institutions began to attract attention in the U. S. The first organization of which there is record was effected in the city of New York, Nov. 29, 1816. The first to go into practical operation was in Philadelphia, which as a purely voluntary association began to receive deposits Dec. 2, 1816, which would indicate an organization effected prior to that in New York. The first to become incorporated was in Boston, Dec. 13, 1816, and it organized and began business in the spring of 1817. Thus the U. S. anticipated Great Britain in giving to this interest the sanction and protection of law. The savings-bank of Salem, Mass., was next incorporated Jan., 1818, and commenced business in April following. The savings-bank of Baltimore opened as a voluntary association for receiving deposits on Mar. 16, 1818, and was duly incorporated in December of that year. The example of these cities and towns was rapidly followed by others.

The plan of organization of savings-banks is not altogether uniform. In some States there is a large body of corporators, empowered to enlarge their number indefinitely, who elect from their number annually a board of trustees or directors, to whom the management of the institution is committed. In others the corporators are a defined and limited number, who are themselves the trustees and responsible for the management. These are commonly empowered to fill vacancies that occur, though in some cases this is done by designated authority outside of the board. In the Northeast savings-banks are managed by trustees for the depositors; in other parts they are frequently managed by corporations with capital stock.

Of the total of 1,002 banks reporting, 652 in 15 States were organized under the mutual system, and 350 in 13 States as stock banks with capital stock aggregating $19,892,294.

While there is much diversity among the several States in their policy concerning investments, the favorite and best approved securities are the stocks of the U. S. or of States in undoubted credit, the bonded obligations of cities and counties, and mortgages of real estate. The investments of the savings-banks of the U. S. in 1899–1900 were as follows: Real estate loans, $914,066,518; loans on other securities, $43,738,808; U. S. bonds, $111,118,450; State stocks and bonds, $513,971,965; railway securities, $230,488,662; bank stocks, $34,607,547; real estate, $56,651,224; other resources, $220,224,460; total, $2,624,873,634. The total liabilities, aside from savings-deposits, were $240,102,785.

Legislation in the U. S. has followed the English precedent of imposing restrictions upon the amount which might be deposited by one person in any savings-bank, but the occasion which made such restriction necessary in England has never existed. To this may be attributed the fact that the effort has never been attended by marked success, savings-banks having seldom regarded these restrictions whenever they have deemed it desirable to evade or to defy the law imposing them. The only really effective restriction of this nature is that imposed by those savings-banks which, for reasons of their own, have preferred to deal only with small individual accounts; but with every savings-bank in the country open to any depositor the restrictions of the law, if rigidly enforced, would be the occasion of inconvenience rather than of hardship.

The original theory of savings-banks was that their earnings, after paying expenses, were to be ratably divided among the depositors. To this was afterward supplemented the idea of reserving a small sum for the purpose of meeting any losses which might occur, thus forming a surplus in order to promote security. In late years a practice has grown up of agreeing to pay a given rate of interest. This is a departure from true savings-bank principles. The disasters that have fallen upon savings-banks are in nearly every instance traceable to the attempt to fulfill promises concerning interest. Subject to such general restraints as the law may impose, each savings-bank regulates the dividends or interest allowed according to its own discretion. In the early history of savings-banks 4 per cent. was a common rate, with extra dividends once in three or five years. During the civil war, and for many years after, 6 per cent. was the prevailing rate. The disasters that followed and the general lowering of interest on good securities have led to the adoption of the old rate of 4 per cent., and in some banks as low as 3 per cent.

GROWTH OF SAVINGS-BANKS IN THE U. S. SINCE 1820.

YEAR.	Number of banks.	Number of depositors.	Deposits.
1820	10	8,635	$1,138,570
1830	36	33,085	6,973,304
1840	61	78,701	14,051,520
1850	108	251,354	43,431,130
1860	278	693,870	149,277,504
1870	517	1,630,846	549,874,358
1880	629	2,335,582	819,106,973
1890	921	4,258,893	1,524,844,506
1895	1,017	4,875,519	1,810,597,023
1900	1,002	6,107,083	2,449,547,885

The savings-bank system of Canada is largely under Government management. The statistics of the post-office and Government savings-banks of the Dominion for 1899 are as follows: Deposits, with interest, $12,276,094; withdrawals, $12,145,498; balances, $50,241,715. Besides these there are a few private savings-banks and a number of ordinary banks which perform to a considerable degree the savings-bank functions.

The savings-bank system of France dates from 1818, but was first regulated by law in 1835. At the close of 1900 the number of depositors was 7,105,958, and the amount deposited 3,220,463,500 francs. In the postal savings-banks at the same date the number of depositors was 3,318,469, and the amount of deposits 929,454,282 francs; on Dec. 31, 1893, the accounts numbered 2,095,622, and the aggregate deposits 607,871,925 francs. The system of savings-banks is highly developed in Austria, Italy, Switzerland, Denmark, and some parts of Germany. A recent unofficial estimate gives the following figures:

COUNTRIES.	Number of depositors.	Amount of deposits.
Austria	1,850,000	$613,000,000
Italy	1,970,000	346,000,000
Prussia	.....	720,000,000
Scandinavia	1,600,000	220,000,000
Switzerland	1,600,000	118,000,000

Revised by A. T. HADLEY.

Savoie: a department of France. See SAVOY.

Savo'na (anc. *Sabatium*): town and seaport of Italy, province of Genoa; 26 miles by rail S. by W. of Genoa (see map of Italy, ref. 4–B). It has a large inland and maritime trade, extensive manufactures, metallurgic foundries, and shipbuilding interests. The old maiolica of Savona is still prized. Savona is of ancient origin. Its mediæval history is intimately connected with that of Genoa. Pop., including suburbs, 30,000.

Savonaro'la, GIROLAMO: religious reformer; b. at Ferrara, Italy, Sept. 21, 1452. He was intended for the medical profession, and his early studies were directed accordingly. Before the age of twenty he had become so shocked by the vices of the brilliant court of Ferrara, and by the degraded state of morals and religion around him, that he resolved to retire to a monastery; but respect for his father's wishes and love for his mother delayed his purpose for some years. In 1475, however, he entered the Dominican convent in Bologna, where he passed seven years. He was then sent to preach in Florence, where Lorenzo de' Medici was at the height of his power, but his first appearance as a preacher was a failure. He went elsewhere, but in 1490 he returned to Florence, and was successful. His reputation as a popular preacher rose rapidly, and he was soon listened to with admiring respect by many of the greatest men of that great age, such as Michelangelo Buonarroti, Pico della Mirandola, etc., as well as by the thousands of humbler citizens who thronged the churches where he preached. In 1491 he was elected prior of San Marco, and at the same time he refused the largess sent to his convent by Lorenzo, who had hoped to buy his silence. His rebukes, hurled alike at the highest and the lowliest wrongdoer, roused a deadly hostility against him. He asserted both the right and the obligation of the Christian teacher to instruct his hearers in their civic as well as other duties, and his bold exercise of this right drew upon him the increased ill will of Lorenzo. In his last hours, however, the offended prince turned to him for consolation, and in 1492 an interview took place between Fra Girolamo and the dying Lorenzo, when, it is said, the priest refused to grant absolution. Nor was the heroic reformer more indulgent to tyranny and vice in the Church than in the state. He launched the most scathing denunciations against the shameful corruption then scarcely less conspicuous in the higher ecclesiastics than in the pope, Alexander VI. With the prophet's "Thus saith the Lord," he threatened Church and state with the speedy vengeance of heaven if they did not repent. His followers in Florence, known as *Piagnoni* ("the weepers," because professed penitents), multiplied; he pressed his reforms more vigorously, his enemies the *Arrabbiati* (the enraged) grew bitterer and fiercer. The pope remonstrated, a cardinal's hat was offered, on conditions, but he was not to be moved. In 1495 he was summoned to Rome, but, knowing what awaited him there, evaded the summons. Finally an order from the Vatican forbade him to preach. He submitted at first, then disobeyed, declaring himself un-

able to resist the prophetic spirit which compelled him to speak his Master's words. The sentence of excommunication followed (1497). The *Arrabbiati* got possession of Florence. Fra Girolamo's letters to foreign sovereigns, urging them to call a council to dethrone the Borgia and elect a new pope, fell into the hands of his enemies. On Apr. 7, 1498, occurred the famous attempt at a "trial by fire," to decide whether he was divinely commissioned, but its fiasco turned the people against him, and on the night of the following day the convent of San Marco was attacked by an infuriated mob. The signoria sent thither officers to demand the surrender of the prior, who, with two of his brethren, was conveyed to the dungeons of the Bargello, and brutally tortured the same night. These barbarities were continued for weeks, and suspended only when the life of their victim was in danger. In the delirium of agony Savonarola sometimes gave confused answers as to his prophetic gifts, but no confession of guilt could be extorted from him. His destruction, however, was inevitable. The pope threatened Florence with an interdict and with every other form of vengeance if she spared the hated friar. Sentence of death was pronounced on May 22, 1498, and the next day he and his two friends and fellow monks Domenico and Silvestro were publicly hanged and then burned in the Piazza della Signoria and their ashes thrown into the Arno. The judgment of history has acquitted Savonarola of the charges brought against him in his own day, and the sincerity of his faith and the disinterestedness of his aims are as unquestioned as the purity of his life and the power of his intellect. Even the Roman Catholic Church, through Popes Paul V. and Benedict XIV., has declared his works irreproachable, and placed him among the servants of God. In the convent of San Marco are preserved various objects of interest once belonging to the martyred prior, such as his Bible filled with annotations by his own hand, etc., and a portrait, probably by his friend Fra Bartolommeo. He was of middle stature, dark complexion, plain in feature, pallid and worn with abstinence; his expression severely noble, but benevolent, and when animated his keen dark eyes glowed like flames. It is incorrect to speak of him as "a reformer before the Reformation," for he had no thought of leaving or opposing the Church. Yet his insistence upon the Bible as the surest guide to the knowledge of spiritual things, and his protests against the corruptions of the Church, had unquestionable influence in hastening the Reformation which followed so shortly after. Among the many works of Savonarola the best known is his *Triumphus Crucis de Veritate Fidei* (Florence, 1497; Eng. trans. *Triumph of the Cross*, London, 1868; also translated *Sorrow and Hope: Meditation on the 31st Psalm, written in Prison*, 1894). The principal *Life* of Savonarola is by Prof. Pasquale Villari (2 vols. 8vo, Florence, 1860; translated into English by Horner, London, 1863; 2d ed. 1888), with full references to authorities and a list of Fra Girolamo's works, both published and unpublished; see also W. R. Clark's *Life and Times of Savonarola* (1878). Revised by S. M. Jackson.

Savory: popular name of the *Satureja hortensis* (summer savory) and of the *Satureja montana* (winter savory), labiate garden-herbs of Old World origin, employed in domestic cookery for their flavor.

Savoy: formerly a political division of the kingdom of Sardinia, and originally the family possession of the dynasty now reigning in Italy. In 1860 it was ceded to France, and it is divided into the two departments of Savoie and Haute-Savoie. Savoy is the loftiest mountain region of Europe, containing the highest peak, Mont Blanc. Bounded N. by the lake of Geneva and E. by Piedmont, it is covered by the Graiian Alps, and entirely broken up into mountains and valleys. It contains very little arable land, but that which it contains is most carefully cultivated, planted with vines and mulberry-trees, and generally produces wheat enough for home consumption. The mineral wealth of Savoy is not great, though coal, lead, iron, etc., are found, and to some extent worked. But the pastures which cover the mountains are very important, and feed large herds of cattle and sheep; dairy-farming is the principal occupation. The area of the two departments is—Savoie, 2,224 sq. miles, with (1896) 259,790 inhabitants; Haute-Savoie, 1,667 sq. miles, with (1896) 265,872 inhabitants. The Savoyards are an honest, industrious, intelligent, and hospitable race, deeply attached to their native country. They emigrate in large numbers, but when they have amassed enough wealth they return to live in their fatherland.

Savoy Conference: a conference between Episcopalians and Presbyterians held in London soon after the Restoration. The Episcopalians were determined to restore the Church of England to what it was before the civil war, but the Presbyterians, who mainly had been in possession of church benefices and church power for many years, contended for some modification of the former system. A royal commission was issued on Mar. 25, 1661, appointing certain Church of England and Presbyterian divines to confer together, and gave them authority to review the Book of Common Prayer, to compare it with ancient liturgies, to consult respecting exceptions made to it, and by agreement to make alterations such as would satisfy tender consciences and restore unity to the Church. The instrument appointed "the master's lodgings in the Savoy," London, as the place of meeting. As the terms of the commission specified advice and consultation as purposes of the meeting, friendly conference seemed necessary; but the Episcopal party manifested no disposition for anything of that kind. They required written communications from their opponents stating their exceptions to the Liturgy, and to them gave answers both uncourteous and captious, not indicating any disposition to conciliate, but foreclosing the possibility of removing Presbyterian objections. They said: The alterations asked, if allowed, would be a virtual confession that the Liturgy was an intolerable burden, a cause of schism, and would justify past nonconformity. Taking such ground, it mattered not what the objections made might be—none was admissible; and therefore to advise and consult was a thing out of the question. It had been arranged that, while the rest of the Presbyterian brethren employed themselves in drawing up *exceptions* against the Book of Common Prayer, Baxter should prepare *additions*. In one fortnight he accomplished his task and presented his reformed Liturgy. The author tells us that he compared what he did with the Assembly's Directory, the Book of Common Prayer, and Hammond l'Estrange; but he seems to have borrowed little or nothing from these sources, beyond introducing or allowing the use of the creeds—sometimes the use of the Athanasian Creed—the *Te Deum*, and the Psalms in order for the day. A rejoinder to the bishops' answers touching exceptions made to the Liturgy followed on the part of the ministers, but no effect was produced by it. At last it was settled that there should be a formal debate, to be conducted by three persons on each side. Strangers were allowed to be present, and the room was full of auditors, young Tillotson, the eminent preacher and archbishop of later days, being among them. The debate turned upon vague abstractions and upon subtle theological distinctions, occasionally interrupted by outbursts of temper and uncivil personalities. As might be expeeted, the hall of the Savoy Palace became an arena for logical gladiatorship, the object of the meeting was a strife for victory, and the end of the conference was hopeless disagreement. Baxter's *Reformed Liturgy* was reprinted, edited by Charles W. Shields, under title *The Book of Common Prayer as Amended by the Presbyterian Divines of 1661* (Philadelphia, 1864; 2d ed. New York, 1883).
Revised by S. M. Jackson.

Savoy Declaration: an ecclesiastical document, deriving its name from the Savoy Hospital in London, where it was framed. Before the death of Oliver Cromwell a meeting was convened by notice from the clerk of the council of state, addressed to the Congregational elders resident in London. Cromwell, though not favorable to the proceeding, yet permitted it; but the ministers did not meet until after his decease; then they assembled in the Savoy Sept. 29, 1658, to declare the principles of their faith and polity. The business was disliked by people about the court, who feared it might lead to fresh divisions between the Independents and Presbyterians. There might be political intrigues at the background of the movement, for Cromwell said in reference to some of its projectors, who were republican officers, "They must be satisfied, or we shall all run back into blood again." At all events, when the meeting came to be held nothing was done which the Protector would have disapproved. The Declaration did not clash with the sentiments of broad charity so dear to his heart. As to doctrine, the Declaration is substantially the same as the Westminster Confession. Its specialty consists in its outline of ecclesiastical order. Whereas the covenants or mutual agreements into which Congregationalists had entered at the formation of their churches in the time of the civil wars generally contained some references

to further light breaking in upon them from God's word, there is in the Savoy Declaration no language of that kind; and it seems to be assumed in the document that Congregationalism, as to the knowledge of its principles, had by that period attained to something like completeness.

JOHN STOUGHTON.

Savoy, The: a spot between the Strand and the Thames Embankment, London, remarkable for its ancient buildings and historical associations. The Savoy Palace was first built by Peter, Count of Savoy, uncle of Eleanor of Provence, queen of Henry III. It came into the possession of John of Gaunt, and within its walls John, King of France, was confined after the battle of Poitiers (1356). In 1381 it was burned during Wat Tyler's insurrection. It was rebuilt toward the close of the reign of Henry VII., who made it a hospital or refuge for 100 poor people. It afterward became a resort for abandoned characters, until the reign of Queen Anne, when the institution was dissolved, and the buildings began to fall into ruin. In 1811 the shattered walls were swept away, with the exeeption of the chapel royal built in 1515. The chapel was much injured by fire in 1864, but was restored at the expense of Queen Victoria. See *Memorials of the Savoy*, by W. J. Loftie.

Saw [M. Eng. *sawe* < O. Eng. *sage*: O. H. Germ. *sega* (> Mod. Germ. *säge*)]: a thin plate of metal usually having sharp, angular teeth upon one edge, used for dividing materials by a cutting, crumbling, or abrasive action.

This tool has been known and used from a very remote period. W. M. Flinders Petrie has discovered indisputable evidence that bronze saws having jeweled teeth were used by the ancient Egyptians for cutting the hardest stones, and a two-handled saw of iron (3 ft. 8 in. long by $4\frac{5}{8}$ inches wide) was found by Layard at Nimroud. Saws are mentioned in the Bible. Some of the Christian martyrs in apostolic times "were sawn asunder." The Grecian carpenters had saws that were quite similar to some in use at the present time. In a painting discovered at Herculaneum two genii are shown at the end of a bench supported by two four-legged "horses." The piece of wood to be sawn through is secured by cramps in the shape of the figure seven; the ends pass through, and are seen below the bench. The saw has a perfect resemblance to our frame-saw. Cicero, in his oration for Cluentius, speaks of an ingenious saw with which a thief sawed out the bottom of a chest. Pliny says that among the Belgæ saws were used for cutting white building-stone. The saws of the Japanese and other Oriental nations have their teeth so shaped that the saw cuts when pulled by the workman, and not when pushed; such saws are superior, inasmuch as they are not liable to flexure and consequent breakage by the force employed, and can be made much thinner, and therefore require less strength to operate than the saws used in Europe and Amcriea.

The uses to which saws are put suggest their classification into rip-saws and cross-cut saws. The first have their teeth especially adapted for dividing materials in a direction parallel to their fibers. In the second class the teeth are designed for cutting at right angles to the direction of the fibers. There are over 100 varieties in each of these classes, each made with reference to the execution of a specific kind of work. These several varieties may be arranged in four groups, viz., reciprocating saws, circular saws, cylinder or drum saws, and endless-band saws.

The reciprocating saw is the oldest, and there are more of this variety used than of all others combined. Circular saws, having jewels for teeth, were known to the ancient Egyptians, who used such saws in shaping small stones, but there is no evidence that they were used by them for cutting wood. Circular saws were used for cutting the spaces between the teeth of wheels for clocks and watches (the teeth being afterward shaped by a file) many years before they were applied to the cutting of wood, and may properly be regarded as anticipating the tool called a mill, commonly used for such purposes. The circular saw was patented in England by Samuel Miller on Aug. 5, 1777, although it is claimed it was used in Holland nearly a century before. The use of this form of saw has become indispensable in wood-working establishments. Cylinder or drum saws are, it is supposed, the invention of Hippocrates (b. 460 B. C.), and were first used by him in the operation of trepanning the skull. Such saws are largely used for cutting out button-blanks, sheaves for blocks, and similar forms. They are also used for making curved staves for barrels, tubs, pails, and other articles of woodenware.

The endless-band saw (sometimes called ribbon-saw) consists of an endless band or ribbon of steel, one edge of which is provided with teeth of a form suitable for the work expected of the saw, which in use is strained over two large wheels placed one over the other, and is made to move by turning one of these wheels, the wood to be divided being pressed forcibly against the descending portion of the saw. The band-saw was invented in 1808 by William Newberry, of London, England. Notwithstanding the many valuable features of the invention it did not attract attention until its principle was embodied in a sawing-machine invented by Thouard, of Paris, in 1846; but it is to the persistence of M. Périn, another Frenchman, that the world is indebted for the practical development of this invention. W. F. DURFEE.

Sawakin: See SUAKIM.

Sawfish: See PRISTIDÆ.

Saw-fly: a hymenopterous insect of the family *Tenthredinidæ*. See ENTOMOLOGY and HYMENOPTERA.

Sawmill: usually a building containing mechanism for operating saws; the term is also applied to the combination of a saw with its actuating machinery.

Marble was cut by power-saws as early as A. D. 360, and it is not at all improbable that mills for preparing lumber were also in use at that time. The ancient method of procuring boards, planks, and joists, was to split round logs with wedges, and then hew the rough lumber resulting to the required dimensions. This process is still used in making certain kinds of lumber, such as staves for heavy casks and strips for wooden hoops.

The first reliable evidence of the employment of sawmills for cutting lumber relates to one at Augsburg, Bavaria, in 1322. Soon after the discovery of Madeira, in 1420, sawmills were erected there for the purpose of making lumber for exportation to Portugal. In 1427 there was a sawmill in the city of Breslau, and in 1490 the magistrates of Erfurt established one in a forest which they had purchased. The first sawmill in Norway was built about 1530, and the number of such mills rapidly increased in that country. A sawmill was in operation at Lyons, France, as early as 1555. On the Danube, near Ratisbon, in 1575, there was a sawmill having "gang-saws" by which several boards were cut at the same time. A work published at Lyons in 1578 by Jacobi Bessoni gives illustrations of two forms of sawmills having gang-saws; in one of these the saws have teeth on each edge. The first sawmill in Holland was erected at Zaandam in 1596. A sawmill was first operated in Sweden in 1653. The building of sawmills in England was violently opposed, because it was thought that the hand-sawyers would be deprived of their means of living; one erected in 1653, near London, had to be abandoned, and it was not until over one hundred years later (in 1768) that another attempt in this direction was made. A wealthy timber-merchant, under the patronage of the Society of Arts, caused a sawmill driven by wind to be constructed at Limehouse. This mill was destroyed by a mob, but, the damage having been made good by the Government, it was rebuilt and allowed to run without interference. Some years earlier a sawmill had been erected at Leith, in Scotland. Probably the first sawmills in America were the three, driven by wind, which were erected at New Amsterdam (now New York) in the year 1633; one of these was located on Nut (now Governor's) island. In 1706 the first sawmill in Canada was built on the river Richelieu, near Montreal, by a Mr. Sawyer, of Lancaster, Mass. (who had been made prisoner by the Indians), as the ransom of himself and son. In 1803 there was a steam-sawmill in New Orleans run by an engine built by Oliver Evans, of Philadelphia. This mill was burned by the hand-sawyers.

All these mills were of the vertical reciprocating type; their saws were strained in a strong rectangular frame, or gate, to which a vertical reciprocating movement was given by a crank on a revolving shaft, usually placed below it. The gate was moved in and kept from swerving by suitable vertical guides. The log to be cut was secured upon a sliding carriage automatically moved a certain distance at each stroke of the saw, until finally the saw had cut its way from end to end of the log. In mills in which but one saw was used the log had to be moved laterally after each cut a distance equal to the thickness of the lumber required; this necessitated as many longitudinal movements of the log as there were cuts made, but in the best mills which had abundant motive power several saws (called a gang), placed the thickness of the intended lumber apart, were strained in the

same gate, and then the entire log could be cut into boards by a single traverse of the carriage.

In the more recent gang-saw mills there are two gates, in one of which there are but two saws, through which the log is first passed and made parallel-sided; it is then turned upon one of these sides and passed through the second gate, in which there is a sufficient number of saws to cut the log into the desired thickness of boards or planks.

Circular saws, driven by steam or water power, have been largely used for the manufacture of lumber, especially in the U. S., where their use for that purpose originated in a patent granted on Mar. 16, 1820, to Robert Eastman and J. Jaquith, of Brunswick, Me. Multitudes of other patents for circular-saw mills have been granted, covering more or less valuable improvements, but this form of mill remains a very wasteful means of converting timber into lumber.

The band-saw has been adapted to the sawing of logs, and is used to a large extent on the Pacific coast of the U. S. for utilizing the large timber of that region; this form of saw is less wasteful and works rapidly. W. F. Durfee.

Sawyer, Leicester Ambrose: biblical scholar; b. at Pinckney, N. Y., July 28, 1807; graduated at Hamilton College, Clinton, N. Y., 1828; studied theology; was ordained as a Presbyterian minister in 1832, and from 1840 to 1847 was teacher in Central College, Ohio, after which he preached in several places; subsequently was editorially connected with the Utica *Morning Herald*. Author of *Elements of Biblical Interpretation* (New Haven, 1836); *Mental Philosophy* (1839); *Moral Philosophy* (1845); *A Critical Exposition of Baptism* (Cincinnati, 1845); *Organic Christianity, or the Church of God* (1854); and *The Reconstruction of Biblical Theories, or Biblical Science Improved* (1862). In 1838 he began a new translation of the entire Bible, which he completed about 1862. The New Testament was published at Boston, Oct., 1858. The prophetical books of the Old Testament were issued Dec., 1860, and the book of Daniel, with the apocryphal additions, was separately issued in 1864. The remaining (earlier) portions of the Old Testament were not published. Revised by W. H. Whitsitt.

Sawyer, Philetus: U. S. Senator; b. at Whiting, Vt., Sept. 22, 1816; went to Wisconsin 1847; engaged in the lumber business at Oshkosh on an extensive scale; was a member of the Legislature 1857 and 1861; mayor of Oshkosh 1863–64; was a delegate to the Loyalists' convention 1866, and sat in Congress as a Republican from 1865 to 1875, when he declined a re-election. He served on several important committees connected with the business interests of the Northwest, and became chairman of the committee on Pacific railways. He was U. S. Senator from Wisconsin 1881–93.

Sawyer, Thomas Jefferson, D. D.: clergyman; b. at Reading, Vt., Jan. 9, 1804; graduated at Middlebury College 1829; was pastor of a Universalist church in New York 1830–45, and again 1852–61, having in the interval been principal of the Liberal Institute at Clinton, Oneida co., N. Y.; taught theology in the same institution; resided on a farm at Clinton 1861–69, after which he became Professor of Theology in Tufts College, Medford, Mass., an institution which he had been instrumental in founding (1852), as he had also been in the establishment of the theological department of the St. Lawrence University (1856). He has defended the doctrines of Universalism in public discussions with clergymen of other denominations, and some of these polemics have been published, the most important being the discussion with Rev. Isaac Westcott, entitled *The Doctrine of Eternal Salvation* (New York, 1854). In opposition to the views of Henry Ward Beecher, he published *Who is our God? the Son or the Father?* (1859).—His wife, Caroline M. Fisher, b. at Newton, Mass., Dec. 8, 1812, was married 1832; has written much in prose and verse for periodicals, especially *The Christian Messenger*; published several translations from the French and German, and edited *The Ladies' Repository*, a Universalist monthly magazine. She also published the *Poems* of Mrs. Julia H. Scott (1854), preceded by a *Memoir*.

Saxe, John Godfrey: poet and humorist; b. at Highgate, Vt., June 2, 1816; graduated at Middlebury College 1839; was admitted to the bar at St. Albans 1843; practiced law in Franklin County 1843–50; was editor of the Burlington *Sentinel* 1850–56; was State's attorney of Vermont one year, after which he devoted himself chiefly to literature and to popular lecturing; was Democratic candidate for Governor 1859 and 1860. Author of several volumes of humorous poems, the longest of which were delivered at college commencements and other anniversary occasions. His published works include *Progress* (1846); *New Rape of the Lock*; *The Proud Miss McBride*; *The Money King* (1859); *Clever Stories of Many Nations*; *The Masquerade* (1866); and *Leisure Day Rhymes* (1875). More than forty editions of his collected poems have been issued in the U. S. and in England. D. at Albany, N. Y., Mar. 31, 1887.

Revised by H. A. Beers.

Saxe, Marshal: the name by which Maurice, Count of Saxony, is generally known. He was born at Goslar, Oct. 28, 1696; a son of Augustus II. the Strong, Elector of Saxony and King of Poland, and Aurora von Königsmark. In his twelfth year he was in the army of Prince Eugene, and in 1711 received formal recognition from his father, who raised him to the rank of count, but his debaucheries and dissipations, in which he surpassed even his father, developed as early and as rapidly as his brilliant talents. He served in a campaign against the Turks in 1717, and two years later went to France, bought a regiment, was appointed *maréchal de camp*, and studied with great energy mathematics, mechanics, and fortification. In 1726 the estates of Courland elected him duke, but, declining the proposed marriage with the duchess, he maintained his ducal authority against her opposition with great difficulty, supporting a small army by means of the money lent him by Adrienne Lecouvreur, the actress. In 1727 he withdrew to Paris. At the outbreak of the Austrian War of Succession he offered his services to his native country, but by the fault of Count Brühl they were not accepted, and he received a French command. He took Prague by storm in 1741, and fought with great distinction in Bohemia, Bavaria, and on the Rhine; but his fame as a great general he gained chiefly by his campaigns in Flanders from 1744 to 1748. He won a brilliant victory at Fontenoy May 11, 1745, and at Raucoux Oct. 11, 1746. He took Brussels, Bergen-op-Zoom, and Maestricht, and conquered the whole of Belgium. The enthusiasm of the French people and king knew no bounds; honors were heaped upon him; he was made marshal-general of all French camps and armies, and presented with the palace and estates of Chambord, where he led a princely life, and died Nov. 30, 1750. His *Rêveries*, written in 1731, but afterward revised and much enlarged, is full of ingenious and audacious ideas; his *Lettres et Mémoires*, published in 1794, have also some interest. Revised by F. M. Colby.

Saxe-Al'tenburg: a duchy of the German empire; area, 511 sq. miles; pop. (1900) 194,273; budget of 1895, 3,847,110 marks; public debt (July, 1893), 887,450; is situated N. E. of the Thuringian Forest, and consists of two separate parts, called the eastern and the western district. Capital, Altenburg. By the division of 1485 the country fell to the Albertine line. In 1553 it was returned to Duke Johann Friedrich the Magnanimous, of the Ernestine line, and was under dukes of its own from 1603 to 1672, when the reigning family became extinct, and it fell to Saxe-Gotha. As this line too became extinct the country fell, according to the convention of Nov. 15, 1826, to the Duke of Saxe-Hildburghausen, who gave up his own country, Hildburghausen, and became Duke of Saxe-Altenburg. His descendants are still reigning. Revised by M. W. Harrington.

Saxe-Co'burg and Gotha, -gō'tăă: two duchies which together form a constitutional and hereditary monarchy, under the sovereignty of a duke, and an independent member of the German empire; area, 755 sq. miles, of which 217 sq. miles belong to Coburg and 538 sq. miles to Gotha; separated from each other by the Thuringian Forest—Coburg to the S. and Gotha to the N. Pop. (1900) 229,567. Capitals, Coburg and Gotha. Each duchy has a legislative chamber of its own (Gotha 19 and Coburg 11 deputies). These deputies also form a common diet for the united duchies. Coburg has a budget of 1,233,200 marks, with a debt of 3,213,829 marks: Gotha, a budget of 4,204,150, and a debt of 140,198. There is also a budget of 2,012,182 marks, common to the two duchies. Since the accession of Duke Ernst II. in 1844, these two small duchies have formed the starting-point for much intellectual progress. The union of the two countries dates from 1826. The house of Saxe-Coburg, founded in 1680, became extinct in 1699. The contest concerning the heritage ended in 1720. The Duke of Saxe-Saalfeld received the country. The Dukes of Saxe-Saalfeld-Coburg reigned to 1826, when they ceded Saalfeld to Meiningen, and received Gotha, whose own dynasty had died out. Ernst II. was succeeded in 1893 by his nephew, the Duke of Edinburgh.

Revised by M. W. Harrington.

Saxe-Lau'enburg: the name of the Saxon duchy of LAUENBURG (*q. v.*), from the twelfth to the eighteenth century.

Saxe-Mei'ningen: a duchy of the German empire; area, 953 sq. miles; pop. (1900) 250,683; budget, receipts, 7,195,990 marks; expenses, 6,415,090; public debt in 1892, 11,788,074 marks; is situated to the S. of the Thuringian Forest. Capital, Meiningen. The reigning line was founded in 1681 by Bernhard, third son of Ernst the Pious. In 1826 Duke Bernhard acquired the duchy of Hildburghausen, with Saalfeld and other estates, but, having sided with Austria in 1866, he was compelled to abdicate, and was succeeded by his son Georg. Revised by M. W. HARRINGTON.

Saxe-Wei'mar: a grand duchy of the German empire; area, 1,388 sq. miles; pop. (1900) 362,018; annual budget 1893–95, 8,733,584 marks; public debt, 5,083,671 marks in 1891. It consists of three districts—Weimar, Neustadt, and Eisenach—situated along the Rhön and the Thuringian Forest. The capitals are Weimar and Eisenach, and there is a university at Jena. The reigning line descends from William, the third son of Johann III., the ancestor of the living Ernestine line. In 1672 the house was divided into the lines of Weimar, Eisenach, and Jena. That of Jena became extinct in 1690, and the countries were again united in 1741 under Ernst August. The congress of Vienna enlarged the country with 31 geographical sq. miles and 77,000 inhabitants, and made it a grand duchy. In 1853 Carl Alexander began to reign. Revised by M. W. HARRINGTON.

Saxifrage [viâ O. Fr. from Lat. *saxi'fraga* (sc. *her'ba*, plant), maidenhair, liter., fem. of *saxi'fragus*, stone-breaking; *sa'xum*, stone + *fran'gere*, *fractum*, break; applied to some plants as growing in clefts of rocks, to others as supposed solvents of stone in the bladder]: a name popularly applied to a very great number of plants of widely different characters, though properly limited to plants of the genus *Saxifraga* (family *Saxifragaceæ*). This large genus comprises many alpine and high northern species, some of them highly ornamental in culture. Some species were once used in medicine, but none have active properties. The U. S. has numerous species, some of which are natives of Europe also. The early saxifrage (*S. virginiensis*) is a very common spring flower in the eastern U. S. The swamp-saxifrage or meadow-plantain (*S. pennsylvanica*) is common in wet grounds in the same region, and its radical leaves are gathered and boiled as potherbs in spring.

Revised by CHARLES E. BESSEY.

Saxifrage Family: the *Saxifragaceæ*; a group of about 650 species of dicotyledonous herbs and shrubs, comprising the true saxifrages, hydrangeas, gooseberries, currants, grass-of-Parnassus, mock-oranges (*Philadelphus*), and numerous other plants, many of them ornamental and some useful. Not a few are astringent. The family is moderately represented in the U. S. The true *Saxifragaceæ* are most nearly related to the *Rosaceæ*, from which they differ in the definite stamens, endospermous seeds, and in the tendency to consolidation of the carpels, and to possession of opposite leaves without genuine stipules.

Revised by CHARLES E. BESSEY.

Saxo Grammat'icus: historian; b. in Denmark, date unknown. He was probably secretary to Bishop Absalon, from whom he received valuable assistance in his work. His *Gesta Danorum*, or *Historia Danica*, consists of sixteen books, and reaches to the year 1186. The last six books contain reliable historical material; but his representation of the heathen age, based on Runic inscriptions, old songs, the writings of the Icelanders, etc., is uncritical in the extreme. His surname he received from the correctness and elegance of his Latin, which excited the admiration even of Erasmus. His work was first printed in Paris in 1514 under the direction of C. Pedersen. The best edition is that by P. E. Müller (3 vols., Copenhagen, 1839–58). It was translated into Danish by Vedel in 1575, by Schonsbölle in 1752, and by Grundtvig in 1818. C. Pedersen is also said to have made a translation, which has been lost. The classical Danish version is Vedel's. D. after 1208. Revised by D. K. DODGE.

Saxon: See DUTCH LANGUAGE.

Saxon, Low: See PLATTDEUTSCH.

Saxons [Lat. *Saxones*; Celtic, *Sassenach*, *Saisnaig*, perhaps from *Sachs*, a battle-knife]: a Low German tribe that dwelt on both sides of the Elbe in its lower course and on the islands near its mouth (*Insulæ Saxonum*). They were first mentioned in history in 287 A. D., when they appeared off the coast of Gaul. Their name survives in Saxony, Prussian Saxony, the minor Saxon states, etc. (On the relations of the Saxons to the Angles of Britain, see ANGLO-SAXONS.) They were early colonists of Normandy and France, where they were soon compelled to give way before the Franks. There is a large number of so-called Saxons in Transylvania, descendants of the Low German colonists introduced in 1143 and 1247 by the Hungarian kings. They are one of the dominant races of that region, and preserve the use of the German language, which, however, is considerably corrupted. At home the Saxons enlarged their territory by conquest north and northwest to the North Sea, the Yssel, and the Rhine, and east to the Weser and Werra, the southern Harz, the Elbe, and the lower Saale. After many years of heroic contest with Charlemagne in defense of their national religion and national independence they were forced to accept Christianity and to acknowledge the supremacy of the Holy Roman empire.

Saxony: province of Prussia, between Hanover, Brandenburg, Silesia, Hesse-Nassau, the kingdom of Saxony, and Thuringia; area, 9,746 sq. miles; pop. (1895) 2,698,549. The western portions are occupied by the Hartz Mountains; the rest is low and level, sloping northward and watered by the Elbe and its affluents. The soil is very fertile and very well cultivated, and many branches of manufacture are developed with great energy and success. Capital, Magdeburg.

Revised by M. W. HARRINGTON.

Saxony, Kingdom of: a part of the German empire, comprising an area of 5,787 sq. miles, with (1900) 4,199,758 inhabitants. It lies between Prussia and Austria, a position fraught with great political difficulties and the principal cause of most of the historical vicissitudes of the country. It belongs to the North German mountain region, two-fifths of the surface being mountainous (Erzgebirge S., Lausitzergebirge E., with the Saxon Switzerland), two-fifths hilly, and one-fifth lowland. The principal river is the Elbe, with its affluents, the Black and the White Elster, the Mulde, and the Pleisse. The population is very dense, 725 per sq. mile; 56,000 Wends, nearly all settled in the government of Bautzen, live among the Germans, who belong partly to the Franconian and partly to the Thuringian tribes. The country is divided into four governments, with population (1895) as follows: Bautzen, with 385,010 inhabitants; Dresden, with 1,067,757; Leipzig, with 945,179; Zwickau, with 1,389,672. The principal towns are—Leipzig, with 399,963 inhabitants; Dresden, with 336,440; Chemnitz, with 161,017; Plauen, with 55,191; Zwickau, with 50,391; Freiberg, with 29,287; Zittau, with 28,132; and Glauchau, with 24,914. With respect to creed, there are 3,611,670 Lutherans, 140,285 Roman Catholics, 10,538 Reformists, 15,059 of other Christian sects, and 9,902 Jews. Agriculture is carried on with a high degree of perfection. Wheat, rye, oats, barley, millet, etc., are cultivated; also flax. The vine is grown along the Elbe. Cattle-breeding is important; sheep especially are very numerous. The arboriculture is excellent; 28 per cent. of the total area is covered with forest. Mining is an old occupation here, especially in the Erzgebirge, and is very flourishing. Silver, iron, gold, lead, sulphur, arsenic, zinc, etc., are produced; 4,200,000 tons of coal and about 950,000 tons of brown coal are annually raised. Manufacturing industry is much developed; Chemnitz, Zwickau, Plauen, Zittau, Bautzen, and Leipzig especially are important. Linen, cotton, and woolen goods, paper, chemicals, metal ware and machinery, straw goods, porcelain, musical and mathematical instruments are manufactured. Leipzig has large type-foundries and printing-establishments. The commerce is also very comprehensive; its principal center is Leipzig, which is also the seat of the highest commercial court of Germany. The most important financial institutions are the Bank of Leipzig, the Saxon Bank in Dresden, and the Agricultural Bank of Bautzen. The kingdom is better provided with railways than any other part of Germany; 1,738 miles were in operation in 1892. Public education stands very high; the numerous educational institutions comprised, in 1891, a university in Leipzig, a mining academy in Freiberg, an academy of arboriculture at Tharand, a polytechnic school in Dresden, an industrial school at Chemnitz, 5 commercial schools, 38 schools for the exact sciences, 15 gymnasiums, and 2,171 Evangelical and 39 Roman Catholic public elementary schools. The Government is a constitutional monarchy, established in 1831 and modified in 1849, 1851, 1860, 1861, 1868, and 1874. In all foreign affairs and in many important interior questions the authority of the German empire has wholly superseded that of

the particular Saxon Government, which is independent with respect to the interior administration. The reigning king is Albert, who ascended the throne Oct. 29, 1873; the representation of the people is composed of two chambers. The finances are in good order. The budget estimate for each of the years 1892–93 was 97,683,109 marks, with a special revenue and disbursement of 51,405,100 marks, relating to public works. More than half the total revenue is derived from state domains, forests, and railways, the last alone giving, in 1892, a net revenue of 30,597,450 marks. The total debt in 1892 was 625,780,750 marks, nearly all incurred in the acquisition of railways and telegraphs, and the promotion of other works of public utility. The total income of all classes of the population was estimated in 1892 at 1,584,950,632 marks, an increase of 17,000,000 marks over the preceding year. The army forms the Twelfth Corps of the German imperial army. The Saxon colors are green and silver.

History.—That German tribe which the Romans called Saxones was in ancient times settled between the Eider, the Elbe, and the Trave. Charlemagne made war upon them 772–804, and subjugated them, and Saxony became a dukedom, belonging to the Frankish and afterward to the German empire. Under Otto the Magnificent, Thuringia was united to it, and Otto's son, Henry, became King of Germany in 919. His successor, the Emperor Otto I., gave the dukedom of Saxony to Hermann Billung. Under the house of the Billungs, Saxony made war upon the Emperor Henry IV. in 1073, but in 1106 the house became extinct, and under the Emperor Lothar, in 1125, the country came into the possession of Duke Henry of Bavaria. His son, Henry the Lion, increased the dukedom, but when he was placed under the imperial ban his dominions were scattered, and, after being reduced to a small piece of land, the dukedom of Saxony was given to Margrave Bernhard of Ascania. The house of Ascania branched off in 1260 into two lines, of which one, the Wittenberg, became extinct in 1422, while the other, the Lauenburg, reigned until 1680. The title of Duke of Saxony followed the Wittenberg branch; it was changed in 1355 to that of elector, and both land and title were bestowed on Frederick the Valiant, Margrave of Meissen, in 1423. Thus the name of Saxony, which originally designated a tribe, became a princely title, and was transferred to countries with which it had no historical connection. Since 1088 the house of Wettin has reigned in the margraviate of Meissen. In 1485 the grandsons of Frederick the Valiant, Ernst, and Albert, divided the inherited countries, so that Ernst received Thuringia, and Albert, Meissen, and two lines were thus formed, which still flourish, the Ernestine and the Albertine, of which the former reigns in the Saxon duchies, the latter in the kingdom of Saxony. After the Peace of Westphalia, in 1648, the rise of Brandenburg became an impediment to the development of the electorate. The Elector Augustus embraced Roman Catholicism in 1697, became King of Poland, and involved Saxony in war with Charles XII. of Sweden. His successor, Augustus, sided with Maria Theresa of Austria against Frederick of Prussia, and in the Seven Years' war Saxony suffered heavy losses. Under Frederick Augustus III. (1763–1827) the country again began to rise, though it had some very hard years also during this period. As a member of the German empire it took part in the war against France, and concluded an alliance with Prussia in 1806, but after the defeat at Jena it concluded an alliance with Napoleon and entered the Confederation of the Rhine, after which the elector received the title of king. By the Peace of Tilsit the King of Saxony obtained the duchy of Warsaw, which had just been established, and portions of Prussia and Austria, but after the battle of Leipzig he was taken prisoner by the allied Russians, Prussians, and Austrians, and at the Congress of Vienna (1815) was deprived of 7,720 sq. miles of territory. In the long period of peace from this moment, and up to 1866, the country became very prosperous, though a narrow and short-sighted policy of government presented many obstacles to its development. The revolutionary years of 1848–49 brought many great and beneficial reforms to Saxony. Aug. 9, 1854, King John ascended the throne, and both he and his minister, Beust, made a most stubborn opposition to the Prussian policy, and showed a decided partiality for Austria as the leader of the small states. The war of 1866 brought the independence of Saxony in imminent danger, and the king, John, saved his crown only by entering the North German confederacy, over which Prussia presided, by paying 30,000,000 marks in war indemnity, and by dismissing Beust. The liberal party in Saxony hailed this event with enthusiasm, but the party consisting of the court, the nobility, and the army officers continued hostile to Prussia. In 1870–71 the Saxon soldiers fought under the leadership of the crown prince, afterward King Albert, as true allies by the side of the Prussians, and the interior development of the country has not only kept pace with that of the rest of Northern Germany, but in some respects even advanced beyond it. A new modification of its constitution took place Oct. 12, 1874, giving to the lower house of representatives a more democratic character, while the upper house is still strongly aristocratic in its membership. Revised by M. W. HARRINGTON.

Saxton, JOSEPH: inventor; b. in Huntingdon co., Pa., Mar. 22, 1799. His mechanical ingenuity was early shown by improvements in the machinery in his father's nail-factory. At the age of eighteen he went to Philadelphia, and there invented a machine for cutting the teeth of chronometer wheels, an original escapement with a compensating pendulum, and made the clock which marks the time from the belfry of Independence Hall. In 1828 he went to London, where he resided for nine years. He was placed as chief assistant in the Adelaide Gallery, then the great scientific repository, and while there constructed a magneto-electric machine by which the first magnetic spark was produced. He also constructed the apparatus used by Wheatstone in his experiments on the velocity of electricity in its passage through a wire. He next invented a locomotive differential pulley, by means of which high speed may be given to vehicles by horses traveling at a slow rate, and a medal-ruling machine for tracing lines on metal or glass, representing by an engraving the design on the face of the medal. He returned to the U. S. to superintend the construction of the machinery and balances for the Philadelphia mint, and subsequently was placed in charge of the construction of the standard weights and measures for the U. S. This position he filled with ability, furnishing the State capitals and the custom-houses with accurate sets of weights and measures. A gold medal was awarded him at the London Exhibition of 1851 for a large class-balance of extreme precision. He was one of the original corporators of the National Academy of Sciences. Among his many ingenious devices and inventions, the mirror-comparator for comparing and the tracing-machine for dividing standard measures, his deep-sea thermometer, used in the exploration of the Gulf Stream by the U. S. Coast Survey, his self-registering tide-gauge, and his immersed hydrometer, deserve especial mention. D. at Washington, D. C., Oct. 26, 1873.
Revised by R. H. THURSTON.

Saxton, RUFUS: soldier; b. at Deerfield, Mass., Oct. 19, 1824; graduated at the U. S. Military Academy July 1, 1849, as brevet second lieutenant of artillery; from 1855 to 1859 was on coast-survey duty, and for a year was assistant instructor of artillery tactics at West Point. On the outbreak of the civil war he was stationed at St. Louis, and participated in dispersing the Confederate force at Camp Jackson, May 10, 1861; appointed assistant quartermaster U. S. army May 13, 1861, he served on the staff of Gen. Lyon as chief quartermaster until transferred in July to the staff of Gen. McClellan in West Virginia. In September he accompanied the expedition to Port Royal, S. C.; appointed brigadier-general U. S. volunteers in Apr., 1862, he commanded at Harper's Ferry when threatened by Jackson; assigned to duty as military governor of the department of the South July, 1862, where he was engaged in organizing Negro laborers and troops, and as commissioner of the Freedmen's Bureau until Jan., 1866, when he was mustered out of the volunteer service; brevet major, lieutenant-colonel, colonel, and brigadier-general. In 1872 he became deputy quartermaster-general U. S. army, with rank of lieutenant-colonel; in 1882 assistant quartermaster-general, with rank of colonel; retired Oct. 19, 1888. Revised by JAMES MERCUR.

Say, JEAN BAPTISTE: economist; b. in Lyons, France, Jan. 5, 1767; was educated for a commercial career, and spent a part of his youth in England; found employment on his return to Paris on Mirabeau's paper, *Courrier de Provence*, and afterward as secretary to Clavière, Minister of Finance; edited from 1794 to 1800 *La Décade*; became a member of the tribunate in 1799; published his celebrated *Traité d'Économie politique* in 1803, and enjoyed a great reputation when his thorough disagreement with Napoleon's policy compelled him to retire into private life. He established a large spinning-mill, and published in 1815 *Catéchisme*

d'Économie politique and in 1816 *De l'Angleterre et des Anglais*. After the fall of Napoleon he again took an active part in public life, and was appointed professor at the École des Arts et Métiers in 1819, and at the Collège de France in 1831. D. in Paris, Nov. 15, 1832. He was the first writer to popularize the doctrines of Adam Smith on the Continent. His lectures were published 1828–30 under the title *Cours complet d'Économie politique*.

Say, Jean Baptiste Léon: economist; b. in Paris, June 6, 1826; grandson of Jean B. Say; studied political economy; took an active part in conducting the *Journal des Débats*; was appointed prefect of the department of the Seine in 1871, and elected a member of the Legislative Assembly; was Minister of Finance in 1872, 1875, and 1877, president of the international monetary conference which met at Paris in 1878, minister to Great Britain in 1880, and in the same year president of the Senate; Feb. 11, 1886, he was elected a member of the French Academy. D. in Paris, Apr. 21, 1896. Author of *Théorie des changes étrangers*; *Histoire de la Caisse d'escompte*; *La Ville de Paris et le Crédit foncier*; *Examen critique de la situation financière de la Ville de Paris*, etc.

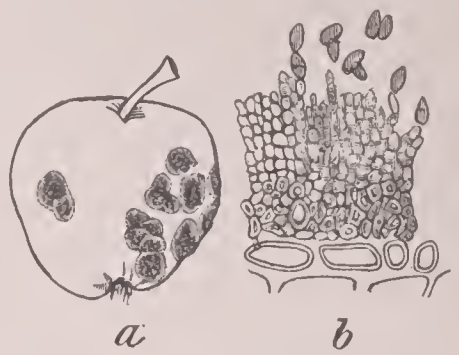
Say, Thomas: zoölogist; b. in Philadelphia, Pa., July 27, 1787; was one of the founders, and the first curator, of the Philadelphia Academy of Natural Sciences; accompanied Maclure, Peale, and Ord in their scientific exploration of Georgia and Florida 1818; was zoölogist to Maj. Long's expeditions to the Rocky Mountains 1819–20, and to St. Peter's river 1823; published *Vocabularies of Indian Languages* (Philadelphia, 1822); issued his principal work, *American Entomology*, in 3 vols. (Philadelphia, 1824–28); removed with Maclure and Owen to New Harmony, Ind., 1825, as one of the founders of that socialistic experiment; remained there after the separation of his associates; published 7 numbers of a great work on *American Conchology* (1830–34), with colored plates. D. at New Harmony, Oct. 10, 1834. His *Comptete Writings on Conchology* was edited by William G. Binney (New York, 8vo, 1858), and his *Complete Writings on Entomology* was issued by Le Conte (New York, 2 vols. 8vo, 1859). Say must be regarded as the father of American systematic zoölogy. Revised by J. S. Kingsley.

Sayce, Archibald Henry, LL. D.: philologist; b. at Shirehampton, England, Sept. 25, 1846; graduated at Oxford in 1869, where he became a fellow of Queen's College; was appointed Deputy Professor of Comparative Philology at Oxford in 1876, which office he resigned in 1890. He has worked in a great variety of fields, classic, biblical, Assyrian, Hittite, Vannic, Egyptian, and has published a number of books and essays. Among these are *Introduction to the Science of Language* (2 vols., 1880); *The Ancient Empires of the East* (1884); *The Hibbert Lectures for 1887* (on the religion of the ancient Babylonians); and *The Records of the Past* (new series, 6 vols., 1888–92). D. G. Lyon.

Sayre, Lewis Albert, M. D.: surgeon; b. at Madison, N. J., Feb. 29, 1820; graduated at the University of Transylvania in 1837. Having selected the medical profession, in 1839 he entered the office of Dr. David Green in New York; in 1842 took the degree of M. D. in the College of Physicians and Surgeons; was appointed resident physician of Bellevue Hospital, New York, in 1859, and soon after was elected Professor of Orthopædic Surgery in the Bellevue Hospital Medical College. In 1843 he advocated free incision for the treatment of suppurative diseases of the joints; and in 1852 first exsected the head of the os femoris and portion of the acetabulum with success—an operation that he performed oftener probably than the whole profession besides. He inaugurated important steps in the treatment of hip-joint disease and caries of the vertebræ, lecturing on these subjects in the U. S. and Europe, and may be said to be the founder of orthopædic surgery as a specialty. Dr. Sayre was the author of several monographs on orthopædic surgery. In 1872 the King of Sweden appointed him a Knight of the Order of Vasa. D. Sept. 21, 1900. Revised by S. T. Armstrong.

Scab: a disease of sheep much resembling the itch which sometimes afflicts the human species. Like that disease, it is caused by the presence of a minute acarus or spider-like mite. Sulphur ointment, arsenical washes, tobacco-water, and mercurial ointments are all useful, and the disease can generally be cured without difficulty. It may be suspected when the sheep rub themselves much or have bare and scurfy patches upon the skin.

Scab (in plants): the popular name of several diseases, characterized by a roughening of the surface of the affected part. *Apple-scab* is a disease in which the fruit becomes more or less covered with black scab-like spots, varying from mere specks a millimeter in diameter to blotches nearly or quite an inch in diameter. It is caused by a minute hyphomycetous fungus (*Fusicladium dendriticum*) of the family *Dematiceæ*, which grows upon the surface and in the superficial cells of the leaves and fruit. According to Prof. Scribner, whose figures we reproduce, the loss in some States from the apple-scab amounts to one-half the crop. Spraying the trees in the spring with poisonous solutions (iron or copper sulphate) is beneficial.—*Pear-scab* is a similar affection of the pear, caused by the same or a very nearly related fungus known as *F. pirinum*.—*Grape-scab*, or more properly anthraenose, occurs upon the leaves, twigs, and berries of the grape, forming brownish or grayish scabs with darker margins. It is one of the most destructive of the grape diseases and is caused by a minute melanconiaceous fungus (*Glœosporium ampelophagum*, or, according to de Bary, *Sphaceloma ampelinum*) which attacks the superficial cells of the affected parts. The application of poisonous solutions by spraying has been found beneficial.—*Potato-scab* is a disease of the tubers of common potatoes in which the surface becomes more or less covered with rough warty scabs, greatly injuring their appearance and value. Careful investigations by Prof. Bolley show that it is caused by bacteria which invade and destroy the outer cells. As a consequence, the tuber develops masses of cork-like cells to close the wounds resulting from the action of the bacteria. Soaking the potatoes before planting for an hour and a half in a solution of corrosive sublimate in water (1 to 1,000) will destroy the bacteria. The planting should be upon ground free from contamination.—*Beet-scab* is a disease of sugar-beets similar to the potato-scab, and, as shown by Prof. Bolley, caused by the same species of bacteria. The scabby patches occur upon the upper portion of the beetroot, and greatly disfigure it. It is therefore necessary in growing sugar-beets to avoid the use of fields in which scabby potatoes have been grown.—*Wheat-scab* is a disease of the heads of wheat in which they turn pale yellow, wholly or in part, the kernels shriveling and drying up. The chaff also becomes coated over with a sticky growth, which the microscope shows to be a hyphomycetous fungus, probably *Fusarium tritici*. Early sowing upon well-prepared soil tends to decrease this disease. See F. L. Scribner's *Fungus Diseases of the Grape* (U. S. Dept. Agric., 1886); *Fungus Diseases of the Grape and other Plants* (1890); J. C. Arthur, *Wheat Scab* (Bull. Purdue Univ. Expt. Station, 1891); H. L. Bolley, *Potato Scab and Beet Scab* (Bull. N. Dak. Expt. Station, 1891). Charles E. Bessey.



Apple-scab: *a*, an affected apple, reduced; *b*, section showing the parasite, much enlarged.

Scabbard-fish: the *Lepidopus argyreus*, a species of the family *Trichiuridæ*, distinguished by the elongated, ribbon-like body, pointed head, formidably armed mouth, elongated dorsal and anal, and well-developed and forked caudal fin. The species is an open-sea fish, and rather rare on the coasts of Europe.

Scabies, or **Itch** [*scabies* is Mod. Lat., from Lat. *sca'bies*, scurf, mange, itch]: a parasitic disease of the skin. It affects chiefly the hands, more especially the webs of the fingers, their inner surfaces, and the back of the hand. Less frequently it extends to the arms, and rarely the feet, legs, and abdomen are affected. The scalp may be invaded, but the face is exempt. This disorder infests children, the peculiar insect being transmitted from person to person by contact at school or play, and its lodgment being facilitated by neglect to wash perspiration and dirt from the hands. Persistent and annoying itching is experienced; careful inspection detects small red elevations, points of irritation, papular at first; soon these become vesicular or watery at the tip, and often from scratching are rendered pustular, and later scaly. Closer inspection discloses small red lines connecting these vesicles or branching from them into adjacent healthy skin. These red lines are subcuticular channels,

produced by the burrowing of the itch-insect beneath the cuticle or scurf-skin, and the vesicles are the result of inflammation to which its presence and irritation have given rise. The insect will not be found in the fluid or cavity of the vesicle, but by laying open the diverging canals with a fine needle may often be found at its end. This parasitic insect is known as the *Acarus scabiei*, or *Sarcoptes hominis*. It is a whitish insect, from $\frac{1}{100}$th to $\frac{1}{50}$th of an inch long. The male is migratory in his habits, and small. His head is provided with two mandibular organs and four palpi or bristles; the adult male has eight legs. The female is sedentary in habits, and more easily found, especially at the ends of channels, where she lays her eggs. The acarus makes its progress beneath the epidermis by means of suckers or disks upon its legs, and by aid of bristles upon its back, directed backward. Hahnemann ascribed itch to a supposititious cause, a subtle humor, which he termed *psora*, and which he regarded as the cause of multitudinous ailments of all kinds; but the microscope has established the parasitic nature of the disease. The treatment of scabies consists in killing the parasites. Remedies producing this end are termed parasiticides. Chief among these is sulphur, in ointment, powder, or vapor. Sulphurous acid is a convenient application. Carbolic acid, kerosene, petroleum, strong alkalies, and solution of corrosive sublimate are also efficacious. Even when cured as a specific disease, the redness and vesicles may linger, a chronic condition of irritation. Soothing ointments are then indicated.

Revised by W. Pepper.

Scad: the *Trachurus trachurus*, a fish of the family *Carangidæ*, distinguished by its elongated, fusiform body, completely plated lateral line, and silvery color. When fresh it is scarcely edible, but it takes salt well, and when pickled is very good. Many are taken in the British seas. The name has been extended to congeneric species, as well as to species of the genera *Trachurops* and *Decapterus*.

Scadding, Henry: See the Appendix.

Scævola, sev′ō-lăă: a cognomen common among the members of the plebeian family of the Mucii in ancient Rome. The two most prominent members of the family were Quintus Mucius Scævola, the Augur, and Quintus Mucius Scævola, the Pontifex, both celebrated as jurists, and nearly contemporary. The former was tribune of the people in 128 B. C., prætor in 121, consul in 117, and died soon after the outbreak of the war between Marius and Sulla. Cicero, who was born in 106 B. C., states that after assuming the garb of manhood (*toga virilis*) he was taken by his father to Scævola to be instructed in law, and that he remained in close attendance upon him until his death. The Pontifex Scævola was tribune in 106 B. C., and consul in 95. He was proscribed and put to death by the party of Marius in the year 82. Cicero, who, after the death of Scævola the Augur, attached himself to the Pontifex, characterizes him with the epigrammatic phrase that of jurisconsults he was the most eloquent, and of orators the most deeply versed in the law. Revised by G. L. Hendrickson.

Scagliola, skăl-yō′lăă [from Ital. *scagliuo′la*, liter., dimin. of *sca′glia*, scale]: an imitation of marble, made by mixing ground gypsum with glue, coloring it, applying it to the surface to be marbleized, and setting into the soft mass, if it be desired, bits of various ornamental stones. When hard the surface is smoothed and polished. It is an admirable imitation of the more costly marbles, but is not durable, especially in damp places.

Scala, skaa′lăă (Lat. *Scaligeri*): the name of a celebrated Italian family which reigned in Verona from 1260 to 1387. After a long series of internal disturbances, tyranny alternating with anarchy, Mastino della Scala succeeded in 1260 in making himself master of the city. He ruled with firmness and wisdom; the city prospered, and, although he was assassinated in 1277, the power continued in his family for more than a century. Under Cangrande (1311–29) the fortune of the family culminated. He was confirmed in his possessions, to which were added Vicenza, Padua, Treviso, etc., by the Emperor Henry VII. At his court lived Dante, and many of the most magnificent architectural monuments of the city were erected during his reign. Most of his successors, Cangrande II., Paolo Alboino, and others, were worthless and infamous tyrants, and in 1387 Galeazzo Visconti of Milan expelled Antonio della Scala. The male line of the family, which flourished in Bavaria under the name of Scaligeri, became extinct in 1598; the female is still flourishing in the families of Dietrichstein and Lamberg.

Scala Nova (anc. Νεάπολις): town; in Asia Minor, vilayet of Aïdin; 7 miles S. W. from the ruins of Ephesus (see map of Turkey, ref. 5–D). It has a good harbor, and is the main port of the towns in the valley of the Meander. Pop. 7,500.

Scalchi, Sofia: See the Appendix.

Scald: See Burns and Scalds.

Scaldhead: See Favus.

Scale [from Lat. *sca′la*, flight of steps, for **scadla*, deriv. of *scan′dere*, climb]: a mathematical instrument used in plotting and in other branches of applied geometry. It consists of a slip of wood or other material divided into parts in accordance with some mathematical law. The common ivory ruler of the instrument-maker has a great variety of scales stamped on its faces, of which the *scale of equal parts* and the *scale of chords* are of most frequent use.

Scale of Equal Parts.—This consists of a number of inches, or aliquot parts of an inch, laid off along a line. The representative fraction gives the ratio between the scale and the object it represents. Thus if the scale is of 1 inch to 8 miles the representative fraction is 1 : 506,880. The first part, counting from the left, is subdivided into ten equal parts, the 0 of the scale being at the beginning of the second part. The *principal divisions* are numbered from the 0 toward the right, and the *subdivisions* toward the left. This scale is used, in connection with a pair of dividers, for laying off and measuring the lines of a drawing. The diagonal scale is used to further divide the subdivisions. If the division is into tenths, ten parallel lines at equal distances are drawn above the simple scale, and the perpendiculars are erected at the ends of the division. Then from the points of subdivision on the uppermost line parallel lines are drawn to the corresponding points one subdivision to the right on the base line. The intercepts of these diagonals on the lines parallel to the base determine the length of the farther subdivision.

Scale of Chords.—This scale is used for laying off and for measuring the angles of a drawing. It is constructed by laying off from the left-hand extremity of a given line the chords of all the arcs from 0° up to 90°, corresponding to some assumed radius. The extremity of each chord is marked by a corresponding number; the origin of the scale and the extremity of the chord of 60°, which is equal to the radius, are marked in a more conspicuous manner than the other divisions. To lay off an angle, the vertex and one side being given, take the chord of 60° as a radius, and from the vertex of the angle as a center describe an arc cutting the given side; then from the point in which this arc cuts the side as a center, with a radius equal to the chord of the arc corresponding to the given angle, describe a second arc cutting the first; join this point of intersection with the given vertex; the last line will make the required angle with the given side. The method of measuring an angle by means of the scale is obvious.

Scale: in music, the regular series of sounds, or degrees on the stave, which form the gamut. The scale in its simplest form consists of seven steps or degrees, counted upward in regular order from a root or prime, to which series the eighth is added to complete the octave. By reverse motion the same notes form the descending scale; and by the addition of other notes above or below in a continuous order the scale may be extended to seven, eight, or more octaves. The *diatonic* scale is that which consists of the tones and semitones of the octave in their natural order and relation; as, for example, A, B, C, D, E, F, G, A. (For the origin of this scale, see the article Gamut.) Of the diatonic scale, only two varieties are in use in modern music—viz., the *major* and the *minor*. The chief characteristic interval in both these scales is the *third*, which is one semitone greater in the major than in the minor. In ancient music several other diatonic scales were in use as described under the head of Mode (*q. v.*). The word scale means also the entire range or compass of sounds producible by any given instrument, as the scale of the violin, flute, organ, or piano. It is also applied by organ-builders to a graduated rule, plan, or scheme showing the lengths and diameters of the various pipes comprised in any stop. In like manner the length and thickness of the strings of a piano are regulated by a carefully graduated scheme called the *scale*; hence the terms new or improved scale refer to changes adopted by manufacturers in regard to the length and thickness of the strings.

Revised by Dudley Buck.

Scale-carp: See Carp.

Scales (of fishes): See ANATOMY, COMPARATIVE (*Mucodermal System*).

Scal'iger, JOSEPH JUSTUS: classical scholar; tenth child and third son of Julius Cæsar Scaliger; b. at Agen, Guyenne, France, Aug. 4, 1540. He was carefully educated by his father, and studied in Bordeaux and Paris (under Turnebus 1565), and was professor in Geneva 1572–74. The succeeding twenty years were spent in travel and on the estates of his patron, de la Rochepozay. In 1593 he accepted a call to the University of Leyden, where he remained till his death Jan. 21, 1609, in undisputed possession of the throne of learning, but embittered by the venomous attacks upon his character which SCIOPPIUS (*q. v.*) hurled against him in the *Scaliger Hypobolimæus* (1607). Scaliger has been justly styled the "most richly stored intellect that ever spent itself in acquiring knowledge." He mastered no fewer than thirteen languages, and his acquirements in mathematics and the sciences generally were profound, and his acquaintance with classical antiquity all-embracing. He opened new regions of research for the classical scholar, being virtually the founder of epigraphy, numismatics, and chronology as sciences. His critical talent was of the highest order, and there is scarcely an ancient author whose text has not been benefited by Scaliger's genius, although he has said of himself "Melius morbos quam remedia novimus." His most celebrated works are *Festus* (1575); *Catullus, Tibullus, Propertius* (1577), a work unfortunately marred by a wanton disregard of MS. tradition; twenty-four indexes to Gruter's *Thesaurus Inscriptionum Latinarum* (1601), a colossal and epoch-making achievement; *De emendatione Temporum* (1583) and *Thesaurus Temporum* (1606), immortal masterpieces and the basis of all subsequent chronological research, the restoration of the lost portions of the *Chronicon* of Eusebius being perhaps the greatest triumph of conjectural skill on record, for when the missing parts were discovered in an Armenian translation they were found to coincide with Scaliger's reconstruction. See Jacob Bernay's *Joseph Justus Scaliger* (Berlin, 1855), pp. 319 (list of his works, pp. 267–305); L. Mueller, *Geschichte der class. Philologie in den Niederlanden*, pp. 222–227; M. Pattison, *The Lives of the Two Scaligers*, in *Essays*, vol. i., pp. 196–244. ALFRED GUDEMAN.

Scaliger, JULIUS CÆSAR: classical scholar; b. at Riva, Lake Garda, Italy, Apr. 23, 1484; the son of Benedetto Bordone, a miniature-painter of Padua. The latter assumed or received the name Della Scala (de l'Escale) from the street in which he lived, for the genealogy by which his descent from the noble family of the Della Scalas was made out is a pure fabrication, though obstinately upheld by his illustrious son. The elder Scaliger, according to the account given by his son, served as a page under Maximilian I., and as a soldier of fortune in the armies of François de Valois. He studied medicine, and after living for some time at Venice settled down at Agen, France, in 1529, as physician to the bishop of the diocese. D. Oct. 21, 1558. He was a man of great learning and a versatile Latin poet, but of a very irritable and pugnacious nature. His best-known works are, besides seven books of poetry (1561), commentaries on Hippocrates, *De insomniis* (1538); Aristotle, *De plantis*; Theophrastus, *De Causis plantarum* (1566); and a grammatical work, *De causis Linguæ Latinæ* (1540). His attack on Erasmus (*Oratio pro Cicerone contra Erasmum*, 1531) is characterized by a most virulent invective, remarkable even for an age so tolerant of personal vituperation. See Joseph Scaliger, *De vetustate et splendore gentis Scaligeræ et Jul. Cæs. Scaligeri vita* (Leyden, 1591); Janus Dousa, *Vita Julii Cæsaris Scaligeri* (1594); A. Magen, *Documents sur Julius Cæsar Scaliger et sa famille* (1880). ALFRED GUDEMAN.

Scallop [from O. Fr. *escalope*, a shell; cf. Dutch *schelp*]: a common name for molluscs of the family *Pectinidæ*. The shell, the two valves of which are usually unequal, is circular in outline, the straight hinge having ear-like lobes at either end. There are many species, most of them being used for food. The Eastern markets of the U. S. are supplied by the *Pecten irradians*, which abounds on the south shore of Cape Cod and southward. Only the muscle which closes the shell is used for food. A scallop-shell was formerly worn by pilgrims to show that they had been to the Holy Land. J. S. KINGSLEY.

Scalp: the outer covering of the top of the human head, consisting of the hairy integument, the flattened tendon of the occipito-frontal muscle, and subcutaneous cellular tissue. Wounds of the scalp are peculiarly liable to take on an untoward kind of inflammation, and their treatment requires great care. The removal of the scalp of a dead (or even a living) enemy as a token of triumph is one of the customs of many tribes of North American Indians.

Scaly Ant-eater: See MANIDIDÆ.

Scaman'der (in Gr. Σκάμανδρος): a stream in the plain of Troy. Homer says that it was called *Xanthus* by the gods, but *Scamander* by men; it is probable, however, that it received the name Xanthus from the yellow or brownish color of its water, which was believed to have the power of dyeing the wool of sheep which drank of it. According to Homer, it arose from two sources, one of hot, and the other of cold water. To-day, at all events, the waters of the sources of Scamander do not differ in temperature. The river is still called Mendere-Su by the Turks. J. R. S. S.

Scammony [viâ O. Fr. from Lat. *scammo'nea, scammonia* = Gr. σκαμμωνία]: a cathartic drug obtained from the *Convolvulus scammonia*, a twining plant of the family *Convolvulaceæ*, indigenous in Greece, Syria, Anatolia, and Southern Russia. The root of this convolvulus contains a milky juice which, collected from the cut surface of a fresh root, dries into a slate-colored lump, hard and brittle, and constitutes the drug in question. At the time of collection the juice is much adulterated, so that scammony varies greatly in purity. The purest quality is called virgin scammony. The active principle of scammony is a resin which may be used in medicine instead of the crude drug. Scammony has been known from a remote period. It is a powerful drastic cathartic, and in overdose is capable of exciting dangerous inflammation. Its principal advantage is the fact that an emulsion of the drug is nearly tasteless, but it is very seldom used except in combination with other purgatives. Resin of scammony is an ingredient of the U. S. compound extract of colocynth, and therefore of the compound cathartic pill. Revised by H. A. HARE.

Scamozzi, skăă-mōt'sĕĕ, VINCENZO: architect; b. at Vicenza, Italy, in 1552. His father, also an architect, grounded him in his art. He then studied at Venice with Palladio and Sansovino, and in 1579 he went to Rome to study ancient monuments. In 1583 he returned to Venice to establish himself, and was commissioned by Marc Antonio Barbaro to erect a monument to his family in the Church of the Carità. This work was so much approved of that Scamozzi immediately was appointed to finish the library of St. Mark's. The Cornaro Palace on the Grand Canal, Venice, is his work, also the Trissino Palace at Vicenza. The second or uppermost story was added to the Palazzo Strozzi, at Florence, by Scamozzi, and he built the Ravaschieri Palace at Genoa. His designs were in request all over Europe, for he was acknowledged to be one of Italy's best architects. He published several works, and had completed six parts of his *Ideas of Universal Architecture*, when he died in Venice, Aug. 7, 1616. W. J. STILLMAN.

Scan'derbeg: soldier and patriot; b. 1404. His real name was George Castriotes, and he was fourth son of John Castriotes, despot of Northern Albania. The four brothers were given as hostages to Murad II. in 1423, when he invaded Albania. The three elder died from poison, but the beauty and brightness of George rendered him a favorite of the sultan, who made him a janissary and gave him the title of Iskender (Alexander) Bey; hence his popular name of Scanderbeg. He gained great distinction in the Ottoman campaigns in Asia, but when his father died in 1432 the sultan incorporated Albania as a province. Scanderbeg was offended and indignant, but bided an opportunity for freedom and revenge. In 1443 he was sent as second in command of a large army into Hungary. He so manœuvered as to give the victory to the Hungarian Huniadi, and fled with a few followers to Croia. Previously he had compelled the sultan's secretary to sign an order, bidding the Ottoman commander of Croia to give up his office to the bearer of the order, and had then killed the secretary to prevent discovery. He thus obtained possession of the chief Albanian fortress. Abjuring Islam, he called upon his countrymen to rise against their Mussulman masters. The country responded; even the rival, semi-independent Albanian chiefs forgot their jealousies and agreed to pay him tribute. During seventeen years Scanderbeg successfully resisted the whole power of the Ottoman empire, fifteen times defeating armies always far more numerous than his own, commanded by the ablest generals and often by Murad II. or his successor, Mohammed

II., in person. In 1461 the sultan, hopeless of victory, acknowledged the independence of Albania and Epirus. Persuaded by the pope to violate the treaty and attack the Ottomans, Scanderbeg won eight splendid victories, the last, with 24,000 men, over Mohammed II., who had 100,000. He died at Alessio, Jan. 17, 1468, and was buried at Scutari in Albania. When in 1477 the Ottomans captured Scutari, they broke open his tomb, divided his bones into fragments as precious relics, had them set in gold and silver, and wore them around their necks as talismans to give intrepidity and success. Despite his ferocity and lack of faith, Scanderbeg is deservedly honored and revered as the "hero of Albania."

E. A. GROSVENOR.

Scandina'via: a name applied by the Romans to a supposed great island N. of Germany, probably the southern point of Sweden, extended by moderns as a geographic name for the peninsula between the Baltic Sea and Gulf of Bothnia on the one hand, and the North Sea and Atlantic Ocean on the other. It includes Norway, Sweden, and part of Finland. The name is sometimes used in an ethnographic sense, when it also includes Denmark. See NORWAY, SWEDEN, DENMARK, FINLAND, and LAPLAND. M. W. H.

Scandinavian Languages: the name applied collectively to the Teutonic languages of the Scandinavian north, inclusive of settlements from Scandinavia, notably Iceland and the Faeroes. With Gothic and West Germanic Scandinavian forms the Teutonic branch of the Indo-European family of languages. An earlier classification made Scandinavian and Gothic East Germanic as opposed to West Germanic, but, although coincidences in some points exist, no other relationship than the one at present assumed is probable. The linguistic territory of Scandinavian is Norway, Sweden, including parts of Finland and Esthonia, Denmark, including the adjoining northern parts of Schleswig and the Danish dependencies of the Faeroes, Iceland, and Greenland. At an earlier period Scandinavian was, at least for a time, the language of conquered territory elsewhere—viz., in Swedish settlements in Russia from the ninth to the eleventh century; in Norwegian settlements in the Orkneys and Shetlands from 800 to 1800; in the Hebrides, Northern Scotland, and the Isle of Man from 800 into the fifteenth century; and in Ireland from 800 to 1300; in Danish settlements in England from the ninth into the eleventh century; and in Danish and Norwegian settlements in Normandy from 900 until after 1000. From the Shetlands, Ireland, Scotland, England, Normandy, and Russia there is, however, no extant monument from ancient times.

In its historical development Scandinavian falls chronologically into several periods. Common Norse, the first, extends from the earliest time down to the beginning of the Viking age in 700. It is the homogeneous parent language of the north before it shows traces of dialectic differences. The second period is coincident with the so-called Viking age, from 700 to 1050. Instead of a single language, three dialects appear—Old Norwegian, Old Danish, and Old Swedish, including the sharply defined dialect of the island of Gotland, Old Gutnic, to which was added after the settlement of Iceland, principally from Western Norway, in the ninth century, a fourth, Old Icelandic. This dialectic separation, furthermore, proceeded in such a way that two groups were formed—an eastern, made up of Old Danish and Old Swedish, together, accordingly, called East Norse, and a western, comprising Old Norwegian and Old Icelandic, together called West Norse. At the end of the Viking age these dialects again had differentiated into languages, properly so called, whose early or "old" period extends to the Reformation, or about the year 1530, at which time the modern or "new" period begins. The whole development of the Scandinavian languages down to the Reformation is commonly included under the one term Old Norse. In Scandinavia itself, in the Viking age and later, *dǫnsk tunga*, Danish language, was applied to the language of the entire north; in the same signification *norrønt mál*, Norwegian language, also occurs in Norway and Iceland, but it is usually limited specifically to West Norse.

Common Norse is only scantily preserved in Scandinavian loan-words adopted by the neighboring Lapps and Finns in the early centuries of the Christian era, and in something over a hundred runic inscriptions in the earlier Germanic alphabet of twenty-four characters, the oldest of which date from about the year 500. Of the Teutonic dialects Common Norse even more than Gothic stands nearest in essential points to Common Teutonic. Important differences between Scandinavian and Gothic observable in the earliest time are: Norse retention of final *a*, *i*, *u* of stem in substantives, syncopated in Gothic; Norse *a*-stems end genit. sing. *-as*, dat. sing. *-e*, Goth. *-is*, *-a*; *an*-stems end genit. and dat. sing. *-an*, Goth. *-ins*, *-in*; *u*-stems end dat. sing. *-iu*, Goth. *-au*; *r*-stems end nom. pl. *-iR* (*R* palatal liquid), Goth. *-jus*; 1 sing. pret. of weak verbs ends *-o*, Goth. *-a*. The most important points of coincidence with Gothic are the development of Teutonic *jj* to Gothic *ddj*, Norse *ggj*; Teutonic *ww* to Gothic *ggw*, Norse *ggw*; Teutonic *z* to Gothic *s*, Norse *R*.

During the Viking age (700–1050) it is possible to obtain for the first time a tolerably complete view of the language. The sources of information are, as in the earlier period, loanwords, and not only in Finnish-Lappish, but in Keltic, Russian, and Anglo-Saxon. Runic inscriptions, besides, occur in great numbers over the whole Scandinavian north, written after the middle of the ninth century exclusively in the shorter or Old Norse alphabet of sixteen characters. To these, after the end of the ninth century, is to be added a literature consisting of the oldest Eddic lays and early Skaldic poetry cited in Icelandic MSS. of the thirteenth century, until then orally transmitted and still preserving an archaic form. The Viking age was not only pre-eminently a period of rapid organic change, but local differentiations occur also at an early period, as has already been noted, in two well-defined groups, and after the introduction of Christianity, which marks the end of the period, there are four languages instead of the one at its beginning. After the middle of the twelfth century a native literature begins in Icelandic-Norwegian, soon abundant enough to show comprehensively the facts of the language. The alphabet used is essentially the Latin. From the runic alphabet þ, thorn, was retained, and the Anglo-Saxon ð was borrowed. To indicate new vowel-conditions the MSS. use, but inconsistently, various digraphs and modified forms. Vowel-length in the oldest MSS. is indicated by accent.

Old Norse in the literary period exhibited the following phonetic conditions:

A. Sonants:

Vowels: Palatal. Short: *i*, *j*, *e* (*ę*), *y*, *ø*. Long: *í*, *é*, *ǫ*, *ý*, *ǿ*.
Guttural. Short: *a*, *o*, *u*, *v*, *ǫ*. Long: *á*, *ó*, *ú*, *ǫ*, *ǿ*.

In the function of sonants (only in unstressed syllables):

Nasals: *m*, *n*.
Liquids: —, *l*, *r*.

Diphthongs: *ei*, *au*, *øy* (*ey*); *ja*, *jo*, *jǫ*, *ju*, *já*, *jó*, *jǿ*, *jú*; *va*, *ve* (*vę*), *vi*, *vǫ*, *vá*, *vé*, *vǽ*, *ví*, *vǫ́*.

All vowels and diphthongs may be nasalized. *e* has a twofold value: close Teutonic *e*, whose corresponding long form is *é*; open *e*, by umlaut from *a*, whose long form is *ǽ*. The two values fall together in most MSS. *ø* has a twofold value: short close *ö* from close *e* or *o*, the long form *ǿ*; or short open *ö* from open *e* or *ǫ*, the long form lacking. *ö*, which is used in most printed texts, was borrowed from German in the sixteenth century.

B. Consonants:

CLASSES OF CONSONANTS.	Labials.	Interdentals.	Dentals.	Palatals and gutturals.
Explosives: voiced....	*b*	——	*d*	*g*
voiceless..	*p*	——	*t*	*k*
Spirants: voiced.....	*f*, *v*	ð	——	*g* (i. e. ȝ)
voiceless....	*f*	þ	*s*	*h*, *g*
Nasals	*m*	——	*n*	*n* (i. e. ŋ)
Liquids..... ...	——	——	*l*, *r*	——
In the function of consonants.....	*u*, *v*, (*w*)	——	——	*i*, *j*

There was, in addition, breath (laryngeal) *h*; *ts* is represented by *z*; *ks* by *x*.

The consonants occur long (geminated), with the exception of the spirants where *s* is the only one lengthened. *ff* occurs in loan-words. Common Norse palatal (dorsal) *R* (Teutonic *z*) is merged in Old Norse *r*.

Of the Common Teutonic vowels Old Norse maintained, under circumstances, in direct continuity: Short: *a*, *e*, *i*, *o*, *u*. Long: *â*, *ê*, *î*, *ô*, *û*. Diphthong *au*. Teutonic *ǽ*, is represented throughout by Old Norse *á*, by *i*-, *R*-umlaut *ǽ*. Teutonic *ai* by Old Norse *á*, by *i*-, *R*-umlaut *ǽ*; by *i*-umlaut *ei*, which in its turn as final is contracted to *é*, and sporadically is

shortened to *e*. Teutonic diphthongs *eu*, *eo* in Common Norse interchanged and went over into *iu*, *io*, which became later *jú*, *jó*.

Of the Common Teutonic consonants Old Norse maintained in direct continuity: *b*, *d*, *g*, *bb*, *dd*, *gg*; *p*, *t*, *k*, *pp*, *tt*, *kk*; ð, *g* (ȝ); *f*, þ, *s*, *ss*, *h*; *m*, *n*, *n* (ŋ), *mm*, *nn*; *l*, *r*, *ll*, *rr*; *j*; *h*. Teutonic *b* is represented as initial by Old Norse *b*; before *k*, *s*, *t* by Old Norse voiceless *f*. Teutonic *z* is Common Norse *R* (palatal). Teutonic *w* is Old Norse *v*.

Within Old Norse itself the combinatory sound-changes that acquired the importance of laws were in detail as follows:

A. *Sonants.—Umlaut.*—Umlaut, which attains an extraordinary development in Old Norse, is primarily a shifting either through palatalization or labialization. Palatal umlaut is either *i*-umlaut caused by a following *i* (*j*), or it is *R*-umlaut caused by an immediately following palatal *r*. The vowels that undergo *i* (*j*)-umlaut are *a*, *á*, *o*, *ó*, *u*, *ú*, *au*, *ai*, *jo*, *ju*, *jú*, which become respectively *e* (*æ*), *ę*, *ø* (close), *ǿ*, *y*, *ý*, *øy* (*ey*), *ei*, *jø* (*ø*), *y* (presumably with *jy* as an intermediate step), *ý* (presumably through *jý*).

The vowels that undergo *R*-umlaut are *a*, *á*, *u* (*o*), *ú*, *au*, *jú*, which become respectively *e* (*ę*), *ǽ*, *ø* (close), *ý*, *øy* (*ey*), *ý* (presumably through *jý*).

Labial umlaut is caused by a following *u* (*o*), *v*. The vowels that undergo *u*-umlaut are *a*, *á*, *e* (open), *e* (close), *i*, *í*, *ei*, *va*, *vá*, *vi*, *ví*, which become respectively *ǫ*, *ǫ́*, *ø* (open), *ø* (close), *y*, *ý*, *øy* (*ey*), *vǫ*, *vǫ́* (*ó*), *y* (presumably through *vy*), *ý* (presumably through *vý*).

In unstressed syllables the only instances of *i*-umlaut are *a*, *u* becoming *e* (open), *y* respectively; of *u*-umlaut, *a* becoming *ǫ*.

The chronology of umlaut is varied. *i*-umlaut originated apparently in the Common Norse period; it had, on the other hand, in the oldest West Norse literature ceased to be an active force. *u*-umlaut was consummated later, but is, nevertheless, to be ascribed to the end of the Norse period.

Fracture.—Fracture occurred, apparently in Common Norse, in the case of Teutonic *e* (in Old Swedish, Old Danish in *e*, *i*) whenever there followed in the next syllable *a*, *o*, *u* (*v*), *á*, *ó*, *ú*, providing that the *e* is not immediately preceded by *v* or *r*. According to the quality of the parasitic vowel, it is either *a*-fracture, *a* > *ea* > *ja*, or *o*-, *u*- (*v*-) fracture, *e* > *eǫ* > *jǫ* (*jo*, *ju*).

Lengthening of Short Vowels.—Every short vowel final originally or by loss of a consonant is lengthened. Compensatory lengthening occurs also under circumstances for the loss of a consonant.

Shortening of Long Vowels.—This occurs frequently, but sporadically. Every long vowel immediately before another vowel could be shortened. In unstressed syllables, late in the Common Norse period, all long vowels of the inflexional ending were shortened.

Loss of Vowels.—In words originally trisyllabic almost every short vowel in the penult was syncopated at an early time. The law of syncope in Old Norse is that in syllables of derivation a short vowel is syncopated wherever by the addition of an ending with an initial vowel it stands in open syllable. In end syllables of words originally disyllabic short ultimate vowel is regularly lost when it had not been protected by two consonants; long vowel is only lost when no consonant stood after it. In words originally trisyllabic the ultimate vowel is only in exceptional cases lost and the vowel of the penult retained. An important result of the loss of the ultimate vowel is the acquirement of sonantal function by *l*, *m*, *n*, *r*, which happens when through this loss an explosive or a spirant stands immediately before them.

Interchange of Vowels.—In unstressed syllables *o* and *u*, *e* and *i* respectively, without regard to origin, are indiscriminately interchanged.

B. *Consonants.—Change in the Form of Articulation.*—The voiced spirants *b*, ð, ȝ toward the end of the Common Norse period as initial became the voiced explosives *b*, *d*, *g*. As the result of the working of the law of vowel-syncope *b* became voiceless *f*; ð became *d* (ðð > *dd*), or þ, which then went over to *t*; ȝ became *g*, which went over to *k*. The voiceless spirants *h*, þ, *f* became, in part in Common Norse, respectively: *h* > (breath) *h* before sonants (*hs*, however > *ks* (*x*)); þ > ð (*d*, *t*) after vowels and *r*, and in unstressed syllables; *f* > (voiced) *f* after vowels and *l*, *r*. The voiced explosives *d*, *g*, probably in Common Norse, became as final *t* (*ld*, *nd*, *ng* > *nt*, *nk* > *tt*, *kk*). As the result of the working of the law of vowel-syncope, *d* > *t* before *s*; *g* > *k* before *s*, *t*. The voiced explosives *k*, *t* in unstressed syllables after vowels frequently became the spirants *g*, ð. This change is exemplified even in the oldest MSS. After 1300 instances are frequent. In later Icelandic the spirants stand regularly as final after-vowels. The half-vowel *v* in the twelfth century is merged in voiced *f*. In the Common Norse period *mn* > *bn*, written *fn*.

Change in Place of Articulation.—The bilabial spirants *f*, *b* became, in the thirteenth century, the corresponding labio-dental spirants, both written *f*. The gutturals, possibly even before the Common Norse period, before palatals were palatalized. The change of spirant *h* to breath *h* has already been noticed.

Change in Quantity. — Lengthening. — Assimilation.—Consonantal assimilation is either regressive or progressive.

Regressive.—Apparently as old as the Common Norse period is the assimilation of the nasals to a following *k*, *t*, *p*: *nk* > *kk*; *nt* > *tt*; *mp* > *pp*. Other assimilations are *ht* > *tt*, with compensatory lengthening of the preceding vowel. Teutonic *zð*, *zn* > (ðð) *dd*, *nn* respectively. The syncope of an unstressed vowel causes the following: *dd*, *ddt* > *tt*; ðt > *tt*; *ggk* > *kk*. Other instances occur sporadically.

Progressive.—Probably in the Common Norse period occurred the assimilation of þ to a preceding *l*, *n*: *l*þ > *ll*; *n*þ > *nn*. As the result of vowel-syncope *t*ð > *tt*. Palatal *R* was throughout originally assimilated with preceding *l*, *n*, *r*, *s* to *ll*, *nn*, *rr*, *ss*, which process, however, through analogy has in many cases been obliterated. According to universal law, if a consonant precedes the long (geminated) consonant that arises through assimilation, the latter is shortened. After a long vowel or diphthong the final consonant may be lengthened; this occurs without exception in the adjective declension in nom., acc. sing. neut. *tt* instead of *t*.

Shortening.—A long consonant immediately following another consonant is invariably shortened. In unstressed syllables old Teutonic gemination is always simplified.

Loss of Consonants.—Teutonic *j* at an early time was lost as initial. Teutonic *w* (*v*) was lost in the following cases: before *o*, *ó*, *u*, and their umlauts; before *l*, *r*, and final. ȝ final in the Common Norse period became *h*, which was then lost according to the rule that *h* medial and final was everywhere dropped. Old Norse *j* is lost except before *a*, *á*, *o*, *ó*, *ǫ*, *ǫ́*, *u*, *ú*. Old Norse *v* is lost before *o*, *ó*, *u*, and their umlauts, before consonants and final. There are many instances of sporadic loss.

East Norse and West Norse.—The principal characteristic correspondences of the languages of the West Norse group, i. e. Old Icelandic and Old Norwegian, as contrasted with East Norse, i. e. Old Swedish and Old Danish, are as follows: West Norse retains *i*-, *R*-, *u*-umlaut in many cases where in East Norse it has been replaced through analogy by the unumlauted form. West Norse has fracture of old *e* alone; East Norse of *e* and *i*. West Norse has *ú* in many words where East Norse has *ó*. West Norse changes to consonantal *i* (*j*) the vowels *é*, *í*, *ý* in the event of hiatus. West Norse assimilates the nasals to a following *k*, *t*, *p* where East Norse in many instances still retains *nk*, *nt*, *mp*.

Within the West Norse group the principal differences between the two languages are as follows: Old Icelandic retains *u*-umlaut before *u* (*o*), in which position in Old Norwegian it has been replaced through analogy by the unumlauted form. Old Icelandic has *ja* where Old Norwegian has a progressive umlaut *jæ* in stressed syllable. Old Icelandic *ǿ*, before the middle of the thirteenth century, became *ǽ*, and *øy* became *ey*; in Old Norwegian they were retained. Old Icelandic changes *ǫ* to *au* before *ng*, *nk*; Old Norwegian retained *ǫ*. Old Icelandic lengthened *a*, *o*, *u* before *l* + consonant, and, later, *a*, *i*, *u*, *y* before *ng*, *nk*; Old Norwegian retains the short vowel. Old Icelandic retains initial *h* before *l*, *n*, *r*, which in Old Norwegian is lost at an early period.

Within the East Norse group differences in the earliest period of the languages are comparatively insignificant. Important characteristics are as follows: Old Danish changes *k*, *t*, *p* after vowels, at first only in initial, to *g*, *d*, *b* respectively; Old Swedish maintains the ancient conditions. Old Danish changes *z* medial and final in many cases to consonantal *u*; Old Swedish has *gh*.

Specifically Scandinavian and characteristic of all members of the group are the following:

The Medio-Passive.—Traces, in a single form only, of the old Teutonic Medio-Passive are still to be found in Common Norse (*heite*). During the Viking age a new Medio-Passive appears, which is peculiar to Scandinavian. It is formed by the enclitic addition of the reflexive pronoun *sik* to the

corresponding active form, which then ends in *-k*, *-sk*, *-zk*. These endings were supplanted early in the thirteenth century by *-z* or *-s*, which somewhat later became *-zt* or *-zst*. Modern Icelandic has *-st*; Swedish and Danish have *-s*.

The Use of the Definite Article.—The definite article *enn* (*inn*) stands before an adjective, but after a substantive, to which it is suffixed with (original) declension of both substantive and article. That it was originally free in the same position is shown by instances in the Old Icelandic Stockholm Book of Homilies, so called, from early in the thirteenth century.

For the history of the individual Scandinavian languages, see DANISH LANGUAGE, ICELANDIC LANGUAGE, NORWEGIAN LANGUAGE, and SWEDISH LANGUAGE.

Scandinavian Literature: the literary monuments of the Scandinavian language or languages. See SCANDINAVIAN LANGUAGE, DANISH LITERATURE, ICELANDIC LITERATURE, NORWEGIAN LITERATURE, and SWEDISH LITERATURE.

Scandinavian Mythology; the system of myths pertaining to the Scandinavian peoples. It is frequently called Norse or Northern mythology, but might more properly be denominated Teutonic mythology, since its chief deities were worshiped not only in Iceland, Norway, Sweden, and Denmark, but also in Germany and England—in short, by every branch of the Germanic or Teutonic race.

Original Sources.—Some information in regard to this mythology is to be gleaned from the old runic inscriptions found on monumental stones throughout the lands inhabited by Teutonic races, but mainly in the Scandinavian countries. Heathen Germany supplies a few ancient laws and glossaries containing mythological words. Formulas are also preserved by which converts to Christianity renounced the old gods and in which names of heathen divinities accordingly occur. Richer veins of information are such German heroic poems as the *Nibelungen Lied*, the *Gudrun*, the Saxon *Heliand*, and the Anglo-Saxon *Beowulf*. Cæsar, in his *De Bello Gallico*, gives us glimpses of the manner in which the Teutonic Druids preserved their mythological songs and epics, and with Cæsar Tacitus ranks as a source of information. Next after Cæsar and Tacitus come the Christians who wrote in Latin down through the Middle Ages, but they are, as a rule, very silent on the subject of the heathen religion. Among this class of writers Denmark furnishes a remarkable exception in Saxo Grammaticus. The first eight books of his *Historia Danica* contain an outline of Scandinavian mythology, the deities being presented as kings and potentates of early times. Mythological fragments must also be looked for in the customs, habits, speech, traditions, proverbs, ballads, folk-lore tales, and in the usages of the Christian Church throughout Teutonic lands. The chief sources of Scandinavian mythology are to be found in Iceland, and in Icelandic literature the most important documents are the *Elder* and the *Younger Edda*. (See EDDA and ICELANDIC LITERATURE.) The *Younger Edda* gives in prose a succinct account of the Odinic religion. It also contains some poetic quotations not found in the *Elder Edda*.

Interpretations.—Modern Authorities.—Both Snorre and Saxo Grammaticus present the euhemeristic interpretation of the myths, and this view prevailed until late in the eighteenth century. Euhemerism was finally superseded by the so-called physical interpretation making the divinities represent the various forces and phenomena of nature. This theory was most elaborately developed by the Icelander Finn Magnusson in his *Eddalæren og dens Oprindelse* (Copenhagen, 1824–26). More recently an ethical has been combined with the physical interpretation—that is, while accepting the phenomena and forces of nature as the basis of the myths, the scholar seeks to establish its deeper, philosophic, poetic, and moral value to its votaries.

The most prominent writers on Scandinavian mythology of the nineteenth century are Finn Magnusson, *Lexicon Mythologicum* (Copenhagen, 1828); Jacob Grimm, *Deutsche Mythologie* (4th ed. 1875; an Eng. trans. by Stallybrass London, 1880); Karl Simrock, *Deutsche Mythologie* (several editions); Wilhelm Mannhardt, *Germanische Mythen* (1858); P. A. Munch, *Nordmændenes Gudelære i Hedenold* (Christiania, 1847); R. Keyser, *Nordmændenes Religions forfatning i Hedendommen* (Christiania, 1847); N. F. S. Grundtvig, *Nordens Mythologi* (Copenhagen, 1808–32); N. M. Petersen, *Nordisk Mythologi* (Copenhagen, 1849); Benjamin Thorpe, *Northern Mythology* (London, 1851); Rasmus B. Anderson, *Norse Mythology* (5th ed. Chicago, 1891). Finally, special attention should be called to the elaborate investigations made since 1880 by the Norwegian linguist Sophus Bugge (*Studier over de nordiske gude- og helte-sagns Oprindelse*, Christiania, 1890) and by the Swedish scholar Viktor Rydberg (*Undersökningar i germanisk mythologi* (Göteborg, 1886–90). Bugge attempts to show the influence of classical mythology and early Christianity upon Scandinavian myths, while Rydberg, in opposition to Bugge, vindicates the exclusive Teutonic origin, and seeks to establish the harmonious connection between the various myths as parts of an all-embracing mythological epic. In his conflict with Bugge he is ably supported by the German scholar Müllenhoff (*Deutsche Alterthumskunde*, vol. v., 1883). An English translation of Rydberg's work by R. B. Anderson appeared in London in 1889, and bears the title *Teutonic Mythology*.

General Features.—The various forces and phenomena of nature—heat and cold, night and day, the seasons, thunder and lightning, life and death—led the old Teutons to speculate on the rise, development, and fall of all living things. The Scandinavian myths are inferior to the Greek in point of beauty, but, on the other hand, they outrank them in deep significance and wealth of thought. The Greek gods live a happy life, free from care. The life of the old vikings was characterized by constant struggle and warfare, and so their gods too are engaged in an unending conflict with the powers of evil which they never wholly overcome. A peculiar feature of the asa-faith is its eschatology, by which it presents in the clearest manner the idea that the present world must perish and give place to a new and better one. The gods themselves know that they in common with all other beings are sinful and contaminated by evil. They are conscious that they can not escape death and destruction, but they seek in every way to ward off that terrible catastrophe as long as possible. They also know that after the destruction of this world and out of its fragments there are to rise a new heaven and a new earth which are to be more beautiful than the present universe and free from sin and sorrow and care. In the regenerated world gods and virtuous men shall enjoy eternal happiness. The Scandinavian myths form a drama, in which every detail leads up to Ragnarok, the twilight of the gods, which constitutes the final act.

The Creation.—In the beginning (the prechaotic period) there were two worlds, Niflheim to the N. and Muspelheim to the S., and between them was Ginnungagap, the wide abyss. In Niflheim were the well Hvergelmer, from which flowed twelve ice-cold streams, called the Elivogs, into Ginnungagap. Muspelheim, on the other hand, was intensely bright and hot, and in the midst of it sat Surt guarding its borders with a flaming sword in his hand. The Elivogs flowed far into Ginnungagap, where the venom they carried with them became ice. Vapors rose and froze to rime, and in this way were formed many layers of congealed vapor. Meanwhile sparks flew from Muspelheim, and when the heated blasts came in contact with the frozen vapor it melted into large drops, and *by the might of him* (Surt) *who sent the heat* these drops quickened into life and took the form of an immense giant named Ymer and of a great cow named Audhumbla (chaos). Ymer was nourished by the cow's milk, and the cow fed herself by licking the salt rime on the stones, and by this licking she produced in the course of three days a man named Bure. Bure begot a son, named Bor, by the giantess Bestla, daughter of the giant Bolthorn; Bor became the father of three sons, Odin (spirit),

Vile (will), and Ve (holiness). These three brothers slew the giant Ymer, and from his dead body they created the present world (cosmos). Of his flesh they made the earth, of his blood the ocean, of his bones the rocks, of his hair the forests, of his skull the vaulted sky, and of his brains the clouds. On the flat, round earth they built a high wall called Midgard as a protection to the abode of man against the giants. Outside of this wall was Jotunheim, the home of the giants who descended from Ymer. Above Midgard was Asgard, the home of the asas or gods. The vans, who were not of the same race as the asas, originally dwelt in Vanaheim, but after a prolonged warfare peace was declared and asas and vans were united into one family of deities. In the earth and rocks dwelt the dwarfs. The elves lived in Alfheim, and the inhabitants of the lower world had their abodes in Helheim and Niflheim. Dwarfs, elves, and men were created by the gods, were subject to their protection, and owed them obedience and service. The giants and the dwellers in the nether world were the enemies of gods and men. One day three gods, Odin, Hoener, and Loder, found two trees by the seaside, an ash and an elm. Of these they made the first human pair, Ask and Embla, and gave them earth as their dwelling-place.

The Golden Age, the Norns, and the Conflict between the Good and Evil Powers.—Immediately after the creation of the world there was a golden age. The gods met on the plains of Ida, where they built temples and citadels of gold. All household utensils and implements were made of gold. They played with golden tablets, and their happiness was complete. This condition lasted until there came three maidens from Jotunheim. They were the so-called norns (fates), Urd (the past), Verdande (the present), and Skuld (the future). They were the rulers of fate, and time and even the gods were subject to their decrees. With the advent of the norns the active life of the gods began. Henceforth their lives were full of care and trouble. With the norns came avarice, strife, and warfare into the world. From this time on there is constant activity and conflict between all powers until the world shall fall dead. The evolution of the cosmic world consists in a ceaseless strife between the good and the evil powers, neither side gaining a decisive victory over the other. The gods gain temporary advantages and subdue the giants for a time, but the powers of evil gradually increase in strength, the world grows in depravity until the final day comes when all perish in an interneeine feud in Ragnarok, a catastrophe which is most vividly described in the *Eddas*.

Ygdrasil.—One of the most poetic and significant myths in Scandinavian mythology is that of the world ash-tree Ygdrasil, which symbolizes the whole universe. It has three roots extending one into Niflheim, a second into Jotunheim, and a third into Asgard. The branches of Ygdrasil spread over the whole world and aspire above heaven itself. Ygdrasil means the bearer of Odin, and the *Elder Edda* says Odin hung nine nights on this tree and sacrificed himself unto himself. While hanging there he discovered the runes.

The Principal Divinities.—The *Eddas* call the Scandinavian gods asas (as, pl. æsir) and the goddesses asynjas. The chief god is Odin (*q. v.*). As Alfather he is active in every part of the world created by him and his brothers Vile and Ve. No one knows better than he the fate of the world, and hence no one is more interested than he in warding off as long as possible the Ragnarok doom. This can only be done by enlisting all the forces possible on his side. He is accordingly the god of war who sends forth his maid-servants, the valkyries, to gather the faithful heroes slain on every battle-field and to conduct them as einherjes to Valhal, where they are to dwell with Odin, and whence they will follow him to the Ragnarok battle-field. Other prominent asas were Thor, Balder, Hermod, Tyr, Brage, Heimdal, Had, Vidar, Ul, Vale, and Forsete. Njord and Frey were originally vans, but were adopted by the asas. Loke, though of giant race both by father and mother, early formed a foster-brotherhood with Odin, and he too unfortunately was adopted by the asas. While the most of these are gods of war, still some of them also have other functions. Thus Brage is the god of song and eloquence. Njord, as the god of the sea, presides over fishing and commerce. Frey is a sun-god, and rules over harvests and the fertility of the earth. Heimdal represents eternal vigilance. He stands at the Bifrost (rainbow) bridge and proclaims the coming of danger to the gods with blasts from his trumpet called gjallarhorn. Forsete was worshiped as the god of justice. Thor (Thursday—i. e. Thor's day—is named after him) is the god of thunder, and he is foremost in the conflict with the giants. The *Eddas* contain elaborate accounts of his conflicts with the giants Hrungner, Geirrod, Thrym, and others. Balder is the representative of moral purity, wisdom, peace, and good will. While he lived the power of the asas was secure, but when Balder, at the instigation of Loke, was slain the fall of creation could not be prevented. Thus the death of Balder, which is told very fully and with great pathos in the *Eddas*, forms the turning-point in the great drama. Loke is the Mephistopheles of Scandinavian mythology. He is the personification of evil, though he constantly assumes the guise of virtue: but when he has accomplished the slaying of the good Balder he throws off the disguise by which he gained the favor and confidence of the gods. He is then put in chains, but finally gains his liberty, and in Ragnarok is the leader of the hosts of Hel that sally forth to the Vigrid plains.

Of goddesses there are in all twenty-six, and chief among them is Frigg, the wife of Odin. Several goddesses of lower rank serve her in her magnificent hall called Fensal. Thor's wife is Sif, and Balder's is the graceful Nanna. Brage's wife is Idun, who possesses the apples of eternal youth. Freyja (Friday is named after her) is also called Menglad. She is the goddess of love, the Norse Venus. Njord married Skade, and Frey's wife was the giantess Gerd, for whom he gave his trusted sword.

The Giants.—Next in importance to the gods are the giants and giantesses. They are countless in number and are the chief foes of the gods. They bring about the destruction of the world. Loke, himself a giant, became the parent of three terrible children in Jotunheim. These are (1) the Fenriswolf, (2) the Midgard-serpent, and (3) Hel, the giantess of death. The gods knew that these terrible monsters were growing up and would some day cause them great mischief. They therefore bound the Fenriswolf on a barren island and put a sword in his open-stretched mouth, but for this the god Tyr had to sacrifice his right hand. They cast the Midgard-serpent into the ocean, where he encircles the whole earth and bites his own tail. Hel was thrown into Niflheim, and Odin commanded that all who die from sickness or old age should go to her. The giants were older than the gods, and hence surpassed them in knowledge. The wisest one among them is Mimer, who presides over the fountain of wisdom. Many of the giants are represented as good-natured, and fond of gold and silver and other riches. Ægir, the giant of the sea, is the wealthiest of all, and he once entertained all the gods in his magnificent hall in grand style.

Literature.—J. Grimm's *Deutsche Mythologie* (Eng. trans. by Stallybrass); G. Vigfusson's *Corpus Poeticum Boreale*; Laing's *Heimskringla* (new ed. by R. B. Anderson, 1889); N. M. Petersen's *Nordiske Mythologi* (1849); P. A. Munch's *Normændenes ældste Gude- og Helte-sagn* (1854; new ed. 1880); Mannhardt's *Germanische Mythen* (Berlin, 1858); and R. B. Anderson's *Norse Mythology* (5th ed. 1891).

Rasmus B. Anderson.

Scanso'res [Mod. Lat., liter., climbers, from Lat. *scan'dere*, *scan'sum*, climb]: a name applied by Illiger, in 1811, to a group of birds containing those having the toes two before and two behind. The group was purely artificial, containing such dissimilar forms as the cuckoos, toucans, woodpeckers, and parrots, and its members are now distributed among several orders. F. A. L.

Scanzoni, skăănt-sō'nĕĕ, Friedrich Wilhelm, von, M. D.: obstetrician and gynæcologist; b. at Prague, Bohemia, Dec. 21, 1821; graduated M. D. from the University of Prague in 1844; after a tour abroad he returned to Prague, and was appointed assistant obstetrician to the Imperial Royal Lying-in Hospital; later he was appointed assistant to the chair of Obstetrics in the university; in 1850 he was appointed Professor of Obstetrics and Gynæcology in the University of Würzburg, resigning this chair in 1888 to retire to private life. He was a voluminous writer, his better-known works being *Lehrbuch der Geburtshülfe* (Vienna, 1849), a work that passed through many editions and was translated into nearly all the European languages; *Lehrbuch der Krankheiten der weiblichen Sexualorgane* (Vienna, 1857). D. June 12, 1891. S. T. Armstrong.

Scaphi'opus [from Gr. *σκάφιον*, *σκαφεῖον*, spade + *πούς*, foot]: a genus of toad-like animals belonging to the family *Pelobatidæ*; externally recognizable by having teeth in the upper jaw, the fingers and toes without sucking-disks, and

the heel with a flat-edged spur. The spade-foot toads burrow by day and feed at night. In the breeding season they frequent temporary pools, and at this period their voices are very loud. The allied genera belong, with one exception, to the Old World.

Scaph'oid, or **Navic'ular Bone** [*scaphoid* is from Gr. *σκάφη*, boat + *εἶδος*, appearance, form, likeness; *navicular* is from Lat. *navi'cula*, dimin. of *na'vis*, boat]: a name applied to one of the bones of the wrist, and another of the foot, on account of their fancied resemblance to a boat in shape.

Scaphop'oda: See Mollusca.

Scap'ula [Mod. Lat., from Lat. *sca'pulæ* (plur.; sing. not used), shoulder-blades, back]: the shoulder-blade, a bone of the anterior or upper extremity, forming part of the shoulder. It is regarded as a pleurapophysis of the occipital (fourth cephalic) vertebra. In man and nearly all mammals it is normally firmly united to the coracoid bone, which is regarded as a process of the scapula, though representing a hæapophysis of the occipital vertebra. The dorsum of the scapula is marked by a prominent keel or spine. The scapula is developed from seven centers, and is in man not fully ossified till the twenty-fifth year of life.

Scap'ular [from Late Lat. *sca'pula*, shoulder, formed as sing. to Lat. *sca'pulæ*, shoulder-blades]: (1) a garment worn by lay brethren and professed monastics of various Roman Catholic orders. It is a long piece of serge, one end of which falls in front and behind the wearer. Its size, color, and proportions vary. (2) A small concealed emblem worn by many Roman Catholics, who bind themselves to a certain round of religious exercises called the Devotion of the Scapular. There are several scapulars, as that of the Passion and that of the Seven Sorrows of Mary, but the original one, that of Our Lady of Mt. Carmel, was, it is claimed, revealed by the Virgin to the Blessed Simon Stock, an English Carmelite and general of that order, who died in 1265.

Scar'ab, or **Scarabæ'us**: a black or metallic-colored dung-beetle (*Scarabæus ægyptiorum* or *Ateuchus sacer*) found in tropical countries, particularly in Egypt, where it was regarded as the symbol of the god Kheper (*q. v.*), and the emblem of the revivification of the body and the immortality of the soul. This was by virtue of the solar significance of the object, whose Egyptian name (*kheper*) signified to be or exist and also to roll, as of the sun. The daily revolution and reappearance of the sun typified the return of the soul to life. The beetle places its eggs in a mass of ox-dung which it rolls into a ball. The ball is propelled by the beetle with its hind legs. According to Horapollo and early Greek and Syrian writers, the female did not exist, and hence, as procreated by the male only, the scarab was held to be a symbol of the self-begetting and of the immortal, while in the hermetic literature it was regarded as the type of the "only-begotten," of "generation," of "father," of "man," and of the "world." It is evident, however, that these latter ideas are for the most part foreign to the original Egyptian conception.

The Egyptian figures of the scarab were made of gold, silver, precious stones, granite, basalt, steatite, faïence, and paste, and, in the Roman period, of glass. Those in stone, faïence, and paste were usually glazed blue or green. They were inscribed with religious or historical texts, with names of gods, kings, and other persons, and with magical legends and devices which are impossible of clear explanation. It is doubtful whether they were ever intended to be read. They may most conveniently be classified, according to their purpose, as funereal, ornamental, and historical. Funereal scarabs were placed on the fingers or over the heart of the dead, and in the latter case the Ritual of the Dead (*q. v.*) prescribed that certain words should be inscribed on a scarab of green jasper and put in the place of the heart. When buried with the mummy they bore a variety of names or of magical emblems that were to serve for the protection of the dead. Ornamental scarabs were an adoption by the living of the trappings of the dead, and were apparently employed principally as charms. They were strung together lengthwise as necklaces, or used singly as rings or seals, and were inscribed with the name of the reigning sovereign, or some national hero, or with magical or ornamental designs. Historical scarabs comprise all those bearing royal names or historical texts or data. The number of the former is very great, and nearly every king from Menes, the first Egyptian king, to the Roman Antoninus is represented in extant specimens. The favorite names, if frequency and number may form the test, were those of Thothmes III., Amenophis III., and Ramses II. Curiously enough a large proportion of these scarabs date from periods other than that of the Pharaoh in question. From the reign of Amenophis III. come four scarabs which contain actual historical texts, relating to his prowess as a lion-hunter, to the limits of his kingdom (from Nubia to Mesopotamia), to the arrival of his Semitic bride, and to the construction of a sacred lake in his eleventh year, which has intimate connection with the introduction of the solar monotheism of the "heretic" king of the succeeding reign, Amenophis IV., or Khunaten. When Egyptian influence extended to the East, the Phœnicians and others borrowed this design and produced objects to which the name *scaraboids* is usually applied. The design, and in part the symbolism, were also adopted by the Gnostics, and upon their gems they inscribed appropriate legends. The manufacture of forged scarabs is pursued to a large extent in Egypt, to meet the demand of travelers, some of the specimens being made with such skill as to deceive the unwary or even experts. See Birch, *Catalogue of Egyptian Antiquities at Alnwick Castle* (London, 1880); Loftie, *Essay of Scarabs* (London, 1884); Budge, *Catalogue of the Egyptian Collection of the Harrow School Museum* (Harrow, 1887), *The Mummy* (pp. 231 ff., London, 1893), and *Catalogue of the Fitzwilliam Collection* (London, 1894); Murray and Smith, *Catalogue of Gems* (London, 1888); Petrie, *Historical Scarabs* (London, 1889), and his various works, such as *Illahun* (London, 1891), *Hawara* (1889), and *Kahun* (1890); Meyer, *Scarabs* (New York, 1894).

Charles R. Gillett.

Scarborough [O. Eng. *Skardeburge*, fortified rock]: town; in Yorkshire, England; 43 miles N. E. of York and 54 miles N. of Hull (see map of England, ref. 5–J). It rises like an amphitheater from a sandy bay, and is protected on the N. by a promontory which is crowned by an historical castle dating from 1136 and rebuilt by Henry II. Scarborough is one of the principal watering-places of England; it has an aquarium, a museum, a market-hall, a spa, with mineral springs discovered in 1620, and a promenade three quarters of a mile long opened in 1890. The harbor is inclosed by three piers, and has a floating dock and a lighthouse. Jet is manufactured and there is a considerable fishing-trade. Scarborough returns one member to Parliament. Pop. (1891) 33,776.

Scarf-skin: See Epidermis.

Sca'ridæ [Mod. Lat., named from *Sca'rus*, the typical genus, from Lat. *sca'rus* = Gr. *σκάρος*, a kind of sea-fish (*S. cretensis*)]: a family of teleocephalous fishes known as parrot-fishes, from some resemblance of their mandibles to the bill of a parrot. The body is oblong and compressed; the scales large and cycloid; the jaws well exposed, and with the teeth soldered to them, so that they form a cutting edge, but with imbricated series of older worn teeth; dorsal single, with a longer anterior spinous part (containing nine spines), and a shorter posterior portion (with ten articulated rays); anal fin corresponding to the posterior half of the dorsal, and provided with two spines and eight soft rays; pectorals with branched rays; ventrals thoracic, with one spine and five soft rays; the lower pharyngeal bones are ossified together in a solid mass. The species are confined to the tropical regions, and in these latitudes are everywhere to be found on coral-reefs and among the groves of coral. They are reported to browse upon the coral, which they cut by means of their strong trenchant jaws, in order to obtain the living polyp.

A species of the family (*Scarus cretensis*) was known to the Greeks and Romans, and was the subject of several fables. In the reign of Claudius, according to Pliny, Optatus Elipertius introduced it into the Italian sea between Ostia and Campania, where it became abundant. It was regarded, at least for a time, as being the very first of fishes.

Revised by F. A. Lucas.

Scarlati'na, or **Scarlet Fever** [*scarlatina* is Mod. Lat., from Ital. *scarlattina*, liter., dimin. of *scarlatto*, scarlet]: one of the acute eruptive or exanthematous fevers. It is chiefly a disease of childhood, with immunity for adults, increasing as the period beyond puberty lengthens. It is an infectious disease, propagated often by close aggregation of children, as in schools, asylums, or at play; but the contagion retains vitality with great persistence, and may be conveyed by clothing, letters, food, etc. The disease occurs sometimes in local epidemics; at other times with a graver type and great mortality, involving whole communities. In different individual cases, as well as different seasons and epidemics, it

assumes variable degrees, from a trivial disorder to a malignant and hopeless attack. Physicians recognize three marked varieties: (1) *Scarlatina simplex*, simple scarlet fever, in which the rash or eruption is fairly developed, the patient comfortable, and complications do not exist; (2) *S. anginosa*, where an unusual soreness of the throat, with formation of pseudo-membrane resembling that of diphtheria, is present; (3) *S. latens* or *maligna*, a latent form, where the eruption may be absent or doubtful, but grave injury is done by the scarlatinal poison in the blood to the nerve-centers or the kidneys. Like other contagious diseases, scarlatina has its period of incubation or development; four to six days usually intervene between exposure and the consequent attack. The fever develops suddenly, and without premonition, or more often in association with vomiting, nervous excitement, convulsions, or exhaustion indicative of a powerful impression on the nerve-centers. The temperature may rise to 104° or 107° F.; higher in fatal cases. The throat is already florid and tender, the tongue studded with sensitive red papillæ. At the end of twenty-four hours of fever the eruption appears—an efflorescence composed at first of minute red points upon a flushed surface, and later of a uniform scarlet hue. It develops upon the body and neck before the face, but the face, arms, and lower extremities are soon involved, and the cuticle, destroyed by the high temperature of the surface, may begin to fall by the fifth day. This process of desquamation varies. In mild cases, when sponging or bathing has been employed to allay fever, no flaking or falling of the cuticle is seen. In others it may slowly separate in shreds and patches. Still again, the cuticle covering fingers and toes may exfoliate intact, in the form of casts. During and following this desquamation danger is greatest of acute inflammation of the kidneys, the desquamative nephritis constituting the most serious complication of scarlet fever. The mortality is very variable, from 1 in 5 to 1 in 25, according to class of patients and type of epidemic. The chief causes of death are early convulsions, severe throat complications, and uræmic poison and dropsy, from implication of the kidneys. Deafness often results from severe attacks of *S. anginosa*.

Treatment is chiefly directed (1) to confining the temperature within limit by the use of aconite, diaphoretic drinks, blanketing, frequent sponging, or even the wet pack; in very marked cases the use of a cool bath is absolutely essential, and may completely modify the nature of the disease, as is the case also with typhoid fever; (2) to favoring the action of the kidneys by digitalis and emollient alkaline drinks, as flaxseed tea and soda; the inunction of lard, practiced by the Germans, and of butter of cacao, protects the skin and guards the kidneys from congestion; (3) to maintaining the patient's strength and counteracting the poison of the disease. Quinine and tincture of iron are chiefly indicated, in free and frequent doses. The patient should have liberal liquid diet throughout, and mild alcoholic stimulus when convalescing. Local astringent and antiseptic applications for the throat are useful to prevent the anginose form of the disease from developing and to prevent spread of the inflammation to adjoining mucous surfaces. Secondary kidney disorder—dropsy and scanty urine—calls for dry cups over the kidneys, the hot-air bath, elaterium as a purge, digitalis, and alkaline diuretics. Revised by WILLIAM PEPPER.

Scarlat'ti. ALESSANDRO: composer; b. at Trapani, Sicily, in 1659; produced his first opera in 1680 in Rome, in the palace of Queen Christina of Sweden; lived afterward alternately in Rome and Naples as chapel-master; composed 115 operas, of which only the titles of twenty are known, 200 masses, nine oratorios, more than 500 cantatas, and thousands of minor pieces. D. in Naples, Oct. 24, 1725. He was the originator of the overture, and the first composer who gave to orchestral accompaniment an air of separate design.—His son, DOMENICO SCARLATTI, b. 1683, d. 1757, was considered the greatest pianist of his time, held positions in Madrid and Lisbon as court-pianist, and composed operas and many pieces for the piano and harpsichord.

Revised by DUDLEY BUCK.

Scarlet Fever: See SCARLATINA.

Scar'pa, ANTONIO: anatomist; b. at Castello-Motta, Friuli, Italy, June 13, 1747; studied medicine at Padua; traveled extensively; was appointed Professor of Anatomy at Modena in 1772, and in 1783 at Pavia, where he died Oct. 31, 1832. He was one of the greatest anatomists of his time, and wrote a number of works: *Anatomicæ Disquisitiones de Auditu et Olfactu* (1789); *Tabulæ Neurologicæ ad illustrandam Historiam Cardiacorum Nervorum* (1794); *De Anatomia et Pathologia Ossium* (1827); *Sull' Aneurisma* (1804); and *Sull' Ernie* (1807).

Scarpan'to, or Car'pathos: island; one of the Sporades; belonging to Turkey; nearly equidistant between Rhodes and Crete; a mass of naked rocks, some of which rise nearly 4,000 feet; the reputed birthplace of the mythologic Titans. Pop. 3,500. E. A. G.

Scarron, skăă'rōñ', PAUL: writer of burlesque; b. in Paris, France, in 1610; was destined for the Church, but spent his youth in the grossest dissipations, and was in 1637 overtaken by paralysis, which deprived him of the use of his legs. He then took up literature as a means of subsistence, and developed a brilliant talent for burlesque, which owed largely to him the vogue it enjoyed in France in the middle of the seventeenth century. His comedies and poems are forgotten, but his *L'Énéide Travestie* (1648), *Mazarinade* (1649), which during the war of the Fronde he wrote in opposition to the powerful minister Mazarin, and which cost him the pension Anne of Austria had bestowed upon him, and especially his *Roman comique* (1651, translated into English by Oliver Goldsmith 1775), became literary types, and are still read with interest. In 1652 he married Françoise d'Aubigné, afterward Madame de Maintenon, and she, as well as the irresistible humor of her husband, made their home a rendezvous for all the Parisian wits. D. in Paris in 1660. A complete edition of his works, in 10 vols., was published by Bruzen de la Martinière (1737).

Revised by A. G. CANFIELD.

Scazon: another name for choliambus. See IAMBIC METRES.

Scepter [viâ O. Fr. from Lat. *scep'trum* = Gr. *σκῆπτρον*, staff, scepter, deriv. of *σκήπτειν*, prop against, lean on]: a rod or truncheon borne by kings and other magnates as an emblem of authority. It has been employed as part of the regalia of almost all monarchies of which there is any record. The English scepter now in use dates from Charles II.'s time; it is cruciform. The scepter for Scotland dates from the time of James V.

Scepticism, or **Skepticism** [from Gr. *Σκεπτικοί*, the Sceptics, a school of philosophers, liter., plur. of *σκεπτικός*, thoughtful, inquiring, deriv. of *σκέπτεσθαι*, consider]: the doctrine which sets up, as its highest principle, doubt or suspense of judgment in view of the contradictory nature of phenomena. It endeavors to establish the subjectivity of all cognitions, and to show their incompatibility with each other; it infers, as a consequence, the impossibility of knowing truth, and takes its stand simply and solely upon its own individuality. Scepticism therefore deepens and intensifies mental independence, and is regarded as a necessary clearing up preparatory to philosophic thinking. At least since the time of Descartes this has been the case, and some writers—as Herbart, for example—insist upon the point that all beginning in philosophy is sceptical, and, on the other hand, that all scepticism is elementary philosophy. It is most important to note that all scepticism is based upon the observation of method, and in this respect is a higher activity of the mind than the mere dogmatism which it attacks. All modern philosophy is a struggle to found itself upon method, and thus to place its structure above the assaults arising from scepticism. Sceptical arguments emanate neither from the stage of sense-perception nor from that of simple reflection—i. e. neither from the first nor second intention of the mind, so called, but from a third, or rather a fourth, intention, a perception not of external objects, nor of species or genera, but a perception of the activity or process of reflection itself. Hence simple common sense, alike with the deepest speculative insight, may be attacked and undermined by scepticism, but sceptical arguments can have no weight except for those minds that abandon other points of view and give attention to the method of cognition.

The ancient scepticism is directed against sense-perception, and usually counts Pyrrho of Elis as its founder. Gorgias, the Sophist, had reached the doctrine of nihilism; nothing exists; nothing can be known if it does exist. Socrates had asserted that he knew only that he knew nothing. The Megarian Stilpo had shown the contradictions in sense-perception involved in predicating universals of individual objects. The scepticism of the second and third schools of the Middle Academy, founded respectively by Arcesilaus and Carneades, was of a modified type. But Pyrrho, who seems to have learned much from Stilpo, de-

veloped scepticism as a system of philosophy, and made universal doubt the highest principle, and ἐποχή (suspension of judgment) and ἀταραξία (tranquillity of mind, imperturbability) the practical objects to be attained. With Pyrrho, Timon the Sillograph and Ænesidemus are reckoned as the representatives of the old sceptics. The last named collected Pyrrho's arguments in the form of ten tropes, as follows: Knowledge of truth is uncertain, because of the difference (1) in the organization in animals resulting in different modes of knowledge (how can we decide?); (2) in the human constitution in tastes, feelings, desires, capacities, etc.; (3) in the structure of the organs of sense, the same object being white to the eye, sweet to the taste, rough to the touch, etc.; (4) in the mental and physical conditions at different times; (5) in the position, distances, and intervals of objects; (6) in the appearance of objects by reason of their complication with each other; (7) in the appearance of objects owing to their variation in quantity, size of parts, etc.; (8) in objects on account of the general relativity of things known; (9) in the frequency with which objects are observed; (10) in regard to education, all customs, habits, laws, ideas, faith, and theories being derived from it. The later school of sceptics includes Agrippa, Favorinus, Sextus Empiricus, and others. Agrippa reduced the tropes to five: (1) The discordance of opinions renders all uncertain; (2) every proof rests upon grounds which again need proof, and so *ad infinitum*; (3) all our ideas are relative; (4) all systems rest upon hypotheses; (5) the vicious circle, demonstrating the grounds on which the proof rests by that which is proved by them. Sextus Empiricus has left us a complete account of ancient scepticism, and himself sums up the whole as follows: Nothing is certain in itself, as is proved by the diversity of opinion, and nothing can be made certain by proof, since it derives no certainty from itself, and, if based on other proof, leads us either to the *regressus ad infinitum* or to a vicious circle.

Among famous sceptics of later times are Algazel the Arabian, Duns Scotus the Schoolman, Agrippa of Nettesheim, Glanvill, Nicolaus Cusanus, and Hirnhaym, who reject science in the interest of faith. Montaigne, Charron, Sanchez, and Le Vayer revive the ancient scepticism. Hume is the greatest modern sceptic. He saps all dogmatism by making habit or "invariable sequence" the origin of the idea of causality, and thus occasions by way of reaction the rise of the Kantian system and its derived schools, which "criticise the faculty of cognition" and build their structures upon insight into method, and thus eliminate scepticism by making its partial view (of method) a complete one. WILLIAM T. HARRIS.

Scerodite: See SINTERS.

Schabzieger Cheese: See CHEESE.

Schack, shaak, ADOLF FRIEDRICH, Graf von: poet; b. at Schwerin, Mecklenburg, Germany, Aug. 2, 1815; studied law at Bonn, Heidelberg, and Berlin, devoting much of his time to the study of Oriental and European languages; traveled in Italy, Egypt, Syria, Turkey, Greece, and Spain, where he made extensive researches into the history of the Spanish drama; was called to Munich by King Maximilian of Bavaria where he resided up to the time of his death, Apr. 14, 1894. He published *Epische Dichtungen aus dem Persischen des Firdusi* (1853); *Stimmen vom Ganges* (1856); *Gedichte* (1866); *Nächte des Orients* (1874); *Weihgesänge* (1878); *Lotosblätter* (1883); *Memnon* (1885); and a number of epic and dramatic poems. Like Rückert, with whom he may be compared in many respects, he was a master of the poetic form, not only in his translations from Oriental literatures, but also in his original productions, which, moreover, are distinguished by their deep philosophic thought.
JULIUS GOEBEL.

Scha'dow, FRIEDRICH WILHELM, von: painter; b. in Berlin, Sept. 6, 1789. He was a son of J. G. Schadow, the sculptor, and was thoroughly taught. In 1810 he went to Rome with his brother Rudolph, the sculptor, and there was influenced by Cornelius and Overbeck; became a Roman Catholic and a member of the religious and somewhat mystical school which those painters had brought together. In 1819 he returned from Italy to Berlin, and was made professor in the Academy of Fine Arts. In 1826 he was made director of the Düsseldorf Academy. D. at Düsseldorf, Mar. 19, 1862. In the Berlin National Gallery are his picture *Christ at Emmaus* and a *Portrait Group* of his father and brother with the sculptor Thorwaldsen. At the Staedel Institute at Frankfort is the picture of the *Wise and Foolish Virgins*; at the old Pinakothek at Munich is a *Holy Family*; and at the Cathedral of Anspach is a *Christ*. His last work was an allegorical painting founded upon Dante's *Divina Commedia*. RUSSELL STURGIS.

Schadow, JOHANN GOTTFRIED: sculptor; b. in Berlin, May 20, 1764; studied drawing and sculpture in his native city and at Rome 1785–87, and was appointed professor at the Academy of Art in Berlin in 1788. His life was spent chiefly at Berlin from this time on, but he traveled much, especially in Italy. His style is founded upon classical traditions. His principal works are statues of Frederick the Great, in Stettin; Leopold of Dessau, in Ziethen, and the Count de la Marck, in Berlin; Luther, in Wittenberg; the monument of Marshal Blücher, at Rostock; and a number of busts, some of which are in the Walhalla on the Danube near Ratisbon, etc. He also modeled the quadriga over the Brandenburg gate of Berlin, and a frieze on the outside of the mint in that city. D. in Berlin, Jan. 27, 1850.
Revised by RUSSELL STURGIS.

Schadow, RUDOLPH, called also **Zeno Ridolfo**: sculptor; b. in Rome, July 9, 1786; was the oldest son of Johann G. Schadow. He studied with Thorwaldsen and Canova, and became famous at an early age. He was much employed, and perhaps too constant application caused his early death, at Rome, Jan. 31, 1822. Among his works are the bas-reliefs of the *Daughters of Leucippe*, *Socrates and Theodata*, and that of the tomb of the Marquis of Lansdowne; the statues of St. John the Baptist, Diana, and a Bacchus; a group of the Virgin and Child; and his last work, *Achilles defending the Body of Penthesilea*. RUSSELL STURGIS.

Schaeffer, shā'fer, CHARLES FREDERICK, D. D.: theologian; b. at Germantown, Pa., Sept. 3, 1807; graduated at the University of Pennsylvania; studied theology privately; pastor at Carlisle, Pa., Hagerstown, Md., Lancaster, O., Red Hook, N. Y., and Easton, Pa.; professor of theology, Columbus, O., 1840–45, Gettysburg, Pa., 1857–64, and Philadelphia, Pa., 1864–79. D. in Philadelphia, Pa., Nov. 23, 1879. Among his more important works are the translation of Lechler *On Acts* in the English edition of Lange's *Commentary*, the translation of Kurtz's *Sacred History*, a revised translation of Arndt's *True Christianity*, and a *Commentary on Matthew*. Dr. Schaeffer was a prominent advocate of confessional Lutheranism, and his articles in *The Evangelical Review* of Gettysburg contributed powerfully to the movement that resulted in the establishment of the General Council. H. E. JACOBS.

Schaeffer, CHARLES WILLIAM, D. D., LL. D.: theologian; nephew of Rev. Charles Frederick Schaeffer; b. at Hagerstown, Md., May 5, 1813; graduated at University of Pennsylvania, and Theological Seminary at Gettysburg, Pa.; pastor at Barren Hill, Pa., 1835–40, Harrisburg, Pa., 1840–49, Germantown, Pa., 1849–74; professor in the Lutheran Theological Seminary, Philadelphia, 1864–94, when, on his resignation of the chair of Church History, he was elected professor emeritus. Dr. Schaeffer was for many years president of the Lutheran Ministerium of Pennsylvania, was president of the General Synod and the General Council, and served the University of Pennsylvania as a trustee from 1859 till his death, in Philadelphia, Mar. 15, 1896. Author of *Early History of the Lutheran Church in America* (1857), *Family Prayers*, and one volume of a translation of the *Halle Reports* (Reading, Pa., 1882). H. E. JACOBS.

Schaeffer, DAVID FREDERICK, D. D.: Lutheran pastor and theologian; b. at Carlisle, Pa., July 22, 1787; graduated at the University of Pennsylvania 1807; studied theology privately; pastor at Frederick, Md., 1808, until within a year or two before his death. He conducted a private theological seminary, and directed the studies of a number of most useful pastors. He was one of the most active founders of the Theological Seminary at Gettysburg, and of the General Synod, of which body he was secretary for a number of years from its founding. He edited *The Lutheran Intelligencer*. D. at Frederick, Md., May 5, 1837. H. E. JACOBS.

Schaeffer, NATHAN C.: See the Appendix.

Schaff, PHILIP, S. T. D., LL. D.: b. at Coire, Switzerland, Jan. 1, 1819; studied at Coire, Stuttgart, Tübingen, Halle, and Berlin; took the degree of B. D. and passed the examination for a professorship in Berlin 1841; traveled as tutor of a Prussian nobleman through several European countries; returned to Berlin and lectured in the university on exegesis and church history 1842–44; was called to a professorship in the theological seminary of the German Reformed Church

of the U. S. at Mercersburg, Pa. He removed to New York during the civil war, Dec., 1863; was secretary of the New York Sabbath committee 1864–69, and delivered lectures on church history in theological seminaries at Andover, Hartford, and New York. He was Professor of Sacred Literature in Union Theological Seminary, New York, from 1870 to 1887, when he became Professor of Church History. He received the honorary degree of D. D. from the University of Berlin 1854, the University of St. Andrews 1887, and the University of the City of New York 1892; the degree of LL. D. from Amherst College 1876; was elected member of the Leipzig Historical, the Netherland, and other literary societies in Europe and America. He was one of the founders and honorary secretaries of the American branch of the Evangelical Alliance, and was sent in 1869, 1872, and 1873 as commissioner to Europe to make arrangements for the general conference of the Alliance, which, after a second postponement in consequence of the Franco-German war, was held in New York Oct., 1873. He was also one of the Alliance delegates to the Emperor of Russia in 1871, to intercede with him in behalf of the religious liberty of his subjects in the Baltic provinces. He took part in the founding of the Presbyterian Alliance in London 1875, and was prominent in the first Presbyterian council at Edinburgh 1877, in the second in Philadelphia 1880, in the third at Belfast 1884, and in the fourth in London 1888. He visited Bible lands in 1877. He was president of the American Bible revision committee, which he organized in 1871 at the request of the English committee, and he was sent to England in 1875 to negotiate with the British revisers and university presses about the terms of co-operation and publication of the Anglo-American revision, and attended repeatedly the meetings of the English revisers in Jerusalem Chamber (the last time in 1884). He was also sent as delegate to the fifth centennial of the University of Heidelberg 1886, and to the eighth centennial of the University of Bologna 1888. In 1892 he celebrated the semi-centennial of his professorship. See *Berlin 1842 to New York 1892: Semi-Centennial of Philip Schaff*, privately printed (New York, 1893). He died in New York, Oct. 20, 1893.

Dr. Schaff's books are mostly historical and exegetical. He wrote *History of the Apostolic Church* (New York, 1853; Edinburgh, 1855; Leipzig, 1854, etc.); *History of the Christian Church* (English and German; New York and Leipzig, 1867; rewritten (more than doubled), New York and Edinburgh, 5th ed. 1889–92, 7 vols.); *Creeds of Christendom* (New York and London, 1876, in 3 vols.; 4th ed., rev. and enlarged, 1884). He edited the Anglo-American reproduction and adaptation of Lange's *Critical, Theological, and Homiletical Commentary on the Bible* (1864–80, 25 vols.); an *International Revision Commentary*, with illustrations and maps (New York and Edinburgh, 1879–83, 4 vols.); a *Religious Encyclopædia*, based on Herzog (New York and Edinburgh, 1883–84, 3 vols.; 3d ed., rev., 1891, 4 vols., including *Encyclopædia of Living Divines*); and the *Nicene and Post-Nicene Library of the Fathers* (New York and Oxford, 1888, *seq.*). In addition he wrote a great number of minor books, including *The Principles of Protestantism* (1845); *Critical Edition of the Heidelberg Catechism*, with its history to the tercentenary celebration (1863; rev. ed. 1866); *Bible Revision* (New York, 1873); *Literature and Poetry* (1890). His last work was *Theological Propædeutic: a General Introduction to the Study of Theology, Exegetical, Historical, Systematic, and Practical* (New York, 1893). Several of his works have been republished in Germany, England, and Scotland, and translated into French, Italian, Dutch, Greek, Bulgarian, Arabic, Chinese, Hindustani, and Japanese.

Revised by S. M. Jackson.

Schaffhausen, shăăf-how'zĕn: the northernmost canton of Switzerland; bounded N. by the grand duchy of Baden and S. by the Rhine. Area, 114 sq. miles. It consists mostly of a number of valleys, which slope toward the Rhine and are very fertile. Wheat and other kinds of grain, fruit and wine of superior quality, hemp and flax are extensively cultivated; the rearing of cattle and the manufacture of steel and silk are important. Pop. (1888) 37,783.

Schaffhausen: capital of the canton of Schaffhausen, Switzerland; on the Rhine, 3 miles above the celebrated falls (see map of Switzerland, ref. 2–G). It is an old, curiously built town, with some manufactures of ironware and silk goods. Pop. (1888) 12,402.

Schäffle, shef'fle, Albert Eberhard Friedrich: political economist; b. at Nürtingen, Würtemberg, Feb. 24, 1831; studied theology at Tübingen, where he became Professor of Political Economy in 1861. He was active in politics, sitting in the Würtemberg Landtag 1862–65, and being Minister of Commerce in Austria for a short time in 1871. On the downfall of the ministry in the same year he went back to Stuttgart, and devoted himself to economic studies. His works prove him to belong to the historical school of economists who have broken with the traditions of Adam Smith and the exponents of *laissez faire*. His chief writings are *Die Nationalökonomie* (1861), 3d ed. published under the title *Das gesellschaftliche System der menschlichen Wirthschaft* (1873); *Kapitalismus und Sozialismus* (1870); *Quintessenz des Sozialismus* (1874; Eng. trans. 1889); and *Die Aussichtslosigkeit der Sozialdemokratie* (1885).

Schalk, Franz: See the Appendix.

Schamyl, shăm'il; warrior and prophet of the tribes of the Caucasus; of Tartar origin; b. in Daghestan in 1797. From 1824 to 1831 he took an ardent part in the holy war which Kasi Mollah proclaimed against Russia. A sufi, he claimed to be the mourshid, or elect envoy of God. Twice coming to life when apparently dead, exceedingly astute and thoroughly sincere, he made the Circassians recognize his pretensions. So from 1837, during twenty-two years, he was their sagacious and generally successful leader in their resistance to Russia. In 1859, hemmed in on all sides and cut off from escape, he was made prisoner and carried to Russia. There he remained ten years, being treated with great honor and kindness. In 1870 he went on a pilgrimage to Mecca, and died at Medina in 1871. A marvelously handsome man, daring, eloquent, always master of himself, an economical and judicious administrator, he maintained an absolute supremacy over his lawless followers, who feared him as a wizard and revered him as a saint. E. A. G.

Schandorph, shăn'dŏrf, Sophus Kristian Frederik: poet and novelist; b. at Ringsted, Denmark, May 8, 1834. Originally an idealist, he soon adopted the literary methods of the new school. As a delineator of the life of the Danish peasantry and lower middle class, he is, perhaps, without an equal. To great power of observation he adds a keen humor, which sometimes borders on coarseness. His most ambitious work is a novel dealing with Danish peasant conditions, *Thomas Fris's Historie* (two parts, 1881). Among his other publications may be mentioned *Fra Provinsen, Fortællinger og Skizzer* (From the Provinces, Tales and Sketches, 1877); *Uden midtpunkt* (Without Center, 1878); *Skovfogeds börnene* (The Forester's Children, 1884); *Det gamle Apothek* (The Old Drug-store, 1885); *Fra Isle de France og fra Sorö Amt* (From L'Isle de France and from Sorö District, four tales, 1888); *Stillelivs-Folk* (Quiet Folk, 1889); *Poet og Junker* (Poet and Cavalier, 1892). D. K. D.

Scharn'horst, Gerhard Johann David, von: general; the organizer of the Prussian military service; b. at Bordenau, Hanover, Nov. 12, 1756; entered the Hanoverian army in 1776; became a lieutenant of artillery in 1780, and soon afterward teacher in the school of artillery in Hanover. He served with the allies in the Netherlands 1793–95. Having attracted much attention by his military writings, he was invited to enter the Prussian service, and became in 1801 director of the military academy of Berlin. His lectures here became quite celebrated, but his ideas called forth a strong opposition from the older military men, and in 1803 he was removed to the staff, where he advanced to the rank of general. After the Peace of Tilsit, in 1807, he took charge of the whole administration of military affairs in Prussia until 1810, when he was compelled to retire at the request of Napoleon. He continued to exercise a decided influence, and it was chiefly due to his energy and his ideas that Prussia in 1813 was able to place a large and effective army in the field. He was wounded at Grossgörschen, and died at Prague June 28, 1813, on his way to Vienna to persuade Austria to join the allies against Napoleon. See *Life*, by Lehmann (Leipzig, 1886–87), and von Boyen's *Erinnerungen* (1891). F. M. Colby.

Scharwenka, shaăr-ven'kaă, Philip: composer and teacher; b. at Samter, Posen, Prussia, Feb. 16, 1847. In 1865 his family moved to Berlin, and Philip began study in Kullak's New Academy, and on completing his studies he remained with the academy as a teacher. He is a fine pianist, and has composed largely for his instrument. D. E. H.

Scharwenka, Xaver: composer and teacher; a younger brother of Philip Scharwenka; b. at Samter, Prussia, Jan. 6, 1850; also studied at Kullak's New Academy. He made his first appearance in Berlin as a pianist in 1869, and re-

mained there as a teacher till 1873. In 1877 he produced his first piano concerto. Since then he has composed largely for the piano and for orchestra, and also has written an opera, *Mataswintha*. In 1890 he visited the U. S. on a concert tour, and the next year he settled in New York, where he established a conservatory of music. D. E. H.

Schauffler, showf'fler, William Gottlieb, D. D., LL. D.: missionary; b. at Stuttgart, Germany, Aug. 22, 1798; resided in Russia during his youth; studied theology, and went to Turkey as an independent missionary 1825, but having soon convinced himself that he needed more thorough training, removed to the U. S. in 1827; graduated at Andover Theological Seminary 1830; was ordained Nov. 14, 1831; was missionary to the Jews in Constantinople, Turkey, 1831–55, and after that to the Moslems; he translated the entire Bible into Hebrew-Spanish and into Turkish, the New Testament, the Pentateuch, and Isaiah in the latter language having been printed in Germany under his supervision; and published an *Essay on the Right Use of Property* (1832). He was also author of a work entitled *Meditations on the Last Days of Christ*. D. in New York, Jan. 26, 1883.

Schaumburg-Lippe, showm'boŏrch-lip'pe: a principality and state of the German empire, between Hanover and Westphalia. Area, 131 sq. miles; pop. (1900) 43,132. The southern part is hilly and well wooded; the northern is flat, and here is found Lake Steinhudermeer, occupying an area of 22,000 acres. The actual revenue in 1892–93 was 1,096,516 marks: the public debt in 1891 was 510,000 marks. Capital, Bückeburg: pop. (1895) 5,620.

Schedone, skā-dō'nā, Bartolommeo (called also Schidone): painter; b. at Modena, Italy, in the latter part of the sixteenth century. He was supposed to have been a pupil of the Caracci, but his paintings seem to show a deep study of Correggio and Raphael. He worked in the palace and in the cathedral of his native city. His chief works are a *Madonna di Pietà*, at the Academy of Parma, the *Birth of Christ*, and a *Madonna*, at Loreto. His pictures at Capo di Monte, Naples, were painted for his generous patron, Duke Ranuccio of Parma. He is also well represented in the Louvre. He distinguished himself as a portrait-painter. He died at Parma in 1615 of grief at having lost a large sum of money through gambling. W. J. Stillman.

Scheele, shā'le, Karl Wilhelm: chemist; b. at Stralsund, Pomerania, at that time a Swedish possession, Dec. 19, 1742; studied chemistry in Stockholm and Upsala, and settled in 1777 as apothecary at Köping, near Stockholm, where he died May 21, 1786. By his comprehensive chemical analyses he discovered tartaric acid, manganese, chlorine, baryta, glycerin, the pigment called Scheele's green, and the coloring-matter of Prussian blue. His papers were collected and published in French, English, German, and Latin (*Mémoires de Chimie*, 2 vols., Paris, 1785–88). In his *Chemical Observations and Experiments on Air and Fire* (Leipzig, 1777; translated into English, London, 1780) he described oxygen, unaware of its previous discovery by Priestley.

Scheele, Knut Henning Gezelius, von, D. D.: bishop; b. at Stockholm, Sweden, May 31, 1838; educated at Upsala, where he became Professor of Theology in 1879, whence he was appointed Bishop of Gotland, with residence at Visby, in 1885. He visited the U. S. in 1893 as special representative of the King of Sweden at the tercentenary of the Decree of Upsala, celebrated by the Swedish Augustana Synod. Among the more important of Bishop von Scheele's works is a work on symbolics, published in both Swedish and German, and an outline of the same subject in Zöckler's *Handbuch der Theologischen Wissenschaften*. H. E. J.

Scheele's (sheelz) **Green**, or **Swedish Green**: name given to the arsenite of copper. Scheele prepared it by slowly pouring a hot solution of 11 parts of arsenious oxide in 32 of potash into a hot solution of 32 parts of blue vitriol, with constant stirring. Sharples says the best results are obtained when a solution of 2 parts arsenious oxide and 8 parts cryst. carb. soda is mixed with a solution of 6 parts blue vitriol. The product is a yellowish-green powder, consisting essentially, according to Sharples, of $Cu_3As_2O_6 2H_2O$, or CuO, 51·49; As_2O_3, 41·93; H_2O, 7·93. It may or may not contain basic sulphate and carbonate of copper, according to the proportions and degree of dilution of the materials. *Parrot green*, *pickel green*, and many varieties of *Brunswick*, *Neuwied*, and *mineral green* and *blue*, consist of Scheele's green with more or less hydrate, basic sulphate, or basic carbonate of copper, and sometimes considerable gypsum. Scheele's green is little used in the U. S., being replaced by the more brilliant Schweinfurth Green (*q. v.*).

Revised by Ira Remsen.

Scheffel, Joseph Viktor, von: poet and novelist; b. at Karlsruhe, Germany, Feb. 16, 1826; studied law and German philology at the Universities of Heidelberg, Munich, and Berlin; practiced law for several years; traveled in Italy; and after his return, devoted himself entirely to literary pursuits. In 1854 he published his famous *Trompeter von Säckingen*, an epic poem of great poetic charm, and in 1858 his great historical novel *Ekkehard*, a story of the tenth century. Both of these works were little noticed at first, until the great events of contemporary German history and the subsequent establishment of the empire gave rise to a renaissance of German antiquity. Scheffel's artistic description of German life of the past, his delightful humor, and true patriotic feeling, then led to his being imitated by a host of followers, and for a long time the historical novel was the literary fashion of Germany. He became equally popular as a lyric poet, especially by his *Gaudeamus* (1868), a collection of lyrics of quaint and exquisite humor, many of which became favorite student songs. His *Bergpsalmen* (1870), a later collection of poems, is less popular, though it probably contains his best lyric productions. D. Apr. 9, 1886. Julius Goebel.

Scheffer, Ary: historical and portrait painter; b. at Dordrecht, Holland, Feb. 10, 1797; son of Johann Baptist Scheffer, historical painter (1773–1809); pupil of Guérin in Paris; officer Legion of Honor 1825. He was not in sympathy with either the academic or classic style of painting taught by his master, nor with that of the new school of romanticists led by Delacroix and Géricault, and he formed a style of his own, more sentimental than vigorous and healthy. He was a devoted adherent of the Orleans family, and accompanied the Duc d'Orléans to the siege of Antwerp. After returning to Paris, he painted pictures of military scenes for the Versailles Museum, and when the Revolution of 1848 broke out he assisted the king and his family to escape from Paris, and retired to Holland. He went to England later, and returned to Paris after the *coup d'état* of 1851, but kept aloof from politics. D. at Argenteuil, France, June 15, 1858. One of his most noted pictures, *The Suliote Woman* (1827), is in the Louvre. Other works are in the museums at Versailles, Nantes, Marseilles, Montpellier, and Amsterdam, and in the National Galleries in London and Berlin. William A. Coffin.

Scheldt, skelt (anc. *Scaldis*, Fr. *Escaut*): the most important river of Belgium. It has its rise in a small lake in the department of Aisne, France, and by a circuitous passage enters Belgium near Tournay; thence flows N. N. W. past Tournay, province of Hainault, at Hérinnes becomes the boundary of this province and East Flanders, and at Escamaffles becomes the common boundary between West and East Flanders; thence N. N. E., past Oudenarde to Ghent, where it receives the Lys on the left; thence E. S. E. to Dendermonde and N. N. E. to Antwerp, at which point it becomes a noble stream, with a fine harbor sufficient for the largest ships. Leaving Antwerp, its course is N. W. The island of South Beveland divides it into two arms; the left, or south, known as The Hond or West Scheldt, and the most important, enters the North Sea near Flushing. The right, or north, called the East Scheldt arm, is divided again by the island of North Beveland before it flows into the sea. It has an entire length of 210 miles, and is navigable to Condé, near its source. Among its numerous affluents, the Scarpe, Lys, and Darme, from the left, and the Dender and Rupel, from the right, are the most important. A system of canals connects this stream with the principal cities of Belgium. The entrance to the river is rendered somewhat difficult for large vessels by sandbanks which form at its mouths. These mouths are almost opposite that of the Thames, thus increasing its commercial and naval importance. Revised by M. W. Harrington.

Schelling, shel'ling, Friedrich Wilhelm Joseph, von: philosopher; b. at Leonberg, a village near Stuttgart, Würtemberg, Jan. 27, 1775; d. at the baths of Ragatz, Switzerland, Aug. 20, 1854. His father, distinguished as an Orientalist, was a country clergyman who became prelate at Maulbronn; he directed his son's education. In his sixteenth year young Schelling entered the theological seminary at Tübingen, and studied theology in connection with philosophy and

philology. In his seventeenth year (1792) he wrote a thesis for his degree of master of philosophy, taking as his theme the origin of evil as set forth in Gen. iii. As early as 1793, in his essay on myths, historical sagas, and philosophemes of antiquity, there begins to appear in outline his most important theory, developed in later life. In the spring of 1796 he went to Leipzig, and there remained for two years. He had already published his essay *On the Ego as Principle of Philosophy*, in which he had repudiated the Kantian dualism, and pointed out the common source of the two sides, theoretical and practical, subjective and objective, and set up the theory of a faculty of knowing which could grasp the unconditioned ground of these two sides—a faculty or activity which he called "intellectual intuition." At Leipzig he pursued studies in mathematics and natural science, and paid special attention to medicine. His attitude toward Fichte's system was at first that of an expounder, afterward that of a critic. He put forth his *Ideas on the Philosophy of Nature* (1797) and *Concerning the World-Soul* (1798), indicating his departure from this standpoint. The *Science of Knowledge*, by Fichte, had made the Ego all in all, and nature a mere subordinate affair. Consciousness being regarded as the essential principle, and the will as the highest, ethical science was the sole outcome, and the natural sciences, as well as all partially unconscious activity of man as displayed in art, religion, poetry, and the mythologies, was ignored. Schelling's function was to call attention to this unconscious evolution of Reason—the side of the absolute Ego which Fichte had slighted. Schelling, however, went so far in this new direction as to make Nature a coequal pole of the absolute, with Mind as the other, apparently influenced in this by Spinoza, who had made "thought and extension" the two poles of his "substance." Accordingly, the union of the ideal with the real, of mind with matter, was the ultimate principle with Schelling's system. In æsthetic art this union was to be found. The Beautiful is the highest realization of the Absolute, and that "toward which the whole creation moves." This standpoint was criticised subsequently by Hegel, who restored the supernatural realization of the highest principle in the human soul as above its mere incarnation, which then sinks into a subordinate phase of spiritual life as a mere probationary stage thereof, a step in its progressive development. If the Beautiful be the highest principle, immortal life, a soul divorced from body, becomes a mere abstraction, and with this God, as supernatural, loses consciousness and perfection. Schelling remained almost entirely silent from 1812 to 1834, during the period of the activity of Hegel, whose system was that of Schelling, with the essential modification of substituting religion for art as the highest activity, and indeed preferring conscious thought as found in theology or speculative philosophy to all other forms. He seems to have felt this defect in his system, and after the death of Hegel (1831) to have developed his system from the amended basis. He calls, therefore, his earlier system, which lays so much emphasis on nature-philosophy and art, his negative system, and his later one, in which he endeavored to make freedom the highest ideal, his positive system. From Leipzig he was called to Jena (1799), partly through the interest of Goethe, who was attracted toward his philosophy of nature. At this time he came into contact with and exercised a powerful influence upon the romantic school, becoming intimate with the Schlegels, Novalis, Fries, and others.

If Fichte may be regarded as building his system chiefly on Kant's *Critique of Practical Reason*, Schelling certainly builds upon the *Critique of Judgment* and the *Metaphysical Principles of Natural Science*. Kant's use of the forces of attraction and repulsion for the construction of matter suggested an entire system of philosophy in his fertile mind. Polarity became the principle of matter and of mind as well. In 1800–01 he edited *The Journal of Speculative Physics*, and set forth the doctrines of this fundamental conception, showing how the giant mind of the world develops from its sleep in nature to consciousness in man. In 1802 appeared his dialogue, *Bruno, or on the Natural and Divine Principle of Things*, in which the theory of Giordano Bruno is given in the style of the Platonic *Timæus*. In the same year he associated himself with Hegel for the publication of *The Critical Journal of Philosophy* (Tübingen, 1802–03), the latter furnishing the greater part of the articles for it. In his *Lectures on the Method of Academical Study*, delivered in 1802 and published the next year, he gives the outlines of his entire system in a popular form. The tendency toward mysticism here makes its appearance, and is quite marked in his works written during the next few years. In his *Philosophy and Religion* (1804) he makes finiteness and materiality to be the result of a lapse from the Absolute, to recover from which lapse is the object and goal of human history. Theosophic doctrines appear in his essays *On the Philosophy of Nature* (1806) and *On the Relation of the Plastic Arts to Nature* (1807). The influence of Franz Baader upon Schelling belongs to this period, and is manifested in the noteworthy treatise, *Philosophical Inquiries into the Nature of Human Freedom* (1809), in which he seems to follow Jacob Böhme in his theological distinctions. In this treatise also, which does not strictly accord with his system of transcendental idealism already given, the stress that he lays upon freedom and personality indicates the first appearance of his latest system, which he called his "positive philosophy." He defended his system against the charges of naturalism, Spinozism, and atheism in a controversial work against Jacobi in 1812. In 1808 he had gone to Munich as secretary of the Academy of Arts and Design. When in 1826 the University of Munich was founded, after the removal of that at Landshut, Schelling became professor, and for a time formed the chief attraction of the university. At Erlangen in 1820 he wrote the *Philosophy of Mythology* and the *Philosophy of Revelation*, mythology, according to his view, being an imperfect revelation. In 1834, upon the occasion of the publication of Hubert Becker's translation of Cousin's estimate of French and German philosophy, Schelling wrote a preface for it, and criticised the Hegelian philosophy as being merely negative, and as substituting logical abstractions for the living and real. The dialectic of Hegel he regarded as a fiction of hypostatization, whereby self-movement is ascribed to the Idea. In his lectures on the history of modern philosophy, delivered at Munich, he unfolded this critical view more fully. Ten years after Hegel's death, Schelling became his successor at the University of Berlin, and in his opening lecture (1841) endeavored to unite his earlier and later systems, pronouncing the system of Identity to be the necessary negative phase of his entire philosophy, and needing only to be supplemented by his philosophy of mythology and revelation, which he regarded as the positive phase. The publication (1842) of the substance of his lectures at Berlin, from notes taken by Paulus and Frauenstädt, showed very clearly that the work on freedom already mentioned lay at the basis of his later views. He distinguished in God, after the fashion of Böhme, (1) a blindly necessary or unpremeditating Being—the primordial "abyss" of the divine nature; (2) the three potencies of the essence of God: (*a*) unconscious will, the *causa materialis* of creation; (*b*) conscious will, the *causa efficiens*; (*c*) *causa finalis*, the union of the two—that by which all things are made that are made; (3) the three Persons, who proceed from the three potencies by overcoming the first or unconscious phase by means of the theogonic process. These Persons are the Father, Son, and Spirit—the possibility, the power, and the completed deed of overcoming that "primordial abyss of unconsciousness." In nature only potencies are at work; in man, personalities. Both Schelling and Fichte laid great stress on the distinction between Pauline and Johannean Christianity. Schelling makes three periods of Christianity: (*a*) Petrine, or Catholicism; (*b*) Pauline, or Protestantism; (*c*) Johannean, or the Church of the future.

The two sons of Schelling (Karl F. A. and Hermann) published a complete collection of his writings (Stuttgart and Augsburg, 1856–61) in 14 vols., of which the first division, in 10 vols., contains the works published during his life, arranged in their chronological order, while the second division, in 4 vols., gives what had remained unpublished, and is chiefly the exposition of his later system. Schelling's works have not been, to any great extent, translated into other languages. His introductions to the *Sketch of a System of Nature-Philosophy* and to the *System of Transcendental Idealism* (1799), and the famous *Method of Academical Study*, however, have been translated and published in *The Journal of Speculative Philosophy*. His *Life* was written by Plitt (3 vols., 1867–71). William T. Harris.

Scheltopu'sic, or **Scheltopusik**: a lizard (*Pseudopus pallasii*) inhabiting Sicily and parts of Southern Europe, devoid of external limbs and clothed, except for a space on either side of the body, in a complete armor of small bony plates. It reaches a length of nearly 3 feet, and feeds on insects, birds, and small quadrupeds. F. A. L.

Schem, shem, ALEXANDER JACOB: author; b. at Wiedenbrück, Germany, Mar. 16, 1826; studied at the gymnasium of Paderborn 1839–43; at the university of Bonn 1843–45, and at that of Tübingen 1845–46; edited Westphalian newspapers 1849–51; removed to the U. S. 1851; was Professor of Hebrew and of Modern Languages at Dickinson College, Carlisle, Pa., 1854–60, after which he devoted himself to literature in New York, chiefly in the departments of geography and statistics; edited ecclesiastical almanacs for 1860 and 1868–69; wrote for religious and political newspapers; aided Rev. George R. Crooks in the preparation of his *Latin-English School Lexicon*; was one of the editors of *The Methodist* and of *The Methodist Quarterly Review*; was a contributor to Appletons', McClintock & Strong's, and Johnson's *Cyclopædias*, and prepared a revised American edition of a *Conversations-Lexicon* in the German language (12 vols., 1869, *seq.*). D. at West Hoboken, N. J., May 21, 1881.

Revised by A. OSBORN.

Schemnitz, shem'nits: a large mining-town in Hont county, Northern Hungary; on the Schemnitz; 65 miles N. by W. of Budapest, at an elevation of 1,300 feet above the sea (see map of Austria-Hungary, ref. 5–G). It has a celebrated mining-school with chemical laboratories and a fine collection of minerals. The mines, which yield gold, silver, copper, and iron, extend below the city. Pop. 15,265.

Schenck, skenk, ROBERT CUMMING: diplomat; b. at Franklin, O., Oct. 7, 1809; graduated at Miami University in 1827; studied law and was admitted to the bar, beginning practice at Dayton; member of State Legislature 1841 and 1842, and member of Congress 1843–51; U. S. minister to Brazil, and employed on diplomatic missions to Buenos Ayres, Montevideo, and Paraguay 1851–54. Appointed brigadier-general of volunteers on the outbreak of the civil war in the U. S., he commanded a brigade at the battle of Bull Run July 21, subsequently in Western and Northern Virginia; engaged at the battle of Cross Keys Apr., 1862. At the second battle of Bull Run he was severely wounded and incapacitated until December, when, having meanwhile been promoted to be major-general from Aug. 30, he was placed in command of the Eighth Army-corps and Middle department. He resigned from the army Dec., 1863, and resumed his seat in Congress, having been re-elected, serving at the head of the committee on military affairs and that of ways and means; appointed minister to Great Britain Dec. 22, 1870; resigned 1876, and resumed the practice of law in Washington, D. C., where he died Mar. 23, 1890.

Schenck, WILLIAM EDWARD, D. D.: clergyman; b. at Princeton, N. J., Mar. 29, 1819; was educated at Princeton College and Seminary with one year in the study of law between the two courses; pastor at Manchester, N. J., 1842–45; Hammond Street church, New York, 1845–48; First church, Princeton, N. J., 1848-52; superintendent of church extension in the Presbytery of Philadelphia 1852–54; secretary, 1854–86, and editor, 1862–70, of the Presbyterian board of publication; permanent clerk of the General Assembly (Old School) 1862–70; and vice-president of the American Colonization Society since 1877. Dr. Schenck has published many minor works and several books, including *Children in Heaven*; *Historical Account of the First Presbyterian Church of Princeton, N. J.* (Princeton, 1851); *God our Guide*; *The Fountain for Sin* (1867–68; translated into German); *Church Extension in Cities*; *General Catalogue of Princeton Theological Seminary* (1881); and *Necrological Reports of Princeton Theological Seminary* (1874–84).

C. K. HOYT.

Schenec'tady: city; capital of Schenectady co., N. Y.; on the Mohawk river, the Del. and Hudson and the N. Y. Cent. and Hud. River railways, and the Erie Canal; 17 miles W. of Albany (for location, see map of New York, ref. 4–J). It has connection with the West Shore Railroad at South Schenectady and with the Fitchburg at Scotia, on the opposite side of the river, and local roads connect it with Saratoga and Troy. The city is located in one of the most beautiful portions of the renowned Mohawk valley. The older parts are along the river-bank, the modern are on the heights which surround the valley here. The supply of water is by the Holly system. The city has gas and electric lights and an electric street-railway.

Public Buildings.—Among the notable public buildings are the Ellis Hospital, Children's Home, Home of the Friendless, Free Public Library, the Van Curler opera-house, and a State armory.

Churches and Schools.—Schenectady has 22 churches and 4 missions, the former divided as follows: Methodist Episcopal, 3; Presbyterian, 3; Roman Catholic, 3; Baptist, German, Protestant Episcopal, and Reformed, each 2; and African, Congregational, English Lutheran, German Lutheran, and Jewish, each 1. There is a Y. M. C. A., with a commodious building. The city is the seat of UNION COLLEGE (*q. v.*), the academical department of Union University, and of Union Classical Institute, a preparatory school. The public-school system comprises graded schools, occupying seven modern buildings, having 3,916 pupils, and costing annually about $50,000. There are two parochial schools, a business college, and several private schools.

Finances and Banking.—The city receipts for the year ending Feb. 28, 1901, were $1,011,393.50, and expenditures $834,745.39; the debt was $1,159,114.16, and the property valuation $1,065,430. In 1901 there were two national banks with combined capital of $200,000, a State bank with capital of $100,000, and a savings-bank with deposits of $3,130,000.

Business Interests.—The manufacturing industries are numerous and extensive, and include the main plant of the Edison General Electric Company, the Schenectady Locomotive-works, Westinghouse Agricultural Works, car-works, copper and sheet-iron works, foundries, 3 knitting-mills, mica-insulator works, shawl-factory, women's underwear mill, lace-mill, shirt-factory, planing-mills, boat-yards, and carriage, varnish, and sash and blind factories. There are 3 daily and 4 weekly newspapers.

History.—Schenectady is one of the oldest cities in the State. It was settled by Arent Van Curler in 1661; patented in 1684; burned by the French and Indians, who massacred all but sixty of its inhabitants, in 1690; created a borough in 1765; incorporated as a city in 1798; and had almost its entire business portion burned in 1819. Pop. (1880) 13,655; (1890) 19,902; (1900) 31,682.

CITY EDITOR OF "DAILY GAZETTE."

Schenkel, DANIEL: theologian; b. at Dögerlin, Zurich, Switzerland, Dec. 21, 1813; studied theology in Basel under de Wette and Hagenbach, afterward in Göttingen; was appointed pastor at Schaffhausen in 1841; Professor of Theology at Basel in 1849, and in 1851 at Heidelberg. He became professor emeritus in 1884. He edited *Allgemeine Kirchenzeitung* (1852–59) and *Allgemeine Kirchliche Zeitschrift* (1859–72), and *Bibel-lexicon* (1869–75, 5 vols.); wrote *Das Wesen des Protestantismus aus den Quellen des Reformationszeitalters beleuchtet* (3 vols., 1846–51; 2d ed. 1 vol., 1862), which defended the thesis that Protestantism had for its end rather to found a new community of believers than a new theology or polity. This idea he again developed in his *Das Prinzip des Protestantismus* (1852). Up to this time he was orthodox, but with his *Christliche Dogmatik vom Standpunkte des Gewissens* (2 vols., 1858–59) he came out on the liberal side, and this altered position is yet more plain in his *Das Charakterbild Jesu* (1864; translated into English by W. H. Furness, 1866), which represents Jesus as a mere man without miraculous power. He was the founder of the German Protestant Union. D. at Heidelberg, May 21, 1885.

Schenk'endorf, MAX. von: poet; b. at Tilsit, Germany, Dec. 11, 1783; studied law at the University of Königsberg; practiced his profession until the breaking out of the wars of liberation in 1813, when he entered the Prussian army. Though unable to fight on the battle-field, on account of the lameness of his right arm, he inspired his comrades by his excellent war-songs. Many of these songs, which appeared in the collection of his *Gedichte* (1815), possess the true ring of popular poetry, and, like the war lyrics of Körner and Arndt, they were a powerful help in arousing German patriotism against the tyranny of Napoleon. See A. Hagen, *M. von Schenkendorf* (1863). JULIUS GOEBEL.

Scherer, she-rãr', EDMOND HENRI ADOLPHE: critic; b. in Paris, Apr. 8, 1815; was educated in the Collège Bourbon, Paris; studied theology at Oxford, England, and Strassburg, and was in 1845 appointed Professor of Exegesis at Geneva. His views of the inspiration of the Bible having undergone some modification, he resigned his chair in 1850 and settled in Paris, where he became one of the leaders of the liberal movement within the Protestant Church. For many years he wrote literary and political articles for *Le Temps*. Elected a member of the Legislative Assembly in 1871, he took an active part in politics. D. at Versailles, Mar. 16, 1889. His principal theological works are *De l'État actuel de l'Église Réformée en France* (1844); *La Critique et la Foi* (1850); *Alexandre Vinet, sa vie et ses*

écrits (1853); *Mélanges de critique religieuse* (1860; often reprinted). He also published *Études critiques sur la littérature contemporaine* (7 vols).

Scherer, shā'rer, WILHELM: philologist; b. at Schönborn, Austria, Apr. 26, 1841; studied Germanic philology at Vienna under Franz Pfeiffer, and later at Berlin under Jacob Grimm and Karl Müllenhoff; was Professor of German Language and Literature at Vienna 1868–72, at Strassburg 1872–77, at Berlin 1877–86. D. Aug. 6, 1886. While a student he was made by Müllenhoff coeditor of the famous *Denkmäler deutscher Poesie und Prosa aus dem VIII.–XII. Jahrhunderten*, and by his masterly treatment of the difficult questions of text criticism and philological interpretation in this work he at once attracted the attention of German philologists. In 1868 he published *Zur Geschichte der deutschen Sprache*, in which he made use of the results of comparative philology far more extensively and successfully than had hitherto been done in this field, and opened new fields for linguistic research by the application of advanced methods borrowed from the natural sciences. A number of studies in the history of German literature, *Deutsche Studien* (1870), *Geschichte der d. Dichtung im 11 und 12 Jahrhundert* (1875), *Geistliche Poeten der deutschen Kaiserzeit* (1875), *Die Anfänge des Prosaromans* (1877), *Aus Goethes Frühzeit* (1879), etc., gave evidence of the thorough zeal with which he applied himself also to the investigation of the history of German literature. The results of these studies he embodied in his famous *Geschichte der deutschen Litteratur* (1883), a masterwork which has been translated into English. His essays on Goethe were published under the title *Aufsätze über Goethe* (1886), and his minor writings were collected in the *Kleine Schriften* (1893), with an excellent preface by Konrad Burdach. See W. Dilthey, *W. Scherer* (in *Deutsche Rundschau*, Oct., 1886); Johannes Schmidt, *Gedächtnissrede auf W. Scherer* (1887); E. Schmidt, *Goethe-Jahrbuch* (1888); Julius Goebel, *Modern Language Notes* (1887). J. G.

Scherr, JOHANNES: historian; b. at Hohenrechberg, Würtemberg, Oct. 3, 1817; studied philosophy and history at Tübingen; was appointed Professor of History at the Polytechnic School of Zurich in 1860. He was a very prolific writer, who indulged in strange oddities of diction and style, and as a critic was for a time very influential in German literature. His principal works are *Geschichte der deutschen Litteratur* (2d ed. Leipzig, 1854); *Geschichte der englischen Litteratur* (Leipzig, 1854; 3d ed. 1883); *Schiller und seine Zeit* (Leipzig, 1859, several editions); *Geschichte der deutschen Frauenwelt* (Leipzig, 1860; 4th ed. 2 vols., 1879); *Blücher, seine Zeit und sein Leben* (Leipzig, 3 vols., 1862–63; 4th ed. 1887). D. Nov. 21, 1886.

Revised by J. GOEBEL.

Scherzer, shert'ser, KARL, von: *savant* and traveler; b. in Vienna, Austria, May 1, 1821. In company with Dr. Moritz Wagner he made a scientific journey through North and Central America and the West Indies 1852–55, and on his return published (with Wagner) *Reisen in Nordamerika* (3 vols.), *Die Republik Costarica*, and *Wanderungen durch die Mittelamerikanischen Freistaten*. He was one of the scientists of the Novara expedition round the world 1857–59, and wrote the narrative *Beschreibender Theil der Reise der Oesterreichischen Fregatte Novara* (3 vols., 1861–62, and subsequent editions) and *Statistisch-Kommerzieller Theil der Novara Expedition*. From coca-leaves which he brought home cocaine was first prepared. Scherzer was knighted and was commissioned to edit the commercial statistics of the Austrian empire. In 1869–70 he was chief of an Austrian scientific expedition to Eastern Asia, of which he published a narrative. Besides the works mentioned he is the author of many scientific papers, and a volume of commercial statistics, *Weltindustrien* (1880). He edited (in German) Ximencz's history of Guatemala. H. H. S.

Schiaparelli, skĕe-ăa-păă-rel'lĕe, GIOVANNI VIRGINIO: astronomer; b. at Savigliano, Piedmont, Italy, Mar. 4, 1835; studied in Turin, Berlin, and Pulkowa; became director of the observatory at Milan, 1862, and is best known for his remarkable discovery of the relation between the orbits of comets and meteors. His observations on the surface of the planet Mars are also of much note, as well as his conclusion, not yet fully established, that the planets Venus and Mars, in their rotation around the sun, always present the same face to it, as the moon does to the earth. He is the author of *Astronomical Theory of Shooting Stars* (1867); *The Predecessors of Copernicus in Antiquity*; and of numerous shorter works. S. NEWCOMB.

Schidone, BARTOLOMMEO: See SCHEDONE, BARTOLOMMEO.

Schiedam, *skhĕe*-daam': town of the Netherlands, province of South Holland; on the Schie; 2½ miles W. of Rotterdam (see map of Holland and Belgium, ref. 6–E). It is a neat and well-built place, and has fine buildings, among which the town-hall and exchange are the most remarkable. Its principal industry is gin-manufacturing, for which it has many distilleries and malt-works. Large herds of cattle and swine are fed from the refuse of the distilleries, and an extensive trade is carried on. Pop. (1899) 27,081.

Schiff, MORITZ, M. D.: professor of physiology; b. at Frankfort-on-the-Main, Germany, Jan. 28, 1823; educated in the same city; demonstrator of ornithology in the University of Frankfort till 1852; Professor of Comparative Anatomy in the University of Berne 1852–62; Professor of Zoölogy in the Instituto di Perfezionamento at Florence 1862–70; Professor of Physiology in same institute 1870–76; then took the chair of Physiology in the University of Geneva. His principal works are *Muskel und Nervenphysiologie* (Leipzig, 1853); *Untersuchungen zur Physiologie des Nervensystems* (Frankfort, 1855); *Untersuchungen über Zuckerbildung* (Würzburg, 1859); *Lezioni di Fisiologia sperimentale* (Florence, 1865; 2d ed. 1873); *Leçons sur la Physiologie de la Digestion* (2 vols., Turin, 1867); besides various papers on physiology, translated into French (5 vols., vol. i., 1893).

Schiller, HERMAN, Ph. D.: professor of pedagogy; b. at Wertheim, Baden, Nov. 7, 1839; studied at gymnasium, Wertheim, and at the Universities of Heidelberg and Erlangen; gymnasial professor at Wertheim, 1862–68, Karlsruhe 1868–72; gymnasial director at Constance 1872–76; director of gymnasium and of the seminary, and professor in the university, Giessen, since 1876. Schiller ranks among the foremost leaders of the new educational movements in Germany. His pedagogical writings and the practical application of his theories in his training-school, connected with the Giessen gymnasium, have been largely instrumental in shaping the methods for the professional preparation of teachers for the higher schools of Prussia. In literary activity and in devotion to the solution of problems pertaining to the secondary schools he may be classed with Dr. O. Frick (d. at Halle, 1892); to these two practical schoolmen are due in large measure the new life and scientific spirit of the German gymnasia. His principal works are: 1. Historical, *Geschichte des römischen Kaiserreichs unter der Regierung des Nero* (1872); *Geschichte der röm. Kaiserzeit* (2 vols., 1886–88); *Handbuch der röm. Staats- u. Kriegsalterthümer* (2d ed. 1892); *Lehrbuch der griech. u. röm. Geschichte* (1891). 2. Pedagogical, *Die lyrischen Versmasse des Horaz* (3d ed. 1892); *Handbuch der praktischen Pädagogik* (3d ed. 1894); *Lehrbuch der Geschichte der Pädagogik* (3d ed. 1894); *Die einheitliche Gestaltung u. Vereinfachung des Gymnasialunterrichts* (1890); *Pädagogische Seminarien für das höhere Lehramt* (1890); *Hausarbeit und Schularbeit* (1891); *Vorträge über Schulgesundheitspflege* (1893). Since 1870 Schiller has been a frequent contributor to the leading educational journals. J. E. RUSSELL.

Schiller, JOHANN CHRISTOPH FRIEDRICH, von: poet; b. in the town of Marbach, in Würtemberg, Germany, Nov. 10, 1759. His father was a military surgeon, who was made captain in the army for his services in the Netherlands and Bohemia. His mother, Elizabeth Kodweiss, was a baker's daughter, with some natural taste for music. As a boy, Schiller exhibited signs of a highly imaginative and spiritual nature, and his ambition was to become a clergyman. But Duke Karl of Würtemberg insisted, against the wish of the parents, on having the boy educated in a new academy—the Karl's School—which he had founded according to the most approved plan of military discipline. Theology was not taught in this academy; Schiller, therefore, entering at the age of fourteen, first selected law, but afterward changed to medicine, in which branch he graduated in his twenty-first year. There can be no doubt that the rigid, soulless discipline to which he was subjected for seven years was one cause of the reckless, rebellious spirit which breathes through his earliest works. Even before leaving the academy he had written his play of *The Robbers*, and after his graduation and appointment as military surgeon to a regiment in Stuttgart, he published it at his own expense. The impression it made was immediate and universal: the time was ripe for a revolt in literature against the French classicism which had governed the intellectual tastes of Europe for a century. Baron Dalberg, then di-

rector of the theater at Manheim, announced *The Robbers* for representation on the stage, and Schiller, being refused leave of absence, went to Manheim without it, and witnessed the first successful performance of the play Jan. 13, 1782. On his return to Stuttgart he was arrested and temporarily imprisoned; the duke endeavored to exact a pledge from him that he would write no more poetry, and the probability of sterner measures being taken induced Schiller to take refuge in flight. In September of the same year, under an assumed name, in company with a musician named Streicher, he left Stuttgart, and for nearly a year afterward remained in concealment on an estate belonging to the noble family of Wolzogen, near Meiningen. During this time he completed his plays of *Fiesco* and *Intrigue and Love*. The first of these, rejected by Dalberg, was finally produced at Manheim, and became so popular that the author was offered the post of dramatic poet to the theater there, with a meager salary. He accepted the position, undertook also the editing of a new dramatic periodical, *Thalia*, and remained in Manheim until the spring of 1785, when an invitation from Körner (the father of the famous poet, Theodore Körner) drew him to Leipzig. Soon afterward he followed Körner to Dresden, and was supported in the most generous manner by that faithful friend during two years while writing his tragedy of *Don Carlos*, his historical sketch *The Revolt of the Netherlands*, the romantic fragment *The Ghost-seer*, and a number of lyrical poems. In the summer of 1787 Schiller visited Weimar for the first time, and made the acquaintance of the authors Wieland and Herder. He also met his future wife, Charlotte von Lengefeld, whom he returned to see the following summer, and in the garden of the Lengefeld family at Rudolstadt first met Goethe. The interview has a special interest from the fact that these poets, destined to be such friends and colaborers, disliked each other at first sight. Nevertheless, it was through Goethe's influence that Schiller early in 1789 was offered the place of Professor of History at the University of Jena. He at first hesitated to accept on account of want of preparation, but he was tired of his homeless life, and saw in the appointment the possibility of marriage. His opening lectures were remarkably popular. He married Charlotte von Lengefeld early in 1790, and devoted himself to a life of study and creative activity. But during the following year he was brought to the verge of the grave by an inflammation of the lungs; the report of his death was circulated, and he was already so well known beyond the boundaries of Germany that two Danish noblemen, the Prince of Augustenburg and Count von Schimmelmann, sent him the sum of 1,000 thalers annually for three years, in order that he might rest and recover his strength. His *History of the Thirty Years' War* was published in 1793, and in the autumn of that year he returned to Würtemberg, with his family, and remained until the following spring, his visit being wisely ignored by the duke. Through consultation with the publisher Cotta a literary periodical called *The Hours* was projected, and this led to the most important crisis of his life. Goethe's co-operation was too important to be overlooked; the two poets discovered unexpected points of sympathy, and soon became united in a personal and literary friendship as noble as it is rare in history. Schiller soon freed himself from the influence of Kant, which had for a time interrupted his poetical activity, but which had also been of great influence on his artistic development; stimulated by Goethe, he wrote his finest ballads and lyrics, and was greatly encouraged by the success of his periodical, *The Hours*. His plan for a great drama based on the history of Wallenstein was resumed, and the completion of the work as a trilogy or triple drama in the year 1799 placed him at once in the first rank of authors. His ill health, however, made it more and more difficult for him to discharge the duties of his professorship at Jena; a closer intercourse with Goethe became an intellectual necessity, and in the year 1800, after the grant of a liberal pension by the duke, Karl August, he removed to Weimar. His friendship with Goethe drew upon both the bitter hostility of most of the secondary authors of Germany, and many attempts were made to estrange the two great friends. The splendid rhythm, rhetoric, and artistic completeness of form of Schiller's *Song of the Bell*, *The Diver*, and his classical ballads bore down all narrow criticism, and secured his fame as a poet in the universal judgment of the German people. His *Wallenstein* was a great success upon the stage; not less so his *Maria Stuart*, which appeared in 1800, and the *The Maid of Orleans*, in 1801. In the year 1802 Schiller was ennobled by the emperor, Francis II. His next work, *The Bride of Messina* (1803), was an attempt to unite the stately formalism of the antique Greek chorus with the free romantic element of modern dramatic art. Notwithstanding passages of rare lyrical beauty, the experiment can not be considered successful, although the play is occasionally given on the German boards. *William Tell*, which appeared in 1804, although poetically inferior to *Wallenstein*, was Schiller's greatest dramatic success. He visited Leipzig and Berlin when it was produced, and was received with the greatest popular enthusiasm. There was a chance of his obtaining the post of director of the royal theater in Berlin, but the duke doubled his pension in order to retain him, and Schiller was also unwilling to relinquish his intercourse with Goethe. He began a new play, *Demetrius*, and was well advanced in the work when, in the spring of 1805, his failing vital power reached its limit. A simple cold apparently turned the balance, and on May 9, he died. A dissection showed that under no circumstances could his life have been prolonged for more than six months more. His remains were exhumed in 1826, placed in a granite sarcophagus, and transferred to the vault of the grand ducal family, where they now repose beside those of Goethe. While as a poet Schiller holds one of the most prominent places in German literature, ranking next to Goethe, his influence as a philosopher and critic must not be overlooked. Quite early in his literary career we discover a pronounced talent for philosophy, a talent which he afterward, by the careful study of Kant's system, developed to so great an extent that he ranks among Germany's greatest thinkers. His philosophic studies were, however, not directed to the logical operations of the human mind, but rather to ethics and æsthetics, and a number of essays (*Ueber Anmuth und Würde*, 1793; *Ueber das Erhabene*, 1793; *Briefe über die ästhetische Erziehung des Menschen*, 1795, etc.) give evidence of the profoundness with which Schiller grasped and solved the most difficult problems. In these brilliantly written essays the rigidness of Kant's ethics and the one-sidedness of his æsthetics are overcome, and the innermost thoughts of the great classical period of German literature, which culminate in the advancing of a modern ideal of humanity superior to that of the Greeks, find their powerful philosophic expression. The results of his philosophic studies Schiller with a remarkable skill undertook to turn into poetry in his famous philosophic poems (*Das Glück*, *Der Genius*, *Das Ideal und das Leben*, etc.), the like of which no other literature possesses. The influence of philosophy on Schiller's critical activity is also quite evident. He stands next to Lessing as a critic of German literature. While the former carefully established the subtle formal distinctions between the various branches of poetry, and laid down the laws which govern poetic production accordingly, Schiller discusses chiefly the nature of poetry and its different branches, inquiring besides into the psychological operations of the poet's mind. To him we owe the best critical estimate of Goethe's genius (*Correspondence with Goethe*), and his famous essay on *Naïve and Sentimental Poetry* has influenced literary criticism to the present time.

In Schiller the interest belonging to individual character is associated with his genius, and lends to it the magnetism which accompanies universal popularity. On the hundredth anniversary of his birth, in 1859, a "Schiller fund," amounting to several hundred thousand dollars, was created in Germany, and the annual income is devoted to the assistance of needy authors, some fifteen or twenty of whom are now wholly or partially supported from this source. All the principal cities of Germany have erected statues in his honor. The unselfish devotion of his life to his art is recognized with a fervor which takes no note of his early irregularities; and without ever having made the slightest profession of democracy he is everywhere celebrated in Germany as the poet of the people. The explanation of this fact must be sought for in the sincerity of his nature, no less than in the persecution of which he was temporarily the object. Carlyle finely says of him: "He was a high ministering servant at truth's altar, and bore him worthily in the office he held."

Schilling, JOHANNES: sculptor; b. at Mittweida, Saxony, June 23, 1828; studied sculpture in Dresden, Berlin, and Rome; settled in 1856 at Dresden, and was appointed professor at the academy in 1868. The first work which attracted attention was *Amor and Psyche*. Among his later works are the Schiller monument in Vienna, the war monument in Hamburg, the monument of the Archduke Maximilian at Trieste, and the grand national monument on the edge of the Niederwald, overlooking the Rhine, which was unveiled by Emperor William I. in 1883.

Schism [viâ O. Fr. from Lat. *schis'ma* = Gr. *σχίσμα*, a split, schism, deriv. of *σχίζειν*, to split]: a division in the Church on points of worship and discipline. A schismatic is one who separates himself, or improperly cuts off others, from the Church. The New Testament word refers to differences rather than divisions. Some of the chief divisions, either voluntary or forced, are the Ebionite (second and third centuries), Novatian (251 A. D.), Miletian (305), Donatian (311), Arian (first under Damasus 355; second under Miletian 361), Nestorian (428), Monophysite (482). The great schism between the East and West (about 880) arose from hierarchical rivalry, the conflict concerning courts of appeal between Pope Nicholas I. and Photius, Patriarch of Constantinople, limits of jurisdiction, doctrines, and rites. Their mutual excommunication dates 1054. The papal schisms concerning the election of popes were 963, 1159, 1164, 1168, 1178, and the great schism, with rival courts at Rome and Avignon, 1378–1429. With discussions and corruptions rose new sects, some fanatical, some reforming, but in their separation from the Church differences of doctrine were emphasized, and generally they were called hereties.

Schist: See CRYSTALLINE SCHISTS and ROCKS.

Schizomyce'tes: See BACTERIOLOGY.

Schizop'oda [Gr. *σχιζόπους*, with cleft feet; *σχίζειν*, cleave, split + *πούς*, *ποδός*, foot]: an order of crustaceans (see MALACOSTRACA), the members of which are small and shrimp-like, but differ from the true shrimps (decapods) in having six pairs of locomotor appendages, and, besides, two pairs of accessory jaws which are pediform. All these feet are two-branched. The present tendency is to dismember the group, distributing its members between the mysids and the euphausia-like forms. The species of *Mysis* are remarkable, from the fact that the auditory organs are in the tail. On the side of the body and abdomen of the euphausians are a series of eye-like organs, which have recently been shown to be phosphorescent. The species, nearly a hundred in number, are almost entirely marine, but one species has been found in the lakes of Sweden as well as in Lakes Michigan and Superior.

J. S. KINGSLEY.

Schlagintweit, shlaach'int-vīt: the name of several travelers and authors; Baron HERMANN von Schlagintweit, b. May 13, 1826, d. at Munich, Jan. 19, 1882; ADOLF, b. Jan. 9, 1829, killed at Kashgar, Turkestan, Aug. 26, 1857; ROBERT, b. Oct. 27, 1833, d. at Giessen, June 6, 1885. They were the sons of an oculist in Munich; were early distinguished by their enthusiastic study of physical science, especially geology. Twice they explored the Alps, and communicated the results of their researches in *Untersuchungen über die physikalische Geographie der Alpen* (1850) and *Neue Untersuchungen* (1854), which attracted general attention. From 1854 to 1858 they undertook, supported by the King of Prussia and the British East India Company, comprehensive explorations of the Himalayas, Tibet, Hindustan, and Deccan, the results of which were communicated in *Results of a Scientific Mission to India and High Asia*, with an atlas of panoramas, views, and maps (1860–64), and *Reisen in Indien und Hochasien* (1869–80), written by Hermann alone. Robert also traveled extensively in North America, and wrote in 1870 *Die Pacific Eisenbahn in Nordamerika*, and in 1871 *Californien, Land und Leute*, and *Die Mormonen* (2d ed. 1878). Hermann in 1864 received the honorary surname of SAKÜNLÜNSKI, because of his ascent of the Kuenlun Mountains.—A fourth brother, EMIL, b. July 7, 1835, studied first law at Berlin, afterward Oriental languages and history, and published *Buddhism in Tibet* (1863); *Die Gottesnrtheile der Indier* (1866); *Die Könige von Tibet* (1866).—A fifth brother, EDUARD, b. Mar. 23, 1831, entered the Bavarian army, and fell in the battle of Kissingen, July 10, 1866. He published *Der Spanisch-marokkanische Krieg* (1863).

Revised by M. W. HARRINGTON.

Schlegel, AUGUST WILHELM, von: critic and poet; b. at Hanover, Germany, Sept. 8, 1767; studied philology under the famous Chr. G. Heyne at Göttingen; was private tutor at Amsterdam; lectured at Jena 1796–98; was appointed professor at Jena in 1798; went to Berlin in 1801, where he lectured on art and literature. He traveled for several years with Madame de Staël; was private secretary of the Crown Prince of Sweden during the wars of liberation. In 1815 he joined Madame de Staël at Paris, and remained with her until her death in 1817. In 1818 he was appointed Professor of Art and Literature at the University of Bonn, where he died May 12, 1845. Schlegel began his literary career as a critic and translator of English, Spanish, and Italian poets. Some of his reviews, as those on Schiller's *Künstler* and Goethe's *Hermann und Dorothea*, may still be considered classic specimens of literary criticism. His translation of Shakspeare, which he began to publish in 1797, and which was continued and finished by L. Tieck and Wolf Baudissin, made the great English poet one of the German classics. In 1798 he founded with his brother Friedrich the *Athenäum*, a periodical which became the chief organ of the romantic school, the new literary movement started by a number of young writers in opposition to the extreme classicism of Goethe and Schiller. Though Schlegel was one of the principal leaders of this new movement, he never participated in the eccentricities of his brother in advocating the return to Catholicism and mediæval feudalism. He was the representative of the sound elements in romanticism, and as such he exerted a great influence upon the development of the mental life in Germany. While his own poetic attempts, though perfect in regard to form, lack the true poetic spirit, his name is to be mentioned among the founders of the study of German antiquities, of Sanskrit and comparative philology. His best work, besides his masterly translations, is his *Vorlesungen über dramatische Kunst und Litteratur* (1809), a book which places Schlegel as a critic very near to Lessing. See Haym, *Die Romantische Schule* (1870); Hettner, *Die Romantische Schule* (1850); Bernays, *Zur Entstehungsgeschichte des Schlegelschen Shakespeare* (1872); I. Minor, *A. W. Schlegels Vorlesungen über schöne Litteratur und Kunst* (1884); D. Fr. Strauss, *Kleine Schriften*.

JULIUS GOEBEL.

Schlegel, FRIEDRICH, von: poet and critic; b. at Hanover, Germany, Mar. 10, 1772; studied philology at Göttingen and Leipzig; lived in Berlin and Jena; lectured in Jena 1801, in Paris 1802; studied Oriental languages, and especially Sanskrit, in Paris; joined, with his wife, the Roman Catholic Church at Cologne in 1808; settled finally in Vienna, where he lived, lecturing and writing, to the end of his life. D. on a lecturing tour at Dresden, Jan. 11, 1829. In his early writings—*Ueber das Studium der griechischen Poesie* (1796); *Die Griechen und Römer* (1796)—Schlegel is still influenced by the critical writings of Schiller, especially by the latter's essay on *Naïve and Sentimental Poetry*. He points to Greek art as the model of artistic perfection, and praises Goethe as the "dawn of true art and beauty." Soon afterward he became the chief theorist and organizer of the romantic school, which aimed at an entire reformation of German literature. For this purpose he founded and edited, with his brother August Wilhelm, the *Athenäum* (1798–1800), in which he advocated most zealously the doctrine of romanticism. As illustrations of his critical principles he wrote the drama *Alarcos* (1802), the indecent novel *Lucinde* (1799), and a great many poems, interesting documents for the study of romanticism, but without poetical value. He exerted far greater influence on the science of linguistics and the history of literature. His book *Ueber die Sprache und Weisheit der Inder* (1808) opened the way for the study of Sanskrit in Germany, and his *Vorlesungen über die Geschichte der alten und neueren Litteratur* (1815) marks the beginning of the science of the history of literature in Germany. Like his brother he directed the attention

of his contemporaries to the beauties of Old Germanic poetry, and by his letters on art in the *Europa*, a periodical which he edited while in Paris, he caused a revival in the plastic arts of Germany. But he is also, especially during the last period of his life, the chief representative of the pernicious elements of romanticism. He advocated the re-establishment not only of the papal hierarchy, but also of mediæval feudalism, and the injurious effects of his and his associates' influence in this direction were only gradually overcome. See R. Haym, *Die romantische Schule* (1870); W. Dilthey, *Schleiermacher* (1870); I. Minor, *Fr. Schlegels prosaische Jugendschriften* (1882). JULIUS GOEBEL.

Schleicher, shlī'cher, AUGUST: comparative philologist; b. at Meiningen, Germany, Feb. 19, 1821; studied theology and comparative philology at Leipzig, Tübingen, and Bonn 1840–46; privat docent in science of language at Bonn 1846–48; newspaper correspondent in Austria 1848–50; appointed Assistant Professor of Comparative Philology at Prague 1850; Professor of Science of Language and Teutonic Philology at Jena from 1857; died at Jena, Dec. 6, 1868. His residence at Prague directed his interest toward the Slavic languages, which, with the related Baltic languages, became from that time central in his scientific work and interest. Though his favorite thesis, that the science of language is to be classed among the natural sciences, has not been maintained, the influence of his views has been powerfully felt in checking arbitrary empiricism and establishing stricter methods of investigation. Chief works: *Die Sprachen Europas* (Bonn, 1850); *Formenlehre der kirchenslav. Sprache* (1853); *Handbuch der litauischen Sprache* (2 vols., Prague, 1856–67); *Die deutsche Sprache* (Stuttgart, 1860); *Compendium der vergl. Grammatik* (Weimar, 1862; 4th ed. 1876); *Laut- und Formenlehre der polabischen Sprache* (St. Petersburg, 1871). BENJ. IDE WHEELER.

Schlei'den, MATTHIAS JAKOB: botanist; b. in Hamburg, Germany, Apr. 5, 1804; first studied law at Heidelberg, then medicine at Göttingen, and finally botany at Jena, where he was appointed professor in 1839. In 1862 he resigned his office, and after a short stay at Dorpat (1863–64) as Professor of Vegetable Chemistry, he settled at Dresden. His principal works are *Grundzüge der wissenschaftlichen Botanik* (2 vols., 1842–43), which attracted much attention and gave rise to many controversies; it was translated into English by Dr. Lankester (1849); *Die Pflanze und ihr Leben*, translated into English by Prof. Henfrey (1848); *Baum und Wald* (1870); *Die Rose* (1873). D. at Frankfort-on-the-Main, June 23, 1881.

Schleiermacher, shlī'er-mā*kh*-er, FRIEDRICH ERNST DANIEL: theologian and philosopher; b. at Breslau, Germany, Nov. 21, 1768; the son of a Reformed clergyman; was brought up in the community of Moravian Brethren, receiving a profound religious impulse from them. From 1783 to 1787 he attended the pædagogium at Niesky and the seminary of the United Brethren at Barby. He completed his theological course at Halle, and after filling the positions of private tutor, assistant preacher, etc., became in 1796 the chaplain of the Charity Hospital at Berlin; in 1802 court chaplain at Stolpe, and in 1804 Professor (*extraordinarius*) of Theology and Philosophy at Halle. In 1809 he preached at the Trinity church in Berlin, and the following year received appointment as Professor (*ordinarius*) of Theology at the new University of Berlin, which position he retained till his death. During the ten years previous to going to Berlin he had studied and criticised the Kantian philosophy, and was greatly attracted by Jacobi's exposition of Spinoza. He subsequently studied and translated Plato, and did much by his lectures to encourage the study of the remains of the early Greek philosophy. His activity knew no limits. He labored to effect a union of the Lutheran and Reformed Churches on the broad basis that demanded unity in the spirit of Protestantism and allowed diversity as to doctrines and modes of worship. His failure in this led to a misunderstanding with Minister von Altenstein, which lasted for some years. D. in Berlin, Feb. 12, 1834.

The fundamental point of view of Schleiermacher's system is this: Religion is not a knowing nor a doing, but a feeling—a feeling of the universal life of the Infinite, and of the dependence of the Ego upon it. Hence, with him, religion begins with the feeling of dependence. Reflection upon this feeling gives rise to descriptions of it, and hence the statement of religious principles and dogmas. All religions are historic and positive. Among these Christianity holds a unique place, inasmuch as in it is found the reconciliation with the Infinite, hence the very essence of religion itself. Upon the same framework of antithetic ideas of the universal and particular (infinite and finite, common and special, God and the Ego) he builds his system of ethics. The organizing activity of reason in the realm of the common or universal, securing identity of common usage, is the first province of ethical action—that of interchange among men. The second is that of organization in the realm of particular individuality, the province of inalienable personality. The third and fourth provinces of ethical action are not those of organization, but of "symbolism," the third being that of symbolism with identity in the realm of thought and language, and the fourth the symbolism with individuality in the realm of feeling. Corresponding to these four provinces are the four institutions: (*a*) State, in which each is for the whole; (*b*) civil society, organized for the benefit of the individual; (*c*) school (college, etc.), for community of culture; (*d*) church, "for individual symbolic activity." The most important of Schleiermacher's writings are: (1) *Discourses on Religion* (Berlin, 1799); (2) *Monologues* (1800); (3) *Confidential Letters on F. Schlegel's Lucinde* (1800); (4–7) *Four Collections of Sermons* (1801–20); (8) *Outlines of a Critique of Previous Systems of Ethics* (1803); (9) *Translation of Plato's Works* (1804–28); (10) *The Christian Faith according to the Principles of the Evangelical Church* (1821–22); (11) *Theological Encyclopædia* (1811). After his death were published (1835) lectures on the history of philosophy, dialectics, psychology, ethics, politics, and pedagogics. The lectures on the life of Jesus, which appeared in 1864, made an epoch when first delivered. According to the authority of Zeller, Schleiermacher is the greatest theologian of the Protestant Church since the period of the Reformation—"a churchman whose liberal ideas will yet prevail in regard to the union of Protestant confessions, the constitution of the Church, and the rights of conscience and individuality in religion"—"a deep-working religious teacher, who formed the heart by the understanding and the understanding by the heart—a philosopher who scattered fruitful seeds, who introduced a new era in the knowledge of Greek philosophy, and who assisted in Germany's political regeneration." He investigated the nature of religion more profoundly than any before him. Physically, he was small of stature, slightly deformed, quick and animated in his movements, his countenance kind and sympathetic. His *Autobiography* (covering only the first twenty-six years of his life) was published in 1851. His *Correspondence with J. C. Gass* appeared the following year in 4 vols. His *Biography* has been written by K. Schwartz, D. Schenkel, W. Dilthey, and others. WILLIAM T. HARRIS.

Schleitz, shlīts: town of Reuss (younger branch), Thuringia, Germany, and residence of the reigning family; 24 miles S. S. W. of Gera, terminus of a branch railroad from Schönberg; elevation, 1,407 feet (see map of German Empire, ref. 5–F). It is well kept, has beautiful streets, tanneries, a foundry, factories of lamps, whips, and lace; also a college and schools for teachers, for deaf mutes, and for wood-carving. Near by is the château of Heinrichsruh. Pop. (1895) 5,094. M. W. H.

Schleswig, shles'vich (i. e. Bay of the Schlei): district and town of the southern part of the Danish peninsula (see map of German Empire, ref. 2–E). The district was a Danish province until 1864, when it was taken by Prussia by conquest and united two years later with Holstein to form the province called Schleswig-Holstein. The town is at the end of a slender arm of the Baltic Sea, which penetrates nearly half-way across the peninsula and is called the Schlei. Schleswig is an ancient town, was known to the Arabian geographers, and by 800 was a place of considerable commercial importance. This continued during the Middle Ages, but eventually the removal of the ducal residence, the rivalry of Lübeck and Kiel, and the silting up of the mouth of the Schlei caused its trade to decline, and it remained only of strategic interest, which, however, was lost as a result of the war of 1864. Southwest from the town are the traces of the Danewerk, a line of intrenchments connecting the Schlei with the Treene, which flows westward and empties into the North Sea. It was thrown up in the ninth century, or earlier, and was intended for the defense of the peninsula. It was used for this purpose for ten centuries, and was repeatedly renewed and strengthened until it was abandoned in 1864 by the Danish army under Gen. de Meza without striking a blow. Pop. of town of Schleswig (1895), 17,255. MARK W. HARRINGTON.

Schleswig-Holstein: province of Prussia; bounded N. by Denmark, S. by the Elbe, which separates it from Hanover, E. by the Baltic, and W. by the North Sea. Area, 7,273 sq. miles. Several islands—Rømö, Sylt, Föhr and others in the North Sea, Alsen and Femern in the Baltic—belong to the province. A slightly elevated ridge stretches through the center of the province, sandy, gravelly, and covered with heath in Schleswig—swampy, marshy, and covered with forests in Holstein. To the E. of this ridge the surface is diversified by hills, and the coast much indented by long, narrow fiords. The soil affords excellent arable land, and forests of oak and beech are numerous. To the W. the surface is perfectly level, and the ground so low that in many places it must be protected against the North Sea by high dikes; but the soil is rich and affords excellent pasturage. The chief occupations are agriculture in the eastern part, and cattle-breeding in the western. Wheat, hops, and fruit are raised in great quantities, and thousands of oxen are annually sold in Hamburg and London. The fisheries in the North Sea are considerable. The province is of great importance to Prussia, partly on account of the harbor of Kiel, the best, if not the only one available for naval purposes, on the coast of Germany, and partly because of the fitness of the inhabitants for maritime occupations. Pop. (1895) 1,286,416. In Schleswig about 150,000 of the inhabitants speak Danish; the Frisian language is spoken in the western districts and on the islands of the North Sea; the rest of the inhabitants speak the Low German dialect. See SCHLESWIG-HOLSTEIN in the Appendix.

Schley, WINFIELD SCOTT: naval officer; b. in Frederick co., Md., Oct. 9, 1839; midshipman Sept. 20, 1856. Was in all the engagements from Mar. 16 to July 9, 1863, which led up to the capture of Port Hudson; Mar. 31, 1884, ordered to command Greely relief ships Thetis, Bear, and Alert, the last having been generously presented for the purpose by the British Government. The Thetis, preceded by the Bear, and followed several days later by the Alert, sailed from New York May 1, and rescued Greely and the remnants of his party at Cape Sabine June 22. Schley was made captain in 1888, commodore in 1898, and rear-admiral in 1899, and served under Sampson in the war with Spain. Author, with Prof. James R. Soley, of *The Rescue of Greely* (New York, 1886).

Schliemann, shlee'măăn, HEINRICH, Ph. D., D. C. L.: archæologist; b. at Neubuckow, Mecklenburg-Schwerin, Germany, Jan. 6, 1822. His enthusiasm for classical antiquity manifested itself at a very early age, and when only ten years of age he wrote a Latin essay on the Trojan war, with the site of which his name was destined to become indissolubly associated. Family misfortunes compelled him to leave the gymnasium, and after a five years' apprenticeship as a grocer's clerk in the village of Fürstenberg he walked to Hamburg, where he embarked as a cabin-boy on a vessel bound for Venezuela (Nov. 28, 1841). The ship was wrecked on the Dutch coast, but Schliemann was saved. He then went to Amsterdam and became an office-boy in a commercial house, where he acquired a knowledge of the principal modern languages. In 1846 his employers sent him as their agent to St. Petersburg. In the following year he founded a firm of his own. In 1850, during a trip to California, he accidentally became a citizen of the U. S., having been present on July 4 of that year, when California was received into the Union. In 1852 he founded a branch establishment at Moscow, and by 1858 had amassed a great fortune. He had acquired a knowledge of Greek in Russia, and after traveling over the European continent and around the world (1864), he settled in Paris, giving himself up entirely to archæological study. He began his excavations in the Troad in Apr., 1870, on the hill of Hissarlik, which he believed to be the site of TROY (*q. v.*). These excavations were continued with intermissions till 1882, and brought to a close by Dr. Dörpfeld in 1892. Schliemann's childlike credulity in the historical reality of the Homeric epic had to a certain extent been vindicated, although many of his inferences regarding details had to be abandoned or modified. These successes were followed up by excavations at Mt. Athos (1878), at Mycenæ (1876–88), Ithaca (1878), Tiryns and Orchomenos (1881 f.). The discoveries at Mycenæ, in particular, were not only of great intrinsic value, but they revolutionized the prevalent ideas of the prehistoric civilization of Hellas, and threw a flood of light upon the rise and development of Greek art. The results of Schliemann's excavations were described in numerous works. His Trojan treasures he presented to Berlin, which honored him with the freedom of the city. He died at Naples, Dec. 26, 1890, and is buried at Athens, near the Ilissos. The best survey of his achievements, together with an admirable biographical sketch, is to be found in Dr. C. Schuchardt's *Schliemann's Excavations, an Archæological and Historical Study* (translated, with an introduction of W. Leaf, by Eugénie Sellers, London, 1891). ALFRED GUDEMAN.

Schlosser, FRIEDRICH CHRISTOPH: historian; b. at Jever, Oldenburg, Nov. 17, 1776; studied theology and philosophy at Göttingen; spent several years as a private tutor in various families and as librarian to the city of Frankfort, and was appointed in 1819 Professor of History at the University of Heidelberg, where he died Sept. 23, 1861. His principal writings are *Geschichte des 18. Jahrhunderts* (1823; often reprinted, and translated into English by Davidson, London, 1843–52); *Weltgeschichte in zusammenhängender Erzählung* (1817–24); *Universalhistorische Uebersicht der Geschichte der alten Welt und ihrer Kultur* (1826–34). Written rather from the ethical than from the scientific point of view, the works of Schlosser have taken a strong hold on the popular mind, and have been especially favored by the middle classes. F. M. COLBY.

Schlözer, AUGUST LUDWIG, von: historical writer; b. at Gaggstedt, Würtemberg, July 5, 1735; studied theology at Wittenberg and Göttingen; lived from 1755 to 1759 at Stockholm as private tutor, and wrote here, in the Swedish language, a history of commerce; went to Russia in 1761 with the Russian court-historiographer, Müller, and was appointed Professor of Political Science in 1764 at Göttingen, where he died Sept. 9, 1809. His principal works are his *Allgemeine nordische Geschichte* (2 vols., 1772) and his translation of Nestor's *Russian Chronicles* (5 vols., 1802–09).

Schlyter, KARL JOHAN: legal writer; b. at Karlskrona, Sweden, Jan. 29, 1795. He became docent in law at the University of Lund 1816, but in 1820 moved to Stockholm, and two years later was chosen, together with H. S. Collin, to bring out a complete critical edition of the ancient laws of Sweden. After visiting the principal libraries of Sweden and Denmark, Schlyter entered upon his work in 1823, which after the death of his colleague in 1833 he performed alone. Some idea of the magnitude of the undertaking may be formed from the statement that about 800 separate MSS. were examined in connection with it, the text of each collection being based upon the oldest codex. The different parts appeared as follows: *Vestgötalagen* (1827); *Östgötalagen* (1830); *Uplandslagen* (1834); *Södermannalagen* (1838); *Vestmannalagen* (1841); *Helsingelagen*, etc. (1844); *Gotlandslagen* (1852); *Visby stadslag* (1853); *Skånelagen* (1859); *Konung Magnus Erikssons landslag* (1862); *idem stadslag* (1863); *Konung Kristoffers landslag* (1869); and finally *Ordbok till samlingen af Sveriges gamlalagar* (1877), not the least valuable portion of the work. D. at Lund, Dec. 26, 1888. D. K. DODGE.

Schmal'kalden, or **Smal'cald**: town; in the province of Hesse-Nassau, Prussia; at the confluence of the Schmalkalde and Stille; 19 miles S. W. of Gotha (see map of German Empire, ref. 5–E). It has salt-works, iron-forges and steel-forges, and manufactures of white lead and paper. The famous league of the German Protestant princes was formed here in 1531. Pop. (1895) 7,888.

Schmauk, shmowk, THEODORE EMANUEL: author; b. at Lancaster, Pa., May 30, 1860; graduated at University of Pennsylvania and the Theological Seminary in Philadelphia; pastor Lebanon, Pa., since 1883; literary editor of *The Lutheran*, Philadelphia, since 1889, and a frequent contributor to *The Sunday-school Times*. His chief work is on *The Negative Criticism* (Lebanon, 1894). H. E. J.

Schmid, shmit, HEINRICH: theologian; b. in Harburg, Bavaria, July 31, 1811; studied at Halle, Berlin, and Erlangen; professor extraordinary at Erlangen 1848; ordinary professor 1854–81. D. in Erlangen, Nov. 17, 1885. His chief distinction was as a successful compiler. He is best known by his *Dogmatik*, a compilation of the definitions of Lutheran dogmaticians of the sixteenth and seventeenth centuries, first published in Erlangen in 1843, sixth edition at Frankfort-on-the-Main in 1876, and translated into English by Hay and Jacobs, first edition, Philadelphia, 1875; second, 1888. He also published *Geschichte der synkretistischen Streitigkeiten* (1846); *Lehrbuch der Dogmengeschichte* (1860; 4th ed. 1887); *Geschichte des Pietismus* (1863); and a *Handbuch der Kirchengeschichte* (2 vols., 1880–81). H. E. JACOBS.

Schmid, JOSEPH: See the Appendix.

Schmid, Leopold: cleric; b. at Zurich, June 9, 1808; studied theology at Tübingen and Munich; became professor in the priest seminary at Limburg 1831, and professor of Theology in 1839 at Giessen. Although a strict adherent of the Roman Catholic Church, his broader and more liberal views, acquired by an extensive study of philosophy, brought him into collision with the ultramontane party. In 1849 his election as Bishop of Mentz was not confirmed by Pope Pius IX., who, however, dared not place his book, *Der Geist des Katholicismus oder Grundlegung der christlichen Irenik* (2 vols., Giessen, 1848–50), in the *Index*. The papal action led him to leave the theological and enter the philosophical faculty at Giessen. His little pamphlet *Ultramontan oder katholisch?* (1867) indicated his renunciation of the Roman Catholic Church. D. at Giessen, Dec. 20, 1869.

Schmidt, shmit, Frederick Augustus: theologian; b. at Leutenberg, Thuringia, Jan. 3, 1837; emigrated to the U. S. in 1841; educated in Concordia College and Seminary, St. Louis, Mo.; pastor Erie co., N. Y., and St. Peter's English church, Baltimore, Md.; entered the service of the Norwegian Synod in 1861; professor at Decorah, Ia., 1862–72; professor in Theological Seminary, St. Louis, Mo., 1872–76, at Madison, Wis., 1876–86, Northfield, Minn., 1886–90, Minneapolis since 1890. Dr. Schmidt was a chief opponent of Dr. Walther in the controversy on the subject of predestination that agitated the Synodical Conference, establishing and editing for this purpose the *Altes und Neues* (1880–85). H. E. Jacobs.

Schmidt, Heinrich Julian: journalist and author; b. at Marienwerder, Prussia, Mar. 17, 1818; studied philology and history at the University of Königsberg; settled in 1847 at Leipzig as editor, afterward in connection with Gustav Freytag as proprietor of the *Grenzboten*, which supported the Prussian interest in Germany; removed in 1861 to Berlin and edited the *Berliner Allgemeine Zeitung* 1861–63; d. in Berlin, Mar. 26, 1886. Author of *Geschichte der Romantik im Zeitalter der Reformation und Revolution* (2 vols., 1850); *Geschichte der deutschen Literatur seit Lessings Tod* (3 vols., 1858); *Geschichte des geistigen Lebens in Deutschland von Leibniz bis auf Lessings Tod* (2 vols., 1860-64); *Bilder aus dem geistigen Leben unserer Zeit* (1870); *Geschichte der deutschen Literatur von Leibniz bis auf unsere Zeit* (1886). He was a much-dreaded critic, hostile to morbid romantic tendencies, and advocated healthy realism in poetry. See G. Freytag's *Erinnerungen aus meinem Leben* (1886). J. G.

Schmidt, Henry Immanuel, S. T. D.: educator; b. at Nazareth, Pa., Dec. 21, 1806, where he was educated, and afterward taught 1826–29; Lutheran pastor, Bergen co., N. J., 1831–33, Boston, Mass., 1836–38, Montgomery co., Pa., 1844; professor at Hartwick Seminary, New York, 1833–36, Pennsylvania College and Theological Seminary, Gettysburg, Pa., 1838–43; principal of Hartwick Seminary 1845–47; Professor of German Language and Literature in Columbia College, New York, 1848–80. D. in New York, Feb. 11, 1889. He published *History of Education* (New York, 1842); *The Lutheran Doctrine of the Lord's Supper* (1852); *Course of Ancient Geography* (1860). H. E. Jacobs.

Schmidt, Johannes: comparative philologist; b. at Prenzlau, Prussia, July 29, 1843; educated at the Marienstifts Gymnasium in Stettin and at the Universities of Bonn and Jena; docent in Comparative Philology at Bonn 1868; assistant professor in Bonn 1873; autumn of same year professor in Graz; since 1876 Professor of Comparative Philology in Berlin; member of the Royal Prussian Academy. Author of *Zur Geschichte des indogerm. Vocalismus* (1871–75); *Die Verwandtschaftsverhältnisse der indogerm. Sprachen* (1872); *Die Pluralbildungen der indogerm. Neutra* (1889); *Die Urheimath der Indogermanen und das europäische Zahlsystem* (1890); also important articles in *Kuhns Zeitschrift für vergleichende Sprachforschung*, of which since 1875 he has been coeditor with E. Kuhn. In scientific acquaintance with the grammatical structure of the Indo-European languages he is unexcelled by any living scholar.

Schmidt, Karl: See the Appendix.

Schmidt-Rimpler, Hermann, M. D.: ophthalmologist; b. in Berlin, Prussia, Dec. 30, 1838; graduated M. D. at the University of Berlin in 1861; was a military surgeon for some years, and after 1871 was brigade-surgeon at the Frederiek William Institute; at that time he was appointed Extraordinary and in 1873 Ordinary Professor of Ophthalmology at the University of Marburg; in 1891 he accepted the same chair at the University of Göttingen. His chief work, *Augenheilkunde und Ophthalmoskopie für Aerzte und Studirende* (Brunswick, 1885), has passed through several editions and has been translated into several European languages. S. T. Armstrong.

Schmucker, Beale Melanchthon, D. D.: clergyman and author; son of Samuel S. Schmucker; b. at Gettysburg, Pa., Aug. 26, 1827; graduated at Pennsylvania College and Theological Seminary, Gettysburg, Pa.; pastor at Martinsburg, Va., 1845–51, Allentown, Pa., 1852–62, Easton 1862–67, Reading 1867–81, Pottstown 1881–88. D. at Pottstown, Oct. 18, 1888. He was especially distinguished as a liturgical scholar and writer, being unexcelled in this department in the U. S. *The Church Book* (1867, 1892) of the General Council and *The Common Service* (1888) of all English-speaking Lutherans owe more to his indefatigable labor and investigations than to any one else. The American edition of the *Hallesche Nachrichten* was edited by him, with Dr. Mann and Dr. Germann, and furnished with exhaustive historical notes. He was secretary of the General Council's committee on foreign missions 1869–88, and secretary of the board of directors of the Theological Seminary, Philadelphia, from its founding in 1864 until his death. H. E. Jacobs.

Schmucker, Samuel Simon, D. D.: theologian; b. at Hagerstown, Md., Feb. 28, 1799; educated at the University of Pennsylvania and Princeton Theological Seminary; pastor at New Market, Va., 1820–26; professor in Theological Seminary, Gettysburg, Pa., 1826–64. D. at Gettysburg, Pa., July 26, 1873. Schmucker represented the American Lutheran type of theology, as he termed it, which was characterized by indifference to the distinctive doctrines of the Lutheran Church. He advocated this tendency in his *Elements of Popular Theology*, first published in 1834; *American Lutheran Church* (1851); *Lutheran Manual* (1855); *Lutheran Symbols, or American Lutheranism Vindicated* (1856); *Church of the Redeemer* (1867), besides in numerous articles in the reviews and church papers. He wrote *The Definite Synodical Platform* (1856), as an American recension of the Augsburg Confession to be adopted by the synods of the General Synod, in which the Lutheran doctrines of original sin and the sacraments were greatly modified. He also labored in the cause of Church union, and was one of the founders in 1846 of the Evangelical Alliance. H. E. J.

Schneider, Johann Gottlob: classical scholar; b. at Collmen, near Wurzen, Saxony, Jan. 18, 1750; began his philological studies at Schulpforta, which he continued at Leipzig, and at Göttingen under Heyne, who recommended him to Brunck at Strassburg to aid the latter in his edition of the Greek poets. Here he added to his classical studies that extensive and thorough acquaintance with anatomy, botany, and zoölogy which gave so great value to his editions of the ancient authors who treat of those subjects. In 1776 he was appointed Professor of Ancient Languages and Eloquence in the University of Frankfort-on-the-Oder. When, in 1811, the university was removed to Breslau, he accompanied it, holding the same office, which he resigned in 1816 on his appointment as chief librarian. Of the many valuable editions published by him may be mentioned: *Scriptores Rei Rusticæ* (4 vols., 1794–95); Vitruvius (3 vols., 1807–08); Aristotle's *Historia de Animalibus* (4 vols., 1812); Works of Theophrastus (5 vols., 1818–21); Ælian, *De naturali animalium*; Nicander's *Alexipharmaca* and *Theriaca*; and Orpheus's *Argonautica*. On his large *Griechisch-Deutsches Wörterbuch* (2 vols., 1797–98; 3d ed., with supplement, 1819–21) Passow based his lexicon. D. at Breslau, Jan. 12, 1822. Revised by A. Gudeman.

Schneider, Karl Ernst Christoph: classical scholar; b. at Wiehe, Prussian Saxony, Nov. 16, 1786; studied theology and philology at the University of Leipzig; in 1816 appointed Professor of Ancient Literature in the University of Breslau; published *De Originibus Tragœdiæ* (1818); edited, with a critical commentary, Plato's *Republic* (3 vols., 1830–33; supplement, 1854); German translation of same (*Platos Staat*), of the *Timæus* (1847), and an edition of Proclus's *Commentarius in Platonis Timæum* (1851); Cæsar's *Commentarii de Bello Gallico* (2 vols., 1840–55), with elaborate commentary; edited a portion of the Plato in Didot's *Bibliotheca Græca* (Paris, 1846–53). D. at Breslau, May 16, 1856. Revised by A. Gudeman.

Schnei'dewin, Friedrich Wilhelm: classical scholar; b. at Helmstedt, Brunswick, June 6, 1810; entered the Uni-

versity of Göttingen 1829; appointed in 1833 teacher in the gymnasium at Brunswick; in 1836 instructor in the University of Göttingen, in 1837 professor extraordinarius, and in 1842 regular professor. His literary activity was very great. He published *Exercitationes Criticæ in Poetas Græcos Minores* (1836); *Delectus Poesis Græcæ* (1838–39); Martial's *Epigrammata*, with critical commentary (2 vols., 1842); Sophocles's *Tragœdiæ* (7 vols., 1849, and frequently re-edited since); Æschylus's *Agamemnon*; Simonides's *Carminum Reliquiæ* (1835); Pindar (2d ed. 1865); Babrius (2d ed. 1865); *Paræmiographi Græci* (2 vols., 1839–51, in conjunction with Leutsch); and founded the *Philologus*, the well-known classical quarterly. D. at Göttingen, Jan. 10, 1856.

Revised by A. GUDEMAN.

Schnetz, JEAN VICTOR: painter; b. at Versailles, France, May 15, 1787; studied painting under David, Regnault, and Gérard, and in Italy; began to exhibit in 1819; was director of the French Academy in Rome 1840–66. D. in Paris, Mar. 17, 1870. His most celebrated pictures are *The Gypsy and Sixtus V.* (1820); *The Sacking of Rome* (1835); *Christ and the Little Children* (1855); *The Capuchin Physician* (1867).

Schnitzer, EDUARD: See EMIN PASHA.

Schnorr von Kar'olsfeld, JULIUS: painter; b. at Leipzig, Germany, Mar. 26, 1794; studied painting under his father, who was a painter himself, in Vienna and Italy; was appointed professor at the Academy of Munich in 1827, and director of the picture gallery at Dresden in 1846. D. at Dresden, May 24, 1872. His principal works are his frescoes in the palace in Munich illustrating the *Nibelungen* and the history of Charlemagne, Barbarossa, and Rudolf of Habsburg, his *Luther at the Diet of Worms*, and *Bibel in Bildern* (a collection of wood-cuts giving the Bible history, 240 plates, with text). His celebrated Nibelungen frescoes are in the Königsbau, a part of the royal palace. His *Luther at the Diet of Worms* has often been reproduced by the engraver's and photographer's arts and spread all over Europe. Revised by RUSSELL STURGIS.

Schodde, GEORGE HENRY, Ph. D.: educator; b. at Allegheny, Pa., Apr. 15, 1854; graduated at Capital University, Columbus, O., 1872; studied theology at Columbus, O., Tübingen, and Leipzig; pastor Canal Winchester and Martha's Ferry, O.; professor in Capital University since 1880. He has published a translation of the *Book of Enoch* from the Ethiopic (Andover, 1882); has been on the editorial staff of *The Lutheran Standard* (Columbus, O.), and is a frequent contributor to *The Bibliotheca Sacra*, *The Independent*, etc.

H. E. J.

Schoelcher, Fr. pron. shō'el'shār', VICTOR: legislator and philanthropist; b. in Paris, July 21, 1804; began early to take an active part in political discussion as a republican; traveled in 1829, 1840, and 1845 in Mexico, the U. S., East and West Indies, Africa, and devoted himself to exposing the conditions of slavery in the works *De l'Esclavage des Noirs et de la Législation coloniale* (1833); *Abolition de l'Esclavage* (1840); *Les Colonies françaises* (1842); *Les Colonies étrangères et Haïti* (1843); *Égypte en 1845* (1846); *L'Histoire de l'Esclavage pendant les deux dernières Années* (2 vols., 1847). He was a member of the Constituent and Legislative Assemblies 1848–51, where he championed the cause of emancipation; during the empire he lived in London, where he published violent attacks against it; also a *Life of Handel* (1857); after the downfall of Napoleon III. he returned to Paris, and represented Martinique in the Legislative Assembly. In 1875 he was chosen senator for life. D. in Paris, Dec. 26, 1893.

Schofield, JOHN MCALLISTER: soldier; b. in Chautauqua co., N. Y., Sept. 29, 1831; graduated at the U. S. Military Academy, and promoted brevet second lieutenant of artillery July 1, 1853; captain May 14, 1861. From 1855 to 1860 he was Assistant Professor of Natural and Experimental Philosophy at West Point, and at the outbreak of the civil war was filling the chair of Physics in Washington University, St. Louis, Mo. Appointed major First Missouri Volunteers Apr. 26, 1861, he served with Gen. Lyon as chief of staff in the operations in Missouri, participating in the battles of Dug Spring and Wilson's Creek. Commissioned brigadier-general of U. S. volunteers and of Missouri militia Nov., 1861, he commanded the State troops and the district of St. Louis, and in Oct., 1862, was placed in command of the Army of the Frontier; promoted to be major-general U. S. volunteers Nov. 29, 1862, he commanded the district and department of Missouri until Jan., 1864, when appointed to command the Army of the Ohio; was in immediate command of the Twenty-third Corps in Sherman's Georgia campaign, participating in the almost constant severe fighting ending with the capture of Atlanta Sept. 2, 1864. In Nov., 1864, he was placed in command of the forces detached from Gen. Sherman's army to strengthen Gen. Thomas at Nashville, being constantly engaged with Hood's army invading Tennessee, and defeated it at the battle of Franklin Nov. 30, 1864; joined Gen. Thomas the next day, and commanded the Twenty-third Corps at the battle of Nashville. For his services at Franklin he was appointed brigadier-general in the regular army. Transferred with his command to North Carolina and placed in command of that department Feb. 9, 1865, he occupied Wilmington Feb. 22, fought the battle of Kinston Mar. 8–10, and joined Gen. Sherman at Goldsboro Mar. 22, 1865. Upon the surrender of Gen. Johnston's army (Apr. 26) he was appointed to execute the terms of the convention; in command of the department of North Carolina until June, 1865. He was on special duty in Europe from 1865 to Aug., 1866; in command of the first military district of Virginia 1866–67; Secretary of War *ad interim* May, 1868–Mar., 1869, when he was promoted to be major-general U. S. army, and assigned to the department of Missouri. In May, 1870, he assumed command of the division of the Pacific; became superintendent of U. S. Military Academy at West Point July, 1876; in command of the military division of the Pacific 1882–83; of division of the Missouri 1883–86; of division of the Atlantic 1886–88: of army 1888. In Feb., 1895, he was appointed lieutenant-general, a rank which expires with him. He was retired for age (64) Sept. 29, 1895. Revised by JAMES MERCUR.

Scholasticism [from Lat. *scholasticismus*, scholasticism, deriv. of *scholasticus* = Gr. σχολαστικός, pertaining to leisure or school, deriv. of σχολή (whence Lat. *schola*), leisure, learning, school]: in a large sense, the science of Christian theology and philosophy as presented in the schools and universities of the Middle Ages, notably those of the thirteenth and subsequent centuries. Strictly speaking, it does not mean a doctrine, nor even a system, but a method, a style, a manner of handling certain truths, which contrasts strongly with their treatment in times previous or posterior to the period in which scholasticism flourished. This method is highly technical, didactic, analytic, implying a severe and exact use of the reasoning faculties. It is strictly syllogistic, and tends to present the doctrines of Christian theology and philosophy in a complete methodical system, in which an even balance and a due proportion shall be everywhere observed. The modern emotional element, the "personal equation," and the individualistic tendency are utterly foreign to the nature of this method, which is constructive, architectonic, unitive in its spirit, and is as tangible an expression of the large unity of the life and ideals of the Middle Ages as their cathedrals, laws, and literatures.

Erroneous Views.—It has been made a reproach to the scholastic period that it examined with excessive subtlety, and was marked by an arid formalism, infinite prolixity of treatment, barbarous technology, etc. The excess of subtlety in the mental investigations of mediæval scholars is not to be laid at the door of their method or their system, whose chief element is the employment of philosophy or trained human reason in the service of religion. It was only in the decay of scholasticism that such refiners of doubt appeared, and even then they awoke the ire of all sensible theologians, to use the words of Melchior Canus. It is not entirely true that all the scholastics are distinguished by cold formalism of style. The style of Abelard and John of Salisbury is easy, familiar, and agreeable. Dante, one of the princes of scholasticism, is the glory of Italian literature, and the preaching of the Middle Ages, the hymns, sequences, and masses, are the products of men formed in the schools, and broken by hard dialectic exercise to exact, clear thought, and a certain power of terse and rugged expression. The scholastic style in St. Thomas and St. Bonaventure has somewhat of the severe charm of the early Gothic, where the lines, proportion, and balance of all alone awake admiration. The masters of mediæval philosophy had a great task—viz., to endow with noble ideals, intelligible, tangible, and familiar, a generation just issued from barbarism, and for this end the categorical exposition of principles and truths was the best means; it was left to future generations and to spontaneous action to present the same in a more charming garb. For them it was enough that they made known to the best of their ability truth, duty, life, nature, man, and God, as they were in themselves and

relatively to one another. It would be unjust to tax them with their shortcomings in history and the natural sciences; those elements of human learning they borrowed from their predecessors, and they were too busy as pioneers of a mighty intellectual movement, as the schoolmasters of the young nations, to devote attention to special and minor departments of the world of knowledge, even if their value were as clear to them as to us. To one of these schoolmen, Vincent of Beauvais, we owe the famous *Speculum*, forerunner of our modern encyclopædias, in which the divisions of human science and their respective claims are justly observed and recognized. Withal, Albert the Great and Roger Bacon recognized fully the bearings of the study of nature, and the great moral poem of Dante is a study in social and political questions of the highest order. The annalists, chronielers, and historians of the time, themselves schoolmen or trained in the schools, show an ever-widening interest in human affairs, much shrewdness, a large extent of observation, and a well-developed political sense. It may also be noted that even in the schools during the latter half of the twelfth and in the thirteenth century the technical and oratorical styles were in a constant struggle for the mastery, a phase of this movement which is well illustrated by the contemporary Alexander of Hales and William of Paris, the former representing the didactic and the latter the larger, more rhetorical manner. A glance at the weighty philosophical problems which constantly attracted the attention of the schoolmen is sufficient to impress a frank, intelligent mind with respect. They were the relations of faith and reason; the nature and means of knowledge; the reality of observations, phenomena, experience; the personality of man; the nature of the universe, immortality, the future life; the rights and duties of the factors of society, the forms and functions of government, etc. And all this, not in a loose, inconsistent, contradictory manner, but with logical coherency, and a consciousness that they were contributing in a systematic way to the creation of a great whole in which faith and reason have each the share that is demanded by the peculiar nature and office of each. The most perfect specimen of this philosophic spirit is St. Thomas Aquinas, and the most admirable of the scholastic works is the *Summa Theologica* of that stupendous genius—"a vast encyclopædia of the moral sciences, in which whatever could be known of God and man and their relations was set down; a monument severely harmonious, magnificent in design, but yet unfinished, like so many other of the great mediæval undertakings." (*Ozanam.*)

Sources of Scholasticism.—Inasmuch as this term implies a rounded and consistent body of doctrines, it sums up all previous knowledge of a higher order, and draws upon all the fountains of human learning then known. In theology the written word of God, the decisions of councils and popes, the writings of the Fathers, Church history, canon law, the liturgy, and popular religious custom and feeling, furnish the materials of the scholastic writings. In philosophy Aristotle, as known to the Middle Ages, with Boethius and the pseudo-Areopagite, form the sources of their logic and metaphysics. The schoolmen accepted without question the teachings of the Church, and proceeded to coordinate them by means chiefly of the Aristotelian method and principles, to illustrate, explain, and defend, to reduce the propositions of theology to formal theses, against which they marshaled all possible objections, which were answered briefly and in order, but not before the theological truth in question had been defined and proved. Thus theology grew under their hands into a perfect science, with the aid of the dialectic method, and all the teachings of the Catholic Church were built up as into a vast edifice, which had its vestibule or preparation in natural theology, its framework in the revealed and defined truths of religion, its roof or completion in their orderly presentation by the schoolmen, and its decoration in the countless services rendered by human reason to the entire process.

The Processes of Scholasticism.—The doctors of the schools wrote usually on two distinct lines. Sometimes they composed independent, original writings, and thus arose their sums of theology, their controverted and so-called quodlibetal questions. Again, they wrote commentaries on some favorite work, like the Bible, the pseudo-Areopagite, Boethius, Peter Lombard, or Aristotle. In either case they usually divided their subject-matter into parts, which were in turn subdivided into questions and articles—the bulk of the doctrine being always given in the latter, and the outlines furnished by the titles or theses placed at the head of each division and subdivision. Each article opened with a series of formal objections, after which the doctrine, theological or philosophical, was stated, and the sufficient grounds for it assigned, whereupon the answers to the objections followed. Clear statement, compressed sentences, close dialectic reasoning, frequent fine distinction, and a sharp insistence upon the point at issue mark these brief treatises of theology, which were as pleasing to the mediæval mind as the dialogue was to that of the Greek. There is in the writings of the best of the schoolmen a magnificent play of reason, which recoils before no difficulty, reminding us often of certain wonderful feats of skill that the contemporary architects successfully attempted. Before them there had been theologians without number, and scarcely a point in theology had been left untouched. But they created the *science* of theology; they impressed the most rational of philosophies into its service; they mapped out all the multiplex relations between God and man, and in all this they preserved a certain free and speculative spirit, with minds turned habitually toward investigation, and, within certain limits, filled with an insatiable curiosity.

History of Scholasticism.—The origins of this method or system are not to be found in a sudden discovery and adaptation of the philosophy of Aristotle; they are as old and deep as those of other great phenomena of the time. The philosophy of Aristotle had been handed down through Boethius, and that of Plato through the pseudo-Areopagite. Ecclesiastical science had found numberless exponents, from Bede and Isidore of Seville down to the meager annalists and collectors of canons in the darkest years of the tenth century. The rational and scientific presentation of theological truths had been happily performed by many writers long previous to the rise of what is known as scholasticism. Usually, however, its history is said to begin with St. Anselm of Canterbury (1033–1109), in whose *Monologium* the outlines of the scholastic dialectic method are distinctly visible. Abelard, William of Champeaux, Roscelin, Peter Lombard, the Blessed Albert the Great, St. Thomas Aquinas, St. Bonaventure, and Duns Scotus mark its progress to the end of the thirteenth century, which was its real apogee, and in which its highest exponents were the Blessed Albert the Great, St. Thomas, and St. Bonaventure. Their theological systems are at once complete and grandiose, and awaken forever the astonishment of dispassionate students, for the keen, searching analysis of details, the regular proportions of the parts, and the successful boldness with which they are fitted together, and resist all antagonizing forces. Other great doctors of this brilliant period were Alanus of Lisle, Alexander of Hales, Henry of Gand, Richard Middleton, Peter of Poitiers, William of Paris, etc. From an early date, however, divergent currents and tendencies, arising from various sources, made themselves visible. Thus the Dominicans and Franciscans represented opposing views in theology and philosophy, and again within each great body there were fresh clefts. The second period of scholasticism covers the fourteenth and fifteenth centuries, and is marked by a tendency on the one hand to free philosophy and the other sciences from their ancillary dependence on theology, and on the other to gather from the latter all possible benefit for the practical, ascetic, spiritual needs of the soul, as opposed to the purely scientific satisfaction of the intellect. Thus the differentiation of the sciences (Roger Bacon, Raymond Lull) and the growth of mystical theology as a specific branch (Master Eckhart, Tauler, Suso, Ruysbroeck, Thomas à Kempis, the "German Theology") divide with theology proper the interest of students in this second age. It was inevitable that the succession of men like St. Thomas and St. Bonaventure should fall upon weaker shoulders, and several other circumstances combined to hasten the decline of the great intellectual movement of the thirteenth century. The Western Schism, the Franciscan controversies, and the political changes drew men's minds more to practical immediate interests, and the cultivation of dogmatic philosophy and theology was neglected for moral and legal questions. It is the age of the moralists and jurists, of the commentators on the law of the Church, and the civil law. Durandus, Occam, Pierre d'Ailly, Gerson, Capreolus, Denys le Chartreux, Gabriel Biel, and Thomas of Strassburg represent this later and weaker stage of scholasticism, previous to the Reformation.

Neo-scholasticism.—As the theology and philosophy of the mediæval schools were not a sudden and foreign importation, but the natural outgrowth of the previous literary movement, so the true Catholic theology and philosophy of

to-day are the legitimate heirs of the best thinkers of the scholastic period, and represent, both in spirit and in method, what was most durable and efficient in the great productions of the schoolmen. The needs of polemic warfare and the external vicissitudes of the schools and universities of the Catholic world brought about deviations, changes, and modifications more or less novel and alien to the old traditions. But during the nineteenth century there has been a steady return to the latter on the part of Catholic theologians and philosophers, culminating in the encyclical letter of Leo XIII., *Pastor Æternus*. This is known as *Neo-scholasticism*—not that it is different from the ancient, but that it takes account of all true and stable modern progress, and combines it with the fundamental and general teachings, and with the spirit, methods, and principles of the old scholasticism, as personified in St. Thomas Aquinas, the "angel of the schools." Its influence is felt daily more and more in all Catholic universities and schools, in textbooks, reviews, and newspapers, and in the great issues of political and social life; and it certainly stands for much in the improvement of the mutual relations between the Church and modern society. There are several academies and reviews, notably at Rome and Louvain, devoted to the work of popularizing this movement, to which Leo XIII. has contributed more, perhaps, than any pope in the last six hundred years, and whose beneficent possibilities are visible in his own personal character, as well as in his religious and politico-social activity.

LITERATURE.—The entire works of the scholastics are not to be had in any complete collection. The most accessible is St. Thomas, whose works can be procured in many cheap and portable editions. Consult in general the histories of philosophy, and in particular Haureau, *Histoire de la Scholastique*; Schneid, *Aristoteles und die Scholastik*; Talamo, *L'Aristotelismo nella Scolastica*; Cousin, *Cours de l'Histoire de la Philosophie*; Stöckl, *Philosophie des Mittelalters*; Denifle, *Die Universitäten des Mittelalters*; Vaughan, *Life of St. Thomas Aquinas*; Ozanam, *Dante et la Philosophie Catholique*; Wetzer and Welte, *Kirchenlexicon*, art. *Scholastik*; Leo XIII. encyclical, *Pastor Æternus* (1879).

J. J. KEANE.

Schöll, MAXIMILIAN SAMSON FRIEDRICH: historical writer; b. at Harskirchen, Hesse-Nassau, May 8, 1766; studied at Strassburg; traveled as tutor with a Livonian family (1788–90) in Italy, France, and Russia; attempted different occupations until in 1814 he received employment in the Prussian diplomatic corps; was employed as secretary at various legations and congresses. D. in Paris, Aug. 6, 1833. His literary activity was very comprehensive; the most remarkable of his works are *Cours d'Histoire* (46 vols., 1830–36); *Archives politiques ou diplomatiques* (3 vols., 1818); *Pièces relatives au Congrès de Vienne* (6 vols., 1816); *Pièces officielles destinées à détromper les Français, etc.* (9 vols., 1814); *Hist. de la Litt. grecque* (8 vols., 1823–25); *Hist. de la Litt. romaine* (4 vols., 1815).

Scholten, skōl'ten, JAN HENDRIK, D. D.: theologian; b. at Vlenter, near Utrecht, Netherlands, Aug. 17, 1811; studied theology and philosophy at the University of Utrecht; appointed Professor of Theology in 1843 at the University of Leyden, and became the founder and leader of a liberal movement in Dutch theology called "the modern theology," which attracted much attention, not only in the Netherlands, but also in Germany and France. It was briefly extreme rationalism. The supernatural was entirely rejected and Christ was considered a mere man. He retired on a pension in 1881, and died at Leyden, Apr. 10, 1885. His principal writings, mostly translated into German and French, are *De leer der hervormde kerk in hare grondbeginselen* (2 vols., 1848–50; 4th ed. 1861); *Geschiedenis der Godsdienst en wijsbegeerte* (1853; 3d ed. 1863); *De vrije wil* (1857); *Het evangelie naar Johannes* (1864); *De oudste getuigenissen aangaande de schriften des Nieuwen Testaments* (1866); *Afscheidsrede bij het neerleggen van het hoogleeraarsambt* (1881, his retiring address, in which he reviews his theological career); *Historisch-critische Bijdragen naar Aanleiding van de nieuwste Hypothese aangaande Jezus en den Paulus der vier Hoofdbrieven* (1882).

Schö'mann, GEORG FRIEDRICH: Greek scholar; b. at Stralsund, Germany, June 28, 1793; professor and librarian at the University of Greifswald from 1823 till his death Mar. 25, 1879. His chief works are *Der attische Process* (2 vols., re-edited by Lipsius, 1887) and the *Griechische Alterthümer* (2 vols.; 3d ed. 1873, translated into English by E. G. Hardy and F. S. Mann, London, 1880, and into French by C. Galuski, 1887), both standard works on the subject; *Die Lehre von den Redetheilen bei den Alten* (1862); and editions of Isaeus; Plutarch's *Agis et Cleomenes*; Cicero, *De natura deorum*; Hesiod's *Theogony*. His minor writings, distinguished no less for their brilliant Latin style than for their intrinsic value, are collected in his *Opuscula* (4 vols., 1871). See Bursian's *Biographisches Jahrbuch*, ii., pp. 7 ff.

ALFRED GUDEMAN.

Schom'berg, FREDERICK HERMANN, Duke of: soldier; b. at Heidelberg, Germany, about 1616; served in the army of the United Provinces, afterward in the French army, where he acquired a great reputation as a strategist and tactician; held important commands in Portugal during the war of liberation, and compelled Spain to recognize the independence of that country under the dynasty of Braganza (1668), for which he was made a grandee and received a handsome pension. He was again in the French service in Catalonia 1675, where he won the grade of marshal; was at Maestricht (1676) and Charleroi (1677); left France on the revocation of the Edict of Nantes 1685; and after rendering his services for a short time to the Elector of Brandenburg was appointed by William, Prince of Orange, his second in command in the expedition to England 1688; was made Duke of Schomberg in the English peerage, Knight of the Garter, and master of the ordnance 1689; received from Parliament a grant of £100,000; took a leading part in the expedition against Ireland, and was killed at the battle of the Boyne, July 12, 1690. His brother and son succeeded to his honors and estates, but the title became extinct in 1719.

F. M. COLBY.

Schom'burgk, Sir ROBERT HERMANN, Ph. D.: traveler; b. at Freiburg-on-the-Unstrut, Prussia, June 5, 1804; resided, engaged in mercantile pursuits, at Leipzig 1823, afterward in Virginia as partner in a tobacco-factory, in which business he experienced pecuniary losses; settled in the island of St. Thomas in the West Indies 1829; devoted himself to botany and natural history; made a scientific examination of Anegada, one of the Virgin islands, 1830, on which he prepared a report which procured him the patronage of the Royal Geographical Society; spent four years in the exploration of British Guiana, where he discovered the great water-lily named by him *Victoria regia*; published a *Description of British Guiana, Geographical and Statistical* (1840), a series of *Views in the Interior of Guiana* (1840), *Researches in Guyana* (1840), and several reports to the Royal Geographical Society, for which he received the gold medal of that body 1839, and which were translated into German by his brother Otto, and published at Berlin with a preface by A. Humboldt (1841); was at the head of the commission for surveying the frontier between British Guiana and Brazil 1841–44; published the *Natural History of the Fishes of Guiana* (2 vols., 1841–43); was knighted 1845; published a *History of Barbadoes* (1847) and *The Discovery of the Empire of Guiana by Sir Walter Raleigh* (1848); was British consul and *chargé d'affaires* in the Dominican Republic 1848–57, and consul-general in Siam 1857–64. D. at Schöneberg, near Berlin, Mar. 11, 1865.—His brother, MORITZ RICHARD, took part in the second exploration of Guiana, of which he published an account in German (3 vols., 1847–48); translated some of the works of Sir Robert into German; went to Australia 1849; and has been since 1865 director of the botanical garden at Adelaide.

Revised by M. W. HARRINGTON.

Schön'bein, CHRISTIAN FRIEDRICH: chemist; b. at Metzingen, Würtemberg, Oct. 18, 1799; studied natural science at Tübingen and Erlangen; was appointed Professor of Chemistry at Basel in 1828; discovered ozone in 1839; invented guncotton in 1845. D. at Baden-Baden, Aug. 29, 1868. His principal works are *Das Verhalten des Eisens zum Sauerstoff* (1837); *Beiträge zur physikalischen Chemie* (1844); *Ueber die Erzeugung des Ozons* (1844); *Ueber die langsame und rasche Verbrennung der Körper in atmosphärischer Luft* (1845). Hagenbach wrote his *Life* (1869).

Revised by IRA REMSEN.

Schön'brunn: an imperial palace situated a few miles from Vienna, on the river Wien, built in 1744 by Maria Theresa. It contains 1,441 rooms, among which are several magnificent state-rooms, and is surrounded with a large park, containing a botanical garden, a menagerie, etc. The palace is generally inhabited by the imperial family during parts of the summer. The Peace of Vienna was signed here Oct. 14, 1809.

Schö'nebeck: town; in the province of Saxony, Prussia: on the Elbe; 9 miles by rail S. of Magdeburg (see map of German Empire, ref. 4–F). It has large salt-works, breweries, and distilleries, and manufactures of powder, chemicals, soap, white lead, and vinegar. Pop. (1895) 14,881.

Schöncfeld, Henry: See the Appendix.

Schön'feld, Edward: astronomer; b. in Hillburghausen, Saxe-Meiningen, Germany, Dec. 22, 1828; became an assistant to Argelander at the University of Bonn, where he took an active part in cataloguing all the stars of the northern hemisphere, down to the ninth magnitude. In 1875 he succeeded Argelander as director of the Bonn Observatory and Professor of Astronomy. In 1869 he received the Watson medal from the National Academy of Sciences in Washington for his work in cataloguing the stars. D. in Bonn, May 1, 1891. S. N.

Schoolcraft, Henry Rowe, LL. D.: ethnologist; b. at Watervliet (now Guilderland), N. Y., Mar. 28, 1793; studied at Union and Middlebury Colleges; devoted himself to a scientific study of the art of glass-making, his father being a manager of extensive glass-works; began the publication at Utica in 1817 of a work on *Vitreology*, which was left incomplete through lack of patronage; made a journey through the mineral regions of Southern Missouri and Arkansas in 1817–18, of which he published an account, *A View of the Lead-mines of Missouri* (New York, 1819); obtained from Secretary Calhoun in 1820 an appointment as geologist to an exploring expedition sent to the upper Mississippi and Lake Superior copper region, and published a *Journal* (1821); was in 1822 appointed Indian agent for the tribes of Lake Superior; was the principal founder of the Michigan Historical Society (1828) and of the Algic Society of Detroit (1831); was at the head of a scientific expedition which in 1832 explored for the first time Lake Itasca and the sources of the Mississippi; negotiated in 1836 a treaty by which the U. S. purchased from the Chippewas a tract of 16,000,000 acres on the upper lakes, after which he became superintendent of Indian affairs for the northern department, and in 1839 chief disbursing agent for the same department; published *Algic Researches* (2 vols., 1839), a collection of Indian tales and legends; removed to New York 1841; issued the prospectus of an *Indian Cyclopædia* (1842), afterward carried into effect in another form; superintended at Washington the publication of a series of reports on all the Indian tribes of the U. S. (6 vols., illustrated. Philadelphia, 1851–57). D. at Washington, D. C., Dec. 10, 1864. Among his numerous publications were a *Narrative of an Expedition to Itasca Lake, the Actual Source of the Mississippi* (1834; reissued in 1853); *Oneota, or Characteristics of the Red Race of America* (New York, 1844); *Notes on the Iroquois* (Albany, 1848); *Personal Memoirs of a Residence of Thirty Years with the Indian Tribes* (Philadelphia, 1851); and *Scenes and Adventures in the Semi-Alpine Regions of the Ozark Mountains* (1853).

School Diseases: See the Appendix.

School Gardens: See the Appendix.

School Hygiene: See the Appendix.

School Laws: See the Appendix.

Schoolmen: those philosophers of the Middle Ages whose labors were directed chiefly to adjusting the relations of the Christian religion to philosophy. See Philosophy (*History of Philosophy*), Nominalists, Realism, and Scholasticism.

Schools: collections of persons brought together and duly organized for the purpose of imparting and receiving instruction. The word school is commonly applied to an organization intended to provide elementary, secondary, or professional instruction, and not to an institution designed to offer exclusively non-professional studies of college or university grade. Thus we have elementary schools, secondary schools, normal schools, trade schools, theological schools, law schools, and medical schools, each group of which is treated below. See also Agricultural College, College, Common Schools, Kindergarten, Manual Training, Military Academies, University, etc.

I. Historical Development of Schools.

The Orient.—In India schools for the instruction of boys have existed from time immemorial. These were held in the open country, under the shade of trees, or, in case of bad weather, under primitive roofs. Exercises were first performed on the sand, then on palm-leaves with a stylus, and finally with ink. Among the Israelites great care was taken to instruct the children, but until the Christian era, so far as is known, such instruction was limited to the family. In the year 64 A. D., however, the high priest Gamala decreed that each town should support a school under pain of excommunication. As given in the Talmud, if the number of children did not exceed 25, the school should be conducted by one teacher; if more than 25 and less than 40, there should be an assistant; if more than 40, there should be two masters. The Talmud describes in detail the duties of the teacher and the obligations of the pupil, showing conclusively that great reliance was placed by the Jews upon the effects of the training effected by the schools. Corporal punishment was tolerated only for children above the age of eleven. "After the age of six receive the child and load him like an ox." "Children should be punished with one hand and caressed with two." In case of disobedience the pupil might be deprived of food and even "struck with a strap of shoe-leather." In China the necessity of the most thorough provision for schools was inculcated by Confucius. The philosophy of the country demanded the most complete knowledge possible of the methods and characteristics of the fathers. To this end the provisions for education were systematic and universal. Huc, the famous missionary and traveler, declares that of all countries it is in China that primary instruction is most widely diffused, and another missionary asserts that "there is not a village so miserable, nor a hamlet so unpretending, as not to be provided with a school." When Japan adopted Chinese civilization, it adopted the Chinese school system, which continued until the opening of the country to European and American influences. In 1872 a law was passed providing for an elementary school for every 600 of the population. This law has been very generally carried out, and the benefits derived from it have been very great. In Egypt intellectual culture reached a very high point, but education was confined almost exclusively to the priestly caste, which guarded jealously all the sources of knowledge. Here, therefore, as in the other contemporaneous nations, schools were only imperfectly developed.

Greece.—The necessity of education in the most comprehensive sense was universally recognized among the Greeks; but schools were private and not subject to governmental supervision. The Athenian lad was put under a pedagogue (a conductor of boys, usually a slave), who took him at an early age to a *palestra* or primary school. Here the boy was taught gymnastics, reading, writing, mythology, and especially music. Homer was universally the boy's reading-book. From the *palestra* the pedagogue took his pupil to the gymnasium or secondary school. Here, as in the *palestra*, special attention was given to music, as a means of inspiring the soul with a love of harmony and order. Grammar and rhetoric were also taught. From the gymnasium the pupils either betook themselves to their several vocations or, in case of special ambitions, continued their studies in the schools of the sophists or under personal private instruction. It was to such pupils that Socrates, Plato, and Aristotle gave instruction. In the *Republic* and the *Laws* of Plato and the *Politics* of Aristotle the Greek ideas of education are set forth. The prevailing thought was the harmonious development of all the powers of the pupil, physical, mental, and moral. In Sparta education was regarded as equally important, but here special stress was placed upon the training of men physically for military duty.

Rome.—With the Romans education manifested two somewhat distinct types. During the republic it inclined to the Spartan, during the empire to the Athenian. Before the second Punic war no provision was made for schools, but education was limited to the care of the family. Under this system a severe family discipline, coupled with the Roman ideals as to the civic and military virtues, succeeded in developing a remarkable race of men. With the introduction of a taste for Greek arts and literature in the third century B. C. the era of severe simplicity gradually gave way to new ideals. Schools of philosophers and rhetoricians came into existence, and the younger children were intrusted, as in Athens, to the care of pedagogues. But even under the empire education was not taken up as an affair of the state; each teacher followed his own method. Varro wrote on grammar, rhetoric, history, and geometry, and his works had much influence for several generations. Of more importance were the *Institutes of Oratory* by Quintilian, who gives a detailed account of the ideal education of an orator from the earliest childhood to manhood.

Middle Ages.—During the period of the invasions the pre-

vailing turbulence made the establishment of schools impossible. Even the Christian Fathers were divided in their opinions as to the influence of a comprehensive education. Tertullian rejected all pagan learning, and St. Augustine, after his conversion, renounced his taste for classical poetry and eloquence. St. Basil, on the other hand, recommended that young Christians become familiar with the orators, poets, and historians of antiquity; and St. Jerome wrote a treatise on the education of girls which has elicited warm commendation. But the ideas of the time were monastic in their nature, and early monasticism was unfavorable to the establishment of schools of any kind. Here and there groups of young Christians, aspiring to the priesthood, gathered around the priest for instruction, but these were scarcely worthy the name of schools. Sidonius Apollinaris, writing in the fifth century, says: "Teachers no longer have pupils, and learning languishes and dies." It was not till the age of Charlemagne that an attempt was made to provide for systematic instruction. This great ruler not only established a kind of itinerant school, which followed the king on his travels, with Alcuin at its head, but he decreed the establishment of schools in various parts of his domain. Nothing gives a more depressing picture of the intellectual feebleness of the time than the description of the methods of instruction contained in Einhard's *Vita Caroli Magni*. (See Guizot, *History of Civilization in France*, lect. xxii.) Thus, notwithstanding the enlightened efforts of Alcuin, who has aptly been called the first minister of education in France, neither the clergy nor the people by their intelligence or their appreciation responded to the efforts that were put forth. No one of Charlemagne's successors took up his thought, and the Council of Aix-la-Chapelle, in 817, decided that no more day-pupils should be admitted to the conventual schools. It was not till the twelfth century that SCHOLASTICISM (*q. v.*), by the introduction of the Aristotelian processes of reasoning, awakened some intellectual activity. But even this was chiefly a mental gymnastic, and gave distorted views of all the affairs and relations of life. The fact that Abelard by the renown of his eloquence could gather about him in Paris thousands of students shows that there was an interest in learning, which, under wise, inspiring, and systematic guidance, might perhaps have accomplished important results. But no such guidance was at hand. It is not till that general awakening called the Renaissance that schools of any considerable importance were established. There were, it is true, ecclesiastical schools for the education of priests, but their methods were crude and their results narrow and distorted. In 1363 choirs and benches were forbidden, because they encouraged pride. The rod was freely used. "Day and night," wrote an abbot to Anselm, "we do not cease to chastise the children, but they grow worse and worse." "In the fifteenth century," says Monteil, in describing the schools, "the rods are twice as long as those in the fourteenth." But it would be erroneous to suppose that the conditions generally prevalent in Europe were universal. On the contrary, after the rise of Mohammedanism in the seventh century, schools were established in all the principal cities in the East as well as in the West. The most celebrated were at Bagdad, Damascus, Cordova, Salamanca, and Toledo. Here grammar, philosophy, chemistry, medicine, and the various branches of mathematics were studied with great success. They gave algebra and trigonometry their modern forms, determined the size of the earth by measuring a degree, made a catalogue of stars, invented the pendulum clock, and discovered alcohol, as well as nitric and sulphuric acids. Their schools were largely attended by the most enterprising and aspiring youth of the other countries of Europe, and their influence was considerable in awakening the thought which led to the Renaissance.

The Revival of Learning.—It is of importance to note that the first general intellectual movement of modern Europe was through the universities. Cambridge, Oxford, Bologna, Salerno, Naples, Paris, Prague, Vienna, and Heidelberg were established before the beginning of the fifteenth century. The moral and intellectual tone of the universities was low, but their influence in behalf of learning soon made itself felt. Students had special halls or colleges in which they lodged and boarded under official superintendence. At first the universities were free associations, but they were soon recognized as elements of power by the Church and the rulers, and soon received special privileges. Before the end of the twelfth century contemporary authorities assert that at the University of Bologna there were 12,000 students and a little later that at Paris there were 20,000. These were grouped into four faculties—those of theology, philosophy, law, and medicine, the classification which is still prevalent in Germany. During this period schools were greatly assisted by the writings of the most enlightened teachers. Besides Abelard (1079–1142), Gerson, chancellor of the University of Paris (1363–1429), Vittorino da Feltre of Padua (1379–1446), and Æneas Silvius, afterward Pope Pius II. (1458–64), contributed greatly to improve the methods and spirit of instruction. In the secondary schools, which were mostly conventual, "the seven liberal arts"—viz., Latin, grammar, dialectics, rhetoric, music, arithmetic, geometry, and astronomy—were regularly, though not very efficiently, taught.

The Reformation.—The great religious upheaval of the sixteenth century was heralded by a number of eminent teachers and patrons of learning. Manuel Chrysoloras collected a vast number of Greek MSS. and introduced them into Italy. Pope Nicholas V. founded the Vatican Library and made Rome the center of learning. Agricola not only transplanted the spirit of letters from Italy to Germany, but gave most valuable advice to those engaged in establishing schools. To the authorities at Antwerp inquiring for a head master, he wrote: "Take neither a theologian nor a rhetorician, but one who knows how to teach, to speak, and to act at the same time. If you know such a man get him at any price." Reuchlin created great enthusiasm for the study of Hebrew, and Erasmus performed a still higher service in behalf of Greek and of polite learning in general. The impulse thus given was carried on by Luther, whose doctrine of justification by faith alone transferred from the Church to the individual the responsibility of saving knowledge. The logical result was a great movement in behalf of the means by which individual knowledge could be increased. Luther not only advocated the establishment of schools everywhere, but he gave important advice in regard to their organization and improvement. His teachings wrought a veritable revolution. He pushed forward the art of giving instruction, and provided for special instruction of the best scholars to fit them for the work of teachers. While he put great stress on the study of theology, and gave a very prominent place to studies in Greek, Latin, and Hebrew, he recommended mathematics and history. He made the support of the schools a charge upon the public treasury, and placed upon the parents the moral obligation to send their children to school. Perhaps the most important of all was the fact that he insisted upon an absolute emancipation from the old spirit of exclusiveness, for it was in this emancipation that the revolution really consisted. The gist of his teachings in this respect was contained in these words: "The monks have imprisoned young men like birds in a cage. It is dangerous to isolate the young. It is necessary, on the contrary, to allow young people to hear, see, and learn all sorts of things, while all the time observing the restraints and the rules of honor." This new spirit became the fundamental idea of education in Germany, and it exerted a vast influence in giving German schools of all grades the pre-eminence they have ever since maintained. These fundamental propositions were given definiteness of form two generations later by the great father of educational organization, Comenius. Michelet calls him "the first evangelist of modern pedagogy—Pestalozzi being the second." His particular service was in giving exactness to different grades of instruction, in defining the most important laws in the art of teaching, in determining how elementary instruction should be conducted, and in applying to all grades of teaching the laws of modern logic. The classification of studies outlined in his different works, of which there were twenty volumes, was essentially the same as that generally adopted at the present day by the best schools of Europe and America. While the work of Comenius was going on in Germany, England, and Sweden, other efforts were put forth in different parts of Europe. In Geneva the ecclesiastical policy of Calvin provided for the establishment of schools and teachers. Melanchthon drew up the "Saxony plan," which was long the basis of organization in many parts of Germany. In Strassburg the school of John Sturm became so famous that it was sought by pupils from all parts of Europe. In all Roman Catholic countries schools were organized in the most thorough manner under the direction of the Jesuits. The foundation of all the Jesuit schools was the study of the classics, but they taught also philosophy, ethics, mathematics, and history. At the beginning

of the eighteenth century the fame of the Jesuits as teachers had become so great that they had been called upon to establish schools in every part of the world. In 1710 they were reported to have 612 colleges, 157 schools for the education of teachers, and twenty-four universities. The system proposed by Loyola in 1588, with the exception of some slight modification made in 1832, has remained unchanged to the present day. Thus far the organization of schools since the Reformation has been largely shaped either by individual teachers or by general religious considerations.

Germany.—From the time of Comenius until the nineteenth century the schools of Germany were multiplied, but there was no very radical change in the plan of organization. In 1715 A. H. Francke founded the first *Pedagogium*, or normal school for the training of teachers, and his organizing and inspiring power was such as to bring together more than 4,000 teachers and pupils in the institutions under his control. Methods were still further improved by Basedow and Rochow, and both Frederick the Great and Maria Theresa gave practical encouragement to the schools by declaring them entitled to the protection and care of the state. Even the eccentric Frederick William I. of Prussia published an edict of compulsory education. But notwithstanding all these efforts, the elementary schools remained in wretched condition throughout the eighteenth century. It was not till after the Napoleonic wars had shattered Prussia (see NAPOLEON I., *Jena Campaign*) that thoroughgoing reform took place. The methods recommended by PESTALOZZI and FROEBEL (*qq. v.*) were then generally applied in the elementary schools, and all grades of instruction were subjected to the most systematic and rigid revision, as well as state control and state superintendence. In a most solemn address to the German people, Frederick William III. recognized the great part that education must play if the nation was to be developed in internal power and splendor. Educational affairs of all grades were intrusted to a department of education, consisting of four of the most eminent professors of Germany, at the head of whom was Wilhelm von Humboldt. Order was soon evolved out of the chaotic conditions that formerly prevailed. After tentative orders in 1811 and 1812, a general statute was promulgated in 1816 constituting the fundamental school law of Prussia. Although this great ordinance was in some of its parts modified by the Prussian Code of 1854, and again by the Falk Laws of 1872, its general characteristics were those which have made the schools of Prussia the most famous in the world during nearly the whole of the nineteenth century. The organization may be briefly described as follows: Schools were classified in four general groups—primary schools, secondary schools, universities, and technical schools. In the fourth class the normal schools were to occupy the place of foremost importance. No teacher was to be employed who had not, after a severe course of pedagogical training, passed a rigid examination, not only in the matter to be taught, but also in the art of giving instruction. Pensions were provided for teachers honorably retired. The hours of instruction for pupils in the lowest grades are twenty-two per week; in the highest, thirty-two. In the elementary and secondary schools the work is strictly prescribed; in the universities there is absolute freedom. By the Falk Law of 1872 the middle school was specially adapted to commercial requirements. In Prussia, which may be regarded as the model, all the schools are under the immediate supervision of thirty-six district boards or committees. The laws compel an attendance of pupils from six to fourteen years of age, and in case of deficiency even a longer time. In Prussia, Saxony, and Bavaria, small fees may be exacted of each pupil, but in the other states elementary instruction is free. In all the German states the laws requiring compulsory attendance are enforced with rigor, and consequently the percentage of illiteracy is everywhere very small. The proportion of pupils who advance to the higher grades is very large. In Berlin, during the decade from 1881 to 1891, of the average of about 160,000 scholars in the public schools, about 9,000 were in the gymnasia, about 5,600 in the realschools of the first class, about 10,000 in the various trade and technical schools, and about 133,000 in the common schools. In Saxony, of 600,000 pupils, more than 11,000 were in schools of gymnasium grade. In all the states of Germany trade schools (see below) and schools of agriculture (see AGRICULTURAL COLLEGE) occupy a prominent place, and are generously supported.

France.—Before the Revolution the schools of France were for the most part under the direct or indirect control of the clergy. Napoleon saw the necessity of thorough and comprehensive reorganization. His method (see *Reforms during the Consulate* under NAPOLEON I.) was not fortunate. The organization of an educational hierarchy with the university at Paris as its head proved to be so unwieldy that the primary and secondary schools never acquired life or efficiency. While the Germans were demonstrating the success of local boards of control acting under a wisely framed general law, the French, on the contrary, were showing the inherent weakness of a system that took all power out of the hands of those who were most interested in success. The war of 1870 proved even to the French themselves the superiority of the German system. The law of 1881 provided for a thorough reorganization. The schools were classed under the terms superior, secondary, and primary, and all were placed under the supervision of a Minister of Instruction. Professors in the universities are paid by the state, as are also in part those of the *lycées*. The *collèges* are supported by departments or municipalities, with occasional endowment of chairs by the Government. The normal schools are mainly supported by the central Government, the primary schools mainly by local taxation; but in case of necessity a "supplementary subsidy" is furnished by the general Government for the better payment of teachers. In all the public schools primary education is gratuitous. Of the 4,520,928 children in school in 1891, 3,453,071 were in public schools, and 1,067,857 in schools under private management, but subject to governmental inspection. The system of technical and trade schools is very elaborate, and extends to nearly every vocation. Since 1881 the system of schools of all grades has been made one of the most thorough in Europe, though the French methods of instruction have not yet become equal to those of Germany.

Great Britain.—The schools of Great Britain have had a peculiar history. Before the Reformation there were few schools except those connected with monasteries and cathedrals. At the beginning of the sixteenth century sixteen grammar schools had been founded, and this number was increased by as many more during the reign of Henry VII., by 63 during the reign of Henry VIII., by 138 in the time of Elizabeth, and by 142 in the reign of the Stuarts. These schools, established under private endowments, were not subject to general governmental control. In the eighteenth century a considerable number of charity schools were founded, largely for the purpose of giving religious instruction. While the charity schools were open to both boys and girls, the grammar schools were open to boys alone. The wretched condition of the English schools in the eighteenth century is amply revealed by the writings of Joseph Lancaster and Andrew Bell. In 1808 the Royal Lancastrian Society and in 1811 the British and Foreign School Society were organized, but they accomplished little except to demonstrate the need of governmental assistance. In 1816 a select committee on the condition of schools was appointed, with Henry Brougham at its head; but its achievements were mostly limited to the dissemination of knowledge. It was not till 1832 that Parliament made its first appropriation of £20,000 for the erection of school-buildings. In 1835 and 1838 committees of inquiry were appointed, and in 1839 a committee of the privy council on education was established. The first fruits of this committee were the establishment of model schools and the appointment of inspectors of all aided schools. The system thus entered upon was rapidly developed, and in 1858, when the annual grants amounted to £830,000, a member of the privy council was raised virtually to the position of minister of education. The result was a revised code in 1862, which swept away many of the worst features and made the distribution of funds depend on the efficiency and standing of individual schools. In 1867 the royal commissioners reported that of 3,000 endowed schools, 782 had been designated in the articles of endowment as grammar schools and the others as charity schools. This law was violently opposed as too radical, but it was followed by the much more radical Education Acts of 1870 and 1871, with which the name of the Right Hon. William E. Forster is inseparably connected.

These memorable acts, which may be regarded as the corner-stone of the present English system of elementary education, may be summarized under the following heads: (1) That either by voluntary organization and effort, or by the compulsory establishment of school boards, the supply of elementary schools should be made sufficient for all the school districts in the kingdom. (2) That every such ele-

mentary school should be taught by properly qualified teachers, should conform to the general school laws, and should be subject to official inspection. (3) That in all public elementary schools whatever religious instruction is given shall be either at the beginning or at the end of school hours, so that the secular instruction may be uninterrupted. (4) That a time-table setting forth the hours at which instruction is to be given in each subject shall be displayed in every schoolroom. (5) That in schools managed by public school boards no catechism or other denominational creed shall be taught. (6) That the governmental inspectors are to inspect and report on all the schools receiving governmental aid.

Some of the most eminent of English men of letters have occupied the position of inspector, and their reports are of great educational value.

In the period of the Reformation John Knox advocated for Scotland a school for every parish, a college in every notable town, and the establishment of three universities. The outcome of the movement then begun was a school law in 1696 which, with those soon following it, was the basis of the system of parish schools that prevailed in Scotland until the law of 1870–71 was applied to Scotland in 1872. The parish schools were generally taught by scholarly men, and were among the most efficient schools in the kingdom, taking the pupils from the most elementary studies through those neeessary for admission to the university. In 1872 the parish schools became board schools, and subject to inspection as such.

In the other states of Europe the methods of Germany, France, and Great Britain have generally prevailed, with more or less important modifications.

The United States.—Edueation in the U. S. had its beginnings in New England. Harvard College was founded in 1636, and in 1647 a school law was enacted by Massachusetts which provided for the systematie establishment of primary and secondary schools. This earliest example of providing for education at public expense was soon imitated in other colonies. The Huguenots, the Dutch, the Cavaliers, as well as the Puritans, eaeh in their own way, made provisions for the education of their children. The first public school was established in New Amsterdam in 1633, the second in 1652. During the colonial period schools were everywhere developed by the individual colonies, and accordingly, when the Federal Constitution came to be adopted in 1789, the care of educational affairs was retained by the individual State governments. Massachusetts, in its constitution of 1780, proclaimed it as the "duty of magistrates and legislators to cherish the interests of public schools, grammar schools, colleges, and universities," and the example thus set, even before the adoption of the Federal Constitution, was very generally imitated by other States. When in 1787 the ordinance for the organization of the Northwest was adopted it contained the injunction, "Religion, morality, and knowledge being neeessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." Though the general Government under the Constitution is not charged with the eare of education, Congress has uniformly been actuated by the spirit embodied in this declaration. In 1787 provision was made for giving each State the sixteenth section (1 sq. mile) of every township for common-school purposes, and two townships (72 sq. miles) for the purposes of a university. By an act in 1841 sixteen of the newer States received each 500,000 acres of land for education; and in 1848 the thirty-sixth seetion was added to the sixteenth for common schools. In 1849, 1850, and 1860 large tracts of the public domains, known as swamp-lands, amounting to 62,428,413 acres, were given to Alabama, Arkansas, California, Florida, Illinois, Indiana, Iowa, Louisiana, Miehigan, Minnesota, Mississippi, Missouri, Ohio, and Wisconsin. In 1862 Congress gave to each State 30,000 acres for each of its members of Congress for the purpose of promoting industrial education, and supplementary aets were passed in 1889 and 1890. The amount of land given by Congress for educational purposes has amounted to about 150,000,000 aeres.

While Congress has thus encouraged education with a lavish hand, the details of edueational organization and method have been provided for by the individual States. Each has its own method, though there is general similarity. In New York a board of regents was established in 1784 to have general superintendence of the educational interests of the State, but until the adoption of the eonstitution of 1894 the efficiency of the board was crippled in various ways. In most of the States there is a superintendent of public instruction, whose duties are more or less comprehensive, as defined by constitutional or legislative provisions. In all the States a tax is levied for the support of the elementary schools. In some of the States a portion of the fund so received goes to the free high schools, but in all cases it is distributed in proportion either to the number of pupils in attendance, or to the number securing promotion.

The following table furnishes the most important statistics of public, private, and parochial schools in 1890:

SCHOOL STATISTICS IN THE UNITED STATES AND TERRITORIES, AS SHOWN BY THE CENSUS OF 1890.

STATES AND TERRITORIES GEOGRAPHICALLY GROUPED.	Number of pupils in public schools.	Number of pupils in private schools.	Number of pupils in parochial schools.	Per cent. of enrollment to population in 1890.	Per cent. of enrollment to population in 1880.

California	223,749	20,220	9,826	18·36	18·67

The most noteworthy feature of the above table is the fact that in all the older States the percentage of attendance in 1890 was considerably less than it had been in 1880. While in the older States of the East and North this tendeney seems generally manifest, in the South, on the other hand, there has been a marked improvement.

II. Primary Schools.

This term is here applied to those schools which are planned to furnish the elementary education necessary for citizenship and for the ordinary duties of life. Such schools are now almost universally supported by the state. In point of time, they occupy the children from about the sixth to the fourteenth year, or during the first eight years of a course of study, the kindergarten not being included. Where schools are graded this period is frequently divided in the U. S. into primary, intermediate, and grammar departments. The obligation of the state to provide instruction for all its children is a modern conception. In ante-Christian society education was largely a state concern, but it was confined exclusively to the more wealthy classes. From the time of Christ practically to the beginning of the nineteenth century, all elementary education was controlled by the Church. Occasionally the state intervened when a ruler more enlightened than his fellows took some step in advance. But the great achievements in this field have all been accomplished in the nineteenth century.

In Great Britain.—Until well into the nineteenth century primary or elementary education in England was practically left entirely to the care of the clergy of the Established Church. Parliament in 1832 for the first time voted money to aid in the building of schools. In 1846 money was first given for increasing the salaries of teachers; in 1853 grants began to be made according to the number of pupils in attendance; while in 1862 these grants were made to depend on the successful passing of examinations. The Elementary Education Act of 1870 as subsequently amended regulates elementary education in England and Wales, while the act of 1872 extended the system to Scotland. The central authority is a committee of council on education, the acting chief being the vice-president, who is a member of the cabinet. The local administrative unit is the district, to form which boroughs and parishes are grouped together. Each district has a school board, which may compel parents to send their children to school. Under this law, sufficient school accommodations must be provided in every district for all children between the ages of five and fourteen. The obligatory subjects of instruction are reading, writing, arithmetic, drawing for boys, and needlework for girls. Optional subjects are singing, geography, sciences, algebra, modern languages, cookery, and some others. Religious instruction is given. There are seven grades, and each pupil should pass one grade each year. After passing the fourth grade, the children may, if twelve years of age, leave school. This education became practically free only in 1891. The system of paying for results, or, in other words, giving grants in proportion to the number of examinations passed, still prevails, and with all its faults seems to have a strong hold. The schools are local or denominational institutions. The state aids them, but does not manage them. The managers of any schools may cut loose from the governmental connection at any time, the state's rights to supervision being based solely on its contributions to financial resources. The business of inspectors is solely to ascertain and report on the efficiency of the schools. Probably in no country is there so large local independence and power to adapt the school to the needs of the country as in Great Britain.

The schools of Scotland have long been famous. Here from 1695 to 1872 elementary education was regulated by the act of James VI., which ordained that every parish should have a school supported by revenues derived from the land, the teachers being appointed by the heritors and the presbytery of the Established Church. By the Elementary Education Act of 1872 the Scotch education department was instituted, and each borough and parish, or group of parishes, was required to have a school board to administer both elementary and secondary education and to enforce the attendance of children from five to fourteen years of age. In Ireland, since 1845, elementary education has been under the superintendence of the commissioners of national education in Ireland. Of these national schools there were in 1893 8,459, having on their rolls 832,545 of the 939,694 children of school age.

In Germany.—The school laws of Prussia are, with slight modifications, the standard in all the German states. Thorough organization of the school system dates from the prostration of Prussia after her crushing defeat by Napoleon. The reform in education undertaken under the leadership of von Humboldt began first with the university, then extended to the secondary schools, and presently primary schools felt the same impulse. Since 1816 Prussian common schools have been usually considered the best in the world. The attendance on the schools is compulsory. The law of 1888 provided for making instruction free. About 18 per cent. of the cost of the schools is borne by the state and the rest by the community. The minister of ecclesiastical, educational, and medical affairs, a member of the cabinet, is the head of all the educational institutions of the kingdom. The course of study is prescribed in general outlines by the central Government, and the appointment of teachers must be approved by the Government. The course of study in the elementary schools includes religion, reading, writing, arithmetic, geography, singing, drawing, natural history, and history of man. Needlework and household economy is taught to the girls. Instruction in natural history, natural science, and history of man is entirely oral. Physical exercises are prescribed, and every school is provided with suitable apparatus. Industrial education for girls consists of knitting, crocheting, embroidering, sewing, darning, cutting, fitting, and patching, and is found in every school. The study of arithmetic is less extensive than in the U. S. Vocal music is continued through the entire course. The school hours are usually six a day. Schoolrooms are apt to be small and overcrowded. The school year consists of forty-five weeks, with six or seven weeks of vacation. Legal holidays are more frequent than in the U. S. Lessons usually last from forty to fifty minutes. Examinations are comparatively rare, are usually oral, and are conducted in the presence of parents and friends. In Germany, students who are to take a secondary course, as a rule leave the common schools and enter the secondary schools at the age of nine or ten.

In France.—The educational reorganization of France dates from the Franco-German war. School management is completely centralized. This was done originally by Napoleon in constituting the University of France. Since 1850 the central school organization has not been officially called university, though in common usage it still is. Previous to 1870 only one important effort had been made looking toward the education of the people. This was the passage in 1833 of Guizot's laws which imposed upon the commune the obligation of establishing primary schools. The law was not well executed. Jules Simon declared that it was the German schoolmaster that conquered at Sedan. As in Prussia after Jena, so in France in 1871 it began to be felt that the school was to be the instrument of national regeneration. The law of 1878 created a fund of 23,000,000 francs for the purpose of establishing necessary schoolhouses. The law of June 16, 1881, made instruction obligatory, that of Mar. 28, 1882, made it gratuitous, and that of Oct. 30, 1886, reorganized education, and declared that within a certain period all public schools should be under the charge of laymen. In 1857 France devoted to primary instruction the sum of 16,523,969 francs; in 1891, 173,372,524 francs; and in no modern country has the advancement in educational lines been so great and so rapid. The course of study for primary schools prescribed by the law of Mar., 1882, comprises moral and civic instruction, reading, writing, the elements of arithmetic and the metric system, history and geography, especially of France, object-lessons and the first notions of science, elements of design, of singing, manual work, needlework in the school for girls, gymnastic exercises, and in the school for boys military training. In the superior primary schools this course is much extended.

In the United States.—The school organization of the U. S. shows a general adherence to a certain type, with infinite variety in details. The great local differences work more to the disadvantage of the pupil than they would in Europe, since the people of the U. S. are proverbially migratory, and change of schools, with consequent loss of time, is very common. The success of primary schools is determined by (*a*) the intensity of public interest, (*b*) the thoroughness and comprehensiveness of organization and supervision, and (*c*) the aptitude and training of teachers. There is a general disposition on the part of the people to appro-

priate money freely for the support of the common schools. The instruction is everywhere gratuitous, the teachers are laymen or women, and progress is making in the direction of compulsory attendance; more or less satisfactory laws of this character already exist in over half the States and Territories, the most common age for required attendance being from eight to fourteen. Fairly successful efforts have been put forth, especially in the West, to introduce science teaching in the elementary schools. Opportunities for professional training for teachers are still sadly inadequate. Supervisory and administrative offices are political in their nature, making frequent change inevitable in most localities. There are also, as a rule, too few supervisory officers. Many experienced observers are of the opinion that the children in the schools of the U. S. are in attainments behind those of the same age in the leading countries of Europe. A comparison of the school work in Great Britain, France, and Germany, as given above, with the system in the U. S. will show where lie the differences. As the general government has no control over the schools, the U. S. Bureau of Education being charged solely with the function of collecting and disseminating information, the school system of each State must be studied by itself. The differences that appear in such a study are very great.

C. H. THURBER.

III. SECONDARY SCHOOLS.

Scope.—In the U. S., what is known as secondary instruction technically means the ninth to the twelfth years of the course of study, inclusive, or from about the fourteenth to the eighteenth years of life. The classification into primary, secondary, and higher education has been distinctly recognized only in the nineteenth century, but as early as 500 B. C. the Greeks had divisions in the education of their youth which corresponded fairly well to the three classes of modern times. As a term of general application, then, secondary education covers the intermediate of the three periods in the complete educational plan. In the countries of the Old World its range has been fixed with tolerable definiteness, but in the U. S. the limits both of higher and of primary education are constantly shifting, thus making the secondary sphere rather indeterminate. The U. S. Bureau of Education has selected from the forty or more studies taught in different secondary schools in the U. S. the following as typical secondary-school studies: Latin, Greek, French, German, algebra, geometry, trigonometry, physics, chemistry, history (other than U. S.), rhetoric, English literature, and geology.

In Germany.—With the exception of Great Britain, and to a less extent France, all the European countries have modeled their course largely after the German pattern. The typical German institution of secondary education is the gymnasium. This name came into use as early as the sixteenth century, and in 1812 a ministerial decree ordered that all learned school institutions, such as the lyceum, pedagogium, collegium, Latin schools, etc., should henceforth be called by that name. It has properly six classes, counted upward from the sixth, the lowest, and called sexta, quinta, quarta, tertia, secunda, and prima. In each of the three lower classes the course is one year; in each of the three upper it is two years, making the entire course nine years. There are two terms, or semesters, and generally two corresponding sections in each class, one section comprising the scholars who enter at Easter, and the other those who enter at Michaelmas. The class-system, as opposed to the system of instruction in each subject by specialists (*Fachlehrer*), prevails generally. The course is thorough, and the attainments of the students at graduation correspond in a general way to the attainments of American students at the beginning of the junior year in the best colleges. In 1892 a new programme was adopted for these schools, which is here given:

PROGRAMME OF GERMAN GYMNASIUM.

SUBJECTS.	VI.	V.	IV.	IIIB.	IIIA.	IIB.	IIA.	IB.	IA.	Total.

Totals	23	21	26	28	28	30	30	30	30	246

Attention is called to the provision for religious instruction in Germany, and to the great number of periods—thirty in the upper classes—required of students. Side by side with the gymnasium exist the realgymnasium and realschool, the former having Latin and no Greek, and the latter neither Greek nor Latin. These three institutions correspond in plan and purpose fairly well to the classical, Latin-scientific, and English courses which are found in the U. S. side by side in the same high school. The way to any high position in the army, in the Government service, and in all professional lines in Prussia is through some one of the higher schools. The right to one year voluntary military service, instead of the three years required of the uneducated, is one which belongs to every German youth who completes six years of the course in any one of the three higher schools. Graduates of the gymnasium are admitted to the universities, and to the study of any of the learned professions, as well as to the practice of teaching in all its branches. Graduates of the realgymnasium are excluded from the learned professions, and may study only with the philosophical faculty of the university, and may become teachers only in mathematics and modern languages, and are then eligible for positions only in realschools. The realschools qualify for admission to the technical high schools. Teachers in the gymnasium must be graduates of a gymnasium, who have attended a university three years, passed a severe Government examination, and taught then on trial for two years. There is an ascending salary-scale for length of service. At the age of sixty-five, teachers are entitled to a pension.

In France.—In France the system of education has been entirely reorganized since the disasters of 1870–71. Secondary education is cared for by the *lycées* and communal colleges. Of these the representative establishments are the *lycées.* Pupils enter at eight years of age, and are expected to spend a year in each class, completing their course at eighteen. The discipline is rigid and rather mechanical. Both communal colleges and *lycées* have boarding-departments. The scope of the instruction given is not materially different from the German standard.

In Great Britain.—In Great Britain there is no secondary education at the expense of the state, and for the great mass of children who go through the elementary schools there is no further opportunity, except in the numerous grammar schools and academies, both endowed and private, which are found there, but over which the Government has no direct control. The great public schools of England correspond to the best and most expensive private endowed schools in the U. S. All are boarding-schools, with their own traditions and customs. Nine of these schools have been distinguished by special commission as particularly the public schools, although there are forty or more. Two of these nine are day schools. The others, which are incontestably public schools, are, with the dates of their foundation—Winchester, 1387; Eton, 1440; Shrewsbury, 1551; Westminster, 1560; Rugby, 1567; Harrow, 1571; Charterhouse, 1609. These schools are for the most part well endowed. Eton, for example, has an annual income of some £30,000.

In the United States.—The earliest representative of the secondary schools in the U. S. was the academy, which flourished in New England and New York. At the close of the eighteenth century New York had nineteen of these schools and Massachusetts about an equal number. They were to be found in almost every State, and were the characteristic educational agency of the period. Their course, not planned solely with reference to preparing for college, was frequently followed by a college education, but more often not. Of these schools the Boston Latin School, founded in 1635, was the earliest. Other notable ones are the Hopkins Grammar Schools at Hartford and New Haven, Conn., 1657; Germantown Academy, Germantown, Pa., 1760; Dummer School, Byfield, Mass., 1763; Phillips Academy, Andover, Mass., 1778; Phillips, Exeter, N. H., 1781; and Flatbush Academy, New York, 1787. There soon developed two distinct types of secondary schools—public high schools and the private endowed schools or academies. The public high schools seem to have succeeded in large measure to the work of the old New England academies, which sought not so much to train for college as to give the best possible education for life to those who came within their influence. The academies which sprang up in connection with the early colleges as preparatory departments to the same have, in the Eastern States at least, nearly disappeared and been succeeded by the private endowed schools, which aim mainly to fit their

pupils for the different colleges, though they are managed in entire independence of these colleges. In Massachusetts, as early as 1797, the academies were virtually incorporated into the system of public schools by receiving endowments of land from the State. In 1834, by an act of the New York Legislature, the regents of the university were required to apply the surplus income of the literature fund beyond the sum of $12,000 to the education of common-school teachers by distributing it to such academies as should undertake their instruction. Philadelphia organized a high school in 1837, the first of the kind in the U. S. outside of Massachusetts. Baltimore followed in 1839, Cincinnati in 1850, Chicago in 1856. The New York Free Academy was organized in 1849. Courses of study in the different high schools vary, as the schools themselves are subject to local influences. Private endowed schools also have different courses shaped mainly by the influence of the college to which the majority of their graduates are sent. Most public high schools receive and educate both sexes in the same class-rooms and under the same teachers. In a very few of the larger cities there are separate high schools for girls and boys. The following statistics on secondary education in the U. S. as to students and teachers in public high schools and private academies are taken from the report of the commissioner of education for 1890–91:

PUPILS, ETC.	Public high schools.	Private academies.	Total.
Students	211,000	99,000	310,000
Preparing for college	25,058	20,907	45,965
Sex—male	85,000	51,000	136,000
female	126,000	48,000	174,000
Teachers *	8,270	6,231	14,501
Male	3,745	3,041	6,786
Female	4,525	3,190	7,715

* Incomplete; there are probably at least 20,000 teachers in secondary schools in the U. S.

The constitutions of at least twenty-two States specify high schools as the object of legislative and general interest. The newer States universally recognize the high schools as part of the State system of education. In the East, Massachusetts has gone so far as to compel the offering of high-school advantages to all her children. As high schools can not be established within easy reach of every one, the State pays for carrying children from sparsely settled districts to the nearest village or city high school. The public high schools are relatively best and strongest in the Western States; the private and endowed academies in the Eastern States. The question of introducing military drill and tactics in public schools is beginning to be agitated. In most high schools participation in military drill is yet optional.

Provisions for the preparation of secondary teachers are meager as compared with such provisions in the foremost European countries. The best secondary teachers are college graduates, who, however, rarely have been able to obtain any special professional training. Colleges and universities are beginning to establish chairs in pedagogy to supply this professional training in some measure. A unique contrivance to meet a special want is the summer school for teachers, a feature in many leading universities. These schools are attended largely by secondary teachers, who find opportunity not only for studying their own specialties, but also in most cases for taking work in psychology and pedagogy.

No account of secondary schools would be complete without mention of the work of the committee on secondary-school studies appointed by the National Educational Association July 9, 1892. This committee consisted of ten prominent educators. It appointed nine sub-committees or conferences, each numbering ten, on the various subjects comprising the secondary curriculum. These sub-committees met in Dec., 1892, and prepared elaborate reports, which were transmitted to the central committee as material for their work. The report of the main committee, with the reports of the conferences as an appendix, was published by the U. S. Bureau of Education in Jan., 1894, and has since been the center of educational discussion in the U. S. The committee prepared four model programmes for secondary schools, which are inserted below. No school is known to be actually following any one of these; but since the report appeared a number of schools have modified their programmes to conform closely to these model programmes, and it is certain they will form for some years to come the standard toward which a large number of schools will more and more closely approach.

C. H. THURBER.

* In any school in which Greek can be better taught than a modern language, or in which local public opinion or the history of the school makes it desirable to teach Greek in an ample way, Greek may be substituted for German or French in the second year of the classical programme.

IV. Normal Schools.

A normal school is an institution for the training of teachers, and is usually supported by the state. As a general rule such schools confine their labors to the preparation of teachers for the elementary schools. There are in France two notable exceptions, the Superior Normal School at Fontenay-aux-Roses for women, and that at St.-Cloud for men. These schools devote themselves to the preparation of instructors for the lower normal schools. Nothing of this kind exists in the U. S. or Germany, though the State Normal School at Albany, N. Y., gives a higher grade of professional instruction than that found in other schools. It is designed for those who have completed college or ordinary normal-school courses. By the common practice of the world, therefore, the scope of the normal school is confined to the training of elementary teachers. Beyond the indefinite purpose of training teachers for the elementary schools the function of the normal school has not been accurately defined in the U. S., the work of each school being adjusted to real or seeming local needs and conditions. In the early stages of their development in the U. S. it was held to be the chief purpose of these schools to furnish a limited amount of accurate academic instruction to candidates for the teachers' certificate. In some schools this is still the sole idea. Later it was held to be their chief function to furnish only professional instruction in methods of teaching and school management, the burden of academic instruction to be borne by the secondary or high schools. Nor has it always been clear that normal schools have any inherent right to exist. There may be an abundance of incidental grounds of expediency for their existence, such as the absence of sufficient academic instruction in high schools, or the scarcity of college-bred teachers, or the great cost of their services, without there being any peculiar function for the normal school to perform. Were there college-bred teachers enough to supply the needs of the schools and at prices within the range of the financial abilities of the community, would there be any need of normal schools? Would there be any need of them could the academic and high schools furnish enough teachers well trained in academic branches? If these questions are not to be answered in the negative and there is any real inherent function for the normal school, it must be different from these two types of culture.

The university and college rightly pride themselves upon the breadth and depth of the knowledge they impart and upon the rigorous scientific character of the methods they pursue. But rigorous scientific method for adults is the logical unfolding of relatively perfect systems of completed knowledge, or is a difficult excursion into new realms of truth hitherto unexplored. The young, however, are mostly incapable of pursuing either of these processes successfully. The logical unfolding of a department of acquired and systematized knowledge is not a proper guide for imparting it to children, since this course does not coincide with the psychological laws of learning in the young. The laws of apperception demand that new knowledge shall be imparted in view of the interpreting experience that the child has already acquired. University knowledge is therefore of small account until it has been analyzed and readjusted in accordance with the psychological principles governing the child's mental assimilation. On the other hand, students in academic and high schools acquire in an elementary, non-reflective manner the knowledge imparted. They are so much engrossed in absorbing that they are unconscious of the manner of assimilation, nor do they pursue the higher studies long enough to see their interpreting value for the more elementary branches. It is evident that to a still greater degree there must here be a lack of psychological insight as to the proper way to select, arrange, and impart instruction, since there is a lack both of the knowledge that the university gives and the broad liberalizing outlook that it imparts.

The function of the normal school, therefore, is to pass the white light of knowledge, whether acquired in the high school alone or in that and the college combined, through the prism of that psychology which reveals the elementary processes of learning. The machinery of the best normal schools is all adjusted to this end. Academic knowledge is imparted, not in the rigid scientific method of the university, or in the half-unconscious manner of the academy, but rather according to methods that reflect the psychological conditions under which it can be reimparted to children so as to arouse their greatest interest and promote their most rapid understanding. The purpose of the practice or training school, in which normal-school students do practice teaching, is a practical device for securing still greater objectivity to the psychological adjustment of the matter of education to the mind of the child. The strictly professional aspect of normal schools pertains to theoretical instruction on psychology and the general theory of the educative processes. There are, therefore, in most normal schools these three factors: (1) Academic knowledge from the teacher's standpoint; (2) professional instruction in psychology and theory of teaching; (3) training-schools where candidates for teaching may impart knowledge to children in accordance with the educational doctrines they have learned.

Rise and Growth.—Normal schools had their beginning in the eighteenth century in France and Germany, but their development as important factors in public education is confined to the nineteenth century.

In Germany the beginnings of normal-school instruction were instituted by August Hermann Franke in connection with his orphan school at Halle in 1697. In 1704 he founded his *Seminarium Præceptorium*, or teachers' seminary, which a little later grew into the *Pedagogium*, or normal school, and is still in active operation. A state normal school was founded at Stettin in 1735, one in Potsdam in 1748, and one at Breslau in 1765. After this time the establishment and maintenance of normal schools were greatly stimulated by the demand for popular education incident to the period of the French Revolution and the educational reforms brought about through such men as Pestalozzi. The cause was especially promoted by the effort to free Germany from the rule of Napoleon through the development of the intelligence of the people. The Revolution of 1848 was followed by a reaction in which the normal schools suffered greatly, not so much in diminution of numbers as from the control of the clergy. The three noted Prussian regulations of 1854 crushed all effort to develop independence of character, reducing instruction mostly to memoriter exercises and the inculcation of religious dogma. At the close of the Franco-German war these regulations were repealed, and the number of scholars increased until practically the whole demand for elementary teachers could be supplied from them. Prussia alone has 116 of these schools, 106 being for men and 10 for women. Austria-Hungary has 70 and Switzerland 37 normal schools. Great Britain sustains 44 training-colleges for teachers, the Government paying 58 per cent. of the cost, which amounts to $867,438. Nearly all civilized nations now support normal schools in some form or other.

After the establishment of the "seminary for lay teachers" by La Salle in 1684, the first permanent normal school in France was founded by local authorities at Strassburg in 1810. Between 1830 and 1832, when the state took charge of the matter, fifteen were founded. The course was usually two years in length, most of the schools being supplied with training-departments. The fundamental law of 1879 organized the normal schools upon their present basis. In 1889 there were 82 schools for the training of male, and 89 for the training of female teachers. All were released from the control of the clergy. Most of them are now installed in new and enlarged buildings, and are well equipped with the needed material and teaching facilities. The students in 1889 numbered 4,754 male and 3,647 female, and as a rule resided in the schools. Nearly all French normal schools now have practice schools connected with them.

The first normal school in the U. S. was established at Lexington, Mass., in 1839. During the same year a similar school was established at Barre (now at Westfield) and in 1840 at Bridgewater, both in the same State. During the period from 1840 to 1860 twelve others were founded, located for the most part in the Eastern and Middle States. Normal schools began at this time to multiply rapidly, forty of them having been established from 1860 to 1870, seven of which were in New York, and most of the remainder in the States of the northern Mississippi valley. In 1890 there were 135 public normal schools in the U. S.

Organization of German and U. S. Normal Schools.—In order to understand the points of difference between German and U. S. schools for the training of teachers the following facts must be borne in mind: (1) Of the 116 Prussian normal schools but 10 are for women, thus indicating that but little more than 8½ per cent. of the elementary teachers in that country are women. Normal schools in the U. S. are coeducational, but the number of women attending them is 18,000 and the number of men only 9,000. In Germany

most persons who prepare for teaching follow that business for life, so that the number of new teachers that must be supplied each year is comparatively small, but little over 5 per cent., the average length of service for Prussian teachers during the last 50 years being 16·9 years, while in the U. S. about 30 per cent. must be renewed each year. This fact greatly enhances the cost and labor of preparing teachers in the latter country. To supply trained teachers for all schools it would take—e. g. in the single State of Illinois alone—142 normal schools, each having 100 students (the usual number in a German normal school), a three years' course of study, and graduating 33 students annually. Illinois has in reality two State normal schools, each graduating from 25 to 50 persons every year—that is, instead of furnishing the 4,000 or 5,000 new teachers needed, the normal schools of that State furnish less than 100 annually. (2) The attendance in German normal schools is unbroken save by accident, so that each year there are nearly as many graduating as entering students; but in the U. S. the attendance is so irregular that rarely more than a fourth or a third as many students graduate as enter. This irregularity of attendance causes discontinuity in study, and explains the fragmentary nature of the instruction in the average normal school. (3) As a rule, the preparation enjoyed by students of German normal schools is of uniform amount and excellence, being special instruction in public or private schools for three years after the close of the Volks-school course at the age of fourteen, and concluded by a public examination before school commissioners. The preparation for entrance to normal schools in the U. S. varies much, ranging from that given in the poorest country school to that furnished by the best city high schools. Under such conditions the German method of training teachers can be much more effective in every way than can that in the U. S., with its broken attendance and great variety in preparation. (4) The supply of learned and skillful teachers in Germany being practically unlimited, and the direction of the normal schools being in the hands of state officials and educational experts, it naturally follows that these schools are supplied with thoroughly efficient corps of instructors; whereas in the U. S., in which no such body of trained teachers exists, and where the administration of the normal schools is intrusted to State boards who concern themselves with business rather than with educational affairs, it is not surprising to find a teaching corps in the normal school which varies as much in preparation and fitness to teach as the student body itself does in scholarship and ability.

The normal schools of the U. S. and Germany are practically agreed as to the need of training-schools in which the students may have an opportunity to observe and practice teaching under criticism and direction. The training department usually covers the field of elementary instruction, sometimes including on the one hand the kindergarten and on the other the high school. In Germany it is common to have one class to represent the ordinary country school. In general the student teacher prepares more trial lessons and teaches less in the practice school than is customary in the U. S. Thus there is in Prussia one trial lesson a week for each student during the second and third years, whereas class-teaching in the training-school is reserved for the last year. In the normal schools of the U. S. it is usual to give the actual conduct of a class in the early part of the second year, but it is less common to have repeated trial lessons under searching criticism, followed by thorough discussion on the part of teachers and students.

The following table exhibits the amount and distribution of professional and academic work that is accomplished in the German normal schools, and will furnish a basis for further comparisons:

SUBJECTS.	HOURS PER WEEK EACH YEAR.			Per cent. of whole.

Total required	37	37	32·1	100·0
XII. French (optional)	3	3	2	....

It can be seen from the foregoing table that no subject is pursued for less than one year, while many subjects, such as history, geography, drawing, gymnastics, and certain branches of music, are studied throughout the entire three years. Many other subjects are pursued continuously for two years. It is curious to notice that the number of hours per week assigned to any given subject does not exceed two, except for arithmetic and algebra, biblical history, and teaching in the training-school. On the other hand, the normal schools of the U. S. usually pursue whatever subjects they have in hand for four or five recitation periods of forty-five or fifty minutes each per week.

There has been a decided movement in many States of the U. S. for the abolition of all academic instruction in normal schools, the argument being that the State should not have to pay for this, since the academies and high schools profess to impart academic knowledge. It is declared that the high schools should teach the *what* and normal schools the *how*. This movement has resulted in securing perhaps a higher grade of academic instruction, but it has nowhere driven it out of institutions for the training of teachers.

The conditions of admission to normal schools in the U. S. do not greatly vary in the different States, and may be summarized as follows: (1) The candidate must be not less than sixteen years of age; (2) must possess sound health and a good moral character; (3) must be able to pass a satisfactory examination in reading, spelling, writing, arithmetic, and the elements of English grammar, or be a graduate of an accredited high school; (4) must sign a declaration of intention to teach for a certain specified time, usually two or three years, in the common schools of the State. In city normal schools it is often customary to require graduation from the high school as a condition of admission. That the actual instruction in normal schools is not, or at least need not be, so elementary as might be inferred from a study of the curriculum that follows, becomes evident when the age of the average normal student is considered. Answers from twenty-four representative State normal schools show that the average age at graduation is twenty-two years. Since, however, their courses do not exceed three years in length, it is clear that the average entrance age

is between eighteen and nineteen years. This is the age for beginning superior instruction. The schools just mentioned report that 37 per cent. of their students are graduates of high schools, or have had an equivalent preparation.

The State Normal School at Normal, Ill., founded in 1857, may perhaps be regarded as a typical normal school. Its educational ideals and methods of work were a direct inheritance from the old Bridgewater, Mass., normal school, since the leaders in the early conduct of the Western school came direct from the Bridgewater normal. The faculty consists of twenty-one persons, twelve men and nine women. The president, John W. Cook, A. M., LL. D., is a graduate of the school. Of the professors, ten are college or university graduates, and two have taken degrees at German universities; of the whole number, ten are graduates of the school itself. The scholarship represented in this faculty is considerably above the average for normal schools in the U. S. One of the weaknesses of these institutions comes to light when it is stated that these twenty-one persons must do all the teaching for 646 normal and 186 high school students, besides spending considerable time with the 389 pupils of the model or training school. This makes an average of over forty students to one instructor; in good colleges and universities there are usually only from ten to twelve students for each teacher.

The training-department of this school consists in reality of three groups of pupils—a grammar school with 185, an intermediate school with 83, and a primary school with 121 pupils, each of these schools being in charge of an assistant training-teacher. There is, besides, a model high school, in which pupils may prepare for college or study ancient and modern languages, but in which students do not teach to any considerable extent. The academic year is divided into three nearly equal terms, and each normal-school student who completes the course is required to teach under inspection at least four terms in the training-school, giving during the senior year trial lessons in the presence of instructors and of students in the senior class. In many normal schools there is a different organization of the pupil teaching. Some so arrange the matter that a student may do his practice-teaching for a short period at a time, being in charge, it may be, of all the pupils in a given department for a few weeks.

The curriculum of study is not very different from that of most normal schools in the U. S. having a three years' course. It is as follows, the numerals 1, 2 and 3 indicating the three terms of the year respectively:

STUDIES.	First year.	Second year.	Third year.
Elements of pedagogy	1	.....	.....
Pedagogy	2, 3	.....	.....
Elementary psychology	.....	1	.....
Practice-teaching	.....	2, 3	2, 3
Adv. psychology and Rosencranz	.....	.....	1, 2, 3
Illustrative teaching	.....	.....	1, 2, 3
School laws of Illinois (3 weeks)	.....	.....	3
Reading and orthoëpy	1, 2	.....	.....
Spelling	1, 2, 3	.....	.....
Grammar	1, 3	.....	.....
Rhetoric	.....	2	.....
Criticism	.....	3	.....
English literature	.....	.....	1
Shakspeare and themes	.....	.....	2
Arithmetic	1, 2	.....	.....
Algebra	3	1	.....
Geometry	.....	2, 3	.....
Bookkeeping (8 weeks)	.....	.....	3
Drawing	1, 2, 3	1, 2, 3	.....
Penmanship	2	.....	.....
Geography	1, 2	.....	.....
U. S. history	3	.....	.....
Civil government	.....	1	.....
Ancient history	.....	2	.....
Physical geography	.....	3	.....
Mediæval history	.....	.....	1
Zoölogy	.....	1	.....
Physiology	.....	2	.....
Botany	.....	3	.....
Physics	.....	.....	1, 2
Chemistry	.....	.....	3
Vocal music	3	.....	.....

In addition to this table a number of optional studies, like Latin, Greek, German, astronomy, advanced mathematics, economics, and science, are offered, but the required work so nearly fills the programme that there is little time for extras. The regular number of periods per week for each study is four and a half and five, elements of pedagogy, drawing, penmanship, and vocal music alone having but two each. This is in sharp contrast with the programme of the German normal schools given above. On the other hand, it will be seen that the amount of time given to many important studies is sadly inadequate for anything more than the most superficial knowledge. Thus chemistry, botany, physiology, zoölogy, to say nothing of other branches, receive but one term each. Lack of teaching force prevents any specialization on the sciences. It is difficult to see how much more time can be given to the individual subjects unless their number is reduced, or unless the amount of attention given to the common branches is considerably abridged.

The sharpest contrast between the schools of Germany and the U. S. is in uniformity of excellence. The German system of training teachers insures for every school in the land a high minimum of excellence, since every teacher must demonstrate by examination that he has adequate academic knowledge, and has subjected himself to at least three years of professional preparation. In the U. S. this is by no means the case, for only a small per cent. of the teachers have any professional training whatever, while their academic knowledge is gauged by constantly varying standards. The results obtained in Germany from the universal training of teachers should therefore be an ever-present stimulant for educators in the U. S. to extend and perfect their normal schools. CHARLES DE GARMO.

V. THEOLOGICAL SCHOOLS.

Their Rise.—As forms of worship developed, divine oracles required interpretation, or holy men attracted disciples, schools of theology grew up in all civilized nations of antiquity. Thus Egypt had her priestly colleges at Heliopolis, Memphis, Thebes, and Sais; Assyria her prophetic schools at Arbela and Nineveh; Babylonia her seats of sacred learning at Uruk, Kutha, Babylon, and Borsippa. The prophetic unions of Rama and Gibea can scarcely be called schools, but the disciples of Isaiah were students, and the canonizing of religious writings made the *beth hammidrash*, or "house of instruction," a necessity. The Magi imparted particular instruction in the rites and tenets of Mazdaism. The cult of Eleusis called for training, and the Orphic revelation for special study; young men were drawn to Pythagoras and Socrates, Plato, Aristotle, and Zeno largely by their religious interest; the best theology of Greece was expounded in the academy, the lyceum, and the stoa; and Plotinus, Porphyry, and Proclus made the school of Alexandria a theological seminary.

Like John the Baptist, Jesus gathered about himself disciples whom he taught the way of life and the manner of the kingdom. From his personality, his teaching, and his death the mightiest impulses to theological study, as well as to religious life, have gone forth; but he founded no school of theology. Paul recognized the need of apostles, prophets, and teachers, and chose for his companions young men fit to continue his work; but he established no seminary. The charismatic organization of the Church supplied her for some time with an order of apostolic teachers. As tradition grew in importance, the cult developed, and the ministry of the word was added to the episcopal function, the house of the bishop became a home of Christian training. But it was the maiden efforts of Hellenistic philosophy in the service of the Christian faith that resulted, in the second century, in the first regular schools of Christian theology. Such were the schools of Valentinus in Rome, Carpocrates in Alexandria, Saturninus in Antioch, and Bardesanes in Edessa. A maturer fruit of the same tendency was the school of the catechists at Alexandria, founded by Pantænus in 190 and brought to its highest efficiency by Clemens and Origen, where candidates for the ministry as well as catechumens received instruction. In 231 Origen opened a school in Cæsarea. Of greater importance was the school of Antioch established by Lucian about 300, where Chrysostom and Theodore of Mopsuestia taught. From 363 to 489 the school of the Persians at Edessa was the great center of Christian learning, and there was a flourishing school at Nisibis in the sixth century. The clergy of the Occident, as a rule, studied in the schools of the rhetoricians, so highly praised by Augustine. Besides the ordinary catechetical instruction, ministerial candidates often enjoyed special episcopal training. After Constantine's conversion the school of the Patriarchium at Rome attracted many students. The closing of the University of Athens in 529 really signalized the inability of the pagan schools to furnish any longer the culture needed for theological study. In the same year Benedict of Nursia opened his monastery on Monte Cassino, and in 535 Cassiodorus introduced *trivium*, *quadrivium*, and theology in a cloister school at Vivaria.

Monastic schools had already been established by Cassian

at Marseilles, by Martin at Marmontier, and by Honoratus on the Leryns, about 400. The schools of Armagh, Aran, and Clonard in Ireland, Whitherne, Lantwit, and Llan Elwy in England, may have been founded in the fifth century, and the school of theology at Constantinople owed its origin in the seventh to an independent movement; but it was the Benedictine order and discipline that gave lasting fame to the foundations of Columban at Luxeuil, St.-Gall, and Bobbio, and efficiency to the great schools of Bangor, Iona, Lindisfarne, Canterbury, and York. The *regula* of Chrodegang of Metz (754), made binding on the entire Church in Aachen in 814, provided for an episcopal school at each cathedral. Both episcopal and monastic schools received enthusiastic support by Charlemagne. His palace school, where Alcuin and Erigena taught, set an example followed not only by Tours and Fulda, Corvey and Ferrières, but also by the cathedral schools of Orleans and Rheims. The tenth century marks the ascendency of Liège, the eleventh that of Le Bec. In this Norman cloister Lanfranc and Anselm laid the foundations of scholasticism, and their influence was quickly felt in Chartres and Rouen, in Glastonbury and Oxford. The mendicant friars brought the heritage of Le Bec to the new centers of learning.

University Schools.—From the thirteenth century theological schools began to be connected with the universities. The *studium generale* rarely had its origin in an episcopal school, never in a monastery. Of the forty-six universities founded before 1400, twenty-eight had at the outset no theological faculty, having generally grown out of city schools, medical schools, or law schools. Among the other eighteen many were new creations and some sprang from private schools like that of Abelard. But the Franciscans and the Dominicans, besides founding their own colleges, gradually secured generous representation on the theological faculties. Probably no other school of theology ever enjoyed the prestige of the Collège de Sorbonne. The theological course at Paris (twelfth century) was open only to masters of arts and covered ten years, five for the baccalaureate and five for the licentiate. The student began with a biblical course familiarizing him with the literal, tropical, allegorical, and anagogic interpretations. This was followed by dogmatics based on Lombard's sentences. Instruction was given by lectures, repetitions in the colleges, and disputations. Substantially the same rules prevailed in all mediæval universities. In advance of Cambridge (twelfth century), and next to Paris in importance, was Oxford (twelfth century). Toulouse was founded in 1229, Coimbra in 1291, Salamanca in 1355, and Valladolid in 1418. Bologna had no theological faculty until 1362; but Rome (1303), Pisa (1343), Florence (1349), and Padua (1363) taught theology at the beginning. Prague (1347) was the first German university. Then followed Vienna (1365), Erfurt (1379), Heidelberg (1385), Cologne (1388), Leipzig (1409), Rostock (1419), Freiburg (1457), Tübingen (1477), and Mayence (1477). Geneva had a university in 1368 and Basel in 1460, Upsala in 1477 and Copenhagen in 1479. Famous Louvain (1431) reflected the wisdom of the *fratres devoti*.

Modern Catholic Schools.—The Renaissance inaugurated a new era. Classical antiquity returned, the Semitic world drew nearer, the physical universe expanded and attracted minds emancipated by nominalism, and the religious life demanded greater earnestness and freedom. The intellectual forces of the modern world began to operate. But the renascent influence has been felt in varying degrees in different parts of Christendom. While the Romance and Teutonic nations claimed the heritage of Byzantium, the Slavs, so long under her tutelage, had not yet reached their majority. But the Orthodox Church, by nurturing national life and letters, has proved a faithful tutor in Russia, Servia, and Bulgaria, not less than in Roumania and Greece, and these nations are making rapid progress. The religious academies of St. Petersburg, Moscow, Kiev, and Kasan may not be consciously affected by Occidental thought, but they are flourishing institutions, and especially devote praiseworthy attention to non-Christian religions and to missionary history. The universities of Bucharest (1869) and Czernowitz (1876), as well as that of Athens (1837), have theological faculties.

The Roman Catholic Church owes it largely to a new order of theological schools that her influence, still so marked in the Romanee nations, has survived the Renaissance. By the establishment of colleges, at the universities or independently, embodying Sturm's humanistic and their own religious principles, Loyola and his successors sought to meet the demands of the age for spiritual earnestness, classical learning, and biblical erudition. Few schools have attained the efficiency of the Collegium Romanum (1550). The *studia superiora* comprised four years of philosophy, three years of positive or biblical theology and dogmatics based on Thomas Aquinas, and three years of casuistry. Other famous colleges were the Germanicum (1552), the Anglicanum (1580), the Claromontanum at Paris (1562), and those of Pont à Mousson (1572) and Dijon (1581). Clerical seminaries were also established at Rome (1565), at Milan (1572), and elsewhere by Borromeo, and subsequently in every Roman Catholic country. Had the searching criticisms of the Port Royalists been heeded, the Society of Jesus might have been saved from spiritual decay and loss of power. When, in 1773, Clement XIV. dissolved the order, it had 669 colleges and 176 seminaries, and controlled 80 theological faculties; but its moral influence was so shattered that not even the restoration of 1814 could rehabilitate it. Its system of education still survives, but scarcely to the profit of the Church. To this day Italy depends upon her 217 seminaries, no Italian university having a theological faculty. Spain is equally dependent, and though Coimbra teaches theology Portugal has many seminaries. France is better provided, with her Roman Catholic faculties at Paris, Lille, Lyon, and Toulouse. At Vienna, Salzburg, Budapest, Cracow, Innsbruck, Agram, and Gratz Roman Catholic theology is taught, and Prague has both a Czech and a German faculty, but there are forty-three seminaries besides in Austria. Freiburg (1457), Munich (1826), Münster (1773), Würzburg (1582), Bonn (1818), Breslau (1702), and Tübingen have Roman Catholic faculties. Besides Louvain, Belgium has sixteen seminaries. Since 1854 Ireland has had a Roman Catholic university at Dublin. England has twenty-seven Roman Catholic seminaries.

German Protestant Schools.—In the independent Teutonic churches the Renaissance bore richer fruits. The influence of Luther was strongly felt in the universities already leavened with humanism, and there the study of Lutheran theology remained in touch with other departments of learning. Luther's suggestions were nobly carried out by Melanchthon. Under his presidency Wittenberg (1502) became a great center, and other universities modeled their instruction after it, as Marburg (1529), Tübingen (1536), Leipzig (1539), Königsberg (1544), Greifswald (1545), Rostock (1563), Heidelberg (1551), and Jena (1558). The change involved an extension of the biblical course, interpretation of the Hebrew and Greek texts of the Scriptures, and greater attention to Augustine. The theological faculty became an arbiter in doctrinal matters. In the period of orthodoxism occasioned by this arrangement, Giessen was founded in 1607 and Kiel in 1665. Metaphysics had crowded Bible study and personal piety into the background, when Spener and Francke made their plea for faithful exegesis and living experience, and embodied their ideas in the University of Halle (1694) and the *seminarium ministerii ecclesiastici* (1714). The indifference of pietism to theology as a science undermined orthodoxy and paved the way for rationalism. In the opposition against supernaturalism Göttingen (1737) became a leader. Kant's *Critique* made this conflict meaningless by a higher synthesis, but the new theological development started with Schleiermacher's and Hegel's teaching at Berlin (1810). To their influence the still dominant tendencies emanating from Baur in Tübingen, Reuss in Strassburg, and Ritschl in Bonn are largely traceable. Scientific methods prevail in the biblical departments and find increasing application in Church history, dogmatics, and practical theology. The professors in the seventeen evangelical faculties are free to present their own views and to modify them as research demands. Their lectures are the prominent feature. Disputations are seldom held. Seminars and theses try the student's strength. A triennium leads to the doctorate in philosophy, three additional years suffice for the licentiate. The doctorate in theology is conferred either *rite* or *honoris causa*, the recipient recognizing the honor by dedicating a work to the faculty. The annual average of doctors of divinity made in all Germany is forty.

Other European Schools.—The Universities of Upsala and Lund (1668), Christiania (1813), Copenhagen, Helsingfors (1827), and Dorpat (1632) supply the clerical needs of Sweden, Norway, Denmark, Finland, and Lutheran Russia. Preachers' seminaries have also been established by the Moravians at Gnadenfeld and Nisky, the Baptists at Hamburg and Stockholm, the Methodists at Frankfort and Upsala, and the Congregationalists at Christinehamn. In

scholarship inferior to the state schools, these seminaries emphasize more strongly personal piety.

Zwingli was a humanist, Beza brought the new learning to Lausanne (1536), and Calvin had studied with Sturm in Strassburg before founding at Geneva his college (1536) and theological academy (1559). Calvin's new theology and scholarly exegesis made the academy a center of French Protestantism. Like Lausanne it has maintained itself through the centuries, while Neuchâtel and Freiburg are of modern growth. A reaction against theocratic ideas has called forth theological schools unsupported by the state in Geneva, Lausanne, and Neuchâtel. Similarly Basel, Berne (1528), and Zurich (1832) have theological faculties, and each city also a free seminary. French Protestant seminaries were established at Nîmes (1561), Saumur (1598), Montauban (1598), and Sedan (1580); but the expatriation of the Huguenots left only Montauban, which has been connected with the Academy of Toulouse. In 1877 the seminary of Strassburg (1802) was removed to Paris and incorporated in the university. All these schools are open to bachelors of arts who may graduate as bachelors of divinity after three years and as licentiates after four, upon presenting six discourses and two theses. L'École des Hautes Études (1868) also has a section for theology with excellent equipment for the study of comparative religion. In Holland Leyden (1575) became the representative of Arminianism, while Groningen (1614) and Utrecht (1634) expounded Calvinism. Rationalism in the eighteenth century destroyed these landmarks, and Gröningen, Utrecht, and Amsterdam (1877) are now making valuable contributions to theological science. The Scotch universities of St. Andrews (1411), Aberdeen (1494), and Glasgow (1451) have remained more faithful to Calvinism, while Edinburgh (1583) is at present liberal. Each has four divinity professors. Masters of arts may gain the bachelor's degree in three years. Six discourses and a thesis are required. At St. Andrews bachelors of divinity may obtain the doctorate after eighteen years upon presenting a thesis; elsewhere it is conferred *honoris causa tantum*. The Free Church has three divinity halls at Edinburgh, Aberdeen, and Glasgow, and the United Presbyterians one hall at Edinburgh. Four years' attendance is required, but the course is identical with that at the universities.

Of the English universities Cambridge was first affected by the Renaissance, and under the influence of Puritanism, Platonism, and rationalism, has steadily advanced, while conservative Oxford was aroused from long lethargy by the Tractarian movement. At present both offer excellent opportunities for theological study. Masters of arts may become bachelors of divinity in three years and doctors after four additional years. Durham (1852) admits bachelors of arts and others to theological study. Besides these, the Church of England has 23 theological schools, the Methodists have 10, the Congregationalists 11, the Baptists 9, the Presbyterians 3, the Unitarians 1, and the Jews 1. Two are undenominational.

Schools in North America.—Canada long depended upon the mother country, but in the nineteenth century the Episcopalians have established 2 theological schools at Toronto, the Presbyterians 3 at Montreal, Toronto, and Quebec, the Methodists 2 at Montreal and Toronto, the Baptists 1 at Toronto, and the Congregationalists 1 at Montreal.

The English, Dutch, Swedish, and French colonists in America in the seventeenth century were at first served by ministers educated at Cambridge or Utrecht, Upsala or Montauban. New England began to supply her own needs by establishing Harvard (1638) with a professorship of divinity. William and Mary (1693) probably did similar service for Virginia. In 1740 a professor of divinity was appointed at Yale (1701); but the Dutch Reformed Church founded the first theological school, at New Brunswick, N. J. (1784). The example was followed by the Roman Catholics at Baltimore (1791), the United Presbyterians at Xenia, O. (1794), the Moravians at Bethlehem, Pa. (1807), the Congregationalists at Andover (1807), the Presbyterians at Princeton (1811), the Lutherans at Hartwick (1815), the Unitarians at Cambridge (1817), and the Baptists at Hamilton (1819). Before 1860 50 seminaries had been established. After the civil war the emancipated race and the settled West caused schools to multiply. The commissioners report 143 theological schools; 25 of these have scarcely any existence, 25 are for freedmen, 18 are Roman Catholic seminaries, and 1 is a Jewish school. The remaining 74 belong to 10 Protestant denominations, the most prominent being Baptist: Colgate (1819), Newton (1825), Rochester (1851), Louisville (1858), Chicago (1867), Crozer (1868); Congregationalist: Andover (1808), Bangor (1816), Yale (1822), Hartford (1834), Oberlin (1835), Chicago (1858), Pacific (1869); Episcopalian: New York (1820), Virginia (1823), Berkeley (1854), Philadelphia (1862), Cambridge (1867); Lutheran: Gettysburg (1826), Concordia (1839), Augustana (1860), Philadelphia (1864); Methodist: Boston (1847), Garrett (1857), Drew (1867), Vanderbilt (1873); Presbyterian: Princeton (1812), Auburn (1820), Union, Va. (1824), Columbia, S. C. (1828), Lane (1832), Union (1836), Chicago (1859); Dutch Reformed: New Brunswick (1784); German Reformed: Lancaster (1825) and Heidelberg (1851): Unitarian: Harvard (1817) and Meadville (1846); Universalist: Tufts (1869). Sixteen States have no theological school. No State university teaches theology; of the ten leading ecclesiastical universities Harvard, Yale, Princeton, Colgate, and Northwestern have theological faculties; of the privately endowed, Boston, Vanderbilt, and Chicago. These and many independent schools admit only bachelors of arts to the regular course, and confer the baccalaureate of divinity after a triennium. The anomaly exists that over 300 institutions, not universities and without a theological faculty, can create doctors of divinity, while only a few theological schools have the right even of nomination. No American theologian has formed a school of thought, but the conservatism of Princeton, the "new theology" of Andover, and the more advanced position of Harvard have exerted a wide influence. The revival of Semitic learning, the introduction of scientific methods, the decline of sectarian teaching, the missionary zeal, the close contact with Church life, the high moral tone and the warm piety characterizing the North American schools give promise of rich and independent work in theology.

NATHANIEL SCHMIDT.

VI. MEDICAL SCHOOLS.

I. *In the United States.*—In the earlier history of North America physicians generally received their medical training from preceptors, in whose offices they served an apprenticeship of seven years in the practical branches, receiving at the same time instruction as students and studying such cases of disease as developed in the daily practice of their preceptors. In rare instances these studies were supplemented by a trip to Edinburgh, London, or Paris, and less frequently to Holland or Italy. In some country districts the physician was also the clergyman. Frequently he was engaged in tilling the soil.

Dr. Thomas Cadwallader, of Philadelphia, who had studied anatomy under Cheselden, gave anatomical demonstrations

to the physicians of Philadelphia prior to 1751, and Dr. Hunter, of Newport, R. I., gave anatomical demonstrations in 1754–56. Dr. William Shippen, Jr., of Philadelphia, gave a course in anatomy to twelve students in 1762. These were all private enterprises. The first regularly organized school of medicine was the College of Philadelphia, which was founded by Dr. William Shippen, Jr., and Dr. John Morgan at the suggestion of Dr. John Fothergill, of London, in 1765. Dr. Morgan was appointed to the chair of Medicine in May, 1765, and Dr. Shippen to the chair of Surgery in September of the same year. The first course of lectures was given in Nov., 1765, and continued annually thereafter. The College of Philadelphia subsequently became the University of Pennsylvania.

The requirements for the degree of bachelor of medicine were: (1) A satisfactory knowledge of Latin, mathematics, natural and experimental philosophy; (2) one course of lectures in anatomy, materia medica, chemistry, theory and practice of physic and clinical lectures, and one year's attendance on the practice of the Pennsylvania Hospital and a public examination; (3) apprenticeship to a reputable physician.

The requirements for the degree of M. D. were: The candidate, being twenty-four years of age, and a bachelor of medicine of three years' standing, must present and defend an original thesis. The degree of M. B. was first conferred in 1768, and of M. D. in 1771.

The second medical school in North America was founded in New York in 1767 in connection with King's (now Columbia) College by Dr. Samuel Bard and Dr. Peter Middleton. The degree of M. B. was first conferred in 1769, and of M. D. in 1770. It was broken up by the Revolutionary war, but was reorganized in 1792 and merged with the College of Physicians and Surgeons in 1807. The third medical school was founded in connection with Harvard College in 1783, the fourth in connection with Dartmouth College in 1798, the fifth was the Maryland College of Medicine in Baltimore (now the University of Maryland), founded in 1807, and the sixth at Yale College in 1813.

From this date the growth of medical colleges was rapid, until almost every large city possessed one or more. Many, like those at Castleton, Vt., Berkshire, Mass., and Fairfield, N. Y., were established in small country towns independently of any institutions of learning or hospital facilities, and gave purely theoretical instruction by lectures, the effect being to lower the standard of medical education. In some schools a single course of lectures was exacted prior to graduation; in others two courses of four months each; in the vast majority two courses of not more than six months each; and in comparatively few colleges three courses of lectures. Since 1890 a movement to lengthen the number of courses to three, and in some cases to four, has gained strength, to the great advantage of medical education.

Requirements for Admission to Medical Colleges.—Prior to 1892 no uniform requirements for admission to medical colleges existed in the U. S. In 1892 the Association of American Medical Colleges established the following standard: (1) Ability to write an English composition of not less than 200 words. (2) To translate simple Latin prose. (3) A knowledge of algebra or higher arithmetic. (4) Elementary physics.

The regents in the State of New York require that all applicants for admission to medical schools must file a certificate showing:

(A) That they hold a degree of bachelor or master of arts, of bachelor or master of science, or of bachelor or doctor of philosophy; or, (B) That during or prior to the student's first year of medical study he has passed an examination conducted under the regents of the University of the State of New York, or by the faculty of a medical school or college in accordance with the standard and rules of the said regents, in arithmetic, grammar, geography, orthography, American history, English composition, and the elements of natural philosophy; or, (C) That he possesses one or more of the following equivalents:

(*a*) A certificate of having successfully completed a full year's course of study in any college or university under the supervision of the regents of the university, or registered by them as maintaining a satisfactory standard. (*b*) A certificate of having satisfactorily completed a three years' course in any institution subject to the visitation of the regents, or registered by them as maintaining a satisfactory academic standard. (*c*) A certificate of having passed the examination preliminary to the study of medicine, required by the present medical act of Canada. (*d*) A certificate of having passed the matriculation examinations of any university in Great Britain or Ireland. (*e*) A regent's diploma. (*f*) Regents' pass-cards for any twenty counts not including reading and writing.

Many medical colleges in the South and West do not exact even these modest requirements.

A few medical schools require more, e. g. the University of Michigan, which requires an elementary knowledge of English, mathematics, including arithmetic, algebra and plain geometry, physics, botany, zoölogy, physiology, history, and Latin prose.

The requirements of Harvard Medical School are: English, Latin, physics, chemistry, and any one of the following: French, German, algebra, plane geometry, or botany.

The Johns Hopkins Medical School, at Baltimore, Md., requires: (1) An ability to pass the matriculation examination to enter any undergraduate course at the Johns Hopkins University; (2) a reading knowledge of French and German; (3) a knowledge of minor courses in physics (at least five class-room exercises and three hours' laboratory work each week for one year constituting a minor course), chemistry (five class-room exercises and five hours' laboratory work each week for one year), and biology (five class-room exercises and five hours' laboratory work each week for one year), or the degree of A. B. in the chemical-biological course of the university.

Courses of Study.—The best medical courses are graded and cover a period of four years. In the most advanced schools the first two years are spent in the study of anatomy, embryology, physiology, histology, bacteriology, pathology, physiological chemistry, and pharmacology; the third year is devoted to the study of medicine, surgery, gynæcology, and obstetrics, and the fourth year to clinical work and special branches of medical practice. In the first two years laboratory work occupies a prominent place, and recitations and seminary conferences are held rather than formal didactic lectures.

Many schools have three courses of lectures which practically cover identical subjects, but this method of instruction is no longer popular, and laboratory work and graded recitations are fast taking the place of didactic lectures.

Medical educators differ as to the advisability of requiring a degree in arts or sciences preliminary to the study of medicine, and many are of the opinion that the majority of young men can not afford to sacrifice the time needed to secure a degree before commencing a course of medical study proper, extending over a period of at least four years. They prefer the arrangement of studies existing at Cambridge, England, whereby the last two years of study for the degree of B. A. constitute the first two years of medical study leading up to the degree of M. D. at the end of three years thereafter, thus practically giving a medical course of five years.

Requirements for Degree of M. D.—The requirements for this degree vary materially. In some schools in the U. S. the degree is conferred after three years of medical study and an attendance upon two courses of lectures. The majority of the medical schools since 1892 have required three courses of lectures. The leading schools require four courses of lectures and practical work in laboratories.

Number of Schools.—In 1891 there were 95 regular, 9 eclectic, 14 homœopathic, 2 physio-medical colleges, and 9 post-graduate schools of medicine, with 18,160 students and 4,931 graduates receiving the degree of M. D.

II. *Canada.*—There are 12 medical schools in Canada. The requirements for admission are English, arithmetic, algebra, geometry, Latin, and Greek, French, German, or natural philosophy.

Courses of study extend over four years. During the first and second years, anatomy, physiology, histology, chemical physics, general chemistry, materia medica and therapeutics, toxicology, and botany. During the third and fourth years, theory and practice of medicine, including medical pathology; principles and practice of surgery, including surgical pathology; clinical medicine, clinical surgery, midwifery, diseases of women and children, medical jurisprudence, and sanitary science.

In Quebec the requirements for admission to the medical schools are nearly equal to the medium requirements for admission to the schools of Great Britain.

III. *Great Britain.—Requirements for Admission.—Minimum.*—English, Latin, mathematics, including algebra and geometry, elementary mechanics, and one of the following optional subjects: Greek, French, German, Italian, or

any modern language, logic, botany, zoölogy, elementary chemistry.

Medium.—Latin, Greek, French, German, Sanskrit or Arabic, English language, history and geography, mathematics, mechanics, science—one of the following: chemistry, heat and light, magnetism and electricity, botany.

Maximum.—Latin, translation of selected and non-selected authors, grammar, and short passages to be translated into Latin; Roman history; Greek grammar and translation from a selected author; English language, composition, literature, and history; French or German, grammar, and translation into English; mathematics—arithmetic, algebra to the theory of indices, and logarithms; geometry, plane and solid, with the elements of co-ordinate geometry; trigonometry. This is equivalent to the examination for the B. A. degree in Oxford, Cambridge, and London.

The courses of study occupy at least five years. After finishing the regular courses the students spend several years in the London hospitals.

IV. *Germany.*—The applicant for admission must present a certificate of having successfully passed the final examination of the gymnasial course. Eight semesters must be devoted to medical study. The first four are devoted exclusively to physics, chemistry, zoölogy, botany, mineralogy, anatomy, and physiology. The purely medical studies begin with the fifth semester, and must be pursued for two years.

V. *France.*—The applicant for admission must possess the "diplôme de bachelier ès lettres" and the "diplôme de bachelier ès sciences restreint," which are equivalent to B. A. of London University, with considerable knowledge of chemistry, zoölogy, botany, geology, and astronomy added.

Courses of Study.—These must be pursued at one of the six medical faculties of France, viz., Paris, Montpellier, Nancy, Lille, Lyons, and Bordeaux, and must cover four years.

First year: Physics, chemistry, anatomy and dissection, natural history, physiology, and histology; second year, anatomy and dissection, histology, general pathology, surgical pathology and clinic physiology, medical pathology; third year, dissection, surgical pathology and clinic, medical pathology and clinic, operations and apparatus, gynæcology; fourth year, dissection, surgical pathology and surgery, medical jurisprudence, pathological anatomy, materia medica and therapeutics, hygiene, and gynæcology.

VI. *Italy.—Requirements for Admission.*—Latin, mathematics, including algebra, geometry, plane trigonometry and conic sections, mechanics, elementary physics, chemistry, and natural history.

Courses of Study.—Medical studies are to be pursued at any one of the twenty universities of Italy. The course is six years. There are no rules as to sequence of studies, but the following order is generally observed: First year, zoölogy, botany, inorganic chemistry; second year, physics, organic chemistry, comparative anatomy; third year, anatomy, physiology; fourth year, general pathology and pathological anatomy; fifth year, special pathology and surgery and clinic, topographical anatomy, operative surgery; sixth year, medical and surgical clinic, hygiene and medical jurisprudence, ophthalmology, obstetrics.

VII. *Sweden.*—The applicant for admission must present the *Maturitäts* certificate from the gymnasium. The courses of study must be pursued at Upsala or Lund, or the Medical Academy of Stockholm. The period of study is ten years. The first three years are spent in preliminary studies. Three years are then spent in the study of anatomy, physiology, physiological chemistry, general pathology, pathological anatomy, and pharmacology. Two years are spent in the study of practical medicine, practical surgery, ophthalmology, obstetrics, and forensic medicine. In addition there are eight months in a medical and surgical clinic, four months in an obstetrical clinic, and two months in a psychiatric clinic.

Number of Schools.—The following is a summary of the medical schools of Europe: Belgium, 4; Denmark, 1; Germany, 20; France, 6; Great Britain, Scotland, and Ireland, 32; Italy, 20; Netherlands, 4; Austria-Hungary, 6; Norway and Sweden, 4; Portugal, 1; Russia, 7; Switzerland, 5; Spain, 7—total, 117.

HENRY M. HURD.

VII. LAW SCHOOLS.

In Continental Europe.—With the revival of interest in the Roman law, students flocked to the mediæval universities, notably to Bologna and Paris; and in countries where the system of law is essentially Roman the tradition of obtaining one's legal education at a university is still maintained. Indeed, upon the continent of Europe a university law school is the only avenue to the legal profession. In Germany, for example, the course for one aiming at a legal career is plainly defined. He must first complete the curriculum of a gymnasium; he must then study law for three years at a university and pass an examination at the end of the course; after this theoretical study he must, if he means to be a judge or an advocate, give three years to the "service of practical preparation." Then, upon passing a second state examination, he may expect an appointment as an inferior judge when a vacancy occurs, or, if he prefers to practice, he may be admitted to the body of advocates. One wishing to be a law-professor dispenses with the three years of practical work, and seeks first, by passing a special examination, the position of privat docent. His subsequent promotion to assistant professor and professor will depend wholly upon his ability and success as a private lecturer, for the ranks of the law-professors are recruited, not from judges and successful practitioners, but exclusively from those who have won their spurs as younger teachers. What is true of Germany is, in the main, true of the other continental countries.

In England.—The history of legal education in England has been widely different. The English law was not Romanized and English lawyers were not bred at Oxford or Cambridge. Since the fourteenth century legal education has been in the hands of the four Inns of Court, Lincoln's Inn, Gray's Inn, the Inner Temple, and the Middle Temple. These, with the ten dependent Chancery Inns, have been called by Fortescue and Coke a legal university. In the days of these writers the term was not inapt. The membership of the Inns of Court was made up of students, barristers, readers, and benchers. A student after eight years was admitted to the degree of barrister. From the barristers of longest standing were chosen annually two readers, each of whom was to give a dozen readings or lectures to the members of the Inn, and to preside at mootings. The readers after performing these duties became benchers or governors of the Inn. The two courses of readings were delivered in vacation, and each reading with the discussion that followed between the reader and some of the barristers occupied the morning hours. In term-time the members of the Inns would naturally be engaged in the forenoon in court. Both in term-time and vacation much time was given after dinner and after supper to boltings, i. e. conversational arguments upon cases put to the students by a bencher and two barristers sitting as judges in private, and to mootings, which were public arguments by barristers before the benchers. This continued discussion of points of law could not fail to develop legal acumen and the art of ready speaking. But the readings and the discussions came in time to be regarded as too great a burden. They were at first shortened and finally, in the latter half of the seventeenth century, given up altogether. Membership in an Inn of Court for three years became the sole requisite for a call to the bar. A legal education being no longer obtainable in the Inns of Court, students of law trusted to private reading, supplemented at first by experience in attorneys' offices; but after Lord Mansfield's time the chambers of special pleaders, conveyancers, or equity draughtsmen were resorted to instead of attorneys' offices. Since the middle of the nineteenth century attempts have been made to convert the Inns of Court into a genuine law school, but thus far with very little success. Annual courses of lectures on five subjects have been introduced, upon four of which students must pass examinations before being called to the bar. The attendance at these lectures is not large. At Oxford and Cambridge there are courses both in Roman and English law, but the attendance is small. Another generation may see the establishment of a true law school, but private study and the attendance at the chambers of a barrister are still the normal mode of learning law in England.

In the United States.—This same method was naturally adopted so far as practicable by the English colonists in North America; but the English distinction between the upper and the lower branches of the legal profession was not followed, the law work of the barrister and the business of the attorney being united in the same person. For this reason the office of a lawyer in the U. S., regarded as a place for legal training, was distinctly inferior to the chambers of the English barrister. It is doubtless to a sense of the inadequacy of a law office to give a satisfactory legal education that is due the early origin and later widespread success of the

American law school. It is claimed that the earliest law-school in the U. S. was at the College of William and Mary in Virginia. Chancellor Wythe was certainly appointed Professor of Law in that college in 1779; but it may be doubted if a law school, in the proper sense of the term, existed there at that time. Be this as it may, the famous school at Litchfield, Conn., may justly be regarded as the parent of law schools in the U. S. This school was established by the Hon. Tapping Reeve in 1782. The Hon. James Gould was associated with him in 1798, and after Judge Reeve's retirement in 1820 remained in charge of the school until its discontinuance in 1833. This school was eminently successful in attracting a high class of students from all parts of the U. S., the average attendance being about twenty-five a year. The course, with two months' vacation, occupied fourteen months. The instruction was by lectures, thrown into the form of legal treatises, specimens of which may still be seen in *Reeve's Domestic Relations* and *Gould's Pleading*.

Mention should be made of sporadic and ephemeral courses of lectures delivered by Judge James Wilson at the College of Philadelphia in 1791 and 1792, by James Kent, Esq., afterward Chancellor Kent, at Columbia College, New York, in 1797, and by Prof. Stearns at Harvard College from 1815 to 1817. But it is still true that the Litchfield school was for many years without a rival, the Harvard Law School, the oldest of all existing law schools, not being established until 1817. The first dozen years of this new school were full of discouragement. Most of those who desired a law-school education still resorted to Litchfield, or, during the years 1823–29, to another successful private school at Northampton, Mass., conducted by Judge Samuel Howe and John Hooker Ashmun. The prosperity of the Harvard school dates from its reorganization in 1829 when Judge Story and Mr. Ashmun were appointed professors. In 1833, when the Litchfield school was given up, there were law schools at Harvard, University of Maryland, Yale, University of Virginia, Cincinnati College, and at Transylvania University, Kentucky, with less than 150 students in all. There were two new schools in the next decade, at Dickinson College, Pennsylvania, and at the University of Indiana. Five more were established between the years 1846 and 1850. In 1860 the number of law schools had risen to twenty-two, with a total attendance in that year of about 1,000 students. The following table gives the law schools existing in the U. S., with the date of their foundation, the length of the course, and the number of students in the academic year 1893–94:

NAME OF LAW SCHOOLS.	Date of establishment.	Length of course, years.	Number of students in 1893–94.
Harvard	1817	3	353
University of Maryland	1822	3	146
Yale	1824	2*	188

* Prior to 1895–96 the course was two years.

Fifty-three law schools have been organized since the civil war—seventeen in the period 1890–95. There were 3,906 students in law schools in 1888–89, and 7,804 in 1893–94. This shows the rapidly growing conviction that a legal education is best acquired in a law school. It is noticeable also that at only eight of the seventy-five schools is the course limited to a single year. In eleven the course extends over three years. It is highly probable that in a few years a majority of the schools will have the three years' course. Furthermore, all but seven of the seventy-five schools are university schools. The significant feature of legal education in the U. S., it will be seen, is the wide departure from English traditions in favor of study with a practicing lawyer and the close approximation to the continental principle of university legal training. This result has been reached not by imitation of continental methods, but by an independent development. There are still important differences. Upon the continent of Europe the student's attendance at the university law school is compulsory, while in the U. S. it is optional. In continental countries a collegiate education is a prerequisite to admission to the law school. In the U. S. the great majority of law students have no academic degree, and the standard of admission requirements is lamentably low, although gradually rising. The Harvard Law School, indeed, after the academic year 1895–96 will, with rare exceptions, give the degree of LL. B. only to college graduates.

Methods of Instruction.—There is, as yet, no consensus of opinion as to the best mode of teaching law in a law school. In the European universities the professors teach almost wholly by lectures, but the *seminar* courses, in which the students and the professor discuss the original authorities, are growing in favor. In American law schools, also, in early days the instruction was generally given in the form of lectures, but since the multiplication of legal treatises the lecture method has been largely superseded by the recitation method. The student reads a certain number of pages of a given text-book, upon which he is catechised in the classroom by the professor, who also expounds and criticises the treatise. In 1870 the inductive and genetic method, which is almost universally adopted in the teaching of other sciences, was for the first time used in the teaching of law. To Prof. Langdell, dean of the Harvard Law School, belongs the honor of this innovation. The chief merit of this new system lies in its development of the habit of intellectual self-reliance. The text-books used contain, not a treatise or commentary upon the original sources, but the original sources themselves, being collections of cases upon various branches of the law, properly classified and so arranged as to show the historical development of legal prin-

ciples. These cases are subjected in the class-room to a thorough analysis and comparison by the students, who are made to feel, so far as possible, that they and the instructor are fellow students engaged in the common pursuit of scientific truth. In a word, the students apply to the questions successively arising in the orderly development of a branch of law the same method which is employed by a successful barrister in solving the heterogeneous questions arising in active professional life. The inductive method, or, as it is frequently, but unfortunately, called, the case method, of teaching law has been adopted by all of Dean Langdell's colleagues at the Harvard Law School. It is also the exclusive or prevailing mode of instruction at the law schools of Columbia College, Northwestern University, Western Reserve University, and at the Metropolis Law School, and has also been adopted in one or more courses at the following law schools: Cornell, Leland Stanford Junior, University of Colorado, Columbian, University of Iowa, University of Michigan, University of Minnesota, St. Louis, University of the City of New York, University of Pennsylvania, University of the South, University of Tennessee.

JAMES BARR AMES.

VIII. TECHNICAL SCHOOLS.

Under this head must be included polytechnic institutes, institutes of technology, schools of technology, schools of applied science, mining schools, all schools, in fact, in which the sciences are taught with a view to their practical application to the promotion of the material interests of man. There will necessarily be included also technical departments of colleges and universities, some of which have distinct and separate organization as to faculties of instruction, and often a distinctive name, although controlled by the same corporate body as other departments, while others are little more than technical or professional courses of study, in which instruction is given by the college or university professors.

It is difficult to point out the exact beginnings of technical education, when considered in a general sense as education specially planned to prepare young men for the occupations in which they are likely to be engaged during their active lives. Perhaps the earliest authentic records of such a system of training are those of the ancient Persians. The curriculum, like many in more modern times, was tripartite. It included riding, shooting with the bow, and speaking the truth. The first two accomplishments may rightly be considered as technical in their character, being evidently closely related to the probable future occupation of the young men being educated. That speaking the truth was then considered of sufficient importance to form an essential element of this training is extremely interesting, especially as it appears to have furnished about all there was of the moral-intellectual side of the educational discipline. The purely intellectual found its earliest pronounced development among the Greeks, and technical education had little recognition at their hands. It is true that Aristotle evolved and taught an elaborate system of natural philosophy, but when it is remembered that it was founded on two principles, namely, the principle of generation and the principle of corruption, it is easy to admit that the growth of science was enormously retarded during the nearly 2,000 years over which the influence of Aristotle was dominant. Archimedes, another Greek, living a century later, was the founder of applied science, the great forerunner of the noble army of engineers which has brought the forces of nature into subjection for the benefit of man. He was the first to possess some knowledge of the fundamental principles of mechanics. Out of a clear insight into the doctrine of equilibrium he created the science of statics, one of the two pillars on which the best part of engineering rests. He possessed two accomplishments, even now necessary and all but sufficient to the production of a successful engineer. He had the skill and instincts of a mechanic, and he was a profound mathematician.

In spite of the life and work of Archimedes, the influence of Aristotle remained paramount for many centuries, and throughout all Europe; but a new era began with the appearance of Galileo, who was especially fitted for the task which seems to have awaited his coming. Possessed of many accomplishments, music, painting, eloquence, with charming manners, he was at the same time bold and courageous. At the age of nineteen he began his career as an experimental philosopher by making a discovery which the world will never forget, and which was the beginning of a series resulting in a few years in the establishment on an experimental basis of the fundamental principles of dynamics. These had been beyond the grasp of Archimedes, but the work of the Italian furnished the other pillar upon which, through a system of rational mechanics, the science and art of engineering might now rest. For the first time it came to be recognized that whenever possible every dictum of the science of philosophy should be subjected to the inexorable tests of trial and experiment before acceptance, and the reign of authority was ended, although not without a struggle.

It would seem that the times were ripe for this development, for contemporaneous with Galileo were two Englishmen, Dr. William Gilbert and Lord Bacon, who bore a prominent part in the work. The work of Gilbert, although relatively very narrow and restricted, was on the same high plane of originality as that of the Italian, and furnished one of the earliest and very best examples of the purely experimental method of discovering truth. That of Bacon, while generally over-estimated, was valuable as a formulated expression of the principles of the new philosophy, and a masterly analysis of the methods of inductive reasoning. The labor of these men resulted in the destruction of the method of antiquity. They were followed by Kepler, Newton, and a host of others, who, by creating science, made applied science possible.

Much time elapsed, however, before experimental science was admitted to the sacred precincts of the college curriculum. Brilliant scholars had made beautiful discoveries concerning the interrelation of natural phenomena, the exposition of which at once charmed the cultivated and delighted the ignorant. Practical applications of these discoveries were made from time to time, by means of which the comforts of life were enormously multiplied and wretchedness and anxiety enormously lessened; but all of these originated in more or less irregular and sporadic examples of scientific activity. Science had, it is true, found its way into many institutions of learning before the beginning of the nineteenth century, but the methods of instruction in vogue were those then, and until recently, in use in teaching mathematics, language, philosophy, and history. Such experimental studies and research as were carried on were mostly the private work of the professors; students continued to learn from books only, as they were accustomed to do in other subjects, and independent thinking was not encouraged. As early as the beginning of the nineteenth century, however, the importance of a systematic study of the applications of scientific discovery to the practical affairs of everyday life was felt by more than one man, and the possibility of an organized effort to encourage experimental research and the pursuit of applied science was recognized. The establishment of the Royal Institution in London by Count Rumford was an epoch in the history of science. He unquestionably had in his mind a technical school or college of the modern type. He founded the institution that it might serve for "the general diffusion of the knowledge of all new and useful improvements, and teaching the application of scientific discoveries to the improvement of arts and manufactures, and to the increase of domestic comfort and convenience." It originally contained a workshop for blacksmiths, with a forge and bellows, all sorts of models of machinery, and at one time a score of young mechanics were boarded and lodged in the house. But, fortunately indeed for the world at large, it was not destined to continue as an example of what its founder evidently intended it to be, and what has been so abundantly realized in other more recent institutions. One of the first men to begin the work of the Royal Institution was Davy, and he quickly inaugurated for it a career on a distinctly higher plane. By a rapid evolution it became the most famous laboratory of research in the world, and even its founder would be compelled to admit that by its devotion to pure science and seeming neglect of the practical it has been infinitely more useful to those whom it was originally planned to benefit than if it had been held closely to the lines at first laid down. The splendid and continuous series of epoch-making discoveries by Thomas Young, Davy, Faraday, Tyndall, and Rayleigh constitute an everlasting monument to the founder of the institution.

Indeed it may be safely affirmed that during the first half of the nineteenth century the time was not yet ripe for the establishment of the technical school as it now exists. A science must come to be more or less of an exact science, and it must have accumulated a tolerably well-di-

gested and compact body of facts and principles before its application to practical problems can be undertaken with assurance of success. The splendid researches carried out by a generation of scholars now passed away were essential to successful development of the school of technology, and in a still greater degree were the methods of scientific investigation necessary to that development. Observation and experiment came to the front, and for the first time in the history of education began to be esteemed at something like their full value. It came to be understood that the path to success was not alone through the study of books, but that the study of things was more important. What is known as the "laboratory method" of instruction began to be adopted in the most progressive institutions of learning, and soon proved itself to be vitalizing and powerful. All other departments of learning were forced to become the imitators of science in the use of this method, and the "new education" resulted. Many feared the effect upon the courses of study tending to produce what was long erroneously called a "liberal education," but it was soon found that if the simple "culture effect" be considered alone, the new education asks no odds of the old, while in the production of sound thinking and a virile intellectuality it is far and away ahead.

All of this was a necessary forerunner to the perfectly organized school of technology, but as a matter of fact the development of the latter was in a large measure contemporaneous with the evolution of the new education as outlined above. A class of professional schools has existed, indeed, almost as long as education itself, namely, those organized and maintained for the training of clergyman, lawyers, and physicians. Military schools have also long been in existence, and out of these latter came the beginnings of technical instruction.

In Europe this beginning is to be found in the creation of the celebrated École Polytechnique in France, in the third year of the Convention (1794). It was primarily for the training of young men in mathematics and drawing, to fit them for the Engineer and Artillery Corps of the French army. It owes much of its excellence to the labors of Carnot, who strove to give it a secure and proper foundation. The number admitted to its classes was limited, and only the best of the candidates were selected. Some of the most celebrated military and civil engineers of France have received their training there, and it has numbered among the members of its faculty such famous men as Lagrange, Laplace, Berthollet, Poisson, etc. It continues to adhere with considerable conservatism to the principal methods of its early history, and, in spite of innumerable competitors that have sprung up since its foundation, its rank is among the highest.

The famous School of Mines at Freiberg, earlier in its establishment by many years, has enjoyed a long and illustrious career, and is an excellent type of a technical school differing very decidedly from the École Polytechnique. In its early development, amid the rich mining resources and industries of Saxony, it illustrates the general principle that nearly every one of the first technical schools owes its origin to the demands of the leading industry in its immediate vicinity, by which also the character of its instruction was largely determined. Influenced largely by this principle, schools of technology became very numerous throughout continental Europe during the first half of the nineteenth century. Most of them have kept pace with the extraordinary development of science and scientific methods which has taken place during the last half of the century; their facilities for instruction have increased, and their courses of study have become largely professional. The polytechnic school has begun to assume its proper place in European schemes of education as something quite distinct from the earlier trade schools, from which, however, it was in many instances evolved. Besides France and Germany, Austria, Sweden, Switzerland, and Russia have maintained technical schools of high repute. Indeed, the U. S. is indebted to Russia more than to any other nation for some of the most important and valuable features of the modern school of technology. It was at two famous Russian schools, the Imperial Technical School, at Moscow, and the Institute of Technology, at St. Petersburg, that the experiment was first made of combining in the engineering courses the study of text-books, lectures, and other exercises long known to form a necessary part of scholastic training, with practical exercises in workshops in which the student was made familiar with machines, their construction and use, and the nature of the materials upon which they worked. Many of the older and more conservative schools in Europe have been reluctant to follow the example of the Russians, but the numerous and great advantages of the method have been recognized in England and in a still greater degree in the U. S., where nearly every school of technology has adopted the Russian plan in a greater or less degree.

Great Britain, although contributing more largely, perhaps, than any other nation to those scientific discoveries upon which all technology is based, was slow to realize the necessity for technical education. It was not until it became evident that France, Germany, and other nations of continental Europe were likely, through their encouragement of technical schools and colleges, to deprive the United Kingdom of the prestige of first place in engineering and manufacturing skill, that the British began to develop this side of their educational system. Much interest was suddenly created, royal commissions were appointed, the work of foreign countries was examined and reported upon, and organized efforts resulted in the rapid advancement of the interests of technology. One organization, extensive in scope and comprehensive in plan, deserves more extended notice, even in a brief treatment of the subject. It is the City and Guilds of London Institute for the Advancement of Technical Education. The Prince of Wales is the president of the institute, and among its vice-presidents are the lord mayor of London, the president of the Royal Society, the president of the Institute of Civil Engineers, and many other of the most eminent men of Great Britain. The operations of the institute include the management of three London colleges and the system of technological examinations. The three colleges are the City and Guilds Central Technical College, which is "a college for higher technical instruction in mechanics and mathematics, civil, mechanical, and electrical engineering, and chemistry," the City and Guilds Technical College at Finsbury, and the London Technical Art School. The scheme of technological examinations is very elaborate and ambitious. Examinations are conducted once every year at various centers in the United Kingdom, upon a wide variety of technical subjects, more than sixty in number. Prizes and honors are awarded, and in some cases grants of funds are made. The object is to encourage local development of technical education, and the results are commensurate with the magnitude of the undertaking.

In the U. S. the earliest foundation for technical education was that of the Rensselaer Polytechnic Institute at Troy, N. Y. It was established in 1824 by Stephen van Rensselaer as a School of Theoretical and Applied Science. In the early years of the republic it was the necessary custom to employ learned and skilled foreigners in various public works, and most of the engineers at first engaged on the construction of canals and roads came from France. Many young men were sent there from the U. S. to be educated, and the Rensselaer School evidently owed its origin to a desire on the part of its founder to create an institution capable of supplying this demand. Its work has been mostly confined to the education of civil engineers, in which it has had a long and successful career.

About the middle of the century the importance of the sciences of chemistry, physics, geology, etc., had become so evident that several of the more important colleges established special departments for scientific work. The old education still held sway, and was at most only willing to admit the new as a sort of annex, but carefully avoiding responsibility in most cases by providing quite a distinct organization for the scientific school. The Sheffield Scientific School of Yale University was the earliest of these, having been founded in 1847. It was followed by the Lawrence Scientific School of Harvard University in 1848, and the Chandler Scientific School of Dartmouth College in 1852. The first two were for a long time schools of science rather than its applications, although they have latterly taken more of the character of schools of technology with thorough courses in several branches of engineering. The school at Dartmouth College has confined its work largely to civil engineering. All have done work of a high order.

Technical education in the U. S. received its greatest impetus, however, during the later years of the civil war and those first following its close. This must be attributed to two causes: First, the passage of the Morrill Act by which large land grants were made to the several States for the purpose of enabling them to establish institutions for giving instruction in agriculture and mechanics; second, the very

extensive endowment of schools of technology during these years by private munificence. At this time the great mineral resources of the country began to receive the attention they deserved; the civil war had demonstrated the great value of technical knowledge and skill, and by the rapid rise in the value of real estate near cities and towns, and also by reason of the enormous expenditure of the Government for supplies during the period of the war, many men found themselves masters of larger fortunes than they had ever hoped to possess. Some of them were wise enough to return a good share of their accumulations to the people through educational endowments.

From these two sources came a number of technical colleges, which easily divide themselves into two great classes. In the first are found principally those schools owing their existence to the national land grant and a few others, including some of the early schools already mentioned, all of which are departments or schools or colleges belonging to a university or college organization. Probably half of the institutions growing out of the land grant fund have special courses in the various branches of engineering and other technical subjects. Among those best known for the strength of the technical courses may be mentioned Cornell University, at Ithaca, N. Y.; Purdue University, at Lafayette, Ind.; the Universities of Wisconsin, of California, the Ohio State University, at Columbus, and the Illinois Industrial University. To these should be added, as among the more important technical schools attached to colleges or universities not founded or supported by the land grant fund, the Sheffield, Lawrence, and Chandler Scientific Schools mentioned above, the Thayer School of Civil Engineering, also connected with Dartmouth College, the School of Engineering of the Washington University at St. Louis, organized in 1870, and the School of Mines connected with Columbia College, New York.

In the second class are found schools of technology on an independent and separate foundation, and mostly the outcome of private endowment. The earliest of these was the Rensselaer Polytechnic Institute, already referred to. The next in order of time and one of the foremost in the country is the Massachusetts Institute of Technology, at Boston. It had its origin in a report prepared by Prof. William B. Rogers, entitled *Objects and Plan for an Institute of Technology, including a Society of Arts, a Museum of Arts, and a School of Industrial Science.* It was chartered in 1861, and opened to students in 1865. The school of Industrial science has grown to be the foremost feature of the institute, although the other features are still retained. The next in the order of the date of incorporation is the Worcester Polytechnic Institute, at Worcester, Mass. It was incorporated in 1865, and its first building opened to students in 1867. It was the first school of technology in the country to add a workshop to its equipment for the instruction of mechanical engineers and systematically to provide workshop practice as a part of the course of study. In this class should also be included Lehigh University, at South Bethlehem, Pa., incorporated in 1866. Although bearing the name university, and providing courses of study in general literature as well as in technical subjects, the location of the school in the heart of a region rich in mineral resources has given it such a bent in the direction of applied science that it may not unjustly be regarded as a school of technology. In 1871 the Stevens Institute of Technology was established through the munificent liberality of Edwin A. Stevens, himself a noted engineer. The Case School of Applied Science was opened in Cleveland, O., in 1891, and the Rose Polytechnic Institute, at Terre Haute, Ind., in 1883. All of the schools named as belonging to the last class owe their origin to private endowment. The Massachusetts Institute of Technology receives a share of the congressional aid to land grant colleges.

The courses of study in the schools of technology in the U. S. extend through four years in nearly every instance. Students are not usually admitted under sixteen years of age, and the requirements for admission are not, in general, lower than those of other institutions of college rank, and in some instances they are higher. Modern languages are usually required for admission instead of Latin and Greek. The courses of study generally include, besides mathematics and the more purely technical subjects and sciences, language, history, and political economy, differing in this respect from many of the European technical schools. They differ widely as to the range of their technical courses, a few confining themselves almost exclusively to civil engineering, or in some cases to mining engineering, while the greater number include civil, mechanical, and electrical engineering and chemistry, to which in a few instances are added mining engineering, sanitary engineering, architecture, and general scientific courses. The instruction is largely of a practical character, extensive use being made of laboratories, workshops, etc. Considerable difference exists in the character and amount of workshop practice as a part of the course in mechanical engineering. In some schools this is largely restricted to hand and bench work, little or no attention being given to construction. In others, the use of machine tools and experience in the actual construction of machines, and the assembling of their parts, is regarded as of paramount importance to the engineer. In all schools of technology worthy of the name the methods of instruction are such as tend to create independence of thinking and personal responsibility in judgment. With properly managed courses of study they are not deficient in the production of that intellectual discipline and culture which constitute a liberal education. While not organized for original research, their methods naturally lead to it, and in the U. S. they have probably during the period of their existence contributed more to the advancement of science than have educational institutions non-technical in character. They represent one of the most important achievements of an age whose chief glory is found in the increase and diffusion of science and its applications.

T. C. Mendenhall.

IX. Trade Schools.

The inception and growth of the trade-school idea is, strictly speaking, confined to the nineteenth century. As an institution the trade school is purely a logical outgrowth of the changes in industrial methods which have taken place since the invention of the steam-engine. In the days of the guilds, when all production was in the hands of the master workman and his corps of journeymen, the youth seeking a trade found his natural place in the household of his master, where during the long years of his indenture he was initiated into all the secrets of the craft. With the introduction of machinery, however, a great change began in industrial methods. The economic advantage of quantity production, coupled with the division of labor, appeared, and the master, no longer simply the master craftsman, has gradually developed into the directive head of an industrial establishment. No longer working with his own hands, he uses his brain to direct more effectively the hands of many. Under these conditions the natural relation between the apprentice and his master has ceased, and without any provision for systematic training the apprentice, except in rare instances, is left to pick up the practice of his trade by observation and to such opportunities as chance and the good nature of his fellow workmen afford. Under such conditions a large amount of time is inevitably wasted and the training obtained liable to be one-sided and lacking in thoroughness.

Object of the Trade School.—The trade school represents an attempt to provide a modern substitute for the apprenticeship system better suited to these changed conditions. Before discussing the institutions engaged in such instruction it will be necessary to make clear certain distinctions in purpose and methods existing among the present schools. The trade school proper, with which this article is immediately concerned, is an institution designed to prepare handicraftsmen for practical work at a trade. Such a school may or may not include instruction other than manual, but its primary object is manual dexterity. Such schools are represented by the *Fachschulen* of Germany and Austria and the trade schools of the U. S. A technical school is an institution in which, in addition to practical instruction in the methods of a craft, the scientific principles upon which it is founded are thoroughly explained and their bearing upon the operations of the trade clearly demonstrated. Such schools may prepare superior craftsmen, fitted to become foremen or superintendents, or they may produce designers. The Pennsylvania School of Industrial Art and the weaving-school at Crefeld, Germany, are typical examples of such schools.

Schools in Continental Europe.—On the continent of Europe a large amount of study and experiment has been given to the problem of industrial training, and trade and technical schools have there reached a high point of organization and efficiency. This is particularly true of Germany, Austria, Belgium, and France. In Germany and Austria the system of trade schools is very thorough and much special-

ized. General industrial schools, in which a number of trades are taught, are found throughout the two empires, while special trade schools, in which one particular branch is dealt with, are distributed according to local needs. Thus there are special trade schools for silk-weaving, linen-weaving, watch-making, wood-working, mason-work, machine-work, brewing, etc. Courses in these schools are generally from three to five years in length, and embrace, besides practical trade-training, instruction in mechanical and free-hand drawing, geography, business forms, mathematics, book-keeping, and science. From the nature and extent of the instruction many of these schools should more properly be classified as technical schools, and even when the object is merely to combine the elements of a general education with the training of a handicraftsman the large amount of time required prevents their benefits being very generally reaped by the artisan class. The actual effect of these schools is in consequence rather to prepare a limited number of graduates fitted for superior workmen and foremen than to supply a means of training the great mass of artisans.

The aim of the Belgian schools approaches more nearly to that of a true trade school than those of the schools just described. Trade proficiency rather than an all around education is the end sought. Mental instruction is indeed generally provided, but its character is limited to such branches as have a direct bearing upon the trade. Besides a number of institutions supported by guilds and trade-unions, as well as several parochial schools in which practical trade-training is furnished, two very comprehensive trade schools exist at Tournay and Ghent. In these schools the pupil upon entering selects a special trade, which he pursues for a course of three years. Instruction is given in these schools in drawing, mathematics, science, and industrial economy.

In no country is the character of trade and technical instruction more differentiated than in France. In each of the French schools the grade of product aimed at, whether it be artisan, foreman, superintendent, or engineer, is accurately defined. Of the first mentioned class are the manual apprenticeship schools, into which boys are admitted at twelve or thirteen years of age. These schools are municipal institutions receiving state aid. They are in fact elementary trade schools which devote the greater part of a three years' course to practical manual work. The aim is not to turn out full-fledged workmen, but rather to shorten the period of apprenticeship. Mental instruction to the extent of three or four hours a day is given throughout the course. There are schools of this character in Paris for the mechanical trades, for bookmaking, and for furniture-making. Other schools exist at Havre, St.-Étienne, Rheims, Nantes, and St.-Chamond. Besides these municipal schools there exists a system of national apprenticeship schools, which are divided into primary and secondary grades. The primary schools are similar in character to the municipal schools, but afford somewhat more advanced instruction. In the three secondary schools at Châlons, Angers, and Aix, the instruction in both theoretical and practical branches is very thorough, and is such as to fit the graduates to become superintendents and masters of industrial establishments. The course is three years in length, and pupils must be between fifteen and seventeen years at entrance.

Great Britain.—In Great Britain trade schools (with one or two possible exceptions) do not exist. There are a large number of technical schools representing a great variety of aims and methods in which workshop instruction plays a part, but the principle almost universally obtains that a trade can only be properly acquired in a regular shop.

The United States.—Practical trade-school work in the U. S. began with the foundation of the New York trade schools in 1881. At first the work of these schools was confined entirely to evening classes. From the beginning the aim has been to train beginners for practical work at the trades. It is not designed, however, to reach the expertness of the finished mechanic, but rather to give a thorough grounding in the science and practice of the trade, leaving speed and experience to be acquired in after-practice at the trade. These schools have been pre-eminently successful. Starting with thirty-three pupils in 1881, the attendance has steadily grown, until in 1893 it reached 556. Manual instruction is supplemented in all classes by instruction upon the nature of materials and the scientific principles involved in the trade. Schools of like nature have been established by the Philadelphia Master Builders' Exchange and by the Pratt Institute of Brooklyn. In all of these institutions the principle obtains of confining the instruction given in the schools to an essentially practical preparation for the trade and to pupils of sufficient age to learn rapidly, leaving the general education to be gained in the common schools previous to entering.

This system has received the endorsement of the National Association of Master Builders, who at their meeting of 1888 at Cincinnati passed resolutions recommending that a lad who wished to enter the building trades should go at first to a trade school to learn the science and practice of his trade. When the trade-school course is finished and he has proved by an examination held by a committee of master mechanics that he has profited by it, he is to enter a workshop as a "junior." When old enough and able to do a full day's work he is to apply for a second examination, which if passed entitles him to be considered a journeyman.

This system seems well suited in its essentials to the needs and genius of the people of the U. S. and destined to develop throughout the country. One great obstacle to progress, however, is the attitude of the labor-unions, who oppose the entrance of trade-school graduates into the trade upon the same ground that they seek to limit the number of apprentices. In order to secure a full and free development of the trade-school movement in the U. S., a recognition of the trade-school graduate by the organization of the journeymen as well as by organizations of masters is necessary, and his establishment with a definite place and a definite economic value in the industrial world. C. R. Richards.

Schools of Fine Arts: See the Appendix.

School Statistics: See the Appendix.

Schooner: a vessel with two or more masts and fore-and-aft rigged; or, if the foremast have a square topsail, the vessel is called a topsail schooner. When sailing by the wind, schooners have an advantage over square-rigged vessels, and they are easily handled by a small crew.

Schoonmaker, Augustus: lawyer; b. in Rochester, Ulster co., N. Y., Mar. 2, 1828; was educated in the public schools of his native town; 1848–50 taught in the district schools of the county; in 1851 began the study of law, and was admitted to practice in 1853. He was elected county judge in 1863; re-elected in 1867; in 1875 was elected to the State Senate, where he drafted a bill to provide for uniformity of text-books in the common schools, which embodied the principle of the one which finally became a law of the State. In 1877 he was elected attorney-general of the State, and during his term of office (1877–79) had to deal with the questions relating to the release of William M. Tweed, the complications of the Erie Railway, the new apportionment under the census of 1875, and the constitutionality of that portion of the New York city charter creating a board of estimate and apportionment. In 1883 he was appointed one of the civil-service commissioners of New York. In 1887 he became an interstate commerce commissioner. D. in Kingston, N. Y., Apr. 10, 1894.

Schopenhauer, shō'pen-how-er, Arthur: philosopher; b. in Dantzic, Prussia, Feb. 22, 1788. His father was a banker; his mother, Johanna, a writer of novels and books of travels. He entered the University of Göttingen in 1809; studied philosophy under Schulze the skeptic, and gave especial attention to Kant and Plato; in 1811 heard the lectures of Fichte at Berlin; wrote his famous essay, *On the Fourfold Root of the Principle of Sufficient Reason*, for his degree at Jena in 1813; adopted Goethe's theory of colors, and wrote in 1816 an essay *On Seeing and Color*. His principal work, *The World as Will and Representation*, was composed in Dresden and published in 1819. After a visit to Italy he settled at Berlin University as docent, and remained there in this capacity until 1831, with the exception of some intervals spent in Italy. Want of success as a lecturer caused his withdrawal from Berlin in 1831 to Frankfort-on-the-Main, where he spent the rest of his life in seclusion, and died Sept. 21, 1860. His characteristic doctrine is pessimism. The world is the worst of possible worlds. We can alleviate our lot in it by sympathizing with the suffering, and in a still more effectual way by an asceticism which destroys our will to live. This view of the world he connects with his doctrine of the Will, but not in a very obvious manner. According to him the Will is the only substantial essence in the universe; it is Kant's "thing in itself." The intellect, consciousness, our entire theoretical activity, is simply a result of the Will in its higher forms. The Will constantly energizes toward life, and the stadia of nature are simply the instrumentalities of the Will created on its way to life. Mere matter, as the product of forces, is the lowest

stage, the result of blind Will; in chemical action, where there is reciprocal excitement to activity, the Will is manifested on a higher stage; finally, the Will objectifies itself in organisms, which do not depend upon externally exciting causes for their activity, but work from internal motives, and select likewise their own food, and hence need intelligence to convert blind exciting impulses into motives. The organism thus evolves a brain in which the Will manifests its highest objectivation. With the brain, and intelligence which is its function, there arises simultaneously, as result, the world as representation with all its forms: subject and object, space and time, causality, etc. The brain with its intelligence is therefore only the tool or instrument of the will to live. He adheres to the Oriental idea of annihilation, and considers the Christian idea of immortality a delusion. Hence "the happiest moment of life is the completest forgetfulness of self in sleep, and the wretchedest is the most wakeful and conscious." The world presents a continual tragedy before us, in which eternal justice becomes visible as the Nemesis which reduces to nullity again the individuals which have arisen like bubbles upon the surface of the Eternal Will. Hence the highest act of morality is resignation, renunciation. Enjoyment of art is the only permissible pleasure, because that is cognition devoid of Will. The Nirvana of the Buddhists is the ultimate desideratum in the view of Schopenhauer. In this world, which was the worst possible, the worst features in it, to Schopenhauer, were the contemporary philosophers, Fichte, Schelling, Hegel, and their followers, who achieved popularity and success, while he failed. He exhausted his ingenuity in inventing opprobrious epithets for these "professors of philosophy"; but the dependence of his own views upon contemporary systems is quite obvious, especially upon those of Fichte and Schelling. Optimism might as well have been the logical consequence of his theory that the energy of the Will develops the intellect as its tool; for the world as representation must be then regarded as the ultimate final product of the Will, and any pessimistic annulment thereof as retrogression to a less complete standpoint. It was therefore illogical to adopt Buddhism as a consequence of his system. Consistent elaboration would have developed a philosophy much resembling the earlier system of Schelling. Besides his three works already named, the following are important: *Upon the Will in Nature* (1836); *The Freedom of the Human Will* (1839); *The Basis of Morals* (1841). *The Parerga and Paralipomena* (1850) contains his views in a fragmentary form, and is the most popular of his works. The following of his works have appeared in English translations: (*a*) *The World as Will and Idea*; (*b*) *The Fourfold Root of the Principle of Sufficient Reason*; (*c*) *On the Will in Nature* (London); selections from his *Parerga and Paralipomena*: (*d*) *On the Misery of Life*, etc. (Milwaukee); (*e*) *The History of Philosophy*, etc.; (*f*) *Religion*, etc. (London). See his *Life*, by Helen Zimmern (1876), and by Wallace (Great Writers' Series, 1890). Julius Frauenstädt has edited his works, and done much to make known his doctrines. Edward von Hartmann, in his *Philosophy of the Unconscious*, presents in a modified form the philosophy of Schopenhauer. See Pessimism. William T. Harris.

Schopp, Kaspar: See Scioppius.

Schouler, James, A. B., LL. D.: lawyer and historian; b. at Arlington, Mass., Mar. 20, 1839; graduated at Harvard 1859; served in the civil war; practiced law in Boston and Washington, D. C.; author of legal text-books on *Domestic Relations*; *Personal Property*; *Bailments*; *Wills, Executors and Administrators*. He is more widely known as the author of *History of the United States under the Constitution* (5 vols., 1880–91). C. H. T.

Schouten, *sk*how'ten, Willem Cornelis: navigator; b. at Hoorn, Holland, about 1567. He was long employed by the Dutch East India Company, but resigned in 1610, and engaged with the merchant Isaac Lemaire to find a new route by the W. to the East Indies. Leaving the Texel June 14, 1615, he passed by the Strait of Magellan, discovered the passage named by him Lemaire Strait, was the first to double Cape Horn, and reached the Indies in safety. There he was arrested, but was subsequently acquitted, re-entered the service of the East India Company, and died on the coast of Madagascar in 1625. The Cape Horn route was speedily adopted as preferable to the Strait of Magellan; it is still used for sailing vessels. H. H. S.

Schouvaloff: another spelling of the name Schuvalov (*q. v.*).

Schrader, Eberhard: Orientalist; b. at Brunswick, Germany, Jan. 5, 1836; studied at the gymnasium in Brunswick and the University of Göttingen; Professor of Hebrew and Semitic Languages successively at Zurich, Giessen, Jena, and since 1875 professor and member of the Royal Academy at Berlin; author of *De linguæ Æthiopicæ cum cognatis linguis comparatæ indole universa* (1860); *Studien zur Kritik und Erklärung der biblischen Urgeschichte* (1863); *Einleitung in das alte Testament* (with de Wette, 8th ed. 1869); *Die assyrisch-babylonischen Keilinschriften* (Leipzig, 1872); *Die Keilinschriften und das alte Testament* (Giessen, 1872; 2d ed. 1883; Eng. trans. *The Cuneiform Inscriptions and the Old Testament* 2 vols., London, 1885–88); *Die Höllenfahrt der Istar* (1874); *Keilinschriften und Geschichtsforschung* (Giessen, 1878). Editor of *Keilinschriftliche Bibliothek* (1889, *seq.*). Benj. Ide Wheeler.

Schrader, Julius Friedrich: painter; b. in Berlin, Prussia, June 16, 1815; studied painting at the academy of his native city, at Düsseldorf 1837–45, and in Rome 1845–47, and was appointed professor at the Academy of Berlin in 1851. His most celebrated pictures are *The Death of Leonardo da Vinci* (1851); the great fresco in the New Museum of Berlin, *The Consecration of the Church of St. Sophia in Constantinople* (1853); *Esther before Ahasuerus* (1856), and a number of portraits.

Schrader, Otto: comparative philologist; b. at Weimar, Germany, Mar. 28, 1855; educated at the gymnasium in Weimar, and at the universities at Jena, Leipzig, and Berlin; teacher in the gymnasium at Jena, and assistant professor in the University of Jena; author of *Linguistisch-historische Forschungen zur Handelsgeschichte und Warenkunde* (1886); *Sprachvergleichung und Urgeschichte* (1883; 2d ed. 1890; Eng. trans., *Prehistoric Antiquities of the Aryan Peoples*, 1890); *Victor Hehn, ein Bild seines Lebens und seiner Werke* (1891); edited the 6th (revised) edition of Hehn's *Kulturpflanzen und Hausthiere* (1894). B. I. W.

Schreiner, W. P.: See the Appendix.

Schreyer, Adolf: animal-painter; b. at Frankfort-on-the-Main, Mar. 9, 1828; studied at the Städel Institute, Frankfort; medals, Paris Salons, 1864, 1865, and 1867; medals at Brussels Exhibition 1863 and Munich 1876; Order of Leopold of Belgium. He traveled and painted in Egypt and Algiers, and lived in Paris until 1870, when he removed to Kronberg, near Frankfort. His pictures of horses and Arabs are very popular in the U. S., and many of his works are in private collections in New York and other cities. D. July 29, 1899. W. A. C.

Schriver, Edmund: soldier; b. at York, Pa., Sept. 16, 1812; graduated at U. S. Military Academy, and promoted brevet second lieutenant of artillery July 1, 1833, captain 1842; resigned July 31, 1846, having served as captain of staff and assistant adjutant-general almost continuously from 1838 to 1846. In Apr., 1861, he accepted an appointment on the staff of Gov. Morgan of New York, with the rank of colonel and A. D. C., and May 14 was appointed lieutenant-colonel of the Eleventh Infantry U. S. army; colonel and A. A. D. C. May, 1862, and served as chief of staff to Gen. McDowell and Gen. Fremont (third corps); appointed inspector-general U. S. army (rank of colonel) Mar., 1863, and assigned to the Army of the Potomac; was engaged at Chancellorsville and Gettysburg 1863, and in the Richmond campaign of 1864, up to the investment of Petersburg. He was breveted brigadier-general in 1864 and major-general in 1865: was inspector of the Military Academy 1866–71; retired 1881. D. Feb. 10, 1899. Revised by James Mercur.

Schröder, Friedrich Ludwig: actor; b. at Schwerin, Germany, Nov. 3, 1744; was abandoned, while still a boy, by his parents, who were strolling actors, at Königsberg; found his parents in 1759 in Soleure, where he was trained to become a dancer; joined them finally in Hamburg in 1764; undertook in 1771 the management of the troupe after the death of his step-father, Ackermann, and raised the stage of Hamburg to a position of literary and artistic influence in Germany, partly by his plays (collected and published in 1831 in four volumes, with an introduction by Tieck), partly by the rigid sense of social propriety with which he governed the theater, but especially by his grand impersonations of some of the principal Shakspearean characters, such as Lear, which he was the first to introduce on the German stage. D. at Rellingen, Sept. 3, 1816. His *Life* has been written by F. L. W. Meyer (1810) and Brunier (1864).
Revised by B. B. Vallentine.

Schröder, Sophie (*Bürger*): actress; b. at Paderborn, Westphalia, Feb. 23, 1781; appeared upon the stage when twelve years of age in St. Petersburg, where the troupe to which her parents belonged was playing; married in 1795 Stollmers (whose true name was Smets), the director of another band, in 1804 the singer Schröder, and in 1825 the actor Kunst; acted in all the principal theaters of Germany, but principally at Vienna, and aequired a great fame by her impersonations of Phædra, Medea, Merope, Lady Macbeth, Sappho, etc. In 1840 she retired from the stage with a pension from the Austrian court. D. at Munich, Feb. 25, 1868. Her *Life* was written by P. Schmidt (Vienna, 1870).—Her daughter, Wilhelmine Schröder-Devrient, b. at Hamburg, Oet. 6, 1804, made her *début* as a singer in 1821 in *The Magic Flute*; sang as Donna Anna, Euryanthe, Fidelio, ete., and was soon aeknowledged as the first singer of Germany; was reeeived with great enthusiasm in Paris, London, and St. Petersburg; retired from the stage in 1847. D. at Coburg, Jan. 26, 1860. She was twiee married, the first time (1823) to the actor Karl Devrient. Her *Life* was written by Claire von Glümer (1862) and Wollzogen (1863).

Schubert, Franz: "the immortal melodist"; b. in Vienna, Jan. 31, 1797; son of a school-teacher in the Lichtenthal district of the city; was trained chiefly by the organist of the parish church; became leader of the choristers' school of the court chapel; composed his first symphony in 1813; taught in his father's school to avoid eonseription; in 1818 beeame teacher of music in the family of Count Esterházy at Zeléez, Hungary; in the same year returned to Vienna, where the publieation (1821) of his *Erl King* gained him popularity; gave his first and only public eoneert in 1828 in Vienna. D. in Vienna, Nov. 19, 1828. He is best known by his songs, several hundred in number, of which some fifty or sixty are celebrated and will live. His music was searcely known to the outside world during his lifetime. His fecundity was marvelous, and the quantity of MS. left behind to be diseovered by the musical world was enormous. His original MSS. prove the great ease and rapidity with which he wrote, rarely making a revision. This, indeed, is the source of a characteristie drawback to the merit of most of Schubert's instrumental compositions—viz., a too great diffuseness, or lack of condensation, coupled frequently with literal repetition of large sections. Among his larger works, aside from the songs, may be speeially mentioned the great *C major Symphony* (No. 9), the *Unfinished Symphony*, many fine sonatas for piano solos, and also with violin, trios for piano, violin, and violoneello, the *Mass in E flat*, etc. He wrote several operas which were not suecessful. Schubert's teehnical handling of his material compares respectably with his eontemporaries, but in this regard he made no attempt at originality. The chief characteristies of Schubert are the continued freshness of his peculiarly delightful melodies, supported by harmonies of equal interest. See the *Lives* by von Hellborn (Vienna, 1865) and Reissmann (Berlin, 1875). Dudley Buck.

Schuchardt, shoo'*kh*aart, Hugo: Romanic philologist; b. at Gotha, Germany, Feb. 4, 1842; educated at the gymnasium in Gotha and at the Universities of Jena and Bonn; 1870–73 privat doeent in Leipzig; 1873–76 Professor of Romanic Philology in Halle; sinee 1876 professor in Graz; author of *Vokalismus des Vulgärlateins* (3 vols., 1866–68); *Ueber einige Fälle bedingten Lautwandels im Churwälschen* (1870); *Ritornell und Terzine* (1874); *Slawo-Deutsches und Slawo-Italienisches* (1884); *Ueber die Lautgesetze* (1885); *Romanisches und Keltisches* (1886); *Kreolische Studien* (1881–91); *Auf Anlass des Volapüks* (1888); *Baskische Studien* (part i., 1893); *Weltsprache und Weltsprachen* (1894).

Schuett, Eduard: See the Appendix.

Schulte, shoo̎l'te, Johann Friedrich, von: polemical writer; b. at Winterberg, Westphalia, Apr. 23, 1827; studied law at Berlin; practiced there and at Arnsberg and Bonn; beeame Professor of Canon Law at Prague 1855. He wrote *Handbuch des katholischen Eherechts* (Giessen, 1855); *Das katholische Kirchenrecht* (2 parts: *Quellen des katholischen Kirchenrechts* and *System des allgemeinen katholischen Kirchenrechts*, 1856–60); *Lehrbuch des katholischen Kirchenrechts* (1863; 4th ed. 1886); *Lehrbuch der deutschen Reichs- und Rechtsgeschichte* (2 parts, Stuttgart, 1860–61; 6th ed. 1892); *Die Rechtsfrage des Einflusses der Regierung bei den Bischofswahlen in Preussen* (Giessen, 1869). He made a sensation by his pamphlet *Die Macht der römischen Päpste über Fürsten, Länder, Völker, Individuen* (Prague, 1871), for in it he set himself against the dogma of papal infallibility. He then (1871) left Prague and removed to Bonn, to whose law faculty he belongs. He is a leader of the Old Catholies. In their behalf he has produced many books and pamphlets, of which may be mentioned a second edition of the pamphlet just mentioned with an addition, *Die entgegengesetzten Lehren der Päpste und Concilien der ersten 8. Jahrhunderte über das Verhältniss der weltlichen Gewalt der Kirche gegenübergestellt*; also *Die Stellung der Concilien Päpste und Bischöfe vom historischen und canonischen Standpunkte und die Päpstliche Constitution vom 18. Juli, 1870* (1878); *Der Cölibatszwang und dessen Aufhebung gewürdigt* (in advocacy of its abolition, Bonn, 1876); *Die Geschichte der Quellen und Literatur des canonischen Rechts von Gratian bis auf die Gegenwart* (3 vols., Stuttgart, 1875–80); *Die Geschichte der Quellen und Literatur des evangelischen Kirchenrechts in Deutschland und Oesterreich und die evangelischen Kirchenrechtsschriftsteller* (1880); *Die Summa der Paucapala über das decretum Gratiani* (Giessen, 1890); *Der Alt-Katholicismus, Geschichte seiner Entwickelung, u. s. w.* (Giessen, 1887); *Die Summa des Stephanus Tornacensis über das Decretum Gratiani* (1891); *Die Summa magistri Rufini zum Decretum Gratiani* (1892).

Samuel Macauley Jackson.

Schultz, John Christian, M. D.: lieutenant-governor of Manitoba; b. at Amherstburg, Ontario, Jan. 1, 1840; graduated as a physician in 1861; assisted Gov. Mactavish and Bishop Anderson in establishing the Institute of Rupert's Land in 1863. In 1867 and 1868 he agitated in favor of the union of all the provinces; and when the Northwest was purchased by Canada in 1869 he and others, loyal to the Government, were captured by insurgents who opposed the transfer, and were imprisoned in Fort Garry. He effected his eseape and in 1870 returned to Manitoba, and at the first general election was chosen to represent Lisgar in the Dominion Parliament, which seat he held until 1882, when he was appointed to the Senate. He was captain of the Lisgar Rifle Company 1871–74; a member of the executive council for the Northwest Territories in 1872; appointed member of the Dominion board of health for Manitoba and the Northwest Territories same year, and one of the board of governors of Manitoba medical board, and has been president of the Southwestern Railway of Manitoba. He was appointed lieutenant-governor of Manitoba July 1, 1888. Neil Macdonald.

Schultze, shoo̎lt'se, Carl August Julius Fritz, Ph. D.: professor of philosophy and pedagogy; b. at Celle, Hanover, May 7, 1846; educated at the gymnasium in Celle, and at the Universities of Jena, Göttingen, and Munich; private tutor 1869–70; high-school teacher 1870–72; privat docent 1872–75; and Professor Extraordinary of Philosophy 1875–76 in Jena University; Professor of Philosophy and Pedagogy since 1876 in the Royal Polytechnic School in Dresden. Of his pedagogical works the best known is *Deutsche Erziehung* (1893), an important contribution to Herbartian literature. Others are *Der Fetischismus, Ein Beitrag zur Anthropologie und Religionsgeschichte* (1871); *Geschichte der Philosophie der Renaissance* (vol. i., 1874); *Philosophie der Naturwissenschaft* (2 vols., 1881–82); *Die Grundgedanken des Materialismus und die Kritik derselben* (1881); *Die Grundgedanken des Spiritismus und die Kritik derselben* (1883); *Die Sprache des Kindes* (1880); *Stammbaum der Philosophie* (1890); *Vergleichende Seelenkunde* (vol. i., 1892); *Der Zeitgeist in Deutschland, seine Wandlung im 19. und seine muthmassliche Gestaltung im 20. Jahrhundert* (1894).

J. E. Russell.

Schultze Powder: See Explosives.

Schumacher, shoo'maa̎*kh*-er, Heinrich Christian: astronomer; b. at Bramstedt, Holstein, Germany, Sept. 3, 1780; studied mathematics and astronomy at Kiel, Jena, Copenhagen, and Göttingen, and became Professor of Astronomy at the University of Copenhagen in 1815; removed in 1821 to Altona, where he died Dec. 28, 1850. In 1821 he founded the *Astronomische Nachrichten*. In 1830 he made the observations of the length of the seconds-pendulum which formed the basis of the Danish scale of measure.

Schu'mann, Robert: composer; b. at Zwiekau, Saxony, June 8, 1810; after a short course in law and philosophy at Heidelberg, he settled in 1830 at Leipzig, in order to study under Wieck, an eminent piano-teacher; but having crippled his right hand he was forced to devote himself to composition instead of piano-playing, and in his studies was guided by Heinrich Dorn. In 1843 he was appointed Professor of Composition in the conservatory at Leipzig, and

in 1850 musical director at Düsseldorf. While living at Düsseldorf he became deranged, attempted suicide in the Rhine, was rescued and taken to an asylum. D. at Endenich, near Bonn, July 29, 1856. With the exception of the oratorio, Schumann's works include almost every art-form. Four symphonies, several cantatas, an opera, a mass, sonatas, concertos, quartets for strings and also for voices, many pieces for the piano, a few for the organ, and a number of much-admired songs. The symphonies have been accorded a rank immediately after those of Beethoven. The opera *Genoveva* was given at Leipzig, but failed. Schumann possessed a highly cultivated literary ability, and founded the *Neue Zeitschrift* in Leipzig, a music review to which he contributed many important articles. He may also be considered the founder of the so-called romantic or emotional school. There is a certain semi-mystical trait about a number of Schumann's compositions, which, however, does not prevent him from being clear and strong in the majority of his works, at least in those composed prior to the time when his mind began to be clouded with coming insanity. The gradual approach of this sad fate may be traced in the works themselves. Several lives of Schumann have been published, including those by Wasielewski (3d ed. Dresden, 1880; Eng. trans. 1878) and Prof. Niecks, of Edinburgh (1892). Also see his *Collected Writings* as editor of the Leipzig *Neue Zeitschrift*, with a number of letters (Leipzig, 1854; 3d ed. 1875).—His wife, Clara (*Wieck*), b. at Leipzig, Sept. 13, 1819, the most celebrated female pianist of her day, contributed greatly to a correct understanding of her husband's works by her masterly interpretation of them. Further, she may be said to have first introduced Chopin to the German music-world. D. May 20, 1896. Dudley Buck.

Schürer, Emil: See the Appendix.

Schurman, Jacob Gould, D. Sc., LL. D.: president of Cornell University; b. at Freetown, Prince Edward Island, May 22, 1854; educated first in Canada, and then (from 1875 to 1880) in England, Scotland, France, and Germany. He was Gilchrist scholar for Canada 1875–78; holder of Hibbert traveling fellowship (for Great Britain) 1878–80; Professor of Logic, Psychology, and English Literature in Acadia College 1880–82; Professor of Philosophy in Dalhousie College 1882–86; Professor of Philosophy in Cornell University since 1886, and president since 1892; editor of *The Philosophical Review* since 1892 and of *The School Review* since 1893; author of *Kantian Ethics and the Ethics of Evolution* (1881); *The Ethical Import of Darwinism* (1888); *Belief in God* (1890); and essays and addresses on social, religious, educational, and philosophical subjects.

Schurz, shoŏrts, Carl, LL. D.: statesman and author; b. at Liblar, near Cologne, Rhenish Prussia, Mar. 2, 1829; educated at the gymnasium of Cologne and at University of Bonn 1846–48; aided Prof. Gottfried Kinkel in the publication of a liberal newspaper, begun after the revolutionary outbreak of 1848; took part in the revolutionary movements of 1849 and in the following year, and succeeded in effecting the escape of his companion, Kinkel, from imprisonment in the fortress of Spandau. After spending some months in Paris (1851–52) he settled in the U. S.; entered with great zeal into national politics, becoming a leader of the German element of the newly founded Republican party. He began the practice of law at Milwaukee in 1859; was prominent in the Republican national convention at Chicago 1860, and in the ensuing presidential campaign; was appointed by President Lincoln minister to Spain Mar., 1861, but resigned in December of the same year in order to enter the army. His war record was highly honorable. He was appointed brigadier-general of volunteers Apr., 1862; became major-general Mar. 14, 1863; commanded a division in the second battle of Bull Run and in the battle of Chancellorsville; was temporarily in charge of the Eleventh Army-corps at Gettysburg; took part in the battle of Chattanooga, and resigned May 6, 1865. Having settled in Missouri, he was U. S. Senator from that State 1869–75, and acquired a high reputation for ability by his speeches on finance and national policy. The policy of Grant's administration drove him into the "Liberal" movement, and he presided over the Cincinnati convention which nominated Horace Greeley for the presidency 1872. On his return from a visit to Europe in 1875 he became a resident of New York. He took part in the political campaign of 1875 in Ohio, advocating the election of Gov. Hayes on a "hard-money" platform, was one of the callers of the independent conference of May 15, in New York, and Secretary of the Interior 1877–81. From 1881 to 1883 he was editor-in-chief of the New York *Evening Post*. In the campaign of 1884 he repudiated the candidacy of Blaine, and was one of the earliest and most vigorous of the Republican supporters of Cleveland. Civil-service reform, tariff reform, and the purification of New York politics have received his hearty support. His *Life of Henry Clay* (1887) has given him a high place as an historical critic and interesting writer. F. M. Colby.

Schus'tar (Arab. *Tostar*): town; in the province of Khuzistan, Persia; on the Karun; in lat. 32° 3′ N., lon. 48° 52′ E. (see map of Persia and Arabia, ref. 3–G). It is fortified, and its streets, though narrow and dirty, are lined with elegant houses, but large parts are in ruins and uninhabited since the plague and the inundation which early in the nineteenth century successively visited the city. It was a flourishing Persian provincial capital, and in ancient times was in a populous district, with Susa (bibl. Shushan) to the N. W. and Ram Hormuz on the opposite side. Pop., according to Hübner, 27,000. Revised by M. W. Harrington.

Schuva'lov, Peter Andreievitch, Count: diplomatist; b. in St. Petersburg, Russia, July 15, 1827; entered the army, and became a general at the age of thirty. As governor-general of the Baltic provinces 1864–66 he showed great tolerance in dealing with the German element in the population and opposed the persecutions of the Protestants. In 1866 he was made chief of the secret service, just as the Nihilist movement began to show its power. In 1873 he was sent as ambassador to London, and arranged the marriage between the daughter of Alexander II. and the Duke of Edinburgh. Again representing his Government at the court of St. James, he did much to avert the threatened war between Russia and Great Britain after the Russo-Turkish war of 1877–78. D. in St. Petersburg, Mar. 22, 1889.

Schuyler, skī'ler: city; capital of Colfax co., Neb.; on the Platte river, Shell creek, and the Union Pac. and the Burlington Route railways; 16 miles E. of Columbus, 29 miles W. of Fremont (for location, see map of Nebraska, ref. 10–G). It contains 6 churches, high school building (cost $25,000), a large U. S. sugar-beet experiment station, flour-mill, cigar factory, 2 national banks with combined capital of $100,000, 3 State banks with capital of $87,000, and 4 weekly newspapers. Pop. (1880) 1,017; (1890) 2,160: (1900) 2,157.
Editor of "Sun."

Schuyler, Eugene, LL. D.: diplomatist; b. at Ithaca, N. Y., Feb. 26, 1840; graduated at Yale in 1859 and at Columbia Law School in 1863. He was U. S. consul at Moscow 1867–69 and at Reval 1869–70; secretary of legation at St. Petersburg 1870–76 and at Constantinople 1876–78; *chargé d'affaires* at Bucharest 1880–82; minister to Greece, Servia, and Roumania 1882–84; consul-general at Cairo from 1889 till his death. In 1873 he traveled in Central Asia; an account of the journey is given in his *Turkestan* (2 vols., 1876). Besides contributions to magazines, etc., he wrote also *Peter the Great* (2 vols., 1884) and *American Diplomacy* (1886). D. at Cairo, Egypt, July 18, 1890.

Schuyler, Peter: soldier; b. probably near Newark, N. J., about 1710; recruited and commanded the regiment called the Jersey Blues, and joined the army for the invasion of Canada 1746; commanded Fort Clinton in Saratoga 1746–47; again joined the colonial army with his regiment 1754; attended the congress convoked by Gov. Shirley at New York 1755; was in command at Oswego when that place was taken by the French Aug. 14, 1756, and for a short time was a prisoner in Canada, and was again in command of the New Jersey regiment in Sir Jeffrey Amherst's campaign, which resulted in the conquest of Canada 1759. D. near Newark, N. J., Nov. 17, 1762.

Schuyler, Philip: b. at Albany, N. Y., Nov. 20, 1733. He was appointed captain of New York volunteers in June, 1755, and was engaged in the expedition against the French at Crown Point. At the end of the campaign of 1756 he left the army, but in 1758 accepted the appointment of commissary with the rank of major. Two days after the battle of Bunker Hill Congress appointed him a major-general, and placed him in command of the northern department. In the expeditions against Canada Schuyler commanded that by way of Lake Champlain, but was compelled, owing to ill health, to relinquish his command to Montgomery in September and return to Albany, after having taken possession of Isle au Noix on Sorel river. At Albany, besides continuing to exercise an active supervision of affairs in the northern department, his influence among the Indians was

of great value. The failure of the Canada expedition excited much hostility toward Schuyler, and insinuations were uttered against his loyalty, which became so offensive that in the autumn of 1776 he sent in his resignation to Congress, which that body declined to accept; but the abuse continuing, Schuyler, in Apr., 1777, proceeded to Philadelphia and demanded a court of inquiry, which entirely approved his management of affairs, and he resumed command of the northern department. The forced abandonment of Ticonderoga by St. Clair, and his retreat to Fort Edward, where Schuyler had just arrived with re-enforcements, compelled the latter to fall back to Saratoga, after using every means to obstruct the advance of Burgoyne. The losses thus sustained in stores, ammunition, etc., caused a widespread consternation throughout the country, and the clamor against Schuyler was renewed, and this time Congress ordered his supersedure by Gates. At the time of the latter's arrival (September) to assume command, Schuyler occupied a fortified position at the mouth of the Mohawk, to which he had fallen back from Saratoga. Gates had, since Schuyler's resumption of the command of the northern department, been unfriendly to Schuyler, and it was with feelings of mortification that the latter received the order deposing him at a time when the feeling of depression arising from former disasters had been dispelled by recent victories, and when volunteers were from all quarters swelling his army. He, however, obediently turned over his command and placed his successor in possession of full information of the situation, and, though without command, remained with the army to aid in any capacity, and was present at the surrender of Burgoyne. A court of inquiry again approved of his management in strong terms, but in Apr., 1779, he resigned, though continuing to render valuable service in the military operations in his native State. From 1778 to 1781 he was a member of the Continental Congress, and in 1789 was appointed U. S. Senator from New York, and again in 1797 to succeed Aaron Burr. In the New York Senate he contributed largely to the code of laws adopted by the State, and was an active promoter of the canal system. D. at Albany, Nov. 18, 1804. See his *Life and Times*, by B. J. Lossing (2 vols., 1860–62; new ed. 1872).

Schuylkill, skool'kil [Dutch, liter., hidden channel, because unobserved by the first explorers]: a river which rises in Schuylkill co., Pa., and after a southeasterly course of 125 miles flows into the Delaware at Philadelphia, which city it traverses. Its lower portion affords extensive wharfage, and is of much commercial importance. The river was (1816–25) adapted to slack-water navigation for freight-boats to Port Carbon, 3 miles above Pottsville. The river affords the greater part of the water-supply for Philadelphia. It enters the Delaware between League island, containing a navy-yard, and Mud island, on which is Fort Mifflin. Revised by I. C. Russell.

Schuylkill Haven: borough; Schuylkill co., Pa.; on the Schuylkill river and canal, and the Lehigh Val., the Penn., and the Phila. and Reading railways; 4 miles S. of Pottsville, 31 miles N. N. W. of Reading (for location, see map of Pennsylvania, ref. 5–H). It is in an agricultural and coal-mining region, has large wharves and canal-boat docks for shipping coal, and contains rolling-mills, hosiery-works, railway car-shops, shoe and soap factories, and a weekly newspaper. Pop. (1880) 3,052; (1890) 3,088; (1900) 3,654.

Schwab, shvaap, Gustav: author; b. at Stuttgart, Germany, June 19, 1792; studied theology and philosophy at Tübingen; was appointed Professor of Ancient Literature in the gymnasium of Stuttgart in 1817; pastor at Gomaringen in 1837, and of the St. Leonhard church in Stuttgart in 1840, where he died Nov. 4, 1850. His poems show purity and warmth of feeling, though they do not possess the simplicity and classic perfection of form of Uhland's songs. Like the latter poet and other members of the Suabian school to which he belonged he wrote many ballads, some of which have become very popular. The first collected edition of his *Gedichte* appeared in 2 vols. in 1828–29; a second revised edition, *Neue Auswahl* (Stuttgart, 1838), has been often reprinted. Of his prose works, the most remarkable are *Schillers Leben* (Stuttgart, 1840; 3d ed. 1859); *Sagen des klassischen Alterthums* (Stuttgart, 1838–40; 14th ed. Gütersloh, 1882); *Deutsche Volksbücher* (1843; 13th ed. Gütersloh, 1880); and *Wegweiser durch die Litteratur der Deutschen* (Leipzig, 1846; 4th ed. 1870). See K. Klüpfel, *Gustav Schwab als Dichter und Schriftsteller* (1884).
Revised by Julius Goebel.

Schwalbe, shvaal'be, Gustav Albert, M. D.: professor of anatomy; b. at Quedlinburg, Germany, Aug. 1, 1844; educated in the gymnasium at Quedlinburg, and at the Universities of Zurich, Bonn, and Berlin; became privat docent at Halle Jan., 1870; professor at Freiburg in Baden May to Halle Jan., 1870; professor extraordinary at Leipzig Oct., 1871, to Oct., 1871; professor extraordinary at Leipzig Oct., 1871, to Oct., 1873; ordinary Professor of Anatomy at Jena Oct., 1873, to Apr., 1881; held same position at Königsberg Apr., 1881, to Oct., 1883, when he accepted a chair at Strassburg. His principal works are *Lehrbuch der Neurologie* (1881) and *Lehrbuch der Anatomie der Sinnesorgane* (1887). He is editor of *Morphologische Arbeiten* (begun 1891), and has edited part i. of *Anatomy* (20 vols., 1872–92), and with Hoffmann and Hermann a *Yearly Report of Anatomy and Physiology*.

Schwal'ber [better known as Chelidonius, the punning Græco-Latin translation of the German *Schwalbe*, a swallow; Gr. χελιδών]: a friend of Albert Dürer, and the author of the text in Latin verse to his three series of wood-cuts, *The Apocalypse*, *The Passion of Christ*, and *The Life of the Virgin Mary*. Schwalber was a monk of the abbey of St. Egidius (St. Julian, St. Gilgan, St. Giles), built by Conrad III. in 1140 for a society of Scotch Benedictines. He was nicknamed Musophilus, from his love of learning, and he had a reputation for considerable knowledge of the classic Latin poetry. While a member of this monastery he wrote the text for Dürer's wood-cuts, besides verses about his monastery, *Versic. de Fund. Cœnob. Egid.*, and about the abbots, *Versic. de Abbat. nonnullis ejusdem Cœnob.* In 1515 Schwalber left Nuremberg to become abbot in the Schotten Kloster, near Vienna. D. there Sept. 8, 1521.

Schwann, Theodor: physiologist; b. at Neuss, Prussia, Dec. 7, 1810. He studied at the Jesuits' College, Cologne, at Bonn, Würzburg, and Berlin, where he graduated in medicine in 1834. He was assistant to Johannes Müller in the Anatomical Museum at Berlin till 1838. He discovered pepsin and its function in digestion, the envelop of nerve-fibers, the organic nature of yeast, and made a series of researches on muscular contractility, and other physiological subjects. He was Professor of Anatomy at the Roman Catholic University of Louvain 1838–48, and at Liège from 1848. D. at Cologne, Jan. 14, 1882. His cell-theory, which is the basis of modern histology, was published in *Microscopical Investigations on the Accordance in the Structure and Growth of Plants and Animals* (Berlin, 1839; trans. by Sydenham Society, 1847).

Schwann, White Matter of: See Histology (*Nerves* and *Nerve-centers*).

Schwanthaler, shvaan'taal-er, Ludwig Michael: sculptor; b. at Munich, Aug. 26, 1802, the son of a sculptor; studied in Rome, but wrought in Munich. His statues, decorations, and models, are seen in the great cities of Germany, but chiefly in Munich. He executed the frieze of the Barbarossa hall, the colossal statue of Bavaria, and the metopes of the Ruhmeshalle which adjoins it, the colossal bronze statues in the throne-room of the palace at Munich, and the monumental images in the Walhalla. D. Nov. 28, 1848.

Schwartz, shvaarts, Christian Frederick: missionary; b. at Sonnenburg, Prussia, Oct. 26, 1726; studied in the University of Halle 1746–49; was ordained at Copenhagen 1749; embarked at London for India, where he arrived July, 1750; settled at Tranquebar, a Danish mission on the Coromandel coast; transferred his services to the English Society for Promoting Christian Knowledge 1766, when he removed to Trichinopoly, and in 1778 to Tanjore; was sent as ambassador to Hyder Ali at Seringapatam to negotiate a peace, and admitted by him after all other envoys had been refused, and succeeded in relieving the city of Tanjore from imminent danger of famine by his influence with the native farmers, who brought in their cattle on his personal pledge of payment. D. at Tanjore, Feb. 13, 1798. He was one of the most celebrated missionaries of modern times. He aided Schultz in translating the Bible into Tamil, and was tutor to the son and heir of the rajah of Tanjore, who erected to his memory in the mission church a magnificent monument designed by Flaxman; the East India Company also placed a monument of him by Bacon in St. Mary's church, Madras. See *Memoirs of his Life and Correspondence*, by Hugh Pearson, D. D. (2 vols., 1833; 3d ed. 1839).

Schwartz, Maria Sofia (*Birath*): novelist; b. at Boraas, Sweden, July 4, 1819; was married in 1840, and became a widow in 1858. She was the author of a number of novels, all of which have been translated into German and

Danish, and many of them into English. Their interest lies chiefly in their plot. Among them may be mentioned *Mannen af börd och qvinnan af folket* (The Man of Birth and the Woman of the People, 1858); *Börd och bildning* (Birth and Education); *Arbetet adlar mannen* (Labor Ennobles Man, 1859); *Ädlingens dotter* (The Nobleman's Daughter, 1860); *The Organ-grinder's Son* (1863); *A Child of the Time* (1873). D. 1894. D. K. Dodge.

Schwarz, Berthold, whose true name is said to have been Konstantin Anckl itzen: the reputed inventor of gunpowder; received the name of Berthold on entering a Franciscan monastery at Mentz, Cologne, or Gosslar, and was called Schwarz (black) on account of his passion for the black arts. According to legend, he invented gunpowder in 1259 (the dates 1320 and 1354 are also given), and in Freiburg, his reputed birthplace, a monument was raised in his honor in 1853. All the details of his life are uncertain, however, while it is certain that gunpowder was known before 1320, though not used in war or hunting.

Schwarzburg-Ru'dolstadt: principality and state of the German empire, between the Saxon duchies; comprising an area of 363 sq. miles, with 92,657 inhabitants in 1900. It is covered with well-wooded spurs of the Thüringerwald, and mining and cattle-rearing are the principal industries. Flax is very extensively grown, and some linen manufactures are carried on. The total revenue for 1893 was 2,542,950 marks; public debt, 4,018,688 marks. Capital, Rudolstadt.

Schwarzburg-Sondershausen, -zon'ders-how-zen: principality and state of the German empire, in the Prussian province of Saxony; comprising an area of 333 sq. miles, with 80,678 inhabitants in 1900. It resembles in every respect Schwarzburg-Rudolstadt, except that it is a little smaller. Capital, Sondershausen.

Schwarzenberg, shvaärts'en-bärch: a princely family of Germany, descended from Erkinger von Seinsheim, who was ennobled in 1417 by the Emperor Sigismund, and in 1420 bought the estate of Schwarzenberg in Franconia. In 1670 the head of the family was made a prince of the empire by the Emperor Leopold I., and in 1746 this dignity was conferred on all members of the house by the Emperor Francis I. The most celebrated names of the family are—(1) Karl Philipp: soldier; b. in Vienna, Apr. 15, 1771; received a military education, and distinguished himself in the battles of Würzburg, Ulm, Hohenlinden, and Wagram. After the peace of Vienna (Oct. 14, 1809) he went to Paris as Austrian ambassador, and negotiated the marriage between Napoleon and Maria Louisa. Napoleon placed great confidence in him, and demanded that he should command the Austrian contingent in the Russian campaign of 1812. The slowness of his movements and the inefficiency of his measures have provoked much criticism from French historians, but Napoleon himself never uttered a doubt of his loyalty, and requested the Austrian emperor to make him a field-marshal. In the next year he commanded the Austrian army of observation in Bohemia, and when Austria joined Russia and Prussia he was made commander-in-chief of the allied army, gained the battle of Leipzig (Oct. 16–18, 1813), and led the army victorious into Paris. D. at Leipzig, Oct. 15, 1820.—(2) Felix Ludwig Johann Friedrich: statesman; a nephew of the preceding; b. at Krumau, Bohemia, Oct. 2, 1800; entered the Austrian army in 1818, and was made a lieutenant field-marshal in 1848, shortly before the battle of Custozza, but was mostly employed in diplomatic missions to Russia, Great Britain, Brazil, and Naples, and Nov. 22, 1848, was placed at the head of the Austrian Government as chancellor of the empire. He found the state nearly dissolved, Vienna, Prague, Hungary, and the Italian provinces in open insurrection, the treasury on the very verge of bankruptcy, the Austrian influence in Germany almost annihilated, and the German states about to reorganize their union under the leadership of Prussia, etc. All these difficulties he confronted with a courage and energy which excited admiration, even among those who were very far from approving either his aims or his measures. By the aid of Russia he put down the revolution in Hungary, and in a very short time succeeded in tying together once more the discordant parts of the Austrian empire by means of a military and bureaucratic government. He was, however, by no means a mere repetition of Metternich. He was not averse to reform when it could be achieved in a regular and settled manner. He raised the credit of the state, and he baffled all the Prussian plans in Germany by drawing the southern and middle states over to the Austrian side. D. in Vienna, Apr. 5, 1852.—(3) Friedrich Johann Joseph Celestinus: a brother of the preceding; b. in Vienna, Apr. 6, 1809; was made Archbishop of Salzburg 1836, cardinal 1842, Archbishop of Prague 1849. He opposed the declaration of the dogma of the papal infallibility as inopportune, but accepted it afterward. D. in Vienna, Mar. 27, 1885. Revised by F. M. Colby.

Schwarzwald: See Black Forest.

Schwatka, Frederick: explorer; b. at Galena, Ill., Sept. 29, 1849; graduated at the U. S. Military Academy at West Point, N. Y.; commissioned second lieutenant in 1871; pursued his studies while in the army, and was admitted to the bar in Nebraska in 1875; graduated in medicine at Bellevue Medical College, New York, in 1876. In 1878 he obtained leave of absence from the army and conducted the Arctic expedition which cleared up the mystery surrounding the fate of Sir John Franklin's expedition. He returned to duty in the army in 1880, but finally resigned in 1885. Between 1883 and 1889 he made three journeys to Alaska for the purpose of exploration, and in one of these trips descended the Yukon on a raft from its source to its mouth. In 1889 he conducted an expedition to Northern Mexico to study the remains of Aztec civilization and those of the cliff and cave dwellers. He received the Roquette Arctic medal of the Geographical Society of Paris, and a medal from the Imperial Geographical Society of Russia. D. at Portland, Ore., Nov. 2, 1892. See his *Along Alaska's Great River* (New York, 1885); *Nimrod of the North* (1885); and *The Children of the Cold* (1886).

Mark W. Harrington.

Schwegler, shvāch'ler, Albert: philosopher and theologian; b. at Michelbach, Würtemberg, Feb. 10, 1819; studied theology at the University of Tübingen, where he was appointed Professor of Classical Philology in 1848, and later of Ancient History. D. at Tübingen, Jan. 5, 1857. In theology and criticism he belonged to the Tübingen school of Dr. Baur. Besides annotated editions and translations of the Clementine homilies (1847), Aristotle's *Metaphysics* (1847–48), and Eusebius (1852), he published *Der Montanismus* (1841), which brought him into conflict with the Church and caused him to give up his ministry; *Das Nachapostolische Zeitalter* (1846); and *Römische Geschichte* (unfinished; 1853–58). His best-known work is his *Geschichte der Philosophie* (1848; 11th ed. 1882), originally written for the *Neue Encyklopädie für Wissenschaften und Künste*, but afterward often reprinted and translated into most European languages—into English by J. H. Seelye of Amherst (New York, 1856), and by Stirling in England. His *Geschichte der griechischen Philosophie* appeared in 1859.

F. M. Colby.

Schweid'nitz: town of Prussian Silesia; on the Weistritz; 36 miles by rail S. W. of Breslau (see map of German Empire, ref. 5–H). It is well built, contains several interesting public buildings, and carries on a flourishing manufacturing industry in cloth, paper, leather, chemicals, beetroot-sugar, vinegar, etc. Pop. (1895) 26,130.

Schweigger, shvīg'ger, Karl Ernst Theodor, M. D.: ophthalmologist; b. at Halle, Prussian Saxony, Oct. 29, 1830; studied medicine at the Universities of Erlangen and Halle, graduating at the latter 1852; was assistant in Krukenberg's medical clinic 1852–55; in 1856 studied the microscopic anatomy of the eye under H. Mueller at Würzburg; from 1857–64 was an assistant of A. v. Grafe at Berlin; in 1860 became privat docent of ophthalmology at the University of Berlin; in 1868 was appointed Extraordinary Professor of Ophthalmology and director of the eye clinic at the University of Göttingen; in 1871 was appointed extraordinary and in 1873 ordinary professor at the University of Berlin; in 1885 was made privy councilor. He became coeditor of the *Archiv für Augenheilkunde* in 1881. His best-known work is *Handbuch der speciellen Augenheilkunde* (Berlin, 1871). S. T. Armstrong.

Schweighäuser, shvīch'hoi-zer, Johann: classical scholar; b. at Strassburg, Germany, June 26, 1742: studied theology and the Oriental languages; went to Paris to perfect his linguistic studies under de Guignes; visited Germany, England, and Holland: was appointed Adjunct Professor of Philosophy at Strassburg in 1770, and in 1778 Professor of the Greek and Oriental Languages. After the organization of the university at Strassburg he was made Professor of Greek Literature and dean of the faculty of letters, and was also appointed librarian. His editions are esteemed for

the elaborate and learned commentaries annexed; among the most valuable are Appian (3 vols., 1782–85); Polybius (8 vols., 1795; 5 vols., 1831, Oxford) with *Lexicon Polybianum*; Seneca's *Epistolæ* (2 vols., 1809); Epictetus (5 vols., 1799); Athenæus (14 vols., 1801–07); Herodotus (6 vols., in 12 parts, 1815), to which was added a *Lexicon Herodoteum* (2 vols., 1824); *Opuscula* (2 vols., 1806). D. at Strassburg, Jan. 19, 1830. Revised by ALFRED GUDEMAN.

Schweinfurth, shvīn'fo͝ort: town of Bavaria: on the Main; 28 miles N. E. of Würzburg by rail (see map of German Empire, ref. 5–E). It is beautifully situated and well built, and has large manufactures of chemicals and pigments, especially ultramarine blue and Schweinfurth green. Large cattle and wool markets are held here. Pop. (1895) 13,515.

Schweinfurth, GEORG AUGUST: explorer and botanist; b. at Riga, Russia, Dec. 29, 1836; studied botany and natural science at Heidelberg, Munich, and Berlin; made several journeys in the valley of the Nile to investigate the flora and fauna of those regions 1864 to 1886, and wrote *Plantæ quædam Nilotiæ* (1862); *Beitrag zur Flora Æthiopiens* (1867); *Reliquiæ Kotschyanæ* (1868); *Im Herzen von Afrika* (2 vols., 1874; translated into English as *The Heart of Africa* in 1874); *Artes Africanæ* (1875), etc.
Revised by M. W. HARRINGTON.

Schweinfurth Green, or **Paris Green**: a pigment said to have been discovered by Rusz and Sattler at Schweinfurth in 1814, but there is reason to believe that it was manufactured at Vienna at an earlier date under the name of *Mitis green*. Other names are *Imperial*, *Vienna*, *Emerald*, and *Kaiser Green*. Some varieties of berg or mountain green and of Neuwied green consist of this pigment mixed with gypsum or heavy spar. The first chemical paper by Justus von Liebig related to this color: it was published by him in July, 1822, in the *Repertorium der Pharmacie*.

Schweinfurth green is an aceto-arsenite of copper of variable composition. It has been very extensively used for wall and other paper staining, for tarlatans, artificial flowers, and as a vermin exterminator, especially for cockroaches and potato-bugs. Its use for wall-paper has greatly diminished. Much has been written with regard to the dangers of arsenical wall-paper. It has been alleged that not only may green papers, to which the pigment is loosely attached, give off arsenical dust, which may enter the mouth and air-passages and produce harm, but that paper containing even very small quantities of arsenic, in any form, may evolve arseniuretted hydrogen or other arsenical gases of a very poisonous character. Distinguished chemists, however, deny the possibility of the production of any arsenical gases from wall-paper, and the alarming suggestions concerning arsenical wall-paper are regarded as entirely without foundation. Revised by IRA REMSEN.

Schweinitz, EDMUND ALEXANDER, de, S. T. D.: bishop: son of Lewis David von Schweinitz; b. at Bethlehem, Pa., Mar. 20, 1825; studied theology in the Moravian seminary of his native town and at the University of Berlin; became a clergyman, and was pastor of several churches in Pennsylvania: edited *The Moravian* for several years; consecrated bishop at Bethlehem 1870; was president of the Moravian College and Theological Seminary 1867–84; was one of the translators of Herzog's *Realencyclopädie* (Philadelphia, 1856, *seq.*), and author of *The Moravian Manual, being an Account of the Moravian Church* (Philadelphia, 1859; 2d ed. Bethlehem, 1869); *Systematic Beneficence* (1861); *The Moravian Episcopate* (Bethlehem, 1865; 2d rev. ed. London, 1874); a *Life of Zeisberger, the Western Pioneer and Apostle to the Indians* (1870); and *The History of the Church known as the Unitas Fratrum* (1885). D. Dec. 18, 1887.

Schweinitz, EMIL ALEXANDER, de: See the Appendix.

Schweinitz, GEORGE EDMUND, de, A. M., M. D.: ophthalmologist; son of Bishop de Schweinitz; b. in Philadelphia, Pa., Oct. 26, 1858; educated at the Moravian College, Bethlehem, Pa., and at the University of Pennsylvania, where he graduated in 1881; prosector of anatomy in the university 1883–88; lecturer on medical ophthalmology 1891–92; Professor of Ophthalmology, Philadelphia Polyclinic, 1891; Clinical Professor of Ophthalmology, Jefferson Medical College, Philadelphia, 1892; ophthalmic surgeon to Children's, Philadelphia, Methodist, and Orthopædic Hospitals. His principal published works are *Congenital Anomalies of the Eye* in *American System of Obstetrics* (1889); *Affections of the Eyelids, Lachrymal Apparatus, Conjunctiva, and Cornea* in *Cyclopædia of Diseases of Children* (vol. iv., 1890); *Affections of the Conjunctiva, Cornea, and Sclera* in *System of Therapeutics* (1892); *Diseases of the Eye: a Handbook of Ophthalmic Practice* (Philadelphia, 1892). He was editor, with Dr. Hare, of *The University Medical Magazine* Oct., 1888–Sept., 1889, and of the same journal with Dr. E. Martin Oct., 1889–Sept., 1891. Since 1892 he has been ophthalmic editor of *The Therapeutic Gazette*.

Schweinitz, LEWIS DAVID, von, Ph. D.: botanist; b. at Bethlehem, Pa., Feb. 13, 1780; educated in Germany, where he resided from 1798 to 1812; Moravian minister at Salem, N. C., 1812 to 1821; settled in his native town 1821, and resided there until his death Feb. 8, 1834. He added by his own researches more than 1,400 new species to the catalogues of American flora, the greater part being fungi which had been previously little studied. He was the author of *Conspectus Fungorum in Lusatiæ superioris agro Niskiensi crescentium e methodo Persooniana* (with Albertini, 1805); *Synopsis Fungorum Carolinæ superioris*, etc. (1822); *Synopsis Fungorum in America Boreali media degentium* (1831–34); and monographs on *Viola*, *Carex*, and other genera. Revised by CHARLES E. BESSEY.

Schweizer-Sidler, shvīt'ser-zid'ler, HEINRICH: Latinist; b. at Elgg, Switzerland, Sept. 12, 1815; educated at Zurich; teacher in gymnasium of Zurich, docent in the university, and professor from 1871; author of *Elementar- und Formenlehre der lateinischen Sprache* (1869; 2d ed. as *Grammatik der lateinischen Sprache*, 1888); *Germania of Tacitus* (5th ed. 1890); and numerous articles in journals. D. at Zurich, Mar. 31, 1894. B. I. W.

Schwenk'feld, HANS KASPAR, von: sectarian leader; b. at Ossig, Silesia, 1490; employed in the service of the Duke of Liegnitz; embraced the Reformation with great enthusiasm, but developed afterward its ideas in a manner which brought him in conflict with the Reformers. It was especially his conception of the Lord's Supper as a sacrament of spiritual nourishment without change in the elements and his demands for the establishment of a Church to which only the saints, the truly converted, should be admitted, which gave offense. His teaching was known as The Middle Way. Political pressure having forced the Duke of Liegnitz to adopt Lutheranism, Schwenkfeld voluntarily left Silesia (1529) and went to Strassburg. There he was suspected of Anabaptism, tried, and banished (1533). The next two years were passed in Augsburg, but again Lutheran antagonism drove him away and he went to Ulm, and from there as a center went about preaching. D. at Ulm, Dec. 10, 1561. In his *Grosse Confession* (1540–57, 3 parts) he gave a representation of his doctrines. An edition of his numerous writings appeared at Frankfort 1564–70 in 4 vols. folio. A sect, the Schwenkfelders, was organized in Silesia, but most of them emigrated in 1734 and settled in Pennsylvania, where they number about 1,000 members, and have their own churches and schools. See O. Kadelbach, *Ausführliche Geschichte Kaspar von Schwenkfelds und der Schwenkfelder in Schlesien, der Ober-Lausitz und Amerika* (Lauban, 1861). Revised by S. M. JACKSON.

Schwerin': capital of the grand duchy of Mecklenburg-Schwerin, Germany; on the western side of Lake Schwerin (see map of German Empire, ref. 2–F). It is connected by railways with Hamburg and Wismar, and is beautifully situated, surrounded with old walls, generally well built, and contains many magnificent buildings, among which the ducal palace is the most remarkable. It has good educational institutions, museums, galleries, and collections, and numerous manufacturing establishments. Pop. (1895) 36,388.

Schwerin, KURT CHRISTOPH, Count von: soldier; b. in Swedish Pomerania, Oct. 26, 1684; studied at Leyden, Greifswald, and Rostock; entered the Dutch army in 1700, and fought at Ramillies and Malplaquet; took service with the Grand Duke of Mecklenburg in 1706, and distinguished himself by repelling the Hanoverians, who invaded the country; after that part of Pomerania in which his estates were situated was ceded to Prussia, he entered the service of that country, and was sent by Frederick William I. on several important diplomatic missions. He enjoyed in a still higher degree the confidence of Frederick the Great, who raised him to the rank of field-marshal and gave him the title of count. He won the battle of Mollwitz Apr. 10, 1741, in the first Silesian war, stormed Prague Sept. 16, 1744, in the second, and fell in the battle of Prague May 6, 1757, in the Seven Years' war. See Varnhagen von Ense, *Biographische Denkmale* (Leipzig, 1873). F. M. COLBY.

Schwestriones: See Brethren and Sisters of the Free Spirit.

Schwytz, shwīts: one of the four so-called forest cantons in the middle of Switzerland: borders N. on the Lake of Zurich and S. on the Lake of Lucerne, and comprises an area of 351 sq. miles. It is entirely covered with mountains, but only one peak, the Rieselstock, on the eastern frontier, 8,890 feet high, reaches the line of everlasting snow. Agriculture can be pursued only to a limited extent, though fruits and wines are produced. Cattle-breeding is the principal industry, and cheese, cattle, and timber are largely exported. Manufactures are confined to home demands. The inhabitants speak German, and are Roman Catholics. Pop. (1888) 50,307. The capital is Schwytz; pop. 6,700.

Schytte, Ludwig: See the Appendix.

Sciacca, shaak'kăa: town; in the province of Girgenti, Sicily; 37 miles N. W. of Girgenti (see map of Italy, ref. 9–E). It occupies a site near the ruins of the ancient *Thermæ Selinuntinæ*, the birthplace of Agathocles (330 B. C.) The cathedral was founded in 1090 by Julia de Hauteville, daughter of Roger I. At the foot of Monte S. Calogero are hot wells that have been used as baths from Phœnician times. Off the coast coral-banks are worked. Pop. 21,451.

Sciæ'nidæ [Mod. Lat., named from *Sciæ'na*, the typical genus, from Lat. *sciæ'na* = Gr. σκίαινα, a sea-fish, the maigre; cf. σκιά, shadow]: a family of fishes of the order *Teleocephali*, including the drums, croakers, kingfishes, and weakfishes. The body is more or less elongated and compressed; the scales ctenoid and distributed in very oblique rows; the lateral line continuous and extending generally between the median rays of the caudal fin; dorsal fins two, the first short and with the spines generally feeble, the second longer and with branched rays; anal fin comparatively short, generally with two, but sometimes with one or three, spines; pectoral fins with branched rays; ventrals thoracic, each with a spine and five rays; the skull is channeled by muciferous cavities, bridged over by osseous bars; the stomach is cæcal, and pyloric appendages are developed in moderate number; the air-bladder has generally a number of slender cæcal appendages. The family is represented by about 130 or 140 species, distributed in different parts of the world; most of them are marine and inhabitants of the tropical and subtropical regions, but a few are confined to fresh waters. The most celebrated fish of this family is the famed sciæna of the ancients, *Sciæna aquila* of modern systematists. This grows to a very large size, sometimes attaining a weight of more than 60 lb. It was much esteemed by the Romans for the delicacy of its flesh, and was generally sold in slices. The otoliths or ossicles of the ear are comparatively large in this fish, as in others of the family, and they were esteemed in former times as "colic-stones," and were encased in gold and suspended from the neck. Theodore Gill.

Scialoia, shaă-lō'yaă, Antonio: economist; b. at Procida, near Naples, in 1817; studied law, and gave himself to its practice, but in 1846 he was called to the University of Turin as Professor of Political Economy; in 1848 was Minister of Agriculture and Commerce at Naples; was arrested and imprisoned in 1849, and after three years of confinement was banished. He then returned to Turin, where he resumed his chair in the university, and in 1859 was elected to Parliament; in 1860 became chief secretary of the ministry of finance, and two years later was sent to Paris to negotiate a commercial treaty between Italy and France; in 1865 he took the portfolio of finance, and during the war of 1866 signed the decree for a legal-tender paper currency and for a forced loan. He also warmly advocated the imposition of a tax upon personal property. In 1872–73 he was for some months Minister of Public Instruction. His chief works are *I Principi dell' Economia Sociale* (Naples, 1840); *Sulla Proprietà de' Prodotti d'Ingegno* (Naples, 1843); *Industria e Protezione* (Leghorn, 1843); *Trattato elementare d'economia sociale* (Turin, 1848); and *Prolusione alla prima parte del corso d' economia e diritto* (Turin, 1853). D. at Procida, Oct. 14, 1877. See de Cesare, *La vita, i tempi e le opere di Antonio Scialoia* (Rome, 1879). F. M. Colby.

Sciat'ica [from Lat. *sciat'icus*, for Lat. *ischiat'icus* = Gr. ἰσχιαδικός, subject to pain in the loins, deriv. of ἰσχιάς, pain in the loins, deriv. of ἰσχίον, hip-socket]: *neuralgia ischiadica*, a neuralgia or neuritis of the great sciatic nerve, the sacral plexus, or any of the nerves of the thigh and hip. According to Niemeyer, the cutaneous nerve of the thigh, the superficial branches of the peroneal nerve, and the sural nerve are the principal seats of what is called sciatica. Exposure, rheumatism, gout, tumors near the nerve, fæcal masses, hæmorrhoids, diseased vertebræ, metritis, and perimetritis, are reckoned among the causes. It sometimes follows a severe labor in childbed. Laxatives, cupping, the moxa blisters, hot baths, and local or general anodynes are frequently palliative, and sometimes curative. Periodic sciatica may often be relieved by quinine. Iodide of potassium and turpentine are both sometimes extremely useful, and so is the constant electric current. Absolute rest with fixation, and douching alternately with hot and cold water, or the application of ice for a short time daily, will sometimes cure obstinate cases. Revised by W. Pepper.

Science [viâ O. Fr., from Lat. *scien'tia*, knowledge, skill, science, deriv. of *sci're*, know]: in a general sense, knowledge reduced to order; that is, knowledge so classified and arranged as to be easily remembered, readily referred to, and advantageously applied. All science is based on the assumption that the laws of nature are immutable. From this point of view science may be regarded as a knowledge of the laws of nature, embracing the processes of experiment, observation, and comparison, by which they are discovered, and the modes of reasoning by which their operation in the production of phenomena is made known. Hence most widely it signifies the knowledge of a truth in relation to other truths. Various attempts have been made to classify the sciences, so as to make clear their relations to each other. Of these the best known is that of Comte, who first explicitly drew the distinction between abstract and concrete sciences. See Herbert Spencer on the *Classification of the Sciences* and *Genesis of Science*, and the article Positivism. R. A. R.

Science, Christian: a doctrinal and curative system discovered in 1866, by Mrs. Mary Baker Eddy (a native of New Hampshire then resident in Lynn, Mass.), and now professed and practiced by several hundred thousand disciples in both Europe and America. As stated in their Church Tenets, its members acknowledge and adore one Supreme God, and take the Scriptures for their guide to eternal Life. They acknowledge God's Son and the Holy Ghost, and man as the Divine image and likeness. They acknowledge God's forgiveness of sin in the destruction of sin, and believe that sin and suffering are not eternal. They accept the atonement as the efficacy and evidence of Divine Love, of man's unity with God, and the great merits of the Way-shower. They hold the way of Salvation demonstrated by Jesus to be the power of Truth over all error, sin, sickness, and death, and solemnly promise when they unite with the Church to strive, watch, and pray for that Mind to be in them which was in Christ Jesus, viz.: to love one another, and to be meek, merciful, just, and pure. The curative system is variously spoken of as "Christian Science Mind-healing," or "Metaphysical Healing," and is based on the theory of the unreality or non-existence of matter. All is Mind, and there is, in reality, but one Mind, viz., God. Man is the idea of God.

The following authoritative statement in regard to the history and principles of the system was specially prepared for this cyclopædia by Mrs. Eddy, and is given just as it left her pen:

CHRISTIAN SCIENCE is the Science of God and His universe, including man. Its Principle is the divine triunity of Life, Truth, and Love. There is but one God, one Christ, and one Jesus of Nazareth. God is Mind, and All-in-all; therefore there can be nothing real but infinite Mind, and its manifestation.

The compound individual idea of the Divine Principle is Christ, the spiritual idea of Truth, personifying the primal order of Being, and as perfect as its source.

Jesus represented the incarnation of Christ's Principle, he stood for Truth, healing the sick and sinful, and triumphing over the tomb. By his metaphysical therapeutics, it was proved that miracles do not violate, but fulfill law.

Jesus' mission was not limited to any period, but touches universal humanity. Hence his promise: "Verily, verily, I say unto you, he that believeth in me, the works that I do shall he do also; and greater works than these shall he do." And "these signs shall follow them that believe;" the word *them*, instead of *you*, clearly making this assurance applicable to all Christians in all ages. Jesus' atonement for sin was a human sacrifice which demonstrated man's life in God, divine Good, and this verity when understood is the way of salvation, for it destroys sin. (See Romans xii, 1.)

In the material world, like produces like,—a bird is not the product of a beast. In the spiritual world—that is the real world,—matter is not the progenitor of mind. If Mind is first, it cannot produce its opposite, matter. If matter is first, it cannot produce mind. Hence the irresistible, logical, cardinal point in Christian

Science.—There is no matter, All is Mind. Christian Science defines Soul and dreams. In truth Soul is God. In error soul is sense. Dreams are the conscious and unconscious states of matter; wherein the night dream is quite as real and tangible as the day dream; for Life or mind in matter, is a dream at all times, and is never the reality of Being.

That matter is substance, or includes mind, is pantheism which has no kinship with Christ. Spirit must be substance, since matter is neither the substance of Spirit, nor its reflex universe.

Man's origin is not material but spiritual. The universe is not the result of physical propulsion, but is an evolution from infinite Mind. "God is Spirit." Truth. As matter is the opposite of Spirit, Truth, so must it be the opposite of God. Matter is the subjective state of error, deflecting from the everlasting uprightness, and eventuating in false personal beliefs in sin, disease, and death, only to be overcome by conquering Truth,—eradicated not by drugs or hygienic rules, that is, laws of matter, but by the power of Mind. Jesus, referring to this original evil, which he cast out in healing the sick, called it "the devil," and "a liar from the beginning."

This theory is corroborated by Jesus' supremacy over all phases of matter,—a control not supernatural, but divinely natural, in one abiding in God, Good, the centre and circumference of the universe. From this it follows that genuine healing must be wrought upon thought, not body. When following these leadings of scientific Revelation the Bible was the writer's only text book.

Practically Christian Science is the fulfilling of the law of Love, namely, loving God supremely, loving your neighbor as yourself, and loving your enemies.

These doctrines were brought into modern light by the present writer, in the years 1866-7. When apparently near death, her convictions laid hold upon the sublime verity that all evil, whether moral or physical, must be non-existent because contrary to the omnipotent Good, God. She found in the Bible a new meaning, whereby she was snatched from the Valley of shadows, and her feet set on the Rock. As it was through this understanding of God, through Christ, God's idea, that all healing must come, she adopted Christian Science as the name of this curative system.

In 1867 she began healing others with wonderful success, and taught her first student.

Her textbook, *Science and Health with Key To The Scriptures*, is the outgrowth of her experience, and was first published in 1875. On July 4th, 1876, the first Christian Scientist Association was organized. In June, 1879, the first Church of Christ, Scientist, was founded in Boston, with twenty-six members, the writer becoming its pastor, though she did not receive ordination till 1881. This Mother Church has, in 1895, a membership of five thousand one hundred in different parts of the country, about eight hundred being local residents. During the same year she founded her Massachusetts Metaphysical College in Boston, the laws then enabling her to obtain a charter for medical instruction; though no such privileges were granted after 1883. She started in 1883, as editor and proprietor, *The Christian Science Journal*, still the official organ of the Scientists. The first National Association was convened in New York, on February 11, 1886, and still meets, though discarding organized action.

The first denominational chapel was erected at Oconto, Wisconsin, in 1886, and has been followed by others. In 1894 the Boston Church completed a beautiful edifice, as a Testimonial to the writer of this. It was dedicated on Jan. 6th 1895, and cost, including the land, nearly two hundred and fifty thousand dollars. In 1894, it was estimated that in Europe and America there were at least two hundred thousand disciples, while half a million people more attest its power. In the U. S., in 1894, there were three hundred societies meeting regularly for worship, twenty-six teaching institutes, and sixty-six dispensaries and reading rooms.

The Christian Science Publishing Society, issues *The Christian Science Journal*, the *Quarterly Bible Lessons*, and many tracts, some in German and Norwegian. The writer's works include *Science and Health with Key to the Scriptures* (already mentioned), *Retrospection and Introspection* (1891), *Christ and Christmas*, a poem, illustrated (1893), *Pulpit and Press* (1895), *Unity of Good and Unreality of Evil* (1887), *No and Yes* (1891), *Rudimental Divine Science* (1891), *People's Idea of God* (1886), and *Christian Healing* (1886). MARY BAKER EDDY.

Though numerous books and pamphlets purporting to deal with Christian Science have been published, Mrs. Eddy and her followers recognize as authoritative only those enumerated above. ROBERT LILLEY.

Scientific Schools: See *Technical Schools*, under SCHOOLS.

Scilla: See SCYLLA.

Scilly (sil'lĕe) **Islands** (anc. *Cassiterides*): a group of islands belonging to Great Britain, situated 30 miles W. of Land's End, the southwestern promontory of Cornwall. It consists of 140 isles and rocks, of which six are inhabited—St. Mary, Tresco, St. Agnes, Sampson, Bryher, and St. Helen's. Total area, 3,560 acres. Pop. about 2,500, of whom about 1,300 live on St. Mary, where Hugh Town, the capital, is situated. On St. Agnes is a lighthouse; and on Bishop Rock, 6 miles westward, is one of the finest lighthouses of its kind. All the islands are rocky, consisting of granite with a thin layer of light sandy soil. Agriculture and fishing are the principal occupations; good crops of barley, oats, and potatoes are raised. The navigation around these isles is very dangerous. In 1705 the fleet under Admiral Sir Cloudesley Shovel fell upon these rocks, when his ship and several others were lost. Revised by M. W. HARRINGTON.

Scin'cidæ [Mod. Lat., named from *Scin'cus*, the typical genus, from Lat. *scin'cus* = Gr. *σκίγκος*, *σκίγγος*, a kind of lizard]: an extensive family of lizards of the group *Leptoglossa*. As limited by Gray, it includes those forms in which the body is subcylindrical or fusiform, and with the tail cylindrical or tapering; the scales generally smooth, but sometimes keeled or striated; the head sub-quadrangular and regularly shielded, with the rostral plate moderate, and the nostrils lateral, and in a special nasal shield interposed between the frontal and labial shields; the limbs variable in development, typically four, generally more or less weak, sometimes atrophied. According to Prof. Cope, the temporal fossa is roofed, the premaxillary double, the palatine maxillary laminæ dilated, and rarely a xiphisternal fontanelle is developed. The tongue is short, flat, and squamous. The family embraces numerous genera, distributed in almost all parts of the world. There is every gradation in the development of the members, from those forms in which the limbs are quite strong and provided with five digits each, to those in which they are entirely wanting, and the number or development of these parts is of comparatively little systematic value in the group. The family is well represented in the U. S. chiefly by species of the genus *Eumeces*.

Revised by F. A. LUCAS.

Scinde: a province of India. See SINDH.

Scio, or **Chios** (Turk. *Sakiz Adasi*): island; in the Ægean, in the latitude of Smyrna, and separated from the western extremity of Asia Minor by a strait less than 5 miles wide where narrowest; 32 miles long from N. to S., and from 18 to 8 from E. to W.; area, 579 sq. miles. It is rocky, but so fertile and beautiful as to justify its title of Queen of the Ægean. Water-springs abound. There are few forests near the coast, but the interior of the island is covered with firs. Toward the south there are remarkable plantations of mastic-trees, the culture of which furnishes the main support of twenty villages, and from which a valuable hygienic gum is obtained. Its many harbors render the island easy of access from every direction. The Ionians colonized Scio about 1130 B. C., and it formed a part of the Ionian confederacy. It heroically resisted the Persians, from whom it was delivered by the treaty of Cimon (449 B. C.). During the Peloponnesian, Roman, and mediæval wars, it experienced many vicissitudes. Under the Genoese it enjoyed prosperity from 1346 until 1566, when it was conquered by the Ottoman admiral Piali Pasha. As the private property of the sultana, the island was mildly governed, and the inhabitants became unwarlike and effeminate, and were undisposed to join in the struggle for Greek independence. Hence the atrocious massacre of Apr., 1822, was without provocation and almost without pretext. The Ottomans slew or enslaved 30,000 persons; 20,000 who escaped were scattered over the world, some even reaching America, and by August the population had shrunk to 10,000. Scio has suffered much from frequent earthquakes, yet the industry and intelligence of the people have largely restored their former prosperity. Pop. 70,000, of whom 68,000 are Greeks, and 1,200 Mussulmans. Scio, the capital, was founded by the Genoese at the extremity of the plain of Cambos. It has dockyards and a good harbor, and is the maritime center of the Archipelago. The principal exports are lemons, oranges, olives, almonds, anise, beans, mastic, and worked leather. E. A. GROSVENOR.

Scioppius, stsĕe-op'pĕe-ŏos (*Kaspar Schopp*): classical scholar and controversialist; b. at Neumark, in the Palatinate, May 27, 1576; studied at Heidelberg, Altdorf, and Ingolstadt; visited Italy, Bohemia, Poland, and Holland; abjured Protestantism and became a Roman Catholic in 1598. His fanatical propaganda earned for him the titles of Duke of Clara Valle in Spain and patrician of Rome. His virulent invectives against the Jesuits and Joseph Scaliger (see SCALIGER, JOSEPH), and his insane diatribes against Cicero, Varro, and many post-Augustan writers, alienated even his own partisans, so that he was compelled to publish many of his polemical writings under an assumed name. He died in Padua, Nov. 19, 1649. Among his scientific writings may be mentioned his *Grammatica philosophica*

(1628), his best work; *Observationes linguæ Latinæ*; *De arte critica*; *Verisimilium libri iv.*; *Paradoxa litteraria*, and an edition of Sanctius's *Minerva* (1663). See C. Barth, *Cave canem sive de vita, moribus, rebus gestis, et divinitate G. Scioppii* (Hanover, 1612); C. Nisard, *Les gladiateurs de la république des lettres au XV^e^, XVI^e^. et XVII^e^ siècles* (vol. ii., pp. 1–206, Paris, 1860); H. Kowallek, *Forschungen zur deutschen Geschichte*, vol. ii., pp. 401–482 (Göttingen, 1891).

ALFRED GUDEMAN.

Scioto (sī-ō′tō) **River**: a beautiful stream which rises in Auglaize co., O. Its course to Columbus is S. E., and from that city it flows S. to Portsmouth, where its waters are discharged into the Ohio. It is 200 miles long, and when the water is high may be navigated for 130 miles. Its valley is very productive.

Scipio, sip′ĕe-ō: the name of a distinguished Roman family of the Cornelian gens. (1) PUBLIUS CORNELIUS SCIPIO, father of the elder Africanus, was consul in 218 B. C., the year of Hannibal's advance into Italy. He attempted to thwart the Carthaginians at the Rhône, but Hannibal had already passed the river when Scipio arrived. Scipio thereupon returned by sea to Cisalpine Gaul, and prepared to meet the enemy as they descended the Alps. He suffered defeat, however, in the first engagement at the river Ticinus, and again in the same year at the Trebia. In the following year he joined his brother in Spain, where they continued successful campaigns against the Carthaginians until 211 B. C., when they both lost their lives in battle.—(2) PUBLIUS CORNELIUS SCIPIO, called Africanus, a son of the foregoing, was present as a mere boy at the battle of the Trebia, and served as a military tribune at Cannæ (216). In 210, after the death of his father and uncle in Spain, he presented himself as a candidate for the office of proconsul to continue their campaign, and was enthusiastically elected. His success warranted the choice, and in the course of three years he had made the Romans complete masters of Spain. He was consul in 205, and advocated an aggressive policy upon Carthage; but the conservative party at Rome was too strong, and while he was granted the province of Sicily and permission to go on to Africa, the necessary forces were withheld. Hereupon Scipio called for volunteers, and with an army thus composed he landed on the African coast in 204, and in the following year defeated the Carthaginian army and their allies (under Syphax). In this crisis Hannibal was recalled from Italy and placed in command of the home forces. The decisive battle was fought at Zama, ending in the complete rout of the Carthaginians. Terms of peace were then made, by which the political and military importance of Carthage was greatly reduced, though its commercial interests were not disturbed. The demands of narrow-minded patriots like Cato that Carthage should be destroyed Scipio always withstood stoutly, not only realizing that Carthage could now do Rome no harm, but doubtless also believing that her commercial interests must be of positive value to Rome. Scipio lived in honored leisure for some years after his return from Africa, but in 194 he was again chosen consul, and in 193 he was one of the ambassadors to King Antiochus, at whose court he is said to have met Hannibal. In 190 he served with his brother in the conduct of the war against Antiochus, and with him was accused of misappropriating funds received from the king. The charges were probably not true, but Scipio with great arrogance refused the vindication of a trial and averted the prosecution by an appeal to the memory of his patriotic services. Though they were not renewed, Scipio withdrew from Rome at this evidence, as he esteemed it, of his countrymen's ingratitude, and spent the remainder of his life on his estate at Liternum, where he died about 183 B. C. He was a friend of the new culture and the refinements of civilization which were beginning to come into Rome during his lifetime, a circumstance which was made the basis for many attacks upon him by his political opponents; but he seems to have possessed a truly cosmopolitan mind conspicuously in advance of the narrow patriotism of his contemporaries. His personal bearing was characterized by extreme haughtiness and by a consciousness of his own superiority. His conduct, too, was often characterized by a disregard of the forms of government, and thus in spite of his great popularity with the masses he constantly provoked the dislike and jealousy of others in public life.—(3) PUBLIUS CORNELIUS SCIPIO AFRICANUS, the younger (a son of Æmilius Paulus), was the grandson, through adoption, of Scipio Africanus. In the years between the death of the elder Africanus and 150 B. C. Carthage had recovered its commercial importance, and because of wars with the Numidian king Masinissa, who shared with it the control of Africa, was suspected of planning to recover its ancient political position. On this plea the party of Carthage-haters at Rome succeeded in bringing about a declaration of war in 149, and in the following year Scipio was elected consul to take charge of it. After two years of fierce fighting and siege Carthage was taken and totally destroyed. In 134 Scipio was again consul, and by his administrative and strategic ability put an end to the long siege of Numantia in Spain, capturing and destroying it. Scipio was always a moderate aristocrat, and in the political storms aroused by the reforms of Tiberius Gracchus he made enemies, at whose instigation he was believed to have been assassinated in his bed (129), though the exact circumstances of his death always remained a mystery. Like the elder Africanus, he was devoted to the new Greek culture, especially in literature, and was the center of a famous coterie of literary men (the Scipionic circle), to which the poet Terence, the Greek historian Polybius, the philosopher Panætius, the poet Lucilius, and others less famous belonged.

G. L. HENDRICKSON.

Scire facias, sī′rēe-fā′shi-ăs [so called from these words occurring in the original (Lat.) form of the writ; *sci′re*, to know + *fa′cias*, sec. pers. sing. pres. subjunc. of *fa′cere*, make, cause]: in law, a common-law writ founded upon a record ordering the party against whom it is issued to appear in court and show cause why some act should not be done in favor of the party in whose behalf the writ was issued.

At the common law a *scire facias* was issuable upon three kinds of records—judgments, recognizances, and letters patent. The purpose of the writ when issued upon a previous judgment is either (*a*) to revive such judgment in order to have executions by or against the same party where the right to take out execution has been lost by delay (at the common law for a year and a day); or (*b*) to extend a judgment by or against a new party to a suit, who since the recovery of the judgment has become so related to the original parties that the same rights or liabilities exist for or against them—as in the case of members of joint-stock companies, executors, a feme sole who has married since the judgment, etc. In these cases the writ is in the nature of a continuance of a previous action.

Where the writ is issued upon a RECOGNIZANCE (*q. v.*), its purpose is to secure the issuance of an execution for the purpose of enforcing the obligation which must have been forfeited, and the writ is in the nature of an original action.

The writ when issued to reverse or annul a grant (as of a franchise, monopoly, or the like) by letters patent is the beginning of an original action, and is issued actually or nominally in the interest of the government to revoke the letters for some cause affecting their validity or for abuse, etc. In the U. S., in the Federal courts, a proceeding in the nature of a *scire facias* may be used to annul letters patent for an invention obtained through fraud.

In the U. S., in some States, the writ is used as a mode of foreclosing mortgages and also as a method of enforcing mechanics' liens. There are other uses in which it has been made available by statute in various States, and in some other (code) States it has been abolished for some purposes and a simple motion substituted in its stead. See Foster's *Writ of Scire Facias* and Kelly's *The Law and Practice of Scire Facias*.

F. STURGES ALLEN.

Scissorsbill: See SKIMMER.

Scissorstail: a bird, *Milvulus forficatus*, of the family *Tyrannidæ*. It has an extremely long, forked tail, which it has a habit of opening and closing like the blades of a pair of scissors. The general color is ashy gray; there is a spot of orange on the crown, and another of scarlet on the sides below the wings; the outermost feathers of the tail, which reaches a length of from 8 to 12 inches, are white. It is found from Missouri, southward through Texas, to Central America.

F. A. L.

Sciu′ridæ [Mod. Lat., named from *Sciu′rus*, the typical genus, from Lat. *sciu′rus* = Gr. *σκίουρος*, squirrel; popularly interpreted as *σκιά*, shadow + *οὐρά*, tail, but probably connected with O. H. G. *scēri*, quick]: a family of rodent mammals of the sub-order *Simplicidentati*, including the squirrels, marmots, etc. The skull is well developed and delicate in organization; the infraorbital foramen is only represented by a small anterior foramen, the zygomatic process of the upper jaw being an imperforate, thin, and oblique plate,

which rises from the general level and forms a dead wall in front of the orbit; post-orbital processes are more or less developed; the lower jaw has its descending ramus subquadrate, the upper angle acute and sub-erect, and the lower rounded or subtruncate and bent inward; molar teeth $\frac{4-5}{4} \times 2$, provided with roots, and (except the anterior upper one when present) of nearly equal size, with tubercular crowns; perfect clavicles are developed: the hind limbs moderately large; the fibula and tibia separate from each other. At least 150 species are known, represented in almost all quarters of the world, except Australia. There are all gradations, between the slender and graceful form of the squirrel and the heavy, almost bear-like, form of the woodchuck. This transition is manifest from the arboreal squirrels (*Sciurus*) through the ground-loving *Tamias* with well-developed tails; the *Spermophilus*, or prairie-squirrels, with shorter tails; *Cynomys*, or the prairie-dogs, with stouter forms; and *Arctomys*, or the woodchucks, with still more robust forms.

Revised by F. A. Lucas.

Sclater, Philip Lutley, Ph. D., F. R. S., F. L. S.: ornithologist; b. at Hoddington House, Hampshire, England, Nov. 4, 1829; educated at Winchester College and Corpus Christi College, Oxford, graduating in 1849; took a first class in mathematics, and subsequently became a fellow; was called to the bar at Lincoln's Inn in 1855, and practiced in the western circuit for several years. In 1859 he became secretary to the Zoölogical Society in London, and in 1860 editor of *The Ibis*, positions which he has held ever since. He is a member of the council of the Royal Geographical Society, and from 1877 to 1882 was one of the general secretaries of the British Association. He has published about 1,000 papers on ornithology and other branches of natural science. Among his more important works are *Monograph of the Tanagrine Genus Calliste* (1857); *Monograph of the Jacamars and Puff-birds* (1882); *Nomenclator Avium Neotropicalium* (1872); *Catalogue of Birds in the British Museum*, vol. xi., *Cœrebidæ*, *Tanagridæ*, and *Icteridæ* (1886), vol. xiv., *Oligomyodæ* (1888), vol. xv., *Tracheophonæ* (1890).

F. A. Lucas.

Scleren'chyma: See Histology, Vegetable (*Stony Tissue*).

Scleroder'ma [Mod. Lat.; Gr. *σκληρός*, hard + *δέρμα*, skin]: a sub-order of plectognath fishes, in which the bones of the upper jaw are but imperfectly united, the teeth independently developed, and the scapular arch, with the hypocoracoid and hypercoracoid bones both developed. The form is typically fish-like, in which respect the species differ much from the other members of the order. The dermal armature is developed in the form of small scale-like plates or bristles; the dorsal fin is represented by from one to six spines; the pelvic elements are well developed. To the group thus distinguished belong two well-defined families—*Triacanthidæ*, including the most fish-like forms, and *Balistidæ*, comprising the more aberrant species.

Sclerotica: See Eye.

Sclo'pis, Federigo Paolo, Count: politician and writer on historical law; b. at Turin, Italy, Jan. 10, 1798; took his legal degree in the university of his native city in 1818, and in 1827 gave his first historical lecture, *I Longobardi in Italia*, before the Turin Academy of Sciences. This was followed by *La Storia dell' Antica Legislazione nel Piemonte* (Turin, 1833); *La Storia della Legislazione Italiana* (4 vols., Turin, 1840–64); *Ricerche Storiche sopra le Relazioni Politiche tra la Dinastia di Savoia ed il Governo Britannico* (Turin, 1853). In 1845 he was elected corresponding member of the Institute of France, and in 1869 foreign member of the same; in 1847 was made president of the superior commission of press censorship in Piedmont; in Mar., 1848, accepted the portfolio of justice; in 1849 was named senator, and from 1861 to to 1864 was president of the Italian Senate; was also elected president of the Turin Academy of Sciences. In 1868 Victor Emmanuel bestowed upon him the highest order of the kingdom, that of the Annunziata; in 1871, being selected as representative of Italy in the congress of arbitration which assembled at Geneva for the settlement of the Alabama question, he was elected president of this congress, and performed the duties of his office with signal ability. D. Mar. 8, 1878. Revised by F. Sturges Allen.

Sclot, Bernat: See d'Esclot, Bernat.

Scollard, Clinton: poet; b. at Clinton, N. Y., Sept. 18, 1860. He graduated at Hamilton College 1881, and studied in the graduate department of Harvard University and for a short time at Cambridge University, England. In 1888 he was chosen Assistant Professor of Rhetoric at Hamilton College, and subsequently Professor of English Literature. He has published *Pictures in Song* (1884); *With Reed and Lyre* (1886); *Old and New World Lyrics* (1888); *Giovio and Giulia* (1891); *Songs of Sunrise Lands* (1892); and an edition of Ford's *Broken Heart* (1895). H. A. B.

Scolopac'idæ [Mod. Lat., named from the genus *Sco'lopax*, from Lat. *sco'lopax*, *scolo'pacis* = Gr. *σκολόπαξ*, *σκολόπακος*, snipe, woodcock]: a family of wading birds, including snipe, woodcock, sandpipers, and related forms. The bill is long and slender, rather soft and flexible, and with the sides compressed and grooved to the tip, which is blunt; the lower mandible has no angle at its lower margin; the nostrils are basal, elongated, and situated in a groove closed by a membrane; the wings are long and pointed, the first or second primary being longest; the tail is usually short and even; the legs elongated: the thighs exserted and naked; the tarsi elongated and slender; the toes moderately long and attenuated, the anterior being connected more or less by a basal membrane, the hinder short or wanting. Some members of the family are found in uplands far from water, and others in inland forests. See Curlew, Sandpiper, Snipe, Woodcock, etc. Theodore Gill.

Scombereso'cidæ [Mod. Lat., named from *Scombe'resox*, the typical genus; Lat. *scomber*, from Gr. *σκόμβρος*, mackerel + Lat. *e'sox*, *eso'cis*, pike]: a family of fishes comprising the flying fishes, half-beaks, and other remarkable forms. The body is more or less elongated, the scales are cycloid, a lateral peak developed along each side of the belly: the head is more or less quadrangular and flattened above; the jaws are very variable in development, sometimes very much elongated, and sometimes short and subtruncate; the upper is constituted by the intermaxillaries at the middle and the maxillaries at the sides; the teeth are variable in development; the branchial apertures confluent below; branchiostegals in considerable number; the dorsal fin single and far back, composed mostly of branched rays; anal fin opposite the dorsal; caudal distinct and generally emarginated, and with its lower lobe longest; pectorals with branched rays and variable in development; ventrals abdominal. The air-bladder is generally present, but is shut off from any communication with the intestinal canal; the pseudobranchiæ are hidden and glandular; the stomach is not distinct from the intestine, which is straight and without pyloric appendages. The species are mostly inhabitants of the tropical seas. Revised by F. A. Lucas.

Scom'bridæ [Mod. Lat., named from *Scom'ber*, the typical genus, from Lat. *scom'ber*, from Gr. *σκόμβρος*, mackerel]: an important family of fishes, including the mackerels, tunnies, bonitoes, and related forms. The body is elongated and fusiform; the scales very small or wanting (generally cycloid, but about the thorax larger and sometimes ctenoid ones are developed, which form the so-called corselet of the tunnies); dorsal fins two, the first composed of rather slender spinous rays, the second with branched rays, the posteriors of which are free and developed as finlets; anal similar to the second dorsal; caudal forked, and well adapted for powerful propulsion; pectorals pointed; ventrals thoracic, each with one spine and five rays; numerous (more than twenty-five) vertebræ; numerous pyloric cæca developed. The species vary in size from the dimensions of a small mackerel to those of the great tunny, which sometimes attains a weight of over 1,000 lb. Some are great wanderers. In the summer of 1871, for example, there appeared suddenly on the coast of Massachusetts large numbers of a small tunny (*Orcynus alliteratus*) which had previously been unknown along the coast of America, although familiar as a Mediterranean fish. See Mackerel and Tunny.

Sco'pas (Gr. *Σκόπας*): sculptor; b. in the island of Paros, flourished B. C. 390–350, and was one of the most celebrated of Grecian artists. He worked mostly in marble, the product of his native place, and chose his favorite subjects from the myths of Dionysus and Aphrodite. With Praxitcles, he formed the character of the second or later Attic school of sculpture, in contradistinction to the earlier school of Phidias. He was celebrated also as an architect, and constructed the temple of Athena Alea at Tegea, and engaged with Leochares and others in embellishing the mausoleum at Halicarnassus. The statement that he assisted in the erection of the temple of Artemis at Ephesus rests on a doubtful passage of Pliny. Among the most noted works ascribed to Scopas were a statue of Aphrodite Pandemos in Elis, one of Apollo Smin-

theus in Chryse, the group of Niobe and her children, and the group of sea-deities escorting Achilles to the island of Leuce. His separate figures are enumerated by Sillig in his *Dictionary of Ancient Artists.*

Scopel'idæ [Mod. Lat., named from *Sco'pelus*, the typical genus, from Gr. σκόπελος, high rock, cliff]: a family of fishes allied to the *Salmonidæ*, etc., many members of which are noticeable from the possession of phosphorescent spots. They have an elongate body, either naked or covered with cycloid scales, no barbels, the upper lip formed of the intermaxillary bones alone; a large gill-opening and an adipose fin; air-bladder lacking. The fifty species are arranged in some fifteen genera. All are marine, some living at the surface of the sea in the warmer waters, others being found at considerable depths. The phosphorescent spots of *Scopelus* have been regarded as accessory eyes by Ussow.

J. S. Kingsley.

Scoresby, William, D. D., F. R. S.: Arctic explorer and physicist; b. near Whitby, England, Oct. 5, 1790; son of a noted whale-fisher of the same name; went to sea in one of his father's ships when ten years old; spent the intervals between his annual voyages in scientific studies at Edinburgh; reached the highest northern latitude that had then been attained May, 1806; made important observations on the electrical phenomena of the Arctic regions, and by his communications to Sir Joseph Banks, president of the Royal Society, was instrumental in inducing the Government to send the first (1817) of the long series of Arctic exploring expeditions. After seventeen voyages to the Greenland or Spitzbergen regions, he published his *History and Description of the Arctic Regions* (2 vols., 1820) and his *Journal of a Voyage* (1823). When above forty years of age Capt. Scoresby passed through a course of literary and theological study, graduating in divinity at Cambridge; filled several pastorates; received the degree of D. D.; was noted for philanthropic labors; visited the U. S., in 1842 and 1848, and made a voyage around the world for magnetic research 1855–56. D. at Torquay, Mar. 21, 1857. He published valuable works on magnetism and several scientific books, and wrote a *Life* of his father (1851). His own *Life* was written by a nephew (1861). Revised by M. W. Harrington.

Scorpæn'idæ [Mod. Lat., named from *Scorpæ'na*, the typical genus, from Lat. *scorpæ'na* = Gr. σκόρπαινα, the *Scorpæna scrofa*, deriv. of σκορπίος, scorpion]: a family of fishes of the sub-order *Acanthopteri.* The body is more or less oblong and compressed: the scales (sometimes wanting) typically ctenoid and imbricated; the lateral line continuous; the head compressed, often inflated laterally, and more or less armed with ridges and spines; teeth acute and present on the jaws as well as palate; dorsal fin differentiated into a longer spinous and a shorter rayed portion; anal with its rayed portion smaller than that of the dorsal, and armed generally with three spines; caudal well developed and free; pectorals with at least the inferior rays generally somewhat enlarged and simple, not branched; ventrals thoracic, with a spine and generally five rays; the stomach is sacciform, and pyloric appendages are developed in moderately small number. The family includes many genera, the principal of which are *Scorpæna*, *Sebastes*, *Sebastosomus*, *Pterois*, *Pterodichthys*, *Tæniotus*, and *Apistus.* They are chiefly inhabitants of the tropical or sub-tropical regions, but *Sebastes* proper is peculiar to the northern seas, and of *Sebastosomus* and *Sebastomus* a number of species are found on the western coast of the U. S., as well as corresponding latitudes of the Asiatic portions of the Pacific. In some (*Apistus* and *Minous*) an independent pectoral filament or ray is developed. Revised by J. S. Kingsley.

Scorpio: See Scorpius.

Scorpio'nes [from Lat. *scor'pio*, scorpion]: a group of arachnid (spider-like) animals in which the body is divided into a short leg-bearing cephalothorax and a long abdomen, the seven basal joints of which are as broad as the thorax, the last six, including the terminal sting, being much narrower. To the cephalothorax are attached six pairs of appendages, the first pair being very short, and, like the long second pair, bearing lobster-like pincers at the end. The remaining four pairs are for locomotion. The abdomen is without evident appendages except a pair of comb-shaped organs (pectines) upon the second segment. These are supposed to be sensory in function. There are from three to six pairs of eyes upon the cephalothorax. A peculiarity is noticeable in the respiratory organs, which consist of four pairs of sacs (lungs) upon the basal joints of the abdomen. In each lung is a series of plates, through the walls of which oxygen passes to the blood. The young are born alive. Scorpions are best known for their poisonous character. The poison-gland is in the last joint of the abdomen, its duct emptying in the terminal spine. In tropical countries this sting is not infrequently fatal to man, but in the U. S., while very painful, it only occasionally causes death. The scorpions are largely nocturnal, living under logs and stones and in burrows by day. They feed upon the juices of spiders and insects, which are killed by the sting. In confinement they will eat bananas. The scorpions are inhabitants of warm countries, but have been found as far N. as Nebraska. About 200 species are known. They occur as fossils in the Silurian rocks. To the zoölogist the scorpions possess great interest, as they are the most primitive of the *Arachnida* and because they show most striking resemblances to the horseshoe-crab (*Limulus*). See Thorell, *Classification* (*Annals and Magazine of Natural History*, 1876); Lankester, *Limulus an Arachnid* (*Quarterly Journal of Microscopical Science*, 1881); Laurie, *Embryology* (*Quarterly Journal of Microscopical Science*, 1890).

Black scorpion (*Scorpio afer*).

J. S. Kingsley.

Scorpion-flies: See Entomology (order *Mecoptera*).

Scorpius, or **Scorpio**: the eighth sign of the Zodiac (*q. v.*), also a constellation, the Scorpion. Two thousand years ago the constellation and the sign coincided, but now, owing to the precession of the equinoxes, the constellation Scorpio is situated in the sign Sagittarius. It may be recognized by the bright red star Antares, with a smaller companion on each side of it, and a curved row of stars toward the W. S. N.

Scorzone'ra [Mod. Lat., from Ital. *scorzonera*, appar. liter., black bark; *scorza*, bark + *nera*, fem. of *nero*, black]: a garden vegetable popular in parts of Europe, but unknown in the U. S. The *Scorzonera hispanica*, *S. glastifolia*, *S. deliciosa*, and *S. tuberosa* (family *Compositæ*) furnish edible roots, whose taste is compared to that of asparagus, celery, hazelnuts, and salsify. The black skin is washed off, and the root is soaked in fresh water and then boiled fifteen minutes. Scorzonera is very highly esteemed by many, and is especially praised as food for invalids. It is very hardy and of easy cultivation.

Scotch Confession of Faith: a confession drawn up by John Knox and his compeers at the request of the Scotch Parliament, which assembled at Edinburgh in Aug., 1560, after the death of the queen-regent, Mary of Guise (June), and the close of the civil war. It consists of a preface and twenty-five articles on the chief doctrines of religion, which are briefly, tersely, and vigorously stated. It agrees with the other Reformed confessions of the sixteenth century, but is more pronounced in its opposition to the Roman Catholic Church than most of them. It was rather hastily composed in four days, twice read article by article in Parliament, and adopted by the same as being "based upon the infallible word of God." Only three temporal lords voted against it, for the reason that they believed as their forefathers believed. The Roman Catholic bishops were called upon to object and refute, but kept silence. Seven years later (1567), after the abdication of Queen Mary, the confession was readopted, and the Reformed Kirk of Scotland formally acknowledged and established. In 1580 the confession was signed by King James II., and a supplementary confession (sometimes called the *second* Scotch Confession) added to it. It continued to be the only doctrinal standard of Scotland recognized by the civil government till the Revolution of 1688, but it was practically superseded by the Westminster Confession, which is more logical and complete, and was adopted by the Covenanters and the General Assembly during the Commonwealth. The Scotch Confession is printed in the acts of the Scotch Parliament for 1560, in Knox's *History of the Scotch Reformation* (ed.

Laing, vol. ii.), in Calderwood's *History of the Kirk of Scotland*, in Dunlop's *Collection of Scotch Confessions* (vol. ii.), in Niemeyer's *Collectio Confess. Reform.*, and in Schaff's *Creeds of Christendom* (vol. iii.).

Scoter: any sea-duck belonging to the genus *Oidemia* of Fleming. The species are distinguished by the bill being much swollen at the base, with the terminal part depressed and broad, and the extension of the feathers of the chin forward as far as the nostrils. The color is to a great extent black. The American species are *Oidemia americana* (the common scoter), *O. fusca* (velvet scoter), *O. perspicillata* (commonly called surf-duck or sea-coot), and *O. deglandi* (the velvet duck or white-winged coot).

Scotists: among the SCHOOLMEN (*q. v.*), the followers of John Duns Scotus. Their principal adversaries were the Thomists. The Scotists held to freedom of the will and the immaculate conception of the Virgin. Franciscans were generally Scotists; the Dominicans, Thomists.

Scotland: that part of Great Britain which lies N. of the Cheviot Hills and the Tweed. It is bounded on the N. and W. by the Atlantic Ocean, on the E. by the North Sea, on the S. by England and the Irish Sea. Its greatest extent, from Dunnet Head in the N. (58° 41′ N.) to the Mull of Galloway (54° 38′ N.), is 288 miles. The area is 29,785 sq. miles, of which the islands comprise over one-seventh.

Coast.—The development of the coast-line is very considerable in proportion to the area of the kingdom, for it amounts to 2,300 miles, which gives 1 mile of coast-line to every 12 sq. miles of area. No point of the country is farther than 40 miles from the sea.

No contrast could be greater than that between the east and west coasts. The former resembles that of England. It is generally formed of soft sandstones and clays and generally low and shelving, although marked by a few bold headlands, such as Duncansby Head, Tarbat Ness, Kinnaird Head, Buchan Ness, Fife Ness, and St. Abb's Head. Its indentations, including the Firths of the Forth and the Tay, and the Moray Firth, which bifurcates into Loch Beauly and Cromarty Firth, are few, but they penetrate far inland, and form the estuaries of comparatively important rivers. The west coast, on the other hand, as far S. as the Firth of Clyde, is formed of hard rocks, rises boldly from the sea, and is intersected by numerous narrow sea-lochs, bounded by steep hills, and separated from each other by mountainous peninsulas. The most considerable of these peninsulas is that of Kintyre or Cantire. It is nearly 60 miles in length and terminates in the Mull of Kintyre. Narrow sounds separate the mainland from Skye, Mull, and others of the Inner Hebrides; and a broad strait, the Minch, separates these from the Outer Hebrides, or Long Island.

The eastern coast of the Firth of Clyde is generally level, while that of the peninsula of Galloway, farther S., is generally steep, and juts out in the Mull of Galloway, the most southerly point of Scotland, in lat. 54° 38′ N. The northern coast, between Duncansby Head and Cape Wrath, is wild and rugged and marked by bold headlands.

Relief.—In its broad features Scotland may be divided into a highland region in the north, a lowland plain in the center, and an upland region in the south. The Highlands are cleft in two by a long and narrow valley, the Great Glen (Glenmore), which extends along an anticlinal axis from Loch Eil to the Beauly Loch. This valley is occupied by a chain of lakes connected by the Caledonian Canal, and its summit-level is only 105 feet above the level of the sea. The mountain region to the N. of this glen is, for the most part, sterile and inhospitable and very thinly peopled. Lofty mountains lift their summits above its extensive moors, the most considerable being Ben Dearg (3,547 feet), Ben Wyvis (3,929 feet), and Mam Soul (3,862 feet). Toward the N. E. this mountain region merges into the undulating sandstone plains of Caithness, which form bold and striking headlands on the coast.

The mountain region to the S. of Glenmore is known as the Grampians. In its arrangement it is much more linear than the Northern Highlands. A central chain can be traced from Ben Nevis (4,406 feet) in the southwest to the coast of Aberdeen. The Pass of Drumochter, on the confines of Perthshire and Inverness, crosses this chain at an elevation of 1,488 feet. The Northern Grampians branch off from the central chain near the head-waters of the Dee, and attain an elevation of 4,296 feet in Ben Macdhui. The Southern Grampians culminate in Ben Lawers, 3,984 feet. The Grampians are almost as sterile as the Northern Highlands, and moors abound, but there are excellent pastures in the valleys; and where these open out toward the N. E. and S. E. they offer every facility for a successful pursuit of agriculture. The western coast of the Highlands is generally steep and rugged, and sea-lochs penetrate far into the land; their interior abounds in picturesque lakes. Strathmore (the great vale) extends along the foot of the Highlands from Loch Lomond, in the southwest, to Stonehaven, in the northeast. It is separated from the sea and the great central plain extending between the Forth and the Clyde by a series of hills broken through by the Forth and Tay, and known as the Campsie Fells, the Ochil Hills (2,363 feet), and the Sidlaws (1,399 feet). Southern Scotland consists of an extensive hilly region stretching from St. Abb's Head on the German Ocean to Stranraer on the Irish Sea, and culminating in the Broad-Law (2,754 feet) and the Merrick (2,764 feet). The valleys of the Tweed and Clyde almost cut off from the main mass the outlying ranges of the Lammermuir and Pentland Hills toward the N. The range forming the boundary toward England is known as the Cheviots (2,636 feet). The southern hills are generally broad and flat; they are intersected by deep grassy glens, which open out into fertile valleys and plains. Among the latter that called the Merse, at the mouth of the Tweed, is the most considerable.

The western islands are generally of considerable height (Ben More, on Mull, 3,185 feet); the Orkneys and Shetlands, though they present bold cliffs toward the sea, and are much broken up by intricate channels, rise to a height of only 1,600 and 1,475 feet respectively.

Geology.—The rocks are chiefly of Palæozoic age. The clay and chlorite slates and the graywacke, interstratified with mica-schist and gneissose flagstones, which form nearly the whole of the Highlands, are classed by Prof. A. Geikie as metamorphosed Lower Silurian. On the west coast there occur sandstones of Cambrian age, while crystalline gneiss, equivalent to the Laurentian rocks of North America, occupy the Outer Hebrides and the west coast of Sutherland. These rocks are frequently broken through by igneous rocks, which form some of the highest summits. Granites predominate, but porphyry is found in the southwest, and basalt is highly developed on the islands of Skye and Mull. On the S. E., from the Clyde to Stonehaven, around Moray and Dornoch Firths and in Caithness, these Silurian rocks of the Highlands are bounded by flagstones and sandstones of the Devonian formation, which prevails in the Orkneys, while the Shetlands exhibit the geological features of the Highlands.

The great lowland plain is occupied by limestones and coal-measures of the Carboniferous system, the hills being largely formed of porphyritic rocks and basalt. Tuff and volcanic agglomerate occur in various localities. A narrow belt of Devonian rocks separates these lowlands from the southern uplands, whose graywacke and shale of Silurian age, pierced by masses of porphyry (Cheviots) and granite (in the west), are the prevailing rocks. Indications of an ancient glaciation are frequent. Subsequently an upheaval of the country, evidenced by raised beaches, took place. Scotland is rich in coal and iron. Lead is found in the southern hills. Excellent building-stones abound. Aberdeen is known for its granite; Craigleith for its freestone. Scotch pebbles, garnets, amethysts, and other precious stones are among the minor products of the mineral kingdom.

Hydrography.—The rivers rise in the hills, and frequently pass through mountain lakes. Their course is more rapid than that of the rivers of England. The water-parting being near the west coast the rivers of the eastern slope are much the longest. The Tweed is a rapid stream, forming, in its lower course, the boundary between England and Scotland, and entering the German Ocean at Berwick. The Forth, though an inconsiderable stream, deserves to be mentioned because of its firth. It is navigable to Stirling. The Tay is the most important river of Scotland. It rises to the N. of Loch Lomond, flows through Loch Tay, leaves the mountains at Dunkeld, intersects the Strathmore, and finally enters the Firth of Tay. It is navigable as far as Perth. The remaining rivers, with the exception of the Clyde, are of little use to navigation, but they abound in fish. The Clyde rises in a small lake on the southern confines of Lanarkshire, and enters the Firth of Clyde below Glasgow. Its current is very rapid, and it forms several waterfalls, but at a vast expense for dredging it has been made navigable for large vessels as far as Glasgow.

Scotland abounds in lakes. They are almost without exception in the Highlands and collectively cover an area of

640 sq. miles. The largest among them are Loch Lomond (45 sq. miles), Lochs Awe and Ness (30 sq. miles each), Loch Shin (25 sq. miles), Loch Maree (24 sq. miles), and Loch Tay (20 sq. miles).

Climate.—The climate is influenced by the warm waters of the Gulf Stream, which wash its western shore, the proximity of the Arctic Ocean with its masses of floating ice, and its position to the W. of continental Europe. Cold N. and E. winds prevail during spring; damp, warm winds from the S. and W. during summer and autumn, while the alternation between N. and S. winds during winter yields most rain. The rains are heavier on the west coast than on the east, the annual amount along the former varying between 40 and 80 inches, while along the latter it does not exceed 23 to 30 inches. Much heavier quantities, up to 130 inches, fall in the Western Highlands. Snow in the hills remains on the ground for two or three months. The mean temperature in the Lowlands and on the coast varies between 45° and 47° F. The January temperature varies between 37° and 40°, that of July between 55° and 58°. The winters are colder in the east than in the west (Edinburgh 37°, Glasgow 40°), but the summer temperature is nearly the same.

Scotland has been described as the land of the pine and heather, though in the Lowlands the forest-trees of England, beeches, oaks, and elms, grow well.

Politically it is divided into the following counties:

COUNTIES.	Area, sq. miles.	Pop. 1901.	Pop. to a sq. mile.
I. NORTHERN:			
Shetland*	551	27,755	52
Orkney*	376	27,723	81
Caithness*	685	33,619	54
Sutherland*	2,028	21,389	11
II. NORTHWESTERN:

Totals	29,785	†4,471,957	135

* In counties marked thus * the population has decreased since 1891.
† Includes a shipping population of 9,583.

Population.—The population rose from 2,888,742 in 1851 to 4,025,647 in 1891, and to 4,471,957 in 1901. Between 1881 and 1891 the population increased 7·77 per cent., but had there been no emigration the increase would have amounted to at least 12 per cent., for the excess of births over deaths during these ten years amounted to 441,761. The number of emigrants who left Scotland during the same period for countries outside Europe was 270,459, besides which 282,271 natives of Scotland were enumerated in England, and 27,323 in Ireland. This emigration affects more especially the Highlands, and emigration from these is by no means all voluntary. Thousands of homes have been destroyed and their tenants and fellow clansmen evicted by the landowners in order that the holdings might be converted into sheep-walks or still more profitable deer-forests. These last alone in 1891 covered 4,040 sq. miles.

The bulk of the inhabitants are concentrated in the lowland plain, and there, too, are nearly all the large towns, the only exceptions being Inverness (21,193 inhabitants, the capital of the Highlands), Aberdeen and Peterhead (12,226 inhabitants) in the north, and Galashiels (17,367 inhabitants), Hawick (19,204 inhabitants), and Dumfries (17,821 inhabitants) in the south. Of towns of over 50,000 inhabitants in 1901 there are nine, viz., Glasgow, pop. 760,423; Edinburgh, 316,479; Dundee, 160,871; Aberdeen, 153,108; Leith, 76,667; Paisley, 79,355; Govan, 76,351; Greenock, 67,645; and Partick, 54,274.

The population is the outcome of a fusion of various races, still in progress. The Gaelic Highlanders may be looked upon as the descendants of the ancient Picts and Scots, but they have also absorbed many Northmen, Danes, and Frisians who settled all around the coasts and on the islands. The Lowlanders, on the other hand, have for their stock an Anglo-Saxon element, especially strong in Lothian, and these early immigrants have absorbed not only many Highland Gaels, but also the Cymric Britons of Southwest Scotland and the Scandinavian settlers. English has thus become the predominant speech throughout Scotland. Gaelic, however, is still spoken by about 250,000 Highlanders, but it is rapidly dying out. The old patriarchal constitution of the Highland clans ceased to exist in 1747, and the land formerly held in common by all the members of the clan has been appropriated by the chieftains. Of the inhabitants in 1891, 3,688,700 were born in Scotland, 194,807 in Ireland (besides numerous persons of Irish parentage), 14,045 in England, 14,534 in British colonies, and 16,561 in foreign parts.

The Lowland Scotch are of average height, long-legged, spare, and muscular. Their features are regular, the cheekbones rather prominent. They are intelligent, persevering, shrewd in business, and thrifty almost to avarice, although on occasions and with patriotic objects in view they spend their means most freely; they value education quite apart from the material advantages it may yield, and have furnished some of the most redoubtable champions to free thought or secularism. Throughout the world they retain a love for their native country, and do everything in their power to push the interests of their fellow countrymen. The Highlander is represented by the poets as the type of bravery, loyalty, and every manly virtue, but until compelled by forts and military roads to settle down peaceably he led the life of a predatory herdsman.

Occupations.—Of the total population (1891) 722,329 males and 1,526,366 females, for the most part children and wives, follow no regular trade or profession. Of the remainder 12·3 per cent. are engaged in agriculture, 1·7 per cent. in fishing, 12·2 per cent. in mining and metallurgical works, 11·8 per cent. in textile industries, 34·2 per cent. in all other industries, 3·3 per cent. in commerce, 6·9 per cent. in transportation, 6·2 per cent. in the professions, 11·4 per cent. in rendering personal services, as servants, innkeepers, and the like.

Agriculture.—Scottish farmers enjoy a high reputation for the intelligence which they bring to bear upon the cultivation of the soil. Of the total area only 25·2 per cent. is under the plow (nearly half of which is sown with clover or grasses), 21·9 per cent. is permanent pasture, 4·5 per cent. is covered with woods, and 48·4 per cent. consists of mountain-heath and land used for grazing. The principal cereal crops are oats, barley, and wheat. Great quantities of strawberries, gooseberries, currants, and damsons are grown for export. The live stock numbered (1894) 1,201,506 head of cattle and 7,272,864 sheep; Scotch beef (from Buchan) and Highland mutton are highly esteemed in England. The whole of Scotland was owned (1877) by 132,131 persons, of whom 171 held nearly 60 per cent. of the entire area. There were (1895) 79,639 agricultural holdings of an average size of 61 acres.

Fishing.—The fisheries employ about 29,000 men permanently and 25,000 occasionally. Their produce (1900) was valued at £2,325,742, and 268,457 tons of fish were landed, exclusive of shellfish or salmon. Herrings form a valuable article of export. Dundee and Peterhead still fit out whalers for the Arctic and Antarctic regions.

Mining.—The country is rich in coal and iron. The coal-basin of Lanarkshire is the most extensive, but there are three others, and jointly they yielded (1899) 31,142,612 tons. Iron ores are usually associated with the coal-measures, and the ore is smelted on the spot. Lead is mined at Warlockhead (Dumfries) and at Leadhills (Lanark); a little copper near Loch Tay. The oldest iron-works are those of Carron, in Stirlingshire. Mining and metallurgical works employ 216,110 workmen.

Manufactures.—These are of considerable importance, especially in the lowlands. The textile industry (1891) gave employment to 206,550 persons, and there were 747 factories with 2,413,735 spindles, 71,471 power-looms, and 154,591 hands. The cotton industry has its centers at Glasgow and Paisley; the woolen manufacture is carried on at Hawick and Galashiels on the Tweed, but also in Stirling, Kilmarnock, and Bannockburn; carpets are made at Kilmarnock and Glasgow; Dundee and Dunfermline are the principal seats of the linen, hemp, and jute industries. Knitting is widely carried on as a domestic industry. The making of machinery, which employs 51,426 men, and shipbuilding (23,518 workmen) have their chief seats on the Clyde, where the largest ocean steamers and ironclads are built. Other industries of importance are printing (20,317 workmen), paper-making, sugar-refining, the preserving of provisions, glass-making, and the manufacture of chemicals.

Commerce.—Glasgow is the commercial capital of the country, although as a shipping-port it ranks seventh in the United Kingdom, being preceded not only by London or Liverpool, but also by Cardiff, Hull, Newcastle, and Southampton. The railways at the end of 1899 had a length of 3,480 miles, and there were also about 100 miles of tramway and 153 miles of canal. For further details, see GREAT BRITAIN.

National Wealth.—In 1886 the total value of property and profits assessed by the income-tax amounted to £59,406,708; in 1893 to £65,606,195 (all incomes of less than £150 are exempt). This increase, however, did not extend to the owners or occupiers of lands and tenements. The number of depositors in savings-banks (1893) was 596,179 and £12,583,676 stood to their credit, an increase of £4,338,681 since 1883. In 1892 there existed 342 co-operative industrial and provident societies, with 195,919 members, a capital of £2,983,303, and a turn-over of £9,743,238; and 61 building societies employing a capital of £976,255. On the other hand, in Jan., 1894, there were 61,978 paupers with 33,218 dependents (2·3 per cent. of the total population).

Religion.—Scotland since 1560 has an Established Church, organized on the Presbyterian system, and now governed by 1,348 parochial kirk sessions of ruling elders, with the minister as moderator; 84 presbyteries, 16 synods, and a General Assembly which meets annually in May. It claims 656,112 communicants, and about 45 per cent. of the entire population are claimed to adhere to it. Since 1874 its ministers are elected by the congregations. This question of patronage led in 1843 to a secession and the foundation of the Free Kirk, with 1,260 ministers and missionaries, 1,050 churches, 343,069 communicants, and the adherence of 34 per cent. of the population. On Oct. 31, 1900, the Free Church of Scotland and the United Presbyterian Church of Scotland met together in Edinburgh, through representatives, and constituted the United Free Church of Scotland with 1,656 congregations, 1,781 ordained ministers, and 495,174 members. There are small bodies of other denominations. The Episcopal Church now has 7 bishops, 354 churches and missions, and 336 clergy. The Roman Catholics are supposed to number 365,000 souls, and besides the Irish in the towns they embrace the inhabitants of the islands of Barra, South Uist, Eigg, and Canna, and of a few Highland valleys. See SCOTLAND, CHURCH OF.

Education.—Scotland has long been in advance of England in educational matters, more especially as regards secondary education. Since 1872 all public, elementary, and middle-class schools are administered by school boards, and education is free for all children between the ages of five and fourteen. In 1899 there existed 3,062 of these schools, attended by 731,272 children. In addition to these there are numerous superior schools in the enjoyment of endowments or supported by public bodies, the more famous among these being the Edinburgh Academy, Fettes College, the Edinburgh High School, Merchiston College, and the five schools supported by the Merchant Company. There are four universities and 2 university colleges, with 293 professors and 5,766 students. The oldest of these universities, that of St. Andrews, was founded in 1411. Among schools for special purposes may be mentioned the theological colleges, seven training-colleges for teachers, an agricultural college, veterinary colleges, and a school of medicine for women. Many of these schools are at Edinburgh, which is likewise the seat of the Royal Society (founded 1783) and of the Royal Scottish Academy. See SCHOOLS and COMMON SCHOOLS.

Political Institutions.—Scotland sends 72 members to the House of Commons, and 16 representative peers to the House of Lords, who are elected for the duration of each Parliament (the Scottish peerage numbers 87 members, of whom 48 are also peers of the United Kingdom). At the time of the Union (1707) the Scottish Church and the judicial system were left intact, and Scottish law differs in many notable respects from that of England. The high court of justice includes a court of session for civil cases, and a high court of justiciary for criminal offenses. The inferior jurisdiction is exercised by sheriff courts, by borough magistrates and justices of the peace (bailies). The police force numbers 4,488 men. In 1899 2,153 persons were committed for trial, and 1,785 convicted.

Local government was reorganized in 1889 on the outlines followed in England. Elected county councils have taken the place of the old commissioners of supply and road trustees. Municipal bodies, presided over by a provost, exist in numerous cities and burghs. In 1897–98 (the last year for which there is a complete return) the local expenditure amounted to £12,924,848, inclusive of £1,085,728 for the relief of the poor, and £2,222,686 for the support of schools. Of the total amount required £5,939,719 was raised by rates, tolls, and dues, £1,847,602 was contributed by the imperial Government, and £2,255,099 was raised by loans.

History.—When Scotland first became known to the Romans its Highlands were occupied by Gaelic Picts, while the south was held by Cymric Britons. The Highlands were known to them as Caledonia (a corruption of Gael Dun, Land of the Gael). Julius Agricola (80–85) first penetrated this "Barbaria" as far as the Tay, and inflicted a defeat upon the Picts at Mons Grampius, but his conquests were only temporary, and when the Emperor Hadrian was in Britannia (122) he caused a wall to be built from the Solway to the Tyne as a protection of the Roman provinces against the predatory northern tribes. Twenty years afterward, in the reign of Antoninus Pius, the legate Q. Lollius Urbicus once more advanced into Caledonia, and constructed the Antonine wall between the Forth and Clyde. In 208, however, Severus once more retired to the Tyne, and although Flavius Theodosius, the father of Theodosius the Great, once more recovered the country between the two walls (369), and bestowed upon it the name of Valentia, in honor of the Emperor Valentinian I., the Romans finally retired from their conquests and abandoned Britannia.

The Picts again swept down over the lowlands and far into England, ravaging and devastating the country with savage but irresistible valor. The Britons now called the Anglo-Saxons to their aid, and the Picts were once more confined to their Highlands; in 449 a Saxon chieftain, Edwin, founded Edinburgh. In 503 the Scots—that is, the Celts from Ireland—crossed over to Britain and founded, under the leadership of Fergus, a Scottish kingdom along the western coast of Caledonia, from the Firth of Clyde to the present Ross-shire. The Celts of Ireland were Christians, having been converted by St. Patrick, and in 563 St. Columba went over from Ireland and settled among the heathen Picts, spending the rest of his life, till 597, in converting them to Christianity. In the beginning of the seventh century Scotland formed four independent kingdoms, namely, that of the Scots, along the west coast to the N. of the Clyde; that of the Picts, to the N. of the Forth; Strathclyde in the southwest, which was held by the Britons; and the Saxon domain of Bernicia. In 836, Kenneth, a lineal descendant of Fergus, became King of the Scots, and in 843 he also became King of the Picts, transferring his residence to Forteviot in Stratherne, the old capital of the Picts. Thus the Scots and the Picts, two tribes of the Celtic race and speaking two dialects of the Celtic language, coalesced and formed one empire, which was originally known as Alban (Highlands), but developed in course of time into Scotia or Scotland, a designation by right belonging to Ireland. In 945 the King of England bestowed upon Malcolm I. (942–954) a portion of the Cambrian kingdom, and thus was established that claim for homage which subsequently led to many wars. In 970 King Edgar of England bestowed upon Kenneth III. the purely Saxon district of Lothian. The same king occupied also Strathclyde, and his successor, Malcolm II. (1003–33), acquired the Merse and Teviotdale from the Prince of Northumberland, thus extending Scotland to the Tweed.

While the Scottish kingdom was externally much extended, the Scottish people underwent an internal change by which the Celtic character almost disappeared. So many Teutonic elements were absorbed that in the course of two centuries a new national type was developed, in which the

Celtic element was hardly more than recognizable. Teutonic language, ideas, and races invaded Scotland both from the north and the south. The Norwegians and the Danes held the islands before the time of Kenneth, and afterward, at times, also large tracts of the mainland, and a lively intercourse took place between the Scots and the Scandinavians, both as friends and as foes. The Hebrides and the Isle of Man were not united to Scotland until the reign of Alexander III. (1249–86), who defeated Haco, King of Norway, at Largs, on the coast of Ayr; and the islands of Orkney and Shetland not until the reign of James III. (1460–88), who married Margaret, daughter of King Christian I. of Denmark, and received them as her dowry. Still greater was the Teutonic influence coming from the south—first Anglo-Saxon, then Norman. Malcolm III., who slew and succeeded Macbeth in 1057, was educated at the English court and married an English princess. Her brother, Edgar Atheling, and many Anglo-Saxon nobles sought refuge and support with Malcolm after the Norman invasion of England, but in 1072 William the Conqueror penetrated into Scotland and compelled Malcolm to submit and do homage to him. David (1124–53), the youngest son of this Malcolm, who had resided for several years at the polished court of his brother-in-law, King Henry of England, marched thrice into England to support the claims of his niece Matilda to the throne, but was defeated on each occasion. He is famous among Scottish kings for having introduced into Scotland the type of feudal civilization which obtained in England. He secured peace throughout his dominions, promoted trade and industry, and established schools of learning. During the whole of this period the Scottish kings were looked upon as vassals of the English crown. William the Lion (1165–1214), who resisted the claims of Henry II. of England, was captured at Alnwick (1174), and only liberated on renewing his allegiance. This question of homage and the meddling of the Scottish kings in the affairs of England led to frequent wars, for the concessions made by Richard Cœur de Lion in 1189, in return for a money payment, were of a temporary nature, as John again enforced the claims of the English crown (1209), and Alexander II., after an unsuccessful invasion of England, was compelled to do homage to Henry III. in 1217. When Margaret, the so-called Maiden of Norway, daughter of King Eric of Norway, granddaughter of Alexander III., and heiress to the Scottish crown, died on her voyage from Norway to Scotland, several pretenders appeared, and finally John Baliol obtained the crown by the aid of Edward I., to whom he swore allegiance. But he was deposed by the king after the battle of Dunbar (1296), and then the Scottish people arose and made the fiercest resistance to the English usurper—first under William Wallace, who fell into the hands of Edward I., and was put to death in London 1305; then under the younger Robert Bruce, who routed the English under Edward II. at Bannockburn June 24, 1314, invaded England twelve times in fourteen years, and ravaged the country so fearfully that Edward III. was glad to conclude a truce for thirteen years. But in 1333 a fresh war broke out, and, after the battle of Halidon, and again after that of Neville's Cross (1346), the Scottish kings were compelled to acknowledge themselves vassals of England.

With Robert II. (1371–90) the house of Stuart ascended the throne, and the history of Scotland from this time to the establishment of the union with England is given in the articles on Robert II. and III., James I.–VI., Mary Stuart, Knox, etc. Most of the kings of the Stuart dynasty were valiant and energetic men, but seven of them ascended the throne as minors, and five ended their lives by untimely deaths. This circumstance gave the power of the nobility an exorbitant development, and for centuries the history of Scotland became one long contest between the crown and the nobility, and one confused maze of feuds between the various noble families. In these troubles the kings sought support from the Church; they flattered and enriched it. The Scotch Church was the richest in Christendom. In the sixteenth century it owned half of all the real estate in the country. But its members were the most debased set of men within the pale of Romanism, and were able to maintain their social position only by means of the dense ignorance which they spread around them. The nobility were jealous and afraid of the Church, and embraced the Reformation with great eagerness; and the great crisis in Scotch history in the sixteenth century was essentially a contest between Romanism and absolutism on the one side, represented by the crown, and Protestantism and feudalism on the other, represented by the nobility—a contest in which the final decision was given by a third party, the middle class, the burghers, who, under the leadership of Knox, carried the Reformation through and put certain limits to the power both of the crown and the nobility. Other elements were mixed up in the contest. The relation between Scotland and England during this period consisted mainly in a continuous border feud, which was carried on almost without intermission, and which now and then grew into actual warfare on a great scale. Nevertheless, by degrees there developed an English party within the Scotch people. During the wars between England and France the Scotch went to France to fight against the English, and this circumstance opened the way for a French influence in Scotland, which became of very great importance when James V. (1513–42) married Mary of Guise. France understood that, in a conflict with England, Scotland could be used as one of the most effective weapons, but in her attempts to form a close alliance with this country Roman Catholic France was compelled to seek her main support from the Roman Catholic clergy in Scotland, and thus she caused, most unwillingly, the nobility and the Protestants to turn their eyes to England. Meanwhile, statesmen arose on both sides of the border who wished to stop the perpetual hostilities, and who understood that a union between the two countries was the only means of achieving this end. It was a favorite idea with Henry VIII., and after the death of James V., during the regency of the Count of Arran, a treaty was made by which Mary, the Queen of Scotland, was betrothed to the Prince of Wales, the son of Henry VIII., and it was agreed that when ten years of age she should be taken to England, in order to be educated there. But Henry's demand of political supremacy soon brought discord, and before the treaty was half a year old it was broken, and war was declared. After the death of Henry VIII. the Duke of Somerset tried to re-establish the treaty, but in vain; and after the battle of Pinkie (Sept. 10, 1547), Scotland threw herself into the arms of France. The queen-mother, Mary of Guise, assumed the regency, and the queen was taken to France to be educated, and betrothed to the dauphin. At last, however, by the victory of Protestantism in Scotland, and the extinction of the house of Tudor in England, the union actually took place. The most prominent points in the history of the united kingdoms are the contest between Presbyterianism and Episcopacy, the former being supported by the common people, the latter by the sovereign, the nobles throwing their weight into either scale as it suited their policy at the time, and the Jacobitic reaction which was called forth by the corrupt and oppressive government of Charles II. and James II., and which gradually became so strong that nothing short of an incorporating union seemed capable of averting the danger of a civil war. The act of union with England was formally ratified by the Parliament of Scotland on Jan. 16, 1707.

The history of Scotland has been written by Hume (1657), Maitland (1757), Guthrie (1770–77), Dalrymple (1776–79), Heron (1794–99), Burton (1867–70), Mackenzie (1867), and Keith (1886). Works dealing with particular periods are Skene's *Celtic Scotland* (1876–80); Leslie's *The Early Races of Scotland* (1866); Anderson's *Scotland in Pagan Times* (1883–86); Pinkerton's, Tytler's, and Robertson's *Histories*; R. Chambers's *Domestic Annals of Scotland* (1859–61); Mackintosh's *History of Civilization in Scotland* (1878–83); and Rogers's *Social Life in Scotland* (1884–86).

Revised by E. G. Ravenstein.

Scotland, Church of: the established Church of Scotland, frequently since the Reformation called the Reformed Church of Scotland.

Early History.—There are traditions of the introduction of Christianity into Scotland in very early times, traditions in which figure such names as those of St. Andrew, St. Rule, and St. Ninian. About 563 A. D. St. Columba founded his monastery on the lone isle of Iona, and extended his missionary work all over Scotland, and even into England. His followers and successors are known as the Culdees. In later centuries another stream of Christian influence was poured into Scotland from the South, representing the Roman form of ecclesiasticism; and after the Scottish and Pictish monarchies were united in one king during the reign of Malcolm III., and largely through the influence of Margaret, his Saxon queen, many of the Culdees yielded to the powerful influence of the Roman Church. From this time, the middle of the twelfth century, till the dawn of the

Reformation, the history of the Church in Scotland is one of constantly increasing power and wealth, and of growing corruption. The parochial system of Scotland owes its establishment to this period, and the Scottish ecclesiastics maintained a brave and successful struggle for independence against the claims of the primacies of Canterbury and York, who successively sought to assume control over the Scottish bishops.

In the end of the fifteenth century half the wealth of Scotland had passed into the hands of the Church. The feudal power of the greater nobles was greatly weakened by this, and also by the rising up of a middle class of lesser landholders and burghers, who had become the most powerful party in Scotland in intelligence, industry, and resources. In the beginning of the sixteenth century the writings of the continental Protestant divines were introduced into Scotland, and the result was seen in the awakened intelligence and spiritual earnestness of this middle class. Patrick Hamilton, a youth of high mental endowments, returned from Wittenberg in 1527 and began to preach the Reformed doctrines. He was tried for heresy and burned at the stake (1528). Persecutions followed for thirty years, and then came the triumph of the Reformation in Scotland. See KNOX, JOHN; HENDERSON, ALEXANDER; and PRESBYTERIAN CHURCH.

Distinctive Characteristics.—The peculiar and essential features of the Reformed Church of Scotland, besides the profession of the evangelical faith common to all the churches of the Reformation, were—(1) The government of the Church by that order of men which is indicated in the New Testament by the terms presbyters and bishops or overseers; (2) the subjection of the Church in all things spiritual to Christ as her only Head, and to his word as her only rule.

The First Covenant and Book of Discipline.—In 1557 the First Covenant or Common Bond was signed. The subscribers to this document, after declaring their faith in "the Evangel of Christ," promise "before the majesty of God to maintain and defend the whole congregation of Christ, and every member thereof, to the death," and "to renounce and forsake all superstitions, abominations, and idolatries." The word *congregation* was then used as the distinctive name of all those who held to the doctrines of the Reformed Church, having the same signification as the work *kirk*, which was subsequently introduced, and the leaders of the Reformation in Scotland were known as "the Lords of the Congregation." The various congregations which belonged to the Congregation used the liturgy of Edward VI.; and the Apostles' Creed and King Edward's Catechism formed the articles of religion by which they were bound into a doctrinal unity. At the death of the regent, Mary of Guise, in 1560, the Parliament of Scotland met, and on Aug. 24 an act was passed which is described as "The Confession of Faith and Doctrines believed and professed by the Protestants of Scotland, and authorized by the Estates in Parliament." This confession was in fact "the Order of Geneva," including the confession of faith prepared for the English congregation at Geneva by John Knox. Immediately afterward, on Dec. 20, 1560, the first General Assembly of the Kirk of Scotland was held, and from this date the Assembly "took order for God's glory and the weal of his Kirk in the realm of Scotland." At this Assembly "the Book of Discipline of the Church was allowed and approved." This book was afterward submitted to the council, which refused to sanction it. Nevertheless, the Church proceeded at once to carry it into execution. The principles of religious liberty were not understood in that age, and the Scottish Reformers did not hesitate to enact laws which involved the infliction of civil penalties for offenses that were purely religious, though, to their credit, it should be stated that these penalties were seldom inflicted; but with these exceptions the great principles, both of faith and order, which were then agreed to, remain, amid all the changes of confessions, as those held by all the branches of the Reformed Church in Scotland to this day. It is especially worthy of note that in this "first Book of Discipline," while "the duty of nations and their rulers to own the truth of God and to advance the kingdom of his Son," is clearly stated, it is at the same time maintained that the Kirk possesses an independent and exclusive jurisdiction, "which flows directly from God and the Mediator, Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ, the only King and Governor of his Church." For seven years, from the death of the regent Mary of Guise (1560) till the abdication of Mary Queen of Scots, the Kirk was without state endowment, and indeed without any recognition by the state of her jurisdiction.

Patronage.—At a very early period lay patronage was introduced into Scotland. Laymen who had endowed churches and monasteries reserved for themselves and their heirs the right of presenting incumbents to the benefices thus founded. At a later period these rights of presentation were to a large extent annexed to bishoprics, priories, abbacies, and other religious houses, so that at the time of the Reformation there were only 262 out of the 940 benefices the patronage of which remained in the hands of laymen. The rights of presentation which belonged to the religious houses were after the Reformation a continual subject of contention between the Assembly and the queen. In 1565 the General Assembly asked that the absolute right of the queen or of any lay patron to present a minister without examination be disallowed. To this the queen answered that it seemed to be "no way reasonable that she should defraud herself of so great a part of the patrimony of the crown as to put the patronage of benefices forth of her own hands." The patronage to these benefices continued to be held by the queen, or was by her distributed among her favorite nobles.

Immediately after the queen's abdication the Parliament met on Dec. 15, 1567, and passed an act in favor of the Reformed Kirk, ratifying the act of 1560 by which the Confession of Faith was sanctioned and adopted, and among other statutes one for the examination and admission of ministers by the Kirk, reserving the right of presentation to the lay patrons. This Parliament also "declared and granted the jurisdiction of the Kirk anent preaching of the true word of God, correction of manners, and administration of the holy sacraments." A similar act was passed in 1592, ratifiying and enlarging the rights of the Kirk in regard to her jurisdiction over the appointment or deprivation of ministers. The acts of 1567 and 1592 have always been regarded as the solemn recognition and sanction by the nation of the constitution of the Reformed Church, and the great charters of her Presbyterian government and freedom from the supremacy of the crown in all causes spiritual and ecclesiastical.

The Solemn League and Covenant and the Westminster Standards.—In 1603 James ascended the English throne. After a long and bitter struggle, both in England and in Scotland, against the royal encroachments on the civil and religious liberties of the people, an ordinance of the English Lords and Commons in Parliament was passed on June 12, 1643, calling the Westminster Assembly. The General Assembly of the Kirk met in Edinburgh on Aug. 2 in the same year. Commissioners from England were present, and the result of their conferences was that on Aug. 17 "the Solemn League and Covenant" was passed unanimously by the General Assembly; it was then carried to the Convention of Estates and unanimously ratified by them. Commissioners were also appointed to represent the Kirk of Scotland in the Westminster Assembly. The Confession of Faith of the Westminster divines was finished in 1646, and on Aug. 4, 1647, it was adopted by the Scottish General Assembly, with two modifications; and two years later the Estates of Parliament ratified this decision.

Later History.—Charles II. was restored to the throne in 1660, and an attempt was then made to conform the Scottish Church to that of England by the establishment of the episcopal form of government. So severe was the persecution that even to be present at a field conventicle was punishable by death and confiscation of goods. Yet the great body of the Scottish people steadfastly resisted. In the year 1688 William of Orange became king. In Apr., 1689, the Scottish Parliament met and passed an act abolishing prelacy. In 1690 the Parliament passed acts rescinding the statute of 1669, which had declared the king's supremacy, and ratifying the Confession of Faith and settling Presbyterian church government. The same Parliament passed an act abolishing lay patronage, though the new monarch was known to be strenuously opposed to its abolition. In 1693 the Parliament passed an act for "settling the quiet and peace of the Church," but this act expressly provided for summoning the General Assembly by royal authority. The General Assembly met in May, 1694. The king instructed the royal commissioner that if the act of supremacy was not accepted he should at once dissolve the Assembly, but at last the threat of dissolution was withdrawn, and the independence of the Kirk was again confirmed.

Daughter Churches.—In the articles on the FREE CHURCH OF SCOTLAND and PRESBYTERIAN CHURCH (*qq. v.*) will be found

a statement of the successive legislative acts in reference to the law of patronage and the independence of the Church, and also of the long-continued struggles between the two parties in the Church itself, which resulted in the first secession in 1733, in a second secession in 1752, and ultimately in the formation of the Free Church of Scotland in 1843. In the beginning of the nineteenth century the Church of Scotland established missions in Australia and in the provinces of British North America. These missions grew into presbyteries and synods, and at length dissolved their ecclesiastical connection with the parent churches, and occupy a separate position as churches possessing supreme jurisdiction.

Present Condition.—The Church of Scotland has missions in India and missions to the Jews in Alexandria, Smyrna, and Salonica. During the last thirty years there has been a remarkable development of spiritual and intellectual life among the clergy of the Scottish Church and a corresponding growth of religious power in the congregations. The law of patronage has been abolished, so that each parish as it becomes vacant, on the payment of a small sum to the patron, has the right of electing its own minister, subject to the assent of the presbytery. The General Assembly is the supreme court of the Church, and meets annually in Edinburgh. It consists of representatives from all the presbyteries, and also from the royal burghs and the four universities. The Queen is represented in the General Assembly by the lord high commissioner, but he takes no part in the deliberations. According to what is called the Barrier Act, no law introducing an innovation or change in the established laws can be passed until it is approved by the majority of the presbyteries. Revised by W. J. Beecher.

Scots Law: See the Appendix.

Scots Money: See the Appendix.

Scott, Charles: soldier; b. in Cumberland co., Va., in 1733; served in Braddock's campaign 1755: raised and commanded the first company S. of James river for service in the war of the Revolution; became colonel of the Third Virginia Battalion Aug. 12, 1776; brigadier-general Apr. 2, 1777; distinguished at Trenton, Germantown, Monmouth, and Stony Point; taken prisoner at the surrender of Charleston 1780; settled in Woodford co., Ky., 1785; brigadier-general of Kentucky Volunteers in St. Clair's unfortunate expedition against the Miami Indians 1791, but made an incursion to the Wabash, defeating the Indians; commanded part of Wayne's army at the battle of Fallen Timbers 1794; was Governor of Kentucky 1808–12. D. Oct. 22, 1813. A town and a county in Kentucky bear his name.

Scott, Colin Alexander: See the Appendix.

Scott, David: painter; b. in Edinburgh, Oct. 10, 1806; son of a landscape-engraver; educated at the High School; showed precocious talent for designing and engraving; visited Italy in 1832; was a member of the Royal Scottish Academy. Among his paintings are *Nimrod*, *Sarpedon*, *Wallace*, *Mary Queen of Scots receiving her Death-warrant*, *Jane Shore found Dead in the Street*, *Achilles*, *Orestes*, *Paracelsus*, and *Christ in the Garden*. He wrote papers in *Blackwood* (1840). D. Mar. 5, 1849.

Scott, Dred: See Dred Scott Case.

Scott, Rev. Frederick G.: See the Appendix.

Scott, Sir George Gilbert, R. A., F. S. A.: architect; grandson of Thomas Scott, biblical commentator; b. at Gawcott, Buckinghamshire, England, in 1811; became an architect and a prominent member of the school which effected the so-called "Gothic revival"; was largely employed in the restorations of the ancient cathedrals of England, as well as Westminster Abbey, and the building of new churches, colleges, and secular public edifices. Among his works are the university buildings at Glasgow, the Indian, Foreign, Home, and Colonial offices, London, and the national memorial to Prince Albert in Kensington Gardens. He was knighted Aug. 9, 1872. He was the chief promoter of the Architectural Museum at Westminster, was lecturer on architecture at the Royal Academy, and published several professional treatises. D. in London, Mar. 27, 1878.

Scott, Sir John: See the Appendix.

Scott, John Morin: patriot; b. in New York in 1730, a descendant of the baronial family of the Scotts of Ancram; graduated at Yale 1746; became a prominent and wealthy lawyer in New York; was an early and vigorous opponent of the oppressive measures of the British ministry, co-operating with William Livingston, Sears, Lamb, and the Sons of Liberty, in which organization he was a popular orator; was defeated as a candidate for the Continental Congress of 1774; was perhaps the most influential member of the general committee of New York, appointed in 1775, and of the provincial Congress 1775–76; aided in drawing up the constitution of New York 1776; was made brigadier-general of New York troops June 9, 1776; served at the battle of Long Island, and in Westchester County until Mar., 1777, when he became Secretary of State of New York, which office he filled until 1779; was delegate in the Continental Congress 1780–83, and chosen an honorary member of the Society of Cincinnati 1784. D. in New York, Sept. 14, 1784.

Scott, Julian: See the Appendix.

Scott, Levi, D. D.: bishop of the Methodist Episcopal Church; b. at Cantwill's Bridge (now Odessa, Newcastle co.), Del., Oct. 11, 1802; educated at a neighborhood school, but mainly self-taught; received the degree of A. M. from the Wesleyan University in 1840, and D. D. at Delaware College, Newark, Del., in 1846, both honorary; joined the Philadelphia Conference in 1826; served in the pastorate fourteen years, except one (1832–33) supernumerary from failure in health; was principal of Dickinson grammar school, Carlisle, Pa., from 1840 to 1842; was pastor in Philadelphia 1843–48; presiding elder 1845–48; assistant book-agent at New York 1848-52; and bishop of the Methodist Episcopal Church from 1852 to his death July 13, 1882.

Scott, Richard William, LL. D.: statesman; b. at Prescott, Ontario, Feb. 24, 1825; educated there, and admitted to the bar in 1848. He was mayor of Ottawa in 1852; represented that city in the Canadian Assembly 1857–63, and in the Ontario Assembly 1867–73; was elected Speaker of the Ontario Assembly in 1871, but resigned that office the same year upon being appointed Provincial Commissioner of Crown Lands, which portfolio he retained until 1873. He was Secretary of State for Canada from Jan. 9, 1874, until Oct., 1878; was appointed to the Senate Mar. 13, 1874. In July, 1896, he became Secretary of State and Registrar-General. He prepared and carried in 1863 the Separate School Law of Ontario, and framed the Canada Temperance Act, which was carried through Parliament chiefly owing to his exertions.

Scott, Robert, D. D.: classical scholar; b. in Devonshire, England, in 1811; graduated at Oxford 1833; became a fellow of Baliol; took orders in the Church of England; was rector of Duloe, Cornwall, and of South Luffenham, Rutlandshire; became master of Baliol 1854, Professor of Exegesis 1861, and dean of Rochester 1870. He translated part of the Oxford *Library of the Fathers*, and was associated with Dean Liddell in the preparation of a well-known *Greek-English Lexicon* (1845; 7th ed. 1882). D. Dec. 2, 1887.
Revised by B. I. Wheeler.

Scott, Robert Henry, M. A., F. R. S.: meteorologist; b. in Dublin, Jan. 28, 1833; was educated at Rugby School, Trinity College (Dublin), and in Berlin and Munich; became secretary of the British Meteorological Office, and executive of the British weather service in 1867. He is the author of *Handbook of Volumetric Analysis* (1862); *Weather Charts and Storm Warnings* (1876); *Elementary Meteorology* (1883); and of many papers in the *Proceedings* of the Royal Society, the *Quarterly Journal* of the Royal Meteorological Society, the *Journal* of the Royal Geological Society of Ireland, and other periodicals. M. W. H.

Scott, Robert Nicholson: soldier; b. at Winchester, Tenn., Jan. 21, 1838; appointed second lieutenant of Fourth U. S. Infantry Jan. 21, 1857, adjutant July, 1861, and captain Sept., 1861. He served on the Pacific coast until 1861, being in command of the U. S. steamer Massachusetts during the San Juan difficulties in 1859. He was with the Army of the Potomac as acting adjutant-general from Mar., 1862, until June, 1863; was engaged in the siege of Yorktown and battle of Gaines's Mill, where he was wounded and breveted for gallantry. From June, 1863, to Sept., 1864, he was senior aide-de-camp to Maj.-Gen. Halleck. He continued to serve on staff duty till 1870; was Professor of Military Science at Faribault, Minn., 1872–73; commanded Fort Ontario 1873–77; major Third Artillery 1879; was engaged from 1877 till his death in publishing the official records of the civil war. Author of *Digest of the Military Laws of the United States* (1872). D. at Washington, D. C., Mar. 5, 1887.

Scott, Sir Walter: novelist and poet; b. in Edinburgh, Aug. 15, 1771; the son of Walter Scott, a writer to the sig-

net, and Anne Rutherford, daughter of Dr. John Rutherford, Professor of Medicine in the University of Edinburgh. He was lineally descended from the ancient chieftain Walter Scott, traditionally known as Auld Walt of Harden. He was a strong and healthy child until about eighteen months old, when he became incurably lame in his right leg—a weakness which sadly interfered with his love of active sports, but never marred his cheerfulness, good temper, or courage. His early childhood was passed in the farmhouse of Sandy-Knowe. At the age of eight he was placed in the High School of Edinburgh, where he remained for four years, the first two in the class of Luke Fraser, and the remaining time under the tuition of the distinguished rector, Dr. Alexander Adam, of whom Scott gives a pleasant account in his fragment of *Autobiography*. Personally popular, and making himself respected by his courage and general ability to take care of himself, he was not regarded as a very bright scholar, although even then giving evidence of his love of knowledge, of a strong memory for whatever pleased him, and of special delight in history, poetry, fairy tales, and romances. In 1783 he entered the university, and for a year or more attended the classes in Greek, Latin, logic, and ethics, giving some attention also to history and law. In the ancient languages he made but little progress, although more successful in other studies. It is not surprising, then, that in thorough knowledge and discipline he should have found himself at fault. Years afterward, and when he had become famous, he writes in his *Autobiography*: "It is with the deepest regret that I recollect in my manhood the opportunities which I neglected in my youth. Through every part of my literary career I have felt pinched and hampered by my own ignorance; and I would at this moment give half the reputation I have had the good fortune to acquire if by doing so I could rest the remaining part upon a sound foundation of learning and science." His progress in the university was arrested by a severe attack of illness, which seems to have broken up all plans of further study, and in 1785–86 he entered into indentures with his father to serve the usual apprenticeship to a writer to the signet. In 1792 he was called to the bar. During these and the succeeding years he was crowding his mind with vast accumulations of "ponderous and miscellaneous" knowledge of poetry and archæology, fiction, and history, not easy to condense or reduce to system and order. "My memory of events," he says, "was like one of the large old-fashioned stone cannons of the Turks, very difficult to load well and discharge, but making a powerful effect when by good chance any object did come within range of its shot." He had already begun to collect books and articles of antiquarian interest, "the germ of the magnificent library and museum of Abbotsford." His mind was already turning toward letters, and in 1796 he made his first considerable publication, being translations from the German of Bürger. This was followed in 1799 by a translation of Goethe's *Goetz von Berlichingen*, *The House of Aspen*, which was not published till 1829, and several ballads.

In the meantime, in Dec., 1797, after a serious disappointment in love, he was married to Charlotte Margaret Carpenter, or Charpentier, a young lady of French birth and parentage, but a resident in England. Two years later, through the influence of his friends, he obtained the appointment of sheriff-depute of Selkirkshire, an office with light duties, which brought the important addition to his resources of £300 a year. In Jan., 1802, he published two volumes of the *Minstrelsy of the Scottish Border*, which was completed the next year by a third volume. It was received with great favor, and may be considered as opening the way to his general fame. It brought him also into familiar acquaintance with men of genius and lovers of legendary lore, such as Richard Heber, long member of Parliament for the University of Oxford, and that eccentric genius John Leyden.

From this time onward to the year 1831, when, at the age of sixty, he gave to the world the fourth series of *Tales of my Landlord*, there was but one year (1807) which was not marked by some independent work in verse or prose, bearing the impress of his genius, giving new impulse to literature and new fame to the land of his birth. There is room to mention only the most important of these. In 1805 the *Lay of the Last Minstrel* was published. It took the world by surprise, and was received with unbounded delight, not only for its chivalric spirit, its "vivid richness of coloring," its pathos, beauty, grace, and airy freshness, but as giving the promise of original poetic fervor and power to which the kingdom had long been a stranger. Edition after edition was called for, and sold as soon as published. "In the history of British poetry," says Lockhart, "nothing had ever equaled the demand for the *Lay of the Last Minstrel*." This was followed in 1808 by *Marmion*, perhaps the strongest and boldest of his poems, and in 1810 by *The Lady of the Lake*, in some respects more pleasing than any. In these his poetic power culminated. The poems subsequently published—*The Vision of Don Roderick* (1811), *Rokeby* (1812), *The Bridal of Triermain* (1813), *The Lord of the Isles* (1815)—were unequal to the earlier, and in various ways gave evidence of a waning popularity, which Scott was among the first to recognize. Another reason for this perceptible loss of popular favor was the appearance of another brilliant light in the early poetry of Lord Byron.

During these six or eight years Scott had been advancing in fame and in pecuniary resources. In 1804 he took the house of Ashestiel, in the Ettrick Forest, overlooking the Tweed. In 1806 his friends had procured for him the appointment to one of the clerkships of the court of sessions, worth about £1,300 a year, the emoluments of which, however, by an express arrangement, he did not receive until the death of his predecessor in 1812. Still earlier, in 1805, he had become a regular partner in the printing-house of James Ballantyne & Co., although this connection was kept a profound secret from nearly every one of his most intimate friends. This was undoubtedly one of the most important steps of his life. "He continued bound by it," says his son-in-law, "during twenty years, and its influence on his literary exertions and his worldly fortunes was productive of much good, and not a little evil." In 1808 he took a prominent part in establishing *The Quarterly Review* in London, in opposition, politically, to *The Edinburgh Review*, the acknowledged advocate of the Whigs. In 1811 he purchased Abbotsford, a property of 100 acres of land on the banks of the Tweed, near Melrose, for £4,000. To this he added estate after estate adjoining, purchasing at high rates, till he had expended nearly or quite £40,000, to which must be added £25,000 more for preparing the grounds and erecting the mansion where for a few years he dispensed a splendid hospitality, and to which his fame drew visitors from every part of the civilized world.

In 1813, on the death of Pye, he was offered the office of poet-laureate, which he refused; but in Mar., 1820, he accepted a baronetcy, and in November of the same year the presidency of the Royal Society of Edinburgh. His exertions, two years later, during the visit of George IV. to Edinburgh, seem to have tended, in company with overwork, to undermine his health.

On the decline of his popularity as a poet his fertile mind turned to another form of literature, with which for ten or twelve years he surprised and enchanted the world. In 1814 appeared, anonymously, a novel under the title of *Waverley*. The next year *Guy Mannering* was published; in 1816, *The Antiquary* and the first series of the *Tales of My Landlord*; in 1817, *Rob Roy*; in 1818, *The Heart of Midlothian* (second series of *Tales of My Landlord*); in 1819, *Tales of My Landlord* (third series) and *Ivanhoe*. This splendid series of novels, thrown off with an ease and rapidity without parallel, marks the high tide of his genius. Those which follow are on a somewhat lower level, but the abundance of the production was hardly diminished. *The Monastery* and *The Abbot* followed in 1820; *Kenilworth* and *The Pirate* in 1821; *The Fortunes of Nigel* in 1822; *Peveril of the Peak*, *Quentin Durward*, and *St. Ronan's Well* in 1823; *Redgauntlet* in 1824; *The Tales of the Crusaders* in 1825; and *Woodstock*, written in the midst of impending troubles, in 1826. *The Chronicles of the Canongate* (first and second series) followed in 1827 and 1828. *Anne of Geierstein* and *The Tales of My Landlord* (fourth series) in 1829 and 1831 close the long list.

The secret of the author of *Waverley*, although known to some and confidently conjectured by almost every one, was not acknowledged until after the bankruptcy of Constable and the Ballantynes had rendered even a formal concealment no longer possible. Early in 1826 Constable was obliged to stop payment, and the Ballantynes, including Scott as partner in the house, being closely connected, failed for a very large amount. The humiliation to Scott was indescribable, but he met the trial with remarkable strength and dignity. The most liberal offers of assistance were made to him by friends and admirers, among them one of £30,000 from an anonymous correspondent, but he firmly declined them all. He refused to take any advantage of circumstances which might have freed him from the claims

of his creditors, but insisted that they should stand, and pledged the labor of his future life to the payment of these debts. He at once entered upon that course of untiring industry in writing new works and in the republication of the old with notes and prefaces which enabled him within a few years to pay to his creditors £40,000, and to put things in such shape that soon after his death the principal of the whole was paid by his executors. It was a tremendous exertion, and it cost him his life. In 1830 alarming symptoms, which had appeared the preceding year, were followed by a paralytic attack, from which he partially recovered. In Apr., 1831, the shock was renewed, and in September he left Abbotsford for the Continent, a great part of which he had never visited. The admiralty furnished him a ship of war, on which he proceeded to the Mediterranean, touching at Malta, and thence going to Naples. Here his mind almost entirely gave way, and he hurried homeward as rapidly as possible, stopping for a few weeks in London, and reaching Abbotsford in July, 1832. He died Sept. 21, and on the 26th was buried in the grounds of Dryburgh Abbey; Mrs. Scott had died in 1826. His two sons and two daughters survived him.

Of the standard editions of his works, probably the most complete and discriminating list is to be found in Allibone's *Dictionary of Authors*. Extended memoirs of Scott have been written by David Vedder, William Weir, George Allan, and (in the *Encyclopædia Britannica*) by William Spaulding; but the great work on the author and the man, and one of the best pieces of biography in any language, is the *Life* by his son-in-law, Lockhart. See Novel and English Literature.

Revised by Edmund Gosse.

Scott, William Bell: poet and artist; b. near Edinburgh, Scotland, Sept. 12, 1811; brother of David Scott, engraver; became a distinguished painter and archæologist and head master of the Government School of Design at Newcastle-on-Tyne; afterward resided chiefly at London, associated with the Pre-Raphaelite brotherhood of English painters. Till 1885 was art-examiner under the education board. Published *Hades, and other Poems* (1839); *The Year of the World, a Philosophical Poem* (1846); a *Memoir* of his brother David (1850); *Antiquarian Gleanings in the North of England* (in quarto numbers, 1849–51); *Chorea Sancti Viti* (1851); *Poems* (1854); *Half-hour Lectures on the History and Practice of the Fine and Ornamental Arts* (1861); another volume of *Poems* (1875), with illustrations by himself and by Alma Tadema. D. Nov. 22, 1890. See *Autobiographical Notes of the Life of William Bell Scott*, edited by W. Minto (New York, 1892, 2 vols.).

Revised by H. A. Beers.

Scott, Winfield: soldier; b. in Dinwiddie co., near Petersburg, Va., June 13, 1786; educated at William and Mary College; studied law, and was admitted to the bar. On May 3, 1808, he accepted an appointment as captain of light artillery, and was ordered to New Orleans, where a year later, for disrespectful allusion to the conduct of his superior officer (Gen. Wilkinson), he was suspended by a court martial for one year, rejoining his command at Baton Rouge in the fall of 1811. Promoted to be lieutenant-colonel July, 1812, he was sent to Philadelphia to organize troops for the field, but on application was ordered to the Niagara frontier, reporting to Gen. Smyth Oct. 4, near Buffalo. The attack on Queenstown occurred Oct. 13; Scott did not participate in the carrying of the heights and battery, but the ensuing battle was fought under his command. After a gallant resistance he was overpowered, and, the militia refusing to cross to his support, he was obliged to surrender, but he was exchanged soon after. In Mar., 1813, he was appointed adjutant-general with the rank of colonel, and the same month attained the colonelcy of his regiment. Reporting with his battalion to Gen. Dearborn on the Niagara frontier in May, he led the advance in the assault on Fort George, May 27. In June he commanded the rear-guard in the retreat from Stony Creek to Fort George, and in connection with the navy made the descent on Burlington and York in September. In October he joined Gen. Wilkinson's army in Western New York, but the attack on Montreal being abandoned, he was ordered to Washington, and in Mar., 1814, promoted to be brigadier-general. Reporting to Gen. Brown at Buffalo, he established a camp of instruction. On July 3, 1814, the Niagara river was crossed by Scott's and Ripley's brigades and Fort Erie captured. The battle of Chippawa ensued July 5, in which Scott greatly distinguished himself; the battle of Lundy's Lane next followed (July 25), where Scott was severely wounded after having had two horses shot under him. He was (July 25) promoted to be brevet major-general, and Congress voted him a gold medal. In October, when but partially recovered, he was ordered to Baltimore, then again threatened; thence to Washington, where he was engaged as president of a board on infantry tactics and of a court of inquiry in the case of Gen. Winder. Declining to act as Secretary of War, he sailed for Europe in July, 1815, returning the following year. In 1818 he began the preparation of *General Regulations of the Army*, and in 1826 his *System of Infantry and Rifle Tactics*. During the nullification troubles (1832–33) Scott was ordered to South Carolina, where his tact and decision prevented civil war. He next served in Florida and in the Creek Nation against the Indians, but, being charged with dilatoriness, a court of inquiry was ordered, which resulted in Scott's acquittal. The Canada border troubles (1837–38) next demanded his attention, followed in 1838 by the task of removing the Cherokee Indians to the upper Arkansas, and in 1840–41 he was engaged in Maine during the disputed territory controversy, conducting the management of each of these important duties with great success. In July, 1841, he succeeded to the command of the army as general-in-chief. In the war with Mexico he was ordered in Nov., 1846, to take command. Assembling his troops at Lobos island, whence he moved in transports in February, a landing was effected (Mar. 9) at Vera Cruz, which surrendered, together with the castle of San Juan d'Ulloa, Mar. 29. (See Vera Cruz.) The battle of Cerro Gordo (*q. v.*) was fought Apr. 18, and the battles of Contreras, Churubusco, and San Antonio (see Churubusco) Aug. 19–20. On Sept. 8 the battle of Molino del Rey (*q. v.*) was fought; the heights of Chapultepec (*q. v.*) were carried Sept. 13, as well as the San Cosme and Belen gates of the city of Mexico, the army entering next day (Sept. 14), and practically ending the war. Declining the proffered presidency of the Mexican republic, Scott, having been superseded by Gen. W. O. Butler, and a court of inquiry ordered in his case, arrived in New York May, 1848. Congress in March had extended to him a vote of thanks and authorized a gold medal. In June he was a candidate for nomination in the Whig convention which nominated Gen. Taylor for the presidency. In 1852 he received the nomination from the Whig party, but was signally defeated by Franklin Pierce, though receiving a large popular vote. In 1855 the rank of lieutenant-general by brevet was conferred upon him. In 1859 he was sent to Puget's Sound to arrange the difficulty caused by the occupation of San Juan island by Gen. Harney.

Though too infirm to undertake the conduct of the army in the great civil war, Gen. Scott unhesitatingly threw the weight of his influence in favor of the Government, and in the exciting events preceding actual hostilities rendered important service. On Nov. 1, 1861, he was retired from active service, but without reduction of pay or allowances. He published his *Autobiography* in 1864. D. at West Point, May 29, 1866.

Revised by James Mercur.

Scottdale: borough; Westmoreland co., Pa.; on the Penn. and the Balt. and Ohio railways; 17 miles S. of Greensburg, the county-seat (for location, see map of Pennsylvania, ref. 5–B). It is in a coal-mining region, and contains a rolling-mill, large pipe-works, and other iron manufactories, a national bank with capital of $50,000, a private bank with capital of $50,000, and two weekly newspapers. Pop. (1880) 1,275; (1890) 2,693; (1900) 4,261.

Scotticisms: words and expressions proper to the English of Scotland, and not recognized as belonging to standard English. *Suddenty* for "suddenness," used by Sir Walter Scott, is an example. In the U. S. many of the following words or phrases appear to be due to the speech of settlers from Scotland: *Anunder* (under), *backset* (relapse), *blatherskite*, *big-coat* (great-coat), *bore-tree* (elder), *check* (*chack* (?), a slight repast), *clash* (slanderous talk), a *cut* of yarn, *fornent* (opposite), not a *hait* (whit), *keel* (ruddle or red chalk), *killogue* (to plot), *red* (to comb out), *red up* (to arrange) a room, *scrunty* (stunted), *storm-staid*, *sundown* (sunset), *trap* (to get the place of a higher pupil by a correct answer), and others. Many words and phrases not now admitted as standard English are, however, also used in other English dialects, and the use of such words as those mentioned does not necessarily prove the speaker to be of Scotch descent. It is probable that the common misuse of *will*, *would* for *shall*, *should* in the U. S. is in great part due to the influence of the speech of settlers from Scotland and

Ireland, and the same cause perhaps has something to do with the very common pronunciation of *r* in cases where in Southern England and some regions in the U. S. that sound has been lost (though the Scotch *r* is not like the sound heard in the U. S.), as well as with the fact that in the U. S. speakers rarely drop or misplace the sound of *h* in standard English, and more generally distinguish *wh* from *w* than is the case in England. But it is not necessary to assume that Scotch pronunciation is the only or even the chief cause of these and some other features of American pronunciation. See, further, Jamieson's *Etymological Dictionary of the Scottish Language* (revised ed. 4 vols., 1879–82); J. A. H. Murray, *The Dialect of the Southern Counties of Scotland in Transactions of the* (London) *Philological Society* (1870–72, part ii.); A. J. Ellis, *Early English Pronunciation* (part v., 1889), etc.

Revised by E. S. Sheldon.

Scottish Language: the language spoken in Scotland. This is well known to be not a Celtic dialect, but a form of English which differs from the standard speech by reason of a separate development, and because of external influences to which the latter has not been subjected in the same degree. English became the language of Scotland owing to political events in the early history of the country. The Northumbrian kingdom in the seventh century included the Lowlands of Scotland in its supremacy. As a result, English, the language of Northumbria, began to spread more widely over the Lowlands. When the Scottish kingdom became separated from England, the struggles for supremacy between the Saxons of the Lowlands and the Celts of the Highlands resulted in a victory for the former, and English became after a time the recognized literary language.

The form of English thus adopted was that called Northern English, spoken from the Humber northward. Up to the middle of the fifteenth century Scotch-English did not differ from that used in Yorkshire and Northumberland. From about this time, however, owing to the development of a separate national life and literature, that form of Northern English spoken in the capital city, Edinburgh, became the standard literary language of Scotland. The literature produced in this language includes such important names as Barbour, James I. (of Scotland), Wyntoun, Henryson, Dunbar, and Douglas.

The various external influences affecting Scotch-English differ considerably in degree from those affecting the language of England. Celtic, which remained as a linguistic sub-stratum in the Lowlands and as the dominant speech of the Highlands for many years, influenced the English of Scotland more than that of any other part of Britain. Thus many Celtic words, not found in English, belong to Scotch. The Norse or Scandinavian influence was probably as great as upon Northern English as a whole, and thus greater than upon Southern or Midland English. The French influence was due not so much to the Norman conquest as to those close political relations between Scotland and France which enabled the former to retain her independence for so many years. The revival of classical learning powerfully affected Scotland, as it did the rest of Britain, but the earlier classical influence was probably not so great upon the language of the north as upon the language of the south. More powerful than all other influences has been the effect upon the Scottish language of the standard language of England. Its earliest marked effect was at the time of the Reformation, and this was greatly increased by the union of the two countries under the same king in 1603. In fact, since that time, except for a partial revival of the popular speech in the poems of Ramsey, Fergusson, and Burns, the Scottish language has gradually given place to the literary language of England. Even the speaking of Scotch-English, as distinct from the English of the south, has more and more been given up by educated people, so that this form of the language, so long dominant in the northern kingdom, has been gradually sinking to the position of a mere dialect, without a literature or a considerable body of cultivated speakers.

A systematic treatment of the subject may be found in *The Dialect of the Southern Counties of Scotland*, by James A. H. Murray, *in Transactions of the* (London) *Philological Society* (1870–72). See English Language.

Scouller, James Brown, D. D.: clergyman; b. near Newville, Pa., July 12, 1820; educated at Dickinson College and the United Presbyterian Theological Seminary, Allegheny, Pa.; pastor of the United Presbyterian churches, Fourth of Philadelphia 1844–47, Cuylerville, N. Y., 1847–52, Argyle, N. Y., 1852–62; editor, 1862–63, of *The Christian Instructor*, for which he had written *Forty Letters from Abroad, principally Italy and Egypt* (1860–61). Dr. Scouller's principal published works are *A Manual of the United Presbyterian Church* (1881; 2d ed. 1887); *Calvinism: its History and Influence* (1885); and *History of the United Presbyterian Church*, in American Church History Series (New York, 1894). D. in Newville, Pa., Sept. 11, 1899.

Scovel, Sylvester Fithian: clergyman and educator; b. at Harrison, O., Dec. 29, 1835; educated at Hanover College, Indiana, and New Albany (now McCormick) Theological Seminary; pastor of Presbyterian church, Jeffersonville, Ind., 1852–61, First Presbyterian church, Springfield, O., 1861–66, First Presbyterian, Pittsburg, Pa., 1866–83, and since 1883 has been president of Wooster University, Ohio. He has published sermons, addresses, and *Centennial Volume of the First Presbyterian Church of Pittsburg* (Pittsburg, 1884).

C. K. Hoyt.

Scranton: town; capital of Jackson co., Miss.; on the Pascagoula river and the Louisville and Nashville Railroad; half a mile N. of the Gulf of Mexico, 45 miles S. W. of Mobile, Ala. (for location, see map of Mississippi, ref. 9–H). It saws and ships large quantities of pine lumber, has an extensive oyster industry, and contains a State bank with a capital of $25,000, and two weekly newspapers. Pop. (1880) 1,052; (1890) 1,353; (1900) 2,025.

Scranton: city; capital of Lackawanna co., Pa.; on the Lackawanna river, and the Cent. of N. J., the Del. and Hud., the Del., Lack. and W., E. and Wyo., and the N. Y., Ont. and W. railways; 18 miles N. E. of Wilkesbarre and 107 miles N. of Philadelphia (for location, see map of Pennsylvania, ref. 3–I). It is the fourth city in the State in population and the center of the great anthracite coal region, and has a picturesque location in the Lackawanna valley on a plateau at the confluence of Roaring brook and the Lackawanna river. The city is laid out with wide straight streets; has several public parks and squares, and a beautiful drive to Elmhurst; and contains 150 miles of streets, many paved with asphalt and brick, improved water-works, gas and electric light plants, and electric street-railways. The area is 19½ sq. miles. Among the notable public buildings are the U. S. Government building, court-house, municipal building, Albright Memorial Library, Moses Taylor Hospital, Home of the Friendless, and the Oral School for the deaf and dumb.

Finances and Banking.—The assessed valuation of real and personal property in 1900 was $22,106,533, and the net debt, Jan. 1, 1895, was $438,232. In 1895 there were 3 national banks with combined capital of $650,000, 6 State banks with capital of $630,000, and a trust and safe deposit company with capital of $250,000. Scranton has 15 building and loan associations, all local and all but two on the terminating plan, with an aggregate of 4,851 shareholders, 1,708 borrowers, and 25,746½ shares in force.

Churches, Schools, etc.—Scranton is the seat of a Roman Catholic bishopric and has 70 churches of various denominations. There are 38 public-school buildings, public-school property valued at over $900,000, 4 colleges, a nunnery, 6 public libraries, 4 hospitals, and 4 daily, 17 weekly, and 6 monthly periodicals.

Business Interests.—The census returns of 1890 showed 138 manufacturing establishments (representing 41 industries), with a combined capital of $25,144,936, employing 8,498 persons, paying $3,921,831 for wages and $15,968,846 for materials, with products valued at $22,801,028. The principal industry is the manufacture of iron and steel, 4 establishments, with $8,840,706 capital, employing 3,298 persons, paying $1,726,229 for wages and $10,716,206 for materials, with products valued at $13,278,299. Then follow the manufacture of malt liquor, 3 establishments, $471,700 capital; silk and silk goods, 3 establishments, $440,660 capital; planed lumber, 8 establishments, $429,536 capital; flour and feed, 5 establishments; carriages and wagons, 9. The city is an important center for general trade and one of the principal distributing-points for the anthracite coal trade.

History.—The city was founded by Joseph H. and George

W. Scranton in 1840, and was incorporated as a borough in 1854 and as a city in 1866. The first rolling-mill was put into operation in 1844. Pop. (1880) 45,850; (1890) 75,215; (1900) 102,026. Revised by E. J. Lynett.

Screamer: any bird of the family Palamedeidæ (*q. v.*).

Screw [M. Eng. *scrue*, from O. Fr. *escroue* > Fr. *écrou*, an internal screw, nut; akin to Germ. *schraube*, Dutch *schroef*, Icel. *skrúfa*]: an elementary mechanism consisting of a cylinder having around it a projecting helicoidal rib or thread. When the helicoidal rib is formed on the interior of a hollow cylinder within a movable block the combination is called a nut. The screw is really a particular case of the inclined plane.

The screw was known in Egypt in the days of Hero of Alexandria (B. C. 150), who shows it in several propositions of his *Spiritalia*, and it is also figured in his *Automata*. It was also known to Archimedes (B. C. 250), and he has been credited with its invention for the purpose of launching a large vessel built under his direction. At the beginning of the Christian era it was well known to the nations on the shores of the Mediterranean, and its use in presses seems to have been well understood, for a wall-painting discovered at Pompeii illustrates a press for linen which has two screws and a massive frame.

The earliest writer who described the laying out of a screw-thread was Pappus of Alexandria, a Greek mathematician of the fourth century. His method consisted in winding a right-angled triangle of thin brass around a cylinder and then tracing the screw-thread from the hypothenuse; the space between the threads was then cut or filed out. A similar method was used but a few years ago by native workmen in India for making (of native wrought iron) press-screws 5 inches in diameter and 12 feet in length, having threads three-quarters of an inch thick. At one time it was not uncommon to find in the Southern U. S. plantation cotton-presses having wooden screws 14 inches in diameter and 5 feet long, the threads being 3 inches thick. These screws were cut out by a millwright using ordinary hand-tools. Jesse Ramsden (1775) was the first to pay especial attention to the making of screws by machinery, and his invention may be regarded as the first example of the modern form of screw-cutting lathe, although fifty years before there had been made in France a machine for cutting the thread on the fusees of watches, and 200 years before Jacobi Bessoni had designed a rude lathe for cutting wooden screws. Great attention was given to the making of accurate screws by Henry Maudslay. Sir James Barton and Sir Joseph Whitworth also made improvements in screw-cutting machinery, and the latter developed what is known as the Whitworth standard thread, which is almost universally used in Europe for screw-bolts. The threads on ordinary bolts and nuts in general use in the U. S. are known as the United States standard thread, or the Franklin Institute standard, being based upon the investigations of William Sellers, as set forth in a paper read by him before the Franklin Institute in Apr., 1864.

Of the many varieties of screws, that known as the wood-screw (from their exclusive use in wood) is the most common, and it has been made by machinery for many years. At first such screws had blunt points, and therefore it was necessary to bore a hole for their reception, but about 1850 Thomas J. Sloan, a native of the U. S., devised the well-known gimlet-pointed screw and machinery for its manufacture. The thread of this screw and those of its predecessor were formed by cutting away the metal between them; but in recent years, by a system of rolling combined with forcible compression, the threads are raised and all the metal between them is utilized in their formation.

One of the more important uses to which the screw is applied is the moving of the tool in lathes for turning metal, and it was used for that purpose as early as 1671; but the lathe was not intended for cutting screws, and it is somewhat remarkable that the lead-screw or guide-screw, as applied to lathes especially designed for screw-cutting, did not appear till about 100 years later.

The screw has been applied to iron piles for forming a secure foundation in loose soil, to mooring-chains for vessels, to the raising of heavy weights by jacks and cranes, to micrometers for microscopes and astronomical instruments, to the raising of water and the propulsion of vessels—in fact, there is no mechanism so delicate or machinery so ponderous that is not dependent either for its manufacture or operation upon some application of the screw. W. F. Durfee.

Screw-pines: the *Pandanaceæ*, a small family of about eighty species of mostly tropical, erect, or climbing monocotyledonous trees and shrubs. The family as restricted consists of but two genera (*Pandanus* and *Freycinetia*), and the species are confined to the Old World. They bear some resemblance to the palms, some of which were formerly included in this family, but their strongest affinities are doubtless with the aroids, hence they are placed in the *Nudifloræ*. Screw-pines bear naked, diœcious, spiked flowers; the stamens are many; the ovaries are compound with many ovules, or (by reduction) simple with solitary or few ovules. Many species are cultivated in greenhouses. C. E. B.

Screw Propeller: See the Appendix.

Scribe, skrēēb, Augustin Eugène: playwright; b. in Paris, Dec. 24, 1791; studied law; wrote in 1811 his first play, *Les Dervis*, which failed; achieved his first success in 1816 with *Une Nuit de la Garde nationale*, written in connection with Delestre Poirson; provided from 1816 to 1820 the Théâtre de Vaudeville and the Théâtre des Variétés with as many vaudevilles and small comedies with songs as they could perform; wrote for the Gymnase between 1820 and 1830 about 150 plays, mostly one-act comedies of a sentimental or satirical character; composed, finally, from 1830 to his death, Feb. 20, 1861, more than 100 plays in three or five acts, historical, satirical, and even tragical, for the Théâtre Français and other houses, besides a similar number of opera librettos for Boieldieu, Adam, Auber, Donizetti, Meyerbeer, Verdi, and other composers, and some novels and romances. Most of these plays he produced in connection with some other playwright—Germain Delavigne, Mélesville, Bayard, Dupin, Legouvé, etc.—and at one time, between 1820 and 1830, this artistic copartnership was organized in thorough business style; one made the plot, another sketched the characters, a third wrote the dialogue, etc. After 1830, however, it became necessary to be a little more careful in order to satisfy the public. In general, his success was complete. For nearly forty years he reigned supreme in all the theaters of the world. Nor can it be said that his success was entirely undeserved; his plots have a novelty and originality, their movements an adroitness and rapidity, and the dialogue an eloquence and piquancy which always will be of value; but his picture of characters is superficial, and of passions and sentiments untrue; he lacks ideas, and is deficient in style. The best are his earlier one-act comedies, such as *Les premiers Amours* (1825); the worst are his later historical dramas in five acts, such as *Bertrand et Raton* (1833) and *Le Verre d'Eau* (1840). At present his plays are very seldom acted. His collected *Œuvres* comprise 76 vols. (1874–85). Revised by A. G. Canfield.

Scribes [plur. of *scribe* (from Lat. *scrī'ba*, clerk, scribe, deriv. of *scrī'bere*, write), trans. of Gr. γραμματεύς (deriv. of γράφειν, write) and Heb. *sāphēr*, scribe, deriv. of *sāphar*, write]: originally, officers of state who drew up the decrees of kings, wrote their letters, and kept records. Among the Israelites in Egypt (Ex. v. 6–19) and in the desert (Num. xi. 16) there were scribes whose business apparently it was to keep the genealogical registers, serve processes, and the like. In Palestine the scribes appear to have been chosen from the Levites (1 Chron. xxiii. 4; 2 Chron. xix. 11, xxxiv. 13). From the time of Ezra (fifth century B. C.) they were the copyists and then naturally expounders of the Law. In the New Testament they are generally named in connection with the Pharisees, as they belonged to that party, and were noted for their hypocrisy, ostentation, and arrogance.

Scribner, Charles: publisher; b. in New York, Feb. 21, 1821; son of Uriah R. Scribner, a prominent merchant; educated at New York University and at Princeton, where he graduated 1840; studied law for three years, and was admitted to the bar, but never practiced the legal profession; began the business of book-publishing in the old Brick Church, New York, in partnership with Isaac D. Baker in 1846, under the style of Baker & Scribner. In 1850 Mr. Baker died, and the business was thenceforth carried on in Mr. Scribner's name. In 1870 *Scribner's Magazine* was established. D. at Lucerne, Switzerland, Aug. 26, 1871.

Scribo'nius Lar'gus: physician to the Emperor Claudius. He composed, about the year 47 A. D., a book of medical formulas, *Compositiones*, which is valuable for the history of medicine. Best edition by G. Helmreich (Leipzig, 1887).

Scriptures, Holy: See Bible.

Scrivener, skriv'ner, Frederick Henry Ambrose: biblical scholar; b. at Bermondsey, London, Sept. 29, 1813;

graduated at Cambridge, 1835; was for many years master of classical schools, especially that at Falmouth, where he was also incumbent of a church 1846–61; became rector of St. Gerrans, Cornwall, 1861; vicar of Hendon and a prebendary of Exeter 1876. D. at Hendon, Oct. 26, 1891. He holds a high rank in the philological criticism of the New Testament; published valuable editions of the *Greek Testament* of Stephens (1860; 7th ed. 1877) and of the *Codex Bezæ* (1864); a *Full Collation of the Codex Sinaiticus with the Received Text of the New Testament* (1863); and the *Cambridge Paragraph Bible, with the Text Revised and a Critical Introduction prefixed* (1873); *Greek Testament, with the Changes of the New Testament Revisers* (1881); wrote a *Plain Introduction to the Criticism of the New Testament* (1861; 4th ed. by E. Miller, revised and enlarged, 1894, 2 vols.), and other works of kindred character; was appointed one of the company of revision of the authorized version of the New Testament 1870, and was granted a pension from the civil list 1872, "in recognition of his services in connection with biblical criticism."

Scrivener's Cramp: See NEUROSIS.

Scrof'ula, or **Struma** [*scrofula* is from Lat. *scro'fulæ*. scrofulous swellings, scrofula, plur. of **scro'fula*, liter., dimin, of *scro'fa*, sow, swine being affected by a similar disease; *struma* is from Lat. *struere*, to build, since the lymphatic glands are enlarged in this condition]: a constitutional disease characterized mainly by defective nutrition of the tissues. Persons of the lymphatic temperament are most liable to develop the marked symptoms of struma or scrofula. Scrofula is hereditary in many families. In other persons it may arise *de novo* from bad hygiene and regimen, especially in children when rapidly developing. Most cases formerly considered scrofulous are now regarded as tuberculous, directly caused by the presence of the *Bacillus tuberculosis*. Many symptoms, too, of disordered blood-states formerly grouped as scrofulous are now distinguished as having definite causes. Eczema, though often an exponent of struma, is as often due to other causes—nervous influences, gouty or rheumatic taint, gastric and intestinal derangements. The scrofulous person is often light-complexioned, the skin white, the body full, or even obese, but the muscles soft and flabby. In other individuals, of what is called the dark strumous type, there may be delicately formed features, clear complexion, and much personal beauty. The chief characteristic of scrofula is the susceptibility of the lymphatic glands and of the bones and joints to grave forms of disease from slight exciting causes. It must not be confused with rachitis, or rickets, with which it has no necessary connection, nor with inherited syphilis. Either persistently or with every slight impairment of health the glands of the neck, groin, abdomen, etc., may become indurated and enlarged. Such swellings may be evanescent or leave permanent indurations. The glands of the neck frequently are so engorged with scrofulous exudative matter that it undergoes cheesy or caseous degeneration—or actually suppurates, producing scrofulous abscess. Scrofula is not, then, a definite specific disease, but a condition of serious perversions of the nutritive qualities of the blood, and resulting affections of the various tissues and organs of the body. Enlarged glands, moist skin diseases, superficial abscesses, and destructive inflammations of the bones and joints are some of its manifestations. Inherited scrofulous taint may remain latent until developed by depressing sickness. Thus measles, a harmless disorder in robust children, is hazardous when struma lurks in the system. The bottle-fed infant and the foundling are more often scrofulous than the nursed, home-reared child. The mucous surfaces are very liable to disease in struma, chronic bronchial catarrh, diarrhœa, and cholera infantum. The relation of scrofula and tuberculosis is disputed. Modern pathologists believe that the bacillus of tubercle is the efficient cause of most of the conditions formerly attributed to struma, the micro-organism lying dormant in the body until from some accidental source of depression a suitable nidus is formed for its development and multiplication; but there are some cases in which neither tubercle nor syphilis can be demonstrated, and for these the term struma may still properly be retained. The treatment of scrofula is hygienic and nutritive—warm clothing, bathing, friction to the skin, pure air, nutritious diet, special articles such as cod-liver oil, and preparations of malt and of phosphates. Iron, iodine, and arsenical preparations act as alteratives to reduce glandular enlargements.

Scrophularia'ceæ: See FIGWORTS.

Scruple [from Lat. *scru'pulus* (dimin. of *scru'pus*, a rough, sharp stone), pebble, (as a weight) a scruple]: in apothecaries' weight, one-third of a drachm, 20 grains, the $\frac{1}{288}$th part of the pound troy. The Romans gave the name to the $\frac{1}{288}$th part of any standard unit of measure.

Scudder, HENRY MARTYN, M. D., D. D.: clergyman and missionary; son of Rev. John Scudder; b. at Panditeripo, district of Jaffna, Ceylon, Feb. 5, 1822; went to the U. S. in 1832; graduated at University of City of New York in 1840, and at Union Theological Seminary in 1843; was ordained a Presbyterian clergyman same year, and sailed for Madras as a missionary of the American Board of Commissioners for Foreign Missions. In addition to his missionary work he studied medicine in the medical college of Madras; opened a hospital and dispensary for gratuitous treatment of the poor, and received an honorary M. D. from New York College of Physicians and Surgeons in 1853. He was in Madras from 1844 to 1851, and in the Arcot Mission from 1851 to 1863; returned to the U. S. in 1864; was pastor of a Reformed Dutch church in Jersey City 1865–71; was a Presbyterian pastor in San Francisco; was pastor of the Central Congregational church, in Brooklyn, N. Y., 1871–82; pastor of Plymouth Congregational church, Chicago, Ill., 1883–87, when he joined his son, Dr. Doremus Scudder, in Japan. Returning later he settled first in Chicago, and then in Winchester, Mass., where he died June 4, 1895.

Scudder, HORACE ELISHA: author; b. in Boston, Mass., Oct. 16, 1838; graduated at Williams College 1858; taught in New York till 1861, when he removed to Boston and devoted himself to literary work. He was editor of *The Riverside Magazine* (Cambridge, 1867–71), and became a resident of Cambridge, Mass., 1875. In 1890 he became editor of *The Atlantic Monthly*. He is the author of *Seven Little People and their Friends* (1862); *Dream Children* (1863); *Stories from my Attic* (1869); *The Bodley Books* (1875–87); *The Dwellers in Five-Sisters Court* (1876); *Stories and Romances* (1880); *Life of Noah Webster* (1882); *History of the United States* (1884); *Men and Letters* (1888); etc.

Revised by H. A. BEERS.

Scudder, JOHN, D. D., M. D.: missionary; b. at Freehold, N. J., Sept. 3, 1793; graduated at Princeton 1811; M. D., College of Physicians and Surgeons, New York, 1815; became a physician in New York, where he was house-surgeon to the City Hospital; abandoned an extensive practice to devote himself to missionary work; was a missionary physician of the A. B. C. F. M. in Ceylon 1820–36, after which he was transferred to the Madras mission; spent several years (1842–46) in the U. S., visited the Cape of Good Hope for his health 1854, and died of apoplexy at Wynberg, South Africa, Jan. 13, 1855. Author of several publications on missionary subjects. His labors in the establishment of hospitals and schools in Ceylon and Southern India were very successful. He takes rank with the best of the early missionaries in India. His ten children—eight sons and two daughters—all became missionaries in India; most of them are also physicians. See his *Memoir*, by Rev. J. B. Waterbury (New York, 1856).

Scudder, SAMUEL HUBBARD: naturalist; b. in Boston, Mass., Apr. 13, 1837; graduated at Williams College 1857, and at Lawrence Scientific School of Harvard 1862. He has been a prominent member of the Boston Society of Natural History, holding almost every office, including that of president (1880–87). He was assistant librarian of Harvard College 1879–82; paleontologist of the U. S. geological survey 1886–92; member National Academy of Science since 1877. His publications, which number upward of 620, are mainly upon insects, especially butterflies, Orthoptera, and fossil insects. Among the more important of his works may be enumerated: *Catalogue of N. A. Orthoptera* (1867); *A Century of Orthoptera* (1868–79); *Catalogue of Scientific Serials* (1879); *Butterflies: their Structures, Changes, and Life-histories* (1881); *Nomenclator Zoologicus* (1882); *Butterflies of the Eastern United States* (1888–89); *Tertiary Insects of North America* (1890); *Life of a Butterfly* (1893); *Guide to the Common Butterflies* (1893). He was also one of the founders of *Science*, and its editor 1883–85.

J. S. KINGSLEY.

Scudéry, skü'dā'ree', MADELEINE, de: poet and novelist; b. at Havre, France, June 15, 1607; was educated in Paris; became one of the most conspicuous figures in the literary circle of the Hôtel Rambouillet, and acquired great celebrity

by her romances, *Ibrahim* (1641), *Artamène, ou le Grand Cyrus* (1649), *Clélie* (1656), *Almahide* (1660), etc. After the reunions of the Hôtel Rambouillet had been broken up she formed a salon of her own, frequented by the queen and the princes. D. in Paris, June 2, 1701.

Scu'do [Ital., liter., a shield, hence a coin struck with the image of a heraldic shield < Lat. *scu'tum*, shield]: a coin of Italy, equal to five lire, and nearly equivalent to the U. S. dollar. Many different scudi were struck by the numerous powers which prevailed in Italy, and their values are extremely various.

Sculling: a method of propelling a boat by one oar from the stern. The sculler usually stands, and dipping the oar-blade deeply in the water pushes or pulls the handle from side to side. The blade is inclined at a large angle to the perpendicular, and this angle is changed to the other side of the perpendicular with each stroke.

The principle of sculling is very much the same as that of the screw-propeller or windmill, and the motion very closely simulates that of a fish's tail.

The term is also applied to the rowing of boats in which the oarsman uses a pair of sculls, or short oars, but this use is chiefly confined to shells and racing-boats. A racing-boat rigged for two men, each of whom rowed a pair of oars, would be called a double scull, and the oarsmen scullers. There are also a few racing-boats called centipedes, rigged for four men, each using a pair of oars; but rowing in such a boat is not called sculling. The method of propelling the Venetian gondolas can hardly be classed as either rowing, sculling, or paddling. Here the oarsman stands facing the front of the gondola, pushes his single oar—always on one side of the boat—over a fulcrum, and by a turn of the blade at the end of the stroke also steers the boat. See Rowing.

E. Hitchcock, Jr.

Sculpin [etymology obscure]: any fish belonging to the family *Cottidæ*; distinguished by a rather stout, club-shaped body and large head, the spines with which the head is armed, and a naked or simply rough body; the mouth is quite large. Sculpins are very destructive to other fishes and are a nuisance to the angler. Those commonly found along the Atlantic seaboard of North America are species of the restricted genus *Cottus* (or *Acanthocottus* of Girard). The best known are the *Cottus octodecem-spinosus*, which is the most southerly species, and the *Cottus grœnlandicus*, which is the most common N. of Cape Cod. The name deep-water sculpin, or sea-raven, is applied to the *Hemitripterus acadianus*. On the Pacific coast the name is applied to corresponding species of the same genus. The species are rarely or never used as food except by the Greenlanders and the very poor.

Revised by F. A. Lucas.

Sculpture [viâ O. Fr. from Lat. *sculptu'ra*, carving, sculpture, deriv. of *scul'pere*, *sculp'tum*, carve]: carving, or shaping by means of cutting tools, including incised work or engraving as well as carving in relief or in the solid. By extension, modeling in clay, wax, or other soft material is called sculpture, especially when it is a work of fine art which is described. The art of sculpture includes, then, all kinds of cutting and shaping of solid objects, but the chief use of the term is in naming the fine art described in this article.

Carving may be done with considerable neatness and accuracy without any model or drawing to serve as a guide. Those who have seen an old sailor cutting out a boat in pine-wood will remember how accurately the two sides are made to correspond in curvature and in projection, and how easily the delicate shaping of the bow and the run is made, apparently without special effort. In like manner it is only necessary to have in the mind a clear knowledge of the figure of man or beast one wishes to produce, and some practice, to carve it directly, in soft stone or wood or plaster. It is evident that there will be here no sufficient opportunity for changes and improvements, and that therefore only a certain class of figures can be carved in this way, without previous preparation of the model. Thus the rough and picturesque leafage of an early Gothic capital may well have been carved without a drawing. The sculptor may have shaped the capital roughly, and may then have scratched or chalked upon the stone some guiding lines, then, with a bunch of leaves before him, he may have attacked the stone directly. During the early years of the Gothic revival in England some such way of producing architectural sculpture was preached as the only true way. The workman was encouraged to bring the living plant or a newly cut branch, perhaps to model an experimental spray of leafage or the angle of a capital, and then to work directly upon the solid block of stone. In like manner the wood-carving of barbarous peoples is apparently done directly from the mental image, the shark's tooth or stone knife cutting what the mind suggests, as a schoolboy cuts the edge of his desk or as the Venetian boatmen ornament the gunwales of their large boats with a succession of notches. It is to be observed, however, that the patterns used in such work as that of the Malays, South Sea islanders, and others are traditional. Some are the common property of the tribe, others are handed down from father to son; even the complex patterns become as familiar to the workman as notches and zigzags. Something akin to this familiarity with the form to be reproduced, and consequent ease in bringing it to light from nothing, is to be found in the stories told of some famous sculptors. Of Michelangelo it is related that he would begin upon the block of marble with chisel and mallet, having no model before him and no guide that any one else could see, and work rapidly and furiously, knocking off large chips. Any trained sculptor of large power of imagination of the sort which gives vivid mental pictures to its possessor could do the same, within the limits set by his character and his knowledge, provided he were not wholly unaccustomed to the use of the chisel. It is known that much sculpture was done, in the years before and during Michelangelo's career, in the marble with only a small model as guide. In all refined sculpture of modern times, however, it is customary for the artist himself to make a full-sized model in wet clay, modeling this figure with wooden and iron tools and with the fingers, changing it, reconsidering it, sometimes throwing down the whole model and building it up again. The clay is kept wet throughout the duration of the work, wet cloths being kept swathed around it when the sculptor is away. From the model, when completed, a plaster cast is made; and this is the artist's work, the statue or the bust which the French sculptor sends to the Salon, and which may be honored by a medal or other recompense. It often happens that the sculptor will retouch his work in the plaster cast, in which case that cast becomes in every sense of the word the original work of art. Some works are sent to the Salon first in the plaster, and later in the marble or bronze. At the Paris Exhibition of 1878 the tomb of Gen. Lamoricière was set up in marble, the recumbent statue of the dead man being also in marble, but of the four statues of Virtues which adorned the angles two were in bronze, the others, which there had not been time to complete in the metal, being in plaster.

When the plaster is to be copied in marble it is set up beside the block of marble, and a practiced marble-cutter makes a rough copy, aiding himself by the pointing-machine, which enables him to assure himself of the exactness of every measurement. At this point the practice of sculptors begins to differ. Some begin to work with the chisel themselves at a rather early stage, and before the statue is anything like complete, while other well-known artists never touch the marble. In the case of bronze a statue or a bust is simply cast in a mould made upon the sculptor's clay model or the plaster reproduction of it. A process much used during the Middle Ages and at the time of the Renaissance was making the mould from an original model finished in wax upon a core of a coarser material. The mould was made upon this model in a single piece, its material being applied in coats, the first coats in a semi-liquid state. The liquid bronze being allowed to flow into the mould, and between it and the core, melted the wax and took its place, the mould of course had to be broken to pieces in order to remove the hollow bronze casting. This process, called *à cire perdue*, has been used also in modern times, but more commonly a piece-mould is used which allows of many successive castings being made.

Statues, busts, and groups may also be made of thin plates of metal beaten with hammers. The largest works, such as the colossal *Bavaria* at Munich and the *Liberty* in New York harbor, have been made in this way.

What has been said above applies mainly to sculpture "in the round"—that is to say, finished on all sides, like a statue. For bas-reliefs and similar sculpture see Relief. See also Engraving and Gem for such sculpture as is hollow instead of projecting, concave instead of convex.

The fine art of sculpture is less complex than that of painting, as it deals with form alone. It is also in a sense more simple, because it is more instinctive to make an attempted copy in any soft material or even by cutting in wood or the like than it is to represent the same object by lines and tints upon a flat surface. Drawing and painting involve much greater abstraction and a much more advanced

mental development than rude sculpture. It is not meant that sculpture always precedes drawing; probably the reverse is the case, because the temptation to scratch or otherwise mark on a flat surface, and in doing so to represent a beast or a man, must always have been present. Sculpture may not always precede drawing, but will always be found more nearly truthful to nature than the drawing of the same epoch. The sculptor having form only to consider is concerned at first with two things: The first, to produce an ornamental object, or else to ornament parts of a useful thing, as a paddle or the prow of a canoe; the second, to represent something that he takes an interest in. Another idea often mingles with these two—namely, the production of an object, like an idol or fetish, in which he can embody some notion of worship or which he can use to terrify an enemy. This last motive speedily disappears or becomes of little moment as the skill of the sculptor increases. As he becomes able to deal with form somewhat easily and with results partly satisfying to himself, he finds a pleasure so intense in the production of his work of art and also in the suggestions from nature which he is enabled to embody in it that he forgets all other considerations. Thus in an Assyrian sculptured slab covered with figures in low-relief representing a battle, the triumphal entry of a king, or the same king hunting a lion, it is evident that the sculptor's chief care is for the beauty of his work. His slab was one of many which were to form the dado of a long and narrow gallery; the persons who were to see his bas-relief would never be far away from it, and it was for a point of view 10 or 15 feet away, and for light coming from high in the wall, that he had to plan his work. Therefore his figures were small, or, when large, filled with small details; his relief was kept low, and the outline when the relief quits the background was especially cared for. Under these conditions he labored to produce the most beautiful or striking combinations of lines and masses possible to him; but in doing this he made reference constantly to nature, and indeed found in the study of nature his chief suggestions of beauty and of strength, ferocity, swift and vigorous action, and other things agreeable to look upon. Thus nothing he could imagine would be as fine, let us suppose, as a lion in free action walking or springing; to this beautiful thing he could add human interest by showing the lion struggling with the hunters; and if in so doing he was able to flatter the king who employed him by representing his majesty twice as tall as his attendants and easily victorious over lions by the score, this in no way interfered with his artistic design or its impressiveness. It is true, of course, that religious or patriotic impulses act upon the sculptor as upon other men. Such impulses, however, do not seriously modify the sculptor's work, except in so far as they stimulate the whole man, excite his enthusiasm, raise him above himself as the phrase is, and in doing this they may improve his work or ruin it as man's nature and his surroundings may decree. Thus in the famous group by François Rude on the eastern face of the Arc de l'Étoile and representing the departure for the war of patriotic volunteers, there is no question that Rude was strongly in sympathy with the subject chosen and the enthusiastic love of country which suggested it. As a sculptor, however, he was concerned chiefly with the beauty and vigor of his composition and the harmonizing of the numerous and varied masses which make it up, and at the same time with the full expression of the different figures, here of youthful agility, there of manly strength in its maturity, and in the crowning figure of womanly forms carried to superhuman massiveness and force. Patriotism and hostility to the foes of France must have acted upon Rude as a powerful stimulus throughout his life, but it is only in this indirect way that those passions can be said to have dictated the design for *Le Départ*.

History.—The earliest sculpture of which the date can be fixed approximately is that of the Egyptian buildings of the early dynasties, and the few statues of the same epoch which have been discovered. These are dated by different authorities at from 4500 to 3500 B. C. The merit of these, both artistically and in the representation of natural forms and expression of face, is very great, so that we find Egyptian fine art already in an advanced stage of development at that early age. The sculptures from Mesopotamia of a date almost as remote are indeed far inferior in merit to the Egyptian, but are still those of an advanced civilization. There is no doubt that further investigations in the region about the Euphrates will reveal a continuous series of civilizations, vying with one another in their fine arts as in other respects. That of which we know the most is the Assyrian sculpture. (See ASSYRIAN ART.) There was also sculpture produced among the mountainous states of Asia Minor which has been studied with some success since about 1880; this is of peculiar importance because of the influence of its later productions over the early art of Greece. (For the more developed art of Greece, see GRECIAN ARCHITECTURE; also ARCHITECTURE, CHRYSELEPHANTINE STATUES, and PARTHENON.) The dates of Greek sculpture are nearly as follows: During the years from 600 to 480 B. C. the earliest works which can properly be called Grecian were produced, such as the metopes of Selinus now in the Museum of Palermo, the *Apollo of Tenea* at Munich, the *Apollo of Thera* at Athens, the seated figures from Branchidæ (Miletus) in the British Museum, the frieze of the Temple of Assos partly in the Louvre, and the pediment sculptures of the Temple of Ægina, now in Munich. These are arranged here in the order of their increasing refinement. The two fine statues at Naples called *Harmodius* and *Aristogiton* are thought to be copies or duplicates of statues put up in Athens about 500 B. C. The remarkable statues found in Athens on the Acropolis in 1882 and 1886, and distinguished by their well-preserved painting, may be of the years from 500 to the Persian invasion in 492. The Persian wars following this year and lasting till 477 may probably have checked the growth of fine art in Greece, while preparing for a rapid and splendid development with peace. When Athens became the chief city in Greece and the head of a confederation of states, the epoch of her greatest and noblest fine art was soon to begin. The years from 460 to 430 B. C. are marked by the sculptures of the Temple of Zeus at Olympia, of the Parthenon at Athens, of the Temple at Bassæ (Phigaleia), of the Temple of Athena Nike on the Acropolis, and in part of the Erechtheum. The chief sculptors of the best time of Grecian art, with the dates of their highest achievement approximately given, are Phidias, 440; Myron, 440; Cresilas, 440; Polyclitus, 430; Scopas, 420; Cephisodotus, 370; Praxiteles, 360. From that time until the third century A. D. the history of Greek sculpture is mainly that of an art serving states or powers not Greek; the merit and importance of the work done varies very greatly, according to the opportunity offered by the new masters of the Mediterranean world, such as the Kings of Pergamum, then Alexander the Great and his successors, and finally the Roman dominion. A great deal of noble sculpture was produced in every brief epoch, if not in every year, down to the death of Marcus Aurelius in 180 A. D. See ROMAN ARCHÆOLOGY.

It must be remembered that sculpture was commonly painted in bright and varied colors among all the peoples of antiquity. Egyptians, Assyrians, Greeks, and the people of the Græco-Roman empire all agreed in this. See POLYCHROMY.

During the Middle Ages sculpture had less purely sculpturesque character than generally in classical antiquity—that is to say, the artists had less sense of the beauty and expressiveness of pure form, as in the human body. They knew much less about the body, partly because of the custom of wearing very full and ample clothing, and no longer bathing and exercising in public as the ancients had done; religion, moreover, taught the unworthiness of the flesh as nothing in Greek or Roman life had asserted it. On the other hand, the decorative and building instinct was very strong throughout the Middle Ages. The Byzantine artists had no sculpture beyond that of capitals and similar architectural members and rude bas-reliefs of sacred subject: their decoration was chiefly in color on flat surfaces. The Western nations in the years following the establishment of comparatively peaceful communities showed a strong taste for figure-sculpture as used in the decoration of architecture. This was rude enough in the eleventh century, but grew rapidly in refinement. The statues in the porches and the "royal galleries" in such cathedrals as Chartres in the twelfth century, Bourges, Paris, and Chartres again in the thirteenth century, are the highest development known to us of sculpture, whose chief aim is decoration, the climax of excellence being reached in the porches of Rheims cathedral (1250, and the following years). This art was pursued with almost equal success in England, Spain, and parts of Germany. In Italy the mediæval sculpture is abundant and beautiful; it keeps something of the ancient grace and also some of the ancient knowledge of the human form. For the development of sculpture in Italy at the close of the Middle Ages, see RENAISSANCE, MICHELANGELO, and the names of other sculptors of the epoch. In France and the north generally sculpture passed from the style of the Middle Ages

into a richer and more varied but still decorative style, having less of the purely sculpturesque beauty of Italian work and a fantastic and overwrought character of its own. Thus the famous groups in the abbey of Solesmes near Angers were not begun until Donatello, Verrocchio, Mino da Fiesole, and Luca della Robbia had all done their work and had been dead for ten or twenty years, and yet this French sculpture, although consisting of full statuary and large groups of figures in the round, is mediæval in almost every respect. There were Renaissance sculptors in France, such as Jean Goujon, but their work is not epoch-making in the sense that the Italian Renaissance sculpture is so. It follows from this that modern sculpture is found in France and elsewhere in the north fully developed, nearly as we know it to-day, in the time of Henry IV. and Louis XIII., with such masters as Simon Guillain (d. 1679), Pierre Franqueville or de Francheville (d. 1630), Michel and François Anguier, and Pierre Puget (d. 1694). These men inherited from Michelangelo, in a sense, and not from the earlier Renaissance. They were followed by the men of the Louis XIV. epoch: François Girardon (d. 1715), Antoine Coysevox (d. 1720), Nicolas Coustou (d. 1733) and Guillaume Coustou (d. 1746), Jean Baptiste Lemoyne (d. 1778), and Jean Baptiste Pigalle (d. 1785). The sculptors of the beginning of the nineteenth century were rather cosmopolitan in life and work; thus Augustin Pajou (d. 1809), Claude Michel Clodion (d. 1814), Antonio Canova (d. 1822), John Flaxman (d. 1826), Jean Antoine Houdon (d. 1828), and Bertel Thorwaldsen (d. 1844) were Italians, Frenchmen, or Danes, but all worked under a common Roman influence. The sculpture of the years since 1830 has been characterized, especially in France, by a very remarkable increase in energy and purpose. The skill and knowledge of many of the men whose work has been done between 1830 and 1890 is worthy to be compared with that of the men of antiquity; and if there is no school as strong in artistic charm as that of the Italian Renaissance, there are individual men worthy to be named with the great Italians, and others who are equally efficient in other ways of work. There are many different tendencies visible in nineteenth century sculpture, and it is too soon to judge them fairly. Jacques Pradier (d. 1852), David d'Angers (d. 1855), François Rude (d. 1855), Jean Baptiste Carpeaux (d. 1875), Antoine Etex (d. 1888), and, of men living in 1895, Paul Dubois, Henri M. A. Chapu, Antonin Mercié, Emmanuel Frémiet, and finally Auguste Rodin and Jules Dalou are all sculptors whose abilities and achievements would grace any epoch. These are all men of the great Paris art-world, but not all of the same school. Nearly all modern sculpture is concentrated in Paris, and the different influences at work there show themselves in strong contrasts. Of English sculpture of the nineteenth century Thomas Woolner and Sir J. Edgar Boehm are to be mentioned, and one or two admirable works have been produced by a painter, Sir Frederic Leighton. In the U. S., of men living in 1895, the names of John Q. A. Ward and Augustus St. Gaudens should especially be named. See FINE ARTS.

RUSSELL STURGIS.

Scup, or **Scuppaug**: See PORGY.

Scurvy [for form cf. *scurf*, scab, *scurfy*, *scurvy*, scabby; for meaning cf. Late Lat. *scorbu'tus*, scurvy. Cf. Dutch *scheurbuik*]: a diseased state of the blood, induced chiefly by prolonged privation of fresh vegetable and animal food. Although not exclusively a sailor's malady, its ravages have been most disastrous at sea, devastating, previous to the nineteenth century, the navies and merchant marine of all nations. Pizarro's squadron included 2,700 men, of whom but 100 survived. Ships were often lost adrift at sea, the crew unable to work and perishing. Anson's English fleet in 1742 in nine months lost 626 out of 961 men. The chief cause of this pest of the marine was the exclusive diet—salt meat and hard, dry bread, with impure and deficient drinking-water—upon which sailors subsisted during prolonged voyages. Exposure to cold or to tropical heat, fatigue, and the unsanitary and foul condition of ships contributed to the development of scurvy. As early as 1617 Wodall recorded the virtues of lemon-juice in curing this disease, and in isolated cases its use and a vegetable diet saved the crews so treated; but not until the latter half of the eighteenth century were improved ship hygiene and vegetable diet at sea enforced. Thus only thirty years after Anson's fearful loss Capt. Cook sailed on a three years' voyage around the world, losing but one man by disease. Parry in three polar expeditions of a year and a half and two years' duration lost only seven men out of 334. Modern improvements in sailing ships and the use of steam at sea by shortening voyages have tended to lessen sickness among sailors. The improved hygiene of ships, the supply of fresh meat and vegetables prescribed by law for sailors, and the modern methods of keeping such articles hermetically sealed for long voyages, have rendered scurvy almost unknown at sea, although it occurs occasionally on land, in garrisons and prisons, and in communities suffering from starvation. All of the symptoms of scurvy are directly connected with the impoverished, impure state of the blood. All parts of the body are correspondingly ill nourished. The face is cachectic and sunken, the body emaciated, the limbs are feeble and seem unduly heavy. The gums become dark, bloody, relaxed, and spongy. There is an early tendency for the vitiated blood to escape from its vessels—an occurrence favored both by its thinned consistency and by the changed nutrition of the capillary walls. At first mulberry-colored purple spots of variable size appear on the legs, later on the body. Later, larger purple spots or diffused patches appear upon a tough, indurated, leathery base, due to effusion of blood in quantity beneath the true skin or between superficial muscles, infiltrating and coagulating in the minute interspaces of the connective tissue. Such patches are painful to touch; they may become the site of bloody blebs or of ulcers. Bloody serum often transudes into the pleural cavities, embarrassing the respiration; also into the pericardium, peritonæum, and the cavities of the joints. "Bloody flux," or dysentery, is frequent; also vomiting of blood and nosebleed. Death occurs from exhaustion. Critical cases may rapidly change for the better, and mild cases quickly recover, when put upon supporting and vegetable diet. Onions, cabbage, radishes, horse-radish, "scurvy-grass" or spoon-wort, water-cresses—the entire class of the *Cruciferæ*—are especially efficacious; all the vegetable acids, lemons, limes, oranges, cherries, currants, apples, are valuable. Sauerkraut is extolled by the Germans as combining vegetable food and acids. Animal broths, tonics, and regimen are essential adjuvants to this treatment. It has become known that young infants improperly fed develop a form of acute scurvy which was formerly mistaken for an acute form of rickets. In this there are usually hæmorrhages under the periosteum of the bones, disturbances of the stomach, and general wasting and weakness.

Revised by W. PEPPER.

Scurvy-grass: a cruciferous plant, *Cochlearia officinalis*, abundant upon many seashores (but not on those of the U. S.), and also found on mountain ranges, and sometimes cultivated as a salad-plant. It has the pungent qualities of horseradish, and is of high rank as an antiscorbutic. The scurvy-grass occasionally cultivated for salad in the U. S. is mostly *Barbarea præcox*, the early winter-cress, a European cruciferous plant sparingly naturalized in the U. S.

Revised by CHARLES E. BESSEY.

Scutari, skoo'tăă-rĕĕ (Turk. *Uscudar*; Gr. Χρυσόπολις): the largest and most distinctively Oriental of the suburbs of Constantinople; situated on several hills on the Asiatic side of the Bosphorus, directly E. of the Golden Horn. Here the pagan emperor Licinius suffered his final defeat by Constantine (323). It contains many mosques, tekiehs (dervish convents), several palaces, and immense barracks. The vast cypress-shaded cemeteries are the most striking feature of the city. Mussulmans dying on the other side of the strait desire to be brought here for burial. The hospital, memorable for the devoted labors of Florence Nightingale, still exists, and near it is the beautiful British cemetery wherein are interred 8,000 nameless victims of the Crimean war. In Scutari is the admirable American College for Girls, where a first-class education is given. Pop. 75,000. See CONSTANTINOPLE.

E. A. GROSVENOR.

Scutari (Turk. *Uscodra*, or *Iskenderieh*): chief town of the vilayet of Scodra in Albania; on the southern extremity of the Lake of Scutari, 12 miles from the Adriatic; in lat. 42° N. (see map of Turkey, ref. 3–B). A natural fortress, it was the stronghold of Gentius, last King of Illyricum, who surrendered here to the prætor Anicius (168 B. C.), whereupon Illyricum became a Roman province. In 1477 during eight months it withstood a siege by 80,000 Ottomans, commanded by Sultan Mohammed II. in person, but in the subsequent treaty between Venice and the Porte it was ceded to the latter; in consequence 600 persons, the sole survivors of the siege, abandoned their homes. It is the center of trade-distribution through Albania, but its business activity is greatly checked by the lack of roads in the surrounding country. Imports are woven goods, building tim-

ber, metals, drugs, paper, and earthenware; exports (in value only one-third of the imports) raw stuffs, dyewoods, and rags. Pop. 36,000, of whom 27,500 are Mussulmans.

E. A. Grosvenor.

Scutching: See Flax.

Scutibranchia'ta [Mod. Lat.; Lat. *scu'tum*, shield + *bran'chiæ*, gills]: an obsolete term for those molluscs now included under the *Zygobranchia*. See Gasteropoda.

Scyelite: See Peridotite.

Scylax, sī'laks (Gr. Σκύλαξ): Greek geographer of Caryanda in Caria, who, by command of Darius I., made a voyage of discovery from the Indus through the Indian Ocean to the Red Sea (Herodotus, iv., 44). The *Periplus*, which bears the name of Scylax and describes a voyage along the coast of Europe, Asia, and Africa, is a much later performance, and has been assigned to the middle of the fourth century B. C. It was edited by Müller (*Geographi Græci Minores*, vol. i., pp. 15–96). See Bunbury, *History of Ancient Geography* (vol. i., p. 384, *seq.*). B. L. G.

Scylla, or **Scilla**, sil'lă (Gr. τὸ Σκύλλαιον ἄκρον; Ital. *Sciglio*): a high and steep promontory on the Italian side of the Strait of Messina. In ancient mythology it was the home of the sea-monster Scylla, who, along with the whirlpool Charybdis, threatened destruction to all mariners.

J. R. S. S.

Scylli'idæ [Mod. Lat., named from *Scyllium*, the typical genus, in form dimin. of Gr. Σκύλλα, Scylla; cf. σκύλιον, dogfish, and σκύλλειν, rend, tear]: a family of sharks distinguished by the position of their dorsal fins and their habit of laying eggs like those of the rays. It includes the dogfishes. The body is more elongated than is the case with the sharks generally. The *Scylliidæ* are inhabitants entirely of the seas of the Old World and Australia. They are among the few sharks which lay eggs invested in parchment-like cases, like those of the rays. Revised by F. A. Lucas.

Scym'nidæ [Mod. Lat., named from *Scymnus*, the typical genus, from Gr. σκύμνος, cub, whelp]: a family of sharks distinguished by the absence of the anal fins and presence of unarmed dorsals. It includes the Greenland sharks.

Revised by F. A. Lucas.

Scymnus, sim'nŭs (Gr. Σκύμνος): Greek geographer, to whom has been attributed an outline of the geography of the ancient world composed in iambic trimeters. The authorship of this περιήγησις, as it is called, is doubtful, as the original Scymnus wrote in prose, and the time is uncertain, the first or second century B. C. It was edited by Müller (*Geographi Græci Minores*, vol. i., pp. 196–237). See Bunbury, *History of Ancient Geography* (vol. ii., 71). B. L. G.

Scyphomedu'sæ [Gr. σκύφος, cup + *Medusa*, a fabled monster]: a group of cœlenterates belonging to the class Scyphozoa (*q. v.*).

Scyphoph'ori [Mod. Lat.; Gr. σκύφος, cup + φέρειν, bear]: an order of fishes established by Prof. Cope, and distinguished by the following characters: The skeleton is completely ossified; the basis cranii simple; the parietals narrow, and distinct from each other as well as the supraoccipital; the pterygoid is very peculiar, being enlarged and funnel-shaped, and excavated by a bowl-like chamber (whence the name), which expands laterally and is covered by a lid-like bone; no symplectic exists; the jaws are well developed, but the intermaxillaries coalesce, at least in the old, into a single bone, and the maxillaries are lateral; opercular apparatus complete, but with the interoperculum and suboperculum reduced in size; scapular arch with the several coracoid elements represented; the brain has over the cerebellum a peculiar plicated organ; the air-bladder is simple, and communicates by a duct with the intestinal canal. The order is related to the more generalized form of *Teleocephali*, as well as to the *Nematognathi*. It is represented by but two known families, which are peculiar to the rivers of Africa; these are the *Mormyridæ* and *Gymnarchidæ*.

Theodore Gill.

Scyphozo'a [Gr. σκύφος, cup + ζῷον, animal]: one of the great divisions or classes of the Cœlenterata (*q. v.*), including the sea-anemones, coral-polyps, and the acraspedote jellyfishes. The group is differentiated from the other class (*Hydrozoa*) by the fact that there is an ectodermal œsophagus formed by the inpushing of the external skin through the mouth. As in all *Cœlenterata*, there is no distinction between the digestive cavity and body-cavity, but the common enteric cavity is complicated by folds of the outer wall (septa) which increase greatly the amount of digestive surface. On these septa are borne thread-like gastral or mesenterial filaments which play an important part in digestion. The sexes are usually separate and the genital products (eggs and spermatozoa) arise from the entoderm. Two subclasses are recognized, the *Scyphomedusæ* and the *Anthozoa*. The *Scyphomedusæ* (except the lucernarians) are free-swimming solitary forms commonly known as jellyfishes, in which the body is umbrella-shaped or disk-like, the mouth being on the extremity of a longer or shorter proboscis, while the supporting layer (mesogloea) which lies between the ectoderm and entoderm of all *Cœlenterata* is developed into a thick gelatinous mass which makes up the bulk of the body. In the *Anthozoa* (often called *Actinozoa*) are included sessile, solitary, or colonial (compound) forms commonly called sea-anemones, coral-polyps, and the like. In these the body retains a more simple condition. It is more or less columnar and the free end or oral disk is surrounded by a circle of tentacles, the number varying between wide limits (see below). In the center of the oral disk is the slit-like mouth, no proboscis being present. From the mouth the ectodermal œsophagus extends into the body, opening below into the large digestive chamber. In many forms the two ends of the mouth differ, one being for the taking in of water, while from the other flows out the water already used, carrying with it the indigestible particles taken in with the food. The digestive cavity is partially divided by the septa (already noticed), which are folds of the lining walls which project inward from the wall of the body like the spokes of a wheel from the rim toward the hub. The arrangement of these septa varies greatly, but in all cases there are at either one or both ends of the body (corresponding to the longer axis of the mouth) septa which differ from the rest and are consequently known as directives. The supporting layer is weakly developed, never attaining the thickness presented in the *Scyphomedusæ*. The *Anthozoa* are divided into orders chiefly upon the number and arrangement of the septa. In the Octocorallia (*q. v.*) the septa are eight, and there are usually eight feathery tentacles surrounding the oral disk. In the Tetracorallia (*q. v.*), a group of fossil forms occurring in the Palæozoic rocks, the septa are very numerous, but are always in multiples of four. In the Hexacorallia (*q. v.*) the tentacles are always in multiples of six, while the septa, except in a few instances—e. g. *Antipathus*, with two—follow the same law. J. S. Kingsley.

Scyros: See Skyros.

Scythe [M. Eng. *sithe* < O. Eng. *sigðe*: Icel. *sigðr*: Germ. *sense* < O. H. Germ. *segansa* is from same root; cf. Lat. *seca're*, cut]: a long, curved blade, sharp on the concave edge, used in cutting grass. It is attached, for use, to a curved handle, called a snath. Shorter and stronger scythes are used for cutting bushes, etc. The introduction of mowing-machines has to a great extent superseded the use of scythes in haymaking, but where the former can not be employed scythes are still indispensable.

Scyth'ia: the ancient name for the vast regions which extend N., E., and S. of the Caspian Sea and the Sea of Aral. It was not so much used as a geographical term, for the boundaries of these regions were entirely undefined; it was rather a general term by which the Romans denoted a swarm of savage tribes living there, of whom they knew very little.

Scythop'olis: the *Beth-shean* of Josh. xvii. 11, the *Beth-shan* of 1 Sam. xxxi. 10, now called *Beisan*, the most important city of the ancient Decapolis (*q. v.*), and the only one W. of the Jordan, about 4 miles from that river, and nearly 14 miles S. of the Sea of Galilee. It was nearly as well watered as Damascus, four perennial streams running through it. It was a place of great strength, its acropolis rising 300 feet above the plain. The ruins, which are 3 miles in circuit, surpass all others in Western Palestine. Its classic name, *Scythopolis*, is of disputed derivation, but the old conjecture that there was there a remnant of the Scythians, who invaded Palestine on their way to Egypt (650 B. C.), is the most probable. Scythopolis was the seat of a bishopric in the fourth century A. D. The modern village, of some fifty houses, contains a colony of Egyptians established there by Ibrahim Pasha in 1848. Revised by S. M. Jackson.

Sea: See Ocean and Physiography.

Sea-anemones: See Hexacorallia and Actiniidæ.

Sea-bass: a serranoid fish (*Centropristis atrarius*) common on the Atlantic coast of the U. S. See Fisheries.

Sea-bear: a fur-seal of either of the genera *Callotaria* and *Arctocephalus*, especially the northern species. See OTARIIDÆ.

Seabury, SAMUEL, D. D.: bishop; b. at Groton, Conn., Nov. 30, 1729; son of clergyman of same name; graduated at Yale College 1748; studied medicine and theology in Scotland; was ordained a deacon and priest of the Church of England at London 1753; was in charge of churches at New Brunswick, N. J., at Jamaica, Long Island, 1756–66, and at Westchester, N. Y., 1766–75; was imprisoned at New Haven as the supposed author of some Tory pamphlets, but soon released; resided in New York during most of the Revolutionary war; was at one time chaplain of a loyalist regiment; went to England 1784; was consecrated Bishop of Connecticut by three Scottish prelates at Aberdeen Nov. 14, 1784, being the first American bishop; took part in revising the Prayer-book and framing a constitution for the American Church 1789; published two volumes of sermons (1791) and a number of single sermons; exercised the duties of his episcopal office at New London, Conn., until his death at that place Feb. 25, 1796. A posthumous volume of *Sermons* was published 1798.

Seabury, SAMUEL, D. D.: clergyman and author; son of the Rev. Charles Seabury, and grandson of Bishop Seabury; b. at New London, Conn., June 9, 1801; was ordained in the Protestant Episcopal Church 1826; was for several years a missionary at Huntington, Oyster Bay, and Hallett's Cove (now Astoria), Long Island; was editor of *The Churchman* at New York 1831–49; rector of the Church of the Annunciation 1838–68, and Professor of Biblical Learning in the General Theological Seminary from June, 1862, to his death in New York, Oct. 10, 1872. Author of *The Continuity of the Church of England in the Sixteenth Century* (1853); *Discourses on the Supremacy and Obligation of Conscience* (1860); *American Slavery Justified* (1861); *Theory and Use of the Church Calendar* (1872); and a posthumous volume of *Discourses on the Holy Spirit* (1874), edited by his son, WILLIAM JONES SEABURY, D. D., clergyman and author, who was born in New York Jan. 25, 1837; graduated at Columbia College, New York, 1856; admitted to the bar 1858, but entered the General Theological Seminary 1866; has been rector of the Church of the Annunciation, New York, since 1868, and has been Professor of Ecclesiastical Polity in the General Theological Seminary since 1873. He is the author of *Suggestions in Aid of Devotion and Godliness* (1878) and *An Introduction to the Study of Ecclesiastical Polity* (1894). Revised by W. S. PERRY.

Sea-cow: See MANATEE and SIRENIA.

Sea-cucumber: See HOLOTHURIANS.

Sea-duck: See DUCK.

Sea-eagle: See EAGLE.

Sea-egg: a sea-urchin. See ECHINOIDEA.

Sea-elephant: See ELEPHANT SEAL.

Sea-fan: See GORGONIA.

Seaford: town; Sussex co., Del.; on the Nanticoke river, at the head of navigation by small vessels, and the Phila., Wil. and Balt. Railroad; 33 miles E. by N. of Cambridge, Md., 84 miles S. of Wilmington (for location, see map of Delaware, ref. 7–N). It is in an agricultural region, and contains numerous oyster-packing houses, two national banks with combined capital of $100,000, and a weekly newspaper. Pop. (1880) 1,542; (1890) 1,462; (1900) 1,724.

Seaforth: town of Huron County, Ontario, Canada; on Buffalo and Goderich Branch of the Grand Trunk Railway; 21 miles S. E. of Goderich (see map of Ontario, ref. 4–B). It ships annually 1,000,000 bush. of grain, and is underlaid with a stratum of pure rock-salt, over 100 feet thick at a depth of 1,100 feet. It has a large trade, productive salt-wells, active manufactures, and two weekly papers. Pop. (1891) 2,641.

Sea-horse: See HIPPOCAMPUS.

Sea Islands: littoral band of islands of South Carolina, especially those from Winyah Bay to the mouth of the Savannah. Their fertility is extraordinary, their cotton long-stapled and celebrated, and their rice product large. They are low, and especially subject to the overflows by the storm-waves of hurricanes. Those of 1893 and 1894 destroyed the crops generally, and caused thousands of deaths. The Negroes show a strong tendency to collect on these islands for permanent residence. M. W. H.

Sea-kale: the *Crambe maritima*, a perennial cruciferous herb; a native of European seacoasts; much cultivated in England as a potherb. It requires a generous soil, and its large leaves and sprouts are unfit for eating until blanched.

Seal [from O. Fr. *sëel* > Fr. *sceau*: Ital. *sigillo*: Span. *sello* < Lat. *sigil'lum*, dimin. of *signum*, sign, mark, stamp]: strictly, at the common law, a piece of wax or other tenacious substance which has been affixed to the paper or parchment of an instrument in writing, and stamped with an impression for the purpose of legally executing or authenticating the instrument. The use of these seals becoming inconvenient, the name is by extension applied also to the substitutes used for it, such as an impression made in the paper or parchment of the instrument itself, or a scroll or flourish of the pen placed after the signature, or the letters L. S. The instrument by which the impression on the wax or other material is made is also called a seal. The use of the seal as a device for authenticating important instruments arose from the fact that in early times few could affix a written signature to the instruments made by them, and in place of such a signature they therefore used, with or without a mark or cross, seals with some heraldic or other device worked in relief to impress the wax. The use of the seal became especially associated with deeds and state papers because these then constituted the most important instruments which people had occasion formally to authenticate. In using a seal it is not necessary that it should be affixed by the person whose seal it is intended to be, but he may adopt as his seal one affixed by another; and so one seal may suffice for a number of signers of an instrument. The necessity for the use of a seal and the determination as to the kind of seal necessary in general depends upon the laws of the place where the contract is made; but in the case of deeds always upon the law of the State in which the land is situated.

Effect of Seal.—The common law attributed a very high, but very arbitrary and technical, efficacy to the seal upon instruments of a private nature. A seal was essential to a valid conveyance of a freehold estate in land; and as no contract is obligatory without a consideration, it established a conclusive presumption that there had been some valuable consideration. In some of the U. S. the common-law rule as to presumption of consideration was more or less abandoned, and in many States it is provided by statute that a seal on an executory contract shall be only *prima-facie* evidence of a sufficient consideration.

Statutory Regulation of Seals.—In most of the U. S. the use of the seal is regulated by statutes, extending the application of the term, and doing away entirely in many cases with its use on private instruments, or with any distinction between such instruments when sealed and unsealed. The word "seal" or the letters L. S. may be used instead of a seal in Connecticut and New York. The scroll may be used in place of a seal in Arkansas, California, Florida, Idaho, Illinois, Maryland, Michigan, New Mexico, North Carolina, Oregon, Pennsylvania, South Carolina, Virginia, and West Virginia; and in Minnesota, New Jersey, Wisconsin, and Wyoming any flourish or device intended for a seal may be used. The distinction between sealed and unsealed private instruments (except of corporations) has been abolished in Arizona, California, Colorado, Indiana, Indian Territory, Iowa, Mississippi, Missouri, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, and Utah; so that in these States and Territories the presence or absence of a seal does not affect the validity of the instrument. In Alabama an instrument purporting on its face to be a sealed instrument is taken to be sealed.

Judicial Recognition of Seals.—The public, or great, seals of all independent nations are universally recognized by the governments and tribunals of other civilized countries, so that public records, statutes, etc., when authenticated by their means are accepted as correct without further proof. The seals of notaries public are also regarded as proving themselves, especially in Europe, where the NOTARY (*q. v.*) is an officer of greater dignity than in the U. S. The seals of the superior courts and of many administrative officers also receive judicial recognition, and require no proof in the territorial jurisdiction to which they belong; but in other jurisdictions they must be proved unless they are privileged by comity or statutory provision.

See *American Law Review*, 638; *History and Use of Seals in England*, in vol. xviii. of *Archæologia* (London); Blackstone's *Commentaries*. F. STURGES ALLEN.

Seal [M. Eng. *sele* < O. Eng. *seolh* : O. H. Germ. *selah* : Icel. *selr*]: a pinniped mammal of either of the families *Phocidæ* or *Otariidæ*. The name is applied more particularly to the members of the family *Phocidæ*, the eared seals being termed fur seals or sea-bears and sea-lions. With the exception of a species (*Phoca sibirica*) inhabiting Lake Baikal, seals are marine, but some find their way into the lakes of Newfoundland, and they ascend rivers for considerable distances, a few having been taken even in Lakes Champlain and Ontario. They are more or less gregarious in habits, especially during the breeding season, when they are found in herds of thousands or hundreds of thousands on the ice-floes. As a rule, the female brings forth but one young, and this is covered with a soft woolly coat, which is shed in two or three weeks. Seals feed principally on fish, but also eat cuttlefish, crustaceans, and molluscs. They are capable of remaining beneath the water for five or ten minutes, or, according to some observers, even fifteen or twenty minutes, but if this be true, it is certainly exceptional. Those species which winter in the ice keep a hole open to which they come to breathe, a habit of which advantage is taken by hunters, who either wait by the holes and spear the animal as it emerges or else set a net over the hole.

Four genera of seals (*Stenorhynchus*, *Lobodon*, *Ommatophoca*, and *Leptonyx*), each with a single species, are peculiar to Antarctic seas, but nearly all species and individuals occur in the northern hemisphere, and for the most part in the frigid and colder portions of the temperate zone. The most familiar of the seals is the harbor seal (*Phoca vitulina*), a species common to both the eastern and western hemispheres, ranging from New York to Spain, along the northern shores of Europe and Asia, and down the Pacific coast of the U. S. to California. It attains a length of 5 or 6 feet; the general color is yellowish gray above, varied with markings of dark brown or blackish, lighter below, but it is subject to considerable variation. The Caspian seal (*Phoca caspica*) resembles the harbor seal, and is considered a descendant of that species, having entered the Caspian Sea when it was a branch of the Arctic Ocean, and become modified by isolation. The harbor seal is found on the coast in small bands. The largest of the seals (excepting the Elephant Seal and Sea-leopard, *qq. v.*) are the bearded seal (*Erignathus barbatus*) and the gray seal (*Halichœrus grypus*), each of which attains a length of 8 or 9 feet, although they are said to grow even larger. The gray seal is found only in the North Atlantic and the Baltic, while the bearded seal is circumpolar. Both are less gregarious than the other species. The gray seal, as its name implies, is free from markings, while the bearded seal is blotched with brown or blackish. The netsick, or ringed seal (*Phoca fœtida*), is a species resembling the harbor seal, but is smaller, and has light markings in the form of rings surrounding oblong dark patches. This species is prized by the Eskimo, as it winters in the Arctic regions and forms an important article of food.

The curious hooded or, more correctly, bladder-nosed seal (*Cystophora cristata*) attains a length of 7 or 8 feet, and derives its name from the fact that the males possess the power of inflating the skin about the nose. It is usually incorrectly figured with the hood on top of the head. It is a northern species, and is not found in herds. See Allen, *History of North American Pinnipeds* (1880); Elliott, *Seal Islands of Alaska* (1881); *Fishery Industries of the United States*, Quarto Fishery Report (1884–87). See also Harp-seal, Monk-seal, Otariidæ, Phocidæ, Seal-fisheries, and Sea-lion. F. A. Lucas.

Sea-lavender: See Marsh-rosemary.

Sea Laws: See the Appendix.

Sealchraig: See Selkirk, Alexander.

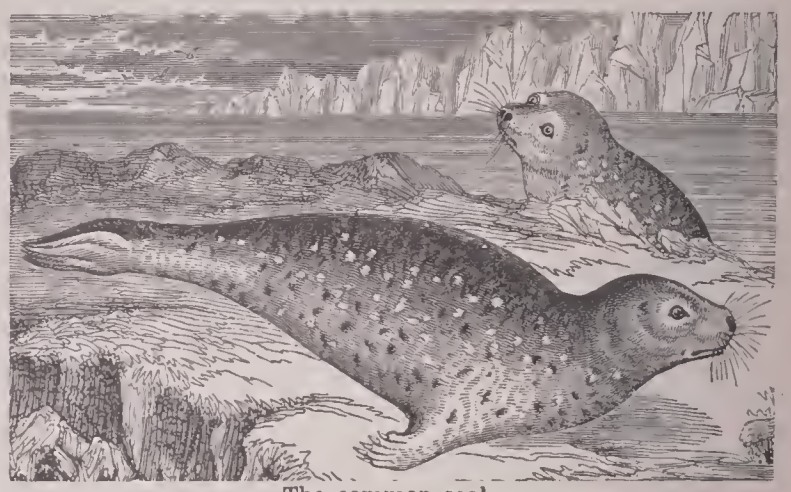
Seal-engraving: See Gem.

Sea-leopard: an Antarctic seal (*Stenorhynchus leptonyx*) named from its spotted coat of gray and white. Aside from the sea-elephant it is the largest southern hair-seal. It attains a length of 10 feet, and the crowns of the molars are divided by deep notches into three portions. F. A. L.

Sea Letter: See the Appendix.

Seal-fisheries: industries which consist in the capturing of seals for commercial purposes, and which may be said to have arisen toward the end of the eighteenth century; though the walrus, a near relative of the seal, had been systematically pursued for at least 200 years before, comparatively few hair or fur seals appear to have been taken prior to 1790. In the present condition of the seal-fisheries it is often found advisable to take different kinds of seals on the same voyage, or to combine the seal-fishing with the whale-fishing, especially in the Antarctic fisheries.

The principal seat of the hair-seal fishery is off the coasts of Newfoundland and Labrador, the value of the seals taken there exceeding that of the catch elsewhere. Still large numbers of seals are taken in the Gulf of St. Lawrence,



The common seal.

near Nova Zembla and Jan Mayen islands, in the White and Caspian Seas, and on Kerguelen and Heard islands in the South Pacific, as well as at other points in the Antarctic Ocean. The harp-seal (*Phoca grœnlandica*) is, commercially, the most important of the hair-seals, but the hooded seal, or bladder-nose (*Cystophora cristata*), the square flipper (*Erignathus barbatus*), and the Caspian seal (*Phoca caspica*) are all taken in considerable numbers. The southern sea-elephant (*Macrorhinus proboscideus*) in times gone by has furnished an enormous amount of oil. The California sea-elephant (*M. angustirostris*) and the Caribbean seal (*Monachus tropicalis*) have been practically exterminated. Within the last few years some of the large southern seals (*Stenorhynchus*, *Lobodon*, *Leptonyx*) have been taken, but there can hardly be said to be a regular fishery for them, and it is not probable that their capture would long prove remunerative. The most important part of the Newfoundland seal-fishery is carried on by steamers, and these are also employed in the Nova Zembla and other northern fisheries, having practically superseded sailing craft where the seals are taken on the ice-floes at some distance from land. Many seals are still taken near shore by nets or by shooting. Between twenty and thirty steamers are engaged in the Newfoundland fisheries, which also employ not far from 5,000 men, although only for a short time, as the season is from Mar. 10 to May 1. In the most flourishing days of the seal-fishery 8,000 to 10,000 men were engaged. In 1892 the Newfoundland sealers took 390,174 seals, the value of skins and oil being $865,784, but in 1893 the catch was only 129,061 seals. The annual product of the Norwegian fishery is about $300,000. The seals are taken on the floe-ice which drifts down from the north, and the major part are the newly born young, which have never left the ice and are excessively fat. They are killed with clubs, and heaped up on the ice until a pause in the slaughter will admit of their being skinned. The pelt, with the attached blubber, weighs from 20 to 40 lb. Sealskin leather is well known; the oil is used for tanning and lubricating purposes, and for making soap. It varies much in quality, according to the care used in its preparation, but the best is limpid and almost devoid of taste or odor. The sea-elephant is taken chiefly on Kerguelen and Heard islands and the Crozets, but some are killed on Macquarie island by the New Zealand sealers, and other localities are visited from time to time with more or less success, much depending on the length of time they have been left undisturbed. New London, Conn., is the principal port from which the sea-elephant and southern fur-seal fishery is prosecuted, the two being generally carried on by the same vessel. The vessels employed are stout schooners of 75 to 150 tons, well provided with boats, and it is customary to land parties of men on the islands, and leave them to kill the animals and try out the oil, or, in the case of the fur-seals, to salt down the skins. Or, again, as at Kerguelen and Heard islands, the vessels may be anchored in the best harbor obtainable, while the greater part of the crew live on shore. The Antarctic seal-fisheries are very arduous, for the climate is severe and gales are frequent, while at the same time a successful voyage is by no means a certainty.

The fur-seals all belong to the family *Otariidæ*, and the most valuable species is *Caltotaria ursina* of the North Pacific. *Arctocephalus australis* is the most important southern species, but *A. gazella*, *A. pusillus*, and *A. forsteri* are all taken. At present 1,000 to 1,500 skins is a fair season's catch, whereas 50,000, 60,000, or even 100,000 skins were formerly taken by a single vessel. The Pribilof and Commander islands in Bering Sea are the chief seats of the northern fur-seal fishery; in the south the South Shetlands and various small islands in the vicinity of Cape Horn, South Georgia, the South Orkneys, the Crozets, and Lobos islands, near the mouth of the La Plata, are also visited. The last-mentioned locality is under the control of the Argentine Republic, and the killing of seals is there regulated by law. At the Commander and Pribilof islands, whence the main supply of fur-seal skins comes, the number of seals that may be taken annually is fixed by law, and none but the young males are killed. With these restrictions the fur-seals might be preserved indefinitely, but unfortunately the value of the skins has led to the pursuit of the animals at sea, where they are shot from small boats or speared. Owing to the fact that dead seals sink very quickly, about seven are killed for every one secured. By an agreement between Great Britain and the U. S. the use of firearms is prohibited. (See Bering Sea Controversy.) The catch at the Pribilofs has fallen from 100,000 to 7,500, or in 1893, 16,000, while the pelagic sealers took not far from 50,000 skins. See Allen, *History of North American Pinnipeds* (Washington, 1880); *Fisheries and Fishery Industries of the United States* (Washington, 1887); *Fur Seal and other Fisheries of Alaska* (Washington, 1889). F. A. Lucas.

Sealing-wax: See Lac.

Sea-lion: any one of several species of large seals of the family *Otariidæ*. Sea-lions are characterized by the development of harsh hair without under-fur, and the color is yellowish brown in the mature, but in the young reddish brown. Two species occur on the Pacific coast of North America, and are found together in the Bay of San Francisco. One (*Eumetopias stetteri*) is the largest of the family, and attains a length of 11 to 13 feet, while the other (*Zalophus californianus*) is the smallest, and is only 7 to 8 feet long. The zalophus is the ordinary sea-lion of the menageries and zoölogical gardens. It has a slender, dog-like head and a "honking bark or howl," while the eumetopias has a thick, mastiff-like muzzle and a deep bass growl and prolonged steady roar. Other species are *Otaria jubata* of South America, *Arctocephalus hookeri* of the Auckland islands, and *A. tobatus* of the Australian seas. The walrus is sometimes called sea-lion. Revised by F. A. Lucas.

Seal Islands: See Lobos Islands.

Sealkote: See Sialkot.

Sealsfield, Charles (psendonym of Karl Postel): novelist; b. at Poppitz, Moravia, Mar. 3, 1793; entered a monastery and was ordained a priest, but fled in 1822 to Switzerland and thence to the U. S.; edited in 1829 the *Courrier des États-Unis* (New York); after 1832 resided in Switzerland, although he took occasional trips to the U. S. D. at Soleure, Switzerland, May 26, 1864. Under the pseudonym of *Charles Siddons* he published in 1828 *Die Vereinigten Staaten von Nordamerika*, and a few years later he created a sensation in German literature by a series of descriptive novels, the most important of which are *Der Legitime und die Republikaner* (1833); *Der Virey und die Aristokraten* (1835); *Lebensbilder aus beiden Hemisphären* (1835–37); *Deutsch-amerikanische Wahlverwandtschaften* (1838–42); *Das Kajütenbuch* (1840); and *Süden und Norden* (1842–43). Some of these novels were also published in English. J. G.

Seaman: literally, a person who is engaged in the navigation of a vessel on the high seas. This term now, however, has acquired in legal literature the broader signification of any person (usually excepting the master, chief officers, and pilot) employed or aiding in the navigation of vessels, ships, barges, etc., either upon the high seas or upon inland waters. In Great Britain, for the construction of the statutes now regulating merchant shipping, the term seaman is defined to mean "every person (except masters, pilots, and apprentices duly indentured and registered) employed or engaged in any capacity on board any ship." It was formerly required by law in Great Britain that a British ship must have for its officers and crew only British subjects (except in certain emergencies), but now this is not necessary. In the U. S. the statutes require that the master of a vessel must be a citizen of the U. S. in order that the vessel may enjoy the benefits and privileges of a vessel of that country.

Experience has shown that seamen are a class of men who need more protection at the hands of the law than ordinary persons, largely because they are more under the control of others when employed. The regulations affording this protection differ in different countries, but the general intent of them all is to do away with disputes between master and seamen as to the terms of the contract of hiring; to interest the seaman in the success of the attempted voyage, by making their earnings depend upon its termination; and to secure obedience to orders.

Shipping of Seamen.—The U. S. statutes provide for the appointment of shipping-commissioners for ports of entry and of ocean navigation, whose general duties are to facilitate and superintend the engagement and discharge of seamen, and to arbitrate in certain disputes between a seaman and the master or owner of a vessel; and at other ports the duties of a shipping-commissioner are imposed upon the collector of customs. In Great Britain similar officers are provided—the superintendents of mercantile marine offices. In general, the master of every seagoing ship must enter into a formal written or printed contract (the *shipping-articles*) with each seaman of his crew, and these articles must be signed before the proper shipping-officer. They must state the nature and duration and port of termination of the voyage, the number and description of the crew and their respective employments, the amount of wages each seaman is to receive, the capacity in which he is to serve, and the time at which he is to begin work on board; a scale of provisions to be furnished; regulations as to conduct and as to fines, short allowance of provisions, or other lawful punishments for misconduct; and any stipulation as to advance or allotment of wages. In the U. S. the master of every vessel of 50 tons burden or upward plying between States not adjoining must enter into a written contract, which, however, need not be signed before a shipping-commissioner. The statutes making these written contracts obligatory, however, do not make void verbal contracts in the absence of written ones.

Wages of Seamen.—The seaman is entitled to wages and provisions from the time he begins work, or from the date agreed upon for the beginning of work, whichever first happens. In case of loss of vessel wages are due only to the date of loss, and proof that a seaman has not duly exerted himself to save the vessel, cargo, and stores will bar his claim. The right to wages does not depend upon the earning of freight, and becomes a lien upon the vessel and freight, and upon the proceeds of them, in the nature of a preferred claim over bottomry or respondentia bonds. Where freight might have been earned that was not, seamen have a right of action *in personam* against the master or owner of a vessel, and this right is not barred by a proceeding *in rem* against the vessel. A seaman can not forfeit or waive by agreement his lien upon the ship, nor any remedy for the recovery of wages, except by agreement for allotment or advance. A stipulation to abandon the right to wages in case of loss of ship, or any right in the nature of salvage, is wholly inoperative; and any assignment other than advance or allotment made prior to the accruing of wages or salvage is equally void. Wages can not be insured by seamen, nor are they subject to attachment in the courts. Seamen may forfeit their wages, either wholly or in part, by any of the following offenses, viz.: desertion, absence without leave, neglecting and refusing without reasonable cause to join the vessel, willful disobedience or continued willful neglect of duty, willfully damaging the vessel, or embezzling or willfully damaging any of the stores or cargo, and by any act of smuggling whereby loss or damage is occasioned to the master or owner. But upon the commission of an offense for which it is intended to prosecute or enforce a forfeiture, an entry of the offense must be made in the official log-book and signed by the master and by the mate or one of the crew, and the reply of the offender, if still in the vessel, must likewise be entered and signed; which entries must be produced or proved in any subsequent legal proceedings.

Miscellaneous Provisions.—Various other provisions are made by statute regulating the rights and duties of seamen, insuring the seaworthiness of the vessel, a proper supply of provisions and medicines, their return from foreign ports when there discharged, extra wages in case of improper discharge; imposing upon consuls in foreign ports the duty of providing subsistence and a passage to a port in the U. S. for destitute seamen of the U. S.; and providing for

the establishment of marine hospitals and relief funds by collections from the wages of seamen, etc. Seamen must submit to the usual punishments lawful and agreed upon in the shipping articles, such as short allowance, being put in irons, etc.; but flogging has fallen into disuse, and in the U. S. has been abolished by statute.

For a full treatment of the rights and duties of seamen, see the statutes; Maude and Pollock's *Compendium of the Law of Merchant Shipping* (London, 1881); Abbott's *Law of Merchant Shipping* (London, 1892); Kay's *Law of Shipmaster and Seamen* (London, 1875); Parson's *Law of Shipping* (Boston, 1869); Desty's *Revised Statutes of the United States relating to Commerce, Navigation, and Shipping.* See also COURTS for the Admiralty Courts.

Search: See INTERNATIONAL LAW (*Summary*).

Search and Seizure: the examination and taking into custody of one's person or property. The fourth amendment of the U. S. Constitution provides that "the right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized." A similar provision exists in each State constitution. It is declaratory only of common-law principles, which were clearly announced in *Wilkes* vs. *Wood* (19 *State Trials* 1153, A. D. 1763), *Leach* vs. *Money* (*ibid.* 1001, A. D. 1765), and *Entick* vs. *Carrington* (*ibid.* 1030, A. D. 1765). The first two cases decided that a general warrant to seize some person or papers not named was illegal, and the third declared a warrant to seize the papers of a person named to be equally illegal. Lord Camden's judgment in the last case is celebrated for its learning and ability, and is regarded "as one of the permanent monuments of the British Constitution."

Some searches and seizures were permitted by the common law, and do not fall within the constitutional inhibition. They may be resorted to for the recovery of stolen goods, or in the case of excisable or dutiable articles, or in the case of things whose possession or sale is forbidden by law, such as burglars' tools, gambling apparatus, intoxicating liquors, and others, or for the purpose of levying an attachment or execution. Even in such cases, however, the law does not authorize the use of general search warrants, but requires the magistrate to have satisfactory evidence upon oath that a case of the kind mentioned probably exists, and to have a particular description of the place to be searched, and of the persons or things to be seized. The warrant must also name the place and the person or thing to be searched and seized. If an officer attempts to arrest a person under a general warrant, or under one which does not truly name or sufficiently identify him, he may resist the officer, and if the latter makes the arrest, he is liable for false imprisonment. (*West* vs. *Cabell*, 153 U. S. 78.) In some of the States statutes authorize officers to seize intoxicating liquors without a warrant, in the first instance, but the officers are required to obtain promptly a warrant therefor, or they become liable as trespassers. *Weston* vs. *Carr*, 71 Me. 356.

Searches and seizures which are resorted to not for the purpose of capturing stolen property, or that which is under the ban of positive law, or of levying legal process, are deemed unreasonable. Accordingly, a statute providing for the issuing of warrants by judges of insolvency on the complaint of an assignee to search for property of the debtor has been declared unconstitutional. (*Robinson* vs. *Richards*, 79 Mass. 454.) The U. S. Supreme Court held a statute to be unconstitutional which authorized a court, in revenue cases, on motion of the Government's attorney, to require the defendant or claimant to produce in court his private books, invoices, and papers, or else the allegations of the attorney should be taken as confessed. (*Boyd* vs. *United States*, 116 U. S. 616.) The provision was deemed tantamount to a compulsory production of a man's private papers, and to effect the sole object and purpose of search and seizure; hence it was declared to be within the scope of the fourth amendment. The language of Lord Camden in *Entick* vs. *Carrington* was regarded as expressing the true doctrine on the subject of searches and seizures, and as furnishing the true criteria of the reasonable and unreasonable character of such seizures. It was said that the principles laid down in that opinion affect the very essence of constitutional liberty and security. They reach further than the concrete form of the case then before the court; they apply to all invasions on the part of the Government and its employees of the sanctity of a man's home and the privacies of life. It is not the breaking of his doors and the rummaging of his drawers, but the invasion of his indefeasible right of personal security, personal liberty, and private property, where that right has never been forfeited, that constitutes the essence of the offense.

FRANCIS M. BURDICK.

Search-light: See the Appendix.

Searcy: town; capital of White co., Ark.; on the Little Red river, and the Searcy and West Point Railroad; 55 miles N. E. of Little Rock, the State capital (for location, see map of Arkansas, ref. 3–D). It is an important shipping-point for cotton and fruit; has several alum, chalybeate, and sulphur springs, which have made it popular as a health resort; and contains Searcy College, for males (Methodist Episcopal, South), Galloway Female College, Searcy Female Institute, a public school, a State bank with capital of $30,000, and a daily, a monthly, and three weekly periodicals. Pop. (1880) 840; (1890) 1,203; (1900) 1,995.

EDITOR OF "CITIZEN."

Searles, WILLIAM HENRY: civil engineer; b. in Cincinnati, O., June 4, 1837; graduated at the Rensselaer Polytechnic Institute in 1860, where later he was Professor of Topography and Road-engineering for three years. He has been locating and constructing engineer on many railways, and is the author of *Field-engineering* (1879) and *The Railroad Spiral* (1882).

Sea-robin: See GURNARD.

Sears, BARNAS, D. D., LL. D.: theologian and educator; b. at Sandisfield, Mass., Nov. 19, 1802; graduated at Brown University 1825, and at Newton Theological Seminary 1829; was pastor of a Baptist church at Hartford, Conn., 1830–32; was afterward Professor in the Literary and Theological Institution at Hamilton, N. Y. (now Colgate University); studied theology at German universities 1833–36; was professor in Newton Seminary 1836–48, acting as president during the later years; succeeded Horace Mann as secretary of the Massachusetts board of education 1848–55; was president of Brown University 1855–67, and after that time general agent of the Peabody Educational Fund. He was several years editor of the Baptist *Christian Review* (1838, *seq.*), a regular contributor to *Bibliotheca Sacra*, and author (with Edwards and Felton) of *Classical Studies* (1843), *The Ciceronian* (1844), and *The Life of Luther* (1850); edited Nöhden's *German Grammar* (1842), *Select Writings of Luther* (1846), and Roget's *Thesaurus* (1854), and published many addresses, educational reports, and miscellaneous essays. During his stay in Europe he baptized in the Elbe, near Hamburg, by night and stealthily, in order to avoid legal prosecution and police persecution, I. G. Oncken and six others, who formed the first German Baptist church in communion with the Baptists of England and the U. S. D. at Saratoga Springs, N. Y., July 6, 1880.

Revised by C. H. THURBER.

Searsport: town; Waldo co., Me.; on Penobscot Bay; 6 miles E. N. E. of Belfast, the county-seat, 27 miles S. W. of Bangor (for location, see map of Maine, ref. 9–E). It is principally engaged in ice-gathering, ship-building, hay-shipping, and the lumber-trade, and contains saw and grist mills, spool-mill, poultry-farms, the Sears Public Library (opened in 1872), a national bank with capital of $50,000, and a savings-bank. Pop. (1890) 1,693; (1900) 1,349.

Rev. ROBERT G. HARBUTT.

Sea-serpent: a gigantic marine animal, said to have been seen in various localities, but never captured, and regarded by most zoölogists as purely mythical. The earliest references to the sea-serpent are to be found in Norse literature, where frequent mention is made of the Sö-Orin. In 1555 the creature was described by Olaus Magnus in his work *Historia Gentium Septentrionalium*, where its length is set down as 200 feet and girth 20 feet. In 1734 the Rev. Paul

Egede gave a detailed description of a sea-serpent which he saw during a voyage from Norway to Greenland, and in 1746, as related by Bishop Pontoppidan, another was seen by Capt. Lawrence de Ferry, of Bergen, Norway, who made affidavit to the truth of his story. From that time onward the so-called sea-serpent has been reported from various localities, but most often in northern waters, and particularly on the coasts of Norway, Scotland, and New England. Many of these accounts are of a very circumstantial nature and are given by people of unquestioned veracity. Perhaps the most noteworthy is that given by Capt. Peter M'Quhae, of H. M. S. Dædalus, who reported that on Aug. 6, 1849, in lat. 24° 44′ S., lon. 9° 22′ E., he and several of his ship's company saw an object which "was discovered to be an enormous serpent, with head and shoulders kept about four feet constantly above the surface of the sea, and as near as we could approximate . . . there was at least sixty feet of the animal *à fleur de l'eau*. . . . The diameter of the serpent was about fifteen or sixteen inches behind the head, which was, without any doubt, that of a snake. . . . It had no fins, but something like the mane of a horse, or rather a bunch of seaweed, washed about its back." Prof. Owen suggested that the animal seen might have been a stray sea-elephant (*Macrorhinus*), but this Capt. M'Quhae emphatically denied. While there is great discrepancy among the various accounts of the sea-serpent in regard to length, proportions, and general appearance of the creature, yet a certain number of them agree in the following particulars: The length is placed at about 60 feet, the color is given as dark above and light below, the creature is said to have moved steadily with its head and neck above the water, and there were appendages back of the head. These, including the animal seen by Capt. M'Quhae, are explained on the theory that one of the great cuttlefishes known to inhabit the depths of the sea has been seen at the surface with the tail projecting above it, this being taken for the head, as the squid moves tail first by means of a current of water expelled from the siphon. The long arms, dragging along near the surface, would represent the body of the sea-serpent. Basking sharks, schools of porpoises, floating logs, kelp, and seals have been considered the basis for other sea-serpents.

A few scientific men are inclined to believe that there is some huge marine animal which has actually been seen, but not yet captured, even going so far as to suppose the existence of some reptile, like the *Plesiosaurus*, or like one of the immense marine reptiles whose remains occur in the Cretaceous. Oudemans considers that the creature known as the sea-serpent is a huge pinniped, with long neck and longer tail, to which the name of *Megophias megophias* (Rafinesque, Oudemans) belongs. The large majority of zoölogists, however, deny the existence of the sea-serpent *in toto*, and it is to be noted that no naturalist has ever had a view of the creature, and that no one of its bones even has ever come to light.

See *The Great Sea-serpent*, by A. C. Oudemans (London, 1892). This is a monographic work containing a very full bibliography of the literature on the subject, and accounts of the various appearances of the sea-serpent. Also *The Romance of Natural History*, by Gosse (1860); *Sea Monsters Unmasked*, by Henry Lee (1883); *Facts and Fiction of Zoölogy*, by Andrew Wilson. F. A. Lucas.

Seashore (in law): By the Roman or civil law the sea was, like the air and running water, common to all, and consequently not susceptible of private ownership either by an individual or by the state. This principle applied equally to the bed and shore as to the waters of the sea. The common law, however, took a different view. Owing to the splendid development of England's sea power and her confident assertion of civil as well as political jurisdiction over the "four seas" (meaning thereby the Atlantic Ocean, the Irish Sea, the German Ocean, and the British Channel), it became the accepted doctrine of English jurists in the seventeenth century that the bed of the ocean was the property of the crown so far as the royal jurisdiction extended. When this jurisdiction was cut down by modern international law to the three-mile limit the assumed property rights of the crown were reduced to the same dimensions. It is, however, a mooted question whether the property rights of the state are coextensive with this jurisdiction or whether they are bounded by low-water mark on the shore, the latter view having lately come to prevail in Great Britain, while the former has usually been taken in the U. S. *Regina* vs. *Keyn*, 2 Exch. Div. 63; Gould on *Waters*, §§ 1–16.

The divergence between the common and the civil law is more marked, however, as regards the seashore itself and the arms and inlets of the sea within the territorial limits of the state. Where by the Roman law it was expressly provided that the seashore and all rivers and harbors were common to all, and that the public use of the seashore as of the sea itself was part of the law of nations, the common law in the U. S. as well as in Great Britain has always regarded the seashore and the beds of rivers and arms of the sea as subject to private property. This property in the seashore is by the common-law rule vested in the state, but it may by charter or by special grant be conferred upon a municipal corporation or a subject. Thus, for example, the city of New York became vested by the Dongan charter (A. D. 1686) with the fee simple of all the tideway on the circuit of Manhattan Island. The common-law rule is generally followed in the U. S., but in several States (e. g. Massachusetts and Maine), the property of the littoral proprietor extends to low-water mark. In the U. S., moreover, it is the several States and not the Federal Government in which the title to the seashore is vested. It is laid down in the *Institutes* of Justinian (book ii., tit. i., 3) that the seashore extends to the limit of the highest tide in time of storm or winter; but by the common law the seashore is the strip included between ordinary high and low water mark.

The right of private property in the sea, whether it be limited to the shore or be coextensive with the jurisdiction of the state, whether it be vested in an individual or in the state, is always subject to certain public rights of user and enjoyment. The principal of these rights are those of navigation and of fishing, the taking of shellfish either from deep water or from the shore being included under the latter. There is, however, no right to take sand, gravel, or shells, nor to use the shore as a highway, nor to frequent it for the purpose of bathing. There seems to be no distinction between public and private ownership of the shore so far as the exercise of these public rights is concerned, and the state can not, by grant of the shore to an individual, diminish or in anywise affect those rights.

The rights of littoral proprietors as such in the shore differ from those of the public only in the fact that it affords them a means of access to their own lands. This right of access is a valuable property right, and is protected as such by the common law. In New York and New Jersey, however (and perhaps in a few other States), it has been decided that littoral proprietors have no remedy for an infringement of this right of access to navigable waters. Of course, where the littoral proprietor is also the owner of the foreshore his property rights therein are absolute, except only as they are limited by the public rights of user above referred to. It follows from what has been said that a littoral proprietor who does not own the shore is not entitled to build wharves or piers except by the consent of the state, and that such proprietor who does own the shore can not build out beyond low-water mark without such permission; nor can he even under the authority of the state build so as to interfere with navigation. In the former case his act is a *purpresture* or trespass on public property; in the latter a public nuisance, which is not justified by pleading the license of the state. The littoral proprietor, whether owner of the shore or not, is under the doctrine of accretion entitled to the increase of his land by the gradual recession of the sea. If the retreat of the sea be sudden, however, or so rapid as to be perceptible in its progress, the land gained will belong to the state.

The law governing the seashore, as above set forth, is a part of the law of public waters. So much of that law as relates particularly to navigable rivers has been treated under the head of Rivers. See also Lakes. The literature of the subject is extensive and full of curious learning. See especially Hale, *De Jure Maris*; Selden's *Mare Clausum*; Hall on the *Seashore*; Angell on *Tidewaters*; and Gould on *Waters*. George W. Kirchwey.

Seasickness: a nervous affection attended with nausea and convulsive vomiting, produced by the oscillations of a ship at sea. Its origin and nature are still very imperfectly known. It may attack the strong and cautious, while the debilitated and incautious go free. It may attack in calm weather and on smooth waters, while a storm and a rough sea fail to produce it. It may pass away after the lapse of a few hours, or last during a long voyage. Seasickness is probably due to circulatory disturbances in the nerve-centers, possibly to a large extent induced by irregular visual

impressions due to the rocking. In many persons a few mild doses of calomel before the voyage prevent the occurrence of seasickness. In others a little bromide of potash, soda-water, or saline draughts suffice. Persons who are specially liable sometimes escape entirely by preserving a horizontal position during most of the voyage. W. P.

Seaside-grape: a small polygonaceous tree (*Coccoloba uvifera*) of Florida and the West Indies, producing the extract called Jamaica kino. (See KINO.) It has clusters of purple edible fruit, and a beautiful hard wood, which yields a red dye.

Sea-squirt: any one of the ASCIDIA (*q. v.*).

Sea-swallow: See GURNARD.

Seattle, sē-at'l: city; capital of King co., Wash.; on Puget Sound, and the Gt. Northern, the N. Pac., the Columbia and Puget S., and the Seattle, Lake Shore and East. railways; 28 miles N. of Tacoma (for location, see map of Washington, ref. 3–D). It lies on the east side of Admiralty Inlet, between Elliot Bay (salt water) and Lake Washington (fresh water). The contour of the city is hilly, with valleys running N. and S. The steep rise of the hills from the water of the sound presents a striking view, especially when approached in the evening. This is enhanced by two snow-capped ranges, the Olympics on the W. and the Cascades on the S. E., and by Mt. Rainier, rising in the south to a height of 14,444 feet. The city has seven public parks—the City, Denny, Kinnear (each partially improved), Madrona, Leschi, Ravenna, and Woodland—some of which afford scenery of rare natural beauty. The business districts are covered with handsome and substantial buildings, nearly all erected since the great fire of 1889.

Climate.—The summers are cool and pleasant; the rainy season is broken by much good weather; the annual range of temperature is from 10° to 88°; the rainfall in 1893 was 45 inches. A peculiar feature of the climate is that the rainy season is more healthful than the dry season. The death-rate is about 8 in 1,000. Ocean storms spend their force on the Olympic Mountains before reaching the city.

Public Buildings.—The county court-house occupies a prominent site overlooking the city; the county almshouse and hospital is a fire-proof structure which cost over $80,000. The Roman Catholic Church maintains Providence Hospital and the House of the Good Shepherd, a reformatory for girls. There is an efficient board of associated charities. The Public Library (founded in 1872) is supported by a percentage of the criminal fines, and has spacious rooms and a large patronage. Terms of the U. S. circuit and district courts are held here, and a U. S. land-office, U. S. custom-house, U. S. weather bureau, and the board of U. S. inspectors of steam-vessels for Washington and Alaska are located here.

Churches and Schools.—Seattle contains 12 Methodist Episcopal churches, 9 Baptist, 5 Congregational, 5 Presbyterian, 5 Lutheran, 4 Protestant Episcopal, 3 Roman Catholic, 3 Disciples, 3 German Evangelical, 3 Methodist Protestant, 2 Jewish, and one each Advent, Free Methodist, Reformed Presbyterian, and Unitarian, besides a Salvation Army barrack, and 17 missions. The public-school system has a large endowment of State lands. There are 16 public-school buildings (which cost, with land, $673,000), with (1893) 134 teachers and 6,424 pupils; 2 parochial schools, several private kindergartens, and girls' schools. The State University occupies a fine site on 341 acres of school land within the city limits, and has about 500 students and a valuable library, practically public. There are also a Baptist university, Seattle Female College, College of the Immaculate Conception, and the Academy of Holy Names. The Workmen's Guild supports a library. In 1894 there were 3 daily, 16 weekly, a semi-monthly, and ten monthly periodicals.

Finances and Banking.—In 1894 the city receipts were $553,630; expenditures, $591,000; the bonded debt was $3,540.000; the assessed property valuation, $32,752,153; tax-rate, 12·5 mills. There were 7 national, 3 savings, and 5 private banks.

Business Interests.—The manufactories number 331, with $4,758,283 capital invested and $10,203,007 value of product, and include sawmills, a flour-mill, breweries, extensive drain-tile and brick works, foundries, boiler-works and machine-shops, sash and door factories, furniture factories, bookbinderies, tanneries, manufactories of tinware, shoes, crackers, soap, and ice, creosoting works, ship-building yards, etc. There is a large business in the wholesale shipments of fresh fish. There are 91 miles of street-railways, of which 22 miles are cable road and 69 miles electric. These lines are also used for freight. The cable lines run over the highest hills, which are the choice residence districts. Every portion of the city is easily accessible. The commercial advantages of Seattle are remarkable. By water there is regular steamship connection with the Orient, with San Francisco, and Alaska. The railway connections are superior to those of any point on the Pacific coast, four transcontinental lines competing for business, two of which have their terminals in the city. Lumber, grain, and coal are shipped to all parts of the world. The city is the center of trade for all the numerous small steamers, called the mosquito fleet, plying to the ports of Puget Sound, which has about 1,300 miles of coast-line. An immense business in cedar shingles and lumber has been developed, and shipments by rail extend to the Atlantic coast. A company has been formed for the utilization of Snoqualmie Falls by electrical transmission of power. Large sums have been invested in a steel plant. An appropriation has been secured from the U. S. Government to begin the construction of a canal connecting Puget Sound through Lake Union with Lake Washington. The lake is about 25 miles in length, and does not freeze in winter. Vessels scour their bottoms in fresh water and avoid the expense of docking. The lake is surrounded with valuable deposits of coal and iron, and with fine bodies of timber. By the canal a landlocked harbor would be formed of great value to the Government in connection with the dry dock at PORT ORCHARD (*q. v.*). A second company has entered into a contract with the State providing for a second canal S. of the city.

History.—Seattle, named from an Indian chief, was founded in 1852. It remained a village until 1880. An important episode in the early history was the protection of the Chinese by a vigilance league. The city early became the central commercial point for the Puget Sound region. On June 6, 1889, a conflagration destroyed property valued at $15,000,000, but one brick building remaining in the business district. Seattle was the first large city to free its streets of horse-cars. Pop. (1880) 3,533; (1890) 42,837; (1900) 80,671. WALLACE NUTTING.

Sea-unicorn: See NARWHAL.

Sea-urchin: See ECHINOIDEA and PALEONTOLOGY.

Seaver, EDWIN PLINY: See the Appendix.

Seaweeds: the popular name for the plants which grow in the sea, often extended so as to include all aquatic plants, whether growing in salt or fresh waters. They are also known as ALGÆ (*q. v.*), sea-mosses, and sea-ferns (although they are neither mosses nor ferns). In this wide sense seaweeds belong to no less than six different classes of the vegetable kingdom, viz.: (1) *Schizophyceæ*, the fission algæ, mostly microscopic and usually blue-green or smoky green, inhabiting fresh and salt waters; (2) *Chlorophyceæ*, the green algæ, mostly microscopic, green (sometimes obscured by brown coloring-matter), inhabiting fresh and salt waters; (3) *Phæophyceæ*, the brown algæ, including FUCOIDS and KELP (*qq. v.*), mostly of large size, green (but obscured by brown coloring-matter), inhabiting salt waters; (4) *Coleochæteæ*, the simple fruit-tangles, microscopic, green, inhabiting fresh waters; (5) *Rhodophyceæ*, including one order (*Florideæ*), the RED SEAWEEDS (*q. v.*), usually of considerable size, green (obscured by red coloring-matter), inhabiting salt waters; (6) *Charophyceæ*, the STONEWORTS (*q. v.*), mostly large plants, green, inhabiting fresh waters. These plants do not constitute, therefore, a single natural group, although usually so treated. CHARLES E. BESSEY.

Seawell, MOLLY ELLIOTT: See the Appendix.

Sea-wolf: See WOLF-FISH.

Sebaceous Glands: See HISTOLOGY (*The Skin and its Appendages*).

Sebac'ic (also called **Sebic** and **Pyroleic**) **Acid** [*sebacic* is from Lat. *se'bum*, tallow; *pyroleic* is from Gr. *πῦρ*, fire + Eng. *oleine*]: a compound with the empirical formula $C_{10}H_{18}O_4$, formed during the destructive distillation of all fatty bodies which contain oleic acid or olein. Nitric acid forms it also when acting upon fatty bodies, together with oxalic acid and other lower homologues of the same series, or those having the general empirical formula $C_nH_{2n-2}O_4$, a series of which *malonic*, *succinic*, and *suberic* acids are members. Sebacic acid is most readily obtained by fusing together castor oil and caustic potash, 2 parts of oil being slowly mixed with one part of potash, fused with a little water, and heated until the mass is faintly yellow. After boiling

the mass with water and adding hydrochloric acid while hot, sebacic acid crystallizes on cooling in needles. It resembles benzoic acid in appearance, tastes acid, reddens litmus, melts at 127°, and sublimes above this. It is slightly soluble in cold, very soluble in hot water and in alcohol. Its salts, called *sebates*, are bibasic, like oxalates and succinates. Neither sebacic acid nor sebates have obtained as yet any practical application. Revised by Ira Remsen.

Sebal'dus: a saint of the Roman Catholic Church, and the patron of the city of Nuremberg, in Bavaria; was the son of a Danish king; began his studies in Paris when only fifteen years old; married a daughter of King Dagobert, but was released from his marriage-vows the day after the wedding had taken place; spent ten years in the practice of the severest asceticism; was by Gregory II. sent into Germany to preach the gospel, and finally settled in Nuremberg, where he died in 801, or, according to some writers, in 901. The magnificent Church of St. Sebaldus still preserves his memory, and in 1425 Pope Martin V. canonized him on account of the marvels which had been wrought by himself while alive and by his relics after his death. Aug. 19 is his day of commemoration, and is still celebrated in Nuremberg.

Sebaste: See Samaria.

Sebastian, Saint: b. at Narbonne in Gaul about 255; educated at Milan; was a captain in the imperial guard when, under Diocletian, he was seized as a zealous Christian, bound to a tree, and used by the Mauritanian archers as a target. He did not die, however, but having been brought to a Christian home and cured, he was seized a second time, trampled to death, and thrown into a sewer, about the year 287. His body was recognized by the Christians and buried in the Catacombs. Pope Damascus (366–384) built a church over his tomb, relics of him were sent to every corner of Christendom as very powerful against the plague, numerous churches were consecrated to him, and he was generally chosen as patron by associations of archers or riflemen. His feast is celebrated in the Roman Catholic Church Jan. 20, and in the Greek Church Dec. 18. Roman Catholic Church historians ascribe much importance to the *Acta Sancti Sabastiani*, which have been ascribed to St. Ambrose. By Christian art he is generally represented as tied to a tree and pierced by an arrow. Numerous legends, pious fictions, and poems have clustered around his name.

Sebastian: King of Portugal, known as Dom Sebastian; b. in Lisbon in 1554; succeeded his grandfather, John III., in 1557; headed an expedition which captured Tangier, Morocco, in 1574; made another expedition into Africa in 1578, and took part in a civil war supporting the claims of Muley Mohammed to the throne of Morocco against his uncle, Muley Malek. On Aug. 4 he fought the battle of Alcazar, in which he lost his life and a great part of his army. As the king had no immediate heir, Portugal was soon annexed by Philip II. of Spain, but the masses of the Portuguese people refused to believe in the death of Dom Sebastian, and a series of pretenders appeared at intervals for many years, and received some popular support. One of them made a great sensation at Venice, Florence, and Naples twenty years later, was taken prisoner, and according to some accounts hanged at San Lucar, in Spain, about 1600. The belief in the future return of Dom Sebastian continued to exist among the ignorant and superstitious for many years, and gave rise to a considerable literature of poems and romances. See d'Antas, *Les faux Don Sébastien* (Paris, 1865). F. M. C.

Sebastopol: See Sevastopol.

Sebes'ten-plum: the fruit of *Cordia myxa* and *C. latifolia*, Asiatic trees of the family *Borraginaceæ*. The fruit is edible, and was once employed in European medicine. The wood is soft, light, and readily takes fire on friction. It was used by the old Egyptians for mummy-cases. The genus *Cordia* is an extensive and interesting one. Florida has two species, and there are two others in Southern Texas. Revised by L. H. Bailey.

Sebic Acid: See Sebacic Acid.

Secanderabad' (properly *Sikanderabad*, Alexander's town): town; in the Nizam's Dominions, India; 5 miles N. E. of Haidarabad (see map of S. India, ref. 4–E). It is a British military cantonment. European troops were first stationed here in 1803. Pop. (1891) about 75,000.

Secchi, sek'kĕe, Angelo: astronomer; b. at Reggio, Lombardy, Italy, July 29, 1818; entered the order of the Jesuits in 1833; studied mathematics, physics, and astronomy; went to the U. S. in 1848, and taught mathematics at the college of Georgetown, D.C.; was appointed director of the observatory of Rome in 1849, and devoted himself to researches in meteorology and spectrum analysis. Besides about 300 papers he wrote, among other works, *Le Soleil* (Paris, 1870), which has been translated into the principal European languages. On the expulsion of the Jesuits from Italy in 1870, Secchi retained his office. D. in Rome, Feb. 26, 1878.

Secession [from Lat. *seces'sio*, deriv. of *sece'dere*, withdraw; *se-*, aside + *ce'dere*, go]: any withdrawal from a political or religious organization. The word has acquired lasting notoriety by being used to describe what was claimed to be the right of a State included under the Constitution of the U. S. to withdraw from the Union and set up an independent government. The way was prepared for broaching and exercising this so-called right by the theory of Nullification (*q. v.*) advanced by South Carolina and some of the people in other States. The tariff law of 1828 was declared by South Carolina to be "null, void, and no law," and duties on imports were forbidden to be paid after a certain day within its jurisdiction. Gen. Jackson, then President, felt that such a power lodged in a State would be a deathblow to the Union and altogether unconstitutional. His energetic opposition and the message on nullification in 1833 put a stop to this political heresy for the time, but only postponed the day of final test. The doctrine was that every State has a right to interpret the Constitution for itself, whatever be the decision of the Supreme Court on the subject, and, so interpreting, to retire from the Union. Hence there is no right to force it to return. This is really a plan to couch under the term *nullification* the extreme act which denies that the "Constitution, and the laws of the United States which shall be made in pursuance thereof . . . shall be the supreme law of the land," and that "the judicial power of the United States shall extend to controversies to which the United States shall be a party," and that the judges in every State are bound thereby. (Art. III., § 2; Art. IV., § 2.) The doctrine assumed practical form after the election of President Lincoln in 1860, when it was claimed on the part of many of the people in the South that the triumph of the Republican party meant the adoption of a policy of such interference with the domestic institution of slavery as to make it impossible for the Southern States any longer to secure and enjoy their constitutional rights within the Union. They accordingly attempted to withdraw from the Union by passing ordinances of secession and resisting the enforcement of U. S. law. For an account of the war, and of events connected with it, see the articles on Confederate States, Democratic Party, Republican Party, Hartford Convention, Foote's Resolution, and Nullification.
Revised by C. K. Adams.

Secession Church of Ireland: See Presbyterian Church (*Some of the Existing Presbyterian Churches*).

Seck'endorf: the name of a family of German nobility, which can be traced back to the middle of the thirteenth century, and still flourishes in various branches. Several of its members have become celebrated in German literature and history: (1) Veit Ludwig von Seckendorf, statesman and author; b. near Erlangen, Dec. 20, 1626; studied law and history at the University of Strassburg; held various important positions in the service of the Duke of Gotha, the Duke of Saxony-Zeitz, and the Elector of Brandenburg. D. at Halle, Dec. 18, 1692. He was the author of *Der deutsche Fürstenstaat* (1655) and *Commentarius historicus et apologeticus de Lutheranismo* (1692), in their time very famous books.—(2) Friedrich Heinrich, Count von Seckendorf, soldier and diplomatist; a nephew of the preceding; b. at Königsberg, Franconia, July 5, 1673; studied law at Jena, Leipzig, and Leyden; served in the Austrian army against the Turks on the Danube, and in the war of the Spanish Succession took part in the negotiations at The Hague, which resulted in the Peace of Utrecht (1713), and held an important command in the Saxon-Polish army against the Swedes. As Austrian ambassador to several German courts he worked to secure the recognition of the Pragmatic Sanction. In the war of the Polish succession he commanded a force of 30,000 men, and defeated the French at Klausen (1735). After the death of Prince Eugene (1736) he was made commander-in-chief of the Austrian army against the Turks, but was defeated, recalled, accused of treason, imprisoned in the fortress of Gratz, and liberated only after much difficulty. He then entered the service of

Charles II. of Bavaria, who, after the death of Charles VI., laid claim to parts of the Austrian heritage, in spite of the Pragmatic Sanction, and was elected emperor under the name of Charles VII.; commanded his army with success; expelled the Austrians from Bavaria, and succeeded in negotiating a tolerable peace for his son in 1745. After this time he lived quietly on his estate, Meuselwitz, near Altenburg, in the Saxon duchies, but in 1758 he was imprisoned by Frederick II. for six months, and forced to pay a heavy fine. D. at Meuselwitz, Nov. 23, 1763.—In the nineteenth century several members have acquired a name as poets: (3) Leo (1773–1809); (4) Karl Siegmund (1744–85), translator of Camoëns; (5) Christian Adolf (1767–1833); (6) Gustav Anton (1775–1823), known also in the U.S. as a lecturer under the name of Patrik Peale. F. M. Colby.

Second Advent: the visible reappearance of our Lord in the world since his ascension to heaven. More exactly, inasmuch as he revisited the world visibly to call the apostle Paul, the second advent denotes a return visible to all the world, or to the whole Church, or to an elect first-fruits of the Church. The first and the third opinion represent two schools of Christian belief. Beyond question, our Saviour himself promised to return visibly. Even assuming (Matt. xxiv., Mark xiii., Luke xxi.) to give his promise intermixed with later interpretations, the unmistakable foundation is a word of his own, which, moreover, is implied throughout the four Gospels, including John (see John v. 25, 28; vi. 39, 40; xiv. 3, 18), and throughout the Epistles of Paul, Peter, John, James, and Jude. The Revelation is full of it. Indeed, next to the Messiahship of Jesus, it has well been called the first Christian doctrine.

In the Gospels our Saviour seems to identify his coming with the fall of Jerusalem. When an evolving event includes many stages, even though widely apart in time, prophecy very commonly blends these in one, inasmuch as the subsequent stages are only an explication and amplification of the first. As has been truly said, prophecies of fundamental import have a springing and germinant fulfillment in every age. The prophecies of the first advent show the same blending of imperfect fulfillments, in which God came near to his people with the consummate fulfillment, in which God, though unrecognized, was with his people. Even so, as the fall of Jerusalem released Christ in his Church from the threatening constraint of Judaism and set him and her free for their victorious course in the world, it was a true and indeed visible return of Christ, with which he therefore fuses every fuller accomplishment of his promised return, even to the consummate fulfillment at the end. He himself, as incarnate, denies of himself any other than a restricted knowledge of times and seasons, which implies a restricted knowledge of specific phases of evolution in the Parousia, or second advent. Only two things are distinct: One, that everything which he foretells shall, in a real sense, come to pass in that generation; secondly, that his coming may be, in its absolute and final sense, long delayed, giving occasion to despondency in some of his people and to licentious security in others. This fusion of different stages of the Parousia is the more obvious, as Christ's visible return is only the highest, coercive evidence of his spiritual return, sight being used as the most convincing and most spiritual bodily sense.

The Revelation alone of the New Testament books describes the second advent as separated by an earthly reign of 1,000 years from the last judgment and reconstitution of all things. Accordingly, since A. D. 200 until of late, this opinion has never had much currency in the Church. It seems to be regaining ground. C. C. Starbuck.

Secondary Era: a division of geologic time co-ordinate with Primary, Tertiary, and Quaternary eras. A synonym in more general use is Mesozoic Era (*q. v.*).

Secondary Schools: See Schools.

Secretary: in the U. S., the name of the officer of the cabinet, the respective heads of the executive departments of State, War, Navy, the Treasury, the Interior, and Agriculture. For an account of their duties, see the articles on these departments.

Secretary-bird: a bird of prey (*Gypogeranus serpentarius*), which owes its popular name to a crest of feathers at the back of the head which suggests a pen tucked behind the ear of a scribe. On account of anatomical peculiarities the bird is placed in a distinct family (*Gypogeranidæ*). The secretary-bird is readily distinguished from all other birds of prey by the disproportionate length of its legs, for while the body is smaller than that of a golden eagle, the legs are 2 feet long. The toes are short, nails blunt; the general color is grayish blue, with blackish markings on wings, tail, and under side. The bird feeds on rats and snakes, even on the venomous species, grasping them with its long legs and using its outstretched wing as a shield on which to receive the fangs of its prey. It is found throughout Southern Africa, W. of lat. 15°, and in Cape Colony is protected by law. F. A. Lucas.

Secret, Discipline of the: an English equivalent of Arcani Disciplina (*q. v.*).

Secretion [from Lat. *secre'tio*, a setting apart, separating, deriv. of *secer'nere*, separate; *se-*, apart + *cer'nere*, distinguish, separate]: one of the chief physiological processes of the body; the separation of certain elements of the blood, and their elaboration to form special fluids, termed secretions and excretions. Both of these products contribute to the health and nutrition of the body, the secretion performing some positive function, as aiding digestion; the excretion subserving the same purpose negatively by freeing the system of effete matter, the *débris* of cell and tissue, which if detained in the blood develops disease. The function of the perspiratory and sebaceous glands is secretory, so far as they preserve the moisture and delicacy of the skin, but is chiefly excretory, eliminating water and various effete matters from the system, and hence is classed as an excretion. Bile is variously defined as a secretion, an excretion, and as both, its constituents being effete substances deleterious to health if not promptly excreted, yet performing an important part in the process of intestinal digestion.

Secretion is performed in several ways. The simplest form is seen in the serous shut sacs which invest the lungs, heart, and intestines—the pleuræ, pericardium, and peritoneum. These are lubricated by a fluid which filters directly through the flat endothelial lining cells from the blood-vessels beneath; so also are produced the synovial fluids on the inner smooth surfaces of the joints. A more typical secretory structure is the *tubule*, a cylindrical recess or tube at right angles to the surface, lined with secreting cells. Secreting surfaces, as the mucous lining of the bronchial tubes, stomach, and bowels, have many hundreds or thousands of such tubules to the square inch. An isolated group of tubules ramifying from a single central duct constitutes a simple gland; a number of such groups having a common duct is a compound gland; the larger glands, composed of an extensively divided tubular system with corresponding lobules, are termed racemose glands—that is, in structure resembling a cluster of berries. Such complicated glandular structures serve merely to multiply secreting surface within a limited space; the functional action is much the same whether performed on the free surface, in the tubule and follicle, or by the multiple gland. Secretion is the product of cell-activity. The cell derives its material from the blood, its stimulus to action from the nervous system, and it elaborates a peculiar fluid, in each instance predetermined by the inherent function of the gland or organ of which it is an integral part. Secreted fluids are homogeneous, consisting chiefly of water with variable quantities of salts and fatty matter, and in each case a distinguishing component, as pepsin in gastric juice and mucin in mucus.

Secular Clergy: See Clergy.

Secular Games [translation of Lat. *ludi sæculares* (also known as *ludi Terentini*); *ludi*, plur. of *lu'dus*, game + *sæcula'res*, plur. of *sæcula'ris* (whence Eng. *secular*), of a century, deriv. of *sæ'culum*, century]: games celebrated in ancient Rome in honor of the infernal deities Dis and Proserpina. The festival seems to have been of Etruscan origin, and to have been connected with a belief in the existence in the life of the state of great periods whose beginning and end were marked by special portents from the gods. Such a period was supposed to be equal to the longest human life, and was variously computed at 100 and 110 years. Owing to the different modes of reckoning, the games were not held at regular intervals. The first well-attested instance of their celebration at Rome was in 249 B. C. Secular games were again held in 146 B. C., and under the empire in 17 B. C., and in 47, 88, 147, 204, 248, and 262 A. D. An inscription has recently been discovered giving an account of the celebration of the games under Augustus in 17 B. C.; it was for this occasion that Horace wrote his *Carmen sæculare*.

G. L. Hendrickson.

Secularism [deriv. of *sec'ular*, from Lat. *sæcula'ris*, deriv. of *sæculum*, race, generation, age, the times, the world]: an ethical and social movement organized in England in 1844. Its most prominent leader during its earlier stages was George Jacob Holyoake, who for several years was president of the London Secular Society. He was succeeded in 1858 by Charles Bradlaugh, who, when the Secularists formed a national society, became its president and remained so for more than twenty years. Under his direction the movement became more aggressively anti-theological than it had been under Holyoake. His pseudonym, *Iconoclast*, expressed the temper of the man and of the movement as inspired by him. The idea of Holyoake is better embodied by the societies for ethical culture than by the secular societies. That idea was that ethical and social good is "the chief end of man," and that this end is not helped, but rather hindered, by theological and especially supernaturalist considerations relating to God and a future life. Belief in these was no bar to admission to the societies, but practically those attracted were intellectually agnostics, and tended to be dogmatic atheists under the Bradlaugh *régime*. In other particulars there was change as time went on. The political elements became more strongly marked, the social and industrial less so. As an earnest apostle of co-operation, Holyoake always insisted on that as the method of social regeneration, but being equally a disciple of Thomas Paine politically and of Robert Owen socially, the tendencies of his societies to become democratic and republican clubs were unmistakable. Under Bradlaugh this tendency became more evident. The National Society of Secularists has made a declaration of principles, which makes its objects clear, and the means and methods by which they are to be attained. It declares the promotion of human improvement and happiness to be the highest duty; that theological teachings are obstructive of the same; that every individual should be well placed and instructed and usefully employed for his own and the general good; that civil liberty and religious liberty are necessary, and that every Secularist is bound to actively attack all barriers to equal freedom of thought and utterance for all upon political and theological subjects. Much of the energy of Bradlaugh and of the society under his direction was in the spirit of this final clause. The same declaration of principles sets forth the objects of its political and social agitation: Secular education; disestablishment and disendowment of the state Church; improvement of the condition of agricultural laborers; such change in the land laws as will give the laborer an interest in the soil; abolition of the House of Lords and substitution of a national senate with life-members; investigation of the causes of poverty and plans for its amelioration. On several of these lines the national society and its local branches have done excellent service. The opposition to the state Church has been more economical than theological.

Secularism must be distinguished from agnosticism, which is merely an intellectual temper that does not admit of either theological affirmation or denial, while secularism, though involving this temper largely, is nothing if not practical. Compared with the ethical culture of Dr. Felix Adler and his school, that is the more subjective, this the more objective; that insisting that good character and right conduct are central to all effective social reform, secularism looking to the social reform, the improvement of circumstances, for the development of character. Secularism has been called by an English clergyman of the Established Church "the religion of doubt." "It does not," he says, "necessarily clash with other religions; it does not deny the existence of God or even the truth of Christianity; but it does not profess to believe in one or the other." This, however, is more secularism in the abstract, and as it was in the original hope and dream of Holyoake, than as it has been practically in the course of its development. It has "clashed with other religions" in a very lively fashion. If the temper of Holyoake could have dominated it always it might perhaps have done better service. That it has done good service in many ways is not denied by those to whom its agnostic and atheistic elements are most deplorable.

JOHN W. CHADWICK.

Secularization: the process of converting objects from a religious or spiritual to a common or secular use, and of removing matters from a purely ecclesiastical control to the civil jurisdiction. During the epoch when the Church had attained its highest degree of power its interference with secular matters extended in every direction, but was most distinctly exhibited in connection with certain special subjects, the control of which it has ever struggled to retain. Vast quantities of lands had gradually accumulated in the hands of the religious houses, and all the most valuable estates of Europe were likely to fall into their ownership. From the time of Constantine the Church had jurisdiction over certain subjects of the utmost consequence to society, the most important of which were marriage, divorce, and the succession of decedents' estates. Education in all its grades and departments was intrusted exclusively to the Church. The progress of secularization has nearly destroyed these spiritual interferences with civil affairs in many countries of Europe and America, and has greatly narrowed their extent in all the others. The first impulse of this grand movement was naturally directed against the threatened monopoly of land. At an early day statutes were passed in England and on the Continent prohibiting the acquisition of lands by religious corporations; and this policy has continued to the present day. (For a description of these enactments, their design and effect, see the article MORTMAIN.) In addition to this system of restraint, the accumulated possessions of the ecclesiastics and the spiritual houses have sometimes been seized by the civil authorities and appropriated to secular uses. The most remarkable instances of such enforced changes occurred in England under Henry VIII., in Scotland at the Reformation, and in France during the Revolution. The Italian and the Mexican Governments have, in the nineteenth century, pursued a similar policy. The nineteenth century also has seen important alterations in the law of matrimony. In Great Britain, France, Italy, Prussia, Austria, and several other European states, marriage has been made wholly a civil contract and status, divorce is regulated by statute, and both are placed under the jurisdiction of the ordinary tribunals. The same steps had before been taken in reference to successions. So far as education is public or is supported at the public expense, the course of modern legislation in Great Britain, France, Italy, and Germany favors a control by the state, and not by the Church. It is in the U. S., however, that the theory of secularization has had the fullest scope, and has been worked out most thoroughly and consistently. The fundamental conception of the state contained in the organic law confines the Church to functions purely spiritual and religious; the Church itself, as a spiritual society, has no legal existence, and is not recognized by the law, and all the separate congregations or parishes are in all respects civil and lay corporations. Marriage, divorce, and all other relations, domestic or social, successions and all other matters connected with property, are of course under the exclusive dominion of the civil government. A few traces are still left of ecclesiastical influence and privilege, but are the objects of frequent attacks. The removal of all distinctively religious instruction from the common schools, with the consequent secularizing of the public educational system, and the repeal of all laws which exempt ecclesiastical property from taxation are strongly advocated.

Revised by F. M. COLBY.

Secun'dus, JOHANNES (*Jan Nicolai Everaerts*): poet; b. at The Hague, Nov. 14, 1511; studied law at Bruges, but devoted himself chiefly to poetry, painting, and sculpture. In 1533 he went to Spain and became secretary to Cardinal Tavera, Archbishop of Toledo. On his return to the Netherlands he was employed as secretary by the Bishop of Utrecht, in which city he died Sept. 24, 1536. His best-known work is *Basia* (Utrecht, 1539), consisting of amatory poems. His *Opera Poetica* was published by his brother (Paris, 1541).

Secundus, PUBLIUS POMPONIUS: a Roman poet who flourished in the reigns of Tiberius, Caligula, and Claudius. He was an intimate friend of Sejanus; and when the favorite fell he was thrown into prison, in 31 A. D., and not released until the accession of Caligula in 37. In 44 he was consul, and in 50 he was sent by Claudius as legate to Germany, where he defeated the Chatti and obtained the honor of triumphal ornaments. It was by his tragedies that Secundus acquired the most celebrity. Tacitus speaks of them in the highest terms, and so does Quintilian. The elder Pliny, who was an intimate friend of his, wrote his *Life* in two books. The few fragments of the works of Secundus which have been preserved hardly suffice to give an idea of his style.

Securities: See the Appendix.

Seda'lia: city; capital of Pettis co., Mo.; on the Mo., Kan. and Tex. and the Mo. Pac. railways; 95 miles E. of Kansas City, 188 miles W. of St. Louis (for location, see map

of Missouri, ref. 4–F). It was laid out by Gen. G. R. Smith from a part of his farm in 1861, was a U. S. military post during the war of 1861–65, and for several years was the west terminus of the Mo. Pac. Railway. Gen. Nathaniel Lyon and Gen. John C. Frémont fitted out military expeditions here in 1861, and for a few days in 1864 the city was held by Confederate troops. The city has an elevation of 986 feet above sea-level, and is in an agricultural, coal-mining, and limestone region, which has also beds of emery and potter's clay, and indications of iron, lead, and zinc. Sedalia contains 23 churches, 13 public schools, a high-school building that cost $40,000, George R. Smith College, public library with over 10,000 volumes, court-house (erected in 1884, cost $115,000), new U. S. Government building, 3 national banks with combined capital of $300,000, 2 State banks with capital of $350,000, 10 building and loan associations, and 3 daily, 7 weekly, and 2 monthly periodicals. The locomotive-shops of the Mo. Pac. Railway and the general offices and car-shops of the Mo., Kan. and Tex. Railway are located here. There are also flour-mills, iron-foundry, woolen-mills, machine-shop, agricultural-implement works, brewery, grain elevator, and carriage and broom factories. Pop. (1880) 9,561; (1890) 14,068; (1900) 15,231. THOMAS SEDDON.

Sedan, Fr. pron. *se-dañ'*: town; in the department of Ardennes, France; on the Meuse; 64 miles by rail N. E. of Rheims (see map of France, ref. 2–H). It contains an arsenal and several magazines, and was at one time a place of great military importance. It has manufactures of cloth and other kinds of woolen fabrics. Metal-working is also carried on. The Protestants had here a flourishing academy, which was closed by the revocation of the Edict of Nantes in 1685. On Sept. 2, 1870, Napoleon III. and his whole army of 86,000 men surrendered here to the King of Prussia. Pop. (1896) 20,163.

Sedan-chair: a portable vehicle differing from the litter and the palanquin in that the traveler is carried in a sitting posture by two men. The sedan-chair took its name from Sedan in France, where it was invented, but it had long been employed in Eastern countries, notably in India and China. It was first seen in England in 1581.

Sedatives [from Lat. *seda're*, *seda'tus*, make sit, settle, compose, calm]: a term somewhat loosely employed in medical parlance to designate agents which are soothing or actually anæsthetic over the sensory function, or which in relation to various motor functions tend to diminish activity. Aconite, hemlock, and chloroform are thus called sedative—the first, because it lessens the force and frequency of the heart's beats; the second, because it paralyzes the voluntary muscular system; and the third, because it is a general paralyzer of the cerebro-spinal functions. From these examples it is obvious enough that there is no group of allied agents to which the general term sedative can apply; and where used in relation to special paralyzing power the latter term is far more accurate and expressive.

Sedge Family: the *Cyperaceæ*; a group of grass-like, monocotyledonous, herbaceous plants, numbering 2,500 to

FIG. 1.—A sedge (*Carex umbellata*) reduced, with enlarged perigynium and bract at left, and pistil and transverse section at right.

3,000 species. Their stems are usually solid and three-angled, and their leaves three-ranked, with closed sheaths. The flowers are greatly reduced from the lily type, having three stamens (rarely more) and a one-celled ovary with two or three carpels, which contains a single basifixed, anatropous ovule, the latter developing into a free seed. The perianth is wanting, or at most rudimentary, and the plants are often monœcious or diœcious.

FIG. 2.—Papyrus (*Cyperus papyrus*).

Sedges are common in all parts of the globe and are particularly abundant upon low and wet lands. They are usually not so nutritious as the grasses, but constitute a large proportion of the coarse hay which is cut from wet meadows. The largest genera of the family are *Cyperus* (containing from 400 to 500 species), *Fimbristylis* (200), *Scirpus* (200), *Rhynchospora* (150), *Scleria* (100), and *Carex* (500). See the articles CAREX, CYPERUS, and PAPYRUS. CHARLES E. BESSEY.

Sedgemoor: a wild region of Somersetshire, England, extending S. E. from Bridgewater. On July 6, 1685, the Duke of Monmouth, son of Charles II. of England by Lucy Walters, was defeated here by the army of James II. under the Earl of Faversham. The duke was taken prisoner, and executed July 15, 1685. See Macaulay's *History of England*.

Sedgwick, ADAM, LL. D., F. R. S.: geologist; b. at Dent, Yorkshire, England, in Jan., 1786; graduated at Cambridge 1808; became fellow of Trinity College 1810; took orders in the Church of England 1817; was appointed Woodwardian Professor of Geology at Cambridge 1818; chosen fellow of the Royal Society 1819; became proctor of the university 1827; president of the Geological Society of London 1829–31; received the Copley medal of the Royal Society 1863. D. at Cambridge, Jan. 27, 1873. His geological studies covered wide areas in continental Europe as well as Great Britain, but the older sedimentary rocks of England and Wales were his special field. In classifying these he first announced the Cambrian as a system below the Silurian; and a question as to the position of the line separating the two systems occasioned a long controversy with Murchison, involving much bitterness and personal feeling. He was an active opponent of the doctrine of evolution. His works consist chiefly of reviews, lectures, addresses, and memoirs, scattered through the publications of learned societies, the most important separate essays being a *Discourse on the Studies of the University of Cambridge* (1834; enlarged ed. 1850) and a *Synopsis of the Classification of the Palæozoic Rocks* (1855). See CAMBRIAN PERIOD, and consult Geikie's *Memoirs of Sir R. Murchison* (1874) and Hunt's *Chemical and Geological Essays* (1875).

Sedgwick, CATHARINE MARIA: author; daughter of Judge Theodore Sedgwick; b. at Stockbridge, Mass., Dec. 28, 1789; undertook after her father's death (in 1813) the management of a private school for the education of young ladies, and continued in that employment fifty years. She published her first work of fiction, *A New England Tale*, in 1822, the success of which decided her to continue the career of authorship; brought out *Redwood* (2 vols., 1824), which was reprinted in England, translated into French, Italian, German, and Swedish, and compared favorably with the novels of Cooper, to whom, indeed, it was attributed in the French version; and was the author of other popular works, including *The Traveller* (1825); *Hope Leslie, or Early*

Times in Massachusetts (2 vols., 1827), reputed her best work; *Clarence, a Tale of our Own Times* (1830); *The Linwoods* (1835); *The Poor Rich Man and the Rich Poor Man* (1836); *Live and Let Live* (1837); *Means and Ends, or Self-Training* (1838); *Stories for Young Persons* (1840); *Letters from Abroad to Kindred at Home* (1841); *Morals and Manners* (1846); *Facts and Fancies* (1848); *Married or Single?* (1857); and *Letters to My Pupils* (1862). D. near Roxbury, Mass., July 31, 1867. See her *Life and Letters*, by Mary E. Dewey (New York, 1871).

Sedgwick, John: soldier; b. at Cornwall, Conn., Sept. 13, 1813; graduated at the U. S. Military Academy in July, 1837; served as first lieutenant in the war with Mexico, winning the brevets of captain and major for gallantry; was successively promoted major, lieutenant-colonel, and colonel of cavalry, and in Aug., 1861, was commissioned brigadier-general U. S. volunteers. He distinguished himself in the battles of Fair Oaks (May 31), Savage Station (June 29), and Glendale (June 30). Appointed major-general of volunteers, to date from July 4, 1862, he commanded a division at Antietam, where he was severely wounded three times and disabled until December, when he was placed in command of the Ninth Corps. Transferred to the command of the Sixth Corps Feb., 1863, he occupied Fredericksburg May 3, and stormed Marye's Heights in the rear of the town. His advance to join the main army at Chancellorsville was checked at Salem Heights on the afternoon of May 4, and only by great skill and hard fighting was he able to hold his ground during the next day, withdrawing after dark across the Rappahannock. In the Pennsylvania campaign of 1863 the Sixth Corps formed the right wing of the army following the movements of Lee, and on the evening of June 30 encamped at Manchester, upward of 35 miles from Gettysburg. The events of July 1 demanded the hasty concentration of the army, and before 2 P. M. of July 2 Sedgwick reached the field with his corps, having made the march of 35 miles in twenty hours. The corps was at once engaged, as also in the third day's fight and pursuit of the enemy, July 5. At the battle of Rappahannock Station (Nov. 7), he commanded the right wing of the army, composed of the Fifth and Sixth Corps, as in the "Mine Run move" (Nov. 26–Dec. 3). Continuing in command of the Sixth Corps, he was conspicuous in the battle of the Wilderness (May 5–6, 1864), as in the battle of Spottsylvania (May 9), where he was killed by a bullet from a sharpshooter while directing the placing of some artillery. A monument wrought of cannon captured by the Sixth Corps was erected to his memory at West Point in 1868.

Sedgwick, Robert: soldier; b. in England about 1590; an early settler at Charlestown, Mass.; had been a member of the Artillery Company in London: aided in founding the Ancient and Honorable Artillery Company 1638; was its captain 1640; became colonel of the Middlesex regiment 1643, and commander of all the militia of Massachusetts 1652; went to England; was employed by Cromwell to expel the French from Penobscot 1654; took part in the West India expedition 1655; was appointed one of the commissioners to govern Jamaica, and in 1656 was made major-general. D. in Jamaica, May 24, 1656. With John Winthrop, Jr., he established the first iron-works in New England 1643–44.

Sedgwick, Theodore: law writer; b. at Albany, N. Y., Jan. 27, 1811; graduated at Columbia College 1829, and (like his father and grandfather before him, both named Theodore) took up the study of law, being admitted to the bar May, 1833; was *attaché* to the U. S. legation at Paris 1833–34, under the U. S. minister, Edward Livingston; practiced law in New York 1835–50; was president of the New York Crystal Palace Association 1852; and became U. S. district attorney Jan., 1858. He was offered the mission to Holland in 1857, and twice offered the office of Assistant Secretary of State, but declined both. D. at Stockbridge, Mass., Dec. 8, 1859. Besides numerous legal and political articles contributed to periodicals, he edited the political writings of William Leggett (2 vols., New York, 1840); wrote a *Memoir* of his great-grandfather, Gov. William Livingston (1833); *Treatise on the Rules which govern the Interpretation and Application of Statutory and Constitutional Law* (1857; 2d ed. 1874); a *Treatise on the Measure of Damages* (1847; 8th ed. 1891), which last work is an enduring monument to his legal learning and sound judgment.

F. Sturges Allen.

Sedimentary Rocks: See Geology and Rocks.

Seduction [from Lat. *seduc'tio*, deriv. of *sedu'cere*, *seduc'tum*, lead astray, seduce; *se-*, aside + *du'cere*, lead]: the enticement of a servant from the master to the latter's legal damage. At present it is applied chiefly to the enticement of a female servant to unlawful sexual intercourse with the seducer. In contemplation of law this wrong is not against the relation of parent and child, although the plaintiff is ordinarily the father of the seduced person, but against the relation of master and servant. Accordingly, a parent can not maintain an action for the seduction of his daughter, unless he can show, in Great Britain, that she was in his actual service, or, in the U. S., that he had the legal right to such service. Having established this fact, however, he is allowed to recover as damages, not only the pecuniary loss he has sustained as master, but such compensation as the jury may give for injury to the plaintiff's feelings, and such amount as they may award for the punishment of the defendant. In returning the damages in a particular case, the jury has a right to take into account the social and pecuniary condition of the parties, and the conduct of the seducer and seduced.

As the wrong in question is against the relation of master and servant, a recovery can not be had unless legal damage to the master is proved. Such damage exists whenever the seduction of the daughter is accompanied by loss of service, as where the daughter was enticed to remain away from home nine days with her seducer (*Evans* vs. *Walton*, Law Reports, 2 Common Pleas 615), or where loss of service follows as the proximate result of the wrong, as in cases of pregnancy, sexual disease, or the infliction of bodily injury. If loss of health is caused by mental suffering produced by abandonment on the part of a seducer, or shame consequent on exposure, it is considered too remote to amount to legal damage. *Abrahams* vs. *Kidney*, 104 Mass. 222.

While the action for the seduction of a daughter is generally brought by the father, it may be brought by the mother in case she sustains the legal relation of master to the child, as it may be by any other person who occupies that relation. In the absence of statute, the seduced female can not bring an action for this wrong, as it was inflicted with her consent, although the consent might have been obtained by fraudulent promises. *Hood* vs. *Sudderth*, 111 N. C. 215 *contra*.

In most of the U. S. the seduction of a woman of previous chaste character is a statutory crime. Many of the statutes require that the seduction shall be accomplished under promise of marriage. Some limit the offense to unmarried females, and provide that no conviction shall be had upon the uncorroborated testimony of the seduced person. The subsequent intermarriage of the parties is often made a bar to a criminal prosecution.

Francis M. Burdick.

Sedu'lius: a Christian poet of the fifth century, who was at the height of his fame in the reign of Theodosius II. and Valentinian III. (425–450). He composed in epic verse a biblical narrative in five books, entitled *Paschale carmen*, book i. being occupied with the miracles of the Old Testament, books ii.–v. with events from the Gospels, treated with greater freedom and originality than the same subject by Juvencus. The work is dedicated to a presbyter, Macedonius, at whose request the writer made a prose version of the work, also extant in five books, *Paschale opus*. Sedulius also wrote an alphabetical hymn, *Abecedarius*, in honor of Christ, in iambic dimeters, in which there is a marked attention to accent and rhyme, and an elegiac poem in which each pentameter ends in the same words with which the preceding hexameter begins (*Epanalepsis*). The best edition is by J. Huemer (Vienna, 1885). See Manitius, *Geschichte der christ-latein. Poesie*, pp. 303–312 (Stuttgart, 1891).

M. Warren.

Sedum: a genus of crassulaceous plants, mostly perennial, and natives of northern temperate and cold regions. The flowers have a four or five lobed calyx, four or five petals, twice as many stamens, and four or five ovaries, each with a small scale at the base. The stems and leaves are fleshy and succulent, and the flowers are cymose and usually white, yellow, or pink. Many of the species are very persistent of life, flowering even from cut stems, as the orpine, live-forever, or live-long (*Sedum telephium*), with purple flowers, and somewhat used as a diuretic. The English wall-pepper (*S. acre*), with yellow flowers, cultivated in the U. S., is known there as golden-moss or love-entangle, and is cathartic and emetic. The name stonecrop is given because of the rocky habitat of many.

See, Horace: naval engineer and architect; b. in Philadelphia, Pa., July 19, 1835. He was educated at the Academy of the Protestant Episcopal Church and the Gregory Academy; became, after entering business life, interested in steamship construction. From 1887 to 1889 he was the superintending engineer of the works of William Cramp & Sons, at Philadelphia, and introduced many improvements into the design and manufacture of the steam-engine. He had much to do with the introduction of triple-expansion engines into the vessels of the U. S. navy. He designed engines for the cruisers Yorktown, Concord, Bennington, Philadelphia, Newark, and Vesuvius, and for several well-known yachts and important merchant vessels. The cylindrical face-plate, if it may be so called, has been one of those by which it has been possible to produce perfect surfaces in main bearings and crank-shaft journals, so that heating, heretofore considered a natural consequence following the trial of a new engine, has been eliminated. He has been president of the American Society of Mechanical Engineers; is fellow of the American Association for the Advancement of Science; and a member of the British Institution of Naval Architects, and of other societies.

Seed-lac: See Lac.

Seeds [O. Eng. *sēd* : Germ. *saat* : Icel. *sāð* : Goth. *-sep̄s* in *manasēp̄s*, seed of men, the world; cf. Lat. *se'rere*, *sa'tum*, sow, Gr. *ἱέναι*, throw; Indo-Europ. root *sē-*, throw]: the immediate result of sexual propagation in phanerogamous plants, being the ovules after fertilization and the consequent formation of the embryo, which is the germ of a new individual. A seed consists of the embryo; of the matured coats of the Ovule (*q. v.*), commonly two, of which the outer, and generally the firmer, is technically called the *testa*, the inner, *tegmen*; and often of a stock of nourishing matter accumulated around or accompanying the embryo. The latter was named *albumen*, from a mainly fanciful analogy; the seed being likened to an egg, the albumen was supposed to answer to its white (albumen) and the embryo to its yolk. Seeds, such as those of peas, beans, and almonds, which have no albumen—that is, no stock of nourishment outside of the embryo—have always a strong and well-developed embryo, abundantly supplied with the same or similar matter stored in its own tissues. The general structure of the seed depending upon that of the ovule, the same terms are mostly applicable to it and to its modifications and parts (such as *anatropous*, *orthotropous*, *rhaphe*, *chalaza*, etc.); but the closed orifice through which impregnation was effected is called the *micropyle*; the scar left by separation from the seed-stalk or placenta is the *hilum*; the accessory and usually partial external covering, which is sometimes developed by a growth from the micropyle or the apex of the seed-stalk, is an *arillus* or *aril*. The mace of nutmeg and the pulpy covering of *Euonymus* seeds are familiar examples. A *caruncle* and a *strophiole* are nearly similar appendages at the base or hilum, not developed into a covering. Other appendages to certain seeds are the *coma*, or tuft of downy hairs at the summit, as in milkweed, or the base, as in willow, also the wing, as in trumpet-creeper; these and various other appendages aid in the dispersion of seeds. The albumen of the seed, when distinctively present, may differ greatly in abundance, consistence, and nature; as from farinaceous or flowery in wheat to cartilaginous or horny as in coffee, or to the texture and appearance of ivory in the vegetable-ivory nuts. In many cases, as in those just referred to, it forms much the larger part of the kernel of the seed; in others the embryo is so minute as to be with difficulty discerned anteceedent to germination; while sometimes the embryo is the more conspicuous, and the albumen is reduced to a thin layer. When copious, the albumen generally envelops the embryo, but sometimes the latter enfolds the former, as in mallows, or is coiled around it, as in four-o'-clock and chickweeds. The embryo and its parts are described in other articles. (See Germination, Cotyledon, and Embryology.) Its most important structural characteristic is the number of cotyledons or seed-leaves—one in monocotyledonous or endogenous plants; two in the dicotyledonous or exogenous.

There are many conflicting accounts as to the duration of vitality in seeds. The story of grain found buried with Egyptian mummies having germinated after being exhumed is generally discredited. All recent attempts under proper observation and due precautions have failed. The appearance of plants new to the station upon the soil brought to the surface from excavations can usually be otherwise explained when they appear to involve a high antiquity, although there is no doubt that buried seeds have germinated after a lapse of fifty or more years. The best-authenticated case, pointing to a much longer preservation of vitality under such conditions, is that of the growth of raspberry-seeds found in the abdominal portion of a skeleton exhumed from a Roman tomb near Dorchester, England; but it is one not beyond doubt and uncertainty. One or two series of experiments, conducted by the sowing of seeds of known age, and also by the annual sowing from a stock of a considerable variety of seeds of the same age, indicate a rapid extinction of vitality under ordinary conditions. Out of 338 species, representing 74 families of plants, only 94 kinds grew after 3 years, only 57 after 4 to 8 years, only 16 from 8 to 21 years, 5 from 25 to 27 years, 3 to 43 years. In ordinary cases, leguminous seeds have longest preserved germinating power, in some very well-authenticated instances up to seventy or perhaps a hundred years. Nearly uniform temperature, darkness, and either dryness or burial beyond atmospheric influences, most favor the prolongation of vitality. See also Food. Revised by Charles E. Bessey.

See'land: the largest and most important of the Danish islands; between the Cattegat and the Baltic, and between the Sound which separates it from Sweden and the Great Belt which separates it from the island of Funen. Area, 2,713 sq. miles, or with neighboring islands administratively dependent, 2,909 sq. miles. The ground is low and undulating, dotted with small lakes and studded with forests of oak and beech, but nowhere rising more than 200 feet above the sea. The soil is very fertile and well cultivated. Pop. (1890) in the administrative limits, 722,000.

Seeley, Levi: See the Appendix.

Seeley, Sir John Robert, M. A.: educator and author; b. in London, England, in 1834; graduated at Cambridge 1857; became fellow of Christ's College 1858; Professor of Latin in University College, London, 1863; succeeded Charles Kingsley as Professor of Modern History at Cambridge Oct. 9, 1869. Author of *Ecce Homo, or the Life and Work of Jesus Christ* (London, 1865), which rapidly passed through many editions and elicited many replies; *Roman Imperialism* (1869); *Lectures and Essays* (1870); and editor of *Livy, with Introduction, Historical Examination, and Notes* (1871); wrote *Life and Times of Stein* (3 vols., 1879); *Expansion of England* (1883); *Natural Religion* (1882); *A Short History of Napoleon I.* (1886); *Goethe Reviewed after Sixty Years* (1893); *Growth of British Policy* (1895). D. at Cambridge, Jan. 13, 1895. Revised by S. M. Jackson.

Seelye, see'lē̆e, Julius Hawley, S. T. D., LL. D.: educator; b. at Bethel, Conn., Sept. 14, 1824; graduated at Amherst College 1849; studied theology at the Auburn Seminary, and also in Germany; was pastor of the First Reformed Dutch church, Schenectady, N. Y., 1853–58, then became Professor of Mental and Moral Philosophy in Amherst College. In 1872 he visited India, where he spent three months, largely occupied in lecturing to educated and English-speaking Hindus on the truths of Christianity. Some of these lectures were published in Bombay (1873) by request of their auditors, and also at Boston (1874), under the title *The Way, the Truth, and the Life*. He also published a volume on *Christian Missions* (New York, 1875), an elementary text-book on *Duty* (1891), besides various sermons, addresses, and articles in quarterly reviews, and translated Schwegler's *History of Philosophy* (New York, 1856). He aided in the revision of Hickok's *Psychology* (1882). In 1874 he was elected to Congress by a spontaneous movement of the people of his district, and without having received a nomination from any political party. In 1876 he was elected president of Amherst College, retaining his professorship. He resigned both offices in 1890. D. at Amherst, Mass., May 12, 1895. Revised by G. P. Fisher.

Seelye, Laurenus Clark, D. D.: educator; brother of Julius H. Seelye; b. at Bethel, Conn., Sept. 20, 1837: graduated at Union College 1857; studied at Andover Theological Seminary 1857–59, at Berlin and Heidelberg Universities 1860–62; traveled in Europe, Egypt, and Palestine; was pastor of the North Congregational church at Springfield, Mass., 1863–65; was Professor of English Literature and Oratory at Amherst College 1865–74; organized and became in 1874 first president of Smith College for young women, at Northampton, Mass.; author of various contributions to reviews, including articles on collegiate education and on Celtic literature.

Seeman, zā′măăn, Berthold, Ph. D.: botanist; b. at Hanover, Germany, Feb. 28, 1825; educated at the lyceum of that city; studied at Kew, England, 1844–46; was naturalist on board H. M. S. Herald on an exploring expedition around the world 1846–47; made three Arctic voyages; explored the Fiji islands and parts of North and South America 1860–62; editor of *Bonplandia* 1853–62, and of *Journal of Botany, British and Foreign*, 1863–71; published *A Narrative of the Voyage of the Herald* (1853); *Popular History of Palms* (1855); *The Botany of the Voyage of the Herald* (1857); *Flora Vitensis* (1865); and other scientific works. D. at the Javali mine, Nicaragua, Oct. 10, 1871. Revised by Charles E. Bessey.

Seetzen, zāt′sen, Ulrich Jasper: Orientalist and traveler; b. at Jever, Oldenburg, Germany, Jan. 30, 1767; was educated at the University of Göttingen; became a friend of Blumenbach and Humboldt; under the patronage of the Dukes of Saxe-Gotha undertook an extensive exploration of Mussulman Africa and Asia; reached Constantinople in 1802; studied Arabic fifteen months at Aleppo (1803–04); disguised as a beggar, made valuable scientific researches in Syria and Palestine, especially in the Lebanon and the regions E. of the Dead Sea (1804–06); in Egypt made a vast collection of MSS. and other objects for the Museum of Gotha, and explored Upper Egypt (1807–08); professed Islam, and as a pilgrim visited Mecca and Medina (1809); reached Mocha, whence his last letter was written on Nov. 17, 1810. Setting out for Muscat (1811), his property was seized under accusation that he was a magician. Nothing certain is known of his subsequent history, but he is believed to have been poisoned (1811) by command of the Imam of Sanaa. His diary and maps, recovered in 1815, were published at Berlin (3 vols., 1854–55). E. A. G.

Segende Nah: See Hakim-Ben-Allah.

Seggars: See Kilns (*Pottery Kilns*).

Segmental Organs: a name formerly given the excretory organs (*nephridia*) of annelids, from the fact that there is typically a pair to a segment.

Segmentation: See Embryology.

Segner's Wheel: See Barker's Mill.

Sego′via: capital of the province of Segovia, Spain; on the Eresma; at the foot of the Sierra de Guadarrama; 32 miles N. N. W. of Madrid (see map of Spain, ref. 14–E). It is surrounded by old walls surmounted by round towers. Its streets are narrow and crooked, but many of its buildings are magnificent. The aqueduct which carries the waters of the Rio Frio into the city is 2,921 feet long and rests on 170 arches, some of which are 102 feet high. It is built of granite blocks, without cement or mortar, and is the grandest specimen of Roman architecture in Spain. The cathedral is a fine specimen of Gothic architecture. There are some manufactures of cloth, paper, and pottery. Pop. (1887) 14,339. The province of Segovia is part of Old Castile, and most of it is plateau; area, 2,714 sq. miles; pop. (1887) 154,443.

Seguin, sā-geen′: town; capital of Guadalupe co., Tex.; on the Guadalupe river, and the S. Pac. R. R.; 35 miles E. of San Antonio (for location, see map of Texas, ref. 5–H). It is in an agricultural and lumbering region; has mills, a bank, and three weekly newspapers. Pop. (1890) 1,716; (1900) 2,421.

Seguin, Arthur E. S., etc. See the Appendix.

Seguin, sā′gwin, Fr. pron. *se-gaăn′*, Édouard, M. D.: physician; b. at Clamecy, Nièvre, France, Jan. 20, 1812; educated at the colleges of Auxerre and St. Louis in Paris, and studied medicine and surgery under Itard, and was subsequently associated with Esquirol; undertook, soon after receiving his medical degree, the training of a few idiot children. Devoting himself with great assiduity to the study of their psychological condition, he at length comprehended the nature of their infirmity so clearly that he was able to produce most remarkable results by his system. In his first experiments Esquirol was associated with him, and their names appear together on the title-page of his first pamphlet on the subject of idiot-training in 1839. In 1844 a commission from the Academy of Sciences of Paris declared that up to the time when he began his labors (1837) idiots could not be educated or cured by any means previously known or practiced, but that he had solved the problem. He published in 1846 *Traitement morale, Hygiène et Éducation des Idiots et des autres Enfants arriérés*. After the Revolution of 1848 Dr. Seguin migrated to the U.S.; visited the school for idiotic children in South Boston and the institution for feeble-minded youth at Barre, Mass., both in large measure the outgrowths of his labors in Paris; went to Albany, where Dr. Wilbur was just organizing the experimental school which has culminated since in the New York State Idiot Asylum at Syracuse, and rendered him invaluable assistance in that organization; in 1851 settled in Portsmouth, O., in the practice of his profession. In 1854–57 he was at Syracuse teaching and training idiot children, aiding in the establishment of new institutions in Connecticut, Ohio, and Pennsylvania, and for a time was at the head of the Pennsylvania institution. In 1859 he settled in practice at Mt. Vernon, N. Y., whence he removed to New York in 1863. In 1879 he established in New York the Seguin Physiological School for feeble-minded children, which still exists. In 1866 he published *Idiocy, and its Treatment by the Physiological Methods*. He was a commissioner at the Vienna Exposition in 1873 from the bureau of education. Among his published works are *Conseils à M. O. sur l'Éducation de son Enfant Idiot* (Paris, 1839); *Théorie et Pratique de l'Éducation des Idiots* (2 parts, Paris, 1842); *Hygiène et Éducation des Idiots* (Paris, 1843); *Images graduées à l'Usage des Enfants arriérés et Idiots* (Paris, 1846); *F. R. Perière, premier Instituteur des Sourds et Muets en France* (Paris, 1847); *Historical Notice of the Origin and Progress of the Treatment of Idiots* (translated by J. S. Newberry, M. D., 1852); *Medical Thermometry and Human Temperature* (1876). He was also inventor of the physiological thermometer. D. in New York, Oct. 28, 1880.
Revised by S. T. Armstrong.

Ségur, sā′gür′: a family of the French nobility, many of whose members have been prominent in war, literature, and politics. The most distinguished are: (1) Louis Philippe, Count de Ségur; b. in Paris, Dec. 10, 1753; received a military education, and served in America under Rochambeau; was appointed in 1783 ambassador to St. Petersburg, where he gained the favor of Catherine II., and concluded an important commercial treaty between Russia and France in 1787; retired from the public service on the overthrow of the monarchy during the Reign of Terror, and devoted himself to literary work; was recalled to service by Napoleon; became a peer during the first Restoration. D. in Paris, Aug. 27, 1830. His principal works are *Théâtre de l'Hermitage* (1798), originally written for the private stage of Catherine II.; *Contes, Fables, Chansons et Vers* (1801); *Tableau historique et politique de l'Europe de 1786–96* (1800); *Mémoires, ou Souvenirs et Anecdotes* (1825). His *Œuvres complètes* were published in 33 vols. in Paris (1824–30).—(2) His son, Paul Philippe, b. in Paris, Nov. 4, 1780; entered the army in 1799; became a member of the staff in 1802; governor of the imperial pages in 1804; and brigadier-general and aide-de-camp to Napoleon during the Russian campaign; after the second Restoration he retired to private life. He was made a peer by Louis Philippe. In 1824 he published *Histoire de Napoléon et de la Grande Armée pendant l'Année 1812*, which made a great sensation, and has been often republished. He also wrote *Histoire de Russie* (1829) and *Histoire de Charles VIII.* (1835; translated into English, Philadelphia, 1842). D. in Paris, Feb. 25, 1873.

Seidl, zīd′l, Anton H.: conductor; b. in Budapest, Hungary, May 6, 1850, and educated there, and at Leipzig and Bayreuth under Richter and Wagner. He assisted Wagner in making the first score of the *Nibelungen* tetralogy, and in 1876 was the chief stage-director at the first production of the *Nibelungen* drama in Bayreuth, and from that time till 1885 was well known in Europe as a Wagner conductor. From 1879 till 1882 he was conductor at the Leipzig Opera-house. In 1885 he married the opera-singer Fräulein Kraus, and in September of that year was called to New York to conduct the German opera, succeeding Dr. Leopold Damrosch. On the departure of Theodore Thomas for Chicago in 1891, Seidl was elected conductor of the Philharmonic Society. He was also a fine pianist, an accomplished *littérateur*, and a deep student of Shakspeare. D. in New York, Mar. 28, 1898. D. E. Hervey.

Seidlitz Powders: See Potassium (*Medicinal Uses of Potassium Compounds*).

Seigniorage: See Coinage.

Seine, Fr. pron. sān (the *Sequana* of Cæsar): a river of France, which rises in the department of Côte-d'Or at an elevation of 1,545 feet above the level of the sea, flows in a

northwestern direction, passes through Paris, where it is from 400 to 600 feet wide, and enters the English Channel at Havre by an estuary 7 miles wide. Its entire length is 482 miles, of which about 350 below Troyes are navigable by barges, and 40 from Rouen to Havre (to which the term *Seine maritime* is applied) by vessels of 200 to 300 tons. It receives from the left the Yonne, the Essonne, and the Eure, and from the right the Aube, Marne, and Oise. By canals it communicates with the Loire, Saône, Rhine, Rhône, Meuse, and Scheldt. Though surpassed in some respects by the Loire, Saône, and Garonne, yet with the hills and valleys, forests and meadows, numerous villages, populous towns, and famous cities which line its banks it is one of the finest rivers in Europe.

Seine: department of France; completely inclosed within Seine-et-Oise; area, 185 sq. miles. It is the smallest but the most densely peopled and wealthiest department of France, comprising Paris and the suburban villages of Boulogne, Clichy, Puteaux, etc. The ground is undulating and traversed by the Seine and the Marne. The soil is not naturally fertile, but it has been made very productive by the skill of the farmers and gardeners. Immense quantities of vegetables, mushrooms, melons, peaches, and strawberries are raised for the markets of Paris. Beautiful forests, as those of Boulogne, Vincennes, St.-Cloud, and Meudon, cover a large part of the surface between the cities, and rich quarries of building-stone and gypsum are found. Pop. (1896) 3,340,514.

Seine-et-Marne, -ā-maarn′: department of France, adjoining Seine-et-Oise on the W.; area, 2,214 sq. miles. The ground is slightly undulating and the soil very fertile. Extensive forests, yielding excellent timber, are found, among which is that of Fontainebleau. Large crops of wheat, vegetables, and fruits are raised; the wine of the department is mediocre, though it produces one of the most celebrated kinds of table-grapes, the Chasselas de Fontainebleau. On the pastures and meadows numerous cattle are reared, and immense quantities of cheese, the so-called fromage de Brie, are sent to the Paris markets. The manufacturing industry of the department is not of great importance. Pop. (1896) 359,044. Capital, Melun.

Seine-et-Oise, -ā-waaz′: department of France. Area, 2,163 sq. miles. In the southern part the ground is almost flat; in the northern, hilly and covered with forests. The soil is generally not fertile, but, being well manured and excellently cultivated, yields large crops of fruits and vegetables for the capital. Different branches of manufactures are pursued with great success. Several fine varieties of stone and clay are found, and the porcelain manufactures of Sèvres have acquired a worldwide reputation. Pop. (1896) 669,098. Capital, Versailles.

Seine-Inférieure, -ăn′fā′ri-ör′: department of France, bordering on the English Channel. Area, 2,330 sq. miles. The ground is generally composed of plains, watered by numerous small streams, and broken only in the southwestern part by ranges of low hills. The soil is fertile and well-cultivated. Forests abound; large crops of grain, hemp, flax, hops, and fruits are raised, and sheep, cattle, and horses are extensively reared. Manufactures, and especially fisheries and commerce, form important sources of wealth. Large quantities of cheese, butter, and cider are made. Poultry, chickens, turkeys, ducks, and geese are raised, and enormous quantities of eggs are exported to England. Pop. (1896) 837,824. Capital, Rouen.

Seines: See Fisheries.

Seip, sīp, Theodore Lorenzo, D. D.: educator: b. at Easton, Pa., June 25, 1842; graduated at Pennsylvania College, Gettysburg, Pa., and Theological Seminary, Philadelphia. He has been connected with Muhlenberg College, Allentown, Pa., since its organization in 1867, first as principal of the academic department, and successively as Professor of the Latin and Greek Languages, becoming president in 1886. H. E. J.

Sei'sin [from O. Fr. *seisine, saisine*, deriv. of *seisir, saisir*, seize: Ital. *sagire*; of Teuton. origin; cf. O. H. Germ. *sazjan*, set]: in law, possession of a freehold estate. The term originally signified any possession, whether of real or personal property, but it became appropriated at an early period to describe the possession of a freehold tenant of lands. If such freeholder surrenders the actual physical possession to another who lays no claim to the freehold (as a tenant for years), he does not thereby lose his seisin. The tenant's possession is referred to the landlord's seisin, and constitutes a part of it. (See Property.) But if actual possession of the land be taken, rightfully or wrongfully, by one who intends thereby to hold the freehold, the act is a *disseisin* of the owner and operates to transfer the freehold to the "disseisor." (For this extraordinary consequence of a disseisin, see Limitation of Actions.) In the same way every one who has a vested future estate of freehold, whether in reversion or remainder, is seised of such estate so long as the present or particular estate upon which the future estate is limited continues to be vested in possession. If the particular tenant is disseised, however, every future estate which depends upon his estate is divested by the same act. See Landlord and Tenant and Remainder.

The expression "livery of seisin," which described the ancient process of conveyance of freehold interests, known as feoffment, is only the archaic equivalent for the phrase delivery of possession. See Feoffment, Freehold, and Grant. George W. Kirchwey.

Seis'mograph: an instrument recording graphically the motions of a point on the earth's surface during an earthquake. Instruments for the automatic record of earthquakes are classed according to special function—as (1) seismoscopes, which merely detect and record the fact of an earth tremor, with or without indication of its time; (2) seismometers, which measure also the maximum force of the shock, either with or without indication of its direction; and (3) seismographs, which record the number, succession, direction, amplitude, and period of successive oscillations. Most seismoscopes are devices involving a delicately adjusted trigger whose small movement permits a weight to fall, causes an alarm to sound, or stops a clock. In seismometers a heavy liquid is agitated or made to spill from a vessel, or a movable solid is thrown down or displaced. In the construction of seismographs the primary endeavor is to give astatic suspension to a heavy body, that is, to suspend it in such way that when its position is disturbed through a small distance no force will be developed tending to restore its original position; or what is the same thing, so that if its support be moved the motion will not be communicated to the body. This ideal result has never been accomplished, but close approximations have been obtained by various devices. The complementary part of the apparatus consists in systems of levers, etc., connecting the body astatically suspended with various fixed points, or surfaces moved by clockwork, in such way as to secure a graphic record of the relative motions in various directions. The more elaborate machines record motion in the vertical direction and in two horizontal directions. See Earthquakes, and consult the *Transactions* of the Seismological Society of Japan. G. K. Gilbert.

Seismology [Gr. σεισμός, earthquake + λόγος, discourse, reason]: See Earthquakes.

Seismometer and **Seismoscope**: See Seismograph.

Seiss, sees, Joseph Augustus, D. D., LL. D., L. H. D.: author and preacher; b. near Emmittsburg, Md., Mar. 18, 1823; student in Pennsylvania College, Gettysburg, Pa.; ordained to the Lutheran ministry 1844; pastor in Virginia 1842–47, Cumberland, Md., 1847–52, Baltimore 1852–58, Philadelphia since 1858. He is a preacher of extraordinary power. His literary career began with *Lectures on the Epistles to the Hebrews* (1846), and has continued until his books and pamphlets number considerably over 100. His *Gospel in Leviticus* was republished in England, and his *Lectures on the Apocalypse* has been translated and published in Germany and Holland. He has been editor of *The Prophetic Times* and *The Lutheran*. He is one of the founders of the General Council, of which, as well as of the ministerium of Pennsylvania, he has been president. He has been president also of the board of trustees of the Philadelphia Seminary almost ever since its foundation, and a member of the committee that prepared *The Church Book* and *The Common Service*. H. E. Jacobs.

Seistan, sās-tawn′, or **Sistan**: district divided between Persia and Afghanistan, Central Asia; between lat. 30° and 32° N. and lon. 60° and 62° E., bordering W. on the Persian provinces of Khorassan and Kirman. The surface forms an extensive depression, toward which the surrounding table-lands slope gently. The soil consists either of quicksand or of a stiff clay covered with coarse grass and tamarisk-bushes, and uncultivable except along the rivers, which from the surrounding highlands gather in the middle of the

depression and form the large but shallow lagoon of Hamun. The land is mostly a desert, but camels and sheep thrive here. Large ruins show, however, that Seistan once must have been well peopled and wealthy; it was probably ruined by Timur at the end of the fourteenth century.

Seizure: See SEARCH AND SEIZURE.

Seja'nus, ÆLIUS: the prime minister of Tiberius; a native of Vulsinii, in Etruria. See TIBERIUS.

Sela'chii [from Gr. *σέλαχος*, a fish having cartilage instead of bones, shark]: the class of ichthyoid vertebrates containing the sharks, rays, and chimæras; the ELASMOBRANCHIATES (*q. v.*).

Selachos'tomi [from Gr. *σέλαχος*, a shark or other cartilaginous fish + *στόμα*, mouth]: an order of fishes forming, with the *Chondrostii* (sturgeons), the sub-class *Chondroganoidea* (see FISHES), in which the skeleton is cartilaginous. They differ from the sturgeons in the obsolescence of the maxillary and interspercle, and the presence of numerous minute teeth disappearing with age. The skin also is naked, or with minute stellate ossifications; the air-bladder cellular: the stomach cæcal and the pyloric cæca form a broad leaf-like organ; the dorsal and anal fins approximate the caudal, which is heterocercal, with fulcra on its upper surface. There is only one family, the *Polyodontidæ*, including the PADDLE-FISH (*q. v.*) and *Psephurus gladius* of Chinese rivers. These have the snout produced into a long flat blade-like process, which overhangs the wide mouth, and is used in stirring up the bottom for the minute organisms which form their food.

Selaginella'ceæ: See FERNWORTS.

Selah [Heb.]: a musical term occurring in the Bible (seventy-one times in the Psalter, three times in Hab., chap. iii.), supposed to indicate a pause in the singing or a change of instrument; LXX., *διάψαλμα*. It may perhaps be derived from a verb (Ps. lxviii. 5), meaning "to sing loudly" (*Jüd. Lit. Blatt.*, 1894, xix., p. 74). Cassel connects it with the Greek *ψάλλε* (*Sendschr. über die Probebibel*, 1885, p. 96); Dalman with *σέλις* (*Theol. Lit. Zeit.*, 1892, xxi., col. 518). See also J. Bachmann, *Alttest. Unters.* (Berlin, 1894, p. 41); Muss-Arnold, *Johns Hopkins Univ. Circulars*, No. 81. R. G.

Selangor': one of the states of the Malay Peninsula, protected by Great Britain. It lies between the parallels 2° 45′ N. and 3° 50′ N., and extends from the west coast to the central watershed. Area about 3,000 sq. miles. It is mostly a low flat plain, is drained by four large rivers, is hot and wet, but not unhealthful. The most important production is tin, of which the state contains many mines, some of which have been worked from very ancient times. Pop. (1891) 81,592. M. W. H.

Selborne, BARON: See PALMER, ROUNDELL.

Selden, JOHN: jurist, legal antiquarian, and Orientalist; b. at Salvington, near Worthing, Sussex, England, Dec. 16, 1584; studied at Chichester free grammar school; at Hart Hall, Oxford, 1598–1601; at Clifford's Inn 1601–04; and afterward at the Inner Temple, where he was called to the bar. He acquired great fame for his classical, Oriental, and political attainments; and became intimate with Camden, Usher, Sir Robert Cotton, Sir Henry Spelman, Ben Jonson, and other celebrities. At an early age he began his prolific literary career by writing, probably in 1606 or 1607, the *Analecton Anglo-Britannicon* (not published until 1615; new ed. 1653), giving an account of the civil administration of Great Britain prior to the Norman conquest; issued his *Jani Anglorum Facies Altera* (1610; Eng. trans. 1682); furnished learned notes and illustrations to Drayton's *Poly-Olbion* (1613); published an elaborate treatise on *Titles of Honor* (1614; 3d ed. 1672), a work still of the highest authority; and *De Diis Syris Syntagmata duo* (1617), a work on Syrian mythology as illustrative of the Old Testament, which supplied Milton with some material for his *Paradise Lost*.

He was for some years an earnest and effective champion of the popular party in the long struggle with the crown, and in 1618 he published a *History of Tithes*, in which he denied the divine right to tithes; was cited before the court of high commissions (Dec., 1618), and compelled to sign a withdrawal; was imprisoned five weeks in the custody of the sheriff of London (1621) for having advised the House of Commons to resist King James's claim that their privileges were derived from royal grants; was elected member of Parliament for Lancaster 1623; conducted the prosecution of the Duke of Buckingham in 1625, and again in 1628; defended Sir Edward Hampden before the court of king's bench for refusing to pay a forced loan 1627; opposed the royal prerogative on the question of tonnage and ship-money, and aided in drawing up the celebrated Petition of Right 1628, for which conduct he was imprisoned in the Tower Jan., 1629; was transferred to the king's bench prison in September, and remained there until 1634, when he was allowed to go at large on bail. During his imprisonment he continued his antiquarian and legal studies; published in 1635, shortly after his release, his most celebrated work, *Mare Clausum* (written sixteen or seventeen years before), defending the sovereignty of England over the "narrow seas," in reply to the claims of Holland to the right of fishing on the coasts of England, as advocated by Grotius in his *Mare Liberum*, the work being dedicated to King Charles, whose good will he seems to have gained; sat in the Long Parliament (1640) for the University of Oxford; favored the exclusion of the bishops from the Upper House, and aided in drawing up the articles of impeachment against Laud, but was subsequently considered a moderate supporter of the royal side, though condemning the excesses of both parties; was a lay member of the Westminster Assembly of Divines; took the Covenant, and was appointed by Parliament chief keeper of the rolls and records in the Tower 1643; was one of the twelve commoners appointed commissioners of the admiralty 1645; received from Parliament a grant of £5,000 in recompense for his losses and as a reward for his services to the state 1647; was one of the university visitors 1647, and influential in Parliament in protecting the endowments of university chairs; remained in Parliament after the death of the king, though taking little part in its proceedings. D. in London, Nov. 30, 1654, and was buried in the Temple church. Among his many works were *Marmora Arundeliana* (1628), a catalogue of the marbles brought from Greece by the Earl of Arundel; *De Jure Naturali et Gentium, juxta Disciplinam Hebræorum* (1640); a discourse concerning the rights and privileges of the subjects (1642); an edition of Fleta's celebrated *Commentary on English Law* (1647); *De Synedriis et Præfecturis Juridicis veterum Hebræorum* (3 books, 1650–55); and an edition of *Eutychius* (1656). His *Table Talk*, an amusing miscellany, was published in 1689 by Rev. Richard Milward, who had been his amanuensis, and by Samuel Weller Singer (London, 1847; 3d ed. 1860). His works were edited, with a memoir, by David Wilkins (3 vols. folio, 1726). See *Temple Bar*, vol. xli., p. 478, and Aikin, *Lives of John Selden and Bishop Usher*. Revised by F. STURGES ALLEN.

Selenates: See SELENIC ACID.

Sele'ne [= Lat. = Gr. *Σελήνη*, liter., Moon]: in Grecian mythology, the moon-goddess, daughter of Hyperion and Theia, sister of Helius and Eos. She was also called Phœbe, as the sister of Phœbus, the sun-god, and in later times she was identified with Artemis. Like Helius she drives across the heavens in a chariot bringing light to men. Her chariot is drawn by white horses, mules, or cows, which latter bore in the shape of their horns the symbol of Selene, the crescent moon. J. R. S. S.

Selen'ic Acid [*selenic* is from Mod. Lat. *sele'nium*. See SELENIUM]: an acid which is very interesting from its analogies with sulphuric acid and the parallelism of the compounds of the two, and has the composition H_2SeO_4. Mitscherlich discovered it in 1827. The anhydrous oxide, SeO_3, is as yet unknown. It is best prepared from selenious oxide by the method of Wohlwill, which consists in forming a selenite of copper, converting this into selenate by the action of chlorine, which gives a mixture of cupric chloride and cupric selenate. The former is dissolved out from the latter by alcohol, and the cupric selenate suspended in water and decomposed by sulphuretted hydrogen. The filtered selenic acid is concentrated by evaporation. The most concentrated liquid acid obtainable boils at 280°. In this state it still contains a little water. It resembles oil of vitriol in many respects, and, like this, dissolves zinc when diluted, with evolution of hydrogen; but it nevertheless has the extraordinary power of oxidizing and decomposing hydrochloric acid when boiled with it, chlorine being evolved and the selenic acid reduced to SeO_2. The selenates are bibasic, like the sulphates, and have a remarkable analogy with the latter, there being biselenates like the bisulphates, and selenic alums similar to common alums; and the corresponding salts of the two acids resemble each other even in solubility, the lead, barium, and strontium selenates being insoluble, like the sulphates. Nitric acid does not act

on them, but with hydrochloric acid they evolve chlorine, forming selenious acid and chlorides.

Revised by Ira Remsen.

Sele'nious Oxide: the only oxide of selenium known. It is a solid white substance obtained by combustion of selenium in oxygen, or by evaporating selenious acid to dryness. Its formula is SeO_2. It sublimes, without fusing, below redness, condensing in crystals, and is very deliquescent. Its compound with water, selenious acid (H_2SeO_3), is a strong acid, which decomposes, with heat, the chlorides and nitrates, and forms neutral salts with bases, being exceptional, nevertheless, in being decomposed by heat, as above intimated. The selenites are bibasic, and large numbers have been prepared and investigated, but for these the chemical text-books must be referred to.

Sel'enite [from Lat. *sele'nites* = Gr. σεληνίτης (sc. λίθος, stone), deriv. of σελήνη, moon. So called from its luster]: a mineralogical name for gypsum. Dana believes that the σεληνίτης of Dioscorides was probably really crystallized gypsum, but not the *selenitis* of Pliny. Discoveries in molecular structure indicate two distinct varieties of the species selenite or gypsum—allotropic modifications, as they may be called—one having density, when homogeneous, = 2·313 (Mohs found 2·31, and Kenngott, as the mean of 15, found 2·317), and the other = 2·337 (Filhol found 2·331).

Sele'nium [Mod. Lat., from Gr. σελήνη, moon. So called from its chemical analogy to *tellu'rium* (from Lat. *tellus*, earth), being as it were a companion to it]: a chemical element discovered by Berzelius in 1817. Sulphur, selenium, tellurium, and oxygen form Berzelius's natural amphigen group of elements, which are certainly separated widely from the halogen group in many respects, though fluorine apparently forms a connecting link, having many affiliations with both groups. Selenium must be considered one of the rarer elements, though several native mineral compounds of it are known. The mineral *clausthalite* is selenide of lead, *zorgite* a double selenide of lead and copper, these being the principal sources of commercial selenium, and somewhat common in the mines of the Hartz Mountains, at Tilkerode, Clausthal, and Zorge, also at Glasbach in Thuringia. *Lehrbachite* is a selenide of lead and mercury from the Hartz; *berzelianite*, a selenide of copper from the same, and from Skrikerum in Småland, Sweden; *eucairite*, a copper and silver selenide, also from Skrikerum, and found in several Chilian localities; *naumannite*, a silver-lead selenide from the Hartz. There is a silver selenide in crystals at Tasco in Mexico (del Rio); *tiemannite*, a mercuric selenide, from the Hartz; and a few others less known. Certain iron pyrites, as at Fahlun in Sweden, contain selenium; and when these are used for making sulphuric acid, a seleniferous deposit forms in the leaden chambers, in which, indeed, the element was first discovered by Berzelius. Selenium is obtained principally from the dust that accumulates in the flues of sulphuric-acid works, and of roasting-furnaces where iron pyrites containing selenium are used. The relative quantity of selenium in the pyrites is very small, but the product of its combustion is a solid that is much less volatile than the gases given off in the burning of the pyrites, so that this product accumulates in the flues. In order to obtain the selenium from the dust, this is treated with an oxidizing agent, either nitric acid or a nitrate, and the selenium thus all converted into the dioxide, SeO_2, or into a salt of selenic acid, H_2SeO_4. Both of these oxides are easily reduced by sulphurous acid, the element selenium being precipitated.

There are at least two modifications of selenium which correspond to those of Sulphur (*q. v.*). One is slightly soluble in carbon disulphide, the other is not. The soluble form is obtained by reducing selenious acid by means of sulphurous acid, or other reducing agent. The insoluble variety is obtained by melting selenium and rapidly cooling it. The soluble form is crystalline, the insoluble form is amorphous.

Selenium does not kindle easily, like sulphur, but when heated strongly will burn in the air; and selenides will burn before the blowpipe. A characteristic odor accompanies this combustion, compared by some to that of horse-radish, by which the presence of selenium in a mineral can be detected by those who know the odor.

Compounds.—Selenietted hydrogen, corresponding to sulphuretted hydrogen, is one of the most interesting of these. It is a permanent gas, which may be formed by the action of an acid on selenide of potassium, or by heating selenium in a current of dry hydrogen to its vaporizing-point. At a higher temperature dissociation again occurs. It is very poisonous, producing catarrhal disease when inhaled, and destroying the sense of smell. It does not liquefy at — 15° C.

The electrical conductivity of selenium is influenced to a remarkable degree by heat and light. Amorphous selenium does not conduct electricity, but the crystallized does so, and the conductivity increases rapidly with a rise in temperature. According to the latest investigations, however, amorphous selenium conducts electricity when heated to 165° or 175° C., and higher. Revised by Ira Remsen.

Seleucia, sel-yoo'sĕe-ăă, or **Seleuceia** (Gr. Σελευκεία) sel-yŏo-see'ăă: the name of several cities founded mostly by Seleucus I., Nicator. 1. A city on the Tigris. In the time of Titus it had a population of 600,000; it was partially burned in 116 A. D. by Trajan, and was destroyed in 162 A. D. by L. Verus.—2. Seleucia Pieria in Syria, near the mouth of the Orontes.—3. Seleucia on the river Belus in Syria.—4. Seleucia in Northern Palestine.—5. Seleucia Sidera discovered by G. Hirschfeld in the plain of Isparta in Pisidia.—6. Seleucia in Pamphylia near the mouth of the Eurymedon.—7. Seleucia on the Calycadnus in Cilicia Tracheia, the scene of the drowning of Barbarossa. J. R. S. Sterrett.

Seleu'cidæ: one of the five great dynasties of ancient Persia before the Mohammedan conquest. After the death of Alexander the Great (B. C. 323) the vast empire, including Iran, that had been brought under his command, fell apart, and Syria became one of the recognized ruling powers under Seleucus Nicator (ruled B. C. 312–281), who had been one of Alexander's generals. This vigorous commander became the founder of the kingdom of the Seleucidæ. He was succeeded by his son Antiochus I., Soter (B. C. 280–261), and the latter in his turn by a son, Antiochus II., Theos (B. C. 261–246). Under the first Seleucids the Greek sovereignty over Persia was preserved intact for nearly seventy years; its unity, however, was broken about B. C. 256 by the revolt of Bactria, and in B. C. 250 by the rebellion and rise of Parthia as an independent power under Arsaces. The Seleucid supremacy itself may be said to have ceased in Iran about B. C. 150, at the time of the Parthian monarch Mithradates the Great. It had lasted less than two centuries, and as a factor in Persian political history its existence was even less than a hundred years in duration. A. V. Williams Jackson.

Seleu'cus (in Gr. Σέλευκος): the name of several rulers of antiquity. 1. Seleucus I., Nicator, one of the generals of Alexander the Great, b. in 365 B. C. In 321 B. C. he became governor of Babylonia and in 317 of Susiana. He was forced by Antigonus in 315 to flee to Ptolemy in Egypt. In 312 he was victorious over Antigonus and regained control of Babylonia, Susiana, and Media. This year (312 B. C.) was the beginning of the Seleucid era. Henceforth his arms were uniformly successful, and he advanced into India farther even than did Alexander, thus gaining the title of *Nicator*. He was the first of all the successors of Alexander to assume the title of king. In the battle of the kings at Ipsus in 301 he chiefly was instrumental in causing the defeat of Antigonus, and he thus added Armenia, Southern Asia Minor, and Syria to his kingdom. He then allied himself to Demetrius Poliorcetes, whose daughter Stratonice he married, but he soon became involved in a war with Demetrius, and, having taken him prisoner, held him in captivity until his death in 283. His war with Lysimachus ended in 282 with the addition of Asia Minor to his empire, which thus extended from the western seaboard of Asia Minor to India, and was divided into seventy-two satrapies. His aim, contrary to that of Alexander, was to Hellenize the Orient, and he was successful to a degree, but the removal of his capital from Seleucia on the Tigris to Antioch on the Orontes tended to estrange the two elements. In 281, in addition to the surrender of his wife Stratonice, he gave the whole of Asia to his son Antiochus, and himself undertook the conquest of Macedonia, but was murdered by Ptolemy Ceraunus in 281 B. C. before he could accomplish his object. —2. Seleucus II., Callinicus, the great-grandson of Seleucus I., reigned 246–226 B. C. He could not withstand Ptolemy Euergetes, King of Egypt, who to avenge the murder of his sister Berenice advanced victoriously against Seleucus as far as Susa, and in 239 added Palestine, Phœnicia, and Cœle Syria to Egypt. Antiochus Hierax, the younger brother of Seleucus, declared himself King of Asia Minor, but was subdued. The Parthians then revolted, and in 238 were victorious over Seleucus, thus founding the Parthian kingdom. Attalus, too, sought for a slice of the crumbling empire, and in 226 defeated Seleucus, who in fleeing from the battle was

thrown from his horse and killed.—3. SELEUCUS III., SOTER, reigned from 226 to 222 B. C., and was assassinated when engaged in a war with Attalus.—4. SELEUCUS IV., PHILOPATOR, reigned from 187 to 176 B. C., tributary to the Romans.—5. SELEUCUS V. reigned 125–123 B. C.; was murdered by his mother Cleopatra.—6. SELEUCUS VI. reigned 95–93 B. C.; died at Mopsuestia, shortly after which Tigranes absorbed the remains of the Seleucid empire. J. R. S. STERRETT.

Self-consciousness: consciousness of self as a person, the highest form of consciousness. The notion of self, like other notions, is a gradual growth. The vague feeling of the ego which the first affective experiences afford, the feeling of modification in consciousness as the background or theater of presentation, and the recurrence of this feeling again and again in connection with objects new and old—and added to this the mass of more constant organic and vital sensation—all this is the beginning of the sense of personality or self. Its attributes of permanence, identity, and activity become more prominent with the development of will in connection with muscular effort, and with the establishment of the relation of subject and object, which is finally a fundamental fact. By reflection is meant the turning in of the mind to itself as its own object. By the result of reflection is meant, therefore, the knowledge which the mind has of its own operations, recognized as its own. It is an advance on the simple awareness of consciousness, in which there is no reference to self, as different from its object. In reflection this reference has distinct place, and the self is discovered through the act of attentive inspection, as having and exercising the characteristics of mind.

Idea of Self.—Through reflection, therefore, the idea of self is attained, and assumes its important place in the mental world. Round the self as a center the intellectual life plays. To it all possible forms of experience are referred. It brings coherence into the circuit of consciousness by giving it a center of reference and a circumference of limitation to the individual. The genesis of the sense or idea of self is one of the most interesting chapters in the mental growth of the child. One of the most remarkable tendencies of the very young child in its responses to its environment is the tendency to recognize differences of personality. It responds to what is called suggestions of personality. As early as the second month it distinguishes its mother's or nurse's touch in the dark. It learns characteristic methods of holding, taking up, patting, kissing, etc., and adapts itself by a marvelous accuracy of protestation or acquiescence to these personal variations. Its associations of personality acquire such importance that for a long time its happiness or misery depends upon the presence of certain kinds of "personality suggestion." It is quite a different thing from the child's behavior toward things which are not persons. Things become, with some few exceptions which are involved in the direct gratification of appetite, more and more unimportant; things get subordinated to regular treatment or reaction. But persons are constantly more important, as uncertain and dominating agencies of pleasure and pain. Movement by persons and its effects on the infant seem to be the most important factor in this peculiar influence; later the voice stands for a person's presence, and at last the face and its expressions equal the person in all his attributes.

Probably this distinction between persons and things, between agencies and objects, is the child's very first step away from what has been called a "projective" consciousness. The sense of uncertainty or lack of confidence grows stronger and stronger in its dealings with persons—an uncertainty contingent upon the moods, emotions, *nuances* of expression, and shades of treatment of the persons around it. A person stands for a group of experiences quite unstable in its prophetic as it is in its historical meaning. This, assuming it to be first in order of development, may be called the projective stage in the growth of the personal consciousness, which is so important an element in social emotion.

Further observation of children shows that the instrument of transition from such a projective to a subjective sense of personality is the child's active bodily self, and the method of it is the principle of imitation. As a matter of fact, accommodation by actual muscular imitation does not arise in most children until about the seventh month, so utterly organic is the child before this, and so great is the impetus of its inherited instincts and tendencies. But when the organism is ripe, by reason of cerebral development, for the enlargement of its active range by new accommodations, then he begins to be dissatisfied with projects, with contemplation, and so starts on his career of imitation. And of course he imitates persons. Persons have become, by all his business with them and theirs with him, his interesting objects, the source of his weal or woe, his uncertain factors. And, further, persons are bodies which move. And among these bodies which move, which have certain projective attributes, as already described, a very peculiar and interesting one is his own body. It has connected with it certain intimate features which all others lack. Besides the inspection of hand and foot, by touch and sight, he has experiences in his consciousness which are in all cases connected with this body—strains, stresses, resistances, pains, etc.—an inner felt series matching the outer presented series. But it is only when there arises a new kind of experience called effort—a set opposition to strain, stress, resistance, pain, an experience which arises, probably, first as imitative effort—that there comes that great line of cleavage in his experience which indicates the rise of volition, and which separates off the series first really subjective. Persistent imitation with effort is probably the first explicit volition, and the first germinating nucleus of self-hood over against object-hood. Situations before accepted simply are set forward, aimed at, wrought; and in the fact of aiming, working, the fact of agency, which arises from the child's realization of the possible capriciousness of character, is the nascent sense of subject. The subject-sense is an actuating sense. What has formerly been projective becomes subjective. The associates of other personal bodies, the attributes which made them different from things, are attached to his own body with the further peculiarity of actuation. This may be called the subjective stage in the growth of the self-notion. It rapidly assimilates to itself all the other elements by which the child's own body differs in his experience from other active bodies—the passive inner series of pains, pleasures, strains, etc. The self suffers as well as acts. All are set over against lifeless things, and against living bodies which act, but whose actions do not contribute to his own sense of actuation or of suffering.

Again, it is easy to see what happens. The child's subject-sense goes out by a kind of return dialectic, which is really simply a second case of assimilation, to illuminate these other persons. The project of the earlier period is lighted up, claimed, clothed on with the raiment of self-hood, by analogy with the subjective. The projective becomes ejective—i. e. other people's bodies, says the child to himself, have experiences *in them* such as mine has. They are also *me's*: let them be assimilated to my *me* copy. This is the third stage; the ejective, or social self, is born.

The ego and the alter are thus born together. Both are crude and unreflective, largely organic, an aggregate of sensations, prime among which are efforts, pushes, strains, physical pleasures and pains. And the two get purified and clarified together by this twofold reaction between project and subject, and between subject and ejeet. My sense of myself grows by imitation of you, and my sense of yourself grows in terms of my sense of myself. Both ego and alter are thus essentially social, which means imitative, creations; and for a long time the child's sense of self includes too much. The circumference of the notion is too wide. It includes the infant's mother, and little brother, and nurse, in a literal sense; for they are what he thinks of and aims to act like by imitating, when he thinks of himself. To be separated from his mother is to lose a part of himself, as much so as to be separated from a hand or foot. And he is dependent for his growth directly upon these suggestions which came in for imitation from his personal *milieu*.

Self-emotions.—The emotions which terminate on one's self must be clearly distinguished from the feeling proper of self. The feeling of self underlies all other forms of consciousness when self-consciousness has once arisen. Assuming this to be so, whatever self may be, we find that the contemplation of self, when it becomes the object of our reflection, arouses certain spontaneous and peculiar forms of emotional excitement. These are the emotions of self.

Such emotions attend either an exalted estimate of one's own person or possessions, or, on the other hand, a depreciatory estimate. The former may be called emotions of *pride*, and the latter emotions of *humility*. Looked at casually, emotions of pride include the states ordinarily called *pride*, *vanity*, *haughtiness*, *conceit*, *superiority*, *complacency*, *arrogance*, *self-confidence*, *forwardness*, etc.; and under emotions of humility are *humility*, *modesty*, *self-debasement*, *self-distrust*, *inferiority*, *bashfulness*, *meanness of spirit*, *weakness*, *poverty*, *shame*, etc. See IDEAL FEELINGS.

Seligman, Edwin Robert Anderson, LL. B., Ph. D.: professor of political economy and finance; b. in New York, Apr. 25, 1861; graduated at Columbia College 1879; studied three years at the Universities of Berlin, Heidelberg, Geneva, and Paris; at Columbia College Law School and School of Political Science 1882–84; lecturer on Political Economy, Columbia College, 1885–87; adjunct professor 1887–90; Professor of Political Economy and Finance 1890; treasurer of the American Economic Association 1885–90; associate editor *Political Science Quarterly* since its establishment in 1886; author of *Railway Tariffs and the Interstate Commerce Law* (1887); *Two Chapters on the Mediæval Guilds of England* (1887); *Finance Statistics of the American Commonwealths* (1889); *Taxation of Corporations* (1890); *On the Shifting and Incidence of Taxation* (1892).

Se'lim: the name of three Ottoman sultans. Selim I., Yavuz, the Inflexible (1512–21); b. 1467. By the aid of the janissaries he usurped the throne, deposing his father Bayezid II., whom he is believed to have poisoned shortly after. Then he put to death all his brothers and kinsmen. Attacking Persia he defeated Shah Ismaïl at Calderon with immense slaughter (1514) and annexed Kurdistan and Mesopotamia. Conquering Syria (1516), the title Servant of the Two Holy Cities (Mecca and Medina), hitherto reserved to the caliphs, was added to his name in the official prayer. He subdued Egypt (1517), hanging at the gate of Cairo the heroic Mameluke sultan Touman Bey. The sherif of Mecca sent him the keys of the Kaaba, and Mohammed XII., the last Abasside caliph, resigned to him the insignia and the rights of the caliphate. Since then the Ottoman sultan has been considered both political and spiritual head of Islam. The next three years he devoted to reorganization of his empire. Excessive use of opium hastened his end, and he died at Tchorlu (1521), the very place where eight years before he had fought against his father. A gifted poet, profound scholar, farsighted statesman, and resistless conqueror, he was bloodthirsty and cruel beyond expression. He is the only parricide among the Ottoman sultans.—Selim II., Mest, the Drunkard (1566–74); b. 1524; son of Suleïman II., and Roxelana. His generals subdued Western Arabia (1567) and Cyprus (1571), but lost the naval battle of Lepanto (1571), where 220 Ottoman ships were sunk or captured, 30,000 prisoners taken, and 15,000 Christian galley-slaves set free. Meanwhile Selim cared only for intoxication and the pleasures of the harem, and died from over-indulgence in wine (1574).—Selim III. (1789–1807); b. 1761; son of Mustapha III.; succeeded his uncle Abd-ul Hamid I. At his accession the empire seemed near dissolution. Syria was in rebellion; Egypt was tyrannized over by the Mamelukes; the Persians and Kurds menaced the eastern frontier; armies of brigands marched through the provinces; a hopeless war against Russia and Austria was going on. Selim was the first sultan animated by Western ideas. Ridding himself of the foreign war by the disastrous treaty of Jassy (1792), he endeavored to repress disorder and introduce administrative, commercial, and military reforms. But popular fanaticism denounced his innovations as violations of the Koran. The support he received from France through the French ambassador, Gen. Sebastiani, excited the jealousy of Great Britain. A British fleet appeared before Constantinople, but was repelled. Finally the janissaries and the Mussulman clergy combined; Selim was deposed and confined in the seraglio and his cousin Mustapha IV. raised to the throne (1807). The following year Baïractar Pasha, his devoted adherent, marched upon Constantinople with a formidable army. Thereupon Mustapha had Selim bowstrung, and Baïractar penetrated the palace in triumph, only to find the corpse of his master in the throne-room. E. A. Grosvenor.

Selimnia or **Islimiye**: See Slivno.

Selinsgrove: borough; Snyder co., Pa.; on the Susquehanna river, and the Penn. Railroad; 50 miles N. of Harrisburg, the State capital (for location, see map of Pennsylvania, ref. 4–F). It has good water-power; is in an agricultural region; contains a national bank with capital of $50,000, a monthly and two weekly newspapers, several sawmills and planing-mills, and sash-factories; and is the principal outlet for the produce of the county. The Missionary Institute of the Evangelical Lutheran Church (chartered in 1858) is located here. Pop. (1880) 1,431; (1890) 1,315; (1900) 1,326.

Seli'nus (Gr. Σελινοῦς): ancient city; on the southwest coast of Sicily; was founded in the seventh century B. C. by a Megarian colony, and derived its name from the quantities of wild parsley (σέλινον) which grew in the vicinity. A strong and flourishing city, it was almost ruined by the Carthaginians under Hannibal Gisgo, when 16,000 of its inhabitants were massacred and 5,000 made slaves (409 B. C.), and was entirely destroyed during the first Punic war (264–241 B. C.). Its ruined temples served as a refuge to the early Christians, but it was never rebuilt. These temples are the vastest in Europe. The last-built and largest, measuring 369 feet by 178 feet, with seventeen columns on each side and double porticoes, was erected toward the middle of the fifth century B. C., and consecrated to Apollo. Its finest sculptures have been removed to the Museum of Palermo. See Benndorf, *Die Metopen von Selinunt* (Berlin, 1873); and Baedeker, *Southern Italy and Sicily*.

E. A. Grosvenor.

Seljuks, sel-jooks': a Turkish tribe which, being driven from the highlands of Turkestan, settled in the plains on the E. of the Caspian Sea. There they were converted to Islam. They were famous for strength and courage, and the Caliph Motassem (833–842), chose his body-guard from among them. Under the leadership of their chief Seljuk—whence the tribe derives its name—these guards revolted, seized the temporal power, and founded an independent state in Khorassan, though all the time acknowledging the spiritual supremacy of their former masters. Togrul Beg, grandson of Seljuk, conquered Balkh and Khaurezm (Khiva) in 1041, Irak Adjemi (1043), Kerman and Fars (1047), Bagdad (1055), and Irak Arabi and Mosul (1061). Having thus completed the subjugation of Persia, he assumed the title of sultan. The extent and prosperity of the empire largely increased under his nephew Alp-Arslan (1063–73), the conqueror of the Byzantine emperor Romanus Diogenes, and under Malek Shah (1073–93), the son of Alp-Arslan. Malek Shah conquered Arabia, Syria, and Palestine, Armenia, and a large part of Asia Minor, ruling as far as the Chinese frontier and from the Caspian to the Arabian Sea. He founded at Bagdad a law school and an observatory, the first established in Asia, but removed the capital to Ispahan. He encouraged the construction of roads, bridges, canals, and works of public utility, being ably seconded in all his undertakings by his vizier, Nizam-ul-Mulk. The rapid growth of the power of the Seljuks was due to their religious ardor, to the skill and intrepidity of their early chiefs, and to their peculiar facility in assimilating not only their kindred of Turkish stock, but also subject races. Their decline dates from the division of their empire by Malek Shah into sultanates for his four sons, followed by other divisions. The sultanate of Iran was the chief, and was to exercise a sort of authority over the others. It was swallowed up by the sultanate of Khaurezm (1194), which in turn was overthrown by the Mongols (1221), when the last sovereign Ala-Eddin and his gallant son Djelal-Eddin were utterly defeated by Genghis Khan. The sultanate of Aleppo fell in 1114, that of Damascus in 1155, and of Kerman in 1191. The sultanate of Iconium comprised nearly all Asia Minor, and lasted till 1299, when Ala-Eddin III., having fled from the Mongols, died at Constantinople. From its ruins arose ten principalities, one of which under the Emir Othman was in time to subdue all the rest and to develop into the Ottoman empire. The Seljuks of Iconium and Iran were the Mussulmans earliest and most frequently encountered by the hosts of the first and second crusades, and were their most formidable antagonists. E. A. G.

Sel'kirk: a county of Scotland, anciently called Ettrick Forest; bounded by the counties of Peebles, Edinburgh, Roxburgh, and Dumfries; area, 257 sq. miles; pop. (1901) 23,339. Its surface is composed principally of rounded grassy hills, the highest of which is Dun Rig (2,433 feet), and it is chiefly devoted to cattle-raising. Selkirk was the birthplace of James Hogg, the "Ettrick Shepherd"; and of Mungo Park, the traveler; and it is noted in both literature and history. With Peeblesshire it sends one member to Parliament. The royal burgh of Selkirk, 39 miles S. E.

of Edinburgh, is the county-town. Pop. (1891) 5,788. It unites with Galashiels and Hawick in sending one member to Parliament.

Selkirk, or **Sealchraig**, ALEXANDER: mariner; b. at Largo, Fifeshire, Scotland, about 1676; made several voyages to the Pacific; was sailing-master to a privateer called the Cinque Ports Galley, and having quarreled with the captain, one Stradling, was put ashore, at his own request, Sept., 1704, on the uninhabited island of Juan Fernandez, off the coast of Chili, with some nautical instruments, a few books, a knife, kettle, axe, gun, and a supply of ammunition. Here he remained until Feb. 12, 1709, when he was relieved by Capt. Woodes Rogers of the privateer The Duke. He lived chiefly on the flesh of wild goats, which abounded in the island. He became mate to Capt. Rogers, whom he accompanied around the world; arrived in England Oct. 1, 1711, when his narrative appeared in an account of the voyage (1712), and in several separate publications. Selkirk subsequently entered the navy, rose to the rank of lieutenant, and died on board the man-of-war Weymouth in 1723. De Foe's celebrated story of *Robinson Crusoe*, which appeared in 1719, has been generally supposed to be based upon the adventures of Selkirk, by whom the incidents were said to have been communicated to De Foe, but there is little reason for supposing that the latter had more than a general knowledge of the facts of the case. *The Life and Adventures of Alexander Selkirk* (Edinburgh, 1829), by John Howell, is the best source of exact information on the subject.

Selkirk, THOMAS DUNDAS, Fifth Earl of: b. in Kirkcudbrightshire, Scotland, June, 1771; studied at Edinburgh University; succeeded his father as earl in 1799; spent several of the later years of his life in promoting emigration to the Red River of the North, British America, where the colony of Manitoba was long known as the Earl of Selkirk's Settlement. He published *Sketch of the British Fur Trade* (1816); *The Red River Settlement* (1817), and other works. D. at Pau, France, Apr. 8, 1820.

Selkirk Mountains: a range of Southeast British Columbia, W. of the Rocky Mountains and N. of Idaho, lying in a bend of the upper Columbia and to the W. of Kootenay Lake. The range is about 175 miles long by 80 broad, and attention was first generally drawn to it by the difficulties encountered by the engineers of the Canadian Pacific Railway in finding a practicable pass across it. Its elevations are from 6,500 to 9,000 feet, and the highest-known mountain in the range is Mt. Macdonald (formerly Mt. Carroll), 9,940 feet high. It is near Roger Pass, toward the northern end of the range, a narrow, rock-bound valley 3 miles long and 4,300 feet above the sea. Although the average elevation of this range is somewhat lower than that of the adjacent Rocky Mountains, its more abundant rainfall and snow cause a much larger development of glaciers and of fields of perpetual snow, which also extend here to lower levels. The line of perpetual snow is formed at an elevation of about 7,000 feet, and the timber-line rises to 6,000 feet. Numerous moraines and other traces of ice-action show that the glaciers were formerly much more extensive than now. The growth of trees is very abundant and dense, and they attain a great size. Trunks 8 feet in diameter are not rare. There are many signs of minerals, and the Gold Range lies immediately W. The Selkirk Range is thought to present many features of resemblance to the Alps. Active exploration of the range began in 1888.

MARK W. HARRINGTON.

Selma: city; capital of Dallas co., Ala.; on the Alabama river, at the head of navigation by steamboats, and the Birmingham, Selma, and N. O., the Louisv. and Nashv., the Mobile and Birmingham, the Queen and Cresc. Route, the Southern, and the West. of Ala. railways; 50 miles W. of Montgomery, 160 miles N. N. E. of Mobile (for location, see map of Alabama, ref. 5–C). It is in a cotton-growing region, and has a large trade in cotton, coal, lumber, and iron. It contains Selma University (Baptist, opened in 1878), Young Men's Christian Association library and reading-room, a national bank with capital of $400,000, 2 State banks with combined capital of $350,000, and a weekly and 2 daily newspapers. There are several cotton warehouses, railway machine-shops, and manufactories. The city was a military center during the war of 1861–65, having an arsenal, a navy-yard, artillery-foundries, and powder-works, and was captured by the Union forces Apr. 2, 1865. Pop. (1880) 7,529; (1890) 7,622; (1900) 8,713.

EDITOR OF "MORNING TIMES."

Selters, or **Seltzer Water**: the water of a mineral spring at Selters, in the valley of the river Ems, in Nassau, which has been known since the ninth century. Having become the most famous and widely known, probably, of all mineral waters, it is very skillfully and extensively imitated by chemical means in the U. S., as well as throughout Europe. It is an alkaline water, containing over 6 grains of sodium carbonate to the gallon, with 30 cubic inches of free carbonic acid. There are also minute quantities of lithia, baryta, and strontia, and of fluorine, with other commoner ingredients usually found in mineral springs.

Selwyn, ALFRED RICHARD CECIL, LL. D., F. R. S.: geologist; b. in England, July 28, 1824; educated in Switzerland. In 1845 he was appointed assistant geologist on the Geological Survey of Great Britain; in 1852 appointed by the Secretary of State for the Colonies to undertake the geological survey of the colony of Victoria, Australia; and in 1854 and 1859 examined and reported on the coal-fields and gold-fields of Tasmania and Australia. He was appointed one of the Victorian commissioners of mines in 1856; a member of the board of science and of the prospecting board in 1858: commissioner for the Victoria International Exhibition in 1861; and acted in various other important capacities until he left Australia for Canada in 1869. In that year he succeeded Sir W. E. Logan in the superintendency of the Geological Survey of the Dominion. He was gazetted C. M. G. in 1886.

NEIL MACDONALD.

Semantics, or **Semasiology** [*semantics* is from Gr. σημαντικός, significant, deriv. of σημαίνειν, show by a sign, deriv. of σῆμα, sign; *semasiology* is from Gr. σημασία, a signifying]: the doctrine of historical word-meaning; the systematic discussion of the history and development of changes in the meanings of words. The meaning of a word at any time is determined solely by its power to convey meaning to a speech-community at such time. The so-called "etymology" of a word exercises no restraint upon its meaning; it serves only to help in explaining how a present meaning came to be what it is. Thus the comparison of Germ. *klein*, little, with its predecessor O. H. Germ. *kleini*, fine, neat, small, and with its cognate English *clean*, serves only to show that the meaning "little" came to the word by the route: clean, neat, trim, fine, small. Such determination of the history of meaning frequently aids most directly in fixing the horizon of a word's meaning, i. e. the range of its general or normal meaning, within which range the great variety of its occasional or special meanings is permitted. When the word home is used in the sense of an asylum, as a "home for the blind," it may be said to be a special or occasional use of the word made possible by the character of the general or normal horizon of the word's meaning. This general range of meaning covers application to an abode as habitual and permanent, and as being one's own. The intelligibility of the special uses is conditioned on the one hand by the general meaning, on the other by the power of interpretation involved in the context and situation. When it comes to pass that a special meaning displaces the general meaning and sets itself up in its stead as the general meaning, a shift of signification has taken place. Thus the word bead once meant "prayer" (cf. Germ. *gebet*). It was also applied in special use to a ball of the rosary that marked a prayer. This special meaning has become the normal meaning. See Paul's *Principien der Sprachgeschichte* (Eng. trans.), chap. iv.; Strong-Logeman-Wheeler, *History of Language*, chap. iv.; Darmesteter, *The Life of Words* (1886): R. C. Trench, *Study of Words* (20th ed. 1888); also the article LANGUAGE.

BENJ. IDE WHEELER.

Sembrich, MARCELLA: See the Appendix.

Semele, sem'ĕe-lēe (Gr. Σεμέλη): in Grecian mythology, a daughter of Cadmus. She was loved by Zeus, and was persuaded by Hera to demand of her lover that he should visit her once in all his royal majesty. Zeus begged her to desist from this demand, but as she would not, and he had sworn to grant her any wish, he came to her with thunder and lightning, and she perished in the flames. She was pregnant by Zeus with Dionysus (Bacchus). Zeus cut the infant from the womb of the dying Semele, and concealed the child in his own thigh until the time for his birth had come, when he was born for the second time.

Seminaries, Theological: See SCHOOLS.

Sem'inole Indians: See MUSKHOGEAN INDIANS, UNITED STATES (*History*), and OSCEOLA.

Semipalatinsk′: Russian province and town of Central Asia. The province is on the upper Irtish river, between Siberia and Lake Balkash. Area, 184,631 sq. miles. It is of triangular form, with the apex directed N. A range of mountains and hills which runs E. and W. through its middle separates the great steppe of the Irtish on the N. from the steppe of Balkash on the S. Pop. (1897) 688,639, four-fifths of whom are Kirghiz, who are generally nomadic. The remainder are nomadic Kalmuks and sedentary Russians, Sarts, and others. The chief town is Semipalatinsk, on the right bank of the Irtish, in lat. 50° 24′ N. (see map of Asia, ref. 3–E). Although of administrative importance, it is a cheaply built and decaying town, surrounded by the bare steppe, and in constant danger from moving dunes. The climate is rigorous, and industry and traffic are small. Pop. (1897) 26,353. MARK W. HARRINGTON.

Semi-Pelagianism: See ANTHROPOLOGY (*Theological*).

Semir′amis: according to Ctesias, the wife of Ninus, founder of the Assyrian kingdom,—a woman of extraordinary beauty, passion, and military prowess who flourished nearly 2,200 years B. C., survived and eclipsed her husband, and after a reign of forty-two years abdicated in favor of her son, Ninyas. All this is admitted to be mythical. Herodotus (*Hist.*, i., 184) mentions a Semiramis who ruled over Babylon five generations before Nitocris. This Semiramis of Herodotus is certainly not to be identified with the Semiramis of Ctesias. The name appears to have been derived from Sammuramat, found upon the monuments, wife of the Assyrian king Rammannirari III. (811–782 B. C.).

Semirechensk′: Russian province of Central Asia; S. of Lake Balkash, and bounded on the S. and E. by Chinese territory; area, 152,280 sq. miles. The province is oval in form, with the long axis N. and S. It falls into two natural divisions, the northern plain and the southern and western mountainous region. The plain is the country of the "seven rivers" (Russian, *Semiretchie*), all tributaries of Lake Balkash. This part is dry, largely sandy, in some places a sandy desert, grows strongly alkaline toward the lake, and has a rigorous climate. The mountainous region includes a part of the Thian-shan range and many lakes, the largest being Issykul; has more rain, a milder climate, and considerable forest growth. Production and trade are very small. Pop. (1897) 990,243, largely Kirghiz, the remainder of many races, fully half nomadic. MARK W. HARRINGTON.

Semit′ic Languages [*Semitic* (i. e. pertaining to Shem or his descendants) is based on the Greek transliteration (Σήμ) of Heb. *Shēm*, which literally means name, sign, celebrity]: a well-defined group of languages co-ordinate in importance with the group known as the Aryan or Indo-European, but sharply marked off from it. The principal representatives of the Semitic group are, in alphabetical arrangement, Arabic, Aramaic, Babylonian, Ethiopic, Hebrew, Phœnician, and Syriac. The name Semitic is an inexact term. It rests on the assumption that the nations classed in the tenth chapter of Genesis among the sons of Shem spoke languages belonging to a single group, and embraced also all the members of that group. Neither proposition is correct. The principle governing the order of enumeration in the famous table of nations is geographical position, and not linguistic affinity. Instead of Semitic, various terms have been proposed, the most satisfactory among them being Syro-Arabic, first suggested by Renan.

The basis of union between the languages belonging to the Semitic group is such that they form intersections of one and the same branch, in contradistinction to the Aryan languages, where two distinct branches emanating from the parent trunk are recognized; and, again, a subdivision into north and south is sufficient for the Semitic group, while in the case of the Aryan eight grand divisions are commonly recognized. The relation of any North Semitic language to a member of a South Semitic is closer than that between members (say) of the Indo-Iranian and the Teutonic division, and almost as close as that marking (say) the English and German within the Teutonic division. Correspondingly, within the Northern and Southern Semitic divisions the members stand in a relation toward one another closely approaching that of co-ordinate dialects.

The intimate relationship thus indicated between the languages of the Semitic group is due to a variety of causes, prominent among which are (1) the comparatively limited territory over which the languages are spread; (2) the uninterrupted communication in consequence largely of this limited territory among the nations speaking or adopting a Semitic language; and (3) the closer ethnic relationship of the Semitic nations, only two races being distinguished by scholars, as against five adopted for the Aryan group.

The chief traits characterizing the Semitic languages are (1) the peculiar relations existing between the consonants and vowels whereby the former constitute the essential elements of a stem and of its accretions, while the latter play the subsidiary though important *rôle* of particularizing the general meaning conveyed by the consonantal framework. (2) The triliteral character, either actual or adapted, of the stems within the historical period of the language. The comparatively small number of instances in which the number of consonants constituting the stem are four, and still more rarely five, are only apparent exceptions to the rule. (3) The arrested development in the expression of the time-relations in the case of the verb, which, starting out with the vague differentiation by means of pronominal affixes between the emphasis placed on the act and when placed on the actor, does not pass beyond the stage of distinguishing between the act when completed, whether in reality or in the mind of the speaker, and when not similarly completed. (4) The pragmatic character of the verbal and nounal formations and the parallel relationship existing between the two. The Semitic stem as such has both substantive and verbal force, and while the actual number of modal variations differs for the different languages of the group, the manner of expressing the variations, (*a*) by means of the reduplication of the second or third letter of the stem, (*b*) by vocalic lengthening after the first consonant or by a vocalic prefix, (*c*) by the prefixing of certain consonants *n*, *h*, *sh*, *t*, is the same in all; and not only does the noun-formation follow the same principles, but the agreement with the verb is such as to indicate the ultimate fusion of the two. (5) The paucity of auxiliary particles, more particularly of conjunctions.

Besides these general traits, there are a number of other features of a secondary order which the Semitic languages have in common. Thus, the general agreement of the vocabulary is very large, embracing a considerable number of common words, the pronouns in the first instance and terms of relationship in the second, as well as verbal stems. But within the Semitic group the agreement is closer between some as against others. The general character of the Semitic syntax is marked by its simplicity, and there is less variation between the languages in this respect than one would perhaps expect until we come to the period of a closer contact between Indo-Europeans and Semites.

Perhaps the most noticeable point of variation among the Semitic languages is to be found in the writing employed. They present at least three distinct alphabets: (*a*) The cuneiform characters of Babylonia and Assyria; (*b*) the Phœnician and its derivatives, the square-letter Hebrew, Palmyrene, Arabic, Syriac, Samaritan, together with the alphabet of the South Arabic and Abyssinian inscriptions as the probable prototype of the Phœnician; and (*c*) the Ethiopic, which is sufficiently distinct to merit a place for itself.

On the basis of the features enumerated the division into North and South Semitic languages is made. To the former belong the Phœnician, Hebrew, Moabitic, Babylono-Assyrian, and the various Aramaic dialects, biblical Aramaic, Palmyrene, Nabatæan, the idioms of the Babylonian and of the Palestinian Talmuds, Samaritan, the North Arabic and ancient Syrian inscriptions, Syriac—Eastern and Western—Mandaic, and the modern Syriac dialects of Urmia, Tur-Abdin, Salames, and of the Lebanon district. To the Southern division belong (1) classical Arabic, and the modern dialects of Egypt, Syria, and Morocco, with Maltese as a fourth, developed under Italian influence; (2) Sabæan, also known, though less correctly, as Himyaritic, of which Minæan is a dialect, and which appears to survive in some dialects spoken along the southern coast of Arabia; (3) Ethiopic or Geëz, spoken in the ancient kingdom of Abyssinia, and surviving in the modern dialects of Tigre, Tigrina, and Amharic, together with its offshoots, Gurague and Harar.

By way of simplification the North Semitic group can be said to comprise (1) Hebræo-Phœnician, (2) Babylono-Assyrian, and (3) Aramaic; and the South Semitic (1) Arabic and (2) Yemenitic-Abyssinian. Taking these up in turn, the Hebrew and Phœnician bear so close a resemblance to one another that they may be regarded as co-ordinate offshoots of some older and lost form. Of the two, the Phœnician on the whole presents the more archaic aspect. Of literature in the true sense nothing has survived in the original Phœnician. Instead there are inscriptions on tombs, tem-

ples, votive offerings, seals, and coins, covering the period from about 600 B. C. to the third century A. D., and significant chiefly as being coextensive with the large domain over which the language spread. The Phœnician script is at least as old as 1000 B. C. In the course of time slight variations arose between the Phœnician of the mainland and that spoken in the various settlements, but hardly sufficient to affect seriously the unity of Phœnician speech.

Of the Hebrew language, the oldest written remains, which date from the seventh century B. C. (see HEBREW LANGUAGE), reveal an alphabet still identical in form with Phœnician. The so-called square characters do not make their appearance till the fourth century of this era. In the Old Testament, which is the chief source of our knowledge of Hebrew, the unifying process superinduced by the late editing of the various books composing it, and the inaccurate preservation of the oldest remains, occasion great difficulties in tracing the development of the language. So much, however, is certain, that the approach to the Aramaic is closer in what may safely be regarded as the earliest sections of the collection.

The bulk of the Old Testament literature, while thus containing elements of varying antiquity, dates in its present form from the centuries intervening between 800 and 500 B. C. The Psalms (with some exceptions), Proverbs, Lamentations, Ecclesiastes, Song of Songs, Ruth, Job, Esther, and Daniel, as well as the final version of the Pentateuch, belong to the period subsequent to the Exile, the latest being in all probability Daniel and Ecclesiastes, which are to be placed in the second century B. C. After this time Hebrew still continues to flourish as the sacred language of the synagogue, and the medium of interchange between the Jewish scholars, gradually giving way to the Aramaic idiom adopted by the populace upon the return from the Babylonian exile.

Of *Moabitic* speech there is only a single specimen—the monument of King Mesha dating from about 850 B. C., and found in 1870 at Dibon, the capital of ancient Moab. The inscription suffices to prove the practical identity of the Moabitic with Hebrew, and it is likely that the speech of the various other tribes and small principalities settled around the Dead Sea and other parts of the Sinai peninsula did not differ materially from the speech of Moab.

Babylono-Assyrian is the language spoken by the ancient inhabitants of the country roughly included between the Tigris and Euphrates. The southern part of the district, which may be distinguished as the Euphrates valley, is the older settlement. The oldest literary remains of Babylonian are the inscriptions of rulers who reigned over the petty kingdoms into which the valley was split up. Next come a large number of religious texts—hymns to the gods and incantations to gods and spirits. From the south, the culture spread to the north, which is distinguished as the Assyrian empire. About the twelfth century B. C. Assyria secures a perfect independence from Babylonia, and soon obtains the supremacy over the latter. Beyond historical annals, however, no original literature was produced in Assyria, whereas in the south poetry, astronomy (in connection with astrology), and medicine (as an offshoot of magic) continued to flourish. The writing used in both Babylonia and Assyria is the cuneiform, so called from the wedge-like forms that the letters in the later phases of their development assumed. See CUNEIFORM INSCRIPTIONS.

The larger bulk of Babylonian literature consists of commercial and legal tablets of clay, giving records of all kinds of transactions, of settlements of disputes, the detailed terms of contracts, accounts, etc. Ranging from the period of 2000 B. C. through the Persian and Greek supremacy over Mesopotamia down to within a few decades of the Christian era, they furnish the most important source for the study of the common speech. The language of the north remains identical in all but minor dialectical variations with that of the south. Occupying a position midway between Hebræo-Phœnician and the Aramaic group, it is yet marked by peculiarities in verb-formation and lexicographical features that indicate an approach to the South Semitic division.

The *Aramaic* group presents a greater number of subvarieties than the two others, and also covers a wider stretch of territory. The oldest specimens of Aramaic speech are the inscriptions found at Sindschirli in Northern Syria, which date from the eighth century B. C. The Sindschirli inscriptions mark the northern limit of Aramaic speech, the southern being the Sinai peninsula and Central Arabia. In the course of time Aramaic became the popular idiom of the entire region lying between the Euphrates valley and the Mediterranean coast, and extending to the N. as far as the Taurus range. The traces of this wide reach are to be seen in the numerous dialects that arise within this district. The most notable of these are (*a*) the dialect of Palmyra; (*b*) the Samaritan, of which besides the translation of the Pentateuch and Joshua some religious fragments are preserved; (*c*) the Syriac proper, in reality the Aramaic dialect of the Christians at Edessa. Slight variations in pronunciation and expression, in addition to distinctive scripts, warrant the division into Eastern and Western Syriac. (*d*) A direct offshoot of biblical Aramaic is the later Palestinian dialect, in which the so-called Jerusalem Talmud is written; while (*e*) the idiom of the Babylonian Talmud represents an eastern variety of the same dialect, occupying a middle ground between biblical Aramaic and Syriac. Aramaic dialects survive in various degrees of corruption in the Christian settlements around the Lake of Van, in the Kurdish Mountains, and in some Lebanon villages. See ARAMAIC.

Arabic.—The most important of the languages of the southern group is the Arabic, which, through the Mohammedan conquest in the seventh century A. D. successfully usurped the place of Aramaic speech in the Semitic world. During the four centuries of Mohammedan supremacy in both Orient and Occident the intellectual movement accompanying the spread of the new religion produced an extensive literature. The only specimens of Arabic literature older than the time of Mohammed are poetical compositions, which in the process of gathering lost some, if not much, of their ancient character. European interference with Mohammedan supremacy, which begins with the crusades, has acted as a powerful factor in destroying to some extent the unity of Arabic speech, so that the dialects of Syria, Egypt, and that of the western coast of Africa have become three distinct varieties. See ARABIC.

Sabæan.—What may be considered to be an ancient form of Arabic speech has been found on inscriptions discovered by travelers in various parts of Southern Arabia (Yemen, Hadhramout), and in some Sabæan settlements of Central Arabia and in Abyssinia. They confirm the existence of an advanced culture which flourished in the south as early at least as 1000 B. C., and of which Abyssinian civilization appears to be an offshoot. In the Yemenitic inscriptions two dialects are distinguished, the Sabæan proper and the Minæan. The alphabet of the Sabæan inscriptions presents some remarkable features. It is certainly more archaic than Phœnician, and this circumstance, taken in connection with the high rank of Sabæan culture, lends additional force to the theory (which is growing in favor among scholars) that makes the Phœnicians the borrowers instead of the inventors of their alphabet, and fixes the place of the invention in Southern Arabia.

Ethiopic, or, to use the native name, *Geëz* (meaning emigrant), falls in the direct line of succession to Sabæan, being the form assumed by the language at the time (about the fourth century A. D.) when Abyssinia became a Christian possession. The alphabet, while connected with the Sabæan characters, has developed, partly on independent lines, partly under Greek influence, in such a way as to present a sufficiently unique appearance.

The Ethiopic literature is almost exclusively religious. Ethiopic continues in use as the sacred language of the Christian Church in Abyssinia. The popular speech bears somewhat the same relation to Ethiopic as the modern Arabic dialects do to the language of the Koran, except that the variations between the several dialects are hardly so pronounced.

The Original Home of the Semites.—Any attempt to trace the origin of the Semitic languages to some common starting-point does not include the problem of the origin of the races which in historic times appear as integral parts of the Semitic world. Separating in this way the question of race from that of language, three theories regarding the cradle of the Semites at present dispute the field. The one starting out from the general proposition that the most ancient Semitic culture, other things being equal, arose in the oldest center of Semitic settlement, would place in the Euphrates valley the original home of the Semites. A second view, held by perhaps the majority of modern scholars, seeks the home of the Semites in Arabia, as being the most favorable for the production of traits, customs, and religious ideas regarded as peculiarly Semitic. More recently evidence has been adduced in favor of Africa as the starting-point both of Semitic speech and of Semitic migration. An important factor in this theory is the relationship that has been demonstrated to exist between Egyptian and the Semitic

languages, a connection so close as to warrant the assumption of a common origin for the two, Egyptian itself being the result of a combination of a Semitic substratum with Hamitic elements. There is nothing improbable in the supposition of an eastern migration of Semites into Arabia and the Euphrates valley, and then by further moves an entrance into Palestine and Syria. If, as seems probable, the origin of the so-called Phœnician alphabet, which is so peculiarly adapted to Semitic speech, is to be sought in Southern Arabia, an additional support for what may be called the African theory will be found. See LANGUAGE.

LITERATURE.—Ernest Renan, *Histoire des Langues Sémitiques* (5th ed. Paris, 1878); William Wright, *Comparative Grammar of the Semitic Languages* (Cambridge, 1890); Theodor Noeldeke, *Die Semitischen Sprachen* (Leipzig, 1887); J. Barth, *Die Nominalbildungen in den Semitischen Sprachen* (Leipzig, 1889–91). MORRIS JASTROW, Jr.

Semler, JOHANN SALOMO: theologian; b. at Saalfeld, Saxe-Meiningen, Dec. 18, 1725; studied theology at the University of Halle, where he was appointed professor in 1751, and director of the theological seminary in 1757. D. at Halle, Mar. 14, 1791. He took a prominent part in the starting of the rationalistic movement in the German theology, but he was cautious in forming his views and careful in arguing them; and although his talent as an author was rather small, his works are pervaded by a spirit of genuine historical criticism, which exercised great influence. His principal works are *Apparatus ad liberalem Veteris Testamenti interpretationem* (Halle, 1773); *Abhandlung von freier Untersuchung des Kanons* (4 vols., 1771–75); *Versuch einer biblischen Dämonologie* (1776); *Versuch christlicher Jahrbücher* (2 vols., 1783–86); and an autobiography (2 vols., 1781–82). Revised by S. M. JACKSON.

Semlin (Hung. *Zimony*): town of Austria, at the eastern end of the military frontier, at the confluence of the Save and the Danube, opposite Belgrade (see map of Austria-Hungary, ref. 9–H). It is poorly built, a large portion consisting of mud huts, but it carries on a very important transit trade between Austria and Turkey. Pop. about 13,000.

Sem'mering, or **Semering**: a branch of the Noric Alps, forming the boundary between Lower Austria and Styria; rises 4,416 feet above the sea, and contains, at an elevation of 3,066 feet, the principal pass leading from Vienna to Trieste. The first carriage-road was built here in 1728 by Charles VI., who placed at the turning-point of the road a memorial column with the inscription, *Aditus ad maris Adriatici litora.* In 1840 a longer but more comfortable road was completed, and in 1854 a railway was opened between Gloggnitz on the Austrian and Mürzzuschlag on the Styrian side, ascending to 2,893 feet, and leading through fifteen tunnels and over sixteen viaducts. The road was constructed by Carlo Chega, and was considered the most audacious and most ingenious engineering work of its kind.

Semmes, RAPHAEL: naval officer; b. in Charles co., Md., Sept. 27, 1809, of Scotch-Irish parentage; became a midshipman in the U. S. navy 1826; was a volunteer aide to Gen. Worth in Mexico 1847; became commander 1855; was secretary of the lighthouse board 1859–61; resigned at the beginning of the civil war; held a commission in the Confederate navy; obtained great notoriety by his exploits as commander of the Sumter and the Alabama in capturing and burning scores of U. S. merchant vessels. After the war he edited a daily paper in Mobile, Ala., subsequently becoming professor in the Louisiana Military Institute, but returned to Mobile to practice law. Author of *Service Afloat and Ashore during the Mexican War* (Cincinnati, 1851); *Campaign of General Scott in the Valley of Mexico* (1852); *The Cruise of the Alabama* (New York, 1864); and *Memoirs of Service Afloat during the War between the States* (Baltimore, 1869). He was editor of the Memphis *Bulletin* in 1867. D. at Mobile, Aug. 30, 1877. Revised by C. BELKNAP.

Semoli'na [from Ital. *semolino*, liter., dimin. of *semola*, bran (whence Fr. *semoule*, semolina) < Lat. *si'mila*, the finest wheat flour]: an article of food much used in France and Italy, and to a small extent also in Great Britain and other countries; consists of a finely cracked wheat, or a very coarse meal made from wheat. The hard-grained wheats of Spain, Odessa, and Southern Italy are best adapted for making it. As those wheats are not easily reduced to flour, small particles continually escape being crushed by the millstones, and after grinding they are separated into various grades. Semolina is used in making bread, puddings, and soups.

Sem'pach: village of Switzerland, canton of Lucerne; famous for the battle fought here on July 9, 1386, between the Austrians and the Swiss, in which the Austrian noblemen, in spite of their valor and superior numbers, were butchered like sheep by the Swiss peasants, as they were unable to use their horse, and unable to fight on foot encumbered by their heavy armor. The army of Duke Leopold, consisting of 4,000 horse, appeared before Sempach on July 9, 1396, and was there met by the confederated Swiss, numbering 1,300. As the ground was unfitted for the action of cavalry, the knights dismounted and formed themselves into a solid and compact body. The Lucerners charged, but the wall of steel was impenetrable, and not a man of the Austrians was wounded, while sixty of the bravest Lucerners, with their chief, were killed. Then Arnold von Winkelried, a knight of Unterwalden, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom, and bore them down to the earth by the weight of his body. His companions rushed over his body into the breach thus made, slaughtered a great number of the armor-encumbered knights, and threw the remainder into the utmost confusion and dismay. See Otto Kleisner, *Die Quellen zur Sempacher Schlacht und die Winkelried-Sage* (Göttingen, 1873).

Semper, GOTTFRIED: architect; b. in Hamburg, Nov. 29, 1803; studied mathematics at Göttingen, architecture in Munich and Paris; traveled much in Italy, Sicily, and Greece; was appointed Professor of Architecture at Dresden in 1834; fled to London in 1849 on account of his participation in the revolutionary movements, and taught at the Royal Academy in Marlborough House till 1856, when he became Professor at the Polytechnic Institude of Zurich. In 1869 he was called to Vienna to give advice as to the proposed building of the museum, and in 1871 he settled there to superintend those important structures. In 1869 also he was employed upon the new Dresden theater in place of the one burned in that year; this building was not finished until 1878. His other important buildings are the Polyteehnicum at Zurich, the Church of St. Nicolai in Hamburg, the synagogue at Dresden, etc. At the Universal Exposition of 1867 he exhibited a plan of a theater in Rio de Janeiro, for which he obtained a gold medal. He wrote *Die vier Elemente der Baukunst* (Brunswick, 1851); *Ueber Industrie, Wissenschaft und Kunst* (1852); *Der Stil in den technischen und tektonischen Künsten* (2 vols., Frankfort, 1860–65), etc. He set forth with great decisiveness and defended with many ingenious arguments and acute observations the view that the antique architecture and sculpture were polychromic throughout, and he decorated the antique department of the Art Museum of Dresden in accordance with this principle. D. in Rome, May, 1879.

Revised by RUSSELL STURGIS.

Semper, KARL: naturalist; nephew of Gottfried Semper; b. at Altona, Germany, July 6, 1832; was educated in the naval school of Kiel and the Polytechnic School of Hanover, and studied natural science in the University of Würzburg. After visiting the principal countries of Europe he embarked in 1858 for the Indies, visited Manila, the Philippine Islands, China, and Japan, and was after his return to Europe, in 1866, appointed Professor of Zoölogy at Würzburg, and held the position until his death May 29, 1893. He visited the U. S. in 1877, and delivered a course of lectures before the Lowell Institute, Boston, published under the title *Animal Life as affected by the Natural Conditions of Existence* (New York, 1881). He published *Reisen im Archipel der Philippinen* (Wiesbaden, 1867–72); *Die Philippinen* (Würzburg, 1869); *Die Palau Inseln im stillen Ocean* (Leipzig, 1873); *Die natürlichen Existenzbedingungen der Thiere* (Leipzig, 1880), and other works. He also edited 9 volumes of *Arbeiten aus dem Zoologischen Institut* in Würzburg. Revised by J. S. KINGSLEY.

Senancour, se-năn'koor', ÉTIENNE PIVERT, de: author of *Obermann*; b. in Paris in 1770; educated for the priesthood, but disliking that profession ran away from home and lived in Switzerland, whence after a brief period of married life he returned to France, saddened by the loss of his young wife and beggared in fortune. His scanty earnings as a hack writer in Paris were supplemented by a small pension granted by Louis Philippe, but his struggle with poverty combined with domestic misfortunes and ill health to give his books a tone of deep melancholy. His *Rêveries sur la Nature primitive de l'Homme* (1799) is strongly marked by the influence of Rousseau. *Obermann* (1804) is the story of

a solitary and melancholy person, who gives expression to his skepticism and his weariness of life in a series of letters written from Switzerland. While the author belongs to the sentimental school of writers and the work is tinged with a somewhat morbid spirit, its style is good, and the subject-matter often striking and original. It exerted a considerable influence upon his own and the succeeding generation, and Matthew Arnold characterizes him as the most sincere and impressive of sentimental writers. D. at St.-Cloud, Feb., 1846.

Senate [viâ O. Fr. from Lat. *sena'tus*, deriv. of *se'nex*, *se'nis*, old man, elder]: originally, the deliberative assembly of the Romans; in modern times the upper house of the national Legislature in the U. S. and in several other countries. See LEGISLATURES.

Senato'bia: town; capital of Tate co., Miss.; on the Illinois Cent. Railroad; 35 miles S. of Memphis (for location, see map of Mississippi, ref. 3–F). It is in an agricultural region, is an important shipping-point of corn, cotton, and live stock, and contains a Peabody public school, a State bank with a capital of $25,000, and 2 weekly newspapers. Pop. (1880) 935; (1890) 1,077; (1900) 1,156.

Sendai, sen'dī': an important city in the northeast of Japan; situated on the left bank of the Shoshi-gawa, about 10 miles inland (see map of Japan, ref. 5–E). It was the castle-town of the great lords of the Date family, who at one time embraced Christianity; and relics of a mission to Rome made in 1615 are still preserved. The castle, partly destroyed in the civil war of 1868, is used as a barrack, Sendai being a military center for the north. It is also an educational center of importance, having a higher middle school, normal school, and several Christian schools. The Greek Church has a strong following in the neighborhood. The town is noted for the production of trays and other articles made of a fossil wood. Pop. 60,000. J. M. DIXON.

Sen'eca: city (founded in 1860); capital of Nemaha co., Kan.; on the Nemaha river, and the Kan. City N. W., and the St. Jos. and Gr. Island railways; 64 miles N. by W. of Topeka, 77 miles W. of St. Joseph, Mo. (for location, see map of Kansas, ref. 4–I). It is in an agricultural, fruit-growing, and stock-raising region, has a large butter-trade, grist-mill, foundry, and shoe-factory, and contains 4 churches, a national bank with capital of $50,000, a State bank with capital of $75,000, a private bank, and 3 weekly newspapers. Pop. (1880) 1,203; (1890) 2,032; (1900) 1,846.

EDITOR OF "TRIBUNE."

Seneca: town; Newton co., Mo.; on the St. L. and San Fran. Railway; 327 miles S. W. of St. Louis (for location, see map of Missouri, ref. 7–D). It is in an agricultural and lead and zinc mining region, has several mills and extensive stock-raising interests, and contains the only tripoli mines in the U. S., a State bank with capital of $16,000, and a weekly newspaper. Pop. (1880) 380; (1890) 1,101; (1900) 1,043.

EDITOR OF "DISPATCH."

Seneca, LUCIUS ANNÆUS: philosopher and writer of tragedies; b. at Corduba, Spain, about 4 B. C.; belonged to a Spanish-Roman family, but was educated in Rome. His father, Annæus Seneca (the prænomen Marcus is without authority; *Lucius* is found in several MSS.), the Rhetorician (b. not later than 54 B. C. at Corduba; d. in Rome about 39 A. D.), was a man of literary studies, wealthy and influential. Almost the whole of his *Suasoriarum Liber* and five books of his *Controversiarum Libri Decem* are extant, edited by Bursian (Leipzig, 1857), Kiessling (Leipzig, 1872), H. J. Müller (Prague, 1887), and give a striking aspect of the moral degradation and æsthetic futility to which the oratorical art had sunk in Rome at his time. (See Koerber, *Ueber den Rhetor Seneca und die römische Rhetorik seiner Zeit*, Marburg, 1864.) Young Seneca was trained in his father's art, and although he afterward left rhetoric for philosophy, he never forgot the lessons of his youth. His style, with all its pompous dignity and brilliant pointedness, is characterized throughout by preponderance of the form over the contents, of the expression over the thought, which rises from a lack of veracity, and results in mannerism and affectedness. Caligula said of his eloquence that it was sand without lime. After traveling in Greece he began to practice as an orator in Rome, and achieved great forensic triumphs, but in 41 A. D. Messalina had him accused of entertaining an adulterous connection with Julia, the daughter of Germanicus and the wife of Vinicius, and he was banished to Corsica. Here he lived for eight years, and wrote, among other works, *De Consolatione ad Helviam matrem Liber*, a consolatory letter to his mother, and one of the best of his writings, and *De Consolatione ad Polybium Liber*, a similar letter to Polybius, a freedman and one of Claudius's favorites, who had lost his brother; but this letter is one of his most disagreeable productions on account of its flattery, and its genuineness has been disputed. When Claudius married Agrippina, Seneca was recalled by her influence in 49 and appointed tutor to her son, Domitius, afterward the Emperor Nero. Most of Seneca's very prolific authorship belongs to this last period of his life. He wrote moral essays, philosophical letters, a biography of his father, orations, physical treatises (*Quæstiones Naturales*, and others now lost), epigrams, and tragedies. The last mentioned, nine in number, are especially interesting from being the only complete specimens of Roman tragedies extant, and from their influence upon the modern revival of tragedy. It is not certain that they were ever performed, or that they were intended to be. They are admirably adapted for recitation, being largely only versified declamations decked out with rhetoric and moral sentiments. In organic structure they are weak, and they sin against the dramatic decencies. The genuineness of these plays, often attacked, is generally conceded, although Ribbeck holds to the possibility of another Seneca, and Leo suspects the latter part of the *Hercules Œtæus*. A tenth play, *Octavia*, which is a *prætexta* and contains an allusion to Nero's death, can not be by Seneca. The best editions are by Leo (Berlin, 1878–79, 2 vols.), and by Peiper and Richter (Leipzig, 1867). Of his prose essays, some of the most celebrated, *De Ira*, *De Tranquillitate Animi*, etc., are inexhaustible sources of piquant quotations; others, *De Clementia ad Neronem Cæsarem Libri Duo*, are rather curious on account of the personal character which the author has not been able to conceal under the representation of his ideas; but the largest portion is vague and trivial—*De Constantia Sapientis*, *De Brevitate Vitæ*, etc. His 124 *Epistolæ ad Lucilium* have more interest, containing moral observations and aphorisms of practical value. His *Apocolocyntosis* is also worth reading. It is a satire on Claudius, written after the death of the emperor, and is very biting. It is a specimen of the Menippean satire, being part prose and part verse, doubtless written to please Nero, for whom Seneca also composed a funeral oration, not extant, upon Claudius. Seneca was consul in 56, but after the death of Burrus in 62 his influence with Nero began to wane. The emperor began to hint at the millions which the philosopher had amassed. Seneca became alarmed, and offered to repay the whole amount and content himself with a small annuity. Nero refused the offer, and Seneca then retired from the court, gave no levees, was never seen in public, and tried his utmost to sink into oblivion. But in vain. Some one mentioned him as an accomplice in the conspiracy of Piso, and Nero sent him an order to commit suicide, which he immediately obeyed. He opened the veins in his feet and arms, and, discoursing with his friends on the brevity of life and the equanimity of the philosopher, bled to death in a hot bath 65 A. D. From the revival of letters in Europe, and up to the beginning of the nineteenth century, the works of Seneca, both the philosophical and the poetical, were much read and much admired. Editions were numerous and translations were made into all European languages. There were, however, always some voices which protested against his fame; and when his admirers tried to prove that he was a Christian and a friend of St. Paul, his adversaries undertook to prove that he was an atheist and a hypocrite. Among later editions of his works are those of his prose writings by Fickert (3 vols., Leipzig, 1842–45) and by Haase (3 vols., Leipzig, 1852–53); of the *Apocolocyntosis* in Buecheler's Petronius (Berlin, 1882); and *Dialogorum Libri XII.* (Gertz, Copenhagen, 1886). See Farrar's *Seekers after God*; Lightfoot's *Essay on St. Paul and Seneca*, appended to his *Commentary on the Epistle to the Philippians* (London, 1879); Westerburg's *Der Ursprung der Sage dass Seneca ein Christ gewesen* (Berlin, 1881). Revised by M. WARREN.

Seneca Falls: village; Seneca co., N. Y.; on the Seneca river (the outlet of Seneca Lake), and the N. Y. Cent. and Hud. River Railroad; 3 miles W. of Cayuga Lake Park, a popular summer resort, and 16 miles W. of Auburn (for location, see map of New York, ref. 5–F). A fall of 50 feet in the river gives the village its name and affords excellent power for manufacturing. The village contains manufactories of steam fire-engines, pumps, machinery, and woolen goods;

job-printing establishment; 7 churches; an academy; a soldiers' monument; electric railway to Waterloo, Genesee, and Cayuga Lake Park; a national bank with capital of $100,000, a savings and a private bank, and 4 weekly newspapers. Pop. (1880) 5,880; (1890) 6,116; (1900) 6,519.
"Courier" Printing Company.

Seneca Indians: See Iroquoian Indians.

Seneca Lake: a body of water in Western New York, bounded by Seneca, Schuyler, Ontario, and Yates Counties. It is 35 miles long, from 1 to 4 miles broad, with an elevation of 447 feet, and its shores are bold, picturesque, and fertile. The lake is navigated by steamboats. Its waters reach Lake Ontario by Seneca and Oswego rivers. Its greatest depth is 630 feet.

Seneca-oil: a local name for Petroleum (*q. v.*).

Se'nefelder, Aloys: inventor; b. at Prague, Bohemia, Nov. 6, 1771; entered on the stage at Munich, his father being an actor: afterward attempted literature, and engaged finally in the printing business, which led to his invention of Lithography (*q. v.*). Lack of money and the imperfection of the invention in its primitive state caused him many difficulties and disappointments, and it was not until 1806, when he settled at Munich and received the support of the Bavarian Government, that he was able to perfect his invention. D. at Munich, Feb. 24, 1834. He wrote a *Lehrbuch der Lithographie* (Munich, 1818; French translation, Strassburg, 1819; English translation, *Complete Course of Lithography*, 1819). See Nagler, *Aloys Senefelder und der geistliche Rath Simon Schmidt* (Munich, 1832).

Sen'ega: a drug consisting of the root of a polygalaceous perennial plant, *Polygala senega*, which grows throughout most parts of the U. S., frequenting open fields and rocky places. It is small, with small white flowers forming a close spike at the summit of the stem. The roots are of various sizes, tapering, branched, and twisted, with a thick gnarled head from which the several yearly stems arise. The epidermis is dark-colored, corrugated, and is the active part of the root. The dried root has little smell, but leaves a pungent and acrid impression in the mouth after chewing. Senega contains a peculiar principle called *polygalic acid*, probably identical with saponine. The drug is an acrid irritant, producing vomiting and purging in overdose. Its first use in medicine was by the Seneca Indians, who employed it as a remedy in cases of rattlesnake-bite, but by physicians it is used almost exclusively as an ingredient in cough-mixtures in the second stage of respiratory catarrhs. Its effects are analogous to those of squill. Senega is an ingredient of the *compound sirup of squill* of the *United States Pharmacopœia*. Revised by H. A. Hare.

Senegal': the largest river of Senegambia, Northwest Africa. It lies almost on the border of the Sahara, and derives its water chiefly from several large southern tributaries rising in the regions of Futa Jallon and Bambara. Though a bar at its mouth obstructs navigation from the sea, the lower half of the river (500 miles) is navigated at high water by small steamers. C. C. A.

Senegal: a French colony bordering on the Atlantic in the northwestern part of Senegambia, Africa. Pop. 135,000. There is a governor-general, assisted by a colonial council, at the chief town, St. Louis. See Senegambia.

Senegam'bia [named from *Senegal* + *Gambia*, names of its two chief rivers]: a French possession in Northwest Africa, with no well-defined boundaries on the E. and S. It borders on the Atlantic and the Sahara limits it on the N. The Gambia may be called its southern boundary, and its extension to the E. may be taken as including that part of the French Sudan lying W. of the upper Niger. The population, including the colony of Senegal and the upper Niger region, is believed to be about 1,850,000. In the seventeenth century France took possession of some points on the coast, but the great extension of the colony eastward dates from the middle of the nineteenth century, and particularly from the period 1871–88, which saw the gradual advance of the French power to the upper Niger, an acquisition that cost enormously in human life and money, on account of the trying climate and stoutly contested campaigns with powerful Mohammedan chiefs. The most formidable opponents of the French advance were the great religious pretenders and potentates, Mahmadu-Lamine, whose final defeat and death was the result of the campaign under Gen. Gallieni (1886–88), and Samory, the most powerful ruler in the French Sudan, who was not finally subdued until 1893. The vast territory is for the most part sparsely peopled. It includes a number of distinct tribes, of whom the Mandingo, the Yolofs, and the Fulbe are the most important. The greater part of the country is very fertile, and rice, maize, tobacco, and cotton raising are capable of large development. In Senegal proper about one-third of the land is under cultivation, and the raising of cattle and sheep is a growing industry. The great drawbacks are the climate and the disinclination of the natives to labor, but in the best-cultivated regions the French, within a few years, have doubled the product. On the upper Senegal, in 1884–86, 45 per cent. of all the European residents died, the most fatal causes being sunstroke, dysentery, and malaria. The capital and chief port is St. Louis, on an island at the mouth of the Senegal. Pop. 20,000. From Kayes, the head of navigation on the Senegal, a railway has been built eastward 94 miles to Bafoulabe, and is to be extended to the upper Niger. Another railway connects St. Louis with Dakar, an important town at Cape Verde, and it is greatly assisting in the development of the coast districts. The most important interior settlements are Kayes, on the upper Senegal, Balfoulabe, at the mouth of the Bathoy, and Bammako, on the upper Niger, from which point the French have descended the river and occupied Timbuctu. See Dakar. C. C. Adams.

Senescence: See Old Age, Diseases of.

Senigal'lia, or **Sinigaglia** (anc. *Sena gallica*): town; province of Ancona, Italy; near the Adriatic, at the mouth of the Misa, which divides the town into two parts (see map of Italy, ref. 4–E). The streets are broad and well paved, and some of them are flanked by fine buildings constructed with porticoes forming a continuous sheltered promenade. The maritime trade is carried on by means of a short canal, for which the lower arm of the Misa has been made available. The manufacturing activity is considerable, chiefly in silk and linen. The annual fair of Senigallia (beginning July 22 and ending Aug. 8) was formerly one of the most famous in Europe, and is still much frequented. The town is the place of the victory of C. Claudius Nero over Hasdrubal (207 B. C.). Pop. 9,602. Revised by M. W. Harrington.

Senior, Nassau William: economist; b. in Berkshire, England, Sept. 26, 1790; graduated at Oxford 1812; was admitted to the bar 1819; was Professor of Political Economy at Oxford 1825–30, and again 1847–62; was master in chancery 1836–53. D. in London, June 4, 1864. He was the author of essays upon political economy, philosophy, etc., of narratives of travel in Turkey and Greece (1859) and in France and Italy (1871), and was for forty years a leading contributor to *The Edinburgh Review* and other magazines.

Senn, Nicholas: See the Appendix.

Senna [from Arab. *sanā*, senna]: the leaves of several species of Cassia (*q. v.*), various preparations of which are used medicinally. Those which constitute the commercial senna are exported from Southern India and from Alexandria. A senna-plant (*Cassia acutifolia*), indigenous in Egypt and the African deserts, furnishes most of the Alexandria senna. Great labor has been expended by chemists in endeavoring to isolate the valuable cathartic principle of senna, which was discovered by Dragendorff and Kubly in 1868 to be cathartic acid. It is a complex glucoside, and, singularly, contains sulphur. Like glucosides generally, it is easily alterable, and hence difficult of isolation and preparation. Further information may be had in the *National Dispensatory*, under *Senna*. Revised by H. A. Hare.

Sennaar': an ancient kingdom of the Eastern Sudan, Africa, which retained its name when it became a province of Egypt; lying mostly between the Bahr-el Azrek and the White Nile. The soil is so fertile along the river banks that Sennaar was long called the granary of the Egyptian Sudan, but away from the rivers the region is mostly an uninhabited sandy waste. In the flourishing days of the Egyptian Sudan there was a dense population along the two great rivers, in whose valleys a large amount of grain was raised, while in the towns gold-smelting, leather-working, pottery-making, and other industries were pursued. Sennaar, for generations the chief town, had great importance until Khartum became the center of commerce. Its population had dwindled to 8,000 before the Mahdist revolt. It was the last Egyptian stronghold to succumb to the Mahdi. Now only heaps of stone mark its site.
C. C. Adams.

Sennach'erib [Gr. Σαναχάριβος: Heb. *San'chērībh*, from Assyr. *Sin-achi-irib*, liter., "the Moon(-god) has multiplied

brothers"]: King of Assyria 705–681 B. C., son and successor of Sargon. He was vain and haughty, a terrible scourge in war, and a great builder. His campaign against the West in 701 was unsuccessful (2 Kings xviii., xix), as may be seen also from his own account of the affair. (Cf. E. Schrader, *The Cuneiform Inscriptions and the Old Testament*, i., 278–310.) He boasts that he destroyed Babylon utterly because this city bore the Assyrian yoke unwillingly. He was murdered by two of his sons. D. G. Lyon.

Sens, sänn (anc. *Agenticum*, later *Senones*): town of France, department of Yonne: on the right bank of the Yonne (see map of France, ref. 4–F); has vestiges of the old walls constructed by the Romans, a fine cathedral, manufactures of leather, serge, druggets, and glue, and an active trade in corn, wine, flax, and hemp. Pop. (1896) 14,924.

Sensation: phenomena which result within the mind immediately from impressions upon the senses. The experiences of moisture and resistance which follow from contact with a piece of iron, and the pain felt in case it is hot, are equally sensations. Sensation must be carefully distinguished from the physical phenomenon which precedes or accompanies it. The impression is the modification of the organ, especially of the nerves and nervous centers, which arises from an external stimulus, as the vibration of ether or air. The nature of the different sense-impressions is not well understood; but in each case they are some form of movement. They have all the characteristics of physical phenomena: they can be located, measured, apprehended by the senses. Sensations, on the other hand, can not be compared with movement of any kind. The difference between them is plainly seen in the fact that an impression may take place without any sensation. The impression may be too feeble, or too prolonged; or too often repeated, as the irritation of our clothing; or the attention may be occupied, so that the impression does not produce its usual sensation.

Affective and Presentative Elements in Sensation.—In most sensations there is a distinct knowledge element over and above the intensive subjective state, which constitutes the sensation proper. There is an element of knowledge of things without us or of our own bodies. This is the presentative or *perception* element in sensation. There are great differences in sensations in this respect.

The *affective* or feeling quality, on the other hand, comes out most strongly in cases of massive or voluminous stimulation: here presented relations are at a minimum and sensibility is at a maximum. When a man plunges into a very hot bath, the feeling experienced is so overwhelming that his knowledge that it is a hot bath, and that it is he himself who is taking the bath, occupies a very slight degree of consciousness. In a case of severe toothache, also, what we really have predominating in consciousness is not knowledge, but feeling. As an immediate state of consciousness, we do not *know* that we have a toothache, we *feel* it. Hamilton announced the law, already anticipated by Kant, that the two elements vary in inverse ratio—which is true only in a very rough way.

Characters of Sensation.—All sensations have certain general characters, which may be subjected to investigation. These characters are four in number.

1. *Quality*: that property by which sensations are distinguished as coming from different senses, such as color, sound, taste.

2. *Quantity*: meaning intensity or mass of sensation. Investigations in intensity constitute Psycho-physics (*q. v.*).

3. *Duration*: the time occupied by the sense-function with its accompanying physical and volitional processes. Investigations in this field constitute Psychometry (*q. v.*).

4. *Tone*: the pleasure or pain which accompanies all sensation. See Pain and Pleasure.

Quality of Sensation.—There is much uncertainty as to the proper classification of sensations. It appears very easy to discover at once what is immediately given as a pure and simple sensation. But it is not so. At the age of maturity, when one is able to make an analytical study of his states, he finds them no longer in that pure and primitive state which he would wish. They have undergone a twofold alteration. In the first place, all the senses act together, and different sensations, by virtue of the laws of association, are experienced as one. And, further, by virtue of the same laws, intellectual elements are superposed upon our sensations, making them much more complex. These associations become, after time has made them habitual, almost indissoluble; so that it is very difficult to isolate the different sensations from one another, or the great body of sensitive data from the contributions of reason and experience.

Relativity of Sense-qualities: Contrast.—Further, we find a series of phenomena which show that there is no fixed typical sensation of each quality; but that all determinations of quality are to a degree relative distinctions among many factors in consciousness. This principle of Relativity (*q. v.*) is illustrated by the so-called *phenomena of contrast*. The general statement of fact is this: Any sensation (color, sound, taste) which occurs after or with other sensations (colors, etc.) is different from what it would have been if the other sensations had not been present, or if the other sensations had themselves been different; the variation, however, is within the same sense-quality.

In the domain of the special senses, such effects of one sense-quality upon another may be subjected to experimental determination by psycho-physical methods. The phenomena of color-contrast are the richest and best understood class of facts. In general, color-contrast means that when part of the retina is stimulated to react to a particular color, there is a tendency of other portions to react to the complementary color. For example, the so-called Meyer's experiment may be cited: Put a scrap of gray paper on a colored (red) background, and spread over the whole a sheet of white tissue; the gray scrap will tend to assume the color complementary to the background (green). The white sheet over the whole is necessary to obscure distinct lines of separation between the colors beneath; if such distinct boundary-lines are exposed, the contrast-phenomena disappear. Recent research has developed a number of interesting optical phenomena of this class. Stumpf has discovered that the pitch of a tone is modified by the occurrence of another tone of a different pitch, in such a way that the interval between them is lessened. Contrasts of temperature are also easily brought about. Cold water feels colder if the hand is just from warm water. Differences in temperature of the two hands lead to exaggerated differences of sensation when they are plunged together into two vessels of water of the same temperature. Contrast is called *simultaneous* or *successive* according as the rival sensational qualities occur together or in succession.

Two theories of sensational contrast have been advocated, one called the psychological, according to which such contrasts are due to judgment or synthesis, the actual sensations themselves having fixed and unaltered qualities. This has been held by Helmholtz, and has been used to support the theory that there may be "unconscious judgments." The other, the physiological theory, holds that contrast-effects are due to complex conditions of stimulation. The different color-stimuli, for example, are not reported separately to consciousness; but only their united effect is operative in the optical center. Consequently, what we have is a case of summation or fusion of stimuli, not of comparison and judgment of sensational atoms. This latter theory is now completely victorious, principally through the brilliant experimental work of Hering.

It seems reasonably safe to conclude that there are well specialized nervous functions which correspond to the great differences of quality in sensations: this is shown by the fact that the differences are stable; that the senses are largely independent of one another in their activity; that each such function has normal minimum and maximum activities which give original degrees of intensity in consciousness. But within these limitations both qualities and intensities are subject to the law of relativity as well by reason of nervous summation as of mental synthesis.

J. Mark Baldwin.

Sensationalism: a term in philosophy sometimes used to denote the doctrine that all knowledge is derived originally from the senses. Various other terms are used as its synonyms—viz., "sensism," "sensualism," "sensuism," "empiricism," etc. Hobbes (in 1650) taught that all knowledge grows out of sensations. After sensation there remains behind the memory of it, which may reappear in consciousness. The memory of objects once perceived is aided by words. We therefore connect words to our mental representations of objects. The same word, serving as a sign for numerous similar objects, gives rise to general ideas. Locke held substantially the same views. Condillac (1755) likewise endeavored to explain all mental functions as transformations of sensation (*sensations transformées*). Desire arises from the recollection of a past sensation; the Ego is the

totality of sensations. Bonnet (1755), von Holbach (1770), Buffon (1780), Cabanis (1798), Destutt de Tracy (1815), Laromiguière (1818) held the doctrine of sensationalism. Among recent German writers Czolbe has elaborated a system of psychology that derives all the elements of self-consciousness from sensation. But he has to assume teleological forms—"the sensations and feelings which are hidden in space or the world-soul"—to explain the "fundamental limits of knowledge." His contemporaries, however—Moleschott, Büchner, Vogt—proclaim not only sensationalism, but materialism without reserve. While Cabanis said that thought is a secretion of the brain, Carl Vogt added, "the brain produces thought in the same way that the liver produces bile," etc. John Stuart Mill (1865) defines matter to be "a permanent possibility of sensation," and mind to be "a series of feelings with a background of possibilities of feeling": thus making sensation the central principle, not only of knowledge, but of being, and apparently reaching the doctrine of Berkeley, *Esse est percipi*. Post-Kantian sensationalism has had to explain away the existence of universal and necessary ideas, such as time, space, causality, etc. Mill holds the geometrical axioms to be "generalizations from observation." Herbert Spencer (1860) holds that knowledge consists in "symbolic conceptions" when it relates to aught else than concrete objects that are not "too great or too multitudinous to be mentally represented." In contrast to this, he holds that "the ultimate truth which transcends experience by underlying it is the persistence of force." Thus he makes in one instance all general ideas "symbolic," the real being particular things only; and then he makes force, which corresponds to the most symbolic of our ideas, to be the most real of realities. Within the period 1870–95 a more thorough study of physiological psychology by a scientific method has done more to clear up and reduce to exact knowledge the theory of the action of the five senses than the loose observations of twenty-five centuries previously. The articles on PSYCHOMETRY and PSYCHO-PHYSICS give the history and bibliography of this movement. It is too early to perceive the effects of these investigations into the essential nature of sense-perception upon general philosophical theories, but it is certain that they will modify very materially the conceptions and method of presentation of those who in the future defend the doctrine that all knowledge is derived from the five senses.

WILLIAM T. HARRIS.

Senses [from Lat. *sen'sus*, feeling, one of the senses, deriv. of *senti're*, *sen'sum*, feel]: special developments of the general sensibility of the living organism. In the special senses, i. e. hearing, sight, etc., the property of general sensibility of the organism has become immensely modified and intensified by being concentrated and localized in distinct organs, the ear, the eye, etc., and by being specialized so that each organ transfers from the object to consciousness only a distinct part of that total impression which the object is able to give and consciousness is capable of receiving—the ear only the audible, the eye only the visible, etc. There are five such senses—hearing, sight, smell, taste, and touch—but they all rise simply as individual developments of the same fundamental faculty of general sensibility. Their degree of individualization is very different, being highest in sight and feeblest in smell and taste; the latter both disappear very easily in mere feeling, as smell in sneezing and taste in nausea. It is apparent, however, that the general sensibility of the human organism covers a much larger ground than its five individual senses. There are sensations which enter into consciousness with great vividness without going through the special senses, as, for instance, the feelings of hunger, thirst, suffocation, pleasure, pain, rest, fatigue, etc., which are termed general sensations. See ACOUSTICS, MUSCLE-SENSE, VISION, etc., and *Organs of Special Sense* in the article HISTOLOGY. Revised by EDWARD T. REICHERT.

Sensibility: See FEELING and SENSATION.

Sensitive Plant: a low leguminous plant, *Mimosa pudica*, of tropical America, now widely dispersed over the world and commonly cultivated, on account of the rapid movement of the leaves which, when brushed or jarred, appear to shrink from the touch. This faculty is shared in a less degree by several other species of *Mimosa* and some related plants, such as the sensitive brier (*Schrankia*) of the southern parts of the U. S. See *Plant Movements* in the article PHYSIOLOGY, VEGETABLE.

Senso'rium [= Lat., the seat or organ of sensation, deriv. of *sen'sus*, sense, feeling]: the supposed seat in the nervous system of the processes which underlie sensation. The cortex or gray matter of the brain is considered the sensorium in modern discussion in physiology and psychology.

J. M. B.

Sentence [viâ O. Fr., from Lat. *senten'tia* (for **sentien'tia*), way of thinking or feeling, opinion, judgment, deriv. of *senti're*, feel, think]: in the law, a judgment or determination pronounced by a court after the trial or hearing of a cause, by which the remedy is granted or the sanction is imposed. In the common-law courts the term is confined to criminal cases, their final decision in civil suits being called a "judgment"; while the corresponding act of a court of equity is usually denominated a "decree." In those tribunals whose procedure is based upon the civil law—in the admiralty courts, the English ecclesiastical courts, and sometimes in the U. S. in the probate or surrogate courts—the term "sentence" is used, instead of "judgment" or "decree," to designate all judicial determinations. The sentences in civil causes like judgments are either final or interlocutory—final, when they pass upon all the issues material to the decision, determine the rights and duties of the parties, and terminate the pending controversy; interlocutory, when they pass upon some collateral matter or proceeding in the action, or when they establish some right preliminary to the final adjudication. In criminal trials, according to the common-law methods, the sentences are all from their very nature final. It is the exclusive province of the jury to determine the guilt or innocence of the accused. When a verdict of guilty is rendered, the prisoner is thereby convicted, and it then becomes the duty and function of the court to pronounce upon him the judgment or sentence which the law provides as a punishment for his crime. Previous to this final act in all cases of felony the convict is publicly asked by the judge if he has anything to say why the sentence of the law should not be pronounced upon him. This proceeding, which was originated at an early period of the English law, when the prisoner could not be defended by counsel, in order that he might have an opportunity to suggest any error that had occurred, is now an empty form, and yet the form must be observed, or else the judgment would be void. No error being shown, the presiding judge declares the sentence, whereby the court orders the prisoner to be capitally executed on a certain day named, or to be imprisoned for a specified period, or to be fined in a designated amount, or otherwise punished as provided by law. This sentence is entered by the clerk, and constitutes a most important part of the judicial record. The doctrines and rules of the law in reference to the nature and effects of a JUDGMENT (*q. v.*) apply also to sentences. See the treatises of Bishop and Wharton on *Criminal Law*, and Black on the *Law of Judgments*.

Revised by F. STURGES ALLEN.

Sentiment: the higher form of emotion, attaching to ideals of art and life. (See IDEALS and IDEAL FEELINGS.) The great classes into which the sentiments fall are usually distinguished as ethical, æsthetic, and religious. The religious are the most complex, and rest upon the other two. Religious objects and ideals involve both the ethical and æsthetic determinations—that is, they are both beautiful and good.

Ethical Sentiment: its Nature and Origin.—Conscience is the popular term for this emotion. It involves three elements, which are, however, closely united in a single state of mind, called ethical. If we fancy the mental life cut right through at the moment of a moral decision, we should find three elements which moralists distinguish by the phrases moral quality, moral authority, and moral ideal. These may be made clearer by a concrete instance: I give money to a beggar because I am bound by conscience to do so. The moral quality of my act is my feeling of its harmony with my better acts as a whole, and the exaction I make upon other men to be charitable also; without this conscience would be wanting—the act would be indifferent. The moral authority of the act is the feeling which at once arises that this quality has an immediate reference to my will. I am bound to choose it as my act; without this there is no conscience—conscience is dead. The moral ideal is the outreach of my feeling toward a state of will in which such a relative and hesitating decision would yield to clearer and more direct moral vision; a state of will which I can not picture, can not conceive, but which I feel my will is meant for, and for which my present act for conscience' sake is the only means to prepare me.

Moral sentiment arises evidently around acts and atti-

tudes of will. It is accordingly to be expected that the account of the genesis of WILL (*q. v.*) can throw some light upon the conditions of the rise of conscience. So if it be true that present character is the deposit of all former reactions of whatever kind, and that what we call will is a general term for concrete acts of volition, and further that volition represents a co-ordination of tendencies, then according as these tendencies are suggestions from other persons on the one hand, or represent partial expressions of one's own personal character on the other hand, there arises a division within the sense of voluntary agency, which is the germ of the notion of self. (See SELF-CONSCIOUSNESS.) Your suggestion to me may conflict with my desire: my desire may conflict with my own present sympathy. Self meets self, so to speak. The self of accommodation, imitation, the self that learns, collides with the self of habit, of character, the self that seeks to dominate. It is no longer a matter of simple habit *versus* simple suggestion, as is the case in infancy, before the self gets the degree of complicity which constitutes it a voluntary agent. It is that form of habit which is personal agency coming into conflict with that form of suggestion which is also personal to me as representing my social self. Your example is powerful to me intrinsically; not because it is abstractly good or evil, but because it represents a part of myself, inasmuch as I have become what I am in part through my sympathy with you and imitation of you. So your injunctions to me bring out a difference of motor attitude between what is socially responsive in me, in a sense public, and that which is relatively me alone, my private self.

When I come to a new moral situation, therefore, I am in a condition of relative equilibrium, or balance of two factors—my personal or habitual self and my social suggestive self. Your natural disinclination to attend a social gathering at the house of Mr. A may be overcome by an appeal to your family, social, public self in its broad sense, supplemented by an appeal to your sympathetic, narrower, social self. The new decision tends to destroy this equilibrium by re-enforcing my "copy," and its influence in my character, on one side or the other, and so to lead me out for further habit or for new social adaptations.

On this basis comes a new mental movement which involves a further development of the imitative *motif*—a development which substitutes warmth and life for the horrible coldness and death of that view which identifies voluntary morality with submission to a "word of command." The child, it is true, very soon comes across that most tremendous thing in its moral environment called authority; and acquires that most magnificent thing in our moral equipment called obedience. He acquires obedience in one of two ways, or both: by suggestion or by punishment.

But whether obedience comes by suggestion or by punishment, it has this genetic value: it leads to another refinement in the sense of self, at first projective, then subjective. The child finds himself stimulated constantly to deny his impulses, his desires, even his irregular sympathies, by conforming to the will of another. This other represents a regular, systematic, unflinching, but reasonable personality—still a person, but a very different person from the child's own. It is a stage of the child's apprehension of persons—his sense of the regularity of personal character in the midst of the capriciousness that before this stood out in contrast to the regularity of mechanical movement in things. There are extremes of indulgence, the child learns, which even the grandmother does not permit; there are extremes of severity from which even the cruel father draws back. Here, in this dawning sense of the larger limits which set barriers to personal freedom, is the "copy," forming which is a sense of personal authority or law. It is projective because he can not understand it, can not anticipate it, can not find it in himself. And it is only by imitation that he is to reproduce it, and so arrive at a knowledge of what he is to understand it to be. So it is a "copy for imitation." It is its aim—so may the child say to himself—and should be mine—if I am awake to it—to have me obey it, act like it, think like it, be like it in all respects. It is not I, but I am to become it. Here is my ideal self, my final pattern, my "ought" set before me. My parents and teachers are good because, with all their differences from one another, they yet seem to be alike in their acquiescence to this law. Only in so far as I get into the habit of being and doing like them in reference to it, get my character molded into conformity with it, only so far am I good. And so, like all other imitative functions, it teaches its lesson only by stimulating to action. I must succeed in doing—he finds out, as he grows older and begins to reflect upon right and wrong—if I would understand. But as I thus progress in doing, I forever find new patterns set for me; and so my ethical insight must always find its profoundest expression in that yearning which anticipates but does not overtake the ideal.

My sense of moral ideal, therefore, is my sense of a possible perfect, regular will taken over *in me*, in which the personal and the social self—my habits and my social calls—are brought completely into harmony; the sense of obligation in me, in any case, is the sense of lack of such harmony—of the actual discrepancies in my various thoughts of self, as my actions and tendencies give rise to them. The friend who urges you to accept an invitation to Mr. A.'s reception adds to the reasons for your attendance, this one: "And, besides, you ought to go out more." This is the profoundest reason of all—not because it has in it the word "ought" merely, but because it makes appeal to the ideal self, before the law of which all the earlier claims have their lesser or greater value. And the thought of this ideal self, made objective, as it must be by the dialectic of this germinating social sense, out of and beyond me—this is embodied in the moral sanctions of society, and finally in God; and it is at this highest level of mental growth that the religious sentiments come fully into play.

Æsthetic Sentiment.—In beauty, the elements of the ideal seem at the outset to be most fully set forth. The simplest observation of beautiful things suffices to illustrate the necessity of both unity and variety in form. There is no beauty when unity is absolute, and it is only when arrangement is possible to a degree which allows a distinction between variety which is yet unity, which has a plan, and variety which is multiplicity, which has no plan—that any such feeling arises at all. It is equally evident, also, that meaning, significance, contributes to æsthetic effect. The beauty of a landscape is cold and formal until the smoke of a peasant's hut, or the spire of a country church, is added to give it a touch of human interest. The village green has more meaning than snow-clad Alps. And, further, we feel the essential share-ableness, universality, validity of all beauty. I expect a face to appeal to you as it appeals to me.

Nature and Origin of Æsthetic Sentiment.—Psychology seems to be tending to a view of art which emphasizes the subjective or emotional side of æsthetic. Considering pleasure the most general element in æsthetic experience, we may bring the topic under the head of Hedonics, and ask what are the marks of objects, situations, ideas, which make them suitable for arousing in us the particular kind of hedonic experience called æsthetic, i. e. what constitutes beauty?

Experiments on sensation-states—especially on the apprehension of visual forms—result in showing that whenever union of parts is effected without strain to the organ stimulated, at the same time that the elements preserve their individuality in a measure, we experience pleasure. In perception a similar principle is found, known as assimilation, to which current psychological analysis is reducing the old laws of association. When a new experience is assimilated readily to old categories—fits into the ready moulds of experience, thought, or conception—then we invariably experience pleasure, not the pleasure of pure identity, but of progressive identity of a process in consciousness. In the higher spheres we find the same fundamental movement. Conception is a process by which detached elements are arranged, brought to unity, sorted out, assimilated; an argument is such a scheme of notions, which go together without strain or conflict; and a beautiful character is one whose acts of will are consistent with one another, and gets assimilated readily in an ideal of duty.

The essential thing in it all—in sensational ease, in assimilation, in logical consistency—is this: Does the attention with both its intellectual and its nervous processes move easily?—that is, is the psycho-physical process impeded or advanced? If the latter, then pleasure, and æsthetic pleasure, just in proportion as the processes to which the attention ministers, all tend to give the best sense or emotion of accommodation.

The older criteria of beauty can be accounted for on this view: unity in variety, adaptation, association, meaning, or expressiveness; and it tends to put an end to the lasting controversy between "form" and "meaning."

For Wundt's facts showing that visual beauty of form is due to ease of eye-movements, and Zeising's "golden section," and Bain's "associations of utility," and the "teleological judgments" of the intellectualists, and the "moral

worths" of the ethical idealists, as well as the "real beauty in objects" of the realists—all these get their due, as far as their psychology is concerned, in some such formula as this: The sense of beauty is an emotional state arising from progressive psycho-physical accommodation to mental objects. Of course the metaphysics of beauty and art is not touched by this, and it does not prejudice full metaphysical treatment.

Seoul, sā-ool' [from Korean *seul*, liter., capital], or officially **Han-yang**: the capital of Korea; on the right bank of the Han-Kang, a tributary of the Yellow Sea; lat. 37° 31′ N., lon. 127° 7′ W. (see map of China, ref. 4–M). It is surrounded by a wall, 12 to 25 feet high, now partly in ruins, with eight gates which are closed at night. It has three straight streets, about 60 feet wide and starting from the three principal gates. These are fairly well kept, but the other streets are narrow, uneven, and filthy. There are but two noteworthy buildings, the palace of the king and a small Buddhist temple of white stone, once richly ornamented, but now much defaced. The other buildings are small, low, thatched, or tiled, and densely peopled, and these buildings encroach on the great streets, from which they are cleared from time to time. There are no arrangements for sanitation or public comfort. A noteworthy object is the great bell which sounds the hours for opening and closing the gates. It was made in 1468 and is alleged to be the third in size in the world. The city dates from 1397 A. D.; became a royal city at the end of the sixteenth century, and was sacked by the Manchus in 1637. It is the heart of Korea in the same sense that Paris is the heart of France, and the ambition of every Korean gentleman is to pass his life there, at leisure to enjoy its attractions. It was long forbidden to foreigners, and in 1888 a fanatical outbreak against foreign residents occurred. The city was occupied by the Japanese in 1894. Pop. (by census in 1793) 193,000, estimated by Cavendish (1891) at 250,000, of whom 50,000 were in the suburbs. See Cavendish, *Two Months in Korea*, in *Scottish Geographical Magazine* (Nov., 1894), and the works mentioned under KOREA. MARK W. HARRINGTON.

Separate Baptists. Separate Churches, or **Separates**: See BAPTISTS and FREE-WILL BAPTISTS.

Separate Lutherans of Prussia: those Lutherans who refused to comply with the order of Frederick William III. uniting the Lutheran and Reformed Churches. See LUTHERANISM AND THE LUTHERAN CHURCH (*The Lutheran Church in the Nineteenth Century*).

Separation: See the Appendix.

Separatists: in general, those who withdraw from an established church or religious organization; sectaries. The term was commonly applied in England in the sixteenth and seventeenth centuries to those who were also called Brownists and Barrowists, and later INDEPENDENTS (*q. v.*).

Sepia: See INDIA INK.

Sepi'idæ: See CUTTLEFISH.

Se'poy [: Fr. *spahi, cipaye*, from Hind. *sipāhī*, native soldier, from Pers. *sipāhī*, horseman soldier, deriv. of *sipāh*, whence Hind. *sipāh*, military force, army]: a native soldier in the British service in India. The practice of employing the natives as troops dates back to the middle of the eighteenth century. A large force of Sepoys took part in the battle of Plassey, and Clive afterward organized a native army in Bengal. Their good conduct inspired general confidence in their loyalty, and their numbers were increased till at the time of the mutiny (see INDIA, *History*) they were about 230,000 strong, while the European troops numbered about 40,000. After the suppression of the mutiny (1858) their numbers were reduced, and in 1894 there were 145,000 natives to 75,000 Europeans in the British army in India. The Sepoys consist of Mohammedans, Rajputs, Brahmans, and men of other castes, besides Sikhs, Gurkhas, and hillmen of various tribes. The higher officers are European.

September [viâ O. Fr. from Lat. *Septem'ber* (sc. *men'sis*, month), liter., the seventh month, deriv. of *septem*, seven]: the seventh month of the old Roman year, but the ninth of the Gregorian. It is the month of the autumnal equinox, which occurs about the 22d.

Septicæ'mia: See BLOOD-POISONING.

Septima'nia [Late Lat., deriv. of Lat. *septima'nus*, pertaining to the number seven, deriv. of *septem*, seven. So called from its seven cities—Toulouse, Agen, Bordeaux, Poitiers, Saintes, Périgueux, Angoulême]: an ancient district in the southwest of France: ceded to the Goths in 419. Its name appears in the writings of Sidonius Apollinaris (430–482). It was conquered by the Saracens in 712–719; desolated by Charles Martel in 737; conquered in part by Pepin in 760; became a part of the kingdom of Aquitaine in 778; became a dukedom in 817, a marquisate in 844; and was devastated by the Normans in 859. The Spanish March was set off in 864, and soon after it passed to the house of Toulouse.

Septim'ius Severus: See SEVERUS, SEPTIMIUS.

Septuages'ima [Lat. (sc. *di'es*, day), the seventieth day, liter., fem. of *septuage'simus*, seventieth, deriv. of *septuagin'ta*, seventy]: in the ecclesiastical calendar, the third Sunday before Lent. The first Sunday in Lent is termed Quadragesima, the three preceding ones Septuagesima, Sexagesima, and Quinquagesima.

Sep'tuagint, or **LXX**. [from Lat. *Septuaginta*, liter., the Seventy, applied to this version because of the alleged number of its joint translators]: the name commonly given to the earliest Greek translation of the Old Testament, otherwise called the Alexandrian version. According to the fabulous account of its origin in the letter of the pseudo-Aristeas, repeated by Josephus (*Ant.*, xii., 2) and others, Ptolemy Philadelphus, King of Egypt from 283 (285) to 247 B. C., at the instance of his librarian, Demetrius Phalereus, sent an embassy to Jerusalem to procure from the high priest Eleazar a copy of the Jewish Law, and to make arrangements for a translation of the same into Greek for the Alexandrian Library. Seventy-two learned men were accordingly selected by the high priest, six from each tribe, and sent to Egypt with a magnificent copy of the Law written on parchment in letters of gold. They retired to the island of Pharos, where they completed the translation in seventy-two days. According to Philo (*Life of Moses*, ii., 5–7), they were divinely inspired. The legend appears with embellishments in Justin Martyr (*Hortatory Address to the Greeks*, chap. xiii. [*Ante-Nicene Fathers*, i., 278]), according to whom the translators were shut up in separate cells and worked independently, yet their several versions, being compared, were found to agree verbatim. So also Irenæus (*Against Heresies*, chap. xxi., 2; do., i., 451, *seq.*) and Clement of Alexandria (*The Stromata*, I., xxii.; do., II., 334). In this later form of the story the translation is made to include the whole Old Testament. All that can be inferred with certainty from this legend is the high estimation in which the translation was held by the Jews as early as the first century of the Christian era. There is no improbability in the supposition that Ptolemy Philadelphus may have procured a copy of the books of Moses for his universal library. Jews were then numerous in Alexandria. On the other hand, a translation of the Old Testament, or at least of the Law, must have become a necessity at that period to the Hellenistic Jews, to most of whom the Hebrew original, long before the Christian era, was a sealed book; and to this necessity alone it may have owed its origin.

The character of the translation proves it to have been the work of many hands. The Pentateuch is best translated. Anthropomorphisms and offensive expressions are, however, often softened; e. g. for "they saw the God of Israel" (Ex. xxiv. 10) we read "they saw the place where the God of Israel stood." The translation of Proverbs has considerable merit, and the book of Job was rendered by a man of genius, who was better acquainted, however, with the Greek poets than with Hebrew, and dealt very freely with his text. The speech of Job's wife (ii. 9) is a curious interpolation. Ecclesiastes is rendered with barbarous literalness, so as to be in some places unintelligible; e. g. Eccl. vii. 30. The prophets are for the most part poorly translated, especially Isaiah; and the translation of Daniel was so bad that the version of Theodotion was early substituted for it in Christian use, and but a single manuscript of it is known. In some books, particularly Jeremiah, a recension of the text was followed differing from our present Hebrew; to others, as Esther and Daniel, apocryphal additions were made. The version contains all the books commonly printed in the English Apocrypha of the Old Testament, except the second book of Esdras. Some manuscripts and editions add a third, others a fourth book of Maccabees.

As to date, the time assigned by the pseudo-Aristeas for the translation of the Pentateuch has nothing against it; and from a passage in the Prologue to Ecclesiasticus, which alludes to a Greek translation of "the Law and the Prophets and the rest of the books," it seems probable that the collection of books had assumed something like its present form before 130 B. C.

In the controversies between Jews and Christians in the second century it was found that the LXX. could not be relied on as an accurate representation of the Hebrew. Other translations were accordingly made, of which the principal were—(1) that of Aquila, in the first half of the second century, slavishly literal; (2) of Theodotion, based on the LXX., but aiming at greater fidelity; and (3) that of Symmachus, distinguished by greater freedom and elegance. These were presented in parallel columns, together with the Septuagint and the Hebrew text (in Hebrew and Greek characters), in the *Hexapla* of Origen in the first half of the third century; in the Septuagint column words and clauses not in the Hebrew were marked with an obelisk or dagger (to stab them as false), and words in the Hebrew not represented in the translation were added from one of the other versions, generally Theodotion, with an asterisk prefixed. Origen's *Hexapla* as a whole was never copied, and probably perished in the destruction of the library of Pamphilus at Cæsarea in Palestine. Copies were taken, however, of his Hexaplar text of the LXX., parts of which have come down to us in various manuscripts, and also in a Syriac version. The best edition of the remains of the *Hexapla* is that by Field (Cambridge, 1867–75, 2 vols. 4to).

The Septuagint has had a wide influence. It was habitually used by Philo and Josephus, and very often quoted by the New Testament writers. Most of the ancient versions of the Old Testament were made from it, as the Old Latin, Memphitic, Thebaic, Ethiopic, Armenian, Slavonic, etc. With all its faults, it has been the only representative of the Old Testament to the Greek or Eastern Church from the beginning, and a knowledge of it is essential to one who would understand the language of the Christian Fathers and the history of theological opinions. From no other source is so much illustration to be derived of the peculiar Greek of the New Testament. It has also considerable value as a help in the criticism of the Hebrew text.

The text of the LXX. became early corrupted, and the Hexaplar edition of Origen increased the corruption, his obelisks and asterisks being often omitted or misplaced by copyists. Existing manuscripts differ considerably, and the correction of the text is a difficult problem. The primary editions of the LXX. are—(1) that contained in the Complutensian Polyglot (1514–17; published 1522); (2) the Aldine (Venice, 1518); (3) the Roman, Vatican, or Sixtine (Rome, 1587, fol.), founded largely on the Vatican manuscript of the fourth century; and (4) that of Grabe (Oxford, 1707–20), the basis of which was the Alexandrian manuscript. The edition of Bos (Franeker, 1709, 4to) exhibits the Roman text with the variations of the other three editions; and the great edition of Holmes and Parsons (Oxford, 1798–1827, 5 vols. fol.) give the same text, with the various readings of more than 300 manuscripts collated for it at great expense. The text of nearly all the oldest manuscripts of the LXX. (fourth to ninth century), as the Sinaitic, Vatican, Alexandrian, etc., has since been accurately published, but no critical edition exists in which these rich materials have been properly used. Meanwhile, the most convenient manual editions are those of Tischendorf (5th ed. Leipzig, 1875) and Henry B. Swete (Cambridge, 3 vols., 1887–94), the best; cf. Bagster's *Septuagint, Greek and English* (London, 1870, 4to), giving the Roman text with Brenton's translation in parallel columns. The concordance to the Septuagint by Trommius (Amst., 1718, 2 vols. fol.) will be superseded by that of Edwin Hatch and Henry Adeney Redpath (Oxford, 1892, *seq.*); there are lexicons by Biel (The Hague, 1779–80, 3 vols.) and Schleusner (Leipzig, 1820–21, 5 parts, or Glasgow, 1822, 3 vols.). The principal works on the version are of long standing—e. g. the classical work by H. Hody, *De Bibliorum Textibus* (Oxford, 1705, fol.); H. G. J. Thierseh, *De Pent. Vers. Alex.* (Erlangen, 1841), excellent in regard to the language; Z. Frankel, *Historisch-Kritische Studien zu der Septuaginta* (vol. i., part 1 [all pub.], Leipzig, 1841); and A. Geiger, *Urschrift u. Uebersetzungen d. Bibel in ihrer Abhängigkeit von der innern Entwickelung des Judenthums* (Breslau, 1857). Cf. Schürer, *Jewish People in the Time of Jesus Christ* (Eng. trans., second division, iii., 159–168).

Revised by S. M. Jackson.

Sepulture: See Funeral.

Sequence [viâ O. Fr. from Lat. *sequen'tia*, a following, deriv. of *se'qui* (pres. partic. *se'quens*, *sequen'tis*), follow]: in music, a peculiar chain-like progression, in which a short musical figure or group of notes is repeated several times on successive steps or degrees of the ascending or descending scale. As a sequence is thus only a group placed one degree higher or lower at each repetition, it can have (in itself) no proper termination, but may be continued indefinitely or through the whole range of the scale. One of the simplest forms of sequence is that made by a chain of thirds and sixths, with each sixth suspended by the seventh, as at *a*, Ex. 1, or with a suspension of the sixth by the fifth, as at *b*:

Ex. 1.—*a*

In sequences the leading trait or figure may lie in the treble, the bass, or one of the middle parts, or in any two or more of the parts together. In Ex. 2 the most forcible expression of the sequential idea is found in the treble at *a*, and in the bass at *b*, while at *c* it appears in the treble and bass combined:

Ex. 2.—*a*

Sequences are of infinite variety, and occupy an important place in fugues, organ-pieces, and instrumental compositions of almost all kinds, furnishing a grateful relief to the ear, and awakening certain emotions which seem peculiar to progressions of this class. Those given in the above examples are founded on the diatonic scale, but many of the richest sequences derive their beauty from the peculiarities of the chromatic scale, and are sometimes exceedingly elaborate and complex.

Revised by Dudley Buck.

Se'quin [= Fr., from Ital. *zecchino*, liter., dimin. of *zecca*, mint, from Arab. *sekkah*, die, stamp]: a name applied to various Italian and Levantine coins. The original sequin was a Venetian gold ducat of the thirteenth century.

Sequoi'a [Mod. Lat., named in honor of *Sequoyah*, the Cherokee Indian who invented letters for his people]: a genus of coniferous evergreen trees of the sub-order *Cupressineæ*, or cypress family, remarkable for the great size which they attain, being the "redwoods" and "big trees" of California. They are natives of California only, and of two species—one, *S. sempervirens*, the true redwood, confined to the Coast Ranges; the other, *S. gigantea*, properly called big tree or rarely mammoth tree, restricted to the western slope of the Sierra Nevada. The Pacific forest-belt produces large trees generally, but the sequoias surpass in girth, if not in height, the sugar-pines, Douglas spruces, etc., with which they are associated. They are distinguished at sight from other trees by the peculiar fibrous bark of a rich cinnamon-brown color.

The nearest relative of the genus is *Taxodium*, which is represented by the bald cypress of the southern Atlantic U. S. and Mexico. The foliage of the two species is strikingly different. The leaves of the redwood resemble those of the yew, being spreading and arranged comb-like on two sides of the branchlet; the cones are the size of a hazel-nut. The leaves of the big tree are smaller, awl-shaped, and closely oppressed to the branchlet; the cones of the size of an English walnut. The wood of the redwood is light, but firm, straight-grained, and handsome, although the rich brownish-red color fades on exposure without protection, while, like most of the cypress family, it is very durable. Only the redwood, which occurs in large quantities, affords a material of commerce, being lumbered on a large scale, and used for construction, interior finish, railway ties, etc.; the available supplies are being rapidly exhausted by the wasteful methods of lumbering. The tree is tenacious of life, the stumps even of the oldest trunks long retaining their vitality at the circumference, and sprouting into a circle of fresh young shoots, in which it differs from most other conifers. This tree (the redwood) occurs along the west slope of the Coast Ranges from Monterey Bay to the Oregon line, but is most abundant N. of San Francisco Bay up to lat. 40°. Where the redwood abounds it forms forests almost by itself. There are trees from 50 to over 75 feet in circumference and from 200 to 275 feet in height, and credible accounts are given of still larger ones. Archibald Menzies was the first botanist to collect specimens of the redwood (about 1810). They remained undescribed until 1832, when one of these specimens was figured by Lambert, and named *Taxodium sempervirens*. Soon after the tree was made known to botanists by David Douglas; in 1847 Endlicher founded upon it the genus *Sequoia*.

S. gigantea, the big tree, appears to have been first discovered in the spring of 1852 by a white hunter named Dowd, who reached the Calaveras grove. Specimens reached the Atlantic States and Europe in 1853, and Lindley first described the species as *Wellingtonia gigantea*, on Dec. 24, 1853; a figure of it also appeared in 1854 in *The Botanical Magazine*. The Californian botanists proposed to call it *Washingtonia californica*, and under this name it was published in the California *Farmer* in 1854. Meanwhile Dr. Torrey determined that this tree was of the same genus as the redwood—i. e. *Sequoia*—notwithstanding the difference in foliage, a conclusion announced also by Dr. Asa Gray in *The American Journal of Science* for Sept., 1854. Prof. Decaisne in Paris had already taken the same view, assigning the name *Sequoia gigantea*, which the tree now bears, as early as June 1854. (*Bull. Soc. Bot. France*, i., 70.) The name *Sequoia wellingtonia*, proposed by Seemann in 1855, is therefore antedated by *S. gigantea*, which must stand.

Although in general of greater size than the redwood, this tree is not so handsome. The branches are short, the spray less graceful. The wood is similar, but of a duller reddish hue. This species nowhere forms a forest by itself, but is mixed with other coniferous trees, mainly sugar-pines, and generally occurs in detached "groves." Its range in latitude is only between two and three degrees, in longitude being confined to a narrow belt on the western slope of the Sierra Nevada; its vertical range is restricted between 4,760 feet (at the northernmost locality) and 7,000 feet.

There are some twenty groups or groves segregated and named. The most northern grove known is situated in Placer County, 50 to 60 miles N. of the two groves, first discovered and most accessible in Calaveras County. The North Calaveras grove, covering 50 acres, contains ninety-three trees, of which four are over 300 feet high, the tallest standing, called the Keystone State, being 325 feet, and its diameter, 6 feet from the ground, 45 feet. Between these groves and the Merced river are two or three patches of big trees (Tuolumne and Merced grove), but none of great note until the Mariposa grove is reached. This is 16 miles S. of the Yosemite valley, and is in two patches, the lower one at 5,500 feet containing about 125 large-sized trees, one of the largest being the Grizzly Giant, over 93 feet in circumference at the ground, and over 64 at 11 feet, which is measured above the bulge of the trunk, characteristic of the cypress family. Most of these trees have been sadly injured by fire. About a dozen miles S. of this grove is the Fresno grove, said to contain about 600 trees, the largest 81 feet in circumference. From this district S. to the Tule river, but at greater elevations, trees appear to be more abundant than elsewhere, and more widely dispersed through the forest, the Dinky, King's river, New King's river, and Kaweah having been named. The age of sequoias was formerly estimated as high as 4,000 to 6,000 years, but countings of annual rings reduce the age of the oldest to between 2,000 and 2,500 years, most of them probably below this. Authentic accounts of the trees are to be found in J. D. Whitney's *Yosemite Book*, and in the writings of Muir, Clarence King, Lemmon, and others. See also *Garden and Forest*, especially vol. iii., p. 573, for a map of the groves.

FIG. 1.—Grizzly Giant, "Wawona," 275 feet high, 28 feet diameter.

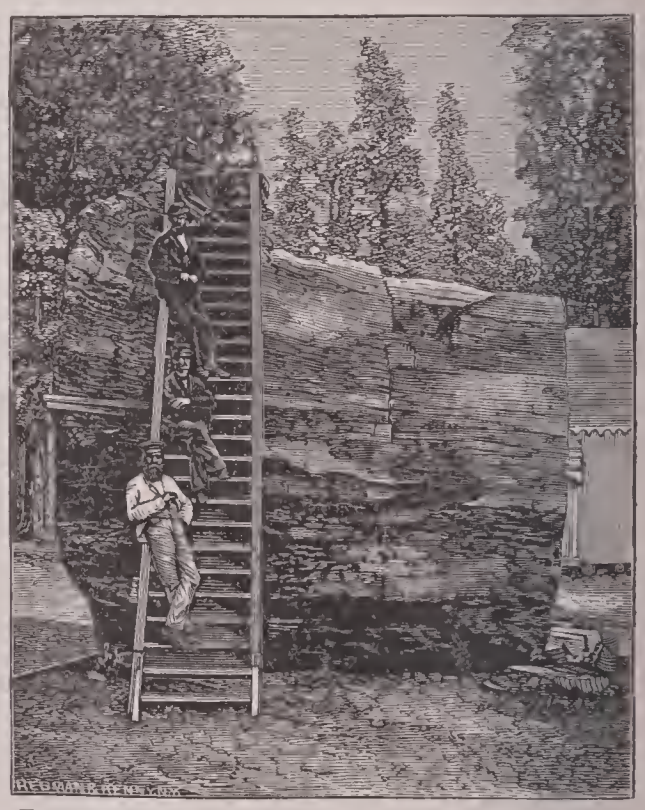

FIG. 2.—Section of a big tree, 92 feet in circumference.

Both species seem to require for their success the humid atmosphere of the region in which they occur. They thrive well, however, in many parts of Europe, especially in England and Ireland. Several trees of the *Sequoia gigantea*, over 40 feet in height, are to be found in Rochester, N. Y. In former ages, seven or eight species were in existence and distributed over a large part of the world, especially in the Tertiary period, when it occurred all around the Arctic zone, and in Europe, as far S. as Greece. B. E. FERNOW.

Sequoyah: See GUESS, GEORGE.

Séracs: See GLACIERS.

Seraing, sē'răn': town; in the province of Liège, Belgium; on the Meuse; 4 miles by rail S. W. of Liège (see map of Holland and Belgium, ref. 10–G). It has large manufactures of steam-machinery, locomotives, iron goods, and mirrors, and has rich coal mines in its vicinity. Pop. (1896) 36,873.

Serajevo: See SARAJEVO.

Serakhs: See SARAKHS.

Serampur': town; in Bengal, India; on the Hugli; in lat. 22° 45′ N., lon. 88° 26′ E.; 15 miles below the town of Hugli; is a neat and well-built city, European in style, extending for about a mile along the right bank of the river, and has large manufactures of paper (see map of N. India, ref. 7–I). It was originally a Danish settlement, founded in 1676, but was sold in 1845 to Great Britain. Under Danish rule Serampur did not prosper. It was the seat of the first Baptist missionary establishment in Hindustan, founded there in 1818. Pop. (1891) 35,952.

Revised by M. W. HARRINGTON.

Serape'um [= Latc Lat. = Gr. **Σεραπεῖον** (sc. *ἱερόν*, temple), a temple of Serapis, deriv. of **Σέραπις**, Serapis]: the name given to the collective temples and tombs of the Apis-bulls (see SERAPIS) of Memphis in Egypt. The site, now covered by about 60 feet of sand, is to the N. of the group of pyramids of Saqqarah, and the present remains are all subterranean. They were explored by Mariette in 1851–55, and all except two of the Apis-sarcophagi were found to have been rifled. Several mummies of Apis-bulls, taken from the Serapeum earlier in the century, are preserved in the Historical Society's museum in New York. The earliest remains found in the Serapeum date from the reign of Amenhotep III. of the eighteenth dynasty, and the Apis-tombs of this and of succeeding reigns down to the thirtieth year of Ramses II. form a class by themselves. Each Apis had its own separate chapel, which was connected by an inclined passageway with a single rock-hewn chamber, where the stone sarcophagus of the Apis-bull was placed. In the following period, which lasted till the time of Psammetichus I. of the twenty-sixth dynasty, the tombs were arranged in forty separate chambers on either side of a gallery about 330 feet long. This gallery and its chambers early fell into ruin, and are inaccessible. They were replaced by Psammetichus with a larger series of galleries, which aggregate 1,151 feet in length, and average 10 feet wide and 17½ feet high. Connected therewith are sixty-four chambers (26 feet high) hewn in the rock and now accessible. They still contain twenty-four large sarcophagi, each of which measures 13 feet in length, 11 feet in height, and 7 feet in width, and is estimated to weigh 65 tons. Only three are inscribed. The portion of the Serapeum above ground seems to have been built after the general plan of Egyptian temples, with two pylons, courts, and inclosures. Before it was a dromos and avenue of sphinxes which led directly to the Greek Serapeum, which was a Greek temple with cella and pronaos, and was adorned with two Corinthian columns. The importance of Mariette's discovery consisted mainly in the fact that some 500 historical monuments were found in the shape of stelæ and statuettes erected by pilgrims, who gave the dates of their pious visits. In this way many data were obtained for fixing the length of reign and succession of various Pharaohs.

According to the *Antonine Itinerary*, another Serapeum was located near the present line of the Suez Canal, at a point overlooking the Bitter Lakes. The Serapeum at Alexandria, erected by the Ptolemies, was probably in the form of a Greek temple, and was dedicated to the god in a form that was Græco-Egyptian. In the same building was the Alexandrian Library, and both perished together after the edict of Theodosius, about 390 A. D.

CHARLES R. GILLETT.

Ser'aph, plur. **Ser'aphim** [from Heb. *serāphīm* (plur.), deriv. of *sāraph*, burn]: a word which occurs but twice in the Bible (Isa. vi. 2, 6). The seraphim are described as creatures, human in appearance, with six wings, symbolical of the "devouring fire" of Jehovah's holiness.

Seraphic Brethren: See FRANCISCANS.

Seraphim, Order of the: in Sweden and Norway, a knightly order founded in 1260 or 1285 by Magnus I., King of Svealand, or, as others say, by Magnus II. in 1334. Charles IX. abolished it about 1610, and Frederick I. restored it Feb. 11, 1748. The bishop of the Seraphim, the prelate of the order, belongs to the national Lutheran Church.

Sera'pis [= Lat. = Gr. **Σέραπις**, **Ὀσαράπις**, from Egypt. *Asàr-Ḥāpi*, liter., Osiris-Apis]: an Egyptian deity, ostensibly a combination of Osiris with the Apis, the bull sacred to Ptah, an incarnation of Osiris, which symbolized the "perpetual regenerating power of the god." In some conceptions the Apis was associated with the moon. His native name, *Ḥāpi*, belonged also to the Nile, which revivified the land at the inundation, and to the cynocephalous deity of the dead, who represented the principle which revived the dead. In the later conception the deity bore a mixed character, and was Græco-Egyptian, combining in one the Greek Pluto and Esculapius and the Egyptian Osiris. The Apis-bull, which was the basis of the Serapis worship, was thought to have descended from a cow that had been impregnated by a ray of the moon. He must have distinctive marks: A triangular white spot on his forehead, a scarab-like growth beneath his tongue, a white vulture or eagle and a scarab on his flank and haunches, and a tail with both white and black hair. The discovery of an animal that possessed these features was greeted with universal joy, and its death with as universal mourning. He was kept with greatest care in a temple (the Apieum) at Memphis, where he received divine honors. When he died he was carefully mummied, and buried with great pomp and expense in the Egyptian SERAPEUM (*q. v.*). His emblem was a bull with the sun-disk and uræus serpent between his horns. The worship of the Apis began early; it is said to have been taken from Heliopolis to Memphis in the second dynasty, and Apis-priests are mentioned as early as the fourth dynasty. In pure or mixed form it continued throughout Egyptian history, and was transferred to other lands. Alexander the Great and the Roman Titus paid honors to the Apis of Memphis. According to Strabo (*Geogr.*, xvii., ii., §§ 10, 23), the worship of Serapis was also practiced at Alexandria, and at the niter mines near Naucratis in the region which the Greeks called Nitria or Nitriotis. His worship spread also to other countries, and in 82 A. D. Domitian built a temple in his honor at Rome.

CHARLES R. GILLETT.

Serena, La: capital of COQUIMBO (*q. v.*).

Se'res [= Lat. = Gr. **Σῆρες**; cf. Chin. *see*, *szĕ*, *sei*, *si*, silk]: Greek and Roman name for a people of Eastern Asia, without doubt the Chinese. See CHINA.

Seres (Lat. *Sericum*; Gr. **Σῆρες**): town; in the vilayet of Salonika, European Turkey; the center of the Turkish cotton culture and trade (see map of Turkey, ref. 4–C). Here the cultivation of the silkworm was introduced by Justinian (530). Two monks brought the eggs of the worm from China in a hollow walking-stick. Pop. 30,000 (18,000 are Greeks, 9,000 Ottomans, and 2,000 Jews).

E. A. G.

Serf [from O. Fr. *serf* < Lat. *ser'vus*, slave; cf. Eng. *servant*]: a person held in a modified form of slavery, bound to the soil and without rights as against his master, who could not, however, sell him like a chattel slave. During the Middle Ages serfdom formed one of the most prominent elements of the existing social order. It originated from the slavery of the ancient republics, and was transformed by the concurring influences of Christianity and feudalism. Slavery existed among the Germanic tribes, who reduced their captive enemies to that condition, but after the invasion of the Roman empire these slaves or thralls were raised to the position of serfs, whose numbers were greatly increased by the addition of the native population of the conquered districts. Then, too, the frequent famines and the need of protection from enemies drove many to sell themselves to the more powerful, especially to churches and monasteries. While the institution of serfdom differed both in origin and in character in the different countries of Europe, it was generally true that the condition of the serf was far superior to that of the slave under Roman law.

It is probable that the mastership which the feudal and ecclesiastical lords exercised over their serfs was for centuries felt as a blessing rather than as a burden; for the feudal system was indeed, up to the tenth century, the main support of social order, the condition of life. In countries into which feudalism did not penetrate, such as Italy, no serfdom was developed; here the peasants, the population of the agricultural districts, entered the armies of the city republics to which they belonged, and their position as citizens was not very different from that of the burghers. In England before the Norman conquest a large part of the population were in a state of serfdom, the *theow* being the lowest in the social scale and approaching the condition of a slave, while the *ceorl* could not be bought or sold and enjoyed some personal rights. With the conquest the *theow* disappears and the *ceorl* becomes the Norman *villein*, whose condition was an improvement on that of his Anglo-Saxon predecessor. If maltreated by his master he might have a hearing in the king's court, and he enjoyed the full protec-

tion of the law against strangers, but he could not own property, and could be sold with the land which he tilled. The terms *serf* and *villein* are used almost indiscriminately of the non-freemen, though originally the former term signified a lower order of bondman.

The abolition of serfdom in Europe was a gradual process. In England it gradually disappeared during the fifteenth and sixteenth centuries. It is mentioned for the last time in 1574 by a commission issued by Queen Elizabeth for its abrogation in the counties of Cornwall, Devon, Somerset, and Gloucester. In France, where both Louis IX. and Louis X. had sought support in the serfs against the feudal counts, serfdom was maintained, often in very harsh forms, up to the Revolution. In Denmark it was abolished in 1784 by Frederick VI., at that time heir-apparent only, but actually governing instead of his insane father; in Prussia in 1808 by von Stein; in Hungary in 1848 by the revolutionary anti-Austrian Diet; and in Russia in 1861 by Alexander II. See SLAVERY.

Revised by F. M. COLBY.

Serge [viâ O. Fr.: Ital. *sargia* < Lat. *se'rica*, silken garments, liter., neut. plur. of *se'ricus*, silken, deriv. of *se'res*. See SERES]: a name applied to various twilled fabrics. Silk serge is a coarse and strong material used for lining coats, making light shoes, etc. Woolen or worsted and woolen serges are made for ladies' cloaks and other uses. Some kinds of coarse serge are employed for making the garments of certain ecclesiastics. Other finer kinds are in some countries used exclusively for shrouds.

Sergeant [viâ O. Fr. *serjant*: Ital. *serviente* < Lat. *serviens, servien'tis*, servant, vassal, soldier, liter., pres. partic. of Lat. *servi're*, serve]: a non-commissioned officer (i. e. an enlisted soldier holding an appointment from the colonel authorizing him to exert a limited authority over his fellow soldiers) in the army and marines, of a rank higher than that of corporal. Each infantry company has a certain number of sergeants, one of which is of higher rank and pay than the rest, and is called first sergeant. Each battalion (or regiment, if, as in the U. S., it has but one battalion) has a sergeant-major, who is the highest non-commissioned officer of the battalion. He is the executive officer of the adjutant, and superintends the making out of details and the performance of other camp duties for the adjutant. There is also a quartermaster-sergeant to each battalion. In the U. S. service a number of quartermaster and commissary sergeants not attached to battalions, and the ordnance sergeants, whose duty relates to the care of ordnance, arms, ammunition, and military stores at the posts to which they are attached, are provided for by law to be selected from sergeants of the line who have served for a certain length of time as privates and non-commissioned officers.

Revised by JAMES MERCUR.

Sergeant, JOHN, LL. D.: lawyer; son of Jonathan D. Sergeant, lawyer; b. in Philadelphia, Pa., Dec. 5, 1779; graduated at Princeton 1795; was admitted to the Philadelphia bar 1799; was appointed a commissioner of bankruptcy 1801; was subsequently deputy attorney-general of Pennsylvania; sat several times in the Pennsylvania Legislature; was member of Congress 1815–23, 1827–29, and 1837–42; was the leading representative of the Northern States in advocating the passage of the Missouri Compromise Act 1820; was minister to the Panama congress 1826; Whig candidate for the vice-presidency on the ticket with Clay 1822, in which year his *Select Speeches* were published; president of the Pennsylvania constitutional convention 1830; declined the mission to England 1841; for half a century was regarded as one of the leaders of the Pennsylvania bar. D. in Philadelphia, Nov. 23, 1852.

Sergi, sār'jĕe, GIUSEPPE: psychologist and anthropologist; b. at Messina, Sicily, Mar. 22, 1841; educated at Messina: became Professor of Philosophy in lyceums at Messina and Milan; in 1880 Professor of Anthropology in the University of Bologna, and in 1884 professor in the University and director of the Institute for Anthropology at Rome. His principal works are *Elementi di Psicologia* (Messina, 1879); *Teoria fisiologica della Percezione* (Milan, 1881); *L'origine dei fenomeni psichici* (Milan, 1885); *Psychologie physiologique* (French trans., Paris, 1887); *Principi di psicologia*, vol. i., *Dolore e Piacere* (Milan, 1894); together with many anthropological memoirs. J. MARK BALDWIN.

Sergipe, originally **Sergipe del Rey**, sār-zheep'ā-dāl-rā': an eastern maritime state of Brazil; between Bahia, Alagoas, and the Atlantic. Area, 15,090 sq. miles. The interior is included in the Brazilian plateau, which is here low, much broken, and has little forest; a broad belt of lowland is separated from the ocean by extensive sand-dunes. The great SÃO FRANCISCO RIVER (*q. v.*) forms the northern boundary; aside from it the state has only a few insignificant streams, and the mouth of the São Francisco forms the only harbor. The climate is dry and much of the land is unfit for agriculture; the best is in the coast belt and on the edge of the plateau, where sugar and cotton are cultivated. In the interior cattle-raising is the principal industry. Sergipe is the smallest and one of the least populous and progressive of the Brazilian states. The exports are hides, sugar, cotton, tobacco, and a little gold obtained from surface-washings. Pop. (1894) estimated, 261,991. Capital, Aracajú, a small town on the coast. H. H. SMITH.

Sericulture: See SILK.

Series [from Lat. *se'ries*, connection, row, succession, series, deriv. of *se'rere*, join, bind together]: in mathematics, a succession of terms whose values proceed according to some law. The most familiar examples are the progressions of elementary algebra, called respectively arithmetical and geometrical progression. A series may terminate at a certain term, but more commonly it may be continued without end. In the latter case it is called an *infinite series*. The above-mentioned progressions are examples of infinite series, because either of them, when once started, may be continued indefinitely.

An infinite series may be either *convergent* or *divergent*. A convergent series is one the sum of all of whose terms approaches a certain limit if the series is continued indefinitely. A familiar example of this is afforded by a decreasing geometrical progression. Students of algebra know that the progression

$$1 + \tfrac{1}{2} + \tfrac{1}{4} + \tfrac{1}{8} + \text{etc., } ad\ infinitum,$$

will approach 2 as a limit, always differing from that limit by a quantity equal to the last term included in the addition, which term may be made as small as we please by continuing the series.

A divergent series is one the sum of whose terms does not thus approach a limit. A series may be divergent in two ways; the sum of the terms may increase beyond all limit, when their number becomes infinite, and may therefore be called infinity. But the sum may also be continually larger and smaller, without increasing indefinitely. Such a series is

$$1 - 1 + 1 - 1 + \text{etc.}$$

The sum of this series will always be either 0 or 1, according as the number of terms added is even or odd. It is therefore called divergent.

Series are of very extensive use in advanced mathematics, especially in the applications of algebraic methods, because of the great number of quantities which can not be expressed in any other way. Quantities expressed by a series are said to be developed in a series, and if the series is convergent their true values can be found with any degree of accuracy by taking a sufficient number of terms. But if the series in which the development is made is divergent, it can not represent the quantity. S. NEWCOMB.

Serinagur: city of Kashmir. See SRINAGAR.

Seringapatam': city of Southern India and formerly capital of Mysor; on an island in the Cavery, in lat. 12° 25′ N., lon. 76° 48′ E. (see map of S. India, ref. 6–D). Under Hyder Ali and Tippoo Sahib its fortifications were strengthened, and although unhealthful it had 300,000 inhabitants. In 1799 it was conquered by the British, and now it has less than 12,000 inhabitants, and these mostly in the suburb of Ganjam. M. W. H.

Sermon: See HOMILETICS and HOMILY.

Serous Membrane [*serous* is deriv. of *se'rum*. See SERUM]: in the human body the membranous walls of the arachnoid, pleural, pericardial, and peritoneal cavities, and the investing membrane of the testis. Serous membranes in all instances, save the peritoneum in women, are closed sacs, with their opposed walls more or less in contact, but lubricated by secreted serous fluid, so as to permit of free motion. The serous membrane is therefore a contrivance of nature to insure the freedom of the large organs of the body in the limited movements incident to their functional activity. The movements of the heart, lungs, and intestines, the more limited increase and decrease of size of the brain, and the considerable friction of the joints are facilitated and made easy by the well-lubricated serous mem-

branes investing these structures. In certain parts the reflections of the serous surfaces serve as ligaments to hold the organs in their proper places. (See HISTOLOGY.) The diseases of serous membranes are chiefly inflammatory, and often involve the underlying invested organs. Hence they are usually very grave. Acute meningitis, acute pleuritis when involving the lung also, pleuro-pneumonia, pericarditis, and peritonitis, all are attended with danger, and often are fatal. Revised by WILLIAM PEPPER.

Serpa Pinto, ALEXANDRE ALBERTO DA ROCHA: explorer; b. in Portugal, Apr. 30, 1846; entered the army, and as major led a Portuguese scientific expedition (1877–79) from Angola to the Transvaal. His *How I Crossed Africa* (1881) appeared in several languages. In 1884–86, with Cardozo, he led another expedition, extending Portuguese influence in Mozambique to Lake Nyassa. D. Dec. 28, 1900.

Serpent: a musical wind instrument of brass invented by Edme Guillaume of Auxerre in 1590. It has a curvilinear form, is composed of a mouth-piece, a neck, and a tail, and has six holes stopped with the fingers, with a compass from B flat below the bass staff to G, the treble-clef line.

Serpentine [named from its mottled yellow and green colors, thought to resemble those of the skins of certain serpents]: a rock chiefly composed of hydrous magnesium silicate. Minerals associated with it may be calcite, dolomite, iron oxides, pyrite, amphiboles, pyroxenes, olivine, etc. The rock is usually green in various shades, often quite dark; sometimes brown or red. The mottling is due to the admixture of other minerals. White spots are usually due to calcite or dolomite, the rock being called ophiolite or ophite.

Verd antique is the name of any serpentinous marble. Red, brown, and darker shades are due to the presence of iron compounds.

Serpentine occurs in large bodies interbedded with limestone and various crystalline schists, or in veins, dikes, or irregularly shaped masses, traversing other rocks in the same manner as igneous rocks. In most cases it can be shown to have resulted from the decomposition of magnesium silicates, chiefly olivine and pyroxenes. Many occurrences are plainly altered igneous rocks rich in magnesia. The origin of those serpentines which are associated with the crystalline schists is not so evident. In some cases they are altered forms of magnesium silicate minerals, possibly basic eruptive rocks or volcanic tuffs connected with rocks subsequently metamorphosed. In others they may have resulted from the alteration of magnesium carbonate into a hydrous silicate.

Serpentine is widely distributed throughout the world. On account of its color and its susceptibility to high polish it is much employed for ornamental purposes, as well as for general building. Details of its occurrence and data of economic importance may be found in Merrill's work, *Stones for Building and Decoration* (New York, 1891). See BUILDING-STONE. J. P. IDDINGS.

Serpent of Delphi: a column of Corinthian brass, fashioned to represent three intertwined serpents, and consecrated by the Greeks to the god Apollo after the battle of Platæa (479 B. C.). It was taken to Constantinople by Constantine, and has stood ever since in the Atmeïdan, the ancient Hippodrome. The heads and upper portion have been broken off, but the mutilated torse still remaining is 18¾ feet high. The names of nineteen of the Greek cities which resisted Xerxes may be distinctly discerned, cut deep in the metal not later than 475 B. C. The twelve other names higher up have been almost obliterated. No more precious monument of Greek antiquity exists. See Grosvenor, *The Hippodrome of Constantinople and its still existing Monuments* (London, 1889). E. A. GROSVENOR.

Serpents [viâ O. Fr. from Lat. *ser'pens*, liter., pres. partic. of *ser'pere*, creep: Gr. ἕρπειν: Sanskr. *sṛp-*, creep, crawl, glide, whence (by deriv.) *sar'pa*, serpent]: the *Ophidia*, an order of reptiles. They are recognized by the absence of true external limbs, and their very elongated body, which regularly graduates into the tail, there being no abrupt distinction between the two; the back and sides have generally imbricated scales. These scales are rarely granular, while the lower surface is generally covered in front of the anus with a row of very broad plates, and behind the anus with usually two, sometimes one, row; sometimes, as in the sea-snakes of the genus *Pelamis*, the scales extend upon the abdomen as well as on the sides and back; the head is covered with plates. The principal characteristics of the order, especially as given by Prof. Huxley, are as follows: the premaxillaries are generally rudimentary, and represented by a single small bone, which is connected with the maxillaries only by fibrous tissue; the palatine bones never unite directly with the vomer or with the base of the skull, but are usually connected with the maxillaries by tranverse bones, and by the pterygoids with the movable quadrate bones; thus the connection of the palato-maxillary apparatus with the rest of the skull is more or less lax, and in the typical species exceedingly so; in certain worm-like forms, however, this is not the case; the lower jaw has its rami connected at their symphysis, generally by ligamentous and extremely elastic fibers: the result of the mechanism exemplified in the typical serpents is, that the mouth-pieces are extremely dilatable, and hence prey of much greater diameter than that of the serpent in its ordinary condition can be ingested. The teeth are acute, and directed more or less backward, and are generally developed simply upon the maxillary, palatine, and dentary bones; in one genus (*Rhachiodon*) the inferior spines of eight or nine of the anterior vertebræ are developed into tooth-like processes tipped with enamel. In the specialized poisonous species poison-fangs only are developed on the maxillaries, the rows on the palatines and dentaries existing as in the typical species; in an intermediate type, containing very poisonous species, there are also rows of teeth behind the poison-fangs. The vertebræ have ball-and-socket articulations and each of them bears ribs, with the exception of the first one or two, which may be considered as cervicals. Anterior limbs are absent in all forms, but the posterior are in some types represented by rudiments which appear externally as hooks on either side, and a little in advance of the vent. The lungs are unequal in size, and in the typical forms the disparity is very great, the left one usually being the smaller of the two; sometimes (especially in the venomous species) only one of the lungs is developed: the form of the lungs is that of an elongated sac, in which the walls are produced into numerous septa "which render the cavity highly cellular near the bronchus, while at the opposite end they become smooth and but little vascular; in this latter region the lung may receive its blood from the systemic, and not from the pulmonary, circulation." The bronchus opens directly into the lung. The heart is divided into two auricles and a single very imperfectly separated ventricle.

The movements of serpents are often misconstrued. They progress by sinuous flexures from side to side, and are incapable of the vertical undulating movements which are sometimes accredited to them in pictorial illustrations. Progression is greatly facilitated by the transverse plates with which the abdomen is covered. Many serpents are also capable of ascending trees, and vertical surfaces; but they are unable to progress on polished or glass-like surfaces. Some live in marshy regions, some in rocky, some on sandy desert plains, others among the trees, and still others burrow in the earth; again, some frequent fresh waters, while a few are even modified for swimming in the ocean. These sea-serpents, the *Hydrophidæ*, are not to be confounded with the mythical sea-serpents (see SEA-SERPENT), for they are comparatively small species, with the tail strongly compressed and adapted for swimming, and with small poison-fangs. The *Scolecophidea*, in part at least, burrow in the earth, and thus by their habits, as well as form, justify the term of worm-like snakes.

Most serpents are oviparous, and lay eggs whose shell is generally more or less soft and yielding, but which have, at the same time, a greater or less amount of lime; and sometimes this is developed in sufficient quantity to give a considerable rigidity to the shell: other serpents are ovoviviparous. The innocuous species are generally oviparous, and the venomous ovoviviparous, but the exceptions are numerous. The eggs are generally extruded in a chain, being connected by a viscous substance. In most cases the mother, after laying her eggs, leaves them to be hatched by the sun or decaying vegetable matter, but some species—the pythons, for example—coil themselves around the eggs and thereby hatch them. Many species go with their young for some time after birth, and protect them from enemies. It has been well ascertained that with some species the parent opens its mouth at the approach of danger, and receives therein its young, which are afterward allowed to depart therefrom unharmed.
