¹ By the treaty of 1872 the Brazilian frontier was drawn up the Paraná from the mouth of the Y-Gunzu (25° 30' S. lat.) to the Salto Grande or Great Cataract of La Guayra (24° 7'), thence west along the watershed of the Sierra de Maracayú, north along the Sierra de Amanbaya to the sources of the Apa, and down that stream to its junction with the Paraguay. The Buenos Aires treaty of February 3, 1876, fixed the frontier between Argentina and Paraguay, and assigned to Paraguay the portion of the Gran Chaco between Rio Verda and Bahia Negra; the appropriation of the portion between Rio Verde and the Pilcomayo was left for after consideration.

³ In regard to the rivers, compare the article PLATE RIVER

over 84 days,—75 days being cloudy and 206 bright and clear. In the five years 1877–81 only 50 frosts were observed, and of these 17 fell in August. The wind blows from the south on 118 days, and from the north on 103; while from the east it blows only 44 days, and from the west only 3. Neither north nor south appears to obtain any definite mastery in any month or season. The south wind is dry, cool, fresh, and invigorating, and banishes mosquitoes for a time; the north wind is hot, moist, and relaxing. Violent wind-storms, generally from the south, average sixteen per annum. Goitre and leprosy are the only endemic diseases; but the natives, being underfed, are prone to diarrhoea and dyspepsia.¹

The fauna of Paraguay proper is practically the same, as that of Brazil. Caymans, water-hogs (*capinchos*), several kinds of deer (*Cervus paludosus* the largest), ounces, opossums, armadillos, vampires, the American ostrich, the ibis, the jabiru, various species popularly called partridges, the *pato real* or royal duck, the *Palamedea cornuta*, parrots and parakeets, are among the more notable forms. Insect life is peculiarly abundant; the red stump-like ant-hills are a feature in every landscape, and bees used to be kept in all the mission villages.

As to the mineral resources of Paraguay but little is known—possibly because there is little to know. The gold mines said to have been concealed by the Jesuits may have had no existence; and, though iron was worked by Lopez II. at Ibicuy (70 miles south-east of Asuncion), and native copper, black oxide of manganese, marbles, lime, and salt have been found in greater or less abundance, the real wealth of the country consists rather in the variety and value of its vegetable productions. Its forests yield at least seventy kinds of timber fit for industrial purposes,—some, such as the lapacho and quebracho, of rare excellence and durability, as is shown by the wonderful state of preservation in which the wood-work of early Jesuit churches still remains. Fifteen plants are known to furnish dyes, and eight are sources of fibre—the caragatay especially being employed in the manufacture of the exquisite handwoven or spiderweb lace of the natives. Fruit trees of many kinds flourish luxuriantly; the cocoa palm often forms regular groves, and the orange tree (reaching a height of 50 feet) is so common and bears so profusely that oranges, like bananas, have a mere nominal value. In the *MATÉ* (*q.v.*), or Paraguayan tea, Paraguay has a commercial plant of great importance, which may be said to be peculiarly its own; and most of the primary crops of the tropics could be cultivated with ease if there were only men and means. Paraguay tobacco is prized in all the La Plata countries, and, as men, women, and children all smoke, there is a large home consumption; but only a small quantity finds its way to Europe, under other names; coffee (though the berry is of excellent quality, if slightly bitter) is even more neglected; sugar is grown only for manufacture into rum and syrups, and loaf-sugar has to be imported from Brazil; and, although the whole population is clothed exclusively in white cotton stuffs, and cotton grows almost spontaneously in the country, English goods burdened by a duty of 40 per cent. keep the market. Wheat, oats, and rice can all be raised in different districts, but the dietary staples of the Paraguayans are still, as when the Spaniards first came, maize and mandioca (the latter the chief ingredient in the excellent *chipa* or Paraguayan bread), varied it may be with the seeds of the *Victoria regia*, whose magnificent blossoms are the great feature of several of the lakes and rivers. Cattle-breeding was formerly a very important interest in several of the departments, but the stock was nearly all destroyed during the

war, and is only being slowly recruited from the Argentine Republic. The total number of horned cattle is estimated at 500,000. Land may be purchased from private owners for from £160 to £200 per square league of 4500 English acres, but the Government rate amounts to £900 or £1000.

The inhabitants of Paraguay are mainly Guaranis or half-breeds with a strong proportion of Guarani blood.² A peaceful, simple people, fond of flowers and fêtes, they displayed during the desolating wars of 1865–70 (as so often before in the time of the Jesuits) indomitable courage in the face of overwhelming odds. Trustworthy figures in regard to the population can hardly be said to exist. A so-called census for 1879 gives a total of 346,048, which is probably not far from the truth. The female births being always in excess of the male, and most of the full-grown men having perished in the wars, the females form about two-thirds of the whole. Of the foreign residents in 1879, about 4000 were Italians, 400 Germans, 400 Spaniards, and 40 English. Formerly, about 1857, divided into twenty-five departments, the country was in 1876 distributed into twenty-three electoral districts, each with a *gefe politico*, a *jefe de paz*, and a municipality. ASUNCION (*q.v.*), the capital, is also the largest city (40,000 in 1857, 16,000 in 1879). Other places of present or historical importance are Villa Rica (12,570 in 1879), often called Villa Pobre, the chief seat of the tobacco trade, and the easternmost of the larger towns; Villa Pilar or El Pilar (3722), formerly Neembucu, opposite the mouth of the Bermejo, and the “strangers’ farthest” under Dr Francia’s despotism; San Estanislao (7453); San Pedro (9706), near the Tejuí, about 3 leagues from its junction with the Paraguay; Concepcion (10,697), the northernmost of the towns or villages, 200 miles above Asuncion, and the trading centre for the northern maté plantations; Humaitá (3868), 198 miles below the capital, the site of the great earthworks by which Lopez stopped the advance of the allies for more than a year; Paraguari (5315), the present terminus of the railway; Jaguarón (3413), 2½ leagues from Paraguari, founded in 1536, and the seat of a manufacture of orange-flower essence; Ita (6332), known for its earthenware; Itangua (6948), with brick and tile works; Luque (8878), the provisional capital in 1868; Villa Hayes (Villa Occidental, Nouvelle Bourdeaux), 10 miles above Asuncion, founded in 1854 by Lopez with French settlers.³

Paraguay is a constitutional republic. The president and vice-president hold office for four years, and are again eligible after eight years. The legislative bodies are a chamber of deputies (one deputy from each 6000 inhabitants) and a senate (one senator from each territorial division with 8000 inhabitants, and beyond that from every 12,000 inhabitants). There are five Government departments, and a supreme court of three salaried judges. The people are nominally Roman Catholics, but full religious liberty prevails. Crime is comparatively rare, and is rapidly diminishing. Marriage has fallen so completely out of fashion that only 3 per cent. of the births are legitimate. Education is technically compulsory; but the 178 schools were in 1879 attended only by 5862 boys and 920 girls. There is only one public library (3000 vols.) in the country. The army, which, when Lopez II. ascended the throne, numbered 12,000 men, but with a reserve of 46,000, is now reduced to 500 men; every able-bodied citizen is under obligation to serve in case of need. There is but one war-steamer, of 440 tons burden. The only railway is the line (45 miles) from Asuncion to Paraguari, which was begun by Lopez I. in 1859, and surveyed as far as Villa Rica. It was bought for £100,000 by a joint-stock company in 1877. The double run, occupying twelve hours, is performed four times a week. The general trade of the country has begun to revive: from £131,493 in 1876, the value of the imports rose to £258,000 in 1881, and the exports from £68,577 to £385,700. Among the exports (all duty free) there appeared in 1881—maté, £182,025; dry hides, £23,345; tobacco, £131,730; 20,009,597 cigars, £4802 (about seventeen a penny); 47,917,700 oranges, £9583; and hard woods, £3342. The customs furnish nearly four-fifths of the national revenue (not much more than £100,000 in 1881). Previous to the war there was no national debt. In 1871 and 1872 two foreign loans (nominally £1,000,000 and £2,000,000) were contracted through Messrs Robinson, Fleming, & Company, London, and hypothecated on the public lands of Paraguay, valued at £19,380,000. Apart from the war debt of more than £45,000,000, the official statement for 1882 recognizes a foreign debt of £3,463,000.

History.—In 1528 Sebastian Cabot, following in the footsteps of De Solis, reached Paraguay and built a fort called Santo Espíritu. Asuncion was founded on August 15, 1537, by Juan de Ayolas, and his successor Martinez de Irala determined to make it the capital of the Spanish possessions east of the Andes. From this centre Spanish adventurers pushed east to La Guayra beyond the Paraná, and west into the Gran Chaco; and before long vast numbers of the less warlike natives were reduced to serfdom. The name Paraguay

¹ Further details will be found in Keith Johnston (*Geog. Mag.*) and Mr Vansittart’s Report.

² A graphic description of the Guarani physique is given by Captai Burton, *Battlefields of Paraguay*, p. 11.

³ Mr Vansittart in *Reports by Sec. of Emb. and Legation*, 1883.

was applied not only to the country between Rio Paraguay and Rio Paraná, but to the whole Spanish territory, which now comprises parts of Brazil, the republic of Uruguay, and the Argentine provinces of Buenos Ayres, Entre Rios, Corrientes, Misiones, and part of Santa Fé. It was not till 1620 that Paraguay proper and Rio de la Plata or Buenos Ayres were separated from each other as distinct governments, and they were both dependent on the vice-royalty of Peru till 1776, when Buenos Ayres was erected into a vice-royalty, and Paraguay placed under its jurisdiction. In the history of Paraguay down to the latter part of the 18th century, the interest develops along two main lines, which from time to time get entangled with each other—the struggle between Spaniard and Portuguese for the possession of the border region between the Brazils and the country of the plains, and the formation and defence of a great philanthropic despotism by the Jesuits. The first Christian missions in Paraguay were established by the Franciscans—Armenta, Lebron, Solano (who was afterwards canonized as the apostle of Paraguay), and Bolaños—between 1542 and 1560; but neither they nor the first Jesuit missionaries, Salonio, Field, and Ortega, were allowed to make their enterprise a permanent success. This fell to the lot of the second band of Jesuits, Cataldino, Mazeta, and Loreuzana, who began work in 1605. The methods by which they controlled and disciplined the Guaranis have been described in the article AMERICA.¹ The greater number of the Jesuit "reductions" lay outside of the present limits of the republic, in the country south of the Paraná, which now forms the two Argentine provinces of Corrientes and Misiones. La Guayra, one of the most celebrated, is in the Brazilian province of Paraná. Though they succeeded in establishing a kind of *imperium in imperio*, and were allowed to drill the natives to the use of arms, the Jesuits never held rule in the government of Paraguay; indeed they had nearly as often to defend themselves from the hostility of the governor and bishop at Asuncion as from the actual invasions of the Paulistas or Portuguese settlers of São Paulo. It was only by the powerful assistance of Zabala, governor of Buenos Ayres that the Anti-Jesuit and quasi-national party which had been formed under Antequera was crushed in 1735. In 1750 Ferdinand VI. of Spain ceded to the Portuguese, in exchange for the fortified village of Colonia del Sacramento (Uruguay), both the district of La Guayra and a territory of some 20,000 square miles to the east of the Uruguay. Seven of their reductions being included in this area, the Jesuits determined to resist the transference, and it was only after several engagements that they were defeated by the combined forces of Spain and Portugal. The treaty which they thus opposed was revoked by Spain in 1761, but the missions never recovered their prosperity, and the Jesuits were finally expelled the country in 1767. In 1811 Paraguay declared itself independent of Spain; by 1814 it was a despotism in the hands of Dr FRANCIA (*q.v.*). On Francia's death in 1840, the chief power passed to his nephew Carlos Antonio LOPEZ (*q.v.*), and he was in 1862 succeeded by his son Francisco Solano Lopez, whose ambitious schemes of conquest resulted in the almost total extinction of Paraguayan nationality. The three allies, Uruguay, Brazil, and the Argentine Republic, which united against him, bound themselves by the treaty of 1865 to respect and guarantee for five years the independence, sovereignty, and territorial integrity of Paraguay, and at the close of the war in 1870 a new constitution was established, and a president, Jovellanos, appointed under their protection. Reduced to utter helplessness, the country owes its continued existence to the jealousy and balance of power existing between its neighbours. By a separate treaty with Brazil in 1872 it undertook to pay the cost of the war—£40,000,000 to Brazil, £7,000,000 to the Argentine Republic, and £200,000 to Uruguay, or more than £136 per head of the population. An attempt made in 1873 by Messrs Robinson and Fleming to establish an English colony of so-called Lincolnshire farmers ended in disaster. Somewhat better success has as yet attended the German colony of San Bernardino on Lake Ipacanay (414 colonists in 1879). The Brazilian army of occupation was withdrawn only in 1876.

Of older works on Paraguay the most important are Azara's *Voyages dans l'Amérique Méridionale*, Paris, 1809; and Charlevoix, *Histoire*, already referred to. As commissioner for the settlement (in 1781) of the frontier between Spanish and Portuguese territory, Azara enjoyed exceptional opportunities of information. Lozano's *Hist. de la Conquista del Paraguay* (used in MS. by Azara) was first printed at Buenos Ayres, 1773-74. Ulrich Schmidt (often, even in editions of his work, called Schmidel or Schmiedels), a German adventurer, left a narrative of the first Spanish expeditions, which was published at Frankfurt in 1563. Like much else of the older literature it is included in Pedro de Angella's *Coleccion de docum. hist. del Rio de la Plata*, 1835, &c. and in De Bry's similar collection, as well as in Barcia's *Historiadores*. A systematic narrative of events in the Spanish period is given in Gregorio Funes, *Ensayo de la hist. civil del Paraguay*, Buenos Aires, y Tucuman, 3 vols., Buenos Aires, 1816; Weshburn's *History of Paraguay*, Boston, 1871, deals with later times. See also Dobrzhizhoffer, *Hist. de Abiponibus*; Page, *La Plata*, &c., New York, 1867; Mansfield, *Paraguay*, &c., London, 1856; Burton, *Letters from the Battlefields of Paraguay*, 1870; Mulhall, *Handbook of the River Plate Republics*, 1873; Mrs Mulhall, *Between the Amazon and Andes*, 1881; E. F. Knight, *Cruise of the Falcon*, 1883. (H. A. W.)

PARAGUAY RIVER. See PLATE RIVER.

PARAHYBA, or PARAIBA, distinguished as Parahyba do Norte from Parahyba do Sul or S. João de Parahyba to the south of Rio de Janeiro, is a city of Brazil on the right bank of the river of the same name, 12 miles from the sea, at the terminus of a railway running 87 miles into the interior. It is divided into a lower commercial town and an upper town containing the governor's residence and other public buildings. From December to March the climate is not considered healthy. The harbour, obstructed by several reefs, has a depth of 15 feet, but vessels ground at low water; there is safe anchorage, however, at Cabedello at the mouth of the river. The population, which was 40,000 about 1845, has decreased to between 12,000 and 14,000, and direct trade with Europe has been given up since 1840. Sugar, cotton, and india rubber are still exported.

PARALLAX may be defined, generally, as the change produced in the apparent place of an object when it is viewed from a point other than that of reference. In astronomy, the places of the moon and planets are referred to the centre of the earth, those of the fixed stars to the centre of the sun. It is shown in ASTRONOMY (vol. ii. p. 775) that, the maximum or horizontal parallax of a celestial object being known, its parallax from any point of observation can be calculated. The present article will be restricted to an account of the methods employed for determining the solar and lunar parallaxes and those of the fixed stars.

SOLAR PARALLAX.—The sun's mean equatorial horizontal parallax (termed briefly the "solar parallax") is the angle which the equatorial radius of the earth would subtend to an observer at the sun when the earth is at mean distance from the sun. For its determination it would appear only necessary to observe the sun's apparent position simultaneously² from two widely different points on the earth's surface; the difference of the apparent positions will be due to displacement by parallax, from which displacement the mean equatorial horizontal parallax can be readily deduced.

The requirements of modern astronomy demand that the solar parallax shall be determined with an accuracy of $\frac{1}{1000}$ part of its amount—that is, within less than $\frac{1}{100}$ part of a second of arc. But measures in the neighbourhood of the sun cannot be made with any approach to this accuracy, not only on account of the effect of the sun's heat on the various parts of the instruments employed, but also of the atmospheric currents created by heat, which tend to destroy steady atmospheric definition and to render the solar image incapable of exact observation. It is thus hopeless to look for any solution of the problem by the most direct method. Two courses remain—either to seek some method which affords a larger angle to measure, or one which permits a mode of observation affording a higher precision. There are many relations to the solar parallax which are well established.

(1) The parallax of the moon is known with very considerable precision by direct determination. The proportion of this parallax to that of the sun is an important term in the lunar theory, and the constant of this term (the *parallactic inequality*³) is a known function of the solar parallax. Hence, if the constant of the parallactic inequality is independently determined, the solar parallax becomes known. The elements of the orbits of Venus and

² In using the word *simultaneously* the reader must understand that, though it is impossible for two widely separated observers to make precisely simultaneous observations, yet there is no difficulty (since the apparent motion of the sun is accurately known) in reducing the observations so as to represent the result as if the two observations had been made at the same instant.

³ See ASTRONOMY, vol. ii. p. 796.

Mars undergo secular variations which increase from year to year, from century to century, and at last acquire very large values. These secular variations (on the assumption that all the terms of the theories of the planets are mathematically accurate) have also a well-determined relation to the solar parallax, and therefore afford a means of determining that parallax with an accuracy which increases by the continuance of observation.

(2) It has been shown (ASTRONOMY, vol. ii. p. 779 sq., and MECHANICS, vol. xv. p. 708) that the proportions of the interplanetary distances can be very accurately determined and tables be computed from observations of the apparent places of the planets, without any knowledge or assumption as to absolute distances (although an accurate knowledge of the solar parallax is required for giving final perfection to the lunar and planetary tables). In astronomical ephemerides therefore the distances of planets from the earth are accurately expressed in terms of the earth's mean distance from the sun, the latter being reckoned unity. Hence, to determine the solar parallax, it is only necessary to measure, at some favourable opportunity, the parallax of any planet, and to multiply the parallax so found by the number which expresses the relation of the distance of the planet from the earth to the earth's mean distance from the sun.

(3) When Jupiter is in opposition he is nearer the earth by the diameter of the earth's orbit than when in conjunction; hence, since light occupies a very sensible time to travel, eclipses of Jupiter's satellites will seem to occur too soon in the first case and too late in the latter, the difference between the extremes of acceleration and retardation being the time occupied by light in crossing the earth's orbit. This time is about $16\frac{1}{2}$ minutes for the mean diameter of the earth's orbit; hence, if the velocity of light can be independently determined, the diameter of the earth's orbit becomes known. The determination, by employing the velocity of light, is also arrived at in another way. The constant of aberration (see ASTRONOMY, p. 757), or the maximum apparent change of a star's true place due to the motion of the observer, depends on the relative velocity of the motion of the observer in space compared with the velocity of light. The angular velocity of the observer is perfectly known; hence if his linear velocity is known his radius of motion is known. Thus, if the constant of aberration and the velocity of light are independently determined, the radius of motion (that is the sun's parallax) will be found.

There are thus three distinctive typical methods:—(1) the gravitational method, depending on terms in the lunar and planetary theories, the constants of which are determined by observation; (2) the geometrical, or direct observational, method; and (3) the physical method.

1. *The Gravitational Method.*—The moon's parallactic inequality appears, at first sight, to furnish a very accurate method, as its constant is about $125''$, or fourteen times as great as the solar parallax, and the existing observations are very numerous. Unfortunately its determination is inextricably mixed up with the determination of the moon's diameter—a diameter increased by irradiation, and therefore different for every telescope, and perhaps for every observer. But this is not all. The maximum and minimum effect of the parallactic inequality occur at first and last quarter, i.e., when the moon is half full. One half of the observations for parallactic inequality therefore are made when the sun is above the horizon, and a great portion of the other half during twilight; whilst those on which the moon's diameter depend are made at midnight, when the irradiation is a totally different quantity from what it is in daylight or during twilight. Newcomb has attempted to determine the correction of the diameter by

the errors in right ascension, derived by comparing Hansen's tables of the moon with observations made by daylight and at night; but he confesses that the result is so mixed up with the correction of the coefficient of the variation (and, he might have added, with the observer's personality and the telescope employed) that it cannot be relied upon.

The following are the most important discussions:—

| | | |
|---|-------------|-------|
| Hansen, <i>Mon. Notices R. A. S.</i> , vol. xxiv. p. 8 | result | 8".92 |
| Stone, <i>Mon. Notices R. A. S.</i> , vol. xxvi. p. 271 | | 8".85 |
| Newcomb, <i>Washington Observations</i> , 1865 | | 8".84 |
| Neison, unpublished, probably to appear in <i>Mem. R. A. S.</i> | .. | 8".78 |

One cannot look with confidence upon a method which thus permits discordance of more than one per cent. in the discussion of the *same observations* by different astronomers. The result arrived at must depend on the adopted corrections of the moon's diameter, and, since that diameter is not capable of determination under the same circumstances of illumination as those in which the observations for parallactic inequality are made, the judgment of the theorist must step in and assign some more or less hypothetical grounds for the adoption of a particular diameter; and upon this assumption will turn the whole of the quantity of which we are in search.

It is, however, not impossible that the method of observing a spot near the centre of the moon, instead of the moon's limb, may lead to a more reliable result. But it will have to be shown by independent methods that the position of the selected spot is not systematically affected by phase.

Attention was first called to the method which employs the secular variations of the elements of the orbits of Venus and Mars for determining the solar parallax by a most able and comprehensive paper communicated by Leverrier to the Paris Academy of Sciences, and published in their *Comptes Rendus* for 1872, July 22. The most important of these variations is that of the perihelion of Mars. The earth's attraction increases the heliocentric position of Mars at perihelion by about $50''$ in a century, and this change at a favourable opposition subtends an angle of $185''$ at the earth.

On 1672, October 1, the star ψ Aquarii was occulted by Mars. The appulse was observed by Richer at Cayenne, by Picard near Beaufort, and by Romer at Paris. The separate comparisons differ only $0''.5$, $0''.8$, and $0''.3$ respectively; and the star ψ Aquarii was very frequently observed by Bradley. The increase in two centuries of the geocentric longitude, corresponding to the distance of the planet Mars from the earth on 1672, October 1, is $294''$. Hence M. Leverrier concludes that (attributing an error not greater than $1''$ to the determination of the observed variation) the time has arrived when the solar parallax can be determined with a probable error not exceeding $\frac{1}{100}$ of its amount, or the concluded parallax will be exact to nearly $\pm 0''.01$. The value of the parallax so deduced M. Leverrier finds to be

8".866.

Similarly he finds from the latitude of Venus, determined by the transits of Venus in 1761 and 1769, combined with the latitude determined by meridian observations of the present day

8".853.

From the discussion of the meridional observations of Venus in an interval of one hundred and six years, he finds

8".859.

These values from the theories of Venus and Mars accord in a wonderful manner, and would appear at first sight to justify considerable confidence in the result. But it is impossible to forget the extraordinary intricacy of the

processes through which these results have been evolved, and the liability to some systematic source of error, such, for example, as some neglected term producing a long inequality which may become mixed up with the secular variation.

In 1874 the tabular errors of Venus, as determined by the planet's transit across the sun's disk, amounted to more than 5" of arc both in R.A. and declination, and the tabular errors of Mars amounted to more than 8" in R.A. and to about 3" in declination at the opposition of 1877, equivalent to an error of 2".45 in heliocentric longitude (*Mem. R. A. S.*, vol. xlv. p. 172). Leverrier's planetary tables do not, therefore, possess the accuracy attributed to them by their distinguished author, and the conclusions at which he arrived probably require some further modification. Tisserand (*Comptes Rendus*, 1881, March 21) has continued the researches of Leverrier, and finds that they require modification, and are also subject to very considerable probable error. The later researches of Tisserand appear to point to a value of the solar parallax smaller than that found by Leverrier, but his work has not yet been brought to final conclusion.

2. *The Geometrical Method.*—The most favourable opportunities for the application of this method are afforded, in a geometrical sense, by the planets Venus and Mars, when the former is in conjunction and the latter in opposition. Of these Venus approaches the earth within one-fourth of the sun's mean distance, whilst Mars, in the most favourable circumstances, approaches only within one-third of the same distance.

When Venus is near conjunction she is only visible as a slender crescent in the neighbourhood of the sun, and at conjunction is only visible on the occasion of a transit across the sun's disk. It generally happens, therefore, that the only means of determining the apparent position of Venus near conjunction is to refer that position to the sun's limb or sun's centre. But the sun's place is also affected by parallax, so that when the position of Venus is referred to the sun the parallactic displacement is only the difference of the parallax of the sun and Venus. Mars, on the other hand, can be referred to stars of which the parallax is absolutely insensible; thus it happens that the advantage of Venus in point of parallactic displacement is diminished till the geometrical conditions are only 5 per cent. in favour of Venus. Transits of Venus across the sun's disk have been observed for parallax in 1761, 1769, 1874, and 1882.¹

If an astronomer at each of two widely separated stations observes the absolute instant of apparent internal contact of Venus with the sun's limb, he is sure that the centres of the sun and Venus are separated by an angular distance equal to the "semidiameter of the sun minus the semidiameter of Venus." The difference of the absolute times at the two stations is due to parallactic displacement, and, the planet's tabular motion being accurately known, the amount of displacement becomes known. If instead of one contact only the two observers note the instants of internal contact both at ingress and egress, then they practically find the chords described by the planet as seen from both stations. The difference of length of these chords (in time) being known, as well as the approximate diameters of the sun and Venus, and their tabular motion, we have the data for computing the difference of least distance of centres of the sun and Venus at the two stations, and this distance being due to parallax, we have the means of computing the parallax of Venus and thence the solar parallax. This latter method (originally proposed by Halley in 1716) has the advantage of not requiring a

rigid determination of the *absolute instant* of each contact, but merely of the duration of the transit; in other words, it involves no very rigid determination of the longitude or clock error, but only an exact knowledge of the clock rate.

It was Halley's opinion that the instants of contact could be observed with an accuracy within two or three tenths of a second of time, but experience has gone to show that the actual errors are from ten to forty times this amount, and the causes of those errors can now be assigned with considerable certainty. These causes are—(1) irradiation and diffraction; (2) disturbance of the image by irregular refraction in the earth's atmosphere; (3) the effect of the atmosphere of Venus in complicating the phenomena at the point of contact.

(1) Irradiation increases the diameter of the sun and diminishes that of Venus. Its extent depends on the aperture of the telescope, the perfection of its optical quality, and the perfection of the focal adjustment. Its amount is also changed by the brilliancy of the sun, *i.e.*, is affected by the transparency of the sky and the density of the sun-shade employed. Also, when the space between the limbs of the sun and Venus becomes smaller than the diffraction disk of the object-glass employed, a greyness or shadow is perceived at the point of past or approaching contact; therefore, within a minute angle equal to the separating power (the diameter of the diffraction disk) of the object-glass, the actual instant of contact can only be estimated by changes in the diffraction phenomena. (2) When the images are thrown into rapid vibration by irregular refraction in the earth's atmosphere, it becomes impossible to distinguish between the vibration of the image of the dark body of Venus across the sun's limb near the point of contact and the regular phenomena of irradiation, provided that the atmospheric vibrations are sufficiently rapid to produce a persistent image on the retina of the observer's eye. Thus at the transit of Venus in 1882 observers were instructed to note at ingress the time when there was "a well-marked and persistent discontinuity in the illumination of the apparent limb of the sun." Now it so happened that at the Royal Observatory, Cape of Good Hope, the definition was very bad—a south-easter was blowing, the effect of which was, as is almost invariably the case, to create a rapid minute vibration in the images of celestial objects (see Sir John Herschel's *Results of Observations at the Cape of Good Hope*, p. xiv.). Thus "a well-marked and persistent discontinuity in the illumination of the apparent limb of the sun" was seen by all of five observers at the Royal Observatory from 10 to 20 seconds of time longer than at the adjoining stations in the Cape Colony, where the images were seen comparatively steady and well-defined. The instant of occurrence of the above-described phase is therefore a function of the state of the atmospheric definition, and no accurate means exist of estimating such influence. (3) The observation is besides complicated by the illuminated atmosphere of Venus, which forms an arc of light round the planet near the point of contact. In many cases this light has been confounded with the light of the sun, and has thus caused very considerable errors of observation.

From these various causes the apparent phenomena are different at different stations; and probably also the same phenomena are described by different observers in very different language. The real difficulty of the discussion of the results arises when these different and differently described phenomena have to be combined. It is of no consequence whether a real or seeming contact has been observed; it is only necessary to be certain that those observations are combined which represent the same phenomenon. The same phenomenon would correspond with the same apparent angular distance of centres of the

¹ For conditions when a transit will occur, and past and future transits, see ASTRONOMY, vol. ii. p. 796

sun and Venus, if all the telescopes were alike, if all the telescopes were in perfect focal adjustment, and if the atmospheric conditions of definition at all the stations were perfect or identical. But if these conditions are not realized (and they cannot be realized in practice) the same apparent phenomena will not represent corresponding phases; and, further, the observers at different stations use such different language to express what they saw that it becomes impossible to select even apparent corresponding phases with any certainty.

The value of the solar parallax deduced from a series of observations of the contacts of Venus with the sun's limb will therefore entirely depend upon the interpretation put upon the language of the various observers. The result will besides be systematically affected if the state of atmospheric definition is systematically different in the opposite stations.

It is thus not surprising that very different results have been arrived at by different astronomers from different transits, and even from different discussions of the same observations of the same transit.

Besides observing the contacts, another method was employed by the Germans, the Russians, the Dutch, by Lord Lindsay's expedition at the transit of Venus in 1874, and by the Germans in 1882, viz., the heliometric method. This consists in observing with the heliometer (see MICROMETER, vol. xvi. pp. 252-254) the distance of Venus from opposite limbs of the sun along known position-angles nearly in the line of greatest and least distance of Venus from the sun's limb. The method possesses many apparent advantages, because it affords the opportunity of multiplying the observations and of eliminating many sources of error.

At first sight it seems as if the method is free from the necessity for any accurate determination of the scale-value of the instrument, because, if measures are made from opposite limbs of the sun, the sun's diameter may be taken as the standard for all observers, and the place of the planet may be interpolated relatively to the opposite limbs. Unfortunately it happens that there is a very marked difference in observing the sun's diameter due both to instrument and observer. Thus two observers with different instruments, who have compared scale-value by a number of pairs of stars, or zones of stars, will measure sun-diameters with a marked constant difference. If the sun's diameter is assumed to be constant, it, in fact, determines the scale-value; hence the distance of centres measured by the two observers will differ by the proportionate part $\frac{s}{d} \times \Delta d$, where s is the distance of centres, d the true diameter, and Δd the difference of diameter as measured by the two observers. Thus it is only when $s=0$ (that is, when the planet is near the centre of the sun) that this method can be used,—a condition that does not exist in practice.

In the case of the transit of Venus fully one-third of the whole of this personality would enter into the result by this method of reduction. For rigid reduction therefore it is absolutely necessary to have a rigid determination of scale-value in seconds of arc. Unfortunately this value, when determined for any uniform instrumental condition of temperature, is liable to change, because, in observations of the sun, difference of temperature between the tube, the object-glass, and the scale of the instrument is produced, and the focal adjustment is also disturbed. The scale-value depends on the relation of the focal length of the object-glass to the length of a part of the scale, and is besides affected by abnormal focal adjustment of the eyepiece.

Drs Auwers and Winnecke adopted a very complete scheme for determining the scale-value at any instant.

1. The scale-value was determined for a uniform condition of the temperature of the instrument by measuring zones of stars whose places were rigidly determined by meridian observations; and by the same means the temperature coefficient of the instrument was determined for different temperatures, the various parts of the instrument being assumed of a uniform temperature in observations of stars by night.

2. The effect of a displacement of focus was determined by measuring the sun's diameter and distances of pairs of stars with different positions of the focal adjustment.

3. The focal point was determined during sun-observations by adjusting the focus on a telescope fixed in a specially prepared chamber, where its temperature would change very slowly, and the temperature of the scale (and hence its length) were measured by a metallic thermometer; hence the change of the proportion of the scale-length to the focal length became known.

In Lord Lindsay's expedition similar precautions were employed, excepting that in the last case an attempt was made to determine the temperature of the tube by thermometers and that of the object-glass by a thermo-pile, and the position of the focal point was calculated from these data.

The uncertainties of all these operations are considerable, and, though from the extraordinary labour and care bestowed upon the determination of the necessary corrections by the German astronomers a fairly reliable result may be arrived at, it is certain that the method of determining the solar parallax from heliometric observation of transits of Venus can now be surpassed by methods more direct, more reliable, and at the same time less laborious and costly.

If photographs can be obtained during a transit in which the limbs of the sun and Venus are sufficiently well-defined, the distance of the centres of the sun and planet can be determined (as in the heliometer method) provided only that the pictures are affected by no systematic errors. That this latter condition may be fulfilled the following are the essential conditions.

1. The picture must be formed on the photographic plate without distortion, or, if it is affected by distortion, that distortion must be ascertained and allowed for.

2. No change must take place in the process of developing and fixing the picture, or, if such change is possible, means must be provided for its detection and elimination.

3. The angular value of one inch on the plate must be accurately known, so as to convert measured distances into arc—for the same reasons as in the heliometer method.

It is necessary to employ an image of considerable size, because otherwise the particles of collodion, if magnified so much as to permit measurement of the requisite accuracy, give an irregularity to the limbs that is fatal to accurate estimation. Thus it becomes necessary either to employ a lens of very considerable focal length (40 feet was generally adopted), or to introduce a secondary lens to magnify the image formed in the primary focus. The first of these methods was employed by the Americans, by the French, and in Lord Lindsay's expedition at the transit of 1874, the second by the British, German, Russian, and Dutch expeditions.

The use of an object-glass of long focus renders mounting of the lens in the usual manner, though not a practical impossibility, yet at least a matter of extreme inconvenience. Accordingly, where lenses of long focus were employed, the telescope was mounted in a horizontal position, and the sun's rays were reflected by a plane mirror in the direction of the tube's length. It is not easy to conceive that any sensible distortion in the image can be produced by a lens of such long focus even if only of mediocre quality of figure; indeed the method may be assumed free from any such error; but it is undoubtedly exposed to all the errors of distortion which may be produced by the plane. From the perfection now attained in the construction of optical planes, and the means which exist for testing them, the errors due to this cause may also probably be safely neglected, except in so far as the figure of the plane is distorted by the heat of the sun, and it is not impossible that some sources of systematic error may be thus created.

To determine the angular value of one inch (or other unit of length) on the photographic plate, it is only necessary to measure the distance of the plate from the posterior surface of the object-glass, and then to determine the distance of the optical centre of the lens from that surface; the sum of these two distances is the radius of which lines on the surface of the plate (reckoned from the centre of the plate) are tangents.

The French adopted the daguerrotype method of photography, in which it is impossible to imagine any errors due to contraction of the photographic film, as in the collodion process, because the picture is virtually a portion of the silver plate on which it is taken. But in adopting this process the advantage of measuring the photographs by transmitted light was lost; and it is a practical question, which experience has not yet decided, whether the loss or the gain is the greater.

The Americans, and Lord Lindsay in 1874, using the collodion process, took the precaution to provide means for the detection of possible contraction of the film during development of the picture or drying of the film. This was done by placing the sensitive plate near to or in contact with a reticula ruled on glass near the primary focus; this reticula was thus photographed simultaneously with each photograph of the sun; hence any change produced during the development would cause a similar change in the relative positions of the images of the ruled lines on the developed plate. As a matter of fact the American astronomers have found fairly reliable results from their photographic operations, but the accuracy arrived at is by no means very considerable: the probable

error of the complete measurements of an average plate amounting to $\pm 0''.5$.

But the difficulties of dealing with systematic errors are enormously increased when a secondary magnifier is employed, because it is theoretically impossible with the present optical glass (employing spherical curves) to construct a perfect secondary magnifier in which the scale value should be absolutely the same in every part of the field; still less is it possible, when the attempt is made, to combine the visual and photographic rays in the same focus; hence every photoheliograph of this construction must be separately studied for distortion of the image. The results of actual trial prove that the distortion is even greater than was expected, and is besides not the same in each radius, and the latter error may be produced by a very small error of centring in the lenses which compose the secondary magnifier. The investigation of such errors with the required accuracy would be a laborious and at best an unsatisfactory operation, and is rendered practically impossible by the fact that, whenever the instrument is turned upon the sun, the object-glass becomes heated, its focal length changed, and the optical relation of the secondary magnifier to the image in the principal focus of the object-glass changed also.

For these reasons the photographic observations in which secondary magnifiers were employed might be expected to prove a failure, and this expectation has been confirmed by the result of experience.

The observation of the transit of Venus on a large scale of national expenditure was certainly justified in 1761 and 1769. In those days there were no refined means of measuring angles with high accuracy, and the employment of the motion of Venus and a time-scale of measurement was the best available method of determining the solar parallax. But since 1820 the art of measurement has so advanced, and such refined instruments and methods have been thus introduced, that it may be a matter of some surprise and question to future generations of astronomers why so much labour and money were expended upon so imperfect a method in 1874 and 1882. The justification of these expeditions must be found, not in the reliability of the value of the solar parallax determined by them, but in the impulse given to the construction of instruments, the awakening of a widespread interest in astronomy, the stimulus to invention of new methods of research, and the accurate determination of the latitudes and longitudes of a large number of important and previously undetermined stations on the earth's surface.

If an opposition of Mars occurs when that planet is near perihelion and the earth near aphelion the planet is then about one-third of the sun's distance from the earth. When these conditions are nearly realized the opportunity is a favourable one for determining the solar parallax.

On 1672, October 1, the star ψ Aquarii was occulted by Mars. Estimations of the distance of the planet from the star were made at well-observed instants of time by Richer, Picard, and Romer, as already noticed, and from these observations the first approximate determination of the solar parallax was made by Cassini, viz., $9''.5$.

The method of observing Mars that has been most largely employed consists in observing the apparent declination of the planet by means of the transit circle—at observatories both in the northern and in the southern hemisphere. To increase the accuracy of the result, the same stars near the planet are observed at the various observatories, so that the method is reduced to measuring the difference of declination between the planet and neighbouring stars. The effects of periodic error in the graduation of the circles, of flexure of the instruments, and of abnormal refraction are thus nearly eliminated, and there remain only the systematic errors which may be supposed to arise from the difference of the habit of the observers in bisecting a star and a planet. To some extent these errors could be eliminated by the use of a reversing prism applied in the place of a sun-shade between the eyepiece and the observer's eye. By the use of such a prism the motion of the spider-web and the limbs of the planet can be reversed with respect to the vertical, and such errors as

depend on a different habit of bisecting a similar apparent upper and lower limb would be thus eliminated. But of account of the chromatic dispersion of the atmosphere the lower limb of the planet is coloured red and the upper limb violet; and in the illuminated field of the telescope it is probable that the observer has a tendency to cut with his spider-web more deeply into the feeble violet limb than into the more glaring red limb. The effect of his so doing would be to increase the value of the resulting parallax, and it seems not improbable that from this cause a larger value of the parallax has been obtained by this than by other methods.

The following are the most important series of observations, and their discussion by this method:—

In 1872 (*Ast. Nach.*, Nö. 1897) Dr Galle of Breslau proposed a method of determining the solar parallax which appears to be the foundation of the method of the future, viz., to measure, by means of the equatorial, the difference of declination between selected stars and a minor planet, or rather to interpolate the declination of a minor planet relative to two stars of comparison. A minor planet presents precisely the appearance of a star, and it is impossible to conceive any personality which can affect the observation of such a planet and a star. The interpolation of the planet's declination relative to two including stars; declinations (i.e., measurement from stars nearly equally north and south of the planet) entirely eliminates errors due to error of the adopted arc-value of the micrometer screw. It is true that in the case of minor planets the parallax factor can hardly exceed $1\frac{1}{2}$, whilst in the case of Mars that factor may be 3; but their disks present objects which are capable of being observed with quite two and a half times the accuracy of Mars. Hence the conditions of accidental accuracy are equalized for a single opposition, whilst the advantages of systematic accuracy are entirely in favour of the minor planets. Moreover, the opportunities offered by favourable oppositions of minor planets are much more frequent than in the case of Mars. The opposition of the minor planet Flora in 1874 was observed, at the request of Dr Galle, by a considerable number of observers in both northern and southern hemispheres, but unfortunately only in very few cases with the precaution, care, and perfection of instrumental equipment necessary. In 1882 the minor planets Victoria and Sappho were similarly observed at the request of Gill. The work was taken up by a number of astronomers in both hemispheres, in a much more complete and systematic manner, with better instrumental means, and with the benefit of former experience. The results have not yet been reduced, but it is believed they will afford a valuable contribution to the problem in question. The results of Dr Galle's discussion of the observations of Flora in 1874¹ give for the solar parallax

$$8''.67 \pm 0''.042;$$

but the same results when the relative weights are assigned in a more legitimate manner lead to the value

$$8''.82 \pm 0''.06.$$

But in any plan requiring numerous and widely spread observers it is very difficult to secure that entire sympathy

¹ Ueber eine Bestimmung der Sonnen Parallaxe aus correspondirenden Beobachtungen des Planeten Flora in October und November 1873. Breslau, 1875.

with the end in view, that scrupulous care in minute detail, which is essential in the highest class of observation, and it becomes impossible to alter the previously prepared programme in such a case, should circumstances render it desirable to do so; nor does it always happen that distant observatories can be supplied with the necessary instrumental details in sufficient time. In the case of the Victoria and Sappho observations of 1882 the requisite sympathy and care were accorded in a very remarkable degree, but on account of the errors of the planetary tables (discoverable only when the observations were begun) the selected stars of comparison were not by any means the most favourable that could have been chosen, and were consequently not the stars that a single observer would have selected at the time. Hence arises the desirability of a method not requiring co-operation, in which success depends upon a single observer, who may obtain independently by his own observations a complete series of results.

In 1857 Airy, in an address to the Royal Astronomical Society on the methods available for determining the solar parallax during the next twenty-five years, called attention to the favourable opposition of Mars in 1877, and declared his opinion that the best method of finding the solar parallax was to determine at an equatorial station the difference of right ascension of that planet and neighbouring stars in the evening and early morning, by observing transits of stars and planet across the webs of a well-adjusted rigidly mounted equatorial. The motion of the earth's rotation would transport the observer 6000 or 7000 miles between the evening and morning observations, and the requisite displacement would thus be obtained. In other words, the observer would avail himself of the diurnal displacement to determine the parallax of the planet. Of course a very large number of observations would be required, because the observation of a transit over the webs of a telescope is not so exact as the micrometric comparison of two points. Only one observer availed himself of Airy's suggestion, but a very good series of observations by this method was obtained by Maxwell Hall at the island of Jamaica. The detailed observations are printed in *Mem. R. A. S.*, vol. xlv. p. 121; the resulting value of the solar parallax is

$$8''.79 \pm 0''.06.$$

In 1874 (in connexion with Lord Lindsay's expedition to Mauritius) Gill, combining the suggestion of Galle as to the employment of a minor planet and Airy's suggestion as to the employment of the diurnal displacement, observed the minor planet Juno, which was at that time favourably situated for the purpose. But instead of employing the method of transits of the planet and stars across spiderwebs he used a heliometer, and measured with that instrument the distance of the planet from the same star in the evening and morning. In order to eliminate the effects of changes in the scale-value, Gill selected stars on opposite sides of the planet, and so arranged his observations as to measure simultaneously the angle between the planet and both comparison stars. That is to say, if the two distances in question are called a and b , the measures were arranged in the order a, b, b, a or b, a, a, b . Thus any abnormal scale-value of the instrument applicable to the measurement a would be equally applicable to the measurement b . If the places of the comparison stars are thus determined by meridian observations, the scale-value may be derived from the observations themselves with all desirable accuracy, and the effect of change in the scale-value (which alone is all-important) be absolutely eliminated. The observations so made at Mauritius showed that the position of the planet Juno relative to two stars of comparison could be so interpolated with a probable error less than $\frac{1}{10}$ th of a second of arc. A full account of these observa-

tions, together with a description of the heliometer, is given in the *Dunedin Publications*, vol. ii. Lord Lindsay's yacht, which conveyed the heliometer to Mauritius, unfortunately did not reach her destination till the most favourable time for making the observations was past; but sufficient observations were obtained to test the method thoroughly and to prove its capabilities.¹ The value of the solar parallax resulting from the observations of Juno at Mauritius was

$$8''.77 \pm 0''.04$$

In 1877, instead of observing the favourable opposition of Mars of that year by Airy's method, Gill proposed to the Royal Astronomical Society to employ a heliometer (kindly lent by Lord Lindsay) to observe the planet in a similar manner to that in which he had observed the minor planet Juno at Mauritius in 1874. The offer was accepted: Gill selected the island of Ascension, and there carried out the necessary observations. The stars of comparison, by the kind and hearty co-operation of astronomers, were observed at thirteen of the principal observatories with meridian instruments, a combination of their results affording standard places of high accuracy. In general the angular distance of the planet was measured both in the evening and morning from each of three surrounding stars. The observed readings of the heliometer were corrected for the effects of refraction and phase, for the errors of division of the scales and of the micrometer screw, and were then converted into arc on an assumed value of one revolution of the micrometer screw (or rather of half an interval of the scale divisions).

The tabular apparent distance of the centre of Mars from each star for the instant of each observation was then computed with an assumed approximate value of the solar parallax ($8''.80$). The calculation of the solar parallax and the elimination of errors of scale-value were then easily effected as follows:—

Let $\Delta\alpha$, $\Delta\delta$ = the corrections in seconds of arc to be applied to the tabular right ascension and declination respectively to obtain the true right ascension and declination of Mars at the epoch τ_0 .

p = the position angle of the planet referred to the star of comparison.

δ_0 = the approximate mean declination of the star and planet

κ = the daily rate of increase of $\Delta\alpha$ for the epoch τ_0 .

κ' = the daily rate of increase of $\Delta\delta$ for the epoch τ_0 .

τ = the Greenwich mean time of observation.

$\frac{1}{n}$ = the number of $\frac{1}{100}$ parts (or the percentage) that the assumed solar parallax must be increased.

z = the correction required to be applied to an observed arc of 10000" reduced on the assumed scale-value.

ν = the observed distance in seconds of arc

$$= \frac{10000}{\text{assumed scale-value}}$$

O = the observed angular distance computed with the assumed scale-value.

C = the calculated or tabular distance computed with the assumed value of the solar parallax.

Then each observation furnishes an equation of condition of the following form—

$$f'\Delta\alpha + f''\Delta\delta + f'''n - \nu = (O - C) - f'(\tau - \tau_0)\kappa - f''(\tau - \tau_0)\kappa';$$

where

$$f' = \sin p \cos \delta_0$$

$$f'' = \cos p$$

$$f''' = \left(\frac{\text{parallax in R. A.}}{100} \right) f' + \left(\frac{\text{parallax in declination}}{100} \right) f''.$$

the parallaxes in f''' being in seconds of arc.

The equations resulting from each group of observations are then combined, care being taken to combine together in one group such observations only as have been made nearly simultaneously and where the value of z may therefore be assumed to be the same.

The combination of a group of evening with a group of morning observations (in which the term representing the error of scale-value must then be represented by z and z') thus affords six

¹ A more complete test has since been furnished by observations for stellar parallax, to which reference will afterwards be made.

equations involving five unknown quantities, from which the most probable value of n can be eliminated with its weight by the method of least squares, in terms of κ and κ' .

Care, however, must be taken to confine the combination to such groups as depend on measures from the same stars, if it is desired to eliminate the effects of errors in the adopted star places. Also, since it is assumed that κ and κ' vary proportionally with the time, it is necessary that only such observations should be combined as have been made at epochs sufficiently near together to render this a safe assumption.

Finally the absolute values of κ and κ' for the various combinations are deduced by developing the values of $\Delta\alpha$ and $\Delta\delta$ from each combination in terms of the time, and thus the definitive values of n are obtained.

The combination of these values of n , having regard to the weight of each led to the result

$$n = -0.209.$$

Whence the value of the solar parallax was

$$8''.78 \pm 0''.012.$$

It should be remarked that in these observations a reversing prism was so employed as to eliminate any systematic error on the part of the observer which might be due to astigmatism of his eye, or a habit of placing the image of the star otherwise than truly central on the image of Mars. The probable error of one observation of distance having weight unity was found to be $\pm 0''.24$. Twelve such observations were generally made (and often more) on each night, and complete combinations of observations were secured on twenty-five nights.

This probable error does not exceed that of a single observation of contact on the occasion of a transit of Venus, and yet *one hundred and ninety-six* such observations were secured, as compared with *two* which is the utmost that can be secured as the result of any single observer's expedition to observe a transit of Venus.

It is impossible, however, to say with certainty that the above result is entirely free from systematic error. There is one possible source of such error to be suspected, viz., the possible effect of the chromatic dispersion of the atmosphere which colours the limbs of Mars in the manner already described. In the case of heliometer observations the effect is certainly minimized from the fact that the star disk which is compared with the limb of Mars is coloured precisely in the same way as the limb—but whether all error is so eliminated it is impossible to say. A detailed account of these observations and their reductions is given in *Mem. R. A. S.*, vol. xvi. pp. 1–172.

If a minor planet, however, is observed in the above-described manner, no suspicion of the error in question can attach to the final result; and, so far as is known, that method affords the only geometrical means of arriving at an absolutely definitive value of the solar parallax.

The following table represents the oppositions of minor planets that will be available for determining the solar parallax till the end of the present century.

| Date of Opposition. | Number and Name of Planet. | Approximate Horizontal Parallax at Opposition. | Magnitude at Opposition. |
|---------------------|----------------------------|--|--------------------------|
| 1886 November. | 8 Flora. | 9" | 8½ |
| 1886 December. | 79 Euryome. | 8 | 9½ |
| 1888 September. | 75 Eurydice. | 10 | 9½ |
| 1888 November. | 7 Iris. | 10 | 7 |
| 1889 July. | 12 Victoria. | 10 | 8 |
| 1889 August. | 80 Sappho. | 9 | 9 |
| 1890 January. | 27 Euterpe. | 8 | 8½ |
| 1890 June. | 43 Ariadne. | 10 | 8½ |
| 1890 December. | 20 Massilia. | 8 | 8½ |
| 1892 August. | 192 Nausicaa. | 8 | 8½ |
| 1893 September. | 6 Hebe. | 9 | 7½ |
| 1894 September. | 84 Clio. | 9 | 9½ |
| 1897 July. | 194 Procne. | 8 | 9 |
| 1898 June. | 25 Phocæa. | 8 | 9½ |
| 1899 November. | 7 Iris. | 9 | 7½ |
| 1899 December. | 8 Flora. | 8 | 8 |

The results of many hundreds of observations for stellar parallax by Gill and Elkin (*Mem. R. A. S.*, vol. xlviii. part 1) prove that the *difference* of two opposite angular distances each not greater than 2° can be measured by a small heliometer with a probable error not exceeding $\pm 0''.15$ when the objects measured are points of light such as two stars (or a star and a minor planet). Hence it is easy to show, that a single observer at an equatorial station (furnished with a suitable heliometer) can determine the solar parallax by the careful observation of two or three of the more favourable of the above oppositions with a probable error not exceeding $\pm 0''.01$, and with absolute freedom from systematic error. Such a result is not possible by any other known method.

3. *The Physical Method.*—The determination of the velocity of light has recently been the subject of very refined and accurate measurement by the methods both of Fizeau and of Foucault (see *LIGHT*, vol. xiv. p. 585). The results of the most recent and best determinations of the velocity of light, expressed in kilometres per second, are the following (*Sidereal Messenger*, vol. ii. No. 6):—

| | |
|--|---------|
| Cornu, by Fizeau's method..... | 300,400 |
| Michelson, by modification of Foucault's method..... | 299,910 |
| Newcomb, by still more powerful apparatus and modification of Foucault's method..... | 299,860 |

If we denote by k the interval required by light to cross the mean radius of the earth's orbit, any independent determination of k will obviously afford, when combined with the velocity of light, a determination of the sun's distance, i.e., of the solar parallax (see *LIGHT*, vol. xiv. p. 584). Such a determination of k is afforded by a discussion of the eclipses of Jupiter's satellites. Only two such discussions that have any claim to acceptance exist:—the first by Delambre in the early part of the present century, from a discussion of an immense mass of eclipses of the satellites of Jupiter comprising observations from 1662 to 1802; the second by Glasenapp, in a Russian thesis, in which there are discussed the observations of the first satellite of Jupiter from 1848 to 1873.

Instead of Delambre's value of $k = 495''.2$

Glasenapp finds $k = 500''.3 \pm 1''.02$.

Todd, in calling attention to Glasenapp's results (*Am. Journal of Science*, vol. xix. p. 62), remarks on these two values as follows:—

"The former determination rests on a much greater number of observations than the latter; but it is difficult to form a just estimate of the work of an average last-century observation of an eclipse of a satellite of Jupiter. And, moreover, astronomers have no means of knowing the process which led the distinguished French astronomer to his result—which was adopted in his own tables of the satellites, and which was adopted by Damoiseau in his *Tables Écliptiques*, published in 1836. The latter determination rests upon a mass of observations of definite excellence, which have been discussed after the modern fashion."

Astronomers, however, whilst generally endorsing these remarks, will not be inclined to follow Todd in combining Delambre's value with Glasenapp's by giving double weight to the latter. Having regard to those portions of Todd's remarks which we have printed in italics, astronomers would generally be of opinion that only Glasenapp's value of k can be seriously considered at the present day. This value, combined with the above mean value of the velocity of light, leads to

$$8''.76 \pm 0''.02$$

as the value of the solar parallax.

The photometric observation of the eclipses of Jupiter's satellites as now being carried out at Cambridge, U. S., under Prof. Pickering, will probably ere long furnish the data for a much more accurate determination of k , and it is not impossible that very refined heliometric observations of the distance of the first satellite (when apparently

parallactic displacement in declination—in practice, however, generally throughout the whole year. The differences of declination so observed, after allowing for the effects of refraction, precession, aberration, nutation, and proper motion, afford the means of deducing the parallax of the star. The most notable series of observations of this character are those of Maclear at the Cape of Good Hope, by which he confirmed the results of his predecessor Henderson and those of Peters at Pulkowa in the second section of his work above mentioned. The latter is the most classic work in existence on refined observations of absolute declination, and it is by no means certain that, in more modern meridian observations, the work and methods of that distinguished observer have been equalled—except perhaps at Pulkowa. The minute precautions necessary in such work will be found in Peters's paper above mentioned (see also TRANSIT CIRCLE). But not with all the skill of Peters, nor with every refinement of equipment and observation, can the difficulties caused by refraction and minute

change of instrumental flexure, &c., be completely overcome; the method of absolute altitudes does not, in fact, respond in accuracy to the demands of the problem.

The *differential method* depends on measuring the difference of declination, of distance, or of position angle between the star whose parallax is to be determined and one or more stars of comparison. It is assumed that the stars most likely to have sensible parallax are those which are remarkable for brilliancy or proper motion, and that the parallaxes of the stars of comparison (having little or no sensible proper motion and faint magnitude) are so small as to be insignificant. So far as our knowledge goes these assumptions are justified.

Researches on stellar parallax by these methods have been followed of late years with considerable success. The instruments employed have been the heliometer and the filar micrometer (see MICROMETER, vol. xvi. pp. 243–248), the latter instrument being used in conjunction with an ordinary equatorial (see TELESCOPE). The precautions

Fig. 1.

Fig. 2.

required to determine and eliminate systematic error, and to secure the necessary refinement of accuracy, demand more space for their description than the limits of this article admit. The reader is referred for these particulars to the undermentioned papers on the subject.

The heliometer method seems to present the greatest facilities for extensive researches on stellar parallax, not only because measures with this instrument seem, on the whole, to possess the highest accuracy, but because (on account of the large angles that can be measured) a much wider selection of suitable stars of comparison is available. Gylden of Stockholm has applied the method of observing the differences of right ascension between the star whose parallax is to be determined and each of two comparison stars, and the same method has also been applied by Auwers (*Math. Abhand. Berliner Acad.*, 1867); but the results obtained in this way do not compare at all favourably with the accuracy of properly conducted heliometer measurements.

The diagram (fig. 1) represents observations made by Gill to determine the parallax of α Centauri, with a heliometer at the Cape of Good Hope. The ordinates of the curve are the time reckoned from 1882.0, the abscissæ the changes in the place of α Centauri due to the parallax computed from the observations. Each dot represents the observations of each single night, and the reader will be able to judge of the accuracy of the observations from the agreement of the dots with the curve. Fig. 2 in like manner represents a series of observations of Sirius.

These and many other results show that, with similar means, it is now possible to detect any differential parallax amounting to $0''.05$ with certainty, by a series consisting of a reasonable number of like observations—thus opening up a wide and important field for future research.

The following table contains a list of those stars of

which the parallax is known with considerable accuracy,—Nos. 1 to 13 being in the northern and Nos. 14 to 22 in the southern hemisphere.¹

| | Magnitude. | Proper Motion. | Parallax. |
|-----------------------------|------------|----------------|-------------|
| 1. 61 Cygni..... | 6 | 5'.14 | 0".50 |
| 2. Lalande 21185..... | 7½ | 4'.75 | 0".50 |
| 3. α Tauri..... | 1 | 0".19 | 0".52 |
| 4. 34 Groombridge..... | 8 | 2".81 | 0".29 |
| 5. Lalande 21258..... | 8½ | 4".40 | 0".26 |

A glance at the table is sufficient to show that neither apparent magnitude nor apparent motion affords a criterion of the parallax of any fixed star. Similar researches must, in fact, be carried out on a much more extended scale before any definite conclusions can be drawn. At present we can only conclude that different stars really differ greatly in absolute brightness and absolute motion.

The following are the formulæ which will be found most useful in computing the corrections for parallax:—

For the Sun, Moon, and Planets.

- Put π = the equatorial horizontal parallax;
 Δ = the distance of the object from the earth;¹
 ζ and ζ' = the geocentric and apparent zenith distances respectively;
 A and A' = the geocentric and apparent azimuths respectively;
 ϕ and ϕ' = the geographical and geocentric latitudes respectively;
 ρ = the earth's radius corresponding to ϕ ;
 α and α' = the geocentric and apparent right ascensions of the object respectively;
 δ and δ' = the geocentric and apparent declinations of the object;
 ι = the hour angle of the object (reckoned + when west of meridian).

1. To find the parallax of the moon in zenith distance and azimuth, from the observed (or apparent) zenith distance and azimuth.

$$\begin{aligned} \text{Put } \gamma &= (\phi - \phi') \cos A' \\ \text{Then } \sin(\zeta' - \zeta) &= \rho \sin \pi \sin(\zeta' - \gamma); \\ \sin(A' - A) &= \frac{\rho \sin \pi \sin(\phi - \phi') \sin A'}{\sin \zeta} \end{aligned}$$

The corresponding quantities are found with all desirable precision for the sun and planets by the formulæ—

$$\begin{aligned} \zeta' - \zeta &= \rho \pi \sin(\zeta' - \gamma); \text{ or approximately } = \pi \sin \zeta'; \\ A' - A &= \rho \pi \sin(\phi - \phi') \sin A' \cos \zeta'; \end{aligned}$$

the latter quantity may generally be neglected.

2. To find the parallax of the moon in right ascension and declination from the true (or geocentric) right ascension and declination.

$$\begin{aligned} \text{Put } \sin \theta &= \frac{\rho \sin \pi \cos \phi' \cos \iota}{\cos \delta}; \\ \text{then } \tan(\alpha - \alpha') &= \tan \theta \tan(45^\circ + \tfrac{1}{2}\theta) \tan \iota. \\ \text{Put } \tan \gamma &= \frac{\tan \phi' \cos \tfrac{1}{2}(\alpha - \alpha')}{\cos[\iota + \tfrac{1}{2}(\alpha - \alpha')]}; \\ \sin \theta' &= \frac{\rho \sin \pi \sin \phi' \cos(\gamma - \delta)}{\sin \gamma}; \\ \text{then } \tan(\delta - \delta') &= \tan \theta' \tan(45^\circ + \tfrac{1}{2}\theta') \tan(\gamma - \delta). \end{aligned}$$

3. To find the parallax of the moon in right ascension and declination from the observed (or apparent) right ascension and declination.³

$$\begin{aligned} \sin(\alpha - \alpha') &= \frac{\rho \sin \pi \cos \phi' \sin \iota'}{\cos \delta}; \\ \tan \gamma &= \frac{\tan \phi' \cos \tfrac{1}{2}(\alpha - \alpha')}{\cos[\iota' - \tfrac{1}{2}(\alpha - \alpha')]}; \\ \sin(\delta - \delta') &= \frac{\rho \sin \pi \sin \phi' \sin(\gamma - \delta')}{\sin \gamma}. \end{aligned}$$

bourg, ser. vii. vol. i. ($0''.147 \pm 0''.009$); Brunnnow, *Dunsink Observations*, vol. i. ($0''.212 \pm 0''.012$), vol. ii. ($0''.089 \pm 0''.017$). 12. Brunnnow, *Ibid.* ($0''.070 \pm 0''.014$). 13. Brunnnow, *Ibid.* ($0''.054 \pm 0''.019$). 14. Gill and Elkin, *Mem. R. A. S.*, vol. xlviii. p. 40 ($0''.747 \pm 0''.013$), p. 51 ($0''.76 \pm 0''.021$), p. 71 ($0''.78 \pm 0''.028$), p. 82 ($0''.68 \pm 0''.027$), independent investigations. 15. Gill and Elkin, *Ibid.*, p. 97 ($0''.37 \pm 0''.009$), p. 115 ($0''.39 \pm 0''.023$), independent investigations. 16. Gill, *Ibid.*, p. 154 ($0''.285 \pm 0''.02$). 17. Gill and Elkin, *Ibid.*, p. 130 ($0''.27 \pm 0''.02$), p. 138 ($0''.170 \pm 0''.03$). 18. Gill, *Ibid.*, p. 160 ($0''.166 \pm 0''.018$). 19. Elkin, *Ibid.*, p. 180 ($0''.14 \pm 0''.02$). 20. Elkin, *Ibid.*, p. 174 ($0''.06 \pm 0''.02$). 21. Elkin, *Ibid.*, p. 184 ($0''.03 \pm 0''.03$). 22. Gill, *Ibid.*, p. 167 ($-0''.018 \pm 0''.019$).

¹ In the case of the sun, planets, and comets this distance is generally expressed in terms of the earth's mean distance from the sun, that distance being reckoned unity.

² Here ζ must first be found by subtracting the value of $\zeta' - \zeta$ from the observed value of ζ' .

³ In preliminary computation of $(\alpha - \alpha')$ employ δ' for δ . With this value compute γ and $\delta - \delta'$. Finally, with resulting value of δ , correct preliminary computation of $\alpha - \alpha'$.

4. To find the parallax of the sun, planets, or comets in right ascension or declination.⁴

$$\begin{aligned} \alpha - \alpha' &= \frac{\rho \pi \cos \phi' \sin \iota'}{\cos \delta'}; \\ \tan \gamma &= \frac{\tan \phi'}{\cos \iota'}; \\ \delta - \delta' &= \frac{\rho \pi \sin \phi' \sin(\gamma - \delta')}{\sin \gamma}. \end{aligned}$$

When the distance of the object from the earth (Δ) is given (the earth's mean distance from the sun being reckoned unity), as is usually the case in ephemerides of minor planets and comets, we have

$$\pi = \frac{\text{mean solar paral} \times x}{\Delta} = \frac{8''.78}{\Delta}.$$

The reader will find the proof of these formulæ in Chauvenet's *Spherical and Practical Astronomy*, vol. i. pp. 104–127.

For the Parallax of the Fixed Stars.

- Put p = the maximum angle subtended by the mean distance of the earth from the sun at the distance of the star,
 = the star's annual parallax;
 ϵ = the obliquity of the ecliptic;
 \odot and r = the sun's longitude and radius vector;
 α and α' = the star's true and apparent right ascensions and
 δ and δ' = declinations respectively.

1. To find the heliocentric parallax of a star in right ascension and declination, its annual parallax (p) being known.

$$\begin{aligned} \alpha' - \alpha &= -pr \sec \delta' \cos \odot \sin \alpha - \sin \odot \cos \epsilon \cos \alpha; \\ \delta' - \delta &= -pr \sin \odot (\cos \epsilon \sin \delta \sin \alpha - \sin \epsilon \cos \delta) - pr \cos \odot \cos \alpha. \\ \Delta s &= pr m \cos(\odot - M); \\ \Delta P &= pr m' \cos(\odot - M'); \end{aligned}$$

where

$$\begin{aligned} m \sin M &= (-\cos \alpha \sin P + \sin \delta \sin \alpha \cos P) \cos \epsilon - \cos \delta \cos P \sin \epsilon; \\ m \cos M &= \sin \alpha \sin P + \sin \delta \cos \alpha \cos P; \\ m' \sin M' &= \frac{1}{s} \left[-(\cos \alpha \cos P + \sin \delta \sin \alpha \sin P) \cos \epsilon + \cos \delta \sin P \sin \epsilon \right] \\ m' \cos M' &= \frac{1}{s} \left[\sin \alpha \cos P - \sin \delta \cos \alpha \sin P \right]. \end{aligned} \quad (D. GJ.)$$

PARALLELS, THEORY OF. The fundamental principles of mathematics have not in general received from mathematicians the attention which they deserve. Mathematical science might in fact be compared to a building far advanced in construction. As to the firmness of its foundations there can be no doubt, to judge by the weighty superstructure which they carry; but the aspect of the building is not a little marred by the quantity of irrelevant rubbish which lies around those foundations, concealing their real strength and security. The question of the parallel axiom in Euclid's geometry is to some extent an exception. There have been endless discussions concerning it. The difficulty is well known, and will be found succinctly stated in the article GEOMETRY (vol. x. p. 378). Those who have treated the subject have devoted themselves either to criticizing the form of Euclid's axiom, suggesting modifications or substitutes (sometimes with undoubted advantage, e.g., Playfair), or to questioning its necessity, offering either to demonstrate the axiom or to dispense with it altogether. It would serve no useful purpose to attempt a complete account of the literature of the subject; we may refer the reader who is curious in such matters to the various editions of Perronet Thomson's *Geometry without Axioms*. It will be sufficient to mention Legendre's views, which, although by no means reaching to the root of the matter, may be held as indicating the dawn of the true theory.⁷ The delicacy of the question

⁴ ι and δ may be used instead of ι' and δ' in these formulæ without sensible error.

⁵ The position angle is to be reckoned from north through east, the star which has sensible parallax being taken for origin.

⁶ Obviously, also, P may here express the relative parallax of the two stars.

⁷ For some interesting controversy on this subject see Leslie's *Geometry*, 3d edition, p. 292; and Legendre, *Éléments de Géométrie* 12th edition, p. 277.

may be illustrated by the story which is told of Lagrange. It is said that towards the end of his life he wrote and actually took to the Institute a paper dealing with the theory of parallels. He had begun to read it; but, before he had proceeded very far, something struck him. He stopped reading, muttered "Il faut que j'y songe encore," and put the paper in his pocket (De Morgan, *Budget of Paradoxes*, p. 173). There appears to be no doubt that the true theory first presented itself to the mind of Gauss. The history of the matter is interesting, and deserves to be more generally known than it appears to be. In his earlier days, before his career in life was determined, when he had to consider the possibility of his becoming a teacher of mathematics, he drew up a paper in which he gave a philosophical development of the elements of mathematics. It was probably in the course of this discussion (about 1792) that he first came across the difficulty of the parallel axiom. He arrived at the conclusion that geometry became a logically consistent structure only after the parallel axiom was given as part of its foundation; and he convinced himself that this axiom could not be proved, although from experience (for example, from the sum of the angles of the geodesic triangle Brocken, Hohenbagen, Inselberg) we know that it is at least very approximately true. If, on the other hand, this axiom be not granted, there follows another kind of geometry, which he developed to a considerable extent and called the antiEuclidian geometry.¹ Writing to Bessel on the 27th January 1829, he says—

"In leisure hours now and then I have again been reflecting on a subject which with me is now nearly forty years old; I mean the first principles of geometry; I do not know if I have ever told you my views on that matter. Here too I have carried many things to farther consolidation, and my conviction that we cannot lay the foundation of geometry completely *a priori* has become if possible firmer than before. Meantime it will be long before I bring myself to work out my very extensive researches on this subject for publication, perhaps I shall never do so during my lifetime; for I fear the ontry of the Boetians, were I to speak out my views on the question."

Bessel entered heartily into the ideas of Gauss, and urged him to publish them regardless of the Boetians. Concerning the generality of mathematicians in his day, Gauss probably judged rightly, however, for his intimate correspondent Schumacher was, as we learn from their correspondence in 1831, unable to follow the new idea. One of the letters (Gauss to Schumacher, 12th July 1831) is of great interest because it shows us that Gauss was then in full possession of the most important propositions of what is now called hyperbolic geometry. In particular he states that in hyperbolic space the circumference of a circle of radius r is $\pi k \left(e^{\frac{r}{k}} - e^{-\frac{r}{k}} \right)$, where k is a constant, which we know from experience to be infinitely great compared with any length that we can measure (supposing, he means, the space of our experience to be hyperbolic), and which in Euclid's geometry is infinite.

Gauss never published these researches; and no traces of them seem to have been found among his papers after his death. Our first knowledge of the hyperbolic geometry dates from the publication of the works of N. Lobatschewsky and W. Bolyai. Lobatschewsky's views were first published in a lecture before the Faculty of Mathematics and Physics in Kasan, 12th February 1826. See Frischlauf, *Elemente der Absoluten Geometrie*, Leipzig, 1876, page 33. Speaking of a German edition of Lobatschewsky's work, which he had seen published at Berlin in 1840, Gauss says that he finds nothing in it which is materially new to him, but that Lobatschewsky's method of development is different from his own, and is a masterly performance carried out in the true geometric spirit. The theory received its complement in the famous *Habilitationschrift* of Riemann, in which the elliptic geometry for the first time appears. Beltrami, Helmholtz, Cayley, Klein, and others have greatly developed the subject; but it is

unnecessary to pursue its later history here, since all essential details will be found in the article MEASUREMENT, vol. xv. p. 659. All that we need do is to call the attention of those who busy themselves with mental philosophy to this generalization of geometry, as one of the results of modern mathematical research which they cannot afford to overlook. (G. CH.)

PARALYSIS,² or PALSY, the loss of the power of muscular action due to some interruption to the nervous mechanism by means of which such action is excited (see "Nervous System" in PHYSIOLOGY). In its strict sense the term might include the loss of the influence of the nervous system or any of the bodily functions, the loss of common sensation or of any of the special senses; but other terms have come to be associated with these latter conditions, and the word "paralysis" in medical nomenclature is usually restricted to the loss or impairment of voluntary muscular power. Paralysis is to be regarded rather as a symptom than a disease *per se*, and is generally connected with some well-marked lesion of some portion of the nervous system. According to the locality and extent of the nervous system affected, so will be the form and character of the paralysis. It is usual to regard paralysis as depending on disease either of the brain, of the spinal cord, or of the nerves distributed to parts and organs; and hence the terms cerebral, spinal, and peripheral paralysis respectively. The distribution of the paralytic condition may be very extensive, tending to involve in greater or less measure all the functions of the body, as in the general paralysis of the insane (see INSANITY); or again, one half of the body may be affected, or one or more extremities, or it may be only a certain group of muscles in a part supplied by a particular nerve. Reference can be made here only to the more common varieties of paralysis, and that merely in general terms.

1. *Paralysis due to Brain Disease*.—Of this by far the most common form is palsy affecting one side of the body, or *Hemiplegia*. It usually arises from disease of the hemisphere of the brain opposite to the side of the body affected, such disease being in the form of hæmorrhage into the brain substance, or the occlusion of blood-vessels, and consequent arrest of the blood supply to an area of the brain; or again it may be due to the effect of an injury, or to a tumour or morbid growth in the tissues of the brain. The character of the seizure and the amount of paralysis vary according to the situation of the disease or injury, its extent, and its sudden or gradual occurrence. The attack may come on as a fit of apoplexy, in which the patient becomes suddenly unconscious, and loses completely the power of motion of one side of the body; or a like result may arise more gradually and without loss of consciousness. In either case of "complete" hemiplegia the paralysis affects more or less the muscles of the tongue, face, trunk, and extremities. Speech is thick and indistinct, and the tongue, when protruded, points towards the paralysed side owing to the unopposed action of its muscles on the unaffected side. The muscles of the face implicated are chiefly those of mastication. The paralysed side hangs loose, and the corner of the mouth is depressed, but the muscles closing the eye are as a rule unimpaired, so that the eye can be shut, unlike what occurs in another form of facial paralysis (Bell's palsy). The muscles of respiration on the affected side, although weakened, are seldom wholly paralysed, but those of the arm and leg are completely powerless. Sensation may at the first be impaired, but as a rule returns soon, unless the portion of the brain affected be that which is connected with this function. Rigidity of the paralysed members is occasionally present as an early or a late symptom. In many cases of even complete hemiplegia improvement takes place after the lapse of

¹ Sartorius von Waltershausen, *Gauss zum Gedächtniss*, Leipzig, 1856, p. 81.

² From *παράλυσις*, to relax. Wickliffe has *palsy*, and another old form of the word is *parlesy*.

weeks or months, and is in general first indicated by a return of motor power in the leg, that of the arm following at a longer or shorter interval. Such recovery of movement is, however, in a large proportion of cases only partial, and the side remains weakened. In such instances the gait of the patient is characteristic. In walking he leans to the sound side and swings round the affected limb from the hip, the foot scraping the ground as it is raised and advanced. Besides this the evidence of the "shock" is felt more or less upon the system generally, the patient rarely (though occasionally) recovering his nervous stability. The paralysed parts retain as a rule their electric contractility, but they are apt to suffer in their nutrition both from disuse and also from certain degenerative changes which the interruption of nervous influence is apt to exercise upon them.

It is to be observed that in many instances the hemiplegia is only partial, and instead of the symptoms of complete paralysis above described there exist in varied combination only certain of them, their association depending on the extent and locality of the lesion in the brain. Thus there may be impairment of speech and some amount of facial paralysis, while the arm and leg may be unaffected, or the paralysis may be present in one or both extremities of one side while the other symptoms are absent. Further, the paralysis may be incomplete throughout, and the whole of the side be weak, but not entirely deprived of motor power. To partial paralysis of this latter description the term "paresis" is applied.

Besides hemiplegia, various other forms of paralysis may arise from cerebral disease. Thus occasionally the paralysis is crossed, one side of the face and the opposite side of the body being affected simultaneously. Or again, as is frequently observed in the case of tumours of the brain, the paralysis may be limited to the distribution of one of the cranial nerves, and may produce an association of phenomena (such as squinting, drooping of the eyelid, and impairment or loss of vision) which may enable the seat of the disease to be accurately localized.

2. *Paralysis due to Disease of the Spinal Cord.*—Of paralysis from this cause there are numerous varieties depending on the nature, the site, and the extent of the disease. Some of the more important only can be noticed.

Paraplegia, paralysis of both lower extremities, including usually the lower portion of the trunk, and occasionally also the upper portion—indeed the whole parts below the seat of the disease in the spinal cord—is a form of paralysis which is a not unfrequent result of injuries or disease of the vertebral column; also of inflammation affecting the spinal cord (*MYELITIS*, *q.v.*), as well as of hæmorrhage or morbid growths involving its substance. When due to disease, the lesion is generally situated in the lower portion of the cord. The phenomena necessarily vary in relation to the locality and the extent of the disease in the cord. Thus, if in the affected area the posterior part of the cord, including the posterior nerve roots, suffer, the function of sensation in the parts below is impaired because the cord is unable to transmit the sensory impressions from the surface of the body to the brain. If on the other hand the anterior portion of the cord and anterior nerves be affected, the motor impulses from the brain cannot be conveyed to the muscles below the seat of the injury or disease, and consequently their power of movement is abolished. In many forms of this complaint, particularly in the case of injuries, the whole thickness of the cord is involved, and both sensory and motor functions are arrested. Further, the functions of the bladder and bowels are apt to suffer, and either spasm or paralysis of these organs is the result. The nutrition of the paralysed parts tends to become affected, and

bed-sores and wasting of the muscles are common. Occasionally, more especially in cases of injury, recovery takes place, but in general this is incomplete, the power of walking being more or less impaired. On the other hand the patient may linger on for years bedridden, and at last succumb to exhaustion or to some intercurrent disease.

A form of spinal paralysis, often showing itself as paraplegia, occasionally occurs in children, and is termed—

Infantile or Essential Paralysis.—It is caused by an inflammatory affection limited to the anterior portion of the grey matter of the spinal cord throughout a greater or less extent, and affects therefore the function of motion, leaving that of sensation unimpaired. This disease is most common during the period of first dentition (although a similar affection is sometimes observed in adults). The commencement may be insidious, or there may be an acute febrile attack lasting for several days. In either case paralysis comes on, at first very extensive, involving both upper and lower extremities, but tending soon to become more limited and confined to one or other limb or even to a group of muscles. The affected muscles lose their electric contractility and are apt to waste. Hence limbs become shortened, shrivelled, and useless, and deformities such as club foot may thus be readily produced. In many instances fortunately recovery is complete, and the prospect of amendment is all the greater if the muscles show any reaction to electricity. There is throughout an absence of some of the more distressing of the phenomena of paraplegia, such as disturbances of the bladder and bowels or extensive bed-sores, and in general the health of the child does not materially suffer.

Progressive Muscular Atrophy or Wasting Palsy is a disease usually occurring in early or middle life. It is characterized by the wasting of certain muscles or groups of muscles accompanied with a corresponding weakness or paralysis of the affected parts, and is believed to depend on a slow inflammatory change in the anterior cornua of the grey matter of the spinal cord. It is insidious in its onset, and usually first shows itself in the prominent muscular masses in the palm of the hand, especially the ball of the thumb, which becomes wasted and deficient in power. The other palmar muscles suffer in like manner, and as the disease advances the muscles of the arm, shoulders, and trunk become implicated if they have not themselves been the first to be attacked. The malady tends to spread symmetrically, involving the corresponding parts of the opposite side of the body in succession. It is slow in its progress, but, notwithstanding it may occasionally undergo arrest, it tends to advance and involve more and more of the muscles of the body until the sufferer is reduced to a condition of extreme helplessness. Should some other ailment not be the cause of death, the fatal result may be due to the disease extending so as to involve the muscles of respiration.

Another form of paralysis in certain respects resembling the last, and supposed by some to be due to a similar cause, is *Pseudo-hypertrophic Paralysis*, a condition occurring most frequently in male children, in whom in such cases there exists at first a remarkable enlargement of certain muscles or groups of muscles, followed sooner or later by wasting and paralysis. The enlarged muscles are chiefly those of the calf and hips, and their abnormal size is caused by an over-development of their connective tissue, and is therefore not a true hypertrophy. The child acquires a peculiar attitude and gait. He stands with his legs widely separated, his body arched forward, and in walking assumes a rocking or waddling movement. Later on the enlarged muscles lose their bulk, and at the same time become weakened in power, so that walking becomes impossible, and the child is completely paralysed in the

limbs and all other affected parts. In most instances death takes place from some intercurrent disease before maturity.

Paralysis Agitans or *Trembling Palsy* is a peculiar form of paralysis characterized chiefly by trembling movements in certain parts, tending to become more widely diffused throughout the body. It is a disease of advanced life. The symptoms come on somewhat insidiously, and first show themselves chiefly by involuntary tremblings of the muscles of the fingers, hand, arm, or leg, which are aggravated on making efforts or under excitement. These trembling movements become more marked and more extensive with the advance of the disease, and along with the tremors there generally occurs increasing weakness of the affected muscles. This is very manifest in walking, the act being performed in a peculiar tottering manner with the body bent forward. The trembling movements cease during sleep. This disease is a chronic one, and is intractable to treatment, but life may be prolonged for many years.

Glosso-labio-laryngeal Paralysis is a form of paralysis affecting, as its name indicates, the functions of the tongue, lips, and larynx (besides others), and depending upon disease of certain localities in the medulla oblongata from which the nerves presiding over these functions arise. The symptoms come on slowly, and are generally first manifested in some difficulty of speech owing to impaired movements of the tongue. Associated with this there is more or less difficulty in swallowing, owing to paralysis of the muscles of the pharynx and soft palate, by which also the voice is rendered nasal. With the advance of the disease the paralysis of the tongue becomes more marked. It cannot be protruded, and frequently undergoes atrophy. Certain of the facial muscles become implicated, especially those in the neighbourhood of the mouth. The features become expressionless, the lips cannot be moved in speaking, the mouth remains open, and the saliva flows abundantly. The muscles of the larynx may also be involved in the paralysis. In the later stages of the malady the power of speech is completely lost, the difficulty in swallowing increases to a degree that threatens suffocation, the patient's condition altogether is one of great misery, which is in no way mitigated by the fact of his mental power remaining unaffected. Complications connected with the respiratory or circulatory functions, or disease affecting other parts of the nervous system with which this complaint may be associated, often terminate the patient's sufferings, and in any case life is seldom prolonged beyond two or three years.

3. *Peripheral Paralysis*, or local paralysis of individual nerves, is of not unfrequent occurrence. The most common and important examples of this condition can only be briefly referred to.

Facial Paralysis, *Bell's Palsy*, are the terms applied to paralysis involving the muscles of expression supplied by the seventh nerve. It is unilateral, and generally occurs as the result of exposure of one side of the head to a draught of cold air which sets up inflammation of the nerve as it passes through the aqueductus Fallopii, but it may also be due to injury or disease either affecting the nerve near the surface or deeper in the bony canals through which it passes, or in the brain itself involving the nerve at its origin. Here the paralysis is manifested by a marked change in the expression of the face, the patient being unable to move the muscles of one side in such acts as laughing, whistling, &c., or to close the eye on that side. The mouth is drawn to the sound side, while, although the muscles of mastication are not involved, the food in eating tends to lodge between the jaw and cheek on the palsied side. Occasionally the sense of taste is

impaired. In the ordinary cases of this disease, such as those due to exposure, recovery usually takes place in from two to six weeks, the improvement being first shown in the power of closing the eye, which is soon followed by the disappearance of the other morbid phenomena. When the paralysis proceeds from disease of the temporal bone, or from tumours or growths in the brain, it is more apt to be permanent, and is in many cases of serious import. Throughout there is no diminution of sensibility in the paralysed muscles; but they early lose their reaction to faradization, retaining that to galvanism.

Lead Palsy is a not uncommon form of local paralysis. It is due to the poisonous action of lead upon the system, and, like the other phenomena of lead poisoning, affects chiefly workers in that metal (see LEAD). The pathology of this disease is still unsettled, but it is believed to depend upon the local effect of the lead upon the nerves of the part rather than to any disease, at least in the first instance, of the nerve centres. The paralysis in this case is as a rule confined to the muscles of the forearm which extend the hand, and as they lose entirely their power the hand cannot be raised when the arm is held out, which gives rise to the condition termed "wrist drop." The paralysis may come to affect other muscles of the arms as well as certain of those of the legs and trunk, and along with the paralysis there occurs wasting of the affected muscles and loss of their electrical reactions. Occasionally in severe cases other nervous phenomena, such as convulsions, delirium, &c., may become superadded. The symptoms usually disappear on the removal of the patient from the source of lead contamination, along with the application of the treatment appropriate to poisoning with this metal,—and all the more speedily if the case has not been of long duration and the affected muscles have not undergone atrophic change.

A form of peripheral paralysis not unlike the last occasionally results from chronic alcoholism. The paralysis occurring after diphtheria, another example of the peripheral variety, has been already referred to (see DIPHTHERIA).

Treatment.—It is impossible in a general notice like the present to refer at any length to the treatment of paralysis. The conditions of the disease in any particular case and its associations are so manifold that they can only be fully understood and appreciated by the medical expert under whose direction alone treatment can be advantageously carried out. It may be stated generally, however, that, since paralysed muscles tend to undergo certain degenerative changes (see PATHOLOGY), it becomes an object in treatment to endeavour to maintain as long as possible their molecular integrity. With this view, when pain and other acute symptoms which may be present have ceased, the use of nerve tonics such as iron, quinine, and strychnine, and the suitable dieting of the patient, are the best constitutional remedies; while of local applications frictions or massage, but more particularly the employment of electricity, will be found of service, the latter agent often yielding markedly beneficial results. (J. O. A.)

PARAMARIBO, the administrative and commercial capital of Dutch Guiana or Surinam, is situated in 5° 44' 30" N. lat. and 55° 12' 54" W. long., on the right bank of the Surinam, which, though at that point 20 miles from the sea, is a tidal river nearly a mile broad and 18 feet deep. Built on a plateau about 16 feet above low-water level, Paramaribo is well-drained, clean, and in general healthy; the straight canals running at right angles to the river, the broad, straight, tree-planted streets, the spacious squares, and the solid if plain-looking public buildings would not be unworthy of a town in the Netherlands. Among the more conspicuous edifices

are—Fort Zeelandia (used as a civil and military prison) at the north corner, between the town proper and the Combé suburb; the Government-house, surrounded by a magnificent garden and park; the town-house, with a tower 100 feet high; the law courts; the public hospital, where there is a remarkable betel-nut avenue 50 feet in height; the Reformed Dutch, Lutheran, Moravian, and Roman Catholic churches; and the Portuguese and Dutch synagogues. The population, barely 16,000 in 1854, was 20,373 in 1869, and 21,265 in 1878.

The Indian village of Paramaribo became the site of a French

settlement probably in 1640, and in 1650 it was made the capital of the colony by Lord Willoughby of Parham. In 1683 it was still only a "cluster of twenty-seven dwellings, more than half of them grog-shops," but by 1790 it counted more than a thousand houses. The town was partly burned down in 1821, and again in 1832.

PARANA. See PLATE RIVER.

PARANAHYBA (PARNAHYBA, or FERNAHYBA), SAO LUIZ DE, a city of Brazil, the chief port of the province of Piahy, is situated on the right bank of the important Rio de Paranahyba, near the beginning of its delta. It has a population of about 15,000, and trades in cotton, leather, &c., but its port is little visited by foreign steamers.

PARASITISM

ANIMAL PARASITISM.

THE problems suggested by the occurrence of parasites not only in the intestines or the kidneys but even in flesh and blood, in eye or brain, have occupied alike physician and naturalist from the earliest times. From ancient Egyptian and Jewish sanitary and religious codes we may perhaps infer considerable knowledge of the distribution and danger of parasites,—unclean animals like the pig, rabbit, and dog being peculiarly infested with them. The schoolmen, too, perplexed themselves with quaint hypotheses as to the time and place and mode of the introduction of the parasites of man, while the long persistence of mediæval myths is evidenced by the "*Furia infernalis*" of the *Systema Naturæ*. The spontaneous generation of parasites seems never to have been doubted until the commencement of the 18th century, when Redi proved the origin of maggots from eggs of the blow-fly, and Swammerdam announced the similar origin of lice and other insect parasites. Both naturalists, however, opposed the extension of their results to the *Entozoa*, but the discovery of microscopic animalcules, and the reflexion that these must readily be introduced into the body, induced Boerhaave to suggest the origin of parasites from free-living worms and infusorians. The sexuality and characteristics of a few *Entozoa* gradually became better known, while Linnæus, though little dreaming of their complex form-history, expelled the spontaneous generation theory by the in-so-far fortunate mistake of identifying the free *Bothriocephalus* of the stickleback as the young stage of *B. latus* of man, and certain free Planarians and Nematoids as the young of liver flukes and thread worms. His school vastly increased the hitherto scanty catalogue of known forms, while their exacter knowledge rendered his hypothesis improbable. The origin of *Entozoa* from eggs which leave the body of their host, enter new hosts in food or drink, and when developing in other organs than the alimentary are carried thither by the circulation, was clearly put forward by Pallas, who also revived the early view of inheritance, which had been propounded before by the contemporaries of Leeuwenhoek (then, however, to avoid the apparently insoluble difficulty of tracing the origin of the parasite from its innumerable yet apparently wasted ova). With the enormous labours of Rudolphi and Bremser helminthology rose to the rank of an important special study, yet the degeneration of the Linnæan school had nowhere fuller course: observation of faunistic and systematic detail excluded all physiological or morphological research, and the knotty problem of origin was simply cut by a return to the hypothesis of spontaneous generation. This view seemed supported by the absence of reproductive organs in cystic parasites, and reigned almost undisputed until the accumulation of a new chain of evidence. Of this the main links were the discovery of the ciliated larva of a Trematode (*Monostomum*) by Mehlis in 1831, of the *Redia* or *Cercaria* stages of the same genus, and of the

six-hooked embryo of *Tænia* by Siebold in 1835, and the renewed study of *Bothriocephalus latus* by Eschricht, who maintained that the encysted forms were persistently larval, and that the life-history of the *Entozoa* should be viewed as broadly parallel to that of parasitic insects. Yet in spite of all this, and of the corroborative researches of Valentin, many helminthologists remained obstinate, until these incredible life-histories had been confirmed and treated as so many other cases of the "Alternation of Generations" in the epoch-making work of Steenstrup (1842). Dujardin next observed the wanderings of *Mermis*, and Siebold those of *Gordius*; the latter, however, advanced the doctrine that cysts were not larval stages, but mere pathological modifications of those worms which had chanced to "wander" into situations unfitted for their normal life. Meanwhile were commencing the important labours of Van Beneden, who traced the actual development of the cystic parasites of the bony fishes into the tape-worms of the rays and dogfishes which had devoured them, so proving that the transmission of the parasites depended upon the mode of feeding. These results were soon confirmed by Küchenmeister, who not only transmuted cyst into tape-worm by transmission in food, but redeveloped the cystic form by feeding with eggs from the adult tape-worm, thus (1852-53) commencing the modern era of experimental helminthology. Häubner and Leuckart eagerly followed for the same group; Filippi, Valette, Pagenstecher, and Cobbold made similar investigations on Trematodes; while Leuckart transferred *Pentastomum* from rabbit to dog, and traced the formidable *Trichina* from pig to man. From this time (1860) the advances of our knowledge have been no longer in principle, though numerous and important, but in detail. To Küchenmeister, Cobbold, Davaine, and others, but more especially to Leuckart, we owe valuable general works; to the last the present article is especially indebted.¹

Any discussion of parasitism with its difficulties and wide theoretic bearings should naturally be preceded by an account of the known facts. This would involve the preparation of two systematic lists,—the first enumerating the parasitic members of each animal group, while the second, from the point of view not of parasites but of hosts, would indicate the forms which are infested, stating by what parasites. Of these lists the following scanty outlines must suffice.

A. List of Parasites.

Protozoa (see PROTOZOA).—Amœboid organisms are occasionally detected in dysentery and kindred diseases; the best known of these is *Amœba coli*. Parasitic *Infusoria* occur much more frequently: thus in the paunch of sheep and oxen six species (*Ophryoscolex*, *Entodinium*, *Isotricha*) are constant; similarly in the rectum of the frog are invariably present *Opalina*, *Nyctotherus*, and *Balanitidium*; while *B. coli*, first described from man, inhabits

¹ See Leuckart, *Die menschlichen Parasiten*, 2 vols., Leipzig, 1863-76; a second edition (commencing in 1879) is now in progress as *Die Parasiten des Menschen*; Cobbold, *Parasites*, London, 1879; Küchenmeister and Zürn, *Die Parasiten des Menschen*, 1881; Hirsch, *Handb. d. hist.-geogr. Pathol.*, 2d ed., vol. II., Stuttgart, 1883.

the pig *Trichodina* infests Plaurians. Flagellate parasites are more numerous: *Cercomonas intestinalis* is frequently observed in choleraic affections; *Trichomonas intestinalis* and *vaginalis* are also described in diseases. In perhaps all invertebrates and cold-blooded vertebrates ciliate and flagellate parasites seem to occur. *Acinetes* are sometimes parasitic on other *Infusoria*.

By far the most important group, however, are the exclusively parasitic *Gregarinida*. These are very widely distributed among the tissues of invertebrates, especially worms and insects, and their normal life-history is readily observed in the species infesting the tissues of the common earthworm. Their spores or *pseudonavicellæ* are apparently closely related to the psorosperms frequently detected in both vertebrate and invertebrate tissues, and even in the liver and hair of the human subject.¹

Dicymida.—This group contains only one entirely parasitic genus, various species of which live in the renal organs of *Cephalopoda*. The adult consists essentially of a simple sac of finely ciliated ectodermal cells enclosing a single elongated endodermal cell, which discharges nutritive and reproductive functions. Some have attempted to demonstrate a mesoderm. The embryos are of two kinds, nematogenic or vermiform and rhombogenic or infusiform, differing in origin, structure and life-history, but of still uncertain relations and import. The infusiform embryo which becomes free is of complicated structure and probably completes its development in some new host. Some have connected the *Dicymida* with such higher forms as the *Rotifera* or *Trematodes*, and have regarded the simplicity of the adult as the result of that degeneration which is suggested both by development and habit. Hæckel, while acknowledging degeneration regards *Dicyma* as a survivor of the originally simple *Gastræda* from which the *Metazoa* have sprung.²

Orthocentrida.—This group consists of a number of minute parasites, such as *Rhopileura*, infesting some Nemertines, Turbellarians, and Ophiuroids. Although moving in linear direction, as their name implies, they exhibit radiate structure. The ciliated and segmented ectoderm encloses an inner endoderm layer and a central cavity which usually contains embryos. They exhibit a well-marked sexual dimorphism, the males being smaller and with fewer segments. Their position is as problematic as that of the *Dicymida*; they may be regarded as degraded forms allied to the *Turbellaria*, *Trematoda*, or *Rotatoria*, or as survivors of the *Gastræda*.³

Celenterata.—In this group (see CORALS, HYDROZOA), while the fixed forms are frequently indebted for support to other organisms or to each other, and although such associations occasionally seem tolerably constant, true parasitism is remarkably rare. Young *Narcomedusæ* (*Cunina*) are parasitic within the mouth of *Carmarina*, and the hydroid *Lafæa parasitica* grows like ivy on *Aglaphenia*.

Similar remarks apply to the *Mollusca*, where, with one or two exceptions (e.g., *Entoconcha mirabilis* discovered by Johannes Müller in *Synapta*, and another Philippine species described by Semper) parasitism is unknown.

Echinodermata.—There are no parasitic Echinoderms.

Vermes.—To this sub-kingdom belong the majority of parasites, but the greater groups are treated in separate articles. See NEMATOIDÆ, and for Cestoids and Trematodes see TAPEWORM.

Acanthocephala.—This group, usually regarded as degenerate from NEMATOIDÆ (q.v.), is represented by various species of *Echinorhynchus*. These parasites possess a muscular elongated body with a retractile proboscis armed with hooks, which serves to fix the animal to its host. Sense organs, mouth, alimentary canal, and anus are wanting; but the muscles, nerves, and generative organs are well developed. There is a complicated subcutaneous canal system; the sexes are distinct, and the reproduction is viviparous. The embryo, well provided with ensheathing membranes and with hooks, is expelled with the excreta of its vertebrate host and swallowed by some Arthropod, such as *Asellus* or *Gammarus*. There a remarkable metamorphosis takes place: the adult is formed within the body of the larva, the skin being the only part of the larva which passes over to the adult. The young *Echinorhynchus* finally passes with its invertebrate host into the alimentary canal of some vertebrate, e.g., fish or bird or even pig, and there attains sexual maturity.

Rotatoria.—Such forms as *Albertia*, found externally on certain worms (Nais, &c.), and *Bulatro* inside the same, are distinctly parasitic, and are not improbably differentiations of the same form.

Among the Nemertean various parasites occur, such as *Pontobdella*, *Branchellion*, *Piscicola*, found especially on fish. The *Chaetopoda* are never parasitic, and but rarely commensal. The

Myxostomata are probably, however, degenerate Chaetopods, represented by the genus *Myxostoma* living ectoparasitically on Crinoids.

Crustacea.—This group includes an immense number of forms in varying degree parasitic. The *Copepoda* include all grades from free-living forms to such degenerated parasites as *Achtheres*, *Lernæa*, *Chondracanthus*, and *Argulus*. Many *Eulimostraca* are parasitic, and among the *Isopoda* we find such forms as *Boyerius* and *Cryptoniscus*. Among the *Cirripedia* again are various grades of parasitism from some of the *Lepadida* to the *na plus ultra* of degeneration—the *Rhizocephala*.⁴

Insecta.—Insects furnish a large proportion of ectoparasites, but comparatively few endoparasites, for very obvious reasons. The *Strepsiptera*, parasitic on bees, the ichneumon-flies, *Platygaster*, and allied Hymenopterous forms, the *Pediculina* (*Derivitera*) and the *Mallophaga* are the more important parasites. Many of the other groups also include parasitic members. See INSECTA.

Arachnida.—The majority of *Acarina* (see MITE) are parasitic, and there are many other *Arachnida* of similar habit. To the *Arachnida* the *Pycnoacnida* and the *Pentastomida* are often referred. The former are parasitic in their youth at least on Hydroids. *Pentastomum* exhibits considerable divergence from the *Arachnoid* type, and has a life-history closely parallel to that of the *Cestoida*. The adult form is found in the frontal sinus of the dog or wolf; the embryos pass through the nose to the exterior, and if eaten by a hare or rabbit lose their investment, penetrate to the liver, encyst, and pass through a complicated series of changes, finally attaining maturity and sexuality when the flesh of the rodent is eaten by the original host.

Vertebrata.—The *Vertebrata* are rarely parasitic. The best case of incipient parasitism is that of *Myxine*, which burrows into the codfish. With this may be compared the well-known *Remora*, which attaches itself externally to sharks, &c. Commensalism is, however, more common, many small Teleostean living with *Medusæ*, sea anemones, and such like. *Fierasfer* finds a lodgment inside the respiratory tree of Holothurians; and Semper describes a Philippine species which actually devours the viscera of its Holothurian host.

B. Distribution of Parasites and List of Hosts.

Protozoa are of course rarely infested; *Celenterata* also rarely; species of *Distomum* have been taken on *Physophora*, *Vetella*, *Pelagia*, *Beroë*, and *Cestum*; a scolex and a nematode have been described from *Ctenophores*, while various Arthropods occur ectoparasitically. Echinoderms are also very free from parasites; on *Echinus*, however, despite its pedicellariæ, occur occasionally the semi-planarian-like Trematode *Syndesmis*, and the molluscs *Stylifer*, *Anapodium*, and *Eulima* (the latter occurs also on starfishes). The *Comatulæ* of all seas bear *Myxostoma*. Holothurians from the Pacific occasionally contain crustaceans, such as the crab *Pinnotheres*, and several Copepods. Their respiratory tree lodges *Fierasfer*, while *Synapta* contains the mollusc *Entoconcha mirabilis*.

Mollusca are more largely infested. *Pinnotheres* and other *Crustacea* frequently inhabit the mantle cavity of marine Lamellibranchia, as the Arachnid *Aiar* does the fresh-water mussel. The Lamellibranchia also have their peculiar Trematodes like *Aspidogaster* and *Buccaphalus*, besides *Cercaria*, from which probably few Gasteropods, whether marine, fresh water, or terrestrial, are ever free. The *Cephalopoda* not only contain certain *Dicymina* in their renal organs, but through their piscivorous habits acquire *Tetrarhynchus* and *Ascarids*. Among the *Chaetopoda* not only are Protozoan parasites frequent, but parasitic worms are occasionally described.

Crustaceans frequently contain Gregarines; and a few Cestoids, Trematodes, and Nematodes (and *Branchiobdella*) have been described, as well as the cystic *Echinorhynchus*, from *Gammarus pulex*. More formidable, however, are the Copepods, like the familiar *Nicothee* of the lobster's gills; and, worst of all, the *Rhizocephala*, like *Pellogaster* and *Sacculina* of the hermit and shore crab respectively.

Centipedes often contain Nematodes, and spiders *Mermis* and *Gordius*. Insects are preyed upon by Ichneumonans, are largely plagued by ticks externally, and internally by Gregarines and worms, most frequently *Gordius* and *Mermis*; but also by larval Hymenoptera of many families, by certain *Diptera*, and by the *Strepsiptera*. See INSECTA.

The *Tunicata* harbour many crustaceans, &c., chiefly in the test.

It is among vertebrates, however, that parasitism is most frequent and most fatal. Fishes swarm externally with Trematodes, leeches, and parasite crustaceans, internally with cysts and intestinal worms all too numerous for enumeration. Nothing gives a more vivid idea of the extent to which parasitism has reached than an examination of a ray, or even better, the common sunfish (*Orthogoriscus*). Amphibians are inhabited by many parasites,—the common frog

⁴ See CRUSTACEA, and the more recent researches of Claus and Kossmann, and also those of Lacaze-Duthiers on *Lernæa*, and the especially remarkable investigations of Delage on *Sacculina* (Zool. Jahrb. Bericht 1880-81).

having almost constantly *Ascaris nigrovirens* in its lungs, and infusorial parasites in its rectum, and may also yield *Distomum*, *Echinorhynchus*, &c., twenty species in all. Lizards harbour tapeworms, Nematoids, including species of *Trichina*, more rarely Trematodes. Ophidians have all kinds of parasitic worms, Chelonians chiefly Nematoids and Trematodes. The parasites of birds are of extraordinary number and variety; preying, fishing, and omnivorous birds serve, of course, very constantly as intermediate hosts; but graminivorous birds are hardly more exempt. The number of parasites is often so vast as to occasion the most serious disease; thus the "gapes" of poultry is due to the choking of the bronchial passages by multitudes of Nematoids (*Sclerostoma syngamus*), and the grouse disease to a similar cause (*Strongylus pergracilis*).

Yet a great number of parasites may be borne without apparent injury: thus the post-mortem examination of a single stork has yielded twenty-four *Filaria* and sixteen *Strongylus* from the lungs and air passages, one hundred *Spiroptera* from the coats of the stomach, more than a hundred of various species of *Distomum*, and many hundreds of *Holostomum* from the gullet and intestine. Ticks and insect parasites are also common; of these the most remarkable are the feather-eating *Mallophaga*. The majority of the *Mammalia* have as internal parasites many different species of worms either in adult or cystic form, which are fully described in veterinary works. The special parasites of man are estimated by Cobbold at as many as 121 species (13 Trematodes, 16 Cestodes, 21 Nematoids, 10 Leeches, 17 Arachnids, 44 Insects); many of these, especially among insects, have occurred only very rarely, and should not be reckoned, e.g., *Musca vomitoria* and *Blaps mortisaga*, while a considerable number of the truly parasitic forms have only been once or twice described,—the above estimate thus becoming reduced well-nigh to half.¹

Taxonomy.—Far then from there being, as was formerly thought, one great group of *Entozoa* by itself, we have seen that most invertebrate groups have their parasitic members and exhibit transitions or grades connecting these with free-living forms. The systematic position of many parasitic species is, however, not yet clear, many have been named by accident or according to habitat, and great concentration seems necessary. It is, for example, extremely probable that a careful systematic study of genera like *Gordius*, *Distomum*, and *Tetrarhynchus*, of which innumerable species have been described from as many different hosts, would result in proving the identity of many forms described as distinct, and that experiment would show that many of the forms still apparently specifically distinct are really only individuals of the same species more or less modified by the host upon whom the lottery of nature has chanced to quarter them.

With the increasing completeness of our knowledge of parasitic forms the transitions from free to parasitic species are becoming more prominent, and the relationships of the parasitic to the non-parasitic groups more definite. Among the *Nematoidea*, for example, as Leuckart indicates, we are able to construct a series, starting from free-living forms, and through such cases as *Leptodera* (a *Rhabditis*-like form, sometimes free, sometimes parasitic), thence to parasitic Nematodes hardly to be distinguished from their free-living relations, but passing gradually through *Oxyuris*, *Trichocephalus*, *Spiroptera*, &c., to such highly parasitic forms as *Trichina*, where all relation to the outer world is lost. The *Acanthocephala* Leuckart has taught us to regard as Nematodes highly modified by parasitism, and he points out how *Gordius*, with its atrophied alimentary canal, terminal position of female reproductive organs, and other persistent and embryonic characters in which it differs from the typical Nematoid, really leads up to *Echinorhynchus*. As *Echinorhynchus* is related to the Nematodes, so are the Cestoids to the Trematodes. The close alliance suggested by numerous points of anatomical correspondence, and by the close parallelism in life-history, is corroborated by such intermediate forms as *Caryophyllæus* and *Amphilina*, from which we pass with ever-increasing parasitic adaptation

through the *Ligulium* to *Bothriocephalus* and *Tania*. Leuckart further points out how closely the Trematodes are united by intermediate forms to the Planarians. The affinities of *Myzostoma* and *Pentastomum* are not yet precisely determined, though the former is most plausibly regarded as a degenerate Chatopod and the latter as similarly degenerated from some low Arachnid or at least Arthropod type. In the *Copepoda*, *Cirripedia*, and other crustaceans all degrees in intimacy of association may be observed, making the relations of the parasitic to the free forms sufficiently obvious. Everywhere, in short, we find a morphological and physiological gradation from free to parasitic forms.

Nature and Degree of Parasitism—Commensalism.—From the foregoing necessarily much abbreviated lists we observe not only the enormously wide prevalence of parasitism—the number of parasitic individuals, if not indeed that of species, probably exceeding that of non-parasitic forms—but its very considerable variety in degree and detail. The majority indeed derive their main support from their host, but of these some are free, wandering about from animal to animal, some are attached permanently to the exterior of their victim, while others again are concealed within its body. In some cases the parasitism is only temporary, with others it is a life-long habit. The majority are free in their youth, while some pass their early life as parasites, becoming free in their mature state, and others again spend their whole life on their host.

In some cases there is the very slightest association; every student of marine forms is familiar with the complex

FIG. 1.—Colony of sea-anemones (*Sagartia parasitica*) on shell of hermit crab.

incrustations and intergrowths of sessile forms, and has seen how almost any surface or cranny may afford a lodgment. Parasitism for support is not infrequent; it may be temporary or permanent; in the former case it is useful in diffusion,—the glochidium-larva of the freshwater mussel, for example, being transported on the fins of fishes. From cases like those of many Cirripedes, which occur indifferently on rocks or on animals, we pass readily to permanent associations like that of *Loxosoma* on the posterior end of *Phascolosoma*. Vague and loose associations, if useful to one or both participants, may become perpetuated by natural selection. Thus sea anemones may settle on any surface,—occasionally therefore on shells inhabited by hermit crabs; hence have arisen permanent

¹ For lists see, in addition to general authorities, Linstow *Compendium d. Helminthologie*, Hanover, 1878; V. Beneden, *Animal Parasites and Mesozoa*; Cobbold, *Human Parasites* (1882), and *Parasites of Domestic Animals* (1874); Ziegler's *Pathology*, English ed., London, 1883.

associations. Of these there are many familiar instances, such as the hermit crabs bearing *Sagartia parasitica* (fig. 1), or having their shell-mouth enveloped by *Adamsia*. One of the quaintest instances is a lately described species of crab which wields an anemone firmly grasped in either claw. In such cases the association is obviously useful: the crab is protected from the octopus and other enemies by the nematocysts of its comrade, which also aid in holding the prey, while the *Actinia* too gains its share of the food, and vicariously acquires means of locomotion. To such cases where two animals are associated together for mutual support and advantage the term "Commensalism" is applied. In the struggle for existence increased complexity of needs, and difficulty in satisfying them, evokes in the individual organism a certain specialization of function and consequent differentiation of structure. Similar causes result not so much in the differentiation of each individual of a species as in the specialization of certain individuals for certain specific functions, resulting again in that specialization of structure which is called polymorphism. Thus in a *Hydractinia* or Siphonophore colony many different individuals of the same species have been specialized in each to perform a certain function. The same purpose is served by those associations, not of individuals of the same species, but of two individuals of different species, united as we have just seen for mutual advantage, and each working out some definite part of the common life-problem. Just as polymorphism in the same species is physiologically equivalent to differentiation in the individual organism, so is commensalism between different species the physiological equivalent of polymorphism in a single species.

But cases of co-operation on equal terms are rare; size constitutes the most frequent disparity, and the smaller tends to become first wholly dependent upon the other for support, then for concealment, and finally perhaps for sustenance. The reverse may occasionally occur, the weaker being utilized for the purposes of the stronger; thus a species of *Dromia* adapts a colony of sponge or ascidian as a removable upper garment for concealment.¹

Parasitism within the same Species.—In some cases even within the morphological unity of the species a physiological relation is established analogous to commensalism if not to parasitism. Thus in *Bonellia* the diminutive and degenerate male lives in the uterus of the female, in *Trichosomum crassicauda* of the rat three or four male are found within the spermatheca of the female, while in *Bilharzia* the incipient-reciprocal of these cases is found, the male being host. Many of the most remarkable cases are also afforded by the *Cirripedia*, in which a female may bear males in various states of dependence and degeneration. In viviparous animals a certain absorption by the young from the tissues of the parent can hardly avoid taking place; this is therefore so far an analogy to endoparasitism. This advantage is clearly retained and developed if absorption take place by an organ specialized for the purpose. Thus in the well-known shark *Mustelus laevis* the young are attached to the oviduct by a placenta developed on the yolk sac; and the like arrangement, though morphologically different, is physiologically the same among the *Mammalia*.

Hyperparasitism.—Not only are very few animals altogether free from parasites, but even parasites themselves find their nemesis in being themselves infested by lesser parasites, though not "*ad infinitum*." Thus Leuckart mentions that water-lice and thread-worms are found on parasitic crustaceans, and the endoparasitic larvae of some *Hymenoptera* are themselves preyed upon by other larvae

(*Pteromalinae*). Nematodes are found in *Nicothoe*, and associated with *Sacculina* are frequently found two other crustacean parasites, one of which, after destroying the greater part of its host, continues to subsist upon the nourishment afforded by its root-like processes which survive the operation.

Classification.—Some classification of these various parasitic forms is necessary. Van Beneden introduced the useful term *commensals* or messmates, under which he includes (1) *oikosites* or fixed and (2) *coinosites* or free partners. These he distinguishes not only from parasites but from *mutualists* where two species are associated, but neither share a common food nor does one prey on the other. Parasites he divides according to the duration of their state of attachment to a host, distinguishing (1) those which are free all their life (leeches, bugs, fleas, &c.); (2) those free as adults but parasitic when young (*Ichneumon*, *Mermis*, &c.); (3) those free only in youth, and attaining their adult form either directly in the first host entered, or only after a migration from one host to another (most parasitic worms); (4) those which pass all phases of their life on or in their host, e.g., *Strepsiptera*, *Tristomum*, &c. In this classification there is no attempt to define the degree of dependence or the closeness of the association, except in the general distinction between parasites and commensals; the group of mutualists is entirely superfluous and confused, no clear definition being given, and in the examples of the various groups the limits of his own definitions are not adhered to.

Leuckart distinguishes parasites as ecto- and endo-parasitic, and divides the former into temporary and permanent. Endoparasites he divides according to the nature and duration of their strictly parasitic life. (1) Some have free-living and self-supporting embryos which become sexually mature either in their freedom or only after assuming the parasitic habit. (2) Others have embryos which, without having a strictly free life, yet pass through a period of active or passive wandering, living for a while in an intermediate host. They may either (a) escape to pass their adult life in freedom (*Archigetes* and *Aspidogaster*), or (b) they may become sexual, or (c) they may bore their way to another part of the body (*Trichina*), or (d) most frequently they pass to their final host either directly when their intermediate host is devoured as food, or indirectly seeking for themselves another intermediate host, or producing asexual forms which do so (*Trematodes* and *Cestoids*). (3) Others again have no free-living or even migratory embryonic stage, but pass through their complete life-cycle in one host (*Trichocephalus*, *Oxyuris*, &c.). This somewhat detailed classification has at least the advantage of clearness, and of showing to some extent the various degrees of parasitism.

Kossmann has proposed a more physiological classification dealing with the organization and habit of the parasite. This he has applied to the *Crustacea*:—I. *Diosmotici*, or vegetative without independent digestive organs, e.g., *Rhizocephala*; II. *Digestorii* with independent digestive system, and including (1) *Sedentarii*, *Copepoda atelemteta*, *Bopyridae*, *Euboniscidae*, *Cryptoniscidae*; (2) *Vagantes*, *Copepoda holotmeta*, *Branchiura*, *Cymothoidae*. The great variety of details, however, makes it almost impossible to establish any logically accurate division. Any strict classification of such a variety of organisms having only in common the physiological correspondence of their mode of life is almost impossible, and the most that can be done is to point out the existence of series of adaptations varying with the intimacy and constancy of the association and the degree of dependence.

Origin of Parasitism and Transmission of Parasites.—With the dismissal of the theory of *generatio equivoca*, the question of the origin of parasites is limited to the discussion of the causes which might induce such a change of habit and environment. There are obviously many opportunities for one animal either in adult or larval state being swallowed by another in food or drink, in which case, if the environment were not too utterly different from that previously enjoyed, parasitism might arise in a purely unconscious way. It is again easily conceivable that animals which have sought a host for temporary protection from climate or enemies, or for safety and seclusion in the bearing and breeding of the young, might, finding the environment congenial and a supply of food at hand, remain there during a large portion of their life. It is worth noticing, as corroboratory of the idea that the host was in many cases resorted to primarily as a sort of maternity asylum, that we find many parasitic females with free males, e.g., *Nicothoe*. Given an animal with a carnivorous habit, it is intelligible enough that during a period of

¹ For an account of many cases of commensalism, see V. Beneden, *Animal Parasites*, and Semper, *Animal Life*, both in International Science Series.

scarcity of food or of extreme pressure from enemies, various methods of solving the problem of life would be attempted, the successful results of which in a few cases persist especially in ectoparasitism, not the least obvious mode of retaliation on stronger foes. The degree of the parasitism is, as we have seen, not of primary moment, and its intimacy may be increased. There are naturally some physiological limits of respiration, &c., determining the possibilities of parasitism—air-breathing insects are found on land animals or at most on some amphibian forms, water-breathing Arthropods on water-breathers, water-breathing worms only in the interior of land animals; but even these limits may be overstepped by adaptation when, for example, the respiration becomes cutaneous in *Pentastomum*, *Sarcoptes*, &c.

The various modes of transmission of parasites, though of great practical importance, do not call for much discussion here. They may be summarized as follows after Leuckart:—(1) the majority of parasites reach their hosts through the medium of food or drink; (2) eggs are in some cases transferred from one animal to another by actual bodily contact, *e.g.*, the eggs of *Pentastomum* by the licking of dogs; (3) sometimes the eggs are deposited in or on the host by the mother, for example, by insect parasites, such as *Ichneumons*, *Æstridæ*, &c.; (4) in some rare cases parasites are transmitted by self-infection,—for example, young *Trichinæ*, born free in the alimentary canal of their host, bore their way thence directly into the muscles, there to grow into the well-known encapsuled worms. Eggs or proglottides of tape-worm may, on gaining the exterior, be transmitted inadvertently to the mouth, and so recommence their life-cycle within the same host.

The mode of diffusion of the ova of parasites presents many analogies to that of seeds in the vegetable kingdom: thus wind and water are alike utilized, passing animals may serve as unconscious bearers, and the like. Though well protected by a usually thickened egg-shell and an often remarkable degree of vitality, so as to resist prolonged drought, burial, and other vicissitudes, the parasite has an exceedingly small chance of success in finding a host; to preserve the species from extinction an enormous number of eggs must be produced, far exceeding that of free-living organisms. Thus Leuckart points out that as a tapeworm has an average lifetime of two years, and produces in that time about 1500 proglottides, each containing say 57,000 ova, and since the species is not increasing in numbers, an ovum has thus only one chance in 85,000,000 of reaching maturity. The difficulties are of course increasingly greater as the life-history becomes more complicated, demanding an increasing number of hosts. Given a sufficient number of eggs, however, no difficulty is insuperable, and few parasitic forms accordingly seem in any risk of disappearance, except, it is to be hoped, in the case of civilized man and the domestic animals, where the large consumption of cooked food, aided by conscious hygienic precautions and medical aid, tends to exclude or remove them.

Effects of Parasitic Life on Parasites.—So far from treating the phenomena of parasitic life as highly aberrant, and the peculiarities of parasitic form as differentiations *sui generis*, it becomes evident that we have to do with only one of the many cases in which the influence of environment on organism is clearly marked. The aetiology of parasitism is only a fraction of a vaster general question; and we shall never fully understand the adaptation of the parasite to its host until the relation of environment to organism has been far more profoundly analysed and completely experimented on—inquiries which have only recently begun to be seriously set on foot. The most cur-

sory consideration of the action of environment shows how profoundly it determines form; of this no better examples can be found than those furnished by the habit of plants. It is easy to see how submerged leaves must become dissected, or desert plants tend to become succulent; how evergreens are only possible in certain conditions of climate, or thorns are only useful where herbivorous mammals abound. In the same way we can broadly see that the conditions of life profoundly influence animal form. Before considering how the abnormal parasitic environment affects the parasite, we should know how the normal environment affects the non-parasite, and how the two cases differ. The environment thus needs analysis into its factors, the organism similarly into its constituent systems of organs; and the influence of any factor of the environment upon each system and organ demands determination, species by species, before safe and exhaustive generalizations can be obtained. Pending these inquiries, which are destined to take so large a place in the biology of the future, and within the present narrow limits, only the merest outline can be attempted.

Morphological science has but slowly and with difficulty disentangled itself from the primitive classifications of plants and animals by habit and resemblances of external form; the physiologist, however, needs to reassert the claims of these and develop them in detail; as for the child so for him whales are in a sense fishes, and bats birds,—just as the swimming organs of the former, like those of the penguin or cuttlefish, are all fins, or the flying organs of the latter and those of insects are wings alike. Such considerations show too the first importance of the mechanical conditions, primarily those of locomotion or rest, and whether in water, or land, or in air, since these determine, not only external form, but muscular and skeletal disposition and structure. These determined, conditions of heat and light play an obvious part; copious supplies of heat energy to the organism have a distinct result in stimulating plant growth, and accelerating that of animals; light too, a primal necessity for green plants, has also the most marked effect on animals, which develop tracts of absorbent pigments in its presence, these becoming locally evolved for perception into eyes; while in relation to sound-vibrations and impressions of contact other sense organs develop. Quantity of food has its influence mainly on size, but nature of food and mode of feeding demand many appropriate specializations of details of form. Expressing the same adaptations from the other point of view, that of the organism, we see how not only the general form but the integument with its colour and texture, and also the respiratory and alimentary organs, are necessarily fitted to avail themselves of the given conditions; how the circulatory and how the reproductive systems must comply; how the sensory organs must take note more and more of the changes in the environment; and how the whole series of complex adaptations demands a similarly complex internal mechanism for their co-ordination through the nervous system.

From the slightest analysis then of the relation of organism to environment, the theory of evolution might almost have been predicted, since, if the details of environment and organism be indeed obviously and precisely adapted one to another, change in the former must either be followed by the extinction of the latter or its modification in the requisite details. To explain the *modus operandi* of change in the organism, we have mainly to bear in mind Dohrn's admirably expressed "principle of functional change,"—the simple conception that any living tissue, however specialized, still retains traces of all the functions of living protoplasm, and that any one of these traces may be indefinitely increased by favourable conditions, and the

specialized function similarly reduced to a trace. Along with this, or rather as a corollary of it, comes the conception of economy of unused structure; our notions of specialization become henceforth associated with a corresponding possibility of simplification, and our idea of progress must be for ever accompanied by the corresponding possibility of degeneration.

The conditions of parasitic life are readily seen to differ primarily from those of independent organisms in negative characters, *i.e.*, in the simplification of the factors of the environment; let us therefore briefly consider the results of such progressive simplification upon organisms in general. Let the mechanical conditions be simplified by the cessation of active movement; the specialized body-form necessary for locomotion then becomes unnecessary; locomotor muscles and their skeletal attachments are simplified or disappear; organs of sense are far less needed, and nervous adaptations and structures become correspondingly reduced. In all these respects then sessile parasites simply agree with other sessile animals. Again, let us simplify the environment by the deprivation of light; eyes and pigment are useless, and our organism, whether cave-dwelling insect or crustacean or internal parasite, becomes blanched and blind; and similarly with other senses. Or let us subtract as far as possible the element of danger from other animals by special protection or concealment in one of the "nooks of life"; here again for shelled mollusc, sand buried *Amphioxus*, or hidden parasite the diminished need of nervous adaptations is a similar degenerative factor. Let food become abundant, the same nervous economy follows; let it be highly nutritive, and digestive structures and functions may be simplified; thus the examples of progressive degeneration of the alimentary system up to its complete replacement by superficial absorption, afforded by various parasitic series, are natural enough. The soft integument unprotected and blanched, the reduced muscular activities, the simple or absent alimentary tube, the reduced circulatory and respiratory organs consequent upon diminished waste and softened integument, are all intelligible enough, as also is the increase in reproductive activity demanded by increased risk of failure to find the appropriate conditions. The few adaptive conditions are readily understood: given the continuous application of a flat muscular surface to resist detachment from the host, and atmospheric pressure helps the development of the sucker; given either a clutching limb or a portion of the body-wall thrust for support into the host, and the mechanical conditions aid the differentiation of a hook; here, if anywhere, function in fact may be said to make the organ, and such curious resemblances of superficial form as those between say a gregarine, a tapeworm, and an *Echinorhynchus* are not hard to explain.

Further details of the process of retrograde metamorphosis and of the enormously important phenomena of degeneration cannot here be attempted; it must suffice if the general dependence of such changes upon simplification of environment—freedom from danger, abundant alimontation and complete repose, &c. (in short, the conditions commonly considered those of complete material well-being)—has been rendered clearer, and if the phenomena of parasitism, however apparently aberrant, become intelligible as new evidences of the unity of organic nature.¹

Effects of Parasite on Host.—As the result of the association of two organisms with more or less constancy, various mutual modifications of form and function must obviously occur. The more important effects of parasite on host may be briefly outlined. Semper cites numerous cases where the commensal or parasite has a mechanically trans-

forming effect on the host. Thus a horny coral with which an annelid is constantly associated has become permanently modified to form an encasing tube. Worms inside corals have enlarged the base of the cavity by stimulating growth, and may also produce permanent pores. Pycnogonids on *Campanularia* produce galls, which acquire specific characters, and various species of crab parasitic on corals form galls, two of which coalescing, form a sort of "cave dwelling" with two fissures which are kept open by the respiratory currents of the crab, which thus both stimulates and checks the growth of the polyps. In higher animals, and with more intimate parasitism, the mechanical influences of the parasite on the host are more serious and more markedly pathological. Thus parasitic worms, by their size and number, frequently close up passages such as arteries, windpipe, &c., causing often fatal results. But many parasites are also actively destructive to certain tissues of their host—thus, as Semper points out, *Peltogaster* destroys the female reproductive organs of *Pagurus*, a Trematode those of *Limnæa stagnalis*, the larva of a fly (*Cuterebra emascuator*) the testes of various species of American squirrel. In none of these cases, however, is the general vitality of the host affected. The results of active motion within the host are productive of still more serious mischief; thus the internal migration and burrowing of such parasites as *Trichina* and *Bilharzia* is well known to produce violent inflammation. The perforation of vessels, the consequent extravasation of blood, and the destruction of tissue often end fatally for the host. Leuckart distinguishes pathological effects as due either to growth and increase of parasites, or to their wanderings within the host, or thirdly to the very considerable loss of nourishment which a number of parasites of appreciable size necessarily entails. Some blood-sucking parasites are specially dangerous, and many less ferocious forms doubtless poison their host to some extent by their waste products. Roux also notes how parasites—an *Echinococcus*, for example—by inducing a flow of nutritive material, may develop a net-work of capillaries and produce other histological changes.²

It is probable that many of the most remarkable integumentary specializations of the animal kingdom are defences against parasites (somewhat as the stings or thorns which protect foliage, or the hairs which keep ants from flowers); thus the nematocysts of coelenterates, the molluscan shell or the crustacean mail, the vigilant pedicellariæ of the echinoderm, or the scales of the fish are alike largely specialized as defences against the never-ceasing attacks of swarms of larval parasites, cagerly struggling to gain entrance or footing anywhere.

The history of the medical aspects of parasitism can only be very briefly alluded to. From the time of the ancient Arabian physicians some diseases, such as itch, have been referred to parasites. With the increasing knowledge as to the prevalence and importance of parasitism there arose a distinct parasitic theory of disease, and in the 17th and 18th centuries such questions were discussed as "an mors naturalis sit substantia verminosa." In spite of the gradual unravelling of the mysteries of origin and life-history, physicians long clung conservatively to the old hypothesis of spontaneous generation, even Bremser regarding the pathological states of the host not as caused by the parasites, but as causing and in fact creating them. It was not till within the last thirty years that, with the rise of experimental helminthology, medical science shook itself free from superstition and ignorance, and devoted close attention to ætiology and treatment, culminating in that systematic warfare against all forms of parasitism

which now occupies so important a place in medicine and the veterinary art (see p. 269 *infra* and VETERINARY SCIENCE).

(P. GE.)

VEGETABLE PARASITISM.

The name of parasites has been given to those plants which are nourished wholly or partially at the expense of other living organisms. The degree and nature of the benefit thus obtained varies greatly with different plants, and the effect produced upon the host ranges from an almost imperceptible one to complete destruction. At one extreme are certain forms which, while drawing the nourishment necessary for life from their hosts, yet do so in such fashion that both organisms continue to live in intimate association, and, it may be, rendering mutual help. From these by a series of gradations we come to parasites of such destructive influence as to cause widespread death to certain animal and vegetable forms of life. This physiological group is closely related to another, the saprophytes, which obtain their nourishment from the dead remains of organisms. True parasites belong exclusively to the dicotyledonous flowering plants and the fungi. A few algæ are partial parasites.

The remarkable appearance presented by most parasitic flowering plants undoubtedly attracted notice in remote times. They are frequently mentioned by early writers, but there is no evidence sufficient to enable us to determine whether they were regarded as independent plants or merely as pathological excrescences—unless in the one case of the mistletoe, which was recognized as the former by Pliny, who gives an account of its reproduction by seed. The effects of the attack of parasitic fungi were also observed in very early times, as there is abundant evidence to show, but the plants themselves which caused the damage were necessarily not detected as such from their minute size and obscure nature. We must come to the middle of the 18th century for the first attempt to establish a botanical group of flowering parasites. Pfeiffer, in his treatise on the *Fungus melitensis* (*Cynomorium coccineum*), divides all flowering parasites into three groups, according as they infested the whole plant or attacked but one place or were confined to the root; but he includes many epiphytes, such as ivy, lichens, &c. After this remarkable classification a knowledge of native and exotic forms grew up, and nothing noteworthy occurred in the history of the subject until the end of last century and beginning of the present one, when there was a relapse to the old theory that parasites were no more than degenerate outgrowths from their hosts. For example, Meyen attempted to account on anatomical grounds for the existence of *Lathræa squamaria* on its host, and more absurdly still, Trattinick, in a letter to Schlechtendal, gave a short list of plants to which parasites bear a very superficial resemblance, and gravely affirmed his belief that the latter are but specific degenerations of these. Thus he contended that *Balanophora* is but an *Arum*, *Cytinus* a *Cotyledon*, *Rafflesia* a cabbage, &c. De Candolle made the first genuine attempt in 1832 to establish a classification of parasites on morphological and physiological grounds; Unger followed in 1840 with a purely morphological arrangement, and, though he advanced matters considerably, his treatise contains much speculation not borne out by facts. Martius's classification of about the same time is on much the same lines as De Candolle's. The knowledge of parasitic fungi has advanced gradually with the improvement of the microscope, and the accumulation of the life-histories of forms has grown up under the hands of numerous observers, among the earliest of whom Knight performed admirable service. With increasing knowledge of native and exotic forms, and the advance

made in the fields of vegetable anatomy and physiology, the whole group of vegetable parasites has become more strictly defined,—the last noteworthy service being the establishment by De Bary (*Morph. u. Physiol. der Pilze, Flechten u. Myxomyceten*) of the physiological group of "saprophytes" to receive those plants which differ from the parasites in obtaining their nourishment from the dead bodies of organisms and from soil rich in humus.¹

PHANEROGAMIA.—The parasitic flowering plants are exclusively dicotyledons confined to natural orders falling under the two divisions of *Gamopetalæ* and *Monochlamydeæ*. Among the *Gamopetalæ* there are the (*Monotropæ*?) *Lennoaceæ*, *Cuscutæ* (*Convolvulaceæ*), certain genera of *Scrophulariaceæ* (such as *Rhinanthus*, *Melampyrum*, *Euphrasia*, and *Pedicularis*), and the *Orobanchææ*. Among the *Monochlamydeæ* there are the *Cytinaceæ*, *Cassytha* (*Lawrinææ*), *Loranthaceæ*, *Santalaceæ*, and *Balanophoraceæ*. The vegetative bodies of these exhibit various degrees of degradation, and this process may go so far that, excepting the parts concerned in reproduction, not only the external appearance but the whole structure of the tissues characteristic of a vascular plant may be lost to the parasite. The roots in particular undergo considerable change of form and structure in adaptation to their peculiar function, and the typical root of a vascular plant may lose all its characteristics, retaining only its physiological properties. A degraded root or part of a root so adapted is termed a *haustorium*, and the mistletoe, dodder, *Thesium*, *Balanophora*, and *Rafflesia* exhibit such in various degrees of removal from the true type.²

The arrangement of the orders as follows is that adopted in systematic botany. Their physiological relations will be afterwards indicated.

The *Monotropææ*, which are allied to the heaths, possess no chlorophyll and only small scale-like leaves. *Monotropa*, which may be taken as a type of the group, undoubtedly subsists as a saprophyte on organic matter derived from the soil. There has been some controversy as to the parasitism of these plants. Perhaps the strongest evidence in its favour was offered by Drude, who stated that he found a parasitic connexion between *Monotropa* and the roots of *Abies excelsa*. *Monotropa* was then generally regarded as both parasite and saprophyte. More recently, however, Kamienski has denied the accuracy of Drude's interpretation of the case, and, affirming that *Monotropa* possesses no haustoria, upholds the view that it is no true parasite. Upon the evidence it may be taken that no case has yet been satisfactorily made out for the parasitism of this group. The suborder consists of ten or twelve species included in nine genera occurring in north temperate regions. *Monotropa Hypopitys*, L., is distributed through Europe var. *glabra*, Roth, mostly among deciduous trees; and var. *hirsuta*, Roth, commonly among conifers.³

The *Lennoaceæ* are a very small order confined to Mexico and California. They are succulent herbs with simple or slightly branched stems bearing small scale-like leaves, and resemble in general habit the *Monotropææ*, to which they are allied. They possess no chlorophyll, and are probably always parasitic.⁴

The *Cuscutaceæ* (Dodders) are a suborder of *Convolvulaceæ*, and are distinguished by their fibrous, climbing stems bearing very small scale-like leaves. They are entirely without chlorophyll, and are true parasites. The group consists of annual plants reproducing each year from their seed, which commonly ripens about the same time as that of the host plants. The seeds of host and parasite are frequently found mixed, and it consequently happens that they are sown together. When the seed of the dodder germinates it

pushes up its stem, which meeting with the stem of the host plant develops a papilla-like body at the point of contact. From the papilla there proceeds the true haustorium, which penetrates the tissues of the host as far as the vascular system, where it expands slightly and terminates in a broad surface. The haustorium is furnished with a central vascular bundle originating in the vascular system of the dodder stem. When this haustorium has been developed the root of the dodder dies off and all connexion with the soil ceases, while the stem above the haustorium continues to wind round its host, producing fresh haustoria at short intervals, and gradually enveloping and destroying the plant. The influences exerted are of two kinds:—(1) a truly parasitic influence, since the dodder, possessing neither connexion with the soil nor chlorophyll, obtains all its nourishment from its host by the action of its haustoria; and (2) a mechanical influence, in depriving its host of air, light, &c., and preventing the development of branches, leaves, &c. (see fig. 2). The commonest species are *Cuscuta Epithymum*, Murr., distributed throughout Europe, growing on *Thymus Serpyllum*, *Calluna vulgaris*, *Genista*, &c.; var. *trifolii* on clover, to which crop it is enormously destructive; *C. europæa*, L., occurring throughout Europe on hops, vines, &c., and *C. Epilinum*, Weihe, commonly found throughout Europe growing on flax.¹

There are at least five genera of *Scrophulariaceæ* which are partially parasitic, viz., *Rhinanthus*, *Melampyrum*, *Pedicularis*, *Euphrasia*, and *Striga*. They all contain chlorophyll, and possess true roots on which small haustoria are developed. *Euphrasia*, occurring in both north and south temperate regions, is partially parasitic on roots of grasses. *Pedicularis* is common in alpine and Arctic regions of the northern hemisphere, *Melampyrum* and

FIG. 2.—*Cuscuta glomerata*, Cholisy. A, Parasite entwining host; B, section through union between parasite and host; c, stem of host; d, stem of *Cuscuta*; h, haustoria. After Dodel-Port.

Rhinanthus in the north temperate zone, and *Striga* is a native of Asia, Africa, and Australia. The last possesses perhaps more distinctly parasitic habits than the others—though the cultivation experiments of Decaisne, Cornu, and others tend to show that parasitism is necessary in the cases of *Melampyrum*, *Rhinanthus*, and *Euphrasia*.²

The *Orobanchææ* (Broomrapes) possess erect, simple or little-branched stems bearing numerous scale-like leaves, and are variously coloured, but destitute of chlorophyll. They are parasitic on the roots of many different herbs and shrubs by means of their haustoria, which penetrate to the vascular system of the host. They attach themselves thus immediately after germination. There are about one hundred and fifty so-called species of *Orobanchææ*, of which the following are perhaps best known:—*Orobanchæ rubens*, Wallr., parasitic on and very destructive to lucerne; *O. minor*, Sutt., on red clover; *O. major*, L., which attains a height of 2 feet on roots of furze and other leguminous plants; and *O. Rapum*, Thuill. *Phelipæa ramosa*, May., attacks particularly hemp and tobacco. *Lathræa*, which according to Solms Laubach belongs to *Scrophulariaceæ*, is parasitic on the roots of trees such as hazels.³

The *Cytinaceæ* are a very remarkable order of truly parasitic plants which are wholly destitute of chlorophyll, and of a very degraded structure. *Cytinus* possesses a scaly stem bearing sessile flowers, while *Rafflesia* and *Brugmansia* consists one may say of a single flower, measuring in the case of *Rafflesia* as much as 3 feet across. These flowers appear first in the form of knobs emerging from the host plant, and before expanding resemble an unopened cabbage. They remain expanded only for a few days, when putrefaction begins and a smell as of putrescent flesh is emitted, serving thus to attract insects which probably aid in effecting fertilization, since the stamens are in different flowers. There are about twenty-four species in the order, and these are mostly tropical. *Cytinus Hypocistis*, L., which is parasitic on the roots of *Cissus*, occurs in southern Europe. *Rafflesia* and *Brugmansia* are limited to the Malay Islands, and *Sapria* has a wider distribution throughout the same region. *Rafflesia* is parasitic on both roots and stems, the latter generally prostrate. *Pilosyles*, a native of America and Africa, and *Apodanthes*, confined to America, are parasitic on branches. *Hydnora*, found in tropical and south Africa, grows on succulent plants, chiefly *Euphorbiaceæ*, and closely allied to it is *Prosopanche*, an American genus.⁴

The genus *Cassytha* (*Laurineæ*), of which there are about fifteen species occurring in the tropics, but mostly in Australia, strongly resembles *Cuscuta*. The plants are exceedingly alike in appearance and in parasitic habit, for which reason the name of "dodder laurels" has been given to the *Cassythæ*. They are wholly without chlorophyll, and their thin, twining, cylindrical stems, bearing scaly leaves, envelop their hosts, to which they are attached by means of papilla-like haustoria. The seeds germinate in the soil, and the roots subsequently die off as in *Cuscuta*.⁵

The *Loranthaceæ* are parasitic on the stems and branches of trees, but, since they bear mostly thick and leathery leaves containing chlorophyll, their parasitism cannot be considered so complete as in those cases where chlorophyll is absent. The order is for the most part a tropical one, but it is represented in Europe by *Loranthus europæus*, L., and *Viscum album*, L., the common mistletoe. *Loranthus* is a large tropical genus containing upwards of three hundred species. *Arceuthobium* occurs in southern Europe. The mode of parasitism of *Viscum album*, L., the mistletoe, may be taken as illustrative of the order. Its seeds adhere to the young shoots of trees by means of the viscid pulp of the fruit (used in the preparation of bird-lime). On germination it shoots out rootlets which traverse the cortex of the host mostly in the direction of the axis, sending down numerous haustoria into the wood, where the cells of the parasite become partly lignified, and thus attain an intimate connexion with the wood-cells of the host. A layer of meristem is formed in the haustorium where it passes through the cambium region of the host stem, thus enabling the parasite to keep pace with the growth in thickness, and gradually to become more deeply fixed. The function of the growing point, which soon passes over into permanent tissue, is thus transferred to this region of the haustorium. Ultimately this layer of meristem is also transformed into permanent tissue, and the activity of the parasite in this direction ceases. The haustoria are commonly situated close together in considerable numbers, and an excessive demand upon the host is thus brought about, causing local death and a hurtful influence throughout the plant, exhibited in its defective development. Where a tree has been attacked by mistletoe a corroded and distorted appearance is presented, owing to the drying up of the tissues and the reparative processes that ensue. When the mistletoe has thus exhausted one region of supply it frequently sends out adventitious shoots, which, attacking the host in fresh places, give rise to new growths of the parasite. The mistletoe grows on a large number of different trees, such as the apple, lime, elm, maple, willow, thorn, poplar, and even on conifers. Though exceedingly plentiful on the apple, it rarely attacks the pear tree, and the Lombardy poplar seems to be exempt, while other poplars suffer considerably. Very rarely does it attack the oak, and Dr Bull, who made exhaustive inquiry (*Journ. Bot.*, vol. ii, into the matter, succeeded in discovering only seven authentic cases in

England. *Loranthus europæus*, L., occurs on the oak in southern Europe.¹

The *Santalaceæ* are mostly if not all partially parasitic shrubs or herbs—their foliage containing chlorophyll. *Santalum* (*S. album* yields sandal wood), distributed throughout the East Indies, Malay Islands, and Australia, and *Thesium*, a native of Europe, are parasites on the roots of plants, especially monocotyledons. Their haustoria are more or less globular in shape, and emit from the surface in contact with the host a process which penetrates the tissues. *Osyris* also attacks the roots of trees. *Henslowia* and *Myzodendron* are partially parasitic on the branches of trees. The latter, a native of south temperate climates, attaches itself to its host by means of the feathered processes on its seeds. These retain them in contact with the branches on which they fall until germination (thus performing the same function as the viscid pulp of the mistletoe), when the haustoria penetrate the bark and become, as it were, grafted into the living tissues.²

The *Balanophoraceæ* are flowering plants of degraded structure, destitute of chlorophyll, and generally coloured red, yellow, or brown. In appearance they somewhat resemble *Cytinaceæ*, though there is no real affinity in the case. The stems are succulent, somewhat knob-shaped or cylindrical, varying in height from a few inches to a foot, in which latter case they are sometimes branched, and bear imbricated scales in place of leaves. They are true parasites on the roots of woody Dicotyledons, rarely on Monocotyledons. The haustoria vegetate in the tissues, frequently setting up extensive hypertrophy. They occur chiefly in mountainous tropical regions—some in Australia and the Cape. The order contains thirty-five species in fourteen genera, of which *Balanophora*, *Cynomorium*, and *Langsdorffia* are the best known. *Cynomorium coccineum*—the *Fungus meitensis* of old writers—is found in Malta, the Levant, North Africa, and the Canary Islands.³

ALGÆ.—Several microscopic algæ may very well be partial parasites, though it is probable that in most cases they are little more than epiphytes in their relation to the plants in which they occur. They all possess chlorophyll and are able to assimilate; but from their situation in the tissues of other plants a degree of parasitism may be inferred. A species of *Nostoc* occurs in the intercellular spaces of the roots, leaves, and thalli of other plants; and *Chlorochytrium* is found in the tissues of *Lemna*, *Ceratophyllum*, and in another alga *Schizonema*. More distinctly parasitic is the case of *Phyllosiphon Arisari*, Kühn, which inhabits the parenchymatous tissue of *Arum Arisarum*.⁴

LICHENES.—*Mycordea parasitica*, Cunn., was described and figured by Cunningham as a parasitic green alga. It, or a closely allied form, has been recently examined by Ward, who says, "It seems clear that the injury is not due to a direct parasitic action of the thallus; even in the extreme case of *Citrus* I do not imagine the active development to depend so much on absorption of food from the living leaf as on the sheltered situation enjoyed by the ensconced thallus."⁵

FUNGI.—The absence of chlorophyll from all fungi, and the necessity thus thrown upon them of taking up the carbon compounds assimilated by other organisms, determines their mode of life, which is therefore either parasitic or saprophytic. The parasitic organ of the fungal thallus

is the *mycelium*, upon which haustoria are sometimes developed in the form of lateral protuberances of various shapes and sizes. In the same species of parasitic fungus receptacles frequently occur of different kinds, succeeding each other more or less regularly in cycles, and sometimes in their course preying upon hosts of remote affinities among themselves. This course of life is of practical importance when effort is made to limit the ravages of such a parasite (see MILDEW, vol. xvi. p. 293). Many indiscriminately attack plants nearly allied to each other; numerous species are peculiar to one host; while others are confined to a single region such as the ovary, the stem, or the leaf of one or more species of the higher plants. The spores, invariably of microscopical dimensions, represent the infectious agent, as the seeds of flowering parasites commonly do. They are conveyed by the atmosphere, by contact of one plant with another, by insects and other animals, &c., and germinate by the emission of a germ-tube, the production of zoospores sometimes intervening. Access to the host is obtained by the penetration of the epidermal tissue or by way of the open stomata. The main body of the fungus is either endophytic or epiphytic—the spore-producing portion in nearly all cases opening externally. The amount of damage effected by the attack varies from slight local injury to the destruction of the host; in some cases cell-contents only are destroyed, while in others whole tissues perish. The effect produced is often in the direction of abnormal stimulus, and the hypertrophy of whole regions or the production of galls ensues. The parasite commonly prepares the way for the saprophyte, which steps in to break up the dead and decaying remains. In certain rare instances the union of parasitic and saprophytic modes of life in the same species has been observed (see below). The fungi which are concerned in the constitution of lichens maintain with the algal components throughout life relations of consortium which will be dealt with below, under "Symbiosis."⁶

For the life-histories of the following groups the student is referred to the article FUNGUS (vol. ix. p. 827), and to the literature therein cited.

Saprolegniæ.—The fungi of this suborder are many of them saprophytes, as their name implies, but some are of distinctly parasitic habits. Certain species of *Pythium* are parasitic on fresh-water algæ, on the prothallia of vascular cryptogams, and in the tissues of the higher plants. Several species of *Saprolegnia* are parasitic on similar hosts, but one in particular, *S. ferax*, Gruith, is well known for the part it plays in the disease of fishes in fresh water—commonly called the salmon disease. That this fungus possesses both parasitic and saprophytic modes of life is established, and the fact is one of remarkable importance, since it stands almost by itself in this respect among the higher fungi.⁷

The *Peronosporæ* are all parasites on vascular plants of many different orders. The mycelium inhabits the tissues of the host, and, in many of the species, while passing through the intercellular passages, sends globular or irregularly branching filamentous haustoria (see fig. 3) into the adjoining cells. On the other hand the mycelial filaments of certain species, such as *Phytophthora infestans*, De Bary, the potato disease, possess no true haustoria, but they penetrate the cells, breaking down the cell-walls in their course. In the regions where the oospores of *Peronosporæ* are formed hypertrophy of the tissues of the host sometimes occurs, and the normal functions being checked, the parts in question die off. The *Peronosporæ* are enormously destructive to the higher plants, and may be reckoned among the most dangerous enemies of agriculture and horticulture. Besides the potato disease, *Cystopus candidus*

Nat., ser. 7., vol. xvi.; Hesse, *Pythium de Baryanum*, &c., Halle, 1874; Sadebeck, "Untersuch. über *Pythium Equiseti*," in Cohn's Beitr. zur Biol. d. Pflanzen, i.; T. H. Huxley and G. Murray, "On Salmon Disease," in Inspector of Fisheries Reports for 1881, 1882, 1883; Marshall Ward, "Observations on the Genus *Pythium*," in Quadri. Journ. Microscop. Sci., vol. xxiii., new ser.

and *Peronospora parasitica*, both occurring plentifully on *Cruciferae*, may be mentioned as typical of the group.¹

The *Chytridiceæ* are a small suborder of parasitic fungi inhabiting rarely the epidermal tissue of higher plants, but commonly attacking fresh-water algae and sometimes *Infusoria*. Many of these exceedingly simple plants consist merely of a sporangial cell maintained in position and nourishment by a haustorium which penetrates the host cell. The affinities of the group are somewhat uncertain, but probably they are correctly placed among *Zygomycetes*.²

The *Uredineæ* are endophytic parasites on vascular plants producing the disease popularly called *rust*. These fungi occur on very various plants, and in their life-history go through a cycle of generations on at least in many cases two different hosts. Corn-mildew is the best known of them, and may be taken as typical of the rest (see *MILDEW*, vol. xvi. p. 293; and for figures, see *FUNGUS*, vol. ix.). This suborder, like the *Peronosporæ*, is exceedingly destructive to cultivated and other plants. The *Rustelia* of the pear tree (which alternates with the *Podisma* of junipers) and the *Puccinia* of *Malvaceæ* may be mentioned as familiar examples of the group. The coffee-leaf disease, *Hemileia vastatrix*, is considered by Ward to be allied to this group.³

The *Ustilaginæ* are all parasites of a very destructive nature on the stems, leaves, ovaries, &c., of the higher plants. The mycelial filaments inhabit the tissues of the host, where hypertrophy is

FIG. 3.—*Peronospora parasitica*, De By. A. Conidiophore with conidia. B. Mycelium with haustoria (h).

frequently set up, and the enlarged space thus obtained is used by the fungus to contain the masses of spores formed by the breaking up of the hyphæ. Their whole life-history is carried out in the same host. Though attacking grain crops particularly, many species infest other plants. *Ustilago Carbo*, Tul., is perhaps the commonest, and is exceedingly destructive to a considerable number of grasses.⁴

The *Entomophthoræ* are a very small group attacking insects. The mycelium ramifies densely in the body of the insect and breaks out through the skin where spores are produced singly on basidia. Within the body resting spores are formed by means of which the fungus hibernates. *Empusa Muscæ* is very common on the ordinary house fly.⁵

Halle*, 1871; and "Ueber Entomophthoraceen," &c., in *Sitzungsber. d. Gesellsch. Naturforsch. Freunde, Berlin*, 1877.

The *Hymenomyces* is the only suborder of *Basidiomycetes* certainly known to include parasitic members, and these relatively few in number. *Agaricus melleus*, Vahl, by means of its subterranean mycelium (*Rhizomorpha subterranea* of older authors), is exceedingly destructive to the roots of many trees and woody plants. Other *Agaricini*, such as *Nyctalis parasitica*, attack members of the same group as themselves, but by far the greater number are saprophytes. *Trametes radiciperda*, R. Hart., and *T. pini*, Fr., *Polyporus fulvus*, Scop., *P. vaporarius*, Fr., *P. mollis*, Fr., and *P. borealis*, Fr., all attack *Coniferae* especially, while *P. sulphureus*, Fr., *P. igniarius*, Fr., and *P. dryadecus*, Fr., are parasitic on oaks, poplars, beeches, willows, and other dicotyledonous trees. *Thelephora*, *Stereum*, and *Hydnum* also include species parasitic on trees.⁶

The *Discomycetes*, like the last group, are mostly saprophytes, but a few distinctly parasitic members are to be found in it. *Ascomyces*, *Gymnoascus*, and *Eoascus* (*E. Pruni*, Fuckel, and *E. deformans*, Fuckel) are parasitic, the last named upon plum, peach, and cherry trees. Several species of *Peziza*, as *P. calycina*, Schum., on the larch, and a number of those belonging to the section of *Pseudopeziza* attack the higher plants. It is highly probable that many *Sclerotia*, numbers of them parasitic, the positions of which are not definitely known, will be found to belong to such discomycetous forms as *Peziza*. *Peziza sclerotoides*, Lib., is said to remain living as a saprophyte after the death of its host. *Rhytisma* is a very common disease of leaves, such as those of *Acer*, in which it produces large darkly discoloured patches.⁷

Pycnomycetes.—Of this group the *Erysiphæ* are perhaps the most destructive as parasites. They exhibit in their life-history a cycle of generations each of considerable parasitic activity. The main body of the fungus is commonly epiphytic, the mycelium sending down haustoria through the epidermis of the host (see fig. 4). Of the perithecial form of fructification good examples are *Sphaerotheca Castagnei*, Lev., the hop mildew (see *MILDEW*, vol. xvi. p. 294), *Phyllactinia*, *Uncinula*, *Calocladia*, and *Erysiphe* (*E. graminis*, Lev., *E. Linkii*, Lev., *E. Martii*, Lev., and *E. lamprocarpa*, Link.). The oidium forms are also conspicuous as parasites, a familiar example being found in *E. Tuckeri*, Berk., the vine-mildew (see *MILDEW*, as above). *Claviceps purpurea*, Tul., the ergot of grasses (see *ERGOT*, vol. viii. p. 251), is the best known and most important of all pycnomycetous parasites. The group includes a multitude of minor parasites,—some of them, however, doubtfully so—belonging to such genera as *Stigmataea*, *Sphaerella*, *Fusisporium*, *Ramularia*, *Fumago*, *Polystigma*, *Pleospora*, *Nectria*, &c. *Nectria ditissima*, Tul., is reputed to be the cause of canker in certain trees. *Cordyceps* is well known as a disease of insects.⁸

FIG. 4.—*Erysiphe Tuckeri*, Berk. A and B, mycelium (m), with haustoria (h). After De Bary.

NATURE OF VEGETABLE PARASITISM.—It has been seen that the dependence of parasites upon their hosts for the means of subsistence varies considerably in degree, but it is equally manifest that underlying this condition of existence there are certain facts which characterize every case. The most important of these is the absence or the inadequate supply of chlorophyll and the

⁶ R. Hartig, *Wichtige Krankheiten der Waldbäume*, Berlin, 1874; Brefeld, *Botanische Untersuch. über d. Schimmelpilze*, III.; and compare also De Bary in *Morph. u. Physiol. der Pilze*, p. 22.

consequent loss or deficiency of the power of assimilation. For a comparison of this abnormal condition with the normal state a subject is found ready to hand in the nourishment of one organ by another, as exemplified in the growth of young seedlings, which in the case of seeds containing endosperm (cocoa-nut, date-palm, and many other monocotyledons) absorb by means of a definite organ the nourishment necessary for their development. Young plants nourished from the reserve-materials stored in bulbs and the like, and the young shoots of a tree from winter buds, afford a comparison which is even closer in an anatomical respect, since in this case there is present, as in the intimate association of parasitic haustoria with the host, a continuity of tissues which is not so strongly marked in the union of the absorbing organ of a seedling with the endosperm. Looking at the subject wholly from the point of view of the process of nutrition, there seems to be little essential difference between parasite and saprophyte, since we have not only experimental instances of the nutrition of parasites on artificially prepared solutions, but the natural union of both habits in the same individual (salmon-disease, &c.; see also the experiments of Grawitz on the growth of saprophytic fungi in the blood of animals). These are exceptional instances, however, and it is manifest that other properties must be brought into play, since most parasites affect peculiar hosts, and many of them certain regions only of the plant. It is equally true that many saprophytes are able to grow only in peculiar substrata.

That parasitism is often but partial is apparent from such instances as the mistletoe, *Rhinanthus*, *Thesium*, &c., which probably obtain from their hosts in the main only water and mineral substances in solution, to be prepared for plant food in their green leaves. It is most likely, however, that a small quantity of certain organic compounds is a necessary accompaniment in all such instances. Here again there exist the means for comparison with green saprophytes. The taking up of ash constituents from the soil may occur in such parasites as *Orobanche*, which possesses rootlets, though undoubtedly the whole of the necessary carbon compounds are obtained from the host.

This mode of life not only acts upon the host, but reacts upon the parasite itself, as is manifested by the aberrant and degraded structure of the parts (directly and indirectly) concerned in nutrition, and even of the reproductive system. This is strongly marked in the case of the embryo. It is apparent that large transpiratory surfaces are unnecessary, and would even be of detriment to a parasite; and with this the formation of wood so intimately connected with the process of transpiration keeps pace in degradation. In the mistletoe, for example, the bulk of wood is in relation to the small transpiratory surface, and in the cases of parasites without chlorophyll it dwindles to insignificance. No other abnormal mode of life so influences the structure of a plant as a parasitic or a saprophytic one, though we see an approach to it in the adaptations existing in insectivorous plants.

The effect upon the host ranges from local injury to destruction on the one hand, and, on the other, in the case of stimulus, from the local production of galls to the complete hypertrophy and transformation of at least large regions of a plant. The exciting of definite reparative processes is an indirect effect. It must be noticed also that many parasites, especially fungi, cause in the host enormous destruction of food material far exceeding that necessary to their maintenance. In this way the parasite frequently commits suicide as it were, and the act is in striking contrast to the relations of symbiosis as exemplified in the lichen thallus.

The change of or alternation between two different hosts is adapted to suit the requirements of the parasite. This is notably so in the case of the corn-mildew, which passes an intermediate stage on the barberry until a period when the wheat plant has sufficiently developed to become a suitable host.

Most fungi are endophytic, and certain phanerogamic parasites, such as *Rajflesia*, develop within the cortex of the host, while on the other hand the fungal part of a lichen encloses the algal.

The existence and complete dependence upon its host of a parasite culminating in the production of seed after its kind is one of the most impressive relationships physiology presents.¹

SYMBIOSIS.—This, the consortism of organisms in such fashion that mutual services are rendered sufficient to make the alliance profitable and successful to the whole community of organisms, is a mode of life closely related to parasitism, in which, however, as has been seen, the profit is one-sided and the alliance ends with the exhaustion of the host or the detachment of the parasite. The term was first employed by De Bary (*Die Erscheinung der Symbiose*, 1879), but the relations expressed by it were first brought into general notice by the epoch-marking discovery of the dual nature of the lichen thallus by Schwendener in 1868, and established after prolonged and searching controversy, more especially by the classical histological researches of Bornet, and the actual artificial lichen synthesis (by sowing fungus on alga) by Stahl. Some theory of reciprocal accommodation was necessary to account for the duration of such relations between a fungal organism and an alga; and, though it is not yet precisely known in what way these relations are maintained, speculation has been active enough. It may safely be inferred that the fungal portion of the thallus is nourished by the exosmose of starch and the like in much the same fashion as the colourless cells of a plant are fed by those bearing chlorophyll; and there can be little doubt that the algal cells benefit in return by the endosmose of the waste products of the fungal protoplasm. In the reproductive process an adaptation exists in certain lichens for the supply of gonidia to the new lichen. Hymenial-gonidia (the offspring of the thallus-gonidia) are present in the apothecia, from which they are cast out along with the spores, and falling with them are subsequently enclosed by the germ tubes (see FUNGUS, vol. ix. p. 835). It may be noted here that, though the fungal portions of the thallus retain the marks of near relationship to ascomycetous fungi, they are yet considerably modified by this mode of life, and unfitted most probably in nearly every case for the distinctly parasitic or saprophytic life normal to fungi. The algal portion, on the other hand, is capable of independent existence after liberation from the fungal thallus. The complete symbiotic community represents an autonomous whole, living frequently in situations where neither alga nor fungus is known to support existence separately.²

The presence of chlorophyll in animals (*Hydra* and *Portia*) was discovered by Max Schultz in 1851, and confirmed more recently (*Hydra* and *Spongilla*) by the spectroscopic evidence furnished by Lankester and by Sorby. That a chlorophyll-bearing animal is able to

vegetate by means of its own intrinsic chlorophyll was finally established in 1878 by the experiments of Geddes on *Convoluta Schultzei*, Schm. He found that the analysis of the gas given off by these green animals, under the influence of direct sunlight, "yielded from 45 to 55 per cent. of oxygen." The discovery of these vegetating animals directed fresh attention to chlorophyll-bearing animals, with much result. The nature and functions of the yellow cells of radiolarians had long been an unsolved enigma. Haeckel had detected in them in 1870 the presence of starch, and regarded them as stores of reserve material. Cienkowski, in the following year, contended for their algal nature without finally deciding the question, and without perceiving the significance such organisms would have in the economy of the radiolarian. Much suggestive observation followed by the Hertwigs, Brandt, Entz, Korotneff, Lankester, Moseley, and others on similar bodies in various organisms; but the subject remained in uncertainty till its reinvestigation by Brandt, and simultaneously and much more conclusively by Geddes, finally supplied the solution of the difficulties. After confirming Haeckel's discovery of the presence of starch, and the observations of Cienkowski, Brandt, and others on the survival of the yellow cells after the death of the radiolarian, and extending his observation to various other organisms, Geddes demonstrated the truly algal nature of these cells from their cellulose walls, the identity of their yellow colouring-matter with that of diatoms, and the evolution of oxygen (in some instances, such as *Anthea Cereas*, very copiously) under the influence of sunlight. It was pointed out that the animal protoplasm investing these starch-producing cells (and containing amylolytic ferment) must obtain by osmosis its share of the dissolved starch, and that benefit must accrue to the animal from the digestion of the dead bodies of the algæ. The evolution of oxygen during sunshine into the surrounding animal protoplasm is a respiratory function fittingly compared to that performed by certain stationary deposits of hæmoglobin. On the other hand the carbonic acid and nitrogenous waste produced by the animal cell is the nutritive return made to the alga, which in removing them performs an intracellular renal function. The young gonophores of *Velella*, after budding off from the parent, start in life with a provision of algæ, and in this respect bear interesting resemblance to the function performed by the hymenial-gonidia of lichens described above. The physiological relations are summed up as follows:—"Thus, then, for a vegetable cell no more ideal existence can be imagined than that within the body of an animal-cell of sufficient active vitality to manure it with abundance of carbonic anhydride and nitrogenous waste, yet of sufficient transparency to allow the free entrance of the necessary light. And, conversely, for an animal cell there can be no more ideal existence than to contain a sufficient number of vegetable cells, constantly removing its waste products, supplying it with oxygen and starch, and being digestible after death." The completeness of the case thus established for a symbiotic mode of life marks one of the most interesting and impressive chapters in the history of the biological relations between animals and plants.

A re-discussion of the subject, largely historical and controversial, but with excellent bibliography, has been lately furnished by Brandt, and more recently a further contribution has been made by Oscar Hertwig, who repeats the views of preceding investigators and goes on to speculate as to the nature of symbiosis and its general relations with other modes of life.¹ (G. MU)

PARASITISM IN MEDICINE.

Only a limited number of the parasitic diseases of man are included in the present article. Under TAPEWORM will be found all that medically relates to that important parasitic group, and under SCHIZOMYCETES will be discussed the significance of the parasitic micro-organisms (*Bacterium*, *Bacillus*, *Spirillum*, *Vibrio*, &c.) in morbid processes, and particularly in the infective diseases. There fall to be considered here (1) the skin-diseases due to filamentous fungi, (2) a peculiar disease called "actinomycosis," primarily affecting cattle, (3) the itch, and (4) certain diseases caused by various species of nematodes, and one disease caused by a trematode.

1. Skin Diseases due to Parasitic Fungi.

Favus ("honeycomb") is a common disease of the scalp (more rarely of the hairless parts of the skin) in children, primarily of scrofulous or ill-cared-for children, but apt to spread to others, especially in schools. The uncomplicated appearance is that of a number of yellowish circular cup-shaped crusts, grouped in patches like a piece of honeycomb, each about the size of a split pea, with a hair projecting in the centre. This was the first disease in which a fungus was discovered—by Schönlein in 1839; the discovery was published in a brief note of twenty lines in *Müller's Archiv* for that year (p. 82), the fungus having been subsequently named by Remak *Achorion Schönleinii* after its discoverer. The achorion consists of slender mycelial threads matted together, bearing oval nucleated gonidia either free or jointed. The spores would appear to enter through the unbroken cutaneous surface, and to germinate mostly in and around the hair-follicle and sometimes in the shaft of the hair. Favus is commonest among the poorer Jews of Russia, Poland, Hungary, Galicia, and the East, and among the same class of Mohammedans in Turkey, Asia Minor, Syria, Persia, Egypt, Algiers, &c. It is not rare in the southern departments of France, in some parts of Italy, and in Scotland.

The treatment of favus is difficult and disappointing. The first requisite is good feeding; meanwhile the crusts are to be removed by poulticing, the hair being cut short. The next thing is to destroy the fungus, to which end a lotion of sulphurous acid (one part to three or four of water) may be applied repeatedly by means of lint, and the scalp kept covered by an oil-silk cap. To prevent the return of the fungus, various agents may be rubbed in, such as cod-liver oil, oil of cade, or an ointment of iodine or of pitch, the oil-silk cap being worn continuously. It has often been found of advantage to pull out all the broken stumps of hairs with a tweezers (see Bennett's *Prin. and Pract. of Med.*, 5th ed., Edin., 1868, p. 847).

Ringworm, or *Tinea Tonsurans*, a much more common disease of the scalp (especially within the tropics), consists of bald patches, usually round, and varying in diameter from half an inch up to several inches, the surface showing the broken stumps of hairs and a fine whitish powdering of desquamated epidermic scales. In scrofulous subjects matter is sometimes produced, which forms crusts or glues the hairs together or otherwise obscures the characteristic appearance. The disease is due to a fungus, *Trichophyton tonsurans*, which exists mostly in the form of innumerable spores (with hardly any mycelium), and is most abundant within the substance of the hairs, especially at their roots. If a piece of the hair near the root be soaked for a time in dilute liquor potassæ and pressed flat under a cover-glass, the microscope will show it to be occupied by long rows of minute oval spores, very uniform in size, and each bearing a nucleus. The treatment of ringworm is very much the same as the treatment of favus.

The same fungus sometimes attacks the hairs of the beard, producing a disease called "aycosis." Sometimes it invades the hairless regions of skin, forming "tinea circinata," circular patches of skin disease, if they be sharply defined by a margin of papules or vesicles, may be suspected of depending on the tinea-fungus. Interesting varieties of tinea are found in some of the Pacific and East Indian Islands.

A less serious condition of the skin due to a fungus is *Pityriasis*

versicolor, consisting of patches of brownish discolorations of various sizes and shapes, mostly on the front of the body, and often attended with itching, especially after heating exercise. The pigmentation seems to radiate from the orifices of hair-follicles. The epidermis is in a scaly condition over the patch, and among the debris of the epidermic cell there may be seen minute oval spores, which are supposed to belong to a fungus, the *Microsporon Furfur*. The disease is mostly one of adult age, found all over the world, and not associated in any special way with poor general health. The treatment consists of rubbing in an ointment of sulphuret of potassium, or one of the mercurial ointments, or using sulphur-soap habitually.

The remarkable brown, black, and blue spots of discoloration of the whole body met with endemically in Mexico, Panama, New Granada, and Venezuela, and known under the name of "pinto" or "mal de los pintos," have been claimed by Gastambide (*Presse Med. Belge*, 1881, Nos. 33-41) as due to the presence of a fungus, whose spores and even mycelial filaments may be detected among the deeper rows of cells of the rete mucosum. The disease, which is somewhat serious from its large superficial area, would appear to be one of the many forms of *morbus miserix*; but it is contagious, and is sometimes seen in the well-to-do. In some villages of the western districts of Tabasco (Mexico), it has been estimated that 9 per cent. of the inhabitants suffer from the pinto; McClellan says that in 1826 in the city of Mexico he saw a whole regiment of "pintados."

Before leaving the parasitic fungi of the skin, it should be mentioned that *Oidium albicans* is apt to plant itself on the mucous membrane of the mouth in young and ailing children, causing whitish patches known as thrush.

2. Actinomycosis.

If certain tumour-like formations of cattle, usually growing from the alveoli of the lower molar teeth, and protruding externally near the angle of the jaw, Bollinger in 1877 detected the presence of a number of sulphur-yellow bodies about the size of a hemp seed and of a fatty consistence. These were found to be aggregates of a peculiar radiate fungus (*Actinomyces*), which assumed the form of minute rosettes, the mycelial filaments expanding into flask-like swellings at their free or circumferential ends. The yellow seed-like conglomerates lay in spaces of the tumour, and they were also found within cavities on the tongue, fauces, larynx, mucous membrane of the stomach, in lymphatic glands, and (by a later observer) in the lungs. In 1879 Ponfick found the same sulphur-yellow bodies in the body of a man who had died of chronic disease of the chest, and who had a number of sinuses in the skin of the back. Some twenty cases of actinomycosis in man have now been described in Germany; in most of them there have been centres of chronic inflammation in front of the vertebrae in the cervical, dorsal, or lumbar regions, with numerous sinuses penetrating the muscles and opening on the skin. The yellow conglomerates of *Actinomyces* are found in or upon the granulations of these sinuses, or in the sero-purulent discharge from them, or in the muscles, or more rarely in centres of granulation-like new growth in some of the viscera. The relation of the fungus to the primary tumour-like new growth of the ox has not yet been made out, and there is hardly any clue to the connexion between the bovine disease and the somewhat modified form of it in man. In some respects there is an analogy between actinomycosis and the fungus-foot of India as described by Vandyke Carter.

3. Scabies.

Of the human diseases due to animal parasites there is only one of any importance affecting the skin, namely, scabies or the itch. The parasite is the *Sarcoptes scabiei* (see MITE, vol. xvi. p. 529), which burrows under the epidermis at any part of the body, but hardly ever in the face or scalp of adults; it usually begins at the clefts of the fingers, where its presence may be inferred from several scattered pimples, which will probably have been torn at their summits by the scratching of the patient, or have been otherwise converted into vesicles or pustules. The remedy is soap and water, and sulphur ointment.

4. Diseases due to Nematode and Trematode Worms.

The common thread-worm (*Oxyuris*), a small white object about half an inch long, is very frequent in all countries, mostly in children; its habitat is the lower bowel, but it is often a troublesome irritant outside the bowel as well. The round-worm (*Ascaris lumbricoides*), about 6 inches long when full-sized, and not unlike the common earth-worm, is less common in England and other Western countries; but it is enormously common all over the East, and in the tropics generally. Hundreds of them may accumulate in the body, causing an obvious enlargement of the abdomen. The most valuable remedy against them is santonine powder. A third intestinal nematode is the whip-worm (*Trichocephalus dispar*), about 2 inches long, having a slender anterior extremity joined on to the body like the thong to the handle of a whip. It is said to be very common in some countries, such as France, but it has no great importance as regards disease.

The nematodes of greatest pathological interest are *Trichina spiralis*, causing the serious malady of trichinosis; *Anchyllostoma*

duodenale, often associated with the profound anæmia of men working in mines, making tunnels, and the like; *Anguillula stercoraria*, associated with a specific kind of diarrhoea in Cochín China; *Filaria sanguinis hominis*, a blood-worm occurring mostly in China and other parts of the East, and often associated with the disease called lymph-scrotum, and with hæmato-chyluria; and *Filaria medinensis*, the Guinea-worm, very common on the Guinea coast and in many other tropical regions, a long and slender filament like a hair from a horse's tail, and mostly infesting the skin of the legs.

Trichinosis.—The presence of encysted trichinae in the muscles was discovered in one or more of the London dissecting-rooms in 1823 and following years; but it was not until thirty years later that the clinical characters of the acute disease caused by the invasion of the parasite were discovered. This discovery was made in 1860 by Zenker, on examining the abdominal muscles of a patient who had died at Dresden, with symptoms taken to be those of typhoid fever, the case being afterwards accounted one of trichinosis on the *post mortem* evidence. Epidemics of this disease occur from time to time, especially in north Germany, from the eating of uncooked swine's flesh, in which trichinae are not uncommon. The greatest care is now taken in Germany to examine the carcasses of swine for trichinae, a piece of the diaphragm of every animal being searched with the microscope by an inspector specially appointed. The symptoms in man are occasioned by the presence of the free parasites in the intestine, by the development of young trichinae from the eggs, and most of all by the migration of the parasites from the intestinal canal to the muscles, where they become quiescent within a calcareous shell. This cycle occupies from four to six weeks. When consumed in small quantity, the parasites may give rise to no marked symptoms, and they are sometimes found accidentally in muscular fibre in the bodies of those who had probably experienced no definite symptoms from their invasion. In the more acute and serious cases, sometimes ending fatally, the early symptoms are nausea, failure of appetite, diarrhoea, and fever; later, when the migration to the muscles begins, there is more fever, stiffness, pain, and swelling in the limbs, swelling of the eyelids, continued exhausting diarrhoea, perspirations, and sometimes delirium. During convalescence there is desquamation of the cuticle. If the diagnosis be made early in the case, brisk purgatives, particularly calomel, are the best treatment; if the parasites are already on their way to the muscles, the only thing left to do is to support the patient's strength.

Anæmia and Cachexia caused by *Anchyllostoma duodenale*.—A disease which caused a great mortality among the negroes in the West Indies towards the end of last century, and of which descriptions were afterwards sent from Brazil and various other tropical and subtropical regions, was identified, chiefly through the labours of Bilharz and Griesinger in Egypt (1854), as being due to the presence in the intestine of nematoid worms from one-third to half an inch long, and variously named *Anchyllostoma*, *Sclerostoma*, *Strongylus*, &c. The same disease has subsequently been found in some places among miners, and particularly among the men employed in making the St Gotthard tunnel. Various names have been given to the malady, such as *mal d'estomac*, *mal de cœur*, *dirt-eating*, *anæmia intertropicalis*, *cachexia Africana*, and *cachexie aqueuse*. The symptoms, as first observed among the negroes, were pain in the stomach, capricious appetite, *pica* (or dirt-eating), obstinate constipation followed by diarrhoea, palpitations, small and nsteady pulse, coldness of the skin, pallor of the skin and mucous membranes, diminution of the secretions, loss of strength, and, in cases running a fatal course, colliquative diarrhoea and dysentery, hæmorrhages, and dropsies. The parasites, which cling to the intestinal mucous membrane, draw their nourishment from the blood-vessels of their host, and as they are found in hundreds in the body after death, the disorders of digestion, the increasing anæmia, and the consequent dropsies and other cachectic symptoms are easily explained. It seems probable that the parasite is introduced in its larval stage through the medium of the drinking-water. Male-fern, santonine, or other anthelmintic remedies are prescribed for it; but, inasmuch as it is most apt to lodge in the bodies of the ill-fed and otherwise ailing poor, there is little doubt that the most satisfactory remedy would be to increase the power of resistance by improving the general well-being.

Chyluria and Lymph-Scrotum caused by *Filaria sanguinis hominis*.—A milky appearance of the urine, due to the presence of a substance like chyle, which forms a clot, had been observed from time to time, especially in tropical and subtropical countries; and it has been proved by the late Dr Wucherer of Bahia, and by Dr Timorhy Lewis, that this peculiar condition is uniformly associated with the presence in the blood of minute eel-like worms, visible only under the microscope, being the embryo forms of a *Filaria*. The parent worms are very difficult to find, and their characters and habits are imperfectly known; but they are supposed to be about 3 inches long, and to inhabit dilations of the lymph-carrying vessels. It is not yet clear how the chyle gets into the urine, but it seems probable that the blood in which filariae are present is altered in its constituents, although there is no obvious change

its microscopic characters beyond the presence of the young nematodes. These are also present in the chylous urine. Sometimes the discharge of lymph takes place at one or more points of the surface of the body, and there is in other cases a condition of nævoid elephantiasis of the scrotum, or lymph-scrotum. More or less of blood may occur along with the chylous fluid in the urine. Both the chyluria and the presence of filariæ in the blood are curiously intermittent; it may happen that not a single filaria is to be seen during the daytime, while they swarm in the blood at night, and it has been ingeniously shown by Dr S. Mackenzie that they may be made to disappear if the patient sits up all night, reappearing while he sleeps through the day.

Dr Manson of Amoy has proved that mosquitoes imbibe the embryo filariæ from the blood of man; and that many of these reach full development within the mosquito, acquiring their freedom when the latter resorts to water, where it dies after depositing its eggs. Mosquitoes would thus be the intermediate host of the filariæ, and their introduction into the human body would be through the medium of water.

Dracontiasis or *Guinea-worm*.—*Filaria medinensis*, or *Dracunculus*, or Guinea-worm, is a very long filariform nematode like a horse hair, whose most frequent habitat is the skin of the legs and feet. It is common on the Guinea coast, and in many other tropical and subtropical regions, and has been familiarly known since ancient times. The condition of dracontiasis due to it is a very common one, and sometimes amounts to an epidemic. The black races are most liable, but Europeans of almost any social rank and of either

sex are not altogether exempt. The worm lives in water, and, like the *Filaria sanguinis hominis*, appears to have an intermediate host for its larval stage. It is doubtful whether the worm penetrates the skin of the legs directly; it is not impossible that the intermediate host (a cyclops) which contains the larvæ may be swallowed with the water, and that the larvæ of the *Dracunculus* may be set free in the course of digestion.

Endemic Hæmaturia and Calculus due to Distoma hæmatobium.—*D. hæmatobium* is a trematode or fluke-worm, which is extensively parasitic in man in northern and southern Africa—in the former along the Nile, and in the latter mostly on a narrow belt of the Natal coast. The parasites live mostly in the blood-vessels of the intestine and of the urinary bladder, whence they reach the mucous membranes; and the most remarkable effects of their parasitism are bleeding from the surface of the bladder and the formation of uratic and phosphatic calculi around the clusters of eggs deposited by the *Distoma*. The mode of access to their human habitat is still uncertain.

Literature.—The more special memoirs are Ponfick, *Die Actinomykose des Menschen, eine neue Infektionskrankheit* (plates, Berlin, 1882); Leuckart, *Untersuch. über Trichina spiralis* (plates, Leipzig, 2d ed., 1866); Virchow, *Darstellung der Lehre von den Trichinen* (plate, Berlin, 2d ed., 1864); Long, "De l'anémie des mineurs du Gohard, causée par l'Ankylostome duodénal," in *Trans. Internat. Med. Congr.*, 1881, i. p. 437, and papers quoted in Hirsch; T. R. Lewis, *On a Hamatozoan inhabiting Human Blood, its relation to Chyluria, &c.*, Calcutta, 1872; Manson, *The Filaria Sanguinis Hominis*, &c. (plates, London, 1884); S. Mackenzie, "Case of filarial hæmato-chyluria," in *Trans. Path. Soc. Lond.*, 1882, p. 334; see also Hirsch, *Historisch-geographische Pathologie*, vol. II., Stuttgart, 1883 (English translation). (C. C.)

PARCÆ. See FATES, vol. ix. p. 49.

PARCHMENT consists of skins of various animals, unbaired, cleaned, and dried so as to form sheets of uniform thickness suitable for writing upon and for the numerous other purposes to which such preparations are devoted (see PALEOGRAPHY, p. 144). The skins employed for parchment are principally those of sheep, lambs, and calves; but goat and ass skins are similarly dressed for special purposes. The preliminary unbairing and cleaning of the skins are effected as in the leather manufacture (see LEATHER, vol. xiv. p. 380). In their moist flexible condition the unbaired skins are tightly and uniformly stretched over a wooden frame termed a herse, and on the flesh side they are carefully gone over with a semicircular fleshing knife which removes all adherent flesh. The grain side is also gone over to clean the surface and squeeze out a proportion of the absorbed moisture. Ordinary binder's parchment and drum-head parchment need no further preparation, but are simply allowed to dry gradually on the frames on which the skins are stretched. But fine parchment for writing and vellum are powdered with chalk on the flesh side and carefully rubbed with fine pumice stone till a delicate uniform velvety surface is raised. All inequalities on the grain side are also removed by paring and rubbing with fine pumice. Stout vellum is made from calf skins, and ordinary qualities from split sheep skins; for drum heads, tambourines, and like applications goat and calf skins are used, and it is said that wolf skins yield the best drum heads.

Vegetable Parchment, or parchment paper, is a modified form of paper produced by chemical treatment, having considerable similarity to ordinary animal parchment. It is prepared by acting on ordinary unsized paper with dilute sulphuric acid, and immediately washing away all trace of acid. Paper so treated will be found to have undergone a remarkable change: the porous intertexture of cellulose composing unsized paper will have expanded and agglutinated, forming a homogeneous surface, translucent, horny, and parchment-like; it will have acquired about five times the strength of ordinary paper; it will become soft and flaccid when steeped in water, to which, however, it is impervious; and it is unaffected by boiling in water. The formation of vegetable parchment is due to a molecular change in cellulose when acted on by sulphuric acid, owing to which the substance is transformed into a

starch-like body—amyloid—with simultaneous swelling of the fibres, which thereby soften and agglutinate. The preparation of vegetable parchment was patented in 1857 by Mr W. E. Gaine, and machinery has been adapted for the manufacture. The paper to be acted on passes in a continuous web through a vat containing commercial sulphuric acid diluted with half its volume of water. In this it is immersed from five to twenty seconds at a temperature of about 60° Fahr. It then passes in succession through pure water, next an ammoniacal solution to remove all acid, and finally again through water, after which it is dried and finished by passing between felted rollers and over heated polished metal cylinders. A similar effect is produced on paper by treating it with a syrupy solution of zinc chloride at from 120° to 212° Fahr. Vegetable parchment has not realized all the expectations of it. It is most largely used as covers for preserve jars, bottles, &c., and to some extent for tracings of plans, charts, &c.

PARDON is the remission, by the power entrusted with the execution of the laws, of the penalty attached to a crime. The right of pardoning is coextensive with the right of punishing. In a perfect legal system, says Beccaria, pardons should be excluded, for the clemency of the prince seems a tacit disapprobation of the laws (*Dei Delitti e delle Pene*, ch. xx.).¹ In practice the prerogative is extremely valuable, when used with discretion, as a means of adjusting the different degrees of moral guilt in crimes or of rectifying a miscarriage of justice. By the law of England pardon is the sole prerogative of the king, and it is declared by 27 Hen. VIII. c. 24 that no other person has power to pardon or remit any treasons or felonies whatsoever. This position follows logically from the theory of English law that all offences are breaches of the king's peace. Indictments still conclude with a statement that the offence was committed "against the peace of our lady the queen, her crown and dignity." The crown by pardon only remits the penalty for an attack upon itself. The prerogative is in modern times exercised by delegation, the crown acting upon the representation of the secretary of state for the home department in Great Britain, of the lord lieutenant in Ireland. The prerogative of the crown is subject to some restrictions. (1) The committing of a

¹ See further, on the ethical aspect of pardon, Montesquieu, *Esprit des Lois*, bk. vi. ch. 21, Bentham, *Principles of Penal Law*, bk. vi. ch. 4.

subject of the realm to a prison out of the realm is by the Habeas Corpus Act a *præmunire*, unpardonable even by the king (31 Car. II. c. 2, § 12). (2) The king cannot pardon an offence in a matter of private rather than of public wrong, so as to prejudice the person injured by the offence. Thus a common nuisance cannot be pardoned while it remains unredressed, or so as to prevent an abatement of it. A fine or penalty imposed for the offence may, however, be remitted. By 22 Vict. c. 32 Her Majesty is enabled to remit wholly or in part any sum of money imposed upon conviction, and, if the offender has been imprisoned in default of payment, to extend to him the royal mercy. There are other statutes dealing with special offences, *e.g.*, by 38 & 39 Vict. c. 80 Her Majesty may remit any penalty imposed under 21 Geo. III. c. 49 (an Act for preventing certain abuses and profanations on the Lord's Day called Sunday). (3) The king's pardon cannot be pleaded in bar of an impeachment. This principle, first asserted by a resolution of the House of Commons in the earl of Danby's case, 5th May 1679, forms one of the provisions of the Act of Settlement, 12 & 13 Will. III. c. 2. It is there enacted "that no pardon under the great seal of England shall be pleadable to an impeachment by the Commons in parliament," § 3. This provision does not extend to abridging the prerogative after the impeachment has been heard and determined. Thus three of the rebel lords were pardoned after impeachment and attainder in 1715. (4) In the case of treason, murder, or rape, a pardon is ineffectual unless the offence be particularly specified therein (13 Rich. II. c. 1, § 2). Before the Bill of Rights, 1 Will. & M. c. 2, § 2, this statute seems to have been frequently evaded by a *non obstante* clause. But, since by the Bill of Rights no dispensation by *non obstante* is allowed, general words contrary to the statute of Richard II. would seem to be ineffectual.

Pardon may be actual or constructive. Actual pardon is by warrant under the great seal, or under the sign-manual countersigned by a secretary of state (7 & 8 Geo. IV. c. 28, § 13). Constructive pardon is obtained by endurance of the punishment. By 9 Geo. IV. c. 32, § 3, the endurance of a punishment on conviction of a felony not capital has the same effect as a pardon under the great seal. This principle is reaffirmed in the Larceny Act, 1861 (24 & 25 Vict. c. 96, § 109), and in the Malicious Injuries to Property Act, 1861 (24 & 25 Vict. c. 97, § 67). Further, pardon may be free or conditional. A conditional pardon most commonly occurs where an offender sentenced to death has his sentence commuted to penal servitude or any less punishment. The condition of his pardon is the endurance by him of the substituted punishment. The effect of pardon, whether actual or constructive, is to put the person pardoned in the position of an innocent man, so that he may have an action against any one thereof calling him traitor or felon. He cannot refuse to give evidence respecting the offence pardoned on the ground that his answer would tend to criminate him. A pardon may be pleaded on arraignment in bar of an indictment (though not of an impeachment), or after verdict in arrest of judgment. No doubt it would generally be advantageous to plead it as early as possible.

It is obvious that, though the crown is invested with the right to pardon, this does not prevent pardon being granted by the higher authority of an Act of Parliament. Acts of Indemnity have frequently been passed, the effect of which is the same as pardon or remission by the crown. Recent examples of Acts of Indemnity are two private Acts passed in 1880 to relieve Lords Byron and Plunket from the disabilities and penalties to which they were liable for sitting and voting in the House of Peers without taking the oath.

Civil rights are not divested by pardon. The person injured may have a right of action against the offender in spite of the pardon of the latter, if the right of action has once vested, for the crown cannot affect private rights. In Scotland this civil right is specially preserved by various statutes. Thus 1593, c. 174, provides that, if any respite or remission happen to be granted before the party grieved be first satisfied, the same is to be null and of none avail. The assything, or indemnification due to the heirs of the person murdered from the murderer, is due if the murderer have received pardon, though not if he have suffered the penalty of the law. The pardon transmitted by the secretary of state is applied by the supreme court, who grant the necessary orders to the magistrates in whose custody the convict is.

In the United States the power of pardon vested in the president is without any limitation, except in the case of impeachments (U. S. Constitution, art. ii. § 2). The power of pardon is also vested in the executive authority of the different States, with or without the concurrence of the legislative authority. Thus by the New York Code of Criminal Procedure, 1881, §§ 692, 693, the governor of the State of New York has power to grant reprieves, commutations, and pardons, except in the case of treason, where he can only suspend the execution of the sentence until the case can be reported to the legislature, with whom the power of pardon in this case rests. The usual form of pardon in the United States is by deed under seal of the executive.

PARDUBITZ, a town of Bohemia, situated at the confluence of the Elbe and the Chrudimka, 55 miles to the east of Prague. The most interesting buildings are the old fortified château of the 16th century, with its Gothic chapel; the church of St Bartholomew, dating in its present form from 1538; the quaint town-house; the Grünes Thor, a mediæval gateway; and the handsome new synagogue. The inhabitants, amounting to 10,292 in 1880, are engaged in the manufacture of sugar, agricultural implements, sweetmeats, spirits, beer, and iron. There is also a tolerably active trade in grain and timber, and the horse-fairs attract numerous customers. Pardubitz is a town of ancient origin, the history of which is little more than a record of a succession of feudal superiors. In 1560 it passed into the possession of the crown, which retained the town-lands down to 1863, when it sold them to the Austrian Credit Bank. Pardubitz suffered severely in the Hussite wars.

PARÉ, AMBROISE, the father of French surgery, was born at Laval, in the province of Maine, in 1517, and died in 1590. A collection of his works was published at Paris in 1561, and was afterwards frequently reprinted. Several editions have also appeared in German and Dutch. Among the English translations was that of Thomas Johnson, London, 1634. For Paré's professional career and services, see SURGERY.

PAREJA, JUAN DE (1606–1670), Spanish painter, was a mestizo, born in the West Indies about 1606, and in early life passed into the service of Velazquez, who employed him in colour-grinding and other menial work of the studio. By day he closely watched his master's methods, and by night stealthily practised with his brushes until he had attained considerable manipulative skill. The story goes that, having succeeded in producing a picture satisfactory to himself, he contrived furtively to place it among those on which Velazquez had been working, immediately before an expected visit of King Philip IV. The performance was duly discovered and praised, and Pareja forthwith received his freedom, which, however, he continued to devote to his former employer's service. His extant works are not very numerous; the best known, the Calling of St Matthew, now in the Royal Picture Gallery, Madrid, has considerable merit as regards technique, but does not reveal much originality, insight, or devotional feeling. He died in 1670.

PARENT AND CHILD. See BASTARD, INFANT, and MARRIAGE.

PARENZO, a city on the west coast of Istria (Austria-Hungary), 30 miles south of Trieste, with about 3000 inhabitants (2825 in 1879), has considerable historic and architectural interest. It is built on a peninsula nowhere more than 5 feet above the sea-level; and from the fact that the pavements of the Roman period are 3 feet below the present surface it is inferred that this part of the coast is slowly subsiding. The well-preserved cathedral of St Maurus was erected by Euphrasius, first bishop of Parenzo, probably between 535 and 543. The basilican type is very pure; there are three naves; the apse is hexagonal without and round within. The total length of the church proper is only 120 feet; but in front of the west entrance

is a square atrium with three arches on each side; to the west of the atrium is a now roofless baptistery, and to the west of that rises the campanile; so that the total length from campanile to apse is about 230 feet. Mosaics, now greatly spoiled, form the chief decoration of both outside and inside. The high altar is covered with a noble baldachin, dating from 1277. Small portions of two temples and an inscribed stone are the only remains of the ancient Roman city that readily catch the eye.

Parentium, conquered by the Romans in 178 B.C., was made a colony probably by Augustus after the battle of Actium, for its title in inscriptions is Colonia Julia and not, as it has often been given, Col. Ulpia. It grew to be a place of some note with about 6000 inhabitants within its walls and 10,000 in its suburbs. The bishopric, founded in 524, gradually acquired ecclesiastical authority over a large number of abbeys and other foundations in the surrounding country. The city, which had long been under the influence of Venice, formally recognized Venetian supremacy in 1267, as a Venetian town it was in 1354 attacked and plundered by Paolo Doria of Genoa. In 1630 the plague (which had already visited Parenzo in 1360, 1453, &c.) reduced the population to barely 100; but by 1800 the number had increased again to 2000. The bishoprics of Pola and Parenzo were united in 1827. The basilica is one of those churches in which the priest when celebrating mass stands behind the altar with his face to the west.

See Vergottin, *Breve saggio d'istoria della città di Parenzo*, Venice, 1796; Kandler, *Conni al forestiero che visita Parenzo*, Trieste, 1845; Neale, *Notes on Dalmatia, Istria, &c.*, 1861, with ground plan of cathedral; and E. A. Freeman in *Saturday Review*, 1875, reprinted in his *Subject and Neighbour Lords of Venice*, 1881.

PARGA, a town on the Albanian coast, in the Turkish vilayet of Janina, beautifully situated in the midst of orchards devoted to the cultivation of the larger citron, with a rock-built citadel and a harbour formed by a mole constructed by the Venetians in 1572. Its population does not now exceed 1500, but its imports and exports (citrens, wool, oak bark, and skins) reach a value of £42,000 (1880), and the place is historically famous.

Originally occupying the site of the ancient Torone (Palæo-Parga), a short distance to the west, Parga was removed to its present position after the Turkish invasion. Under Venetian protection, freely accepted in 1401, the inhabitants maintained their municipal independence and commercial prosperity down to the destruction of the great republic in 1797, though on two occasions, in 1500 and 1560, their city was burned by the Turks. The attempts of Ali Pasha of Janina to make himself master of the place were thwarted partly by the presence of a French garrison in the citadel and partly by the heroic attitude of the Pargiotes themselves, who were anxious to have their city incorporated with the Ionian Republic. To secure their purpose they in 1814 expelled the French garrison and accepted British protection; but the British Government in 1815, with a breach of faith which excited general reprobation, determined to go back to the convention of 1800 by which Parga was to be surrendered to Turkey, though no mosque was to be built or Mussulman to settle within its territory. Rather than subject themselves to the tyranny of Ali Pasha, the Pargiotes decided to forsake their country; and accordingly in 1819, having previously exhumed and burned the remains of their ancestors, they migrated to the Ionian Islands. The Turkish Government was constrained to pay them £142,425 by way of compensation.

See *Edinburgh Review*, 1819, and Finlay's *Hist. of Greece* (Tozer's edition) for authorities.

PARHELIA. See HALO, vol. xi. pp. 398, 399.

PARIAN CHRONICLE. This famous Chronicle is contained in the ARUNDELIAN MARBLES (*q.v.*) now at Oxford. It originally embraced an outline of Greek history from the reign of Cecrops, king of Athens (1582 B.C.), down to the archonship of Diognetus at Athens (264 B.C.), but the remaining portion extends no farther than 355 B.C. The Chronicle seems to have been set up by a private person; but, as the opening of the inscription has perished, we do not know the occasion or motives which prompted the step. The author of the Chronicle has given much attention to the festivals, and to poetry and music; thus he has recorded the dates of the establishment of festivals, of the introduction of various kinds of poetry, the births and deaths of the poets, and their victories in contests of poetical skill. On the other hand, important political and military events are often entirely omitted; thus the return of the Heraclidæ, Lycurgus, the wars of

Messene, Draco, Solon, Clisthenes, Pericles, the Peloponnesian War, and the Thirty Tyrants are not even mentioned. The years are reckoned backward from the archonship of Diognetus, and the dates are further specified by the kings and archons of Athens. The reckoning by Olympiads is not employed. Amongst the legendary dates recorded in the Chronicle the following may be mentioned:—

| | |
|--|-----------|
| Deucalion's Deluge, 1265 years before the archonship of Diognetus, <i>i.e.</i> | 1529 B.C. |
| Origin of Amphictyonic league | 1522 " |
| National name changed from Grecks (Graikoi) to Hellenes | 1521 " |
| Arrival of Cadmus; foundation of Cadmea | 1519 " |
| Arrival of Danaus and the Danaides in Greece | 1511 " |
| Invention of the flute | 1506 " |
| Minos reigns in Crete; discovery of iron in Mount Ida | 1432 " |
| Introduction of corn by Ceres and Triptolemus | 1409 " |
| Orpheus publishes his poetry | 1399 " |
| First purification for manslaughter | 1326 " |
| Theseus founds Athens by union of twelve cities; he establishes the democracy | 1259 " |
| Beginning of Trojan War | 1218 " |
| Capture of Troy | 1209 " |
| Hesiod flourishes | 937 " |
| Homer flourishes | 907 " |

From the attention bestowed on poets and tyrants in the Chronicle, Boeckh infers that its author drew mainly on the works of Phantias of Eresus, a disciple of Aristotle, who wrote on poets, the tyrants of Sicily, tyrannicide, &c. Further, from some resemblances between Eusebius and the Chronicle, Boeckh is led to conjecture that the Christian historian may have made use of the same sources as the author of the Chronicle.

The Parian Chronicle is given by Boeckh in the *Corpus Inscriptionum Græcarum*, vol. II., and by Müller in the *Fragmenta Historicorum Græcorum*, vol. I.; it is edited separately by Flach, Tübingen, 1883.

PARINI, GIUSEPPE (1729–1799), Italian poet, was born in the district of Bosisio in the Milanese, on the 22d of May 1729. His parents, who possessed a small farm on the shore of Lake Pusiano, sent him to Milan, where he studied under the Barnabites in the Academy Arcimboldi, maintaining himself latterly by copying manuscripts. In 1752 he published at Lugano, under the pseudonym of Ripano Eupilino, a small volume of *scioltto* verse which secured his election to the Accademia dei Trasformati at Milan and to that of the Arcadi at Rome. Encouraged yet further by his success in two controversies with Alessandro Bandiera and Onofrio Branda, he proceeded to utilize in the composition of the satire, *Il Mattino*, the knowledge of aristocratic life which he had gained as tutor in the Borromei and Serbelloni families. The poem, which was published in 1763, and which marked a distinct advance in Italian blank verse, consisted of ironical instructions to a young nobleman as to the best method of spending his mornings. It at once established Parini's popularity and influence, and two years later a continuation of the same theme was published under the title of *Il Mezzogiorno*. The Austrian plenipotentiary, Count Firmian, who had favoured the publication of the poems, interested himself in procuring the poet's advancement, appointing him, in the first place, editor of the *Gazette*, and in 1769, in despite of the Jesuits, to a specially created chair of belles lettres in the Palatine School. His subsequent lectures as professor of rhetoric in the Gymnasium di Brera are still of value, and as occupant of the chair of fine arts he was frequently consulted by the artists of the day in matters of taste and design. On the French occupation of Milan he was appointed magistrate by Napoleon and Saliceti, but almost immediately retired to resume his literary work and to complete *Il Vespro* and *La Notte*, the two last divisions of the *Giorno*. He died on the 15th of August 1799. An indisputable force in the history of Italian literature, he owed his influence rather to a carefully cultivated taste than to any strongly marked originality of genius. His works were published in 3 vols. 8vo, Milan, 1801–4.

PARIS

PARIS, the capital of France, the seat of the legislature and of the administrative departments, is situated on both banks of the Seine, in $48^{\circ} 50' 14''$ N. lat. and $2^{\circ} 20' 14''$ E. long. (Observatory). It occupies the centre of the so-called Paris basin, which is traversed by the Seine from south-east to north-west, open towards the west, and surrounded by a line of Jurassic heights. The granitic substratum is covered by Jurassic, Cretaceous, and Tertiary formations; and at several points building materials—freestone, limestone, or gypsum—have been laid bare by erosion. It is partly, indeed, to the existence of such quarries in its neighbourhood, or on the very ground on which it stands, that the city owes its vast development.¹ The mean elevation of the Seine valley at Paris is from 100 to 130 feet. On the north bank rise the heights of Charonne, of the Buttes-Chaumont (404 feet), of La Villette, and of Montmartre (345 feet); on the left or south bank the Butte-aux-Cailles, and beyond the valley of the Bièvre the hill of Ste Geneviève and Montrouge. Between those lines of heights, the Seine flows from east to west, encircling the island of St Louis, the Île de la Cité, and lower down the Île aux Cygnes. The Bièvre or Gobelins stream flows for some distance in an open channel on the left side of the river, and then disappears in a sewer. On the right side the brook which used to run from Ménilmontant to Chaillot past the site now occupied by the opera, has at length been dammed by masonry, driven into the sewers, or lost underground.

Climate.—Paris enjoys a fairly uniform climate, subject, however, to frequent changes at all seasons of the year. The mean temperature, calculated by M. Flammarion from observations extending over seventy-two years (1804–76), is $51^{\circ} 4$ Fahr. The highest reading observed (in July 1874, and again in July 1881) is 101° Fahr., the lowest (in December 1879) is -14° . The monthly means for the sixty-four years 1806–1870 are—January $36^{\circ} 3$, February $40^{\circ} 1$, March $43^{\circ} 5$, April $50^{\circ} 2$, May $57^{\circ} 6$, June $63^{\circ} 0$, July $66^{\circ} 0$, August $65^{\circ} 3$, September $60^{\circ} 3$, October $52^{\circ} 3$, November $43^{\circ} 7$, December $38^{\circ} 7$. The river freezes when the temperature falls below 18° . It was frozen in nearly its whole extent from Bercy to Auteuil in the winters of 1819–20, 1829–30, 1879–80; and partially in the winters of 1840–41, 1853–54, 1857–58, and 1870–71. Rain falls, on an average, on 143 days, of which 38 are in winter, 35 in spring, 34 in summer, and 36 in autumn,—the average quantity in a year being 19.68 inches. The driest month is February, the rainiest July,—the rainfall for these months being respectively 0.87 inch and 2.15 inches. There are 12 days on which snow falls, 184 on which the sky is covered; 40 with fogs, and 9 with hail. The following figures show the directions of the winds:—N. 38 days, N.E. 41, E. 24, S.E. 26; S. 53, S.W. 70, W. 67, and N.W. 36, with 10 calm days. Thunderstorms average 13 per annum,—ranging from 6 (in 1823) to 25 (1811). There is comparatively little variation in the barometer. Its mean height is 29.763 inches at a height of 216 feet above sea-level. On the whole the climate is healthy and agreeable, its variations, though frequent, being comparatively slight.

Boundaries.—Since January 1, 1860, the boundaries of Paris have extended to the fortifications built in accordance

with the scheme of 1840. The total area thus included is 30 square miles, of which 6 square miles are occupied by the public streets, 458 acres by squares and gardens, $642\frac{1}{2}$ acres by the river and canals, and 224 acres by cemeteries. The line of fortifications measures $22\frac{1}{2}$ miles. On the right side of the river it presents 68 fronts, and on the left 26, each consisting of a curtain connecting two demi-bastions. It is pierced by 56 gates, 9 openings for railways, and 2 openings for the Ourcq and the St Denis canals. Outside of this encinte are a number of detached forts arranged in two main lines. First come the forts erected previous to 1870 at St Denis, Aubervilliers, Romainville, Noisy, Rosny, Nogent, Vincennes, Ivry, Bicêtre, Montrouge, Vanves, Issy, and Mont Valérien; and next the new forts of Palaiseau, Villeras, Buc, and St Cyr, which protect Versailles, and Marly, St Jamme, and Aigremont, which surround St Germain. On the right side of the Seine are Forts Cormeilles, Domont, Montlignon, Montmorency, Écouen, Stains, Vanjourns, Villiers, and Villeneuve St Georges. Between the two lines the Chatillon fort occupies the site of the German batteries which bombarded Paris in 1871.

Boulevards, Streets, and Squares.—The line of the ~~Streets~~ Boulevards from the Madeleine to the Bastille, nearly 3 miles, is one of the busiest and most fashionable in the world; here are the Porte St Denis, the Porte St Martin, most of the large cafés, the Opera-House, and the various theatres distinguished as Le Vaudeville, Les Nouveautés, L'Opéra Comique, Les Variétés, Le Gymnase, La Porte St Martin, La Renaissance, L'Ambigu, Les Folies Dramatiques, Dejazet, Beaumarchais, and Le Cirque. Traffic passes east and west from the Bastille to the Place de la Concorde by Rue St Antoine and Rue de Rivoli. North and south the line of the Boulevard de Strasbourg and the Boulevard de Sébastopol stretches from the station of the Eastern Railway (Gare de l'Est) to the Seine, and is continued by the Boulevard du Palais in the Cité and the Boulevard St Michel, on the left side of the river, as far as the observatory. The total length is not less than $2\frac{1}{2}$ miles. On the right side of the river may also be mentioned the Rue Royale; the Malesherbes and Haussmann boulevards, which cross the most elegant quarters of the town; the Avenue de l'Opéra, which unites the Place du Palais Royal with the Place de l'Opéra, and terminates at the main entrance of the Opera; the Rue de la Paix, Rue Auber, and Rue 4 Septembre, which also terminate in the Place de l'Opéra, and are remarkable for their magnificent shops; Rue Lafayette, one of the longest thoroughfares of Paris, traversing the town from the Opera to the end of La Villette; the Boulevard Magenta, from Montmartre to the Place de la République; Rue de Turbigo, from this place to the Halles Centrales. The older streets known as Richelieu, Vivienne, De la Chaussée d'Antin, St Honoré, Montmartre, St Denis, St Martin, are full of shops and offices. The Place de l'Arc de Triomphe de l'Étoile is the centre of twelve avenues stretching out from it like the spokes of a wheel, but not all as yet lined with buildings. On the left side of the river the main thoroughfare is the Boulevard St Germain, from Pont Sully to the Pont de la Concorde, which passes in front of the school of medicine, the Place St Germain des Prés, and the war office. The Rue de Rennes, which extends from St Germain des Prés to the Mont Parnasse Railway station, is to be prolonged as far as the Seine.

The finest of the public squares in Paris are Place de la

¹ The quarries of Montrouge, the Montmartre and the Buttes-Chaumont plaster-kilns, and the brick-works of Vaugirard or of Passy are gradually being built over. At Passy there is a cold chalybeate spring, and sulphurous waters are found at Belleville and at Les Batignolles.

Concorde; Place de l'Étoile; Place Vendôme, with the column and statue of Napoleon I.; Place du Carrousel, with a small triumphal arch commemorative of the campaign of 1806, which formed the entrance to the palace of the Tuileries, now demolished; Place des Victoires, with the equestrian statue of Louis XIV.; Place des Vosges, formerly Place Royale, with that of Louis XIII.; Place de la Bastille, with the column commemorative of the Revolution of July 1830; Place de la République, with the Republic statue; Place de l'Hôtel de Ville; Place du Châtelet, with a column commemorative of the Italian campaign of 1796; those which take their names from the Bourse, the Palais Royal, and the Opera; Place de Rivoli, with the equestrian statue of Joan of Arc; Place Moncey, adorned with a monument in memory of the defence of Paris in 1814, as Place Denfert, at the opposite extremity of the town, is adorned with a colossal lion symbolizing the defence of 1871. South of the Seine are the Place St Michel, adorned with a monumental fountain, and one of the great centres of traffic in Paris; Place du Panthéon; Place St Sulpice; Place Vauban, behind the dome of the Invalides, and Place du Palais Bourbon, in front of the chamber of deputies. Besides those already mentioned there are monumental fountains in the Places de la Concorde, de la République, and du Châtelet, the Avenue de l'Opéra, and the Place Louvois opposite the national library; and attention must also be called to the Fountain of the Innocents near the markets, which was originally adorned with sculptures by Jean Goujon; the Molière Fountain, in the Rue Richelieu; the Gaillon Fountain; and on the left side of the river the Fountain of Rue de Grenelle.

The Seine.—The Seine flows for 7 miles (taking five hours) through Paris. As it enters and as it leaves the city it is crossed by a viaduct used by the circular railway and for ordinary traffic; that of Point du Jour has two stories of arches. Two bridges, the Pont des Arts and the Passerelle de Passy, are for foot passengers only; all the others are for carriages as well. The most famous is the Pont Neuf, the two portions of which rest on the extremity of the island called La Cité where the river is at its widest (961 feet). On the embankment below Pont Neuf stands the statue of Henry IV., the people's king. Between La Cité and the left bank the width of the lesser channel is reduced to 161 feet. The whole river has a width of 532 feet as it enters Paris and of 440 as it leaves it. As it descends it passes under the bridges of Tolbiac, Bercy, and Austerlitz (built of stone), that of Sully (of iron), those of Marie and Louis Philippe between Île St Louis and the right bank; that of Les Tournelles between Île St Louis and the left bank; that of St Louis between Île St Louis and La Cité; and Pont d'Arcole, a very elegant structure connecting La Cité with Place de l'Hôtel de Ville. La Cité besides communicates with the right bank by the bridges of Notre Dame and Au Change; with the left bank by that of the Archevêché, the so-called Pont au Double, the Petit Pont, and Pont St Michel. Below Pont Neuf come the Pont des Arts, Pont du Carrousel (of iron), Pont Royal (a fine stone structure leading to the Tuileries), and those named after Solferino, La Concorde, the Invalides, Alma, Jena, (opposite the Champ de Mars), Passy, and Grenelle.

The houses of Paris nowhere abut directly on the river banks, which in their whole extent from the bridge of Austerlitz to Passy are protected by broad embankments or "quays." At the foot of these lie several ports for the discharge of goods:—on the right side Bercy for wines, La Rapée for timber, the Port de l'Arsenal at the mouth of the St Martin Canal,¹ the Port de l'Hôtel de Ville for

fruits, and the Port St Nicholas or du Louvre (steamboats for London); on the left bank Port de la Gare for timber, St Bernard for wines, and those named after La Tournelle, the Saints Pères, the Invalides, and Grenelle.

Promenades and Parks.—In the heart of Paris are situated the gardens of the Tuileries (74 acres), laid out in parterres and bosquets, planted with chestnut trees, lindens, and plane trees, and adorned with playing fountains and basins, and numerous statues mostly from the antique. From the terrace along the river side a fine view is to be had over the Seine to the park and palace of the Trocadéro; and from the terraces along the Place de la Concorde the eye takes in the Place and the Avenue of the Champs Élysées. The gardens of the Luxembourg, in front of the palace occupied by the senate, are rather larger than those of the Tuileries; with less regularity of form they present greater variety of appearance. In the line of the main entrance extends the beautiful Observatory Walk, terminating in a monumental fountain, which is in great part the work of Carpeaux. The Luxembourg conservatories are rich in rare plants; and classes are held in the gardens for the study of gardening, fruit-tree pruning, and bee-keeping. The Jardin des Plantes will be mentioned below in the list of scientific establishments. Besides these three great gardens laid out in the French taste, with straight walks and regular beds, there are several in what the French designate the English style. The finest and most extensive of these, the Buttes-Chaumont Gardens, in the north-east of the city, occupy 62 acres of very irregular ground, which up to 1866 was occupied by plaster-quarries, lime-kilns, and brick-works. The "buttes" or knolls are now covered with turf, flowers, and shrubbery. Advantage has been taken of the varying relief of the site to form a fine lake and a cascade with picturesque rocks. The Montsouris Park, in the south of the city, 40 acres in extent, also consists of broken ground; in the middle stands the meteorological observatory, built after the model of the Tunisian palace of Barde, and it also contains a monument in memory of the heroic and unfortunate Flatters expedition. Monceau Park, surrounded by the most aristocratic quarters of modern Paris, is a portion of the old park belonging to King Louis Philippe, and is now the property of the town. The gardens of the Palais Royal are surrounded by arcades and fine shops. There is hardly, it may be further remarked, a district in Paris which has not of recent years its well-planted square kept up at municipal expense on some plot of ground cleared during the improvements. Such are those named after Tour St Jacques (one of the most graceful monuments of old Paris), the Conservatoire des Arts et Métiers, the Temple, Montholon, Cluny, &c. There have recently been added the park of the Champs de Mars, and that of the Trocadéro with its fountains and aquarium.

But the real parks of Paris are the Bois de Boulogne and Bois de Vincennes, which belong to the city, though situated outside of the fortifications. The former is reached by the wide avenue of the Champs Élysées as far as the Arc de Triomphe, and thence by the avenue of the Bois de Boulogne or that of the Grande Armée. The first of these, with its side walks for foot passengers and equestrians, grass-plots, flower-beds, and elegant buildings with gardens and railings in front, affords a wide and magnificent prospect over the Bois and the hills of St Cloud and Mont Valérien. The Bois de Boulogne covers an area of 2158 acres, one-fourth of which is occupied by turf, one-eighth by roads, and the rest by clumps of trees, sheets of water, or running streams. Here are the two race-courses of Longchamps (flat races) and Auteuil (steeple-chases), and the gardens

¹ This canal, leaving the Seine below Austerlitz Bridge, passes by a tunnel under Place de la Bastille and Boulevard Richard Lenoir, and

rises by sluices to the La Villette basin, from which the St Denis Canal descends to the Seine at St Denis. In this way boats going up or down the river can avoid passing through Paris.

of the Acclimatization Society, which, with their menageries, conservatories, and aquarium, are largely visited by pleasure-seekers. The Bois de Vincennes, a little larger than the Bois de Boulogne, is similarly adorned with streams, lakes, cascades; and from the Gravelle plateau there is a splendid view over the valleys of the Marne and the Seine. Unfortunately the wood is cut in two by an open space comprising a drill-ground for artillery and infantry, a race-course, and a farm (La Faisanderie) for agricultural experiments. Trees for the public parks and squares are grown in the great municipal nurseries at Auteuil and Bois de Boulogne; and the municipal botanical gardens of La Muette, with thirty-five conservatories covering $1\frac{1}{2}$ acres, and an equal area under frames, contain magnificent collections of azaleas, palm-trees, and other exotics for ornamenting the public gardens or decorating official apartments on fête days.

Public Buildings, Palaces, &c.—The following are among the public buildings of Paris which have most architectural interest. The palace of the Louvre (see pp. 281, 288), which lies on the right side of the Seine in the heart of the city, consists of a quadrangle with an inner court 394 feet square, two galleries extending westwards from two sides of the quadrangle, and two galleries external and parallel to these, and continued till they meet the side wings of the Tuileries. The east front of the Louvre is 548 feet long and 90 feet high, and the first story is occupied by Perrault's famous colonnade. Towards the west are those portions of the Tuileries which escaped the fire of 1871, —the connecting galleries and (on the south) the Flora pavilion and (on the north) the Marsan pavilion, which was entirely rebuilt between 1872 and 1877. From Perrault's colonnade to the Flora pavilion the side facing the quay is 2250 feet long. In the matter of sculpture the south and west sides of the inner court are considered the best parts of the Louvre. On the west side lies the oldest part of the palace, and the principal points in the former arrangement of the building are indicated by the paving of the court. In the middle of each façade there is a pavilion rising above an archway. The western archway, which is surmounted by the clock, leads into Place Napoléon III., which has its centre occupied by a square, and its north and south sides bordered with porticos surmounted by statues of eminent Frenchmen. To the west is the Place du Carrousel. On the south side at the junction of the Louvre and the Tuileries is a gateway with three arches, of which the middle one is crowned with the bronze group by Mercier, "The Genius of the Arts," erected in 1875. The river-front of the Louvre is in an older and more elegant style than the side facing Rue de Rivoli. It is connected with the buildings of the quadrangle by Henry IV.'s pavilion, which contains in its first story the elegant Apollo gallery.

The Palais de Justice in La Cité presents on the W. side, towards Place Dauphine, a Greek façade by Duc (1865–1870), one of the finest productions of modern art. From the Boulevard du Palais on the east it is separated by a magnificent 18th-century railing in wrought iron and gilt. On this side lie the Salle des Pas Perdus and the Sainte-Chapelle. The fine square tower known as the Clock Tower stands at the corner formed by the Quai du Nord and the Boulevard du Palais; and on the north side lies the Conciergerie prison with the dungeon once occupied by Marie Antoinette. Opposite the Palais de Justice on the other side of the Boulevard is the Tribunal de Commerce with a remarkable staircase under the cupola.

On the left bank of the Seine are the Luxembourg palace, the seat of the senate and formerly the residence of Mary de' Medici; the Bourbon palace, the seat of the chamber of deputies, fronting the river and Pont de la Concorde with a fine columned portico and pediment: the

palace of the Legion of Honour, an exquisite building of Louis XIV.'s time; and the palace of the Institute, with a handsome dome. On the right side of the river lie the Elysée palace (in the Champs-Élysées), a vast building in a modern style, the residence of the president of the republic, and the palace of the Trocadéro, built for the Exhibition of 1878, the central rotunda of which contains the largest music-hall in Paris (for 15,000 auditors) and a colossal organ.

Among the Government and administrative buildings may be mentioned the Hôtel de Ville, burnt in 1871, but rebuilt finer than before on the old site; the ministry of foreign affairs, where the congress of Paris was held in 1856; the ministry of marine, which occupies on Place de la Concorde one of the two pavilions erected by Gabriel on each side of Rue Royale; the ministry of war in the Boulevard St Germain; the Bank, formerly the De la Vrillière "hôtel," built by Mansard; the Mint, with a fine façade stretching 394 feet along Quai Conti not far from Pont Neuf; the national printing establishment, formerly Cardinal Rohan's mansion; and the national record office, close at hand, formerly the Soubise mansion. These last two buildings are in the Quartier du Marais, where a great many ancient mansions are now used as warehouses and workshops. Besides the Hôtel Carnavalet and the Hôtel de Cluny may be mentioned the tower of Rue aux Ours, the last remnant of the Hôtel de Bourgogne; the Hôtel de Sens, formerly the residence of the archbishop of the province; the Hôtel Lambert at the head of Île St Louis, adorned with paintings by Lesueur; the turret of the Hôtel Barbette (Rue vieille du Temple).

The largest and finest of the religious buildings of Paris is the cathedral of Notre Dame (426 feet long by 164 wide), restored between 1846 and 1879 by Viollet-le-Duc. As it now exists this church has five naves running the whole length of the building, and square chapels; the central flèche, recently restored, is 312 feet high, and two massive square towers worthily crown the principal façade, which is one of the most beautiful that has come down to us from the Middle Ages. The transept has also two façades, which, while less imposing, are more richly decorated with chiselled work, dating from about the middle of the 13th century. Of the elaborate decoration of the interior all that is old is a part of the screen of the choir, from the 14th century.

St Geneviève or the Panthéon, consecrated by the Convention to illustrious men, but since restored to Christian worship, has the form of a Greek cross with a dome in the centre and a columned portico in front, the pediment of which contains an immense bas-relief by David of Angers representing great men crowned by their country. Fénelon, Rousseau, Voltaire, Mirabeau, Laplace, Cuvier, &c., may be distinguished. The crypt contains the tombs of Soufflot (the architect of the church), Rousseau, Voltaire, &c. Near St Geneviève stand St Étienne du Mont with a magnificent roodloft, and the chapel of St Geneviève with the tomb of this patroness of Paris. The Madeleine, intended by Napoleon I. for a temple of victory, has consequently the form of a Greek temple. At St Germain des Prés, St Severin, and St Vincent de Paul are beautiful frescos by Hippolyte Flandrin, to whom a monument has been erected in St Germain. St Eustache contains Colbert's tomb; St Germain l'Auxerrois has a curious porch; and St Sulpice, which is nearly as large as Notre Dame, presents in its main front the most vigorous effort yet made to apply classical architecture in the building of Christian churches. Notre Dame des Victoires is a great resort of pilgrims. The church of the Vow of the Sacred Heart, at present in course of erection on Montmartre, will when finished be one of the most remarkable buildings in Paris from its commanding site, the extent of its crypt, and the vast propor-

tions of its dome and tower, respectively 197 and 262 feet in height.

Theatres.—Of the many buildings in Paris devoted to theatrical entertainments there is only one, at once the largest and the most beautiful, which is of real architectural importance—the Grand Opéra, or national academy of music and dancing. The opera house, which covers 2½ acres, is the finest theatre in the world. The process of erection, directed by Charles Garnier, lasted from 1861 to 1875, required 673,295 days' work, and cost £1,440,000. The front is decorated on the ground story by allegorical groups (music by Guillaume; lyrical poetry by Jouffroy; lyrical drama by Perraud; and dancing by Carpeaux) and allegorical statues. In the first story a row of coupled Corinthian columns (each consisting of a single block) forms an open gallery, above which are seven busts of famous musicians, Mozart, Beethoven, &c. Above the architrave of the front appears the dome which covers the auditorium, and behind that rises the vast pediment above the stage decorated at the corners with enormous groups. On the summit of the pediment an Apollo, raising aloft his lyre, is seen against the sky and forms the culminating point of the whole edifice. The sides are not so richly decorated as the front, but each has in the centre an elegant cylindrical pavilion with a carriage entrance. Behind are the buildings occupied by the managers and staff. The interior is decorated throughout in the most gorgeous manner with massive gilding, flamboyant scroll-work, statues, paintings, &c. The grand vestibule with statues of Lully, Rameau, Gluck, and Handel, the grand staircase (an indubitable masterpiece), the *avant-foyer* or corridor leading to the *foyer*, and the *foyer* or crush-room itself are especially worthy of mention. This last, which is 197 feet long, 43 broad, and 59 high, has its ceiling brilliantly painted by Baudry, whose work, however, can hardly be appreciated properly from the excess of light. The auditorium is seated for 2156; its ceiling is painted by Lenepveu. Behind the stage is the *foyer de la danse* or green-room for the ballet, adorned with large allegorical panels and portraits of the most eminent danseuses.

The comic opera has a theatre to itself, L'Opéra Comique; and operettas are played at La Renaissance, Les Bouffes, Les Folies Dramatiques, and Dejazet. The Théâtre Français and the Odéon represent the works of the classical dramatists, as well as modern pieces tragic or comic. Comedy and vaudevilles are played at the Gymnase and the Vaudeville; and the Palais Royal, the Variétés, and the Nouveautés devote themselves especially to farce. Pieces of the popular class, fairy scenes and spectacular displays, are the main attraction of the Châtelet, the Gaiété, the Porte St Martin, and the Ambigu. The Château d'Eau now gives popular operatic performances. Equestrian entertainments are supplied by the hippodrome and three circuses. The café concerts—which during the summer season abound in the Champs Élysées—remove in winter to the Boulevard de Strasbourg and the Montmartre and Poissonnière faubourgs, where there are also some permanent establishments of the kind. Several companies give concerts of classical music on stated days in the winter season; the finest are those of the Conservatoire and the Château d'Eau, Châtelet, and Cirque theatres.

Arrondissements.—The city is divided into twenty arrondissements. Only the first twelve belonged to Paris previous to 1860; the others correspond to the old suburban communes then annexed. The first four arrondissements occupy the space on the right of the river, extending from the Place de la Concorde to the Bastille, and from the Seine to the line of the Grands Boulevards; the 5th, 6th, and 7th arrondissements lie opposite them on the left side; the 8th, 9th, 10th, 11th, and 12th surround the first four arrondissements on the north; the 13th, 14th, and 15th are formed out of the old suburban communes of the left side; and the 16th, 17th, 18th,

19th, and 20th out of the old suburban communes of the right side.

Population and Vital Statistics.—The growth of the population during the last six hundred years is shown in the following table (I.):—

| Years. | Population. | Years. | Population. |
|--------|----------------------|--------|------------------------|
| 1292 | 215,861 | 1841 | 935,261 |
| 1553 | 260,000 | 1846 | 1,053,897 |
| 1718 | 509,000 | 1851 | 1,053,262 ¹ |
| 1755 | 576,000 | 1856 | 1,174,346 |
| 1784 | 660,000 | 1861 | 1,696,741 ² |
| 1800 | 547,756 ¹ | 1866 | 1,825,274 |
| 1817 | 713,966 | 1872 | 1,851,792 |
| 1831 | 785,862 | 1876 | 1,988,806 |
| 1836 | 868,438 | 1881 | 2,269,023 |

The figures for December 1881, like the rest of those in the table, represent the number of people legally domiciled at Paris at the date given, but the number actually present in the city at last census was only 2,239,928 (1,113,326 males and 1,126,602 females).

The following table (II.) shows the distribution of the population in the several arrondissements:—

| Number and Name of Arrondissement | Area in Acres. | Inhabitants. | Houses. | Births (1881). | Deaths (1881). | No. of Inhabitants per Acre. |
|-----------------------------------|----------------|--------------|---------|----------------|----------------|------------------------------|
| 1. Louvre..... | 470 | 75,390 | 2,164 | 1,605 | 1,428 | 160 |
| 2. Bourse..... | 241 | 76,394 | 2,278 | 1,873 | 1,452 | 317 |
| 3. Temple..... | 287 | 94,264 | 2,380 | 2,134 | 2,000 | 328 |
| 4. Hôtel de Ville..... | 387 | 103,760 | 2,404 | 2,724 | 2,473 | 268 |
| 5. Panthéon..... | 615 | 111,444 | 3,208 | 3,033 | 2,780 | 186 |
| 6. Luxembourg..... | 521 | 97,735 | 2,746 | 2,188 | 1,989 | 183 |
| 7. Palais-Bourbon..... | 996 | 83,327 | 2,441 | 1,796 | 1,994 | 84 |
| 8. Elysée..... | 941 | 89,004 | 3,393 | 1,403 | 1,372 | 95 |
| 9. Opéra..... | 526 | 122,896 | 3,480 | 2,597 | 1,887 | 231 |
| 10. St Laurent..... | 766 | 159,809 | 3,773 | 3,879 | 3,646 | 226 |
| 11. Popincourt..... | 892 | 209,246 | 5,539 | 6,472 | 6,654 | 235 |
| 12. Reuilly..... | 1,303 | 102,435 | 4,181 | 2,984 | 2,864 | 79 |
| 13. Gobelins..... | 1,544 | 91,315 | 3,033 | 2,883 | 3,154 | 69 |
| 14. Observatoire..... | 1,147 | 91,713 | 4,372 | 2,071 | 2,782 | 60 |
| 15. Vaugirard..... | 1,782 | 100,679 | 5,229 | 2,915 | 2,981 | 57 |
| 16. Passy..... | 1,752 | 60,702 | 4,406 | 1,265 | 1,265 | 35 |
| 17. Batignolles..... | 1,100 | 143,187 | 5,366 | 3,637 | 3,214 | 130 |
| 18. Montmartre..... | 1,282 | 178,836 | 6,166 | 6,426 | 4,801 | 139 |
| 19. Butte-Chaumont..... | 1,398 | 117,885 | 4,033 | 3,682 | 3,490 | 84 |
| 20. Ménilmontant..... | 1,287 | 126,917 | 5,522 | 4,007 | 3,875 | 99 |
| | 19,177 | 2,239,928 | 77,014 | 59,874 | 57,066 | 117 |

The number of births and of deaths in Paris during the five years 1876–80—278,785 births and 252,500 deaths—apparently shows nothing exceptional as compared with the rest of France. It is to be observed, however, that the population is composed to a larger extent than usual of adults, young children being sent to the country, and old men withdrawing. The number of marriages, 20,993 for 1881, with an average of 18,427 for the five previous years, is rather small for the proportion of marriageable persons. Of the 1,113,326 males in 1881, 621,569 were unmarried, 440,022 married, and 51,735 widowers; of the 1,126,602 females, 557,054 were unmarried, 446,297 married, and 123,251 widows. The subjoined table (III.) shows the proportion of individuals of the various ages specified, in each 10,000 of the inhabitants, according to the census of 1881. It will be seen that the proportion was greater in Paris from 20 to 55, and smaller below and above those ages.

| Age. | Number of Persons | | Age. | Number of Persons | |
|---------|-------------------|------------|----------|-------------------|------------|
| | In Paris. | In France. | | In Paris. | In France. |
| 0 to 5 | 711 | 976 | 50 to 55 | 554 | 546 |
| 5 „ 10 | 642 | 867 | 55 „ 60 | 391 | 483 |
| 10 „ 15 | 671 | 869 | 60 „ 65 | 297 | 415 |
| 15 „ 20 | 849 | 858 | 65 „ 70 | 186 | 317 |
| 20 „ 25 | 1,118 | 874 | 70 „ 75 | 119 | 222 |
| 25 „ 30 | 1,010 | 709 | 75 „ 80 | 67 | 140 |
| 30 „ 35 | 966 | 707 | 80 „ 85 | 22 | 62 |
| 35 „ 40 | 901 | 682 | 85 „ 90 | 9 | 18 |
| 40 „ 45 | 800 | 641 | 90 „ 95 | 2 | 7 |
| 45 „ 50 | 675 | 604 | 95 „ 100 | 0 | 3 |

The following table shows the occupations of the population in 1881:—

¹ The decrease between 1784 and 1800 was due to the Reign of Terror, and that between 1846 and 1851 to the Revolution of 1848.

² The increase in 1861 is largely due to the incorporation of the suburban districts.

TABLE IV.—*Distribution of Population according to Occupation (1881).*

| | Employers. | | Agents or Clerks. | | Workpeople. | | Members of Family living with the Preceding. | | Domestics attached to the Person. | | Total |

| Grand Total..... | | | | | | | | | | | 2,239,918 |

Barely a third (322 per 1000) of the population are Parisians by birth,—38·2 per 1000 having been born in the other communes of the department of Seine, 565 in the other departments of France or in French colonies, and 74·8 abroad. The foreign population shows a tendency to increase; in 1876 330 per 1000 were natives of the department, the proportion of foreigners being only 60. In 1881 the English numbered 10,789; Germans, 31,190; Belgians, 45,281; Dutch, 9250; Italians, 21,577; Swiss, 20,810; Americans, 5937; and other nationalities, 19,154.

The following were the principal causes of death in 1882:—phthisis, 10,342 deaths; diarrhoea, 5095; pneumonia, 4127; congestion of the brain, 2668; organic diseases of the heart, 2873; meningitis, 2605; chronic bronchitis, 2630; cancer, 2251; typhoid fever, 3352; acute bronchitis, 1730; croup and diphtheria, 1805; small-pox, 661; infantile weakness, 1458; senile debility, 1350.

Municipal Administration.—Each arrondissement is divided into four quarters, each of which nominates a member of the municipal council. The functionaries of the arrondissement are—a mayor (*maire*) and three deputies (*adjoints*) nominated by the prefect of Seine, who act as registrars, and preside over the poor-relief (*bureau de bienfaisance*) of their arrondissement, and a justice of the peace

(*juge de paix*) nominated by the Government. There is no elective mayor of Paris: the president of the municipal council, who is nominated by his colleagues, merely acts as chairman of their meetings. When occasion requires, the function of mayor of Paris is discharged by the prefect of Seine. The municipal council discusses and votes the budget of the city. The importance of the business thus transacted will be seen below. The prefect of Seine and the prefect of police (both magistrates named by the Government, but each with a quite distinct sphere of action) represent the executive authority as opposed to the municipal council, which latter has no power by refusing a vote of credit to stop any public service the maintenance of which legally devolves on the city: in case of such refusal the minister of the interior may officially insert the credit in the budget. And in like manner he may appeal to the head of the state to cancel any decision in which the council has exceeded its legal functions. The prefecture of Seine comprises a departmental service, differing in no essential particular from that of other prefectures, and a municipal service for the city of much more importance. Elections, rates, municipal debt, city schools, public lands, municipal buildings, markets and market-places (in respect to the collection of dues), cemeteries, roads and streets, public edifices

water-works and sewers, promenades and plantations, river navigation and river ports, public pawnbroking establishments, and the relief of the poor are all under the control of the prefecture of Seine.

The prefecture of police includes the whole department of Seine and the neighbouring communes of the department of Seine-et-Oise—Mendon, St Cloud, Sèvres, and Enghien. It consists of three sections—political police, police of public safety, and administrative police, the two former being rather national than municipal. The state consequently repays two-fifths of the annual budget of about £800,000 which this prefecture receives from the city.

The municipal police deals with public health, civil order, and repression of crimes and misdemeanours, whether against person, property, or morals. It exercises surveillance over lodging houses, the insane, and prostitutes, tests weights and measures, and has charge of the markets, the public vehicles, the fire department, sanitary arrangements, and exhumations and reinterments in the cemeteries.

The prefect of police has a staff of 8500 officials—*commissaires de police*, *officiers de paix*, *gardiens de la paix* (a kind of police-magistrate), and inspectors. He has also under his orders the *sapeurs pompiers* or fire-brigade (1742 men), and the republican guard, long called the municipal guard, which numbers 3295 men, besides a mounted force of 726. He has full control over the budget of his department, which is voted *en bloc* by the municipal council.

Revenue and Expenditure.—The heaviest item of expenditure is the public debt: the sum at 31st December 1883, represented by the series of annuities terminable in 1950, amounts to a total of £171,730,965. The annuity for 1883 was £3,693,303. Over and above this the city is authorized to have a floating debt of £800,000. The following are in round numbers the main items of the ordinary budget for 1883,—the exact sum varying from year to year:—

| | |
|---|----------|
| Prefecture of police (partly repaid by the state)..... | £950,000 |
| Streets and roads ("voie publique" and "voierie")..... | 999,000 |
| Primary and professional education..... | 890,000 |
| Poor relief..... | 795,000 |
| Water-works and drainage..... | 520,000 |
| Public walks, plantations, and lighting..... | 392,000 |
| Octroi or customs (the main source of municipal revenue)..... | 296,000 |
| Central administration, "mairies," and municipal council..... | 337,000 |
| Architecture and fine arts..... | 212,000 |

By the addition of the expenses of the Collège Rollin (an institution for secondary education belonging to the city), and some miscellaneous expenses of less amount, the ordinary budget for 1883 reached the sum of £10,106,533, and by the further addition of £44,000 belonging to the previous year, a grand total of £10,150,533.

The extraordinary budget shows expenses to the amount of £298,444 on general funds, and £90,000 on special funds. The former is specially devoted to architectural works (rebuilding the Hôtel de Ville) and keeping up streets and roadways, and the latter to the erection of buildings (Sorbonne, faculty of law, and canal St Denis).

The following are the principal items of ordinary revenue:—

| | |
|--|------------|
| Octroi (municipal customs)..... | £5,996,802 |
| Municipal <i>centimes</i> added to the direct contributions..... | 948,805 |
| Municipal share in the profits of the gas company..... | 604,000 |
| Water-rates and income from the canals belonging to the city..... | 442,867 |
| Government subsidy to the municipal police..... | 307,753 |
| Fines, shooting licences..... | 220,110 |
| Revenue for public instruction (legacies, &c.)..... | Unknown |
| Duty on gas supplied to private persons (0.02 fr. per cub. met., about 5½d. per 1000 cub. feet)..... | 225,250 |
| Cab-stands, omnibuses, and tramways..... | 194,937 |
| Government subsidy for the maintenance of the public roads and streets..... | 164,000 |
| Dues from goods exposed for sale in the public markets..... | 180,012 |
| Slaughter-houses..... | 138,136 |
| Householders' street-cleaning tax (<i>taxe de balayage</i>)..... | 108,416 |
| Warehouses..... | 101,492 |
| Sale of burial-lots in the cemeteries..... | 94,284 |
| Stands in the markets and market-places..... | 83,461 |
| Paving and cleaning of the streets..... | 95,717 |
| Ground-rents..... | 62,594 |
| Nightsoil and sewage..... | 56,597 |
| Rent of stands on the public streets..... | 51,752 |

Including less important items, the total ordinary revenue in 1882 was £10,489,373; and the arrears of former years' revenue paid up amounted to £1,218,883.

The extraordinary budget on general and special funds amounts to £6,450,937; but a large proportion of this consists of sums which are carried forward from one fiscal year to another, till the expenses which they are meant to cover are liquidated.

The chief items in the octroi are—

| | |
|------------------------------------|------------|
| Beverages..... | £2,566,118 |
| Eatables..... | 1,232,362 |
| Liquids, other than beverages..... | 608,238 |
| Fuel..... | 463,278 |
| Building materials..... | 525,698 |
| Wood for industrial purposes..... | 246,693 |
| Fodder..... | 204,102 |

Total (1882), comprising other less important items,....£5,986,541

Streets.—The public streets, covering an area of 3577 acres, make a total length of 580 miles, 143 miles being bordered with trees. The municipality is going on with the work of planting as rapidly as possible, though each new tree costs about 48s.

The staff entrusted with maintaining and cleaning the public streets comprises 320 engineers, overseers, and timekeepers, who have under their orders 2123 javiors and roadmen and 3185 permanent and supernumerary scavengers. The maintenance of the streets costs £406,800; that of the pavements and sidewalks, £62,224; cleaning, £259,480. The streets are for the most part paved (1525 acres on January 1, 1883), usually with Yvette sandstone from the neighbourhood of Paris. The most frequented crossings are laid with Belgian porphyry. The metalled roadways cover 445 acres, the asphalted 83 acres, the earthen 26. Wooden paving, previously employed only for 2 acres, was in 1883 laid down in the Champs Elysées, and in 1884 extended to the Avenue de l'Opéra, Rue de Rivoli, the line of the Grands Boulevards, and Rue Royale. Of the total area of 1131 acres occupied by pavements and sidewalks, two-ninths are covered with asphalt, one-third with sand, one-seventh with granite, and the rest with paving-stone.

There are 5070 plugs for the watering of the streets, and 400 water-carts. The annual consumption of water for this purpose amounts to 130,174,478 cubic feet (195 days). The sweeping of the streets in the morning devolves on the householders, and is commuted by payment of a tax (see above); during the day the whole cost falls on the municipality.

The point of greatest traffic in Paris is the Place de la Bastille; one current passing from Rue St Antoine to the Faubourg St Antoine and another from the Grands Boulevards to the railway stations for Vincennes, Lyons, and Orleans. On an average 42,000 carriages and 55,900 draught horses pass through this square in the twenty-four hours. Next in amount of traffic come Rue de Rivoli, 33,232 vehicles; Avenue de l'Opéra, 29,460; Rue du Pont Neuf, 20,668; Boulevard des Italiens, 20,124; Place de l'Etoile, 18,311; Rue Royale, 14,095. The most frequented of the bridges are Pont de la Concorde, 10,003; Pont Neuf, 8519; and Pont d'Austerlitz, 7340.

Means of Conveyance.—Cabs, omnibuses, tramways, steamboats, Conveyance and a railway (the Chemin de Fer de Ceinture) are the local means of transit in Paris.

The steamboats ply up the river to Charenton, down the river to Suresnes. Within the city, in 1882, they plied on 329 days, made an aggregate of 8162 days of service, traversed 479,997 miles, and conveyed 11,170,980 passengers. Outside the limits of the city, up the river, the days were also 329—aggregate days 2265, aggregate distance 123,007 miles, passengers 3,122,593; down the river the days were 329—aggregate days 2356, miles 180,188, and passengers 1,262,680. The omnibus company employs both ordinary omnibuses and tramway-cars. In 1882 it employed 610 omnibuses and 255 tram-cars, conveying 200,187,455 passengers. The two tramway companies distinguished as Northern and Southern have conveyed respectively 26,076,761 and 27,067,951 passengers. The Chemin de Fer de Ceinture, which runs round the city just within the fortifications, conveyed 21,617,909 passengers. As cab-hiring is an open industry (though the cabmen are restricted in their charges by a tariff, and are subject to police control), the movement of the cabs cannot be given exactly. In 1882 the number of horses belonging to private persons and bound to be at the service of the army in case of mobilization was found to be 95,847; in 1878 the number of carriages was 13,372.

Water and Drainage.—Paris derives its water-supply (1) from the Seine and the Marne, (2) from the Ourcq Canal, (3) from artesian wells, and (4) from springs. (1) The two steam-pumps at Chaillot on the Seine raise each at their ordinary rate 635,688 cubic feet and at their maximum 1,518,588 in the twenty-four hours. The ten pumps at Port à l'Anglais and Maisons-Alfort above Paris, at St Ouen below Paris, and at the Quai d'Austerlitz and Anteuil (within the city), can supply about 600,372,000 cubic feet per annum. In 1880 about 2,119,000 cubic feet on an average were taken daily from the Seine. The water is stored in reservoirs at the highest points in Passy, Montmartre, Charonne, and Gentilly. The establishment at St Maur, situated on the canal which closes the loop of the Marne, and partly moved by the head of water and partly by steam, supplies the Bois de Vincennes and the elevated districts of Belleville and Ménilmontant. It can furnish 2,896,000 cubic feet in the twenty-four hours. (2) The Ourcq Canal, which is

also used as a water-way, comes from the department of Aisne, and terminates at the La Villette basin, which also receives the St Denis and St Martin Canals. It brings a volume of 4,414,500 cubic feet per day, to which are added in summer from 2,000,000 to 2,500,000 cubic feet procured from the Marne near the confluence of the Ourcq, and discharged into the canal. The water is hardly suitable for domestic use owing to the quantity of foreign matter which it contains. (3) The water of the artesian wells is much purer. The Grenelle well is 1797 feet deep, and reaches the greensand; its daily yield is 12,360 cubic feet of water at a temperature of 80° Fahr., which rises to a height of 238 or 239 feet, and can thus be carried to the summit of Mont St Geneviève. The Passy well is 1922 feet deep, and yields an average of 233,000 cubic feet in the twenty-four hours. By the hydrometer Seine water registers 18°, that of the Ourcq 28°, that of the Passy well only 9°. A new well is being sunk (1884) at La Chapelle, and another at Butte-aux-Cailles. (4) Till quite recently all the spring water was brought to Paris by two aqueducts. The Arcueil aqueduct, 8 miles long, on the left of the Seine, furnishes 67,100 cubic feet per day; that of Belleville, on the right side, which up to the beginning of the 17th century fed all the fountains of Paris with the waters of Belleville and the Prés St Gervais, now yields only 6000 cubic feet in the twenty-four hours. This insufficiency of spring water has been supplied by the Dhuys and the Vanne, two streams of La Champagne. The former is diverted near Château Thierry (Aisne) and conveyed by an aqueduct 81 miles long into the Mémil-montant reservoirs (354 feet above the sea, or more than 250 feet above the level of the Seine), which consist of two stories, one above the other, with a united capacity of 4,538,000 cubic feet, and usually containing a store equal to five average days' influx. In the valley of the Vanne (a tributary of the Yonne, which it reaches at Sens), Paris has obtained possession of a great number of springs, which, when the rivers are at their lowest, yield in the twenty-four hours 3,531,600 cubic feet of a perfectly pure water at a steady temperature of 52° Fahr. The aqueduct from the Vanne ends at Montrouge at a height of 262 feet, in reservoirs capable of holding 10,594,800 cubic feet, equal to three average days' influx. Every year new works are constructed to increase the quantity of water distributed. In June 1883 the machines raised for the first time 2,825,000 cubic feet on the plateau of Villejuif. The total quantity of water supplied to Paris will now be 20,130,000 cubic feet in the twenty-four hours. The quantity actually required is not less than 14,127,000 cubic feet, or not quite 44 gallons per head of the population, a proportion exceeded in several other great cities. This water is distributed by 66 monumental fountains, 763 *bornes-fontaines* (i.e., smaller fountains or wells, similar in appearance to a boundary stone or milestone), 5249 common street taps, 53 pumps, 181 plugs for the use of the watering carts, 4175 plugs for attachment of watering hose, 363 fire-plugs, 178 cocks at cab-stands, in the Wallace fountains, and the urinals. There is a certain number of fountains not open to the public where water is retailed to the water-carriers; and a large number of private houses have water laid on to their courts, or in many cases to the several stories. The public baths (151 in number) and the washing establishments (263, with 21,911 stands) receive daily 2,353,000 gallons of water. The water-pipes, varying in diameter from a little more than an inch to upwards of 4 feet, the commonest size being about 8 inches, have a total length of 94,904 miles.

Since about the middle of the present century all houses have been bound to discharge their rain and waste water directly into the sewers; but, though these are annually being extended, there are still streets into which they have not been introduced. On the 31st of December 1881 their total length was nearly 441 miles. The drainage of both sides of the river is collected in a great sewer ending in the Seine at Clichy opposite Asnières; the main sewer of the left side of the river is connected with that of the right side by a siphon which passes under the Seine by a tunnel near the Pont de l'Alma. A departmental sewer, receiving the waters of the elevated districts of Charonne, Mémilmontant, Belleville, and Montmartre, terminates at St Denis. These sewers are much more than great drains: they are used as passages for water-pipes, gas-pipes, telegraph wires, and pneumatic tubes. The two largest classes of them have a height respectively of 14½ feet and 17 feet 6 inches at the keystone, and a width respectively of 18 feet 5 inches and 17 feet at the spring of the arch. The smallest class is only 6 feet high and 3 feet wide. The most usual class, of which there are 171 miles, has a height of 7½ feet and a width of 4½ feet.

The sewage from these mains is partly employed in irrigation in the plain of Gennevilliers on the left bank of the Seine opposite St Denis and Clichy. At the close of 1881 1216 acres were under treatment, though the system was only commenced in 1872 on a tenth of that area; and the drains employed, varying from 1 to 4 feet in diameter, had an extent of 21 miles, and discharged the sewage by 571 outlets. The quantity of sewage discharged daily by the sewers varies from 10,171,000 cubic feet to 13,112,266 cubic feet (1881). The amount absorbed by irrigation varies according to the season. Thus in May 1881 it was 95,907,555 cubic feet, and in

September only 15,719,780 cubic feet. The daily average throughout the year shows 54,935,945 cubic feet, watering 213 acres.

The value of the land (originally sandy) at Gennevilliers has considerably increased since the introduction of this system. The rent of a hectare (2·47 acres), which was 152 francs between 1665 and 1870, reached 300 francs in 1878 and 450 in 1880. The cultivation of the plain gives employment to 1350 hands, and the population of the commune has steadily increased—1897 in 1872, 2369 in 1876, 3192 in 1881. The municipality proposes to extend this system of irrigation, which absorbs only a part of the sewage to the foot of the St Germain forest, and thus to utilize the masses of foul water which still go to pollute the Seine.

Nightsoil is collected in three different ways:—(1) in cesspools of mason-work, which ought to be watertight and to communicate with the open air by a ventilating pipe rising above the tops of the neighbouring houses; (2) in movable buckets, placed in suitably ventilated cellars; (3) in filtering tinettes, which discharge their liquids directly into the sewer. On the 31st December 1882 the number of cesspools was 66,610, of movable buckets 14,952, and of tinettes 17,033. The nightsoil contractors have to be authorized by the prefect of Seine. The cesspools must not be emptied except by night. The quantity removed in 1881 was 39,797,810 cubic feet—35,098,453 cubic feet from the cesspools, 3,682,187 from the movable buckets, and 1,017,170 from the tinettes.

Lighting.—The lighting of Paris is practically in the hands of the gas company, electric lighting being still in the experimental stage (28 burners in the public streets in 1882), and oil being used only in a small and ever-diminishing number of out-of-the-way streets (472 burners in 1881). The gas company manufactured in 1861 2,974,690,553 cubic feet of gas, in 1875 6,213,435,025 cubic feet, and in 1882 9,726,709,281 cubic feet, this last quantity being obtained from 917,867 tons of raw material (10,597 cubic feet per ton). The gas mains belonging to the company make a total length of 1222 miles; those in the public streets feed 42,514 burners, consuming 1,301,226,027 cubic feet for public lighting. The company further supplies 7,163,994,098 cubic feet to 154,962 private customers in the city, and 600,208,654 cubic feet to 53 communes in the outskirts. About 660,593,880 cubic feet, or 6·8 per cent., is lost in transmission. The daily consumption reaches a maximum (36,005,949 cubic feet) in December and a minimum (14,073,112 cubic feet) in July.

Public Instruction.—The so-called *salles d'asile* are infant Eudene schools for children from three to six years of age, i.e., from the time when their mothers place them in the *crèches* or day-nurseries (see below) and the time when they may be admitted to the primary schools. The municipality maintains 126 secular *salles d'asile* receiving 15,939 children, and one *salle congréganiste* (i.e., under the management of a religious society) with 279 children. The private establishments comprise 23 secular "salles" with 1243 children, and 39 congréganist "salles" with 4231.

In 1882 the municipality supported 173 primary secular schools (56,369 pupils) for boys, 161 secular schools (46,579 pupils) and 2 congréganist schools (765 pupils) for girls. The private primary schools are 183 secular schools and 70 congréganist for boys, 577 secular schools and 136 congréganist for girls,—number of pupils unknown. At certain hours the primary schools are transformed into classes for adults—116, with 14,288 pupils. The "higher schools" (*écoles supérieures*) supply education for industrial or commercial careers. They have 677 pupils between six and thirteen years of age and 2956 above thirteen, who are distributed among the Collège Chaptal and the Turgot, Lavoisier, Colbert, J. B. Say, and Arago schools. The apprentice school (*école d'apprentis*) with 228 pupils, the normal schools (for males, 205 pupils; for females, 68 pupils), and the Pape-Carpentier school, which trains matrons for the *salles d'asile*, complete the list of the municipal establishments for primary education. Besides there are private normal schools for Protestant teachers (male and female), a private normal school for girls, normal classes for ladies under the auspices of the Society for Elementary Instruction, and professional schools for both girls and boys. Commercial instruction is given in two schools placed under the patronage of the chamber of commerce, and a special commercial high school established about 1880. In 1881 a fund was established for placing indigent but deserving pupils in free primary boarding-schools, at the expense of the city. Between Oct. 1881 and Oct. 1882 494 pupils were thus dealt with at a cost of £9367. Municipal libraries, subsidized by the city, have been established in all the arrondissements; in 1882 they lent 401,415 works, the number of books contained in the libraries being 89,355.

Secondary education is provided by the municipal Collège Rollin; in the national lycées (Louis le Grand, Henry IV., St Louis, and Vanves), which have both boarders and day pupils; the Charlemagne and Condorcet lycées, for day pupils only; and the Collège Stanislas, more especially for boarders. It is between these establishments, subjected to the same university programme, and the Versailles lycée that the great competition of the Sorbonne takes place at the close of each school year. The number of their pupils in 1882 (Stanislas

excepted) was 8048. Among the private establishments giving secondary education mention must be made of the Collège Ste Barbe, the Monge, Bossuet, Fénélon, and Messillon schools, the old Jesuit colleges at Vaugirard, Rue de Madrid, and Rue Lhomond, the two lesser seminaries of Notre Dame des Champs and St Nicolas, and numerous institutions preparatory for the examinations and special schools. In 1881 there were 11,608 pupils in the secular and 15,811 in the ecclesiastical establishments, of which 1584 in addition attended a lycée course. For some years there have been at the Sorbonne special classes for young ladies, but the secondary education of girls is only beginning to be organized. Higher education is given in the faculties of science, literature, and Catholic theology, which are together in the Sorbonne, and in the faculties of law and of medicine, each of which is by itself. There is also a faculty of Protestant theology, transferred to Paris from Strasburg. These faculties confer the degrees of bachelor, licentiate, and doctor. The Catholic Institute, a private foundation, has faculties of law, literature, and science, but has no right of conferring degrees. The Sorbonne, the seat of the Academy of Paris and of its rector, who is the head of the whole educational system, contains a library of 100,000 volumes belonging to the university, and a well-appointed museum of physical science, and laboratories. The school of law has a library of 30,000 volumes and the school of medicine 60,000 volumes, forming the most complete medical collection in the world. Connected with the school of medicine are the Orfila museum of comparative anatomy, the Dupuytren pathological museum, the practical school of anatomy, and a botanic garden, and the midwifery schools of the Maternity and De la Pitié hospitals; the higher school of pharmacy and the dissecting amphitheatre for hospital students are also affiliated institutions.

Whilst the "faculties" are specially intended to prepare for and confer university degrees (though their lectures are open to the public), the Collège de France is meant to give instruction of the highest order to the general public (men or women); and the various sciences are there represented by thirty-seven chairs. The École des Hautes Études supplements the theoretical instruction provided by the public lectures of the higher education by practical training. The upper normal school is for the training of "professors" for secondary classical education and for the faculties. The École des Hautes Études Ecclésiastiques prepares ecclesiastical "professors" for the institutions and lesser seminaries which supply secondary education, and are placed in the hands of the clergy. The free school of the political sciences prepares more especially candidates for administrative employments (council of state, &c.). The École des Chartes trains record-keepers in the reading and study of ancient documents. The school of living Oriental languages teaches the principal languages from Russian and Modern Greek to Malay, Chinese, and Japanese. The Polytechnic school (École Polytechnique) trains military and naval engineers for the artillery corps, the corps of engineers, and the navy-yards, and civil engineers for the national corps of the roads and bridges, the mines, and the state manufactories (tobacco, powder, and saltpetre). As for infantry and cavalry officers, they usually come from the special military school of St Cyr, when they do not rise from the ranks. In Paris too are situated—the École Supérieure de Guerre; the practical schools of roads and bridges and of mines, for the training of civil engineers, with libraries and collections of models and classes in some cases open to the public; the École d'Application des Tabacs; the school of railway medicine and pharmacy. The central school of the arts and manufactures, though some years ago it became a Government institution, still educates engineers for ordinary industrial careers. The school of the fine arts (École des Beaux Arts), intended for painters, sculptors, and architects, contains valuable collections, which render the palace in which they are exhibited one of the most interesting museums in Paris. The instruction in this institution is at once theoretical and practical. It is open to all Frenchmen from fifteen to thirty years of age, and even in some cases to foreigners. Of the various competitions open to the pupils the most important is for the *prix de Rome*. The successful competitor is rewarded with four years' residence in Italy at Government expense, two years being spent at the Medici palace in Rome. Schools of design for boys and girls serve as preparatory for the school of the fine arts, or train designers for industrial occupations. There is a free school of architecture. Music and elocution are taught at the Conservatoire, which possesses a musical library, and a very curious collection of musical instruments. The diocesan seminary of St Sulpice receives clerical pupils from all France to the number of 200; the foreign mission seminary trains missionaries for the far East, and the seminary of St Esprit missionaries for the French colonies. The Lazarists have also a novitiate of their own. The Irish, English, and Scotch colleges, as their names suggest, prepare priests for the Roman Catholic dioceses of the United Kingdom.

A district at one time almost exclusively occupied by students and known as the Quartier Latin or Pays Latin was situated on the left side of the river mainly in the arrondissement of Luxembourg; the old houses have, however, been almost entirely

demolished since about 1850. It corresponded on the whole to the pre-Revolutionary quarter of St Benoît or the University, otherwise called the Faubourg St Jacques. The most distinctive portion lay between Rue St Jacques and Boulevard St Michel. Rue de la Harpe opens into Boulevard St Michel; and Rue du Foulard frequently mentioned in mediæval and Renaissance writers, strikes N. E. from Rue St Jacques. The students now live for the most part in the vicinity of Sorbonne and the schools of medicine and law. They frequent the cafés and beershops of Boulevard St Michel and its neighbourhood.

The principal libraries in Paris have already been described under LIBRARIES (vol. xiv. pp. 524-6), and an account of the observatory will be found in vol. xvii. p. 712.

The Bureau des Longitudes, which was founded in 1795 for the advancement of astronomy and navigation, and publishes the *Connaissance des Temps*, is located at the Institute. The meteorological office and observatory is situated in the Montsouris Park, and in connexion with it is a school of nautical astronomy and practical geodesy. The observatory for physical astronomy is at Meudon.

The Conservatoire des Arts et des Métiers, in the old priory of St Martin des Champs, was founded (1794) as a public repository of machines, models, tools, plans, descriptions, and books in regard to all kinds of arts and trades. Various courses of lectures on the applications of science to commerce and industry have been added from time to time; they are all open to the public without fee, and are addressed rather to workmen and artisans than to the wealthy or learned. The Agronomic Institute has recently been removed to the Conservatoire.

The Jardin des Plantes (1626), about 75 acres in extent, forms Jardins one of the most interesting promenades in Paris; its museum of natural history (1793), with its zoological gardens, its hothouses, plantations, and greenhouses, its nursery and naturalization gardens, its museums of zoology, anatomy, anthropology, botany, mineralogy, and geology, its laboratories, and its courses of lectures by the most distinguished professors in all branches of natural science, make it an institution of universally acknowledged eminence.

Learned Societies.—Among the learned societies of Paris the first in importance is the Institut de France, which has already been described (see INSTITUTE OF FRANCE, vol. xiii. p. 160). The committee of learned societies at the ministry of public instruction forms, as it were, the centre of the various societies not maintained by the Government; and the French Association for the Advancement of the Sciences, founded in 1872, is based on the model of the older British society, and like it meets every year in a different town. The other societies may be classified as follows:—1. *Historical or Geographical*—History of France, Antiquaries of France (till 1814 known as Celtic Academy), Historic Studies, Numismatics and Archaeology, Bibliophiles, School of Charters, Ethnography, Geography (1821, and thus the oldest of its class), Asiatic (1822), French Alpine Club (Club Alpin); 2. *Natural and Medical Sciences*—Anthropology, Zoological Acclimatization (which has the direction of the zoological gardens in the Bois de Boulogne), Entomological, Geological, Surgery, Anatomy, Biology, Medical of the Hospitals, Legal Medicine or Medical Jurisprudence, Practical Medicine, Pharmacy, Agriculture, Horticulture; 3. *Industrial and Moral Sciences*—Encouragement of National Industry, Statistics, Elementary Instruction, Franklin (for the foundation of popular libraries); 4. *Positive Sciences and Fine Arts*—Philomathic, Physical, Philotechnic, Athenæum of the Arts, Sciences, and Literature (1792), Concerts of the Conservatoire de Musique (1795).

Newspapers.—Paris is very largely supplied with newspapers of all descriptions. See NEWSPAPERS, vol. xvii. pp. 423-8.

Museums.—The richest museum in Paris occupies the Louvre, the finest of its palaces. On the ground floor are museums (1) of ancient sculpture, containing such treasures as the Venus of Milo, the Pallas of Velletri (the most beautiful of all statues of Minerva), the colossal group of the Tiber, discovered at Rome in the 14th century, &c.; (2) of mediæval and renaissance sculpture, comprising works by Michelangelo, Jean Goujon, Germain Pilon, John of Bologna, &c., and special rooms devoted to early Christian monuments and to Jewish antiquities (this last a feature peculiar to the Louvre); (3) of modern French sculpture, with works by Puget, Coustou, Coysevox, Chaudet, Houdon, Rude, David of Angers, &c.; (4) of Egyptian sculpture and inscriptions; (5) of Assyrian antiquities; (6) of Greek and Phœnician antiquities; (7) of engraving. On the first floor are (1) the Lacaze museum, a magnificent collection of pictures presented to the state by M. Lacaze in 1869; (2) the splendid musée de peinture; (3) the Campana museum; (4) a museum of Greek antiquities; (5) a museum of Egyptian antiquities; (6) an Oriental museum (Persian pottery, Chinese vases, lacquered work, &c.); (7) the Lenoir museum (snuff-boxes, jewels, miniatures, lacquered wares, bequeathed to the Louvre by M. and Madame Lenoir

¹ As the National Society of Agriculture, in contrast to nearly all the other societies, consists of only a limited number of persons named by the Government, to be a member of this corporation has a distinct value similar (though at a considerable remove) to that of being a member of the Institute.

in 1874); (8) the Duchatel room, bequeathed by the widow of the minister of that name (*La Source*, a masterpiece by Ingres); (9) the Tiobal, His de la Salle, and Davilliers collections, consisting respectively of furniture drawing and curiosities, drawings, and pottery, furniture, and tapestry; (10) a mediæval and renaissance museum, comprising French, Italian, or Hispano-Moorish pottery and terra cotta ware, as well as objects in bronze, glass, and ivory—the Sauvageot collection being of note; (11) the museum of drawings and chalks, of which the more valuable are preserved in drawers; (12) a museum of ancient bronzes; (13) the Apollo gallery, adorned by the leading artists who have been employed on the palace, and containing the royal gems and jewels, articles of goldsmith's work, and enamels. The second floor accommodates the naval museum, the ethnographic museum (African, Chinese, Mexican), part of the French school of painting, and rooms for the study of Egyptian papyrus-rolls.

The museum of the Luxembourg, installed in a portion of the palace occupied by the senate, is devoted to works of living painters and sculptors acquired by the state. They remain there for ten years after the death of the respective artists, that the finest may be selected for the Louvre.

The Cluny museum occupies the old mansion of the abbots of that order, built in the 15th century by Jacques d'Amboise. It was founded by M. du Sommerard, whose collections were acquired by the state in 1843. Increased from year to year since that date, it now contains about 10,000 articles—pieces of sculpture in marble and stone, carvings in wood, ivories, enamels, terra cottas, bronzes, furniture, pictures, stained glass, pottery, tapestry, glass ware, lock-smith work, and jewellery of mediæval and Renaissance times. In the neighbourhood are the remains of the ancient palace of the emperor Julian; in the midst of the ruins, and in the garden which surrounds them, has been collected a Gallo-Roman museum, to which have been added many fragments of mediæval sculpture or masonry, found in the city or its vicinity. The Carnavalet museum occupies the mansion in which Madame de Sévigné resided; it is a municipal museum, in which are brought together all objects of interest for the history of Paris. The artillery museum, in the Hôtel des Invalides, comprises ancient armour, military weapons, flags, and an ethnographic collection reproducing the principal types of Oceania, America, and the coasts of Africa and Asia. The permanent exhibition of the products of Algeria and the colonies is in the Palais de l'Industrie; and finally the Trocadéro palace contains a museum of comparative sculpture and ethnographic galleries for exhibiting curiosities brought home from distant countries by the principal French official travellers.

Public Charity—Hospitals, &c.—The administration of public charity is entrusted to a responsible director, under the authority of the Seine prefect, and assisted by a board of supervision consisting of twenty members. The funds at his disposal are derived (1) from the revenue of certain estates, houses, farms, woods, stocks, shares (£250,680 in 1882); (2) from taxes on seats in the theatres (one-tenth of the price), balls, concerts, the Mont de Piété, and allotments in the cemeteries (£252,117); (3) from subsidies paid by the town, the department, and the state (£976,368); (4) from other sources (£522,398, including £130,787 from voluntary donations). The charges on the administration consist of "outside

relief" to the poor (*secours à domicile*) the "service" of the hospitals, and the support of charity children. In each arrondissement there is a *bureau de bienfaisance*, consisting of the *maire*, his assistants, twelve administrators, and an indefinite number of ladies and gentlemen (known as *commissaires* and *dames de charité*) who give voluntary and gratuitous assistance. The secretary and treasurer is a paid official; and 180 doctors, 110 midwives, and 207 *religieuses*, distributed among fifty-eight houses of relief (*maisons de secours*), are employed in the service of the bureaux, which in 1880 received 104,236 applications for aid presented by 63 "visitors." The expenses for that year amounted to £69,843 for food, £13,140 for clothing, £6114 for fuel, £29,361 for medicine and medical advice, £15,032 for other assistance in kind, and £83,843 for assistance in money. The pauper population, enumerated every three years, consisted in 1880 of 123,735 persons (53,591 males, 70,144 females) in 46,815 families, or at the rate of 1 person for every 16·07 inhabitants in the city,—an increase of 3153 families and 10,418 persons since 1877, and 10,102 families and 33,448 persons since 1861. Of the families assisted in 1880, 18,125 obtained temporary relief and 23,690 relief throughout the entire year. This destitute class is very unequally distributed among the several arrondissements. Whilst in the 9th arrondissement there is only 1 pauper in 50 inhabitants, and in the 1st, 8th, and 2d 1 pauper in 46, 45, and 44 inhabitants, in the 13th arrondissement there is 1 in 7, in the 20th 1 in 8, and in the 19th 1 in 9. The paupers are for the most part under sixty years of age, and occupy single rooms, at a rent of from £4 to £8 per annum, generally with a single fireplace and a single bed. There are usually no children under fourteen years of age.

The doctors in 1880 gave 453,036 consultations at the dispensaries, and performed vaccination in 31,549 cases. The midwives attended 5126 women boarding in their houses for their confinement, and gave assistance to 14,178 during pregnancy. Domiciliary visits were paid by the medical staff in 1880 to 30,322 patients and to 48,269 necessitous persons.

The doctors, surgeons, chemists, both resident and non-resident, connected with the hospitals, are all admitted by competitive examination. In 1880 the staff for the hospitals of Paris and the auxiliary hospitals of Ferges, Garches, and Roche Guyon (Seine-et-Oise), and Berck (Pas de Calais) consisted of 32 doctors or surgeons at the central office of admission, 118 hospital doctors or surgeons, 8 doctors for the insane, 18 chemists, 291 internes, 1470 externes, 575 probationers, and 9 midwives or midwives' assistants. The hospitals are classified as general hospitals—Hôtel Dieu, Pitié, Charité, Saint Antoine, Necker, Cochin, Beaujon, Lariboisière, Tenon, Laennec, Tournelles; special hospitals—St Louis (skin diseases), Midi or South (venereal diseases, men), Lourcine (venereal diseases, women and children), Maternity, Clinical (operations); children's hospitals—Enfants Malades, Trousseau, Berck-sur-Mer, La Roche-Guyon; hospices—Bicêtre (old men), La Salpêtrière (old women), Ivry (incubables); maisons de retraite—Issy, La Rochefoucauld, Ste Péline; fondations—Boulard St Michel, Brézin at Garches (for ironworkers), Devillas, Chardon Lagache, Lenoir-Jousseran; and asylums for the insane—Bicêtre (men), Salpêtrière (women). The following table (V.) gives details regarding these institutions in 1882:—

| | No. of Patients, 1st January 1882. | Entered during the Year. | Left during the Year. | Deaths. | Remaining on 31st December. | No. of Patient Days. | Mean Length of Term. | Mortality. |
|---------------------------------------|---------------------------------------|-----------------------------|--------------------------|---------|--------------------------------|-------------------------|-------------------------|------------|
| General hospitals | 6,097 | 79,106 | 67,375 | 11,839 | 6,489 | 2,932,302 | 29·28 | 6·94 |
| Special hospitals | 1,532 | 21,794 | 20,974 | 781 | 1,571 | 775,542 | 25·70 | 27·85 |
| Children's hospitals | 1,536 | 9,454 | 7,726 | 1,721 | 1,543 | 736,763 | 62·19 | 5·47 |
| Maison de Santé | 210 | 3,140 | 2,644 | 541 | 185 | 122,186 | 25·60 | 5·88 |
| Temporary service of the hospices... | 113 | 872 | 603 | 140 | 242 | 61,709 | ... | ... |
| Grand total for the hospitals | 9,488 | 114,366 | 99,322 | 14,522 | 10,010 | 4,628,502 | 31·24 | 7·86 |
| Hospices, retraites, and fondations.. | 8782 | 6,311 | 4,979 | 1,413 | 9,201 | 3,561,342 | ... | 7·29 |
| Hospitals for Insane— | | | | | | | | |
| Bicêtre (men) | 652 | 426 | 303 | 105 | 665 | 293,016 | ... | 10·18 |
| Salpêtrière (women) | 711 | 266 | 205 | 64 | 708 | 330,525 | ... | 15·14 |

Several of the hospitals are of recent construction—Hôtel Dieu, Tenon, Lariboisière. The Hôtel Dieu was rebuilt in La Cité at an outlay of £1,800,000, or £4000 per bed; the arrangements for practical education are excellent, and secure the institution a world-wide reputation. La Salpêtrière (oldest of all the hospital buildings) is remarkable for its extent, occupying 74 acres, with 45 large blocks lighted by 4682 windows.

The benefits of the hospitals or hospices are generally given gratuitously, but a certain number of patients pay their expenses, and in 1880 the funds of the department were in this way augmented by £89,262. In connexion with these establishments are a bakery, a slaughter-house, a wine cellar, a central drug-store, a purveyor for purchasing provisions in the open market, a central dépôt for bedding, linen, clothing, furniture, and utensils: and a certain number

of articles are retailed to other departments or private institutions.

Foundlings and orphans are sent to the Hospice des Enfants Assistés, which also receives children whose parents are patients in the hospitals or undergoing imprisonment. In 1882 the hospice received 9620 children; the inmates from the preceding year numbered 274. Of these children 2549 were restored to their parents, 2814 were boarded out in the country, 561 died, and 2594 were

¹ The internes and externes are two grades of medical students—the internes the higher of the two and limited in number. Many doctors of medicine have not passed the *internat*.

² The mortality is here stated for the mean number present on the 1st of January and admitted during the year,—one death for 6·94, &c., of this mean number. The larger the number in the table the less, of course, is the mortality.

formally enrolled among the *enfants assistés*, or charity children. There are in the hospice 102 resident wet-nurses; infants, however, are not kept in the institution, but are boarded out with nurses in the country, of whom 1707 were engaged under the supervision of 361 matrons. Up to twelve years of age these children are kept at the expense of the department of Seine, and they remain under the guardianship of the poor-board till twenty-one years of age. On December 31, 1882, there were 13,861 children of the first class and 12,135 of the second distributed among 32 agencies and 257 medical circuits situated in Nivernais, Burgundy, Bourbonnais, Normandy, Artois, Picardy, and Brittany.

The Quinze-Vingts still gives shelter to the 300 (fifteen score) blind for whom it was founded by St Louis, and gives outdoor assistance to 1550 besides. The blind asylum for the young (Institution des Jeunes Aveugles) has 250 pupils (one-third girls, two thirds boys); the course of study lasts for eight years; most of the pupils are bursars of the state or the departments; some pay a small fee; suitable trades are taught. The deaf-mute institution is for boys only, and they are generally paid for by the state, the departments, and the communes. During a course of seven years they are taught articulation and lip-reading. The Charenton asylum for the insane receives 300 male and 280 female patients, most of them paying for their board, and classed according to their means. Those of Vincennes (522 beds for male patients) and Le Vesinet (300 beds for female patients) take in convalescents from the hospitals sent by the charity boards or friendly societies which subscribe to the institution. The Hôtel des Invalides is for old and infirm soldiers. The pensioners, who have numbered at times as many as 5000, are now only a few hundred, and their immense edifice accommodates the École Supérieure de Guerre, the artillery museum, the galleries for plans in relief of fortified posts, and numerous storehouses of the war department. Under the dome of the Invalides is the tomb of Napoleon I., and in the church the funeral obsequies of distinguished soldiers are performed. There are four military hospitals in Paris—Val de Grâce (960 beds for all ranks), Gros Caillon (630 beds), Saint Martin (425 beds), and Vincennes (630).

Private beneficence maintains a great variety of institutions in Paris. There are 30 *crèches* or day-nurseries in the city and 14 in the suburbs (capable of accommodating respectively 1093 and 393 infants), where mothers who have to go out to work may leave their infants under two years; they are under the direction of the sisterhood of St Vincent de Paul. The Society of St Vincent de Paul, which must not be confounded with the sisterhood, is a society of laymen founded in 1833 and divided into as many conferences as there are parishes, for the purpose of visiting the poor and giving them advice and assistance. The Société Philanthropique distributes food rations in its "kitchens" by means of a system of cheap tickets. The Société de Charité Maternelle devotes its attention to women in childbed; the Petites Sœurs des Pauvres have five houses for poor old men, for whom they collect scraps from the restaurants. The Frères St Jean de Dieu take care of children suffering from incurable diseases. A large number of institutions known as *suoirs* or workrooms bring up orphan and destitute girls and fit them for various industrial occupations, especially the use of the needle. The night asylums offer shelter to the homeless. The Society for the Protection of the Alsace-Lorrainers, and the charity office of the British embassy, are naturally limited to special nationalities. Friendly societies, supported by ordinary subscriptions, donations from honorary members, and state subsidies, are numerous; they give assistance to their members when they are sick or out of work, and pay their funeral expenses.

An evangelistic mission, commenced in 1872 by the Rev. R. W. M'All in the district of Belleville has met with remarkable success. By 1884 it had between thirty and forty stations in Paris and the suburbs, and had extended its activity to various towns in the provinces, to Corsica, and to Algiers. Its income in 1883-4 was £10,607. Homes for English girls were established in 1872 by Miss Ada Leigh, and the association to which they have since been transferred has been presented with an orphanage by M. Galignani.

The Mont de Piété is a national pawnbroking establishment. Charging 9 per cent. for working expenses, it hands over all its proceeds to the public charity funds. The average number of articles pawned per day is 5205, of which 5 only are of suspicious origin (theft); the average sum lent on each was 23 francs in 1881. When the depositor does not redeem his pledge or purchase a renewal the article is sold. In 1882 there were 1,669,582 new transactions and 664,617 renewals, while 1,401,944 articles were redeemed, and 214,840 sold,—the loans amounting respectively to £1,619,621, £676,671, £1,320,838, and £144,315. If the sale involves a loss this falls on the agent who overestimated the value when the article was deposited; any profit, on the contrary, is divided between the administration and the person concerned.

The Caisse d'Épargne, or savings bank, the natural complement of the Mont de Piété, was founded in Paris in 1818. It began that year with 351 depositors, and deposits to the amount of £2153; in

1882 it had 440,728 depositors, and owed them £2,513,432. The new deposits for the year reached a sum of £1,874,697, and the repayments £1,236,060. The number of new pass-books issued was 63,146, of accounts closed 24,228. Three per cent. interest was paid to the depositors. The maximum deposit is £80.

Law and Justice.—Paris is the seat of four courts having jurisdiction over all France:—(1) the Tribunal des Conflits, for settling disputes between the judicial and administrative authorities or questions as to their respective jurisdiction; (2) the Council of State, for litigations between private persons and public departments; (3) the Cour des Comptes; and (4) the Cour de Cassation. The first three sit in the Palais Royal, the fourth in the Palais de Justice, which is also the seat of (1) a cour d'appel for seven departments (five civil chambers, one chamber of appeal for the correctional police, one chamber for preliminary proceedings), (2) a cour d'assises (members nominated for a term of three months; two sessions per month), (3) a tribunal of first instance for the department of Seine (seven civil chambers for civil affairs, sequestration of real estate, and sale of personal property; four chambers of correctional police), (4) a police court where each *juge de paix* presides in his turn assisted by a *commissaire de police*. Litigations between the departmental or municipal administrations and private persons are decided by the *conseil de préfecture*.

The prefect of police, charged with the maintenance of public safety, has the prison department under his supervision. There are eight prisons in Paris—Mazas, La Santé, Ste Pelagie, St Lazare (for females), the dépôt (police station) of the prefecture of police, the Conciergerie or lock-up at the Palais de Justice, the Grande Roquette (for condemned criminals), and the Petite Roquette reformatory. In 1882 there passed through these prisons 108,231 prisoners (83,022 men, 25,209 women), the daily average being 5529. Out of the total number, 30,990 were kept in solitary confinement, and 2905 (males) worked in company by day and were placed in separate cells at night. The prisons also received 1067 young children who accompanied their mothers, and 732 children lost in the streets. The mendicity-station at Villers-Cotterets (Aisne) has besides a daily roll of 919 prisoners (male and female). In the so-called House of Repression at St Denis are confined those mendicants who cannot be removed to Villers-Cotterets, or those discharged prisoners who have not acquired a sufficiency for their immediate necessities; 3240 persons passed through St Denis in 1882. The same year 46,457 persons were arrested in Paris,—44,955 being taken *flagrante delicto* or arrested as vagabonds; 41,207 were brought before the judges. Of the whole number eight-ninths were males. Against five-ninths no previous charge had been made: 899 were ticket-of-leave men, 3291 were foreigners (959 Belgians, 759 Italians, 376 Swiss, 379 Germans, and 126 English). The most frequent causes of arrest were—vagabondism and begging, 16,985; theft in its various forms, 8604; rioting, 5619; assaults and acts of violence, 1338; offences against morals, 825; breach of certificate by ticket-of-leave men, 899; murders, assassinations, and assault by night, 330; drunkenness, 312.

The prefect of police has the control of the locating, discharging, or maintaining of the insane in the six public asylums of Ste Anne, La Salpêtrière, Bicêtre, Charenton, Vaucluse, and La Ville Evrard,—the last two situated in the department of Seine-et-Oise. The financial and administrative management of these establishments is entrusted to the prefect of Seine. At the 1st of January 1882 there were in the different asylums 8260 lunatics, and during 1882 3670 were admitted, while 3938 left or died. Private asylums for the insane cannot be opened within his prefecture without the permission of the prefect of police. Children put out to nurse, and women wishing to be engaged as wet-nurses, are also under his supervision. In 1881 18,627 infants were registered by their parents as requiring to be put to nurse in the various departments; on December 31, 1881, 4393 infants under three years of age were out at nurse within the prefecture; 407 died during the year. An institution of a reformatory character commenced operations on January 1, 1881. In 1881 and 1882 it received 1644 children—1131 brought by their parents, 262 by the magistrates, and 251 by the prefect of police. On December 1882 there remained 1330 children boarded out in the country. The expense for the two years was £18,160.

Establishments which are dangerous or unhealthy are of three classes, according as they have to be kept absolutely at a distance from dwelling-houses or simply subjected to certain precautions. They can be opened only with the permission and under the surveillance of the prefect of police. The first class comprises slaughter-houses, nightsoil reservoirs, vitriol works, &c. In 1882 there were of all the three classes 3049 establishments within the city of Paris; in 1881 there were 2922 in the suburban communes. The shops for mineral oils (3615) and those for mineral waters (1133) are also subject to inspection, and the groceries, drug-stores, and chemists' shops in which medicines are sold (9224) are under the supervision of the upper school of pharmacy. Steam machinery, (3317 machines, of 29,529 horse-power) which must be registered, is inspected by the engineers.

Eighty local committees—forty composed of men and forty of women—are entrusted with the duty of visiting the 12,316 workshops in which 27,402 children are employed (16,945 boys or girls between twelve and sixteen years of age, and 10,336 girls between sixteen and twenty-one, *i.e.*, still minors). Street porters (*commissionnaires*), rag-pickers, hawkers, and lodging-house keepers are under police surveillance. The bodies of the drowned or of those who have died in the streets are conveyed to the Morgue, where *post-mortem* examinations are performed at the command of the court, and lectures delivered on medical jurisprudence. The number of bodies is increasing (718 in 1878; 879 in 1882). Of this total 673 were adults (committed suicide, 219; killed by accident, 105; murdered, 45; died suddenly, 56). Drowning is the most frequent cause of death (321 cases). Of the 673 adults 588 were identified; the 85 unidentified were photographed before burial.

Cemeteries.—A corpse cannot be buried in Paris without a certificate from a medical man who has ascertained that death has really taken place; and at least twenty-four hours must be allowed to elapse. In most cases (30,825 out of 57,871 deaths) the families are too poor to pay any funeral expenses, and the body is consequently buried free of charge. Other interments are divided into nine classes, the cost of which ranges from 15s. to £287, without counting secondary and religious expenses. There are twenty cemeteries in Paris or outside the gates. Père la Chaise, the most extensive, contains 106½ acres; it is there that the most illustrious personages are generally buried. In 1882 the number of interments was no less than 3043 (all permanent). Montmartre, or the Northern Cemetery (26 acres), received 970 (all permanent); Montparnasse, or the Southern Cemetery (46 acres), 1945 (10 being temporary). The two cemeteries of St Ouen (61 acres) received 12,462 gratuitous and 5761 temporary interments, but only 10 permanent; and the two cemeteries at Ivry (69 acres) 20,380 gratuitous interments and 7038 temporary. It is towards St Ouen and Ivry that most of the funerals now make their way and those graveyards, though but recently formed, will before long prove insufficient. The other Paris cemeteries are due to the incorporation of the suburban communes in 1860. The little graveyard at

Picpus is the property of a few families. Old cemeteries, long ago abandoned, in the heart of the city have gradually been built over. The bones found on breaking up the ground are collected in the ossuary of the Catacombs at Montrouge. The Catacombs are ancient quarries extending under a great part of the city south of the Seine; they are subjected to continual inspections and shoring up to prevent subsidences such as have taken place on several occasions.

Fires.—The fire brigade has a military organization, and consists of 1742 officers and men. On 31st December 1882 they had at their disposal 1678 fire-plugs. In the course of that year they extinguished 982 fires (127 in January, the maximum; 55 in September, the minimum) and 1656 burning vents; and there were 72 false alarms. They used 1778 fire-engines, 139 of them worked by steam. Eight individuals perished in the conflagrations; 55 were saved by the firemen. Only 19 of the fires were serious. In 703 cases the damage was less than £40. The total loss for the year was £309,200. The most frequent cause of fires was some defect in the buildings (157 cases); lights ranked next (142 cases), and the falling of petroleum or naphtha lamps accounted for 84.

Military.—Paris is the seat of a military government, whose commander has under him all the troops stationed in the departments of Seine and Seine-et-Oise. The soldiers recruited in the two departments are distributed among the 2d, 3d, 4th, and 5th corps d'armée, whose headquarters are at Amiens, Rouen, Le Mans, and Orleans. The principal barracks belonging to the state in Paris are those of the military school of Prince Eugene and Napoleon; the town possesses the barracks of the republican guard, the gendarmes, and the firemen in different quarters. The most important are those of La Cité, to which the prefecture of police was transferred after the destruction of its former buildings by fire in 1871. Besides the war office and the hospitals named above, the main establishments comprise the dépôt of the fortifications, the central artillery dépôt with the workshops of St Thomas d'Aquin, and the dépôt of the commissariat department.

Food Supply.—The following table (VI.) shows the annual average of food consumed per head of the inhabitants of Paris:—

| | Population. | Wine and Spirits. | Fish. | Oysters. | Poultry and Game. | Butcher Meat. | Tripe, &c. | Butter. | Eggs. | Cheese. |
|------|-------------|-------------------|-------|----------|-------------------|---------------|------------|---------|-------|---------|
| | | Gallons. | lb | lb | lb | lb | lb | lb | | lb |
| 1866 | 1,825,274 | 41 | 19 | ... | 24 | 165.78 | 6.148 | 18.36 | 158 | 4.54 |
| 1872 | 1,851,792 | 47.5 | 29.83 | ... | 24 | 156.10 | 5.348 | 17.16 | 157 | 4.45 |
| 1876 | 1,983,806 | 48.2 | 28.12 | 2.95 | 24 | 165 | 6.391 | 15.96 | 150 | 4.62 |
| 1881 | 2,239,928 | 50 | 28.23 | 5.12 | 24 | 172.74 | 6.64 | 16.66 | 180 | 4.95 |

The average annual consumption of bread is 349.46 pounds per head. Wholesale merchandise in food stuffs, though legal in all the market-places of Paris, is, as a matter of fact, concentrated in the central markets (*halles centrales*), with the exception of the butcher-meat trade, which is carried on by public auction or private sale both in the central markets and the slaughter-houses. The central markets comprise ten elegant "pavilions" of iron and glass, each about ½ acre, and separated from each other by streets which are for the most part covered. Dealers from the neighbourhood of Paris took to these markets, in 1882, 80,472 vehicles loaded with fruit, 723,257 with vegetables, 39,740 with potatoes, and 37,584 with pease and beans. These are entered as market-garden produce. There was also sold wholesale in the pavilions 1506 tons of "choice" fruits and vegetables, 6896 of "fine" fruits and vegetables, 6903 of ordinary vegetables, 4837 of cresses, 321,047,149 eggs (at an average price of 51s. per thousand), 192,629 "hundreds" of oysters, 21,144 tons of fish, 5746 tons of shell-fish, 6167 tons of "new" cheese, 697 tons of dry cheese, 12,419 tons of butter, 21,931 tons of poultry and game (comprising 6,454,876 fowls, 3,102,269 rabbits, 2,819,083 pigeons, 1,936,560 larks, &c., at an average price of 10½d. per lb), 33,086 tons of beef, veal, mutton and pork,—these last figures including butcher meat sold by public auction in the market of the La Villette slaughter-house. Through the same market there passed to the shambles in 1882 354,277 oxen, cows, and bulls, 199,416 calves, 2,054,680 sheep, 315,306 pigs. This cattle-market, connected with the Chemin de Fer de Ceinture so that the trains bring the cattle trucks right into the market, occupies with its slaughter-houses an area of 111 acres. The places of sale (*pavillons de vente*) are capable of containing 4600 horned cattle, 22,000 sheep, 7000 pigs, 4000 calves. Horned cattle are liable to an entry fee of 3 francs, calves and pigs 1 franc, sheep 0.30 franc. Animals not sold are kept in sheds, cattle paying ½ franc per night, and the others in proportion. The slaughter-houses can accommodate 1200 butchers, and contain a tallow-melting house (*fondoir*). Most of the cattle come from Maine-et-Loire, Nièvre, Calvados; sheep from Seine-et-Oise, Seine-et-Marne, Côte d'Or, Nord, Aisne, Allier, Indre, Cher; calves from Seine-et-Marne, Eure-et-Loir, Loiret, Nord, Aube; pigs from Sarthe, Allier, Creuse, Indre-et-Loire, and Maine-et-Loire. Foreign countries also contribute to the supply, especially of sheep. Germany in 1882 sent 576,563, Austria-

Hungary 352,376, Russia 156,005, Algeria 88,172, and Italy 37,694. Beside the Halles Centrales is the Halle aux Blés or corn-market. A certain number of full sacks are stored under the cupola (which, architecturally considered, is a bold and striking design), but the whole of this class of goods arriving at Paris does not necessarily pass through the building. Brought by boat or rail, they are either stored at the stations or taken directly to the bakers, the general warehouses, or the military stores. In 1881 71,961 tons of grain and 208,374 tons of flour reached the city.

The consumption of wine has not increased in Paris during the last decade, allowance being made for the growth of the population. For 1872 the figures were 85,407,322 gallons of wine in cask and 404,272 gallons in bottle; for 1880, 92,840,374 in cask and 428,450 in bottle. But the average consumption of spirits (1,312,498 in 1872, 2,907,190 in 1880) has doubled in the interval. More than the half of the wines and spirits consumed in Paris pass through the entrepôts of Bercy, Quai St Bernard, or Pont de Flandre. To these great markets must be added the market for skins and hides (which, according to the latest returns—taken, however, in 1872—did business to the amount of £880,000), the horse-market (£414,200), charcoal-markets on the boats along the Seine (£180,000), flower-markets (£80,000), and the markets for fodder, dogs, birds, &c. The Marché du Temple, rebuilt about 1864, is devoted to the sale of old clothes and second-hand articles of all sorts. All the market-houses and market-places are placed under the double supervision of the prefect of Seine and the prefect of police. The former official has to do with the authorization, removal, suppression, and holding of the markets, the fixing and collecting of the dues, the choice of sites, the erection and maintenance of buildings, and the locating of vehicles. The latter maintains order, keeps the roads clear, and watches against fraud. A municipal laboratory has recently been established, where any purchaser can have the provisions he has bought analysed, and can obtain precise information as to their quality. Spoiled provisions are seized by the agents of the prefecture; in 1880 458 tons of butcher meat, 123 tons of horse flesh, 52 tons of tripe, fish, vegetables, fruit, mushrooms, &c., were seized in this way.

Industries and Commerce.—Returns issued by the chamber of commerce for 1872 estimated the industrial production of Paris as in the following table:—

TABLE VII.—*Industries of Paris.*

| Class of Industry. | No. of Workmen. | Average Daily Wage. | | Total Annual Wages. |
|--|-----------------|---------------------|------------|---------------------|
| | | s. d. | £ | |
| Food..... | 55,952 | 4 5 | 3,494,651 | |
| Buildlog..... | 55,894 | 4 2 | 3,501,638 | |
| Furniture..... | 36,441 | 5 3 | 3,409,128 | |
| Clothing..... | 112,205 | 4 10 | 6,393,737 | |
| Spun and woven goods..... | 26,733 | 4 4½ | 1,197,618 | |
| Ordinary metals..... | 32,161 | 4 7½ | 2,133,972 | |
| Precious metals..... | 18,219 | 5 4½ | 1,232,412 | |
| Chemical stuffs and pottery..... | 19,109 | 4 4½ | 1,101,467 | |
| Printing, engraving, and paper..... | 33,917 | 4 7 | 1,707,222 | |
| Philosophical instruments, musical instruments, clockwork..... | 16,788 | 5 1½ | 1,173,740 | |
| Skins and leather..... | 1,510 | 4 4 | 388,837 | |
| Carriages, saddlery, military equipments..... | 24,684 | 4 11½ | 1,447,405 | |
| Basket-work, brushes, &c..... | 4,337 | 4 2½ | 243,444 | |
| Articles de Paris..... | 34,913 | 4 5½ | 1,684,677 | |
| Miscellaneous..... | 32,678 | 4 6 | 2,110,429 | |
| | 620,337 | 4 8 | 36,420,137 | |

The larger manufacturing establishments of Paris comprise engineering and repairing works connected with the railways, similar private works, foundries, and sugar refineries. Government works are the tobacco factories of Gros Caillon (2000 workmen) and Reuilly (1000), the national printing establishment (1000), the mint (where money and medals are coined by a contractor under state control), and the famous tapestry factory and dye-works of the Gobelins. The list of minor establishments is a very varied one; most of them devoted to the production of the so-called *articles de*

Paris, and carrying the principle of the division of labour to an extreme. The establishments which rank next to those above mentioned in the number of workmen are the chemical factories, the gas-works, the printing offices, cabinetmakers' workshops, boot factories, tailoring establishments hat factories, and works for the production of paperhangings.

Among the workers are included 189,401 women, girls, and boys, and 123,369 masters—this last a figure which shows how great is the number of the small establishments. The total value produced was estimated at £134,763,717 in 1869, and must have since increased enormously. (Compare Table IV. p. 278.) In 1881 the average day's wages paid in the *petite industrie* were estimated at 4s. 5d. for the men and 2s. 5d. for the women. Since 1878 an increase has taken place year by year, at least for the men. Clerks in warehouses earn about £48 per annum, shop women £32, shop girls £16, male domestics £24, and female domestics £20.

In 1882 2400 new houses were built and 1883 old houses enlarged; on the other hand, 997 old houses were entirely demolished and 777 partially. The last official industrial valuation of rental is for the year 1876. At that date there were 76,129 houses containing 1,038,124 separate establishments, 699,175 being used as dwelling-houses at a rental of £13,381,836, and 338,949 for industrial purposes at a rental of £10,049,542.

Between 1872 and 1881 the navigation of the Seine doubled in Com- importance. It has been free from all dues since 1880. There are mere three divisions—the navigation of the upper Seine and the Marne (above Paris), that of the lower Seine and the Oise (below Paris), and that of the Canal de l'Oureq with its terminus at the La Villette basin, whence the St Denis Canal branches off to the lower Seine and the St Martin Canal to the upper Seine.

TABLE VIII.—*Navigation of the Seine.*

| | Arrivals. | | | Departures. | | | Total Movement. |
|--------------------------|------------------------|-----------------------|-------------------|------------------------|-----------------------|-------------------|-----------------|
| | Upper Seine and Marne. | Lower Seine and Oise. | Canal de l'Oureq. | Upper Seine and Marne. | Lower Seine and Oise. | Canal de l'Oureq. | |
| | Tons. | Tons. | Tons. | Tons. | Tons. | Tons. | Tons. |
| Average for 1872-80..... | 803,749 | 417,780 | 6,629 | 106,160 | 249,933 | 12,246 | 1,596,502 |
| „ 1882 | 1,220,015 | 521,332 | 11,286 | 193,445 | 329,966 | 10,594 | 2,286,638 |

The goods arriving by the upper Seine are chiefly building sand, paving-stones, firewood, timber, grain, coal and coke, pyrites, charcoal, and wines; those by the lower Seine, coal and coke, sand, paving-stones, wines, building materials, grain, and timber; and those by the Canal de l'Oureq, building materials. By the upper Seine Paris despatches mainly refuse and manure; by the lower Seine, manure, pyrites, grain, and refined sugars; by the Canal de l'Oureq, agricultural produce and manure. To the traffic of the river ports situated within the city must be added that of the ports along the canals, and especially that of La Villette, the third port of all France, judged by its commercial activity. The following table (IX.) shows the tonnage of the merchandise that passed through each of the canals in 1882 (the same merchandise may sometimes figure on two canals, or may have also been entered for the ports within the city):—

| Oureq Canal. | | St Denis Canal. | | St Martin's Canal. | | Total for the Three Canals. |
|--------------|---------|-----------------|---------|--------------------|---------|-----------------------------|
| Up. | Down. | Up. | Down. | Up. | Down. | |
| Tons. | Tons. | Tons. | Tons. | Tons. | Tons. | Tons. |
| 112,720 | 894,198 | 1,017,726 | 361,002 | 618,600 | 424,603 | 3,427,050 |

The Oureq Canal brings down wood, building stones, bricks, flour, and especially plaster, and takes in return coal, manure, and night-soil for the Bondy manure-works. The St Denis Canal brings up coal from Nord, Pas de Calais, Belgium, and England; freestone from the valley of the Oise, sands from the lower Seine, wood for industrial purposes, grain, sewage for the works at Aubervilliers, colonial wares for La Villette, &c., and the most important articles taken down are sewage for Aubervilliers, and the various wares embarked at La Villette for Rouen or La Havre. Along the St Martin Canal, on the upward passage, sand, gravel, paving-stones or blocks, firewood, lime or cement, freestone, bricks, tiles, slates are discharged, and sewage especially is taken in for Aubervilliers. On the downward passage are discharged plasters from the Oureq Canal, coal, and stones and sand from the Oise and the Oureq. There is besides a large transit traffic.

Five of the great railway companies have a terminus at Paris. The "Nord" and the "Paris, Lyons, and Mediterranean" lines have each only one station; the "Ouest" has two, St Lazare and Montparnasse; the "Est" two, one of which, Bastille, is only a passenger station for the use of the Vincennes line and its prolongation; the "Orleans" two, of which one, Barrière d'Enfer, is restricted to the short line from Paris to Sceaux and Limours.

The following table (X.) shows the number of passengers and quantity of goods that left Paris in 1880:—

| | Nord. | Est. | Ouest. | Orleans. | Paris-Lyons-Mediterranean. |
|-------------------|-----------|-----------|------------|-----------|----------------------------|
| Passengers..... | 2,998,000 | 5,594,300 | 10,521,500 | 1,900,100 | 1,621,300 |
| Goods (tons)..... | 1,367,093 | 653,598 | 1,359,704 | 601,970 | 1,238,029 |

Some goods are registered and pay dues at the Paris custom-house; but many pay these dues at the frontier. The following returns (Table XI.) must therefore be considered only as showing the importance of the Paris custom-house, and not the extent of the trade of the city:—

| | General Trade. | | Special Trade. | |
|-------------|-------------------|-------------|-------------------|-------------|
| | Quantity in Tons. | Value. | Quantity in Tons. | Value. |
| Imports . . | (A) 484,228 | £26,228,459 | (B) 490,135 | £26,002,716 |
| Exports . . | 85,442 | 13,503,776 | 72,955 | 17,331,080 |

The "special" trade is for home consumption. The duty paid on the imports was £3,774,407.

Till 31st December 1897 the Bank of France has the exclusive privilege of issuing bank-notes. Notes are at present issued for 1000, 500, 100, and 50 francs (£10, £20, £4, and £2); at different times there have been notes for 5000, 2000, 25, 20, and 5. The Bank of France, which has already been described in BANKING (see vol. iii. p. 337-39), has 90 branch offices in the provinces. In 1877 the bank received bills and stock to the value of £56,022,532; its advances on securities amounted to £15,038,072; and the change of bank-notes into gold caused a movement of £33,238,000.

The other chief financial establishments in Paris are the Caisse des Dépôts et des Consignations, which receives voluntary deposits or those which are obligatory in certain cases fixed by law; the Crédit Foncier de France, which gives advances to landowners on real property; the Comptoir National d'Escompte, which carries on the same branches of business as the bank, with the exception of the issue of notes.

Among the great private joint-stock banks must be mentioned the Société Générale, the Crédit Industriel et Commercial, the Crédit Lyonnais, the Banque de Paris et des Pays Bas, the Société des Dépôts et Comptes Courants, the Banque d'Escompte, &c. The Bourse or Exchange is open from noon to 3 o'clock for the negotia-

tion of public stock, and from 3 to 6 for commercial transactions. The former is effected by means of brokers (*agents de change*) named by ministerial decree, and possessing the exclusive right of dealing in public stocks and bills. Brokers for the purchase and sale of goods enjoy freedom of trade, but the tribunal of commerce issues a list of the brokers who have taken the oath. These brokers meet to decide the prices current of the various goods.

The *conseils de prud'hommes* settle differences between workmen and workmen, or between workmen and masters; the whole initiative, however, rests with the parties. There are four of these bodies in Paris (for the metal trades, the chemical trades, the textile trades, and miscellaneous industries), composed of an equal number of masters and men. They succeed in settling without litigation 95 per cent. of the disputes submitted to them.

The tribunal of commerce, composed of business men elected by the "notables" of their order, deals with cases arising out of commercial transactions; declarations of bankruptcy are made before it; and it acts as court of appeal to the *conseils de prud'hommes*. In 1882, out of 75,660 cases brought into this court, judgment was given in 66,156, of which 20,696 were cases of first and 45,460 cases of last instance; 4584 cases were compromised. In the same year 1696 bankruptcies were declared, 10 applications made for rehabilitation, and 7 such applications granted by the Paris court of appeal. Money due to bankrupt estates is paid into the *Caisse des Dépôts et des Consignations*. In 1882 the tribunal of commerce registered 1963 deeds of partnership, 1167 dissolutions of partnership, 1340 home trade marks, and 175 foreign trade marks.

The chamber of commerce (under the honorary presidency of the Seine prefect) consists of twenty-one elective members, of whom a third are renewable every two years. Its duty is to present its views on the means of increasing and developing Parisian commerce. The *Condition des Soies*, as its name indicates, has to determine exactly the quality of the silk purchased by the dealers. The *Chambre Syndicale des Tissus*, a non-official association, is the recognized mouthpiece of the textile industries and trade in their dealings with the public administration.

Post-office

Post-office and Telegraphs.—The post and telegraph department comprised at the close of 1881 56 mixed offices, 22 post offices, 24 telegraph offices, and 862 letter boxes. The postal communications are collected eight times per day, and conveyed to one or other of the 15 sorting-offices (*bureaux de passe*), which arrange them according to their destinations. All are then brought together in the General Post Office (*Recette principale de la Seine*), which in 1881 sent out 277,588,000 letters or post cards and 366,816,144 lower-rate packets (*objets affranchis à prix réduits*), and received 188,815,000 letters and post cards, and 40,716,000 lower-rate packets. In 1882 there were issued 2,143,952 ordinary money orders, 45,823 telegraphic orders, and 240,734 international orders; 3,841,335 ordinary orders, 30,693 telegraphic orders, and 188,430 international orders were cashed. The greatest number of foreign orders is from Belgium (36,835) and from Germany (35,684). Great Britain sent only 19,314 in 1881.

Tele-
graphs.

Telegraphic communication is effected partly by pneumatic tubes and partly by electric apparatus. The year 1881 showed a great increase over 1880 in the matter of pneumatic missives.

TABLE XII.

| | 1881. | 1882. |
|---|------------|------------|
| Telegram-cards within Paris | 619,418 | 646,611 |
| Closed telegrams do. do.... | 335,108 | 515,503 |
| Ordinary pneumatic telegrams do.... | 221,084 | 246,664 |
| Total..... | 1,175,610 | 1,408,778 |
| Telegrams from outside of Paris | 4,452,705 | 4,113,069 |
| Do. from Paris to places outside | 4,399,553 | 3,981,614 |
| Do. passing through Paris by pneumatic tubes..... | 393,153 | 314,785 |
| Total of telegraphic messages..... | 10,421,024 | 10,018,246 |

The pneumatic system had at the close of 1881 64 miles of tube and 49 offices, and by 1884 it was extended as far as the fortifications, and into almost all quarters of the town. The Government electric telegraph system has 27,000 miles of double wires; the branch offices being connected with the central office by 94 wires and with the Bourse office by 53. The municipal system, used by the various departments of the local administration, the police, the fire-brigade, &c., and for the indication of observatory time, has a length of 534 miles. The telephonic system on the 1st January 1882 had a length of 1392 miles and 2144 subscribers;—increased to 2306 miles and 2637 subscribers on the 1st of January 1883. The central telegraphic office has 315 instruments at work in direct communication with 22 foreign towns and 124 offices in the provinces. In 1880 it sent 11,559,200 messages, and in 1881 13,955,291 (G. ME.)

HISTORY.

At its first appearance in history there was nothing to foreshow the important part which Paris was to play in Europe and in the world. An island in the Seine, now almost lost in the modern city, and then much smaller than at present, was for centuries the entire site. The sole importance of the town lay in its being the capital of a similarly insignificant Gallic people, which navigated the lower course of the Seine, and doubtless from time to time visited the coasts of Britain. So few were its inhabitants that they early put themselves under the protection of their powerful neighbours the Senones, and this vassalship was the source of the political dependence of Paris on Sens throughout the Roman period, and of a religious subordination which lasted till the 17th century. The capital did not at once take the name of the Parisii, whose centre it was, but long kept that of Lucetia, Lucotetia, or Lutetia, of which Lutèce is the generally recognized French form.

During the war of Gallic Independence, after being subjugated by Cæsar, who even in 53 B.C. made their territory the meeting-place of deputies from all Gaul, the Parisii took part in the great rising of the year 52, at the same time separating their cause from that of the Senones, who were held in check by Cæsar's lieutenant, Labienus. They joined their forces to the army commanded by an Atulerian, the old Camulogenus, which in turn was to unite with the Bellovaci to crush Labienus advancing from Sens to attack the Parisians. Having marched along the right bank of the river till opposite Lutetia, Labienus learned that the Bellovaci were in arms, and, fearing to find himself between two armies at a distance from his headquarters, he sought to get rid of Camulogenus, who, posted on the left bank, endeavoured to bar his way. The bridges had been cut and the town burned by order of the Gallic chief. By means of a stratagem Labienus drew his opponent up the river to the district now occupied by the *Jardin des Plantes*, and quietly by night crossed the Seine lower down in the neighbourhood of Grenelle, near a place which Cæsar calls *Metiosedum*, identified, but not conclusively, with Meudon. The Gauls, retracing their steps a little, met the Romans and allowed themselves to be routed and dispersed; their leader fell in the fore-front of the battle. Still unsubdued, the Parisii were called upon by the general council assembled in Alesia to furnish eight thousand men to help in raising the siege of that city. It is doubtful whether they were able to contribute the whole of this contingent, when their powerful neighbours the Bellovaci managed to send only two thousand of the ten thousand demanded of them. This was their last effort, and after the check at Alesia they took no part in the desperate resistance offered by the Bellovaci.

Lutetia was somewhat neglected under the Roman emperors of the first centuries. Its inhabitants continued quietly carrying on their river traffic, and devoted part of their wealth to the maintenance of a great temple to Jupiter built on the site of the present cathedral of Notre Dame. It is not known at what date Christianity was introduced into the future capital of France; but it is probable, judging by the use of the title "city," that Lutetia was the see of one of the earliest of the bishoprics of Gallia Celtica. The name of the founder of the church is known, but a keen controversy, not yet settled, has recently been raised with regard to the date when the first Roman missionary, St Dionysius or Denis, reached the banks of the Seine, along with his two deacons Rusticus and Eleutherius. A pious belief, which, in spite of its antiquity, has its origin in nothing better than parochial vanity, identifies the first-named with Dionysius the

Areopagite, who was converted by St Paul at Athens, and thus takes us back to the middle of the 1st century of the Christian era. Better founded is the opinion which dates the evangelization of the city two centuries later; the regular list of bishops, of whom, after Denis, the most famous was St Marcel, begins about 250.

Lutetia was in some sort the cradle of Christian liberty, having been the capital, from 293 to 306, of the mild Constantius Chlorus, who put an end to persecution in Brittany, Gaul, and Spain, over which he ruled. This emperor fixed his residence on the banks of the Seine, doubtless for the purpose of watching the Germans without losing sight of Brittany, where the Roman authority was always unstable; perhaps he also felt something of the same fancy for Lutetia which Julian afterwards expressed in his works and his letters. Be that as it may, the fact that these two princes chose to live there naturally drew attention to the city, where several buildings now rose on the left side of the river which could not have been reared within the narrow boundaries of the island. There was the imperial palace, the remains of which, a magnificent vaulted chamber, beside the Hôtel de Cluny, are now known, probably correctly, as Julian's Baths. At some distance up the river, in the quarter of St Victor, excavations in 1870 and in 1883 laid bare the foundations of the amphitheatre, which was capable of holding about 10,000 spectators, and thus suggests the existence of a population of 20,000 to 25,000 souls. Dwelling-houses, villas, and probably also an extensive cemetery, occupied the slope of the hill of St Geneviève.

It was at Lutetia that, in 360, Julian, already Cæsar, was in spite of himself proclaimed Augustus by the legions he had more than once led to victory in Germany. The troops invaded his palace, which, to judge by various circumstances of the mutiny, must have been of great extent. As for the city itself, it was as yet but a little town (*πολιχμή*) according to the imperial author in his *Misopogon*. The successive sojourns of Valentinian I. and Gratian scarcely increased its importance. The latest emperors preferred Treves, Arles, and Vienne in Gaul, and, besides, allowed Paris to be absorbed by the powerful Armorican league (c. 410). When the patricians Aetius, Ægidius, and Syagrius held almost independent sway over the small portion of Gaul which still held together, they dwelt at Soissons, and it was there that Clovis fixed himself during the ten or eleven years between the defeat of Syagrius (486) and the surrender of Paris (497), which opened its gates, at the advice of St Geneviève, only after the conversion of the Frankish king. In 508, at the return of his victorious expedition against the south, Clovis made Paris the official capital of his realm—*Cathedram regni constituit*, says Gregory of Tours. He chose as his residence the palace of the Thermæ, and lost no time in erecting on the summit of the hill, as his future place of interment, the basilica of St Peter and St Paul, which became not long afterwards the church and abbey of St Geneviève. After the death of Clovis, in spite of the supremacy granted to the kingdom of Austrasia or Metz, Paris remained the true political centre of the various Frankish states, inasmuch that the four sons of Clothaire, fearing the prestige which would attach to whoever of them might possess it, made it a sort of neutral town, though after all it was seized by Sigebert, king of Austrasia, Chilperic, king of Neustria (who managed to keep possession for some time, and repaired the amphitheatre), and Gontran, king of Burgundy. The last sovereign had to defend himself in 585 against the pretender Gondowald, whose ambition aspired to uniting the whole of Gaul under his dominion, and marching on Paris to make it the seat of the half barbarian half

Roman administration of the kingdom of which he had dreamed.

Numerous calamities befell Paris from 586, when a terrible conflagration took place, to the close of the Merovingian dynasty. During a severe famine Bishop Landry sold the church plate to alleviate the distress of the people, and it was probably he who, in company with St Éloi (Eligius), founded the Hôtel-Dieu. The kings in the long run almost abandoned the town, especially when the Austrasian influence under the mayors of the palace tended to shift the centre of the Frankish power towards the Rhine.

Though the Merovingian period was for art a time of the deepest decadence, Paris was nevertheless adorned and enriched by pious foundations. Mention has already been made of the abbey of St Peter, which became after the death of Clovis the abbey of St Geneviève. On the same side of the river, but in the valley, Childebert, with the assistance of Bishop St Germain, founded St Vincent, known a little later as St Germain-des-Prés, which was the necropolis of the Frank kings before St Denis. On the right bank the same king built St Vincent le Rond (afterwards St Germain l'Auxerrois), and in La Cité, beside the cathedral of St Étienne, the basilica of Notre Dame, which excited the admiration of his contemporaries and in the 12th century obtained the title of cathedral. Various monasteries were erected on both sides of the river, and served to group in thickly-peopled suburbs the population, which had grown too large for the island.

The first Carlovingian, Pippin the Short, occasionally lived at Paris, sometimes in the palace of Julian, sometimes in the old palace of the Roman governors of the town, at the lower end of the island; the latter ultimately became the usual residence. Under Charlemagne Paris ceased to be capital; and when feudal France was constituted under Charles the Bald it was liberally bestowed, like any ordinary place, on mere counts or dukes. But the dangers of the Norman invasion attracted general attention to the town, and showed that its political importance could no longer be neglected. When the suburbs were pillaged and burned by the pirates, and the city regularly besieged in 885, Paris was heroically defended by its "lords," and the emperor Charles the Fat felt bound to hasten from Germany to its relief. The pusillanimity which he showed in purchasing the retreat of the Normans was the main cause of his deposition in 887, while the courage displayed by Count Eudes procured him the crown of France. Robert, Eudes's brother, succeeded him; and, although Robert's son Hugh the Great was only duke of France and count of Paris, his power counterbalanced that of the last of the Carlovingians, shut up in Laon as their capital.

With Hugh Capet in 987 the capital of the duchy of France definitively became the capital of the kingdom, and in spite of the frequent absence of the kings, several of whom preferred to reside at Orleans, the town continued to increase in size and population, and saw the development of those institutions which were destined to secure its greatness. Henry I. founded the abbey of St Martin-des-Champs, Louis the Stout that of St Victor, the mother-house of an order, and a nursery of literature and theology. Under Louis VII. the royal domain was the scene of one of the greatest artistic revolutions recorded in history: the Roman stylo of architecture was exchanged for the Pointed or Gothic, of which Suger, in his reconstruction of the basilica of St Denis, exhibited the earliest type. The capital could not remain aloof from this movement: several sumptuous buildings were erected; the Roman choir of St Germain-des-Prés was thrown down to give place to another more spacious and elegant; and when, in 1163, Pope Alexander had solemnly consecrated it, he was invited by Bishop Maurice de

Sully to lay the first stone of Notre Dame de Paris, a cathedral on a grander scale than any previously undertaken. Paris still possesses the Roman nave of St Germain-des-Prés, preserved when the building was rebuilt in the 12th century; the Pointed choir, consecrated in 1163; and the entire cathedral of Notre Dame, which, completed sixty years later, underwent various modifications down to the beginning of the 14th century. The sacristy is modern; the site previous to 1831 was occupied by the episcopal palace, also built by Maurice de Sully, who by a new street had opened up this part of the island.

Philip Augustus may be considered the second founder of Paris. He seldom quitted it save for his military expeditions, and he there built for himself, near St Germain l'Auxerrois, the Louvre, the royal dwelling *par excellence*, whose keep was the official centre of feudalism. He created or organized a regular system of administration with its headquarters at Paris; and under his patronage the public lectures delivered at Pré-aux-Clercs were regulated and grouped under the title of a university in 1200.

This university, the most famous and flourishing in Christendom, considerably augmented the local population, and formed as it were a new town on the left side of the river, where the important abbeys of St Geneviève, St Germain-des-Prés, and St Victor, and a vast Carthusian monastery already stood. Colleges were erected to receive the students of the different countries, and became the great meeting-place of the studious youth of all Europe. Returning to their native lands, where rank and honours awaited them, the pupils of the Paris university spread abroad the name and prestige of France; and sometimes they took home with them, or afterwards sent for, French artists, to whose wanderings must be ascribed the astonishing propagation in other countries of Pointed architecture.

The right side of the river, where commerce and industry had taken up their abode, and where the Louvre, the abbey of St Martin, and a large number of secondary religious establishments were already erected, became a centre of activity at least as important as that on the left. The old suburbs, too, were now incorporated with the town and enclosed in the new line of fortifications constructed by Philip Augustus, which, however, did not take in the great abbeys on the left side of the river, and thus obliged them to build defensive works of their own.

Philip Augustus issued from the Louvre a celebrated order that the streets of the town should be paved. Not far from his palace, on the site of the present Halles Centrales, he laid out an extensive cemetery and a market-place, which both took their name from the Church of the Innocents, a building of the same reign, destroyed at the Revolution. Fountains were placed in all the quarters. As for the lighting of the town, till the close of the 16th century the only lamps were those in front of the madonnas at the street corners. But the first "illumination" of Paris occurred under Philip Augustus: on his return from a victorious expedition to Flanders in 1214 he was welcomed by the Parisians as a conqueror; and the public rejoicings lasted for seven days, "interrupted by no night," says the chronicler, alluding to the torches and lamps with which the citizens lighted up the fronts of their houses. Ferrand, count of Flanders, the traitor vassal, was dragged behind the king to the dungeons of the Louvre, whose doors closed on him for ever.

In 1226 there was held at Paris a council which, by excommunicating Raymond VII., count of Toulouse, helped to prepare the way for the most important treaty which had as yet been signed in the capital. By this treaty (12th April 1229) Blanche of Castile obtained from Raymond VII. a great part of his possessions, while the

remainder was secured to the house of Capet through the marriage of Alphonse of Poitiers, brother of St Louis, with Jeanne, the last natural heiress of Languedoc.

In affection for his capital St Louis equalled or even surpassed his grandfather Philip, and Paris reciprocated his goodwill. The head of the administration was at that time the provost of Paris, a judiciary magistrate and police functionary whose extensive powers had given rise to the most flagrant abuses. Louis IX. reformed this office and filled it with the judge of greatest integrity to be found in his kingdom. This was the famous Étienne Boileau, who showed such vigilance and uprightness that the capital was completely purged of evil-doers; the sense of security thus produced attracted a certain number of new inhabitants, and, to the advantage of the public revenue, increased the value of the trade. It was Étienne Boileau who, by the king's express command, drew up those statutes of the commercial and industrial guilds of Paris which, modified by the necessities of new times and the caprice of princes, remained in force till the Revolution.

St Louis caused a partial restoration of St Germain l'Auxerrois, his parish church (completed in the 15th century, and deplorably altered under Louis XV.); and, besides preferring the palace of La Cité to the Louvre, he entirely rebuilt it, and rendered it one of the most comfortable residences of his time. Of this edifice there still remain, among the buildings of the present Palais de Justice, the great guard-room, the kitchens with their four enormous chimneys, three round towers on the quay, and, one of the marvels of the Middle Ages, the Sainte Chapelle, erected in 1248 to receive the crown of thorns sent from Constantinople. This church, often imitated during the 13th and 14th centuries, is like an immense shrine in open work; its large windows contain admirable stained glass of its own date, and the basements are adorned inside with pictures recently restored. It has a lower story ingeniously arranged, which served as a chapel for the palace servants. The Sainte Chapelle was designed by Pierre de Montereau, one of the most celebrated architects of his time, to whom is attributed another marvel still extant, the refectory of the abbey of St Martin, now occupied by the library of the Conservatoire des Arts et des Métiers. This incomparable artist was buried in the abbey of St Germain-des-Prés, where, too, he had raised magnificent buildings now no longer existing. Under St Louis, Robert de Sorbon, a common priest, founded in 1253 an unpretending theological college which afterwards became the celebrated faculty of the Sorbonne, whose decisions were well-nigh as authoritative as those of Rome.

The capital of France had but a feeble share in the communal movement which in the north characterizes the 11th, 12th, and 13th centuries. Placed directly under the central power, it was never strong enough to force concessions; and in truth it did not claim them, satisfied with the advantages of all kinds secured for it by its political position and its university. And, besides, the privileges which it did enjoy, while they could be revoked at the king's pleasure, were of considerable extent. Its inhabitants were not subjected to forced labour or arbitrary imposts, and the liberty of the citizens and their commerce and industry were protected by wise regulations. The university and all those closely connected with it possessed the fullest rights and liberties. There was a municipal or bourgeois militia, which rendered the greatest service to Philip Augustus and St Louis, but afterwards became an instrument of revolt. The communal administration devolved on *échevins* or *jurés*, who, in conjunction with the notables, chose a nominal mayor called provost of the merchants (*prévôt des marchands*). The powers of this official had been grievously curtailed in favour of the

provost of Paris, and his lieutenants named by the sovereign. His main duties were to regulate the price of provisions and to control the incidence of taxation on merchandise. He was the chief inspector of bridges and public wells, superintendent of the river police, and commander of the guard of the city walls, which it was also his duty to keep in repair. And, finally, he had jurisdiction in commercial affairs until the creation of the consular tribunals by L'Hôpital (Lalanne, *Dict. historique de la France*). The violent attempts made by Étienne Marcel in the 14th century, and those of the communes of 1793 and 1871, showed what reason royalty had to fear too great an expansion of the municipal power at Paris.

The town council met in the 13th and 14th centuries in an unpretending house on Ste Geneviève, near the city walls on the left side of the river. The municipal assemblies were afterwards held near the Place de Grève, on the right side of the river, in the "Maison aux Piliers," which Francis I. allowed to be replaced by an imposing hôtel de ville.

The last of the direct descendants of Capet, and the first

two Valois did little for their capital. Philip the Fair, however, increased its political importance by making it the seat of the highest court in the kingdom, the *parlement*, which he organized between 1302 and 1304, and to which he surrendered a part of his Cité palace. Under the three sons of Philip the Fair, the Tour de Nesle, which stood opposite, on the site now occupied by the buildings of the Institute, was the scene of frightful orgies, equally celebrated in history and romance. One of the queens who, if the chronicles are to be trusted, took part in these expiated her crimes in Château-Gaillard, where she was strangled in 1315 by order of her husband, Louis X. During the first part of the war of the Hundred Years, Paris escaped being taken by the English, but felt the effects of the national misfortunes. Whilst destitution excited in the country the revolt of the Jacquerie, in the city the miseries of the time were attributed to the vices of the feudal system, and the citizens seemed ready for insurrection. The provost of the merchants, Étienne Marcel, equally endowed with courage and intellect, sought to turn this double movement to account in the interest of the

Paris in 1380.

municipal liberties of Paris and of constitutional guarantees. The cause which he supported was lost through the violence of his own acts. Not content with having massacred two ministers under the very eyes of the dauphin Charles, who was regent whilst his father John lay captive in London, he joined the Jacquerie, and was not afraid to call into Paris the king of Navarre, Charles the Bad, a notorious firebrand who at that time was making common cause with the English. Public sentiment, at first favourable to Marcel's schemes, shrank from open treason. A watch was set on him, and, at the moment when, having the keys of the town in his possession in virtue of his office, he was preparing to open one of the gates, he was assassinated by order of Jean Maillard, one of the heads of the *milice*, on the night of July 31, 1358. Marcel had enlarged Philip

Augustus's line of fortifications on the right side of the river, and had commenced a new one.

When he became king in 1364, Charles V. forgot the outrages he had suffered at the hands of the Parisians during his regency. He robbed the Louvre to some extent of its military equipment, in order to make it a convenient and sumptuous residence; his open-work staircases and his galleries are mentioned in terms of the highest praise by writers of the time. This did not, however, remain always his favourite palace; having built or rebuilt in the St Antoine quarter the mansion of St Paul or St Pol, he was particularly fond of living in it during the latter part of his life, and it was there that he died in 1380. It was Charles V. who, in conjunction with the provost of the merchants, Hugues Aubriot, erected the famous Bastille

to protect the St Antoine gate. A library which he founded—a rich one for the times—became the nucleus of the national library. With the exception of some of the upper portions of the Sainte Chapelle, which were altered or reconstructed by this prince or his son Charles VI., there are no remains of the buildings of Charles V.

The reign of Charles VI. was as disastrous for the city as that of his father had been prosperous. From the very accession of the new king, the citizens, who had for some time been relieved by a great reduction of the taxes, and had received a promise of further alleviation, found themselves subjected to the most odious fiscal exactions on the part of the king's uncle, who was not satisfied with the well-stored treasury of Charles V., which he had unscrupulously pillaged. Aubriot, having ventured to remonstrate, was thrown into prison as a heretic, and in 1382 a riot took place for the purpose of delivering the provost and seizing the fiscal agents. Preoccupied with his expedition against the Flemings, Charles VI. delayed putting down the revolt, and for the moment remitted the new taxes. On his victorious return on 10th January 1383, the Parisians in alarm drew up their forces in front of the town gates under the pretext of showing their sovereign what aid he might derive from them, but really in order to intimidate him. They were ordered to retire within the walls and to lay down their arms, and they obeyed. The king and his uncles, having destroyed the gates, made their way into Paris as into a besieged city; and with the decapitation of Desmarets, one of the most faithful servants of the crown, who perished at the age of seventy, began a series of bloody executions. Ostensibly through the intercession of the regents an end was put to that species of severities, a heavy fine being substituted, much larger in amount than the annual value of the abolished taxes. The municipal administration was suspended for several years, and its functions bestowed on the provost of Paris, a magistrate nominated by the crown.

The calamities which followed were due to the weakness and incapacity of the Government, given over because of the madness of Charles VI. to the intrigues of a wicked queen and of princes who brought the most bloodthirsty passions to the service of their boundless ambition. First came the rivalry between the dukes of Orleans and Burgundy, brought to an end in 1407 by the assassination of the former in Rue des Francs-Bourgeois. Next followed the relentless struggle for supremacy between two hostile parties, the Armagnacs on one side, commanded by Count Bernard of Armagnac (who for a brief period had the title of constable), and supported by the nobles and burgesses, and on the other side the Burgundians, depending on the common people, and recognizing the duke of Burgundy (John the Bold) as their head. The mob was headed by a skinner at the Hôtel-Dieu called Jean Caboché, and hence the name Cabochians given to the Burgundian party. They became masters of Paris in 1412 and 1413; but so violent were their excesses that the most timid rose in revolt, and the decimated bourgeoisie managed by a bold stroke to recover possession of the town. The Armagnacs again entered Paris, but their intrigues with England and their tyranny rendered them odious in their turn; the Burgundians were recalled in 1418, and returned with Jean Caboché and a formidable band of pillagers and assassins. Perrinet Leclerc, son of a bourgeois guard, secretly opened the gates to them one night in May. The king resided in the Hôtel St Paul, an unconscious spectator of those savage scenes which the princes Louis and John, successively dauphins, were helpless to prevent.

The third dauphin, Charles, afterwards Charles VII., managed to put an end to the civil war, but it was by a crime as base as it was impolitic—the assassination of

John the Bold on the bridge of Montereau (1419). Next year a treaty, from the ignominy of which Paris happily escaped, gave a daughter of Charles VI. to Henry V. of England, and along with her, in spite of the Salic law, the crown of France. The king of England made his entry into Paris in December 1420, and was there received with a solemnity which ill concealed the misery and real consternation of the poor people crushed by fifteen years of murders, pillage, and famine. Charles VI. remained almost abandoned at the Hôtel St Paul, where he died in 1422, whilst his son-in-law went to hold a brilliant court at the Louvre and Vincennes. Henry V. of England also died in 1422. His son Henry VI., then one year old, came to Paris nine years later to be crowned at Notre Dame, and the city continued under the government of the duke of Bedford till his death in 1435.

The English rule was a mild one, but it was not signalized by the execution of any of those works of utility or ornament so characteristic of the kings of France. The choir of St Severin, however, shows a style of architecture peculiarly English, and Sauval relates that the duke of Bedford erected in the Louvre a fine gallery decorated with paintings. Without assuming the mission of delivering Paris, Joan of Arc, remaining with Charles VII. after his coronation at Rheims, led him towards the capital; but the badly conducted and abortive enterprise almost proved fatal to the Maid of Orleans, who was severely wounded at the assault of the gate of St Honoré on the 8th September 1429. The siege having been raised, Charles awaited the invitation of the Parisians themselves upon the defection of the Burgundians and the surrender of St Denis. The St Jacques gate was opened by the citizens of the guard to the constable Arthur of Richemont on April 13, 1436; but the solemn entry of the king did not take place till November 12 of the following year; subsequently occupied by his various expeditions or attracted by his residences in Berry or Touraine, he spent but little time in Paris, where he retired either to the Hôtel St Paul or to a neighbouring palace, Les Tournelles, which had been acquired by his father.

Louis XI. made equal use of St Paul and Les Tournelles, but towards the close of his life he immured himself at Plessis-les-Tours. It was in his reign, in 1469, that the first French printing press was set up in the Sorbonne. Charles VIII. scarcely left Plessis-les-Tours and Amboise except to go to Italy; Louis XII. alternated between the castle at Blois and the palace of Les Tournelles, where he died January 1, 1515.

Francis I. lived at Chambord, at Fontainebleau, at St Germain, and at Villers-Cotterets; but he proposed to form at Paris a residence in keeping with the taste of the Renaissance. Paris had remained for more than thirty years almost a stranger to the artistic movement begun between 1498 and 1500, after the Italian expedition. Previous to 1533, the date of the commencement of the Hôtel de Ville and the church of St Eustache, Paris did not possess, apart from the "Court of Accounts," any important building in the new style. Between 1527 and 1540 Francis I. demolished the old Louvre, and in 1541 Pierre Lescot began a new palace four times as large, which was not finished till the reign of Louis XIV. The buildings were not sufficiently advanced under Henry II. to allow of his leaving Les Tournelles, where in 1559 he died from a wound received at a tournament. His widow, Catherine de' Medici, immediately caused this palace to be demolished, and sent her three sons—Francis II., Charles IX., and Henry III.—to the unfinished Louvre. Outside the line of the fortifications she laid the foundations of the Château des Tuileries as a residence for herself.

Of the three brothers, it was Charles IX. who resided

most at the Louvre; it was there that in 1572 he signed the order for the massacre of St Bartholomew. - Henry III. remained for the most part at Blois, and hardly came to Paris except to be witness of the power of his enemies the Guises.

Taking advantage of the absence of the kings, the League had made Paris a centre of opposition. The municipal militia were restored and reorganized; each of the sixteen quarters or arrondissements had to elect a deputy for the central council, which became the council or rather faction of The Sixteen, and for four years, from 1587 to 1591, held the city under a yoke of iron. Henry III., having come to the Louvre in 1588, unwillingly received there the duke of Guise, and while endeavouring to take measures for his own protection provoked a riot known as the Day of the Barricades. It was with difficulty that he escaped from his palace, which at that time had no communication with the country, and which Henry IV. afterwards proposed to unite with the Tuileries in order to provide a sure means of escape in case of need.

When, after the murder of the duke of Guise at Blois at the close of 1588, Henry III. desired to return to Paris, he was not yet master of the city, and was obliged to besiege it in concert with his presumptive heir the king of Navarre. The operations were suddenly interrupted on August 1, 1589, by the assassination of the king, and Henry IV. carried his arms elsewhere. He returned with his victorious forces in 1590. This second siege lasted more than four years, and was marked by terrible suffering, produced by famine and the tyranny of The Sixteen, who were supported by the intrigues of the king of Spain and the violent harangues of the preachers. Even the conversion of the king did not allay the spirit of fanaticism, for the king's sincerity was suspected, and the words (which history, however, fails to substantiate), "Paris is surely worth a mass," were attributed to him. But after the coronation of the king at Chartres the commonalty of Paris, weary of intriguing with strangers and Leaguers, gave such decided expression to its feelings that those of its leaders who had kept aloof or broken off from the faction of The Sixteen attached themselves to the parlement, which had already evaded the ambitious designs of the king of Spain; and after various negotiations the provost of the merchants, L'Huillier, offered the keys of the city to Henry IV. on March 22, 1594. The king met no resistance except on the part of a company of German landsknechts, which was cut in pieces, and the students of the university, who, steeped in the doctrines of the League, tried to hold their quarter against the royal troops, but were dispersed. The Spanish soldiers who had remained in the town decamped next day.

Henry IV., who carried on the building of the Louvre, was the last monarch who occupied it as a regular residence. Attempts on his life were made from time to time, and at last on May 14, 1610, he fell under Ravallac's knife near the market-house in Rue de la Ferronnerie.

Whether royalty gave it the benefit of its presence or not, Paris continued all the same to increase in political importance and in population. Here is the picture of the city presented about 1560 by Michel de Castelnau, one of the most celebrated chroniclers of the 16th century:-

"Paris is the capital of all the kingdom, and one of the most famous in the world, as well for the splendour of its parlement (which is an illustrious company of thirty judges attended by three hundred advocates and more, who have reputation in all Christendom of being the best seen in human laws and acquainted with justice) as for its faculty of theology and for the other tongues and sciences, which shine more in this town than in any other in the world, besides the mechanic arts and the marvellous traffic which render it very populous, rich, and opulent; in such sort that the other towns of France and all the magistrates and subjects have their eyes directed thither as to the model of their decisions and their political administrations."

Castelnau spoke rather as a statesman and a magistrate, and he did not look close enough to see that the university was beginning to decline. The progress of the sciences somewhat lessened the importance of its classes, too specially devoted to theology and literature; the eyes of men were turned towards Italy, which was then considered the great centre of intellectual advance; the colleges of the Jesuits were formidable rivals; the triumphs of Protestantism deprived it of most of the students who used to flock to it from England, Germany, and Scandinavia; and finally the unfortunate part it played in political affairs weakened its influence so much that, after the reign of Henry IV., it no longer sent its deputies to the states-general.

If the city on the left side of the river neither extended its circuit nor increased its population, it began in the 16th century to be filled with large mansions (*hôtels*), and its communications with the right bank were rendered easier and more direct when Henry IV. constructed across the lower end of the island of La Cité the Pont Neuf, which, though retaining its original name, is now the oldest bridge in Paris. On the right side of the river commerce and the progress of centralization continued to attract new inhabitants, and old villages become suburbs were enclosed within the line of a bastioned first enceinte, the ramparts of Étienne Marcel being, however, still left untouched. Although Louis XIII., except during his minority, rarely stayed much in Paris, he was seldom long absent from it. His mother, Mary de' Medici, built the palace of the Luxembourg, which, after being extended under Louis Philippe, became the seat of the senate.

Louis XIII. finished, with the exception of the eastern front, the buildings enclosing the square court of the Louvre, and carried on the wing which was to join the palace to the Tuileries. Queen Anne of Austria founded the Val de Grâce, the dome of which, afterwards painted on the interior by Mignard, remains one of the finest in Paris. Richelieu built for himself the Palais Royal since restored, and rebuilt the Sorbonne, where now stands his magnificent tomb by Girardon. The island of St Louis above La Cité, till then occupied by gardens and meadows, became a populous parish, whose streets were laid out in straight lines, and whose finest houses still date from the 17th century. Building also went on in the Quartier du Marais (quarter of the marsh); and the whole of Place Royale (now Place des Vosges), with its curious arcaded galleries, belongs to this period. The church of St Paul and St Louis was built by the Jesuits beside the ruins of the old Hôtel St Paul; the church of St Gervais received a façade which has become in our time too famous. St Étienne du Mont and St Eustache were completed (in the latter case with the exception of the front). The beautiful Salle des Pas-Perdus (Hall of Lost Footsteps) was added to the Palais de Justice. Besides these buildings and extensions Paris was indebted to Louis XIII. and his minister Richelieu for three important institutions—the royal printing press in 1620, the Jardin des Plantes in 1626, and the French Academy in 1635. The bishopric of Paris was separated from that of Sens and erected into an archbishopric in 1623.

As memorials of Mazarin Paris still possesses the Collège des Quatre-Nations, erected with one of his legacies immediately after his death, and since appropriated to the Institute, and the palace which, enlarged in our own time, now accommodates the national library.

The stormy minority of Louis XIV. was spent at St Germain and Paris, where the court was held at the Palais Royal. The intrigues of the prince of Condé, Cardinal de Retz, and (for a brief space) Turenne resulted in a siege of Paris, during which more epigrams than balls were fired off; but the cannon of the Bastille, discharged by order of Mademoiselle de Montpensier, enabled Condé to enter the

city. Bloody riots followed, and came to an end only with the exhaustion of the populace and its voluntary submission to the king. Though Louis XIV. ceased to stay in Paris after he grew up, he did not neglect the work of embellishment. On the site of the fortifications of Étienne Marcel, which during the previous hundred years had been gradually disappearing, he laid out the line of boulevards connecting the quarter of the Bastille with that of the Madeleine. Though he no longer inhabited the Louvre (and it never was again the seat of royalty), he caused the great colonnade to be constructed after the plans of Claude Perrault. This immense and imposing façade, 548 feet long, has the defect of being quite out of harmony with the rest of the building, which it hides instead of introducing. The same desire for effect, altogether irrespective of congruity, appears again in the observatory erected by the same Perrault, without the smallest consideration of the wise suggestions made by Cassini. The Place Vendôme, the Place des Victoires, the triumphal gates of St Denis and

St Martin, and several fountains, are also productions of the reign of Louis XIV. The hospital of La Salpêtrière, with its majestically simple dome, was finished by Liberal Bruant. The Hôtel des Invalides, one of the finest institutions of the Grand Monarque, was also erected, with its chapel, between 1671 and 1675, by Bruant; but it was reserved for the architect Hardouin Mansart to give to this imposing edifice a complement worthy of itself: it was he who raised the dome, admirable alike for its proportions, for the excellent distribution of its ornaments, and for its gilded lantern, which rises 344 feet above the ground. "Private persons," says Voltaire, "in imitation of their king, raised a thousand splendid edifices. The number increased so greatly that from the neighbourhood of the Palais Royal and of St Sulpice there were formed in Paris two new towns much finer than the old one." All the aristocracy had not thought fit to take up their residence at Versailles, and the great geniuses of the century, Corneille, Racine, La Fontaine, Molière, Madame de Sévigné, had their houses

Paris in 1615.

in Paris; there also was the Hôtel de Rambouillet, so famous in the literary history of the 17th century.

The halls of the Palais Royal during the minority of Louis XV. were the scene of the excesses of the regency; later on the king from time to time resided at the Tuileries, which henceforward came to be customarily regarded as the official seat of the monarchy. To the reign of Louis XV. are due the rebuilding of the Palais Royal, the "Place" now called De la Concorde, the military school, the greater part of the church of Ste Geneviève or Panthéon (a masterpiece of the architect Soufflot), the church of St Roch, the palace of the Élysée (now the residence of the president of the republic), the Palais Bourbon (with the exception of the façade) now occupied by the chamber of deputies, and the mint, a majestic and scholarly work by the architect Antoine, as well as the rebuilding of the Collège de France.

Louis XVI. finished or vigorously carried on the works

begun by his grandfather." He did not come to live in Paris till compelled by the Revolution. That historical movement began indeed at Versailles on June 17, 1789, when the states-general were transformed into a constituent assembly; but the first act of violence which proved the starting-point of all its excesses was performed in Paris on July 14, 1789, when Paris inaugurated, with the capture of the Bastille, its "national guard," organized and then commanded by the celebrated La Fayette. At the same time the assassination of the last provost of the merchants, Jacques de Flesselles, gave the opportunity of establishing, with more extended powers, the "mairie" (mayoralty) of Paris, which was first occupied by Bailly, and soon became, under the title of commune, a political power capable of effectively counterbalancing the central authority.

Paris had at that time once more outgrown its limits. The quarter on the left side of the river had more than

doubled its extent by the accession of the great monasteries, the faubourgs of St Germain and St Marceau, the Jardin des Plantes, and the whole of Mont Ste Geneviève. The line of the new enceinte is still marked by a circuit of boulevards passing from the Champs de Mars at Pont d'Austerlitz by Place de l'Enfer and Place d'Italie. Similar enlargements, also marked out by a series of boulevards, incorporated with the town on the right side the faubourgs of St Antoine and Poissonnière and the quarters of La Chaussée d'Antin and Chaillot. In 1784 was begun, instead of a line of fortifications, a simple customs-wall, with sixty propylæa or pavilions in a heavy but characteristic style, of which the finest are adorned with columns or pilasters like those of Pæstum. In front of the Place du Trône (now Place de la Nation), which formed as it were a façade for Paris on the east side, there were erected two lofty rostral columns bearing the statues of Philip Augustus and St Louis. Towards the west, the city front was Place Louis XV. (Place de la Concorde), preceded by the magnificent avenue of the Champs Élysées. Between the barriers of La Villette and Pantin, where the highways for Flanders and Germany terminated, was built a monumental rotunda flanked on the ground floor by four peristyles arranged as a Greek cross, and in the second story lighted by low arcades supported by columns of the Pæstum type. None of these works were completed till the time of the empire. It was also in the latter part of the reign of Louis XIV., and under the first republic, that the quarter of La Chaussée d'Antin was built.

It does not enter into the plan of the present sketch to narrate the history of Paris during the Revolutionary period; that is the history rather of France, and to a certain extent of the whole world (see FRANCE). During the consulate hardly anything of note took place at Paris except the explosion of the infernal machine directed against Bonaparte on December 24, 1800.

The coronation of Napoleon by Pope Pius VII. was celebrated in Notre Dame on December 2, 1804. Eight years later, during the Russian campaign, the conspiracy of General Malet, happily suppressed, was on the point of letting loose on all France a dreadful civil war. The empire, however, was then on the wane, and Paris was witness of its fall when, after an heroic resistance of two days, the city was obliged to surrender to the allies on March 30, 1814.

After the return of the Bourbons, Paris had to submit to a treaty more humiliating than the capitulation. Already in 1763 Louis XV. had signed in his capital the treaty with England known as the shameful (*Honteuse*), by which he surrendered a great part of the American and Indian colonies, and notably Canada. That of May 30, 1814, was more truly disastrous, since it dismembered the mother-country, cancelled almost all the conquests of the republic and the empire, and lessened the military strength of France by robbing it of half its fleet. And worse even than this was the treaty of 28th November 1815, which not only suppressed the slight accessions of territory recognized by the treaty of 1814, and doomed to demolition the fortifications of Huningue, but exacted a war indemnity of 700 million francs (£28,000,000), and demanded the maintenance in seven departments of 150,000 soldiers of the allied army until the payment of the entire sum.

Under Louis XVIII. the only event of note that occurred in Paris was the assassination of the duke of Berry by Louvel, February 13, 1820. Ten years later the revolution of 1830, splendidly commemorated by the Column of July in Place de la Bastille, put Charles X. to flight and inaugurated the reign of Louis Philippe, a troublous period which was closed by the revolution of 1848 and a new republic. It was this reign, however, that surrounded Paris with

bastioned fortifications with ditches and detached forts. The republic of 1848 brought no greater quiet to the city than did the reign of Louis Philippe. The most terrible insurrection was that of June 23 to 26, 1848, distinguished by the devotion and heroic death of the Archbishop Affre. It was quelled by General Cavaignac, who then for some months held the executive power. Prince Louis Napoleon next became president of the republic, and after dissolving the chamber of deputies on December 2, 1851, caused himself to be proclaimed emperor just a year later.

The second empire completed that material transformation of Paris which had already been begun at the fall of the ancient monarchy. First came numerous cases of destruction and demolition caused by the suppression of the old monasteries and of many parish churches. A number of mediæval buildings, civil or military, were cleared away for the sake of regularity of plan and improvements in the public streets, or to satisfy the taste of the owners, who thought more of their comfort or profit than of the historic interest of their old mansions or houses. Destructions of this kind, in some instances of advantage, in other cases without excuse, still continue with more or less frequency. It was under the first empire that the new series of improvements were inaugurated which have made Paris a modern city. Napoleon began the Rue de Rivoli, built along this street the wing intended to connect the Tuileries with the Louvre, erected in front of the court of the Tuileries the triumphal arch of the Carrousel, in imitation of that of Septimius Severus at Rome. In the middle of the Place Vendôme was reared, on the model of Trajan's column, the column of the grand army, surmounted by the statue of the emperor. To immortalize this same grand army he ordered from the architect Pierre Vignon a Temple of Victory, which without changing the form of its Corinthian peristyle has become the church of the Madeleine; the entrance to the avenue of the Champs Élysées was spanned by the vast triumphal arch De l'Étoile (of the star), which owes its celebrity not only to its colossal dimensions and its magnificent situation, but also to one of the four subjects sculptured upon its faces—the *Chant du Départ* or *Marseillaise*, one of the masterpieces of Rude and of modern sculpture. Another masterpiece was executed by David of Angers, the pediment of the Panthéon, not less famous than Soufflot's dome. The museum of the Louvre, founded by decree of the Convention on July 27, 1793, was organized and considerably enlarged; that of the Luxembourg was created in 1805, but was not appropriated exclusively to modern artists till under the Restoration. The Conservatoire des Arts et Métiers, due to the Convention, received also considerable additions in the old priory or abbey of St Martin des Champs, where the council of the Five Hundred had installed it in 1798.

Under the Restoration and under the government of July many new buildings were erected; but, with the exception of the Bourse, constructed by the architects Brongniart and Labarre, and the colonnade of the chamber of deputies, these are of interest not so much for their size as for the new artistic tendencies affected in their architecture. People had grown weary of the eternal Græco-Roman compilations rendered fashionable by the Renaissance, and reduced under the empire to mere imitations, in producing which all inspiration was repressed. The necessity of being rational in architecture, and of taking full account of practical wants, was recognized; and more suggestive and plastic models were sought in the past. These were to be found, it was believed, in Greece; and in consequence the government under Louis Philippe saw itself obliged to found the French school at Athens, in order to allow young artists to study their favourite types on the spot. In the case of churches it was deemed judicious to revive the

Christian basilicas of the first centuries, as at Notre Dame de Lorette and St Vincent de Paul; and a little later to bring in again the styles of the Middle Ages, as in the ogival church of Ste Clotilde.

Old buildings were also the object of labours more or less important. The Place de la Concorde was altered in various ways, and adorned with eight statues of towns and with two fountains; on October 25, 1836, the Egyptian obelisk, brought at great expense from Luxor, was erected in the centre. The general restoration of the cathedral of Notre Dame was voted by the Chamber in 1845, and entrusted to Viollet-le-Duc; and the palace of the Luxembourg and the Hôtel de Ville were considerably enlarged at the same time, in the style of the existing edifices.

But the great transformer of Paris in modern times was Napoleon III. To him or to his reign we owe the Grand Opéra, the finest theatre in the world, and the masterpiece of the architect Garnier; the new Hôtel-Dieu; the finishing of the galleries which complete the Louvre and connect it with the Tuileries; the extension of the Palais de Justice and its new front on the old Place Dauphine; the tribunal of commerce; the central markets; several of the finest railway stations; the viaduct at Auteuil; the churches of La Trinité, St Augustin, St Ambroise, St François Xavier, Belleville, Ménilmontant, &c. For the first international Paris exhibition (that of 1855) was constructed the "palace of industry"; the enlargement of the national library was commenced; the museum of French antiquities was created by the savant Du Sommerard, and installed in the old "hôtel" built at the end of the 15th century for the abbots of Cluny.

All this is but the smallest part of the memorials which Napoleon III. left of his presence. Not only was the city traversed in all directions by new thoroughfares, and sumptuous houses raised or restored in every quarter, but the line of the fortifications was made in 1859 the limit of the city. The area was thus doubled, extending to 7450 hectares or 18,410 acres, instead of 3402 hectares or 8407 acres. It was otherwise with the population; to the 1,200,000 inhabitants which Paris possessed in 1858 the incorporation of the suburban zone only added 600,000.

Paris had to pay dear for its growth and prosperity under the second empire. This Government, which, by straightening and widening the streets, thought it had effectually guarded against the attempts of its internal enemies, had not sufficiently defended itself from external attack, and at the first reverses of 1870 Paris found itself prepared to overthrow the empire, but by no means able to hold out against the approaching Prussians.

The two sieges of Paris in 1870-71 are among the most dramatic episodes of its history. The first siege began on September 19, 1870, with the occupation by the Germans of the heights on the left side of the river and the capture of the unfinished redoubt of Châtillon. Two days later the investment was complete. General Trochu, head of the French Government and governor of the city, had under his command 400,000 men—a force which ought to have been able to hold out against the 240,000 Germans by whom it was besieged, had it not been composed for the most part of hurried levies of raw soldiers with inexperienced officers, and of national guards who, never having been subjected to strict military discipline, were a source of weakness rather than of strength. The guards, it is true, displayed a certain warlike spirit, but it was for the sole purpose of exciting disorder. Open revolt broke out on October 31; it was suppressed, but increased the demoralization of the besieged and the demands of the Prussians. The partial successes which the French obtained in engagements on both sides of the river were rendered useless by the Germans recapturing all the best positions;

the severity of winter told heavily on the garrison, and the armies in the provinces which were to have co-operated with it were held in check by the Germans in the west and south. In obedience to public opinion a great sortie was undertaken; this, in fact, was the only alternative to a surrender; for, the empire having organized everything in expectation of victory and not of disaster, Paris, insufficiently provisioned for the increase of population caused by the influx of refugees, was already suffering the horrors of famine. Accidental circumstances combined with the indecision of the leaders to render the enterprise a failure. Despatches sent by balloon to the army of the Loire instructing it to make a diversion reached their destination too late; the bridge of Champigny over the Marne could not be constructed in time; the most advantageous positions remained in the hands of the Germans; and on the 2nd and 3rd December the French abandoned the positions they had seized on the 29th and 30th of November. Another sortie made towards the north on December 21st was repulsed, and the besieged lost the Avron plateau, the key to the positions which they still held on that side. The bombardment began on December 27th, and great damage was done to the forts on the left of the Seine, especially those of Vanves and Issy, directly commanded by the Châtillon battery. A third and last sortie (which proved fatal to Regnault the painter) was attempted in January 1871, but resulted in hopeless retreat. An armistice was signed on January 27th, the capitulation on the 28th. The revictualing of the city was not accomplished without much difficulty, in spite of the generous rivalry of foreign nations (London alone sending provisions to the value of £80,000).

On the 1st of March the Germans entered Paris. This event, which marked the close of the siege, was at the same time the first preparation for the "commune;" for the national guard, taking advantage of the general confusion and the powerlessness of the regular army, carried a number of cannon to the heights of Montmartre and Belleville under pretext of saving them. President Thiers, appreciating the danger, attempted on March 18th to remove the ordnance; his action was the signal of an insurrection which, successful from the first, initiated a series of terrible outrages by the murder of the two generals, Lecomte and Thomas. The Government, afraid of the defection of the troops, who were demoralized by failure and suffering, had evacuated the forts on the left side of the river and concentrated the army at Versailles (the forts on the right side were still to be held for some time by the Germans). Mont Valérien happily remained in the hands of the Government, and became the pivot of the attack during the second siege. All the sorties made by the insurgents in the direction of Versailles (where the National Assembly was in session from March 20) proved unsuccessful, and cost them two of their improvised leaders—Generals Flourens and Duval. The incapacity and mutual hatred of their chiefs rendered all organization and durable resistance impossible. On Sunday May 21st the Government forces, commanded by Marshal M'Mahon, having already captured the forts on the right side of the river, made their way within the walls; but they had still to fight hard from barricade to barricade before they were masters of the city; Belleville, the special Red Republican quarter, was not assaulted and taken till Friday. Meanwhile the communists were committing the most horrible excesses: the archbishop of Paris (GEORGES DARBOY, *q.v.*), President Bonjean, priests, magistrates, journalists, and private individuals, whom they had seized as hostages, were shot in batches in the prisons; and a scheme of destruction was ruthlessly carried into effect by men and women with cases of petroleum (*pétroleurs* and

peroleuses). The Hôtel de Ville, the Palais de Justice, the Tuileries, the Ministry of Finance, the palace of the Legion of Honour, that of the Council of State, part of the Rue de Rivoli, &c., were ravaged by the flames; barrels of gunpowder were placed in Notre Dame and the Panthéon, ready to blow up the buildings; and the whole city would have been involved in ruin if the national troops had not gained a last and crowning victory in the neighborhood of La Roquette and Père-la-Chaise on May 28th. Besides the large number of insurgents who, taken in arms, were pitilessly shot, others were afterwards condemned to death, to penal servitude, to transportation; and the survivors only obtained their liberty by the decree of 1879.

From this double trial Paris emerged diminished and almost robbed of its dignity as capital; for the parliamentary assemblies and the Government went to sit at Versailles. For a little it was thought that the city would not recover from the blow which had fallen on it. All came back, however—confidence, prosperity, and, along with that, increasing growth of population and the execution of great public works. The Hôtel de Ville has been rebuilt, the school of medicine adorned with an imposing

façade, a vast school of pharmacy established in the old gardens of the Luxembourg, and boulevards completed. The exhibition of 1878 was more marvellous than those of 1855 and 1867, and unlike that of the latter year has left a lasting memorial, the palace of the Trocadéro. Finally the chambers in 1879 considered quiet sufficiently restored to take possession of their customary quarters in the Palais Bourbon and the Luxembourg. This happy event closes for the present the annals, at times only too dramatic, of the capital of France.

(A. S.-P.)

Bibliography.—From the immense list of works relating to Paris it is possible to make but a small selection here. For the history of the city the reader may consult Sauval, *Histoire de Paris*, 3 vols. fol., 1724; Dom Félibien, *Histoire de Paris*, 6 vols. fol., 1725; Lebeuf, *Histoire de la ville et du diocèse de Paris*, 15 vols. 12mo, 1754–57, new ed. by Cocheris, 1863 sq.; Julliot, *Recherches sur Paris*, 5 vols. 8vo, 1772–74; Duhamel, *Histoire de Paris*, often reprinted; Berty, *Topographie historique du vieux Paris*, 2 vols. 4to, 1866–68, and *Atlas des anciens plans de Paris*, published by the city and edited by Ducher. For the libraries and art treasures of Paris the following works may be referred to.—Franklin, *Les anciennes bibliothèques de Paris* (1867); L. Delisle, *Le cabinet des manuscrits de la bibliothèque impériale* (1868); *Inventaire général des richesses d'art de la France, publié par le Ministère de l'Instruction publique et des Beaux Arts* (the volumes relating to Paris), and the *Inventaire général des œuvres d'art appartenant à la ville de Paris*, in course of publication by the municipality. As regards the modern city, see the official *Annuaire statistique de la ville de Paris*; the *Atlas de la ville de Paris par arrondissement*, published by the municipality; Maximo Ducamp, *Paris, ses orgues, ses fonctions, sa vie* (6 vols. 8vo and 6 vols. 18mo, 1869–1875); Lacroix and Veibachkovev, *Paris-Guide, par les principaux écrivains et artistes de la France*, 1867; and A. Joanne, *Paris illustré*, 1881.

PARIS, the son of Priam, king of Troy. Before he was born his mother Hecuba dreamed that she was delivered of a firebrand. The dream was interpreted that her child would ruin his country, and when Paris was born he was exposed on Mount Ida. His life was saved by the herdsmen, and he grew up among them, distinguished for beauty and strength, till he was recognized and received by his parents. When the strife arose at the marriage of Peleus and Thetis between Hera, Athena, and Aphrodite, each claiming the apple that should belong to the most beautiful, Paris was selected as the judge. The three rivals unveiled their divine charms before a mortal judge on Mount Ida. The scene afterwards became a favourite subject in Greek art, and it is usual to represent Hermes escorting the goddesses. Each tried to bribe the judge, Hera by promising power, Athena wisdom, Aphrodite the most beautiful woman in the world. Paris decided in favour of Aphrodite, and thus made Hera and Athena the bitter enemies of his country. To gain the woman whom Aphrodite had promised, Paris set sail for Lacedæmon, deserting his old love CEnone, daughter of the river-god Cebren, who in vain tried to induce him to give up his purpose. He was hospitably received by Menelaus, whose kindness he repaid by seducing his wife Helena to flee with him to Troy. The details of the slight are variously related (see HELENA). The siege of Troy by the united Greeks followed. Paris proved a lazy and backward fighter, though not wanting in actual courage when he could be roused to exert himself. Before the capture of the city he was mortally wounded by Philoctetes with an arrow. He then bethought him of the slighted nymph CEnone, who he knew could heal the wound. He was carried into her presence, but she refused to save him. Afterwards, when she found he was dead, she committed suicide. Paris is represented in Greek art as a beautiful young man, beardless, wearing the pointed Phrygian cap, and often holding in his hand the apple.

PARIS, MATTHEW OF. See vol. xv. p. 633.

PARISH. In England the parish may be regarded as originally an ecclesiastical institution, being defined as the township or cluster of townships which was assigned to the ministrations of a single priest, to whom its tithes and other ecclesiastical dues were paid; and it has been decided that if a place has not a church, churchwardens, and sacramentalia it is not a parish in this original sense of the term.

The word has now acquired several distinct meanings, which must be separately mentioned and investigated.

The Old Ecclesiastical Parish.—In the absence of evidence to the contrary, the ecclesiastical parish is presumed to be composed of a single township or vill, and to be co-terminous with the manor within the ambit of which it is comprised. Before the process of subinfeudation became prevalent, the most ancient manors were the districts which we call by that name when speaking of the tenants, or "townships" when we regard the inhabitants, or "parishes" as to matters ecclesiastical. The parish as an institution is in reality later in date than the township. The latter has been in fact the unit of local administration ever since the country was settled by the English in their several states and kingdoms; the beginnings of the parochial system are attributed to Theodore of Tarsus, who was archbishop of Canterbury towards the close of the 7th century. The system was extended in the reign of Edgar, and it appears not to have been complete until the reign of Edward III. It has been considered that the intimate connexion of church and state militates against the view that the parochial system was founded as a national institution, since any legislation on the subject of the township and parochial systems would probably have resulted in the merging of the one into the other. "The fact that the two systems, the parish and the township, have existed for more than a thousand years side by side, identical in area and administered by the same persons, and yet separate in character and machinery, is a sufficient proof that no legislative Act could have been needed in the first place; nor was there any lay council of the whole nation which could have sanctioned such a measure" (Stubbs, *Const. Hist.*, i. 227). The boundaries of the old ecclesiastical parishes are usually identical with those of the township or townships comprised within its precinct; they are determined by usage, in the absence of charters or records, and are evidenced by perambulations, which formerly took place on the "gang-days" in Rogation week, but are now for the most part held triennially, the Poor-Law Act of 1841 permitting the parish officers to charge the expense on the poor-rate, "provided the perambulations do not occur more than once in three years." The expense of preserving the boundary by land-marks or bound-stones is chargeable to the same rate. Many parishes contain more than one township, and this is especially the case in the northern

counties, where the separate townships are organized for administrative purposes under an Act passed in 1662. In the southern and midland districts the parishes are for the most part subdivided into hamlets or other local divisions known as "tythings," "boroughs," and the like; the distinction between a parish and a subordinate district lies chiefly in the fact that the latter will be found to have never had a church or a constable to itself. The select committee of 1873, appointed to inquire into parochial boundaries, reported to the effect that the parish bears no definite relation to any other administrative area, except indeed to the Poor-Law Union. It may be situated in different counties or hundreds, and in many instances it contains, in addition to its principal district, several outlying portions intermixed with the lands in other parishes. Since the abolition of compulsory church rates in 1868 (subject to certain exceptions as to rates which have already been mortgaged), the old ecclesiastical parish has ceased to be of importance as an instrument of local government. Its officers, however, have still important duties to perform. The rector, vicar, or incumbent is a corporation-sole, in whom is vested the freehold of the church and churchyard, subject to the parishioners' rights of user; their rights of burial have been enlarged by the Burial Laws Amendment Act, 1880, and an Act passed in 1882 to regulate the interment of suicides. The churchwardens are the principal lay officers. Their duties consist in keeping the church and churchyard in repair and in raising a voluntary rate for the purpose to the best of their power; they have also the duty of keeping order in church during divine service; and by Acts passed in 1860 and 1877 they are required to furnish annual accounts to the Local Government Board. The other officials are the parish-clerk and sexton. They have freeholds in their offices, and are paid by customary fees. The office of the clerk is regulated by an Act of 1844, enabling a curate to undertake its duties, and providing facilities for vacating the office in case of misconduct. It is said that the only civil function of the parish-clerk now remaining is to undertake the custody of maps and documents, which may be deposited under the provisions of the Railway Clauses Act, 1845.

The New Ecclesiastical Parish.—Under the powers given by the Church Building Acts, many populous parishes have been subdivided into smaller ecclesiastical parishes. This division has not affected the parish in its civil aspect (Chalmers, *Local Government*, 39). The change has helped to increase the distinction between the ecclesiastical and civil parishes. Mr Chalmers estimates that there are now about 15,000 civil and 13,000 ecclesiastical parishes in England, and that in 1871 not more than 10,000 civil parishes coincided with the ecclesiastical districts of the same names.

The Poor-Law Parish.—For the purposes of civil government the term "parish" means a district for which a separate poor-rate is or can be made, or for which a separate overseer is or can be appointed; and by the Poor Law Amendment Act, 1866, this definition is to be used in interpreting all statutes except where the context is inconsistent therewith. This district may of itself constitute a poor law union; but in the great majority of cases the unions, or areas under the jurisdiction of boards of guardians according to the Poor-Law Amendment Act of 1834, are made up of aggregated poor-law parishes. Each of these poor-law parishes may represent the extent of an old ecclesiastical parish, or a township separately rated by custom before the practice was stayed in 1819 or separated from a large parish under the Act of 1662, or it may represent a chapelry, tything, borough, ward, quarter, or hamlet, or other subdivision of the ancient parish, or an area formed by the merger of an extra-parochial place with an

adjoining district under the Acts of 1857 and 1869, or by the union of detached portions with adjoining parishes under the Acts of 1876 and 1879, or by the subdivision of a large parish for the better administration of the relief of the poor under the Poor-Law Amendment Act of 1867 and the Local Government Board Act of 1871. The civil importance of the poor-law parishes may be dated from the introduction of the poor law by the statute of 43 Elizabeth, which directed overseers of the poor to be appointed in every parish, and made the churchwardens into *ex officio* overseers. The statute was preceded by tentative provisions of the same kind enacted in the reigns of Edward the VI. and Mary and in the fifth year of Elizabeth, and after several renewals was made perpetual in the reign of Charles I. The chief part of the parochial organization is the vestry-meeting. It derives its name from the old place of assembly, which in parishes exceeding two thousand in population may now be replaced by a vestry-hall. The vestry represents the old assembly of the township, and retains so much of its business as has not been insensibly transferred to the court-baron and court-leet. The freemen, now appearing as the ratepayers, elect the "parish officers," as the churchwardens and way-wardens, the assessors, the overseers, and (if required) paid assistant-overseers, a secretary or vestry-clerk, and a collector of rates if the guardians apply for his appointment. A meeting for the election of guardians is held in April every year, subject to the rules laid down by the Local Government Board as to the number of guardians for each parish, and the union of parishes for voting purposes. In case of a contest the election is conducted under Sturges Bourne's Act. Common vestries are meetings of all the ratepayers assembled on a three days' notice; the minister of the ecclesiastical parish is chairman, if present; the meeting acts by show of hands unless a poll is demanded; if demanded, the poll is conducted by plural voting according to payment of rates. Select vestries are regulated by local custom, or may derive their power from Hobhouse's Act (1831). The vestries of the Metropolitan District are elected under the Metropolis Management Acts. The functions of the vestry, apart from elections, are practically confined to the management of the property of the parish. The vestry, however, has power to adopt the Free Libraries Act, or the Lighting and Watching Act of 1833, and may appoint a new burial board if a new burial-ground is required; but with these exceptions, most of its active powers and duties have now been taken away by the Acts relating to the poor laws and public health.

The Land-Tax Parish.—The parishes or places separately assessed for land tax form another class. They are described in the series of land-tax accounts from 1692 to the present time, and are also defined in the Taxes Management Act of 1880.

The Burial Acts Parish.—The Burial Acts from 1852 to 1875 deal with areas which are treated as parishes for the purposes of those Acts, but which have no necessary connexion with the boundaries of the civil and ecclesiastical districts known as parishes in the ordinary sense of the term.

The Highway Parish.—The word "parish" is used in a very wide and vague manner in the Highway Acts. It includes any civil district less than the county, such as wapentakes, hundreds, cities, liberties, or franchises, as well as subdivisions of the ordinary parish, such as townships and hamlets, if by reason of tenure or custom or otherwise such larger or smaller district either maintains its own highways or would do so if it were not included in a highway district composed of several highway parishes or in an urban sanitary district. The constitution of the highway parish is discussed in the Report of the Local Committee on Highways. (C. I. E.)

The Parish in Scotland.—There can be little doubt that about the beginning of the 13th century the whole, or almost the whole, of the kingdom of Scotland was parochially divided. It seems probable (though the point is obscure) that the bishops presided at the first formation of the parishes—the parish being a subdivision of the diocese—and at any rate down to the date of the Reformation they exercised the power of creating new parishes within their respective dioceses (Duncan, *Parochial Law*, p. 4). After the Reformation the power of altering parishes was assumed by the legislature. The existing parochial districts being found unsuited to the ecclesiastical requirements of the time, a general Act was passed in 1581, which made provision for the parochial clergy, and, *inter alia*, directed that “a sufficient and competent” district should be appropriated to each church as a parish (1581, cap. 100). Thereafter, by a series of special Acts in the first place, and, subsequent to the year 1617, by the decrees of parliamentary commissions, the creation of suitable parochial districts was proceeded with. The powers conferred on the parliamentary commissions embraced what are technically known as (1) the disjunction and erection of parishes, (2) the union of parishes, and (3) the disjunction and annexation of parishes. In altering and defining parochial areas in those several ways, the object which the commissioners had in view was to provide for the spiritual wants of particular districts of the country, and to procure from the lands in the parish a proper stipend for the clergy. In the year 1707 the powers exercised by these commissioners were permanently transferred to the Court of Session, whose judges were appointed to act in future as “Commissioners for the Plantation of Kirks and Valuation of Teinds” (Act, 1707, cap. 9). Under this statute the areas of parishes continued to be altered and defined down to 1844, when the Act commonly known as Graham’s Act was passed, (7 & 8 Vict. c. 44). This Act, which applies to the disjunction and erection of parishes, introduced a simpler form of procedure, and to some extent dispensed with the consent of the heritors, which had been required under the earlier statute. Since 1844 proceedings for disjunction and erection of parishes have been taken under it.

The main division of parishes in Scotland as they now exist is into civil and ecclesiastical, or, to speak more accurately, into parishes proper (*i.e.*, for all purposes, civil and ecclesiastical) and ecclesiastical parishes. This division is expressed in legal language by the terms, parishes *quoad omnia* (*i.e.*, *quoad civilia et sacra*) and parishes *quoad sacra*—*civilia* being such matters as church rates, education, poor law, and sanitary purposes, and *sacra* being such as concern the administration of church ordinances, and fall under the cognizance of the church courts. There are other minor divisions which will be noticed below. (1) *The Parish Proper.*—In a number of instances it is difficult to determine the exact areas of such parishes at the present day. The boundaries of the old ecclesiastical parish were nowhere recorded, and the descriptions in the titles of private properties which appear to lie in the parish have sometimes to be taken as evidence, and sometimes the fact that the inhabitants attended a particular church or made payments in favour of a particular minister. Where there has been a union or disjunction and erection of parishes the evidence of the boundaries is the relative statute, order in council, or decree of commission or of Court of Teinds. The total number of parishes proper in Scotland is eight hundred and eighty-six, and they vary to a great degree both in size and population. For ecclesiastical purposes, the minister and kirk-session constitute the parochial authority. The minister is vested with the manse and glebe, to be held by him for himself and his successors in office, and along with the kirk-session he administers church ordinances and exercises church discipline. For purposes of local government, on the other hand, the Scottish parish, unlike that of England, has been largely utilized by modern legislation. The oldest governing authority is the meeting of the heritors or landowners of the parish. Though shorn of much of its old importance, the heritors’ meeting has still the power of imposing an assessment for the purpose of providing and maintaining a church and churchyard and a manse and glebe for the minister. It also possesses power to assess under the Parochial Buildings Acts of 1862 and 1866. In a certain number of parishes also, which have not adopted a parochial board under the Poor-Law Act, 1845, the heritors along with the kirk-session provide for the relief of the poor, and administer the funds legally destined for that purpose. In the great majority, however, of civil parishes the chief governing authority is the parochial board, which in non-burghal parishes is composed of owners of land of £20 annual value and upwards, and representatives of the kirk-session and of the magistrates of any burgh within the parish and of the rate-payers—the number of representative members being in each case fixed by the Board of Supervision. Another local authority of great importance is the school board, created by the recent Education Acts. Speaking generally, the matters administered in the civil parish are poor relief, education, public health, burial, registration, and church rates. (2) *Quoad Sacra Parishes.*—The ecclesiastical or *quoad sacra* parish is a modern creation. Under Graham’s Act, above mentioned,

a parish may be disjoined and erected *quoad sacra tantum* on the application of persons who have built and endowed a church, and who offer securities for its proper maintenance. The creation is made purely on a consideration of the spiritual interests of a particular district, and not for any purposes of civil administration. By the Education Act of 1872, however, the *quoad sacra* parish has been adopted as a separate school district. There are three hundred and twenty-five such parishes in Scotland. (3) *Extra-Burghal Parishes.*—For sanitary purposes, highways, and some others, certain classes of burghs have been made separate areas from the parishes in which they lie. This fact creates a set of incomplete parishes, which are called extra-burghal. (4) *Burghal, Landward, and Burghal-Landward (or Mixed) Parishes.*—This division of parishes depends, as the names imply, upon local character and situation of the parochial districts. The importance of the distinction arises in connexion with the rule of assessment which is to be adopted for various parochial burdens, and the nature of the rights of the minister and corresponding obligations of the parishioners. (5) *Combined Parishes.*—Under the Poor-Law, Education, and Registration Acts power is given to the central authority to combine parishes for purposes of local administration.

The Parish in the United States.—The term “parish” is not in use as a territorial designation except in Louisiana, the fifty-eight parishes of which correspond to the counties of the other States of the Union.

The principal records from which information may be gained as to the oldest parochial system in England are the records called *Nomina Villarum*, the *Taxatio Pape Nicholai* made in 1291, the *Nonarum Inquisitiones* relating to assessments made upon the clergy, the *Valor Ecclesiasticus* of Henry VIII., the lay subsidies from the reign of Edward III. to that of Charles II., the hearth-tax assessments, and the land-tax accounts. On the subject of the parish generally the reader should consult Stubbs’s *Constitutional History*, Glen’s *Parish Law*, Toutin’s *Smith’s work on the Parish*, Holdsworth’s *Handy Book of Parish Law*, and M. D. Chalmers’s work on *Local Government*, published in the English Citizen Series. For fuller information regarding the Scottish parish the following works may be consulted:—Connell on *Teinds*; Duncan’s *Parochial Ecclesiastical Law*; the Cobden Club essays on *Local Government and Taxation in the United Kingdom*, published in 1882; Goody and Smith’s *Local Government in Scotland*.

PARK, MUNGO (1771–1806?), a celebrated African traveller, was born in Selkirkshire, Scotland, on the 20th September 1771, at Fowlshiels on the Yarrow,—the farm which his father rented from the duke of Buccleuch. He was the seventh in a family of thirteen. Having received a good education (at home from a private tutor, and afterwards at the grammar school of Selkirk), he was apprenticed to a surgeon named Anderson, in Selkirk, and then attended the university of Edinburgh for three sessions (1789–91). By his brother-in-law, James Dickson, a botanist of repute, he was introduced to Sir Joseph Banks, and through his good offices he obtained the post of assistant-surgeon on board the “Worcester” East Indiaman. In this capacity he made the voyage in 1792 to Beneoolen in Sumatra, and on his return in 1793 he contributed a description of eight new Sumatran fishes to the *Transactions* of the Linnean Society. Park next offered his services to the African Association, then looking out for a successor to the unfortunate Major Houghton, and, again supported by the influence of Sir Joseph Banks, he was successful in his application. On the 21st June 1795 he reached the Gambia, but it was not till December 2d that he started for Pisania with only two Negro servants (Johnson and Demba) on the hazardous and difficult expedition into the interior, from which he was to return with the proud distinction of being the first of modern Europeans to reach the well-nigh fabulous waters of the Niger. Striking north-eastward across the upper basin of the Senegal, he advanced through Kaarta and El Hodh, and descended upon the great river of his quest at Segou on the north bank, about 13° 5' N. lat. and 6° 20' W. long. Though he was not able to proceed down stream any farther than Mursan and Silla, he managed on his home journey to follow the river valley as far up as Bammako, a distance of about 300 miles. By the 10th June he was again at Pisania, but he did not reach England till December 22, 1796. An account of his journey was at once drawn up for the Association by Bryan Edwards, and a detailed narrative from his own pen appeared in 1799 (*Travels in the Interior of Africa*). Abundance of incident, and an unaffected charm of style, at once rendered

the work extremely popular, and it still holds its place as one of the acknowledged classics in this department of literature. It seemed for a time as if Park was now to settle down quietly at home; he married a daughter of his old master, Mr Anderson, and commenced practice as a country doctor at Peebles, where at least he could enjoy "a glass of strong beer and a peep at the sky through Mr Oman's telescope"; but he was ill at ease—his heart was in Africa. In 1804 the people of Peebles were amused and alarmed by the vagaries of Sidi Omback Boubi from Mogador, who had come to teach their doctor Arabic; and in autumn Park parted from Sir Walter Scott, who had been one of his best friends, with the hopeful proverb on his lips, "Freits (omens) follow those that look to them." He had accepted Lord Hobart's proposal that he should take command of a Niger expedition. He sailed from Portsmouth on January 30, 1805; and the expedition started from Pisanía on May 4th. Unfortunately the rainy season soon afterwards commenced; by the time Bamako was reached the party was reduced from forty-four Europeans to eleven, and from Sansanding the leader had to report "five only are at present alive, viz., three soldiers (one deranged in his mind), Lieutenant Martyn, and myself." Among those who had died at Sansanding was his brother-in-law Mr Anderson. On November 19th he set sail down the river from Sansanding with the "fixed resolution to discover the termination of the Niger or perish in the attempt." Isaaco, the Mandingo guide who had accompanied the expedition up to this point, was afterwards sent on a mission to find out the fate of the voyagers; it was learned that they had managed to make their way through countless perils to Bussa (Boussa) between 9° and 10° N. lat., and that they were there attacked by the natives, and were drowned in endeavouring to escape. Park was 6 feet in height, active and robust; his countenance was prepossessing, his manner in company plain and simple, but somewhat cold and reserved.

See the *Life* (by Wishaw) prefixed to *Journal of a Mission into the Interior of Africa* in 1805, London, 1815; H. B., *Life of Mungo Park*, Edinburgh, 1835; and an interesting passage in Lockhart's *Life of Sir Walter Scott*, vol. ii.

PARKER, JOHN HENRY (1806-1884), architectural archaeologist, was the son of a London merchant, and was born in 1806. He was educated at Manor House School, Chiswick, and in 1821 entered business as a bookseller. Succeeding his uncle Joseph Parker as a bookseller at Oxford in 1832, he conducted the business with great success, the most important of the firm's publications being perhaps the series of the "Oxford Pocket Classics." The cares of business did not prevent him from devoting, in the earlier period of his life, much of his time to those architectural studies which latterly engaged his chief attention. In 1836 he brought out his *Glossary of Architecture*, which, published in the earlier years of the Gothic revival, had considerable influence in extending the movement, and supplied a valuable help to young architects. In 1848 he edited the fifth edition of Rickman's *Gothic Architecture*, and in 1849 he published a handbook based on his earlier volume, and entitled *Introduction to the Study of Gothic Architecture*. The completion of Hudson Turner's *Domestic Architecture of the Middle Ages* next engaged his attention, three volumes being published (1853-60). In 1858 he published *Medieval Architecture of Chester*. Parker was one of the chief advocates of the "restoration" of ecclesiastical buildings, and published in 1866 *Architectural Antiquities of the City of Wells*. Latterly he devoted much attention to explorations of the history of Rome by means of excavations, and succeeded in satisfying himself of the historical truth of much usually regarded as legendary. Two volumes of his *Archæology*

of Rome have been published, the one in 1873, and the other in 1875, while six additional parts have also appeared, and two others were in the press at his death. In recognition of his labours he was decorated by the king of Italy, and received a medal from Pope Pius IX. In 1869 he endowed the keepership of the Ashmolean Museum with a sum yielding £250 a year, and under the new arrangement he was appointed the first keeper. In 1871 he was nominated C.B. He died 31st January 1884.

PARKER, MATTHEW (1504-1575), archbishop of Canterbury, the eldest surviving son of William Parker and Alice Monins, his wife, was born at Norwich 6th August 1504. His father was an artisan, a calenderer of woollen stuffs, but through his mother he could afterwards trace his descent from the earls of Nottingham. He was instructed in reading by Thomas Benis, rector of St Clement's, Norwich, and in the elements of Latin by one William Neve; in the latter he found (a somewhat exceptional experience in those days) a kind and sympathizing teacher. When Matthew was twelve years of age he lost his father; but his mother was, notwithstanding, able to send him at the commencement of the Michaelmas term, 1521, to Cambridge, and to maintain him there until his merits secured some recognition. He was educated partly in St Mary's Hostel and partly in Corpus Christi College. In March 1523 he was elected to a bible-clerkship in the college, an office which involved reading the Bible aloud on prescribed occasions, and waiting at the fellows' table at dinner. In the March of the following year he was admitted B.A.; he was subsequently made a deacon and a priest, in 1527 was elected to a fellowship, and in 1528 commenced M.A.

His industry as a student and his general ability marked him out for early notice; and when, in 1521, Wolsey was founding Cardinal College (afterwards Christ Church), Oxford, Parker was one among a number of rising Cambridge students who were invited to become fellows of the new society. Fortunately, however, for himself and for Cambridge he elected to stay at Corpus. The university was at this time becoming a great centre of the Reformation movement, and he found himself attracted to the meetings held at the White Horse (an inn in the town), which the Catholic party derisively styled "Germany," from the fact that it was the known rendezvous of the supporters of Lutheran tenets. Among those with whom he was thus brought into contact was Bilney, the martyr; and when, in 1531, the latter was burned at Norwich, Parker attended him in his last hours, and afterwards bore testimony to his constancy. On Cranmer's election to the archbishopric of Canterbury, Parker received a licence to preach, and soon became known in Cambridge and its neighbourhood as a divine of considerable oratorical power. He was summoned to preach at court; and in 1535 the queen, Ann Boleyn, appointed him her chaplain. He shortly after received a further mark of her favour by being made dean of the college of St John the Baptist, at Stoke, near Clare, Suffolk—an institution for the training of the secular clergy. Here he gave the earliest indication of his skill as an administrator; and the new statutes which he drew up for the college were deemed so judicious that the duke of Norfolk, in 1540, adopted them as a model for the code which he gave to a similar foundation at Thetford. Parker's retired life at Stoke did not altogether secure him from attack on account of his courageously avowed sympathies with the Reformation, and in the year 1539 he was accused by the townsmen of Clare of manifesting undue contempt for the Catholic ritual.

At Stoke Parker continued to reside more or less until the year 1545. His disposition throughout life was naturally retiring. In one of his letters to Cecil written

about 1543, he confesses to a "natural viciousity of overmuch shamefacedness"; and this constitutional defect would seem, at this time, to have been aggravated by a state of health which made it necessary for him to obtain the permission of the university, when preaching in St Mary's, Cambridge, to do so with his head covered. In the year 1538 he was created D.D. Although his indifferent health and love of study alike inclined him to a retired life, his seclusion was frequently broken in upon by honours and preferment which came unsought. He was selected by Thomas Cromwell to preach at Paul's Cross, on account of "his learning in holy letters and uncorrupt judgment in the same." He was appointed one of the king's chaplains, and in the year 1541 was made a canon of Ely. In 1542 his own college of Stoke presented him to an Essex living. About this time it began to be rumoured that the dissolution of Stoke College could not be averted, and the arguments for Parker's return to his university, in whose welfare his interest had continued undiminished, were such as he could no longer resist. The mastership of Corpus having fallen vacant, he consented to be elected to the post, at that time scarcely of the annual value of £10; to this, however, the society shortly after added the rectory of Landbeach. In January 1545 he was elected to the vice-chancellorship of the university by a large majority. The colleges of both universities were at this period in continual fear of being, sooner or later, handed over, as the monasteries had been, to the greed of the despoiler. It was accordingly resolved, in order to anticipate a commission consisting of unscrupulous courtiers and lawyers, that the university should obtain the royal authority for a commission composed of those who were intimately acquainted with the real state of affairs, and, through the good offices of Catherine Parr, Parker, along with two other heads of colleges, was selected for the task. When their survey had been completed, they repaired to Hampton Court, and laid their statement before the king. Henry, on reading the report, expressed his emphatic admiration at the economical management of the colleges, and dismissed the commission with assurances which completely baffled the expectations of the courtiers. The fate which was averted from Cambridge fell, however, upon Stoke College. Its estate was confiscated, but subject to a charge of £40 per annum as compensation. The purchaser was Sir John Cheke, Parker's personal friend, by whom the money was regularly paid to the former dean. Parker now entered upon the married state, and espoused a Norfolk lady named Margaret Harleston. His choice appears to have been singularly fortunate. His wife proved a true helpmate, and was distinguished for the graceful hospitality she extended to the poor clergy whom Parker was in the habit of inviting to the college lodge at Cambridge.

In the measures which marked the further progress of the Reformation during Edward's reign Parker seems to have cordially co-operated. But he had no sympathy with the bigotry which now began to characterize the contending sects of Protestantism abroad; and when Martin Bucer was fain to quit Strasburg, after the failure of his efforts to mediate between the Lutherans and the Zwinglians, the master of Corpus extended to that eminent theologian a cordial welcome to England. During the short time that the latter filled the post of regius professor of divinity at Cambridge, he found in Parker a firm friend, and it was by Parker that his funeral sermon was preached. Parker's services to his party were not unrecognized. He was occasionally appointed to preach before the young king, and was promoted to the deanery of Lincoln and to the prebend of Corringham in that cathedral. On the occasion of Kett's rebellion in Norfolk, happening to be in Norwich, he visited the rebels'

camp and ventured to preach submission to the constituted authorities.

When Queen Mary ascended the throne, most of the college heads at Cambridge were deprived of office, and Parker only forestalled a like fate by resignation. The fact of his being a married man alone sufficed to entail the loss of all his ecclesiastical preferments. He did not, however, like many of the leaders of his party, fly from the country, but lived in strict retirement, his place of residence being a secret which appears to have died with him. This feature in his career is deserving of note, as offering an important point of contrast to the experiences of those other eminent churchmen who, known as the Marian exiles, returned to England after a long sojourn at the chief centres of the Reformed party on the Continent, strongly prejudiced in favour of Calvinistic doctrine, and bigotedly intolerant of everything approaching to the Roman discipline and ritual. Parker, like Whitgift, stayed in England, and was thus probably better able afterwards to maintain a fairly impartial position in relation to contending religious parties. He himself speaks of these years of his life, passed as they were in solitude among his books and in meditation, but cheered by the possession of a clear conscience, as productive of far more solid enjoyment than he afterwards found in the varied duties and anxieties of the episcopal office.

A fall from horseback, when he was on one occasion compelled to flee by night from Mary's emissaries, resulted in a permanent injury (his language appears to imply a rupture) which still further disinclined him to active and laborious public duties; and upon Elizabeth's accession he evinced little readiness to avail himself of prospects of preferment held out by Sir Nicholas Bacon, the lord keeper. He believed himself to be summoned by duty to return to his former sphere of labour at Cambridge, at that time, like Oxford, in a singularly depressed and unsatisfactory condition. "Of all places in England," he writes to Bacon, "I would wish to bestow most of my time in the university, the state whereof is miserable at this present." His services were needed, however, for a wider sphere of action; and in December 1558 he was summoned by royal command to London, where it was intimated to him that he was to be appointed to the primacy. His election to the office took place on the first of the following August, and his consecration on the 17th December, in the chapel at Lambeth Palace. He was consecrated by Bishop Barlow, formerly bishop of Bath and Wells, bishop-elect of Chichester; John Scory, formerly bishop of Chichester, bishop-elect of Hereford; Miles Coverdale, late bishop of Exeter; and John Hodgkin, suffragan bishop of Bedford. The delay which took place in his consecration arose from the fact that the three bishops named in the original warrant (Tonstal, Bourne, and Poole) refused to act, and a second warrant was consequently found necessary. In the following century the Romanist party sought, by circulating the "Nag's Head fable," to throw discredit on Parker's consecration by representing that he, together with certain other bishops, was simply ordained, and that too in an irreverent and uncanonical fashion, at a tavern in Fleet Street. The evidence which contravenes this story (see Pocock's edition of Burnet's *History of the Reformation*, vol. v.) is, however, singularly full and satisfactory.

During the fifteen years of his primacy, Parker's best energies were devoted to defining more accurately the discipline and belief of the newly constituted Church of England, and to bringing about a general conformity. The Thirty-Nine Articles were passed by convocation under his presidency in 1562. In the year 1566 he issued his celebrated "Advertisements," "for the due order in the

public administration of common prayers and using the holy sacraments, and for the apparel of all persons ecclesiastical." Notwithstanding that they related mainly to questions of detail and ceremonial, these new regulations excited strenuous opposition from the Puritan party, owing to the fact that, although they enjoined the discontinuance of "gorgeous vestments" and the cope, they prescribed the use of the surplice. It is asserted that they were promulgated by the command of Elizabeth, who subsequently withheld her formal sanction, and permitted the obloquy they evoked to fall on Parker. It is certain that they added materially to the embarrassment of his position. The revised translation of the Scriptures known as the Bishops' Bible (1568 and 1572) owed its origin to Parker, and is regarded by English Churchmen as a valuable service to their communion, from the fact that it served to prevent the adoption of the Geneva Bible until superseded by the authorized version.

The determination which Parker showed to withstand, and if possible repress, the growing boldness of the Puritan party, involved him during the latter years of his primacy in a struggle which was detrimental to his health, his temper, and his reputation. In August 1570 his wife died, and the blow was severely felt. He was still able, however, to discharge with efficiency the duties of his office; and in 1573 he entertained Elizabeth with great splendour and sumptuousness in the grand hall of his palace at Canterbury. Among his last measures of reform are to be noted his personal visitation of the church and chapter at Canterbury, and the drawing up of a series of injunctions for their more efficient regulation, the issuing of a commission for the visitation of his diocese, and the publication of new constitutions for the Court of Arches. In 1575 his health began rapidly to give way, and he died on the 17th May in that year, giving evidence almost to the last of that vigorous intellect and strong will by which he was distinguished throughout life.

As an author, Parker cannot be held entitled to any high place. He compiled a Latin treatise, *De Antiquitate Britannicæ Ecclesiæ et Privilegiis Ecclesiæ Cantuariensis*, printed by John Day in 1572, which shows considerable research in connexion with the circumstances under which Christianity was introduced into Britain. In this, however, as in most of his more learned works, he was probably largely assisted by his secretary, Josselin. His letters, which have been published under the title of the *Parker Correspondence* (Parker Society, 1853), are marked throughout by his usual natural good sense and sobriety of judgment, but are characterized neither by originality nor brilliancy of thought. His other writings are chiefly statutes for various ecclesiastical or collegiate foundations, sermons, forms of prayer, and ordinances for the church.

As an editor, while his industry must be admitted by all, he had but an imperfect sense of the responsibilities attaching to such a function and of the limits to be observed in its exercise. He edited *Elfric's Anglo-Saxon Homily*, a treatise much valued by religious controversialists as exhibiting the theory of the early English Church in relation to the doctrine of transubstantiation. The treatise of Gildas, *De Excidio Britannicæ*, next appeared; but this was mainly, if not entirely, the work of Josselin. The *Flores Historiarum* (probably the work of Roger of Wendover) was edited by Parker under the belief that it was the work of an unknown "Matthew of Westminster." The other chronicles which he published were the *Historia Major* of Matthew Paris, the *Historia Anglicana* of Walsingham, the life of Alfred (*Gesta Ælfredi*) of Asser, and the *Itinerarium* of Giraldus Cambrensis. The extreme licence in which he indulged in altering the texts of these writers, and especially that of Matthew Paris, renders his editions, however, almost worthless, and has met with the severest censures from succeeding historical scholars.

But, notwithstanding these errors and defects, Parker's memory must ever be venerated by Englishmen and by scholars; and his country, his university, and his college were alike laid by him under no ordinary debt of gratitude. He revived the study of Saxon literature and of the *origines* of our national history; and the *scriptorium* which he maintained at Lambeth (after the fashion of the mediæval monasteries) was a busy scene where the transcriber, the illuminator, the engraver, and the bookbinder each plied his craft, to the no small advantage of letters and of art. Among the printers whom he patronized were Richard Jugge, John Day,

and Richard Gratton. As a collector of books and manuscripts he was indefatigable; and one of his numerous agents, named Batman, is stated to have collected in four years no less than 6700 volumes, chiefly works which had been scattered on the dissolution of the monasteries. The greater part of this splendid collection, styled by Fuller "the sun of English antiquity," Parker bequeathed to Corpus Christi College. His interest in his university at large did not diminish after his elevation to the archbishopric, and the Regent Walk (an improved approach to the public schools) and the university library were long-standing memorials of his munificence. He also founded a grammar school at Rochdale, and numerous scholarships and annual charities elsewhere. That he died rich cannot be denied; and his enemies have asserted that he was far from scrupulous in the means which he employed in acquiring wealth, especially in "admitting children to cures." On the other hand, it must be allowed that he made a good and generous use of his wealth, and his contemporary biographer claims for him the rare merit of combining strict economy with liberality. Parker had five children. Of these the eldest, John, who was knighted by King James in 1603, alone survived him; he died at Cambridge in 1620, in great want, the cost of his funeral being defrayed by Corpus Christi College.

The best source of information in all that relates to Parker is his *Life and Acts*, by Strype (3 vols., Oxford, 1824), a performance on which that distinguished antiquary bestowed even more than his usual amount of painstaking research. A copy of the folio edition (1711), preserved in the library of St John's College, Cambridge, is enriched with numerous and valuable MS. notes by the donor, the eminent Thomas Baker. The titles of the books which he presented to his own college will be found in Nasmyth's *Cat. of the C.C. MSS.* (1777). (J. B. M.)

PARKER, THEODORE (1810-1860), a distinguished American rationalistic preacher and social reformer, born at Lexington, Massachusetts, August 24, 1810, was the youngest of eleven children. His father, John Parker, a small farmer and skilful mechanic, was a typical New England yeoman, a man of sterling moral worth, of strong intellect, meditative, and fond of reading,—a strict disciplinarian in his house, a Unitarian in his theology before Unitarianism was known in New England as a system, and a Federalist in his politics when there were but four Federalists in Lexington. His mother, "an imaginative, delicate-minded, poetic, yet very practical woman," took great pains with the religious education of her children, "caring, however; but little for doctrines," and making religion to consist of love and good works. Theodore's paternal grandfather, Captain John Parker, fired the first shot upon the British at the battle of Lexington, commanding on that occasion a troop of seventy men. The historic musket from which that shot was fired became one of the most valued ornaments of the grandson's study. His mother taught him to listen to the monitions of conscience as the voice of God, and from his infancy his life was dominated by moral and religious emotions and ideas of overpowering force. The boy was richly endowed intellectually and physically. His memory was marvelously retentive. The acquisition of languages was a delight and recreation to him. He obtained the elements of knowledge in the schools of the district, which were open during the winter months only. During the rest of the year he worked on his father's farm. He was all the time an immense and omnivorous reader, and his powerful memory enabled him to remember all that he read. At the age of seventeen he became himself a winter school-master, and in his twentieth year he entered himself at Harvard, working on the farm as usual while he followed his studies, and going over to Cambridge for the examination only. For the theological course he took up in 1834 his residence in the college, meeting his expenses by a small sum amassed by school-keeping and by help from a poor students' fund. He studied fourteen hours a day, not only following the usual course of the college, but plunging deep into German theology and Biblical criticism, and especially the history of non-Christian religions. At the close of his college career he began his translation of De Wette's *Introduction to the Old Testament*. His journal and letters show that he had made acquaintance with a large number of languages, including Hebrew, Chaldee, Syriac, Arabic, Coptic, Ethiopic, as well as the classical and the

principal modern European languages. When he entered the divinity school he was an orthodox Unitarian; when he left it, he entertained strong doubts about the infallibility of the Bible, the possibility of miracles, and the exclusive claims of Christianity and the church. Emerson's transcendentalism greatly influenced him, and Strauss's *Leben Jesu* left its mark upon his thought. His first ministerial charge was over a small village parish, Roxbury, a few miles from Boston. He was ordained June 1837, and held his pastorate there until the autumn of 1843. He was extremely happy in his position. His parishioners loved him, he had ample time to pursue his studies, and the neighbourhood of Boston gave him congenial society. His views were slowly assuming the form which subsequently found such strong expression in his writings; but the process was slow, and the cautious reserve of his first rationalistic utterances was in striking contrast with his subsequent rashness. But in 1841 he preached at Boston a sermon on "the transient and permanent in Christianity," which presented in embryo the main principles and ideas of his final theological position, and the preaching of which determined his subsequent relations to the churches with which he was connected and to the whole ecclesiastical world. The only permanent element he discovered in the Bible, in Christianity, in Christ, was "absolute, pure morality, absolute, pure religion, the love of man, the love of God acting without let or hindrance." He denied all special authority to the Bible, to Christ, to Christianity. He maintained that "Jesus had not exhausted the fulness of God." The Boston Unitarian clergy denounced the preacher, and declared that the "young man must be silenced." No Unitarian publisher could be found for his sermon, and nearly all the pulpits of the city were closed against him. To exchange with him was fatal to a minister's reputation for Unitarian orthodoxy. But when the Unitarian clergy cast Parker off the laity took him up. A number of gentlemen in Boston invited him to give a series of lectures there. The result was that he delivered in the Masonic Hall, in the winter of 1841-42, as lectures, substantially the volume afterwards published as the *Discourse of Matters pertaining to Religion*. The lectures in their published form made his name famous throughout America and Europe, and confirmed the stricter sect of the American Unitarians in their attitude towards him and his supporters. His friends, however, resolved that he should be heard in Boston. They engaged for him the Music Hall in that city, in which he regularly preached to a congregation of some three thousand persons during the remaining fourteen years of his life. Previous to his removal from Roxbury to Boston, Parker spent a year in Europe, calling in Germany upon Paulus, Gervinus, Do Wette, and Ewald amongst other savants, and preaching in Liverpool in the pulpits of James Martineau and J. H. Thom. Soon after his return, in 1844, to America he resigned his charge at Roxbury, and devoted himself exclusively to his work in Boston. In addition to his Sunday labours, he lectured throughout the States, and prosecuted his wide studies, collecting particularly the materials for an *opus magnum* on the development of religion in mankind. Above all he took up the question of the emancipation of the slaves, and at the imminent risk of his life nobly and powerfully advocated in Boston and throughout the States, from the platform and through the press, the cause of the negroes. Indeed, he did more. He assisted actively in the escape of fugitive slaves, and helped to furnish John Brown with means for carrying out his schemes of liberation. His Sunday sermons were themselves often elaborate essays, almost treatises, on great questions of social and political reform, and he was all along contributing articles and papers on literary,

political, social, and theological subjects to the periodical press. By his voice, his pen, and his utterly fearless action in social and political matters, he became a great power in Boston and America generally. But his days were numbered. From his mother he inherited consumption, and the reckless disregard of the laws of health which he was guilty of in his early years, combined with the tremendous strain of his ordinary work, and the terrible privations and fatigues of his lecturing tours, developed in the prime of his life the fatal seeds. In January 1859 he had an attack of bleeding of the lungs, and sought relief by retreating first to Santa Cruz, and afterwards to Europe. He died at Rome, May 10, 1860.

The fundamental articles of Parker's religious faith were the three "instinctive intuitions" of God, of a moral law, and of immortality. His own mind, heart, and life were undoubtedly pervaded, sustained, and ruled by the feelings, convictions, and hopes which he formulated in these three articles. But he cannot be said to have achieved success when he came to strictly define, expound, and establish them. In his doctrine of God he maintains that man has an innate idea of God as a being of infinite power, goodness, and wisdom; but he often uses language which borders on pantheism, while his criterion of the notions man have formed of the Divine Being appears to leave him no foundation for anything higher than an abstract pantheistic idea of Him. His proof of his fundamental creed is no less at fault than his statement and exposition of it. It is strange that a man who had read so widely and honestly the best literature of his day on the religious ideas of mankind should have referred to the *consensus gentium* for his main proof of the universality of his triad of religious ideas. His own chapter on the immortality of the soul in his *Discourse* abundantly illustrates the weakness of his proof from induction. The distinction he was compelled to draw between the conception and the idea of God illustrates the weakness of his deductive proof. Parker's definitions of religion are various, and show that he had never closely traced its true nature. Of revelation—the counterpart of religion—his notions were of the vaguest description. He could ask "Is Newton less inspired than Simon Peter?" He had never formed any approximately just conception of the work of a great religious teacher, and could say, "Christianity, if true at all, would be just as true if Herod or Catiline had taught it." Naturally, therefore, he never formed an adequate idea of the place of Christianity amongst the world's religions, though he often used language about Christ which in the case of a closer thinker would have indicated the acceptance of Christianity as the absolute and final religion for man. But in truth Parker was more of a speaker than a thinker, of a reformer than a philosopher. He had a wide and firm grasp of facts and principles, but his thought was neither profound nor subtle, neither accurate nor self-consistent. Although rich in poetic elements, he was singularly defective, too, in artistic faculty. He has produced nothing that is perfect in form, while all his works are disfigured by outrageous violations of taste and good feeling. But with all his numerous defects Parker ranks amongst America's great and noble sons, and may perhaps obtain finally a place amongst the world's great men. A future biographer will have to assign him his final position. The three biographies which at present exist—Weiss's (1863), Frothingham's (1874), and Dean's (1877)—are the work of eager partisans and admiring panegyrist rather than of calm critics and historians.

Parker's principal works are *A Discourse on Matters pertaining to Religion*, 1842; *Ten Sermons of Religion*, 1852; *Theism, Atheism, and the Popular Theology*, 1853. A collected edition of his works has been published in England by Frances Power Cobbe, in 12 vols. A German translation of part of his works was made by Zietzen, Leipzig, 1854-57. Valuable reviews of his theological position and of his character and work have appeared—by James Martineau, in the *National Review* (April 1860), and J. H. Thom, in the *Theological Review* (March 1864).

PARKERSBURG, a city of the United States, next to Wheeling the largest city in West Virginia, is the capital of Wood county, and lies on the left bank of the Ohio, at the mouth of the Little Kanawha. It is the western terminus of the Baltimore and Ohio Railroad, and is connected by a fine railway bridge (1½ miles in length, and constructed at a cost of more than \$1,000,000 in 1869-1871) with Belpré, where the Marietta and Cincinnati Railroad begins. Steamers ply both on the Ohio and the Little Kanawha (rendered navigable for 38 miles). The staple industry is the refining of petroleum, but there are also foundries, flour-mills, saw-mills, brickyards (most of the buildings are of brick), &c. The population was 2493 in 1860, 5546 in 1870, and 6582 in 1880. As a town Parkersburg dates from 1820, as a city from 1860.

PARLIAMENT

THE British Parliament is the supreme legislature of the United Kingdom of Great Britain and Ireland, consisting of the King, or Queen, and the three estates of the realm, viz, the Lords Spiritual, the Lords Temporal, and the Commons.

HISTORY.

An inquiry into the early growth and later development of this powerful institution presents at once an interesting historical study and profound political instruction. Its great antiquity, its continuous but ever-changing life, and the social and political causes which have shaped its present constitution and authority are themes which can never fail to attract the historian and the statesman; while speculations regarding its future course concern the destinies of the British empire.

The Anglo-Saxon Polity.—The origin of parliament is to be traced to Anglo-Saxon times. The Angles, Saxons, and other Teutonic races who conquered Britain brought to their new homes their own laws and customs, their settled framework of society, their kinship, their village communities, and a certain rude representation in local affairs. And we find in the Anglo-Saxon polity, as developed during their rule in England, all the constituent parts of parliament. In their own lands they had chiefs and leaders, but no kings. But conquest and territorial settlement were followed by the assumption of royal dignities; and the victorious chiefs were accepted by their followers as kings. They were quick to assume the traditional attributes of royalty. A direct descent from their god Woden, and hereditary right, at once clothed them with a halo of glory and with supreme power; and, when the pagan deity was deposed, the king received consecration from a Christian archbishop, and was invested with sacred attributes as "the Lord's anointed." But the Saxon monarch was a patriarchal king of limited authority, who acted in concert with his people; and, though his succession was hereditary, in his own family, his direct descendant was liable to be passed over in favour of a worthier heir. Such a ruler was a fitting precursor of a line of constitutional kings, who in later times were to govern with the advice and consent of a free parliament.

Meanwhile, any council approaching the constitution of a House of Lords was of slow growth. Anglo-Saxon society, indeed, was not without an aristocracy. The highest in rank were æthelings—generally, if not exclusively, sons and brothers of the king. The ealdorman, originally a high officer, having the executive government of a shire, and a seat in the king's witan, became hereditary in certain families, and eventually attained the dignity of an earl. But centuries were to pass before the English nobility was to assume its modern character and denominations. At the head of each village was an eorl, the chief of the freemen, or ceorls—their leader in war and patron in peace. The king's gesiths and thegns formed another privileged class. Admitted to offices in the king's household and councils, and enriched by grants of land, they gradually formed a feudal nobility.

The revival of the Christian church, under the Anglo-Saxon rule, created another order of rulers and councillors, destined to take a leading part in the government of the state. The archbishops and bishops, having spiritual authority in their own dioceses, and exercising much local influence in temporal affairs, were also members of the national council, or witenagemót, and by their greater

learning and capacity were not long in acquiring a leading part in the councils of the realm. Ecclesiastical councils were also held, comprising bishops, abbots, and clergy, in which we observe the origin of convocation. The abbots, thus associated with the bishops, also found a place with them in the witenagemót. By these several orders, summoned to advise the king in affairs of state, was formed a council of magnates—to be developed, in course of time, into an Upper Chamber, or House of Lords.

The rise of the commons, as a political power in the national councils, was of yet slower development; but in the Anglo-Saxon moots may be discerned the first germs of popular government in England. In the town-moot the assembled freemen and cultivators of the "folk-lands" regulated the civil affairs of their own township, tithing, village, or parish. In the burgh-moot the inhabitants administered their municipal business, under the presidency of a reeve. The hundred-moot assumed a more representative character, comprising the reeve and a selected number of freemen from the several townships and burghs within the hundred. The shire-moot, or shire-gemót, was an assembly yet more important. An ealdorman was its president, and exercised a jurisdiction over a shire, or district comprising several hundreds. Attended by a reeve and four freemen from every hundred, it assumed a distinctly representative character. Its members, if not elected by the popular voice, were, in some fashion, deputed to act on behalf of those whose interests they had come to guard. The shire-moot was also the general folk-moot of the tribe, assembled in arms, to whom their leaders referred the decision of questions of peace and war.

Superior to these local institutions was the witenagemót, or assembly of wise men, with whom the king took counsel in legislation and the government of the state. This national council was the true beginning of the parliament of England. Such a council was originally held in each of the kingdoms commonly known as the Heptarchy; and after their union in a single realm, under King Edgar, the witenagemót became the deliberative and legislative assembly, or parliament, of the extended estate.

The witenagemót made laws, imposed taxes, concluded treaties, advised the king as to the disposal of public lands and the appointment and removal of officers of state, and even assumed to elect and depose the king himself. The king had now attained to greater power, and more royal dignities and prerogatives. He was unquestionably the chief power in the witenagemót; but the laws were already promulgated, as in later times, as having been agreed to with the advice and consent of the witan. The witan also exercised jurisdiction as a supreme court. These ancient customs present further examples of the continuity of English constitutional forms.

The constitution of the witenagemót, however, was necessarily less popular than that of the local moots in the hundred or the shire. The king himself was generally present; and at his summons came prelates, abbots, ealdormen, the king's gesiths and thegns, officers of state and of the royal household, and leading tenants in chief of lands held from the crown. Crowds sometimes attended the meetings of the witan, and shouted their acclamations of approval or dissent; and, so far, the popular voice was associated with its deliberations; but it was at a distance from all but the inhabitants of the place in which it was assembled, and until a system of representation had slowly grown up there could be no further admission of the

people to its deliberations. In the town-moot the whole body of freemen and cultivators of the folk-lands met freely under a spreading oak, or on the village green; in the hundred-moot, or shire-gemót, deputies from neighbouring communities could readily find a place; but all was changed in the wider council of a kingdom. When there were many kingdoms, distance obstructed any general gathering of the commons; and in the wider area of England such a gathering became impossible. Centuries were yet to pass before this obstacle was to be overcome by representation; but, in the meantime, the local institutions of the Anglo-Saxons were not without their influence upon the central council. The self-government of a free people informed the bishops, ealdormen, coorls, and thegns who dwelt among them of their interests and needs, their sufferings and their wrongs; and, while the popular forces were increasing with an advancing society, they grew more potential in the councils of their rulers. Some writers, naturally sympathizing with every tradition of English liberty, have discovered proofs of an earlier representation; but popular franchises are now too firmly established to need support from doubtful traces of antiquity.

Another circumstance must not be overlooked in estimating the political influence of the people in Anglo-Saxon times. For five centuries the country was convulsed with incessant wars—wars with the Britons, whom the invaders were driving from their homes, wars between the several kingdoms, wars with the Welsh, wars with the Picts, wars with the Danes. How could the people continue to assert their civil rights amid the clash of arms and a frequent change of masters? The warrior-kings and their armed followers were rulers in the land which they had conquered.

At the same time the unsettled condition of the country repressed the social advancement of its people. Agriculture could not prosper when the farm of the husbandman too often became a battlefield. Trade could not be extended without security to property and industry. Under such conditions the great body of the people continued as peasants, handicraftsmen, and slaves. The time had not yet come when they could make their voice heard in the councils of the state.

The Norman Conquest.—The Anglo-Saxon polity was suddenly overthrown by the Norman Conquest. A stern foreign king had seized the crown, and was prepared to rule his conquered realm by the sword. He brought with him the absolutist principles of Continental rulers, and the advanced feudal system of France and Normandy. Feudalism had been slowly gaining ground under the Saxon kings, and now it was firmly established as a military organization. William the Conqueror at once rewarded his warlike barons and followers with enormous grants of land. The Saxon landowners and peasants were despoiled, and the invaders settled in their homesteads. The king claimed the broad lands of England as his own, by right of conquest; and when he allowed his warriors to share the spoil he attached the strict condition of military service in return for every grant of land. An effective army of occupation of all ranks was thus quartered upon every province throughout the realm. England was held by the sword; a foreign king, foreign nobles, and a foreign soldiery were in possession of the soil, and swore fealty to their master, from whom they held it. Saxon bishops were deposed, and foreign prelates appointed to rule over the English Church. Instead of calling a national witenagemót, the king took counsel with the officers of his state and household, the bishops, abbots, earls, barons, and knights by whom he was pleased to surround himself. Some of the forms of a national council

were indeed maintained, and its counsel and consent were proclaimed in the making of laws; but, in truth, the king was absolute.

Such a revolution seemed fatal to the liberties and ancient customs of Saxon England. What power could withstand the harsh conqueror? But the indestructible elements of English society prevailed over the sword. The king grasped, in his own hands, the higher administration and judicature of the realm; but he continued the old local courts of the hundred and the shire, which had been the basis of Saxon freedom. The Norman polity was otherwise destined to favour the liberties of the people, through agencies which had been designed to crush them. The powerful nobles, whom William and his successors exalted, became formidable rivals of the crown itself, while ambitious barons were in their turn held in check by a jealous and exacting church. The ruling powers, if combined, would have reduced the people to slavery; but their divisions proved a continual source of weakness. In the meantime the strong rule of the Normans, bitter as it was to Englishmen, repressed intestine wars and the disorders of a divided realm. Civil justice was fairly administered. When the spoils of the conquerors had been secured, the rights of property were protected, industry and trade were left free, and the occupation of the soil by foreigners drove numbers of landowners and freemen into the towns, where they prospered as merchants, traders, and artificers, and collected thriving populations of townsmen. Meanwhile, foreign rulers having brought England into closer relations with the Continent, its commerce was extended to distant lands, ports and shipping were encouraged, and English traders were at once enriched and enlightened. Hence new classes of society were growing, who were eventually to become the commons of England.

The Crown, the Barons, the Church, and the People.—While these social changes were steadily advancing, the barons were already preparing the way for the assertion of popular rights. Ambitious, turbulent, and grasping, they were constantly at issue with the crown. Enjoying vast estates and great commands, and sharing with the prelates the government of the state, as members of the king's council, they were ever ready to raise the standard of revolt. The king could always count upon barons faithful to his cause, but he also appealed for aid to the church and the people. The baronage was thus broken by insurrections, and decimated by civil wars, while the value of popular alliances was revealed. The power of the people was ever increasing, while their oppressors were being struck down. The population of the country was still Saxon; they had been subdued, but had not been driven forth from the land, like the Britons in former invasions. The English language was still the common speech of the people; and Norman blood was being mingled with the broader stream of Saxon life. A continuous nationality was thus preserved, and was outgrowing the foreign element.

The crown was weakened by disputed successions and foreign wars, and the baronage by the blood-stained fields of civil warfare; while both in turn looked to the people in their troubles. Meanwhile the church was struggling, alike against the crown and the barons, in defence of its ecclesiastical privileges and temporal possessions. Its clergy were brought by their spiritual ministrations into close relations with the people, and their culture contributed to the intellectual growth of English society. When William Rufus was threatened by his armed barons, he took counsel with Archbishop Lanfranc, and promised good laws and justice to the people. His promises were broken; but, like later charters, as lightly set aside, they

were a recognition of the political rights of the people. By the charter of Henry I. restoring to the people the laws of Edward the Confessor, the continuity of English institutions was acknowledged; and this concession was also proclaimed through Archbishop Anselm, the church and the people being again associated with the crown against the barons. And throughout his reign the clergy and the English people were cordially united in support of the crown. In the anarchic reign of Stephen—also distinguished by its futile charters—the clergy were driven into opposition to the king, while his oppressions alienated the people. Henry II. commenced his reign with another charter, which may be taken as a profession of good intentions on the part of the new king. So strong-willed a king, who could cripple his too powerful nobles, and forge shackles for the church, was not predisposed to extend the liberties of his people; but they supported him loyally in his critical struggles; and his vigorous reforms in the administrative, judicial, and financial organization of his realm promoted the prosperity and political influence of the commons. At the same time the barons created in this and the two previous reigns, being no longer exclusively Norman in blood and connexion, associated themselves more readily with the interests and sympathies of the people. Under Richard I. the principle of representation was somewhat advanced, but it was confined to the assessment and collection of taxes in the different shires.

The Great Charter.—It was under King John that the greatest progress was made in national liberties. The loss of Normandy served to draw the baronage closer to the English people; and the king soon united all the forces of the realm against him. He outraged the church, the barons, and the people. He could no longer play one class against another; and they combined to extort the Great Charter of their liberties at Runnymede. It was there ordained that no scutage or aid, except the three regular feudal aids, should be imposed, save by the common council of the realm. To this council the archbishops, bishops, abbots, earls, and greater barons were to be summoned personally by the king's letters, and tenants in chief by a general writ through the sheriff. The summons was required to appoint a certain place, to give forty days' notice at least, and to state the cause of meeting. At length we seem to reach some approach to modern usage.

Growth of the Commons.—The improved administration of successive kings had tended to enlarge the powers of the crown. But one hundred and fifty years had now passed since the Conquest, and great advances had been made in the condition of the people, and more particularly in the population, wealth, and self-government of towns. Many had obtained royal charters, elected their own magistrates, and enjoyed various commercial privileges. They were already a power in the state, which was soon to be more distinctly recognized.

The charter of King John was again promulgated under Henry III., for the sake of a subsidy; and henceforth the commons learned to insist upon the redress of grievances in return for a grant of money. This reign was memorable in the history of parliament. Again the king was in conflict with his barons, who rebelled against his gross misgovernment of the realm. Simon de Montfort, earl of Leicester, was a patriot, in advance of his age, and fought for the English people as well as for his own order. The barons, indeed, were doubtful allies of the popular cause, and leaned to the king rather than to Simon. But the towns, the clergy, the universities, and large bodies of the commonalty rallied round him, and he overthrew the king and his followers at Lewes. He was now master of the realm, and proclaimed a new constitution. Kings had

made promises, and granted illusory charters; but the rebel earl called an English parliament into being. Churchmen were on his side, and a few barons; but his main reliance was upon the commons. He summoned to a national council, or parliament, bishops, abbots, earls, and barons, together with two knights from every shire and two burgesses from every borough. Knights had been summoned to former councils; but never until now had representatives from the towns been invited to sit with bishops, barons, and knights of the shire.

In the reign of Edward I. parliament assumed substantially its present form of king, lords, and commons. The irregular and unauthorized scheme of Simon de Montfort was fully adopted in 1295, when the king himself summoned to a parliament two knights from every shire, elected by the freeholders at the shire court, and two burgesses from every city, borough, and leading town. The rebel earl had enlarged the basis of the national council; and, to secure popular support, the politic king accepted it as a convenient instrument of taxation. The knights and freeholders had increased in numbers and wealth; and the towns, continually advancing in population, trade, and commerce, had become valuable contributors to the revenue of the state. The grant of subsidies to the crown, by the assembled baronage and representatives of the shires and towns, was a legal and comprehensive impost upon the entire realm.

Secession of the Clergy.—It formed part of Edward's policy to embrace the clergy in his scheme for the representation of all orders and classes of his subjects. They were summoned to attend the parliament of 1295 and succeeding parliaments of his reign, and their form of summons has been continued until the present time; but the clergy resolutely held aloof from the national council, and insisted upon voting their subsidies in their own convocations of Canterbury and York. The bishops retained their high place among the earls and barons, but the clergy sacrificed to ecclesiastical jealousies the privilege of sharing in the political councils of the state. As yet, indeed, this privilege seemed little more than the voting of subsidies, but it was soon to embrace the redress of grievances and the framing of laws for the general welfare of the realm. This great power they forfeited; and who shall say how it might have been wielded, in the interests of the church, and in the legislation of their country? They could not have withstood the Reformation; they would have been forced to yield to the power of the crown and the heated resolution of the laity; but they might have saved a large share of the endowments of the church, and perhaps have modified the doctrines and formularies of the reformed establishment.

Reluctance of the Commons to Attend.—Meanwhile the commons, unconscious of their future power, took their humble place in the great council of the realm. The knights of the shire, as lesser barons, or landowners of good social standing, could sit beside the magnates of the land without constraint; but modest traders from the towns were overawed by the power and dignity of their new associates. They knew that they were summoned for no other purpose than the taxing of themselves and their fellow townsmen; their attendance was irksome; it interrupted their own business; and their journeys exposed them to many hardships and dangers. It is not surprising that they should have shrunk from the exercise of so doubtful a privilege. Considerable numbers absented themselves from a thankless service; and their constituents, far from exacting the attendance of their members, as in modern times, begrudged the sorry stipend of 2s. a day, paid to their representatives while on duty, and strove to evade the burden imposed upon them by the crown. Some

even purchased charters, withdrawing franchises which they had not yet learned to value. Nor, in truth, did the representation of towns at this period afford much protection to the rights and interests of the people. Towns were enfranchised at the will or caprice of the crown and the sheriffs; they could be excluded at pleasure; and the least show of independence would be followed by the omission of another writ of summons. But the principle of representation, once established, was to be developed with the expansion of society; and the despised burgesses of Edward I., not having seceded, like the clergy, were destined to become a potential class in the parliaments of England.

Sitting of Parliament at Westminster.—Another constitutional change during this reign was the summoning of parliament to Westminster instead of to various towns in different parts of the country. This custom invested parliament with the character of a settled institution, and constituted it a high court for the hearing of petitions and the redress of grievances. The growth of its judicature, as a court of appeal, was also favoured by the fixity of its place of meeting.

Authority of Parliament recognized by Law.—Great was the power of the crown, and the king himself was bold and statesmanlike; but the union of classes against him proved too strong for prerogative. In 1297, having outraged the church, the barons, and the commons by illegal exactions, he was forced to confirm the Great Charter and the Charter of Forests, with further securities against the taxation of the people without their consent, and, in return, obtained timely subsidies from the parliament.

Henceforth the financial necessities of a succession of kings ensured the frequent assembling of parliaments. Nor were they long contented with the humble function of voting subsidies, but boldly insisted on the redress of grievances and further securities for national liberties. In 1322 it was declared by statute 15th Edward II. that "the matters to be established for the estate of the king and of his heirs, and for the estate of the realm and of the people, should be treated, accorded, and established in parliament, by the king, and by the assent of the prelates, earls, and barons, and the commonalty of the realm, according as had been before accustomed." The constitutional powers of parliament as a legislature were here amply recognized,—not by royal charter, or by the occasional exercise of prerogative, but by an authoritative statute. And these powers were soon to be exercised in a striking form. Already parliament had established the principle that the redress of grievances should have precedence of the grant of subsidies; it had maintained the right of approving councillors of the crown, and punishing them for the abuse of their powers; and in 1327 the king himself was finally deposed, and the succession of his son, Edward III., declared by parliament.

Union of Knights of the Shire and Burgesses.—At this period the constitution of parliament was also settling down to its later and permanent shape. Hitherto the different orders or estates had deliberated separately, and agreed upon their several grants to the crown. The knights of the shire were naturally drawn, by social ties and class interests, into alliance with the barons; but at length they joined the citizens and burgesses, and in the first parliament of Edward III. they are found sitting together as "the Commons."

This may be taken as the turning point in the political history of England. If all the landowners of the country had become united as an order of nobles, they might have proved too strong for the development of national liberties, while the union of the country gentlemen with the

burgesses formed an estate of the realm, which was destined to prevail over all other powers. The withdrawal of the clergy, who would probably have been led by the bishops to take part with themselves and the barons, further strengthened the united commons.

Increasing Influence of Parliament.—The reign of Edward III. witnessed further advances in the authority of parliament, and changes in its constitution. The king, being in continual need of subsidies, was forced to summon parliament every year, and in order to encourage its liberality he frequently sought its advice upon the most important issues of peace or war, and readily entertained the petitions of the commons praying for the redress of grievances. During this reign also, the advice and consent of the commons, as well as of the lords spiritual and temporal, was regularly recorded in the enacting part of every statute.

Separation of the Two Houses.—But a more important event is to be assigned to this reign,—the formal separation of parliament into the two Houses of Lords and Commons. There is no evidence—nor is it probable—that the different estates ever voted together as a single assembly. It appears from the Rolls of Parliament that in the early part of this reign, the causes of summons having been declared to the assembled estates, the three estates deliberated separately, but afterwards delivered a collective answer to the king. While their deliberations were short, they could be conducted apart, in the same chamber; but, in course of time, it was found convenient for the commons to have a chamber of their own, and they adjourned their sittings to the chapter-house of the abbot of Westminster, where they continued to be held after the more formal and permanent separation had taken place. The date of this event is not clearly established, but is generally assigned to the 17th Edward III.

The Commons as Petitioners.—Parliament had now assumed its present outward form. But it was far from enjoying the authority which it acquired in later times. The crown was still paramount; the small body of earls and barons—not exceeding forty—were connected with the royal family, or in the service of the king, or under his influence; the prelates, once distinguished by their independence, were now seekers of royal favour; and the commons, though often able to extort concessions in return for their contributions to the royal exchequer, as yet held an inferior position among the estates of the realm. Instead of enjoying an equal share in the framing of laws, they appeared before the king in the humble guise of petitioners. Their petitions, together with the king's answers, were recorded in the Rolls of Parliament; but it was not until the parliament had been discharged from attendance that statutes were framed by the judges, and entered on the statute rolls. Under such conditions legislation was, in truth, the prerogative of the crown rather than of parliament. Enactments were often found in the statutes at variance with the petitions and royal answers, and neither prayed for by the commons nor assented to by the lords. In vain the commons protested against so grave an abuse of royal authority; but the same practice was continued during this and succeeding reigns. Henry V., in the second year of his reign, promised "that nothing should be enacted to the petitions of the commons, contrary to their asking, whereby they should be bound without their assent"; but, so long as the old method of framing laws was adhered to, there could be no security against abuse; and it was not until the reign of Henry VI. that the introduction of the more regular system of legislating by bill and statute ensured the thorough agreement of all the estates in the several provisions of every statute.

Increasing Boldness of the Commons.—The commons, however, notwithstanding these and other discouragements, were constantly growing bolder in the assertion of their rights. They now ventured to brave the displeasure of the king, without seeking to shelter themselves behind powerful barons, upon whose forwardness in the national cause they could not reckon. Notably in 1376 their stout Speaker, Peter de la Mare, inveighed, in their name, against the gross mismanagement of the war, impeached ministers of the realm, complained of the heavy burdens under which the people suffered, and even demanded that a true account should be rendered of the public expenditure. The brave Speaker was cast into prison, and a new parliament was summoned which speedily reversed the resolutions of the last. But the death of the king changed the aspect of affairs. Another parliament was called, when it was found that the spirit of the commons was not subdued. Peter de la Mare was released from prison, and again elected to the chair. The demands of the former parliament were reiterated with greater boldness and persistence, the evil councillors of the late reign were driven out, and it was conceded that the principal officers of state should be appointed and removed, during the minority of Richard II., upon the advice of the lords. The commons also insisted upon the annual assembling of parliament under the stringent provisions of a binding law. They claimed the right, not only of voting subsidies, but of appropriating them, and of examining public accounts. They inquired into public abuses, and impeached ministers of the crown. Even the king himself was deposed by the parliament. Thus during this reign all the great powers of parliament were asserted and exercised. The foreign wars of Henry IV. and Henry V., by continuing the financial necessities of the crown, maintained for a while the powers which parliament had acquired by the struggles of centuries.

Relapse of Parliamentary Influence.—But a period of civil wars and disputed successions was now at hand, which checked the further development of parliamentary liberties. The effective power of a political institution is determined, not by assertions of authority, nor even by its legal recognition, but by the external forces by which it is supported, controlled, or overborne. With the close of the Wars of the Roses the life of parliament seems to have well-nigh expired.

To this constitutional relapse various causes contributed at the same period. The crown had recovered its absolute supremacy. The powerful baronage had been decimated on the battlefield and the scaffold; and vast estates had been confiscated to the crown. Kings had no longer any dread of their prowess as defenders of their own order or party, or as leaders of the people. The royal treasury had been enriched by their ruin; while the close of a long succession of wars with France and Scotland relieved it of that continual drain which had reduced the crown to an unwelcome dependence upon parliament. Not only were the fortunes of the baronage laid low, but feudalism was also dying out in England as on the Continent. It was no longer a force which could control the crown; and it was being further weakened by changes in the art of war. The mailed horseman, the battle-axe and cross-bow of burgher and yeoman, could not cope with the cannon and arquebuse of the royal army.

In earlier times the church had often stood forth against the domination of kings, but now it was in passive submission to the throne. The prelates were attracted to the court, and sought the highest offices of state, the inferior clergy had long been losing their influence over the laity by their ignorance and want of moral elevation, at a period of increasing enlightenment; while the church at large was

weakened by schisms and a wider freedom of thought. Hence the church, like the baronage, had ceased to be a check upon the crown.

Meanwhile what had become of the over-growing power of the commons? It is true they had lost their stalwart leaders, the armed barons and outspoken prelates, but they had themselves advanced in numbers, riches, and enlightenment; they had overspread the land as knights and freeholders, or dwelt in populous towns enriched by merchandise. Why could they not find leaders of their own? Because they had lost the liberal franchises of an earlier age. All freeholders, or suitors present at the county court, were formerly entitled to vote for a knight of the shire; but in the eighth year of Henry VI. (1430) an Act was passed (c. 37) by which this right was confined to 40s. freeholders, resident in the county. Large numbers of electors were thus disfranchised. In the view of parliament they were "of no value," and complaints had been made that they were under the influence of the nobles and greater landowners; but a popular element had been withdrawn from the county representation, and the restricted franchise cannot have impaired the influence of the nobles.

As for the cities and boroughs, they had virtually renounced their electoral privileges. As we have seen, they had never valued them very highly; and now by royal charters, or by the usurpation of small self-elected bodies of burgesses, the choice of members had fallen into the hands of town councils and neighbouring landowners. The anomalous system of close and nomination boroughs, which had arisen thus early in our history, was suffered to continue without a check for four centuries, as a notorious blot upon our free constitution.

All these changes exalted the prerogatives of the crown. Amid the clash of arms and the strife of hostile parties, the voice of parliament had been stifled; and, when peace was restored, a powerful king could dispense with an assembly which might prove troublesome, and from whom he rarely needed help. Hence for a period of two hundred years, from the reign of Henry VI. to that of Elizabeth, the free parliaments of England were in abeyance. The institution retained its form and constituent parts; its rights and privileges were theoretically recognized, but its freedom and national character were little more than shadows.

The Three Estates of the Realm.—This check in the fortunes of parliament affords a fitting occasion for examining the composition of each of the three estates of the realm.

Lords Spiritual and Temporal.—The archbishops and bishops had held an eminent position in the councils of Saxon and Norman kings, and many priors and abbots were from time to time associated with them as lords spiritual, until the suppression of the monasteries by Henry VIII. They generally outnumbered their brethren, the temporal peers, who sat with them in the same assembly.

The lords temporal comprised several dignities. Of these the baron, though now the lowest in rank, was the most ancient. The title was familiar in Saxon times, but it was not until after the Norman Conquest that it was invested with a distinct feudal dignity. Next in antiquity was the earl, whose official title was known to Danes and Saxons, and who after the Conquest obtained a dignity equivalent to that of count in foreign states. The highest dignity, that of duke, was not created until Edward III. conferred it upon his son, Edward the Black Prince. The rank of marquis was first created by Richard II., with precedence after a duke. It was in the reign of Henry VI. that the rank of viscount was created, to be placed

between the earl and the baron. Since that time no new dignity has been invented, and the peerage consists of the five dignities of duke, marquis, earl, viscount, and baron. During the 15th century the number of temporal peers summoned to parliament rarely exceeded fifty, and no more than twenty-nine received writs of summons to the first parliament of Henry VII. There were only fifty-nine at the death of Queen Elizabeth. At the accession of William III. this number had been increased to about one hundred and fifty.

Life Peerages.—The several orders of the peerage are alike distinguished by the hereditary character of their dignities. Some life peerages, indeed, were created between the reigns of Richard II. and Henry VI., and several ladies had received life peerages between the reigns of Charles II. and George II. The highest authorities had also held that the creation of life peerages was within the prerogative of the crown. But four hundred years had elapsed since the creation of a life peer, entitled to sit in parliament, when Queen Victoria was advised to create Sir James Parke, lately an eminent judge, a baron for life, under the title of Lord Wensleydale. The object of this deviation from the accustomed practice was to strengthen the judicature of the House of Lords, without unduly enlarging the numbers of the peerage. But the lords at once took exception to this act of the crown, and, holding that a prerogative so long disused could not be revived, in derogation of the hereditary character of the peerage, resolved that Lord Wensleydale was not entitled by his letters patent, and writ of summons, to sit and vote in parliament. His lordship accordingly received a new patent, and took his seat as an hereditary peer. But the necessity of some such expedient for improving the appellate jurisdiction of the House of Lords could not be contested; and in 1876 three lords of appeal in ordinary were constituted by statute, enjoying the rank of baron for life, and the right of sitting and voting in the House of Lords so long as they continue in office.

The Commons.—The commons formed a more numerous body. In the reign of Edward I. there were about 275 members, in that of Edward III. 250, and in that of Henry VI. 300. In the reign of Henry VIII. parliament added 27 members for Wales and 4 for the county and city of Chester, and in the reign of Charles II. 4 for the county and city of Durham. Between the reigns of Henry VIII. and Charles II. 130 members were also added by royal charter.

Parliament under Henry VIII.—To resume the history of parliament at a later period, let us glance at the reign of Henry VIII. Never had the power of the crown been greater than when this king succeeded to the throne, and never had a more imperious will been displayed by any king of England. Parliament was at his feet to do his bidding, and the Reformation enormously increased his power. He had become a pope to the bishops; the old nobles who had resisted his will had perished in the field or on the scaffold; the new nobles were his creatures; and he had the vast wealth of the church in his hands as largesses to his adherents. Such was the dependence of parliament upon the crown and its advisers during the Reformation period that in less than thirty years four vital changes were decreed in the national faith. Each of the successive reigns inaugurated a new religion.

Queen Elizabeth and her Parliaments.—With the reign of Elizabeth commenced a new era in the life of parliament. She had received the royal prerogatives unimpaired, and her hand was strong enough to wield them. But in the long interval since Edward IV. the entire framework of English society had been changed; it was a new England

that the queen was called upon to govern. The coarse barons of feudal times had been succeeded by English country gentlemen; beyond the influence of the court, and identified with all the interests and sympathies of their country neighbours. From this class were chosen nearly all the knights of the shire, and a considerable proportion of the members for cities and boroughs. They were generally distinguished by a manly independence, and were prepared to uphold the rights and privileges of parliament and the interests of their constituents. A change no less remarkable had occurred in other classes of society. The country was peopled with yeomen and farmers, far superior to the cultivators of the soil in feudal times; and the towns and seaports had grown into important centres of commerce and manufactures. Advances not less striking had been made in the enlightenment and culture of society. But, above all, recent religious revolutions had awakened a spirit of thought and inquiry, by no means confined to questions of faith. The Puritans, hostile to the church, and jealous of every semblance of Catholic revival, were embittered against the state, which was identified, in their eyes, with many ecclesiastical enormities; and their stubborn temper was destined to become a strong motive force in restoring the authority of parliament.

The parliaments of Elizabeth, though rarely summoned, displayed an unaccustomed spirit. They discussed the succession to the crown, the marriage of the queen, and ecclesiastical abuses; they upheld the privileges of the commons, and their right to advise the crown upon all matters of state; and they condemned the grant of monopolies. The bold words of the Wentworths and Yelvertons were such as had not been heard before in parliament. The conflicts between Elizabeth and the commons marked the revival of the independence of parliament, and foreshadowed graver troubles at no distant period.

Conflicts of James I. with the Commons.—James I., with short-sighted pedantry, provoked a succession of conflicts with the commons, in which abuses of prerogative were stoutly resisted and the rights and privileges of parliament resolutely asserted. The "remonstrance" of 1610 and the "protestation" of 1621 would have taught a politic ruler that the commons could no longer be trifled with; but those lessons were lost upon James and upon his ill-fated son.

Charles I. and the Commonwealth.—The momentous struggles between Charles I. and his parliaments cannot be followed in this place. The earlier parliaments of this reign fairly represented the earnest and temperate judgment of the country. They were determined to obtain the redress of grievances, and to restrain undue prerogatives; but there was no taint of disloyalty to the crown; there were no dreams of revolution. But the contest at length became embittered, until there was no issue but the arbitrament of the sword. The civil war and the commonwealth, however memorable in the history of England, are beyond the range of this narrative. But this period proved the supreme power of the commons, when supported by popular forces. Everything gave way before them. They raised victorious armies in the field, they overthrew the church and the House of Lords, and they brought the king himself to the scaffold. It also displayed the impotence of a parliament which has lost the confidence of the country, or is overborne by mobs, by an army, or by the strong will of a dictator.

Political Agitation of this Period.—It is to this time of fierce political passions that we trace the origin of political agitation, as an organized method of influencing the deliberations of parliament. The whole country was then aroused by passionate exhortations from the pulpit and in the press. No less than thirty thousand political

tracts and newspapers during this period have been preserved. Petitions to parliament were multiplied in order to strengthen the hands of the popular leaders. Clamorous meetings were held to stimulate or overawe parliament. Such methods, restrained after the Restoration, have been revived in later times, and now form part of the acknowledged system of parliamentary government.

Parliament after the Restoration.—On the restoration of Charles II. parliament was at once restored to its old constitution, and its sittings were revived as if they had suffered no interruption. No outward change had been effected by the late revolution; but that a stronger spirit of resistance to abuses of prerogative had been aroused was soon to be disclosed in the deposition of James II. and the "glorious revolution" of 1688. At this time the full rights of parliament were explicitly declared, and securities taken for the maintenance of public liberties. The theory of a constitutional monarchy and a free parliament was established; but after two revolutions it is curious to observe the indirect methods by which the commons were henceforth kept in subjection to the crown and the territorial aristocracy. The representation had long become an illusion. The knights of the shire were the nominees of nobles and great landowners; the borough members were returned by the crown, by noble patrons, or close corporations; even the representation of cities, with greater pretensions to independence, was controlled by bribery. Nor were rulers content with their control of the representation, but, after the Restoration, the infamous system of bribing the members themselves became a recognized instrument of administration. The country gentlemen were not less attached to the principles of rational liberty than their fathers, and would have resisted further encroachments of prerogative; but they were satisfied with the Revolution settlement and the remedial laws of William III., and no new issue had yet arisen to awaken opposition. Accordingly, they ranged themselves with one or other of the political parties into which parliament was now beginning to be divided, and bore their part in the more measured strifes of the 18th century. From the Revolution till the reign of George III. the effective power of the state was wielded by the crown, the church, and the territorial aristocracy; but the influence of public opinion since the stirring events of the 17th century had greatly increased. Both parties were constrained to defer to it; and, notwithstanding the flagrant defects in the representation, parliament generally kept itself in accord with the general sentiments of the country.

Union of Scotland.—On the union of Scotland in 1707, important changes were made in the constitution of parliament. The House of Lords was reinforced by the addition of sixteen peers, representing the peerage of Scotland, and elected every parliament; and the Scottish peers, as a body, were admitted to all the privileges of peerage, except the right of sitting in parliament, or upon the trial of peers. No prerogative, however, was given to the crown to create new peerages after the Union; and, while they are distinguished by their antiquity, their number is consequently decreasing. To the House of Commons were assigned forty-five members, representing the shires and burghs of Scotland.

Parliament under George III.—With the reign of George III. there opened a new period in the history of parliament. Agitation in its various forms, an active and aggressive press, public meetings and political associations, the free use of the right of petition, and a turbulent spirit among the people seriously changed the relations of parliament to the country. And the publication of debates, which was fully established in 1771, at once increased the direct responsibility of parliament to the

people, and ultimately brought about other results, to which we shall presently advert.

Union of Ireland.—In this reign another important change was effected in the constitution of parliament. Upon the union with Ireland, in 1801, four Irish bishops were added to the lords spiritual, who sat by rotation of sessions, and represented the episcopal body of the Church of Ireland. But those bishops were deprived of their seats in parliament in 1869, on the disestablishment of the Church of Ireland. Twenty-eight representative peers, elected for life by the peerage of Ireland, were admitted to the House of Lords. All the Irish peers were also entitled to the privilege of peerage. In two particulars the Irish peerage was treated in a different manner from the peerage of Scotland. The crown was empowered to create a new Irish peerage whenever three Irish peerages in existence at the time of the Union have become extinct, or when the number of Irish peers, exclusive of those holding peerages of the United Kingdom, has been reduced to one hundred. And, further, Irish peers were permitted to sit in the House of Commons for any place in Great Britain, forfeiting, however, the privilege of peerage while sitting in the Lower House. The expediency of both these provisions has often been called in question.

At the same time one hundred representatives of Ireland were added to the House of Commons. This addition raised the number of members to six hundred and fifty-eight. Parliament now became the parliament of the United Kingdom, and high hopes were entertained of a salutary fusion of diverse nationalities into a single assembly; but these hopes have scarcely been realized, and the relations of the Irish people to Great Britain and the imperial government continue to be a source of the gravest embarrassment and danger.

Schemes for Improving the Representation.—By the union of Scotland and Ireland, the electoral abuses of those countries were combined with those of England. Notwithstanding a defective representation, however, parliament generally sustained its position as fairly embodying the political sentiments of its time. Public opinion had been awakened, and could not safely be ignored by any party in the state. Under a narrow and corrupt electoral system, the ablest men in the country found an entrance into the House of Commons; and their rivalry and ambition ensured the acceptance of popular principles and the passing of many remedial measures. As society expanded, and new classes were called into existence, the pressure of public opinion upon the legislature was assuming a more decisive character. The grave defects of the representation were notorious, and some minor electoral abuses had been from time to time corrected. But the fundamental evils,—nomination boroughs, limited rights of election, the sale of seats in parliament, the prevalence of bribery, and the enormous expense of elections,—though constantly exposed, long held their ground against all assailants. So far back as 1770 Lord Chatham had denounced these flagrant abuses. "Before the end of this century," he said; "either the parliament will reform itself from within, or be reformed with a vengeance from without." In 1782, and again in 1783 and 1785, his distinguished son, William Pitt, condemned the abuses of the representation, and proposed schemes of parliamentary reform. In 1793 Mr Grey (afterwards Earl Grey) submitted a motion on the same subject; but the excesses of the French Revolution, political troubles at home, and exhausting wars abroad discouraged the supporters of reform for many years. Under more favourable conditions the question assumed greater proportions. Lord John Russell especially distinguished himself in 1820, and in several succeeding years,

by the able exposure of abuses and temperate schemes of reform. His efforts were assisted by the scandalous disclosures of bribery at Grampound, Penryn, and East Retford. All moderate proposals were rejected; but the concurrence of a dissolution, on the death of George IV., with the French Revolution of 1830, and an ill-timed declaration of the duke of Wellington that the representation was perfect and could not be improved, suddenly precipitated the memorable crisis of parliamentary reform. It now fell to the lot of Earl Grey, as premier, to be the leader in a cause which he had espoused in his early youth.

The Reform Acts of 1832.—The result of the memorable struggle which ensued may be briefly told. By the Reform Acts of 1832 the representation of the United Kingdom was reconstructed. In England, fifty-six nomination boroughs returning one hundred and eleven members were disfranchised; thirty boroughs were each deprived of one member, and Weymouth and Melcombe Regis, which had returned four members, were now reduced to two. Means were thus found for the enfranchisement of populous places. Twenty-two large towns, including metropolitan districts, became entitled to return two members, and twenty less considerable towns acquired the right of returning one member each. The number of county members was increased from ninety-four to one hundred and fifty-nine, the larger counties being divided for the purposes of representation.

The elective franchise was also placed upon a new basis. In the boroughs a £10 household suffrage was substituted for the narrow and unequal franchises which had sprung up,—the rights of freemen, in corporate towns, being alone respected. In the counties, copyholders and leaseholders for terms of years, and tenants at will paying a rent of £50 a year, were added to the 40s. freeholders.

By the Scottish Reform Act, the number of members representing Scotland was increased from forty-five, as arranged at the Union, to fifty-three, of whom thirty were assigned to counties and twenty-three to cities and boroughs. In counties the franchise was conferred upon owners of property of £10 a year, and certain classes of leaseholders; in burghs, upon £10 householders, as in England.

By the Irish Reform Act, no boroughs, however small, were disfranchised; but the franchise was given to £10 householders, and county constituencies were enlarged. These franchises, however, were extended in 1850, when an £8 household suffrage was given to the boroughs, and additions were made to the county franchises. The hundred members assigned to that country at the Union were increased to one hundred and five. Notwithstanding these various changes, however, the total number of the House of Commons was still maintained at 658.

The Reformed Parliament.—The legislature was now brought into closer relations with the people, reflected their opinions, and was sensitive to the pressure of popular forces. The immediate effects of this new spirit were perceptible in the increased legislative activity of the reformed parliament, its vigorous grappling with old abuses, and its preference of the public welfare to the narrower interests of classes. But, signal as was the regeneration of parliament, several electoral evils still needed correction. Strenuous efforts were made, with indifferent success, to overcome bribery and corruption, and proposals were often ineffectually made to restrain the undue influence of landlords and employers of labour by the ballot; improvements were made in the registration and polling of electors, and the property qualification of members was abolished. Complaints were also urged that the middle classes had been admitted to power, while the working classes were excluded from the late scheme of enfranchisement. Twenty

years after the settlement of 1832, its revision was seriously approached.

Later Measures of Reform.—In 1852, and again in 1854, Lord John Russell introduced further measures of reform; but constitutional changes were discouraged by the Russian war. In 1859 Lord Derby's Conservative government proposed another scheme of reform, which was defeated; and in 1860 Lord John Russell brought in another Bill, which was not proceeded with; and the question of reform continued in abeyance until after the death of Lord Palmerston. Earl Russell, who succeeded him as premier, was prompt to redeem former pledges, and hastened to submit to a new parliament, in 1866, another scheme of reform. This measure, and the ministry by whom it was promoted, were overthrown by a combination of the Conservative opposition and the memorable "cave" of members of the Liberal party. But the popular sentiment in favour of reform, which had for some years been inert, was suddenly aroused by the defeat of a Liberal ministry, and the triumph of the party opposed to reform. Lord Derby and his colleagues were now constrained to undertake the settlement of this embarrassing question; and by a strange concurrence of political events and party tactics, a scheme far more democratic than that of the Liberal Government was accepted by the same parliament, under the auspices of a Conservative ministry.

The Reform Acts of 1867-68.—By the English Reform Act of 1867, four corrupt boroughs were disfranchised, and thirty-eight boroughs returning two members were henceforth to return one only. A third member was given to Manchester, Liverpool, Birmingham, and Leeds; a second member to Merthyr Tydfil and Salford; the Tower Hamlets were divided into two boroughs, each returning two members; and ten new boroughs were created, returning one member each, with the exception of Chelsea, to which two were assigned. By these changes twenty-six seats were taken from boroughs, while a member was given to the university of London. But before this Act came into operation, seven other English boroughs were disfranchised by the Scottish Reform Act of 1868, these seats being given to Scotland. Thirteen new divisions of counties were erected, to which twenty-five members were assigned. In counties, the franchise of copyholders and leaseholders was reduced from £10 to £5, and the occupation franchise from £50 to £12. In boroughs the franchise was extended to all occupiers of dwelling-houses rated to the poor-rates, and to lodgers occupying lodgings of the annual value of £10 unfurnished.

By the Scottish Reform Act of 1868, the number of members representing Scotland was increased from fifty-three to sixty,—three new members being given to the shires, two to the universities, and two to cities and burghs. The county franchise was extended to owners of lands and heritages of £5 yearly value, and to occupiers of the rateable value of £14; and the burgh franchise to all occupiers of dwelling-houses paying rates, and to tenants of lodgings of £10 annual value unfurnished.

By the Irish Reform Act of 1868, no change was made in the number of members nor in the distribution of seats; but the boroughs of Sligo and Cashel, already disfranchised, were still left without representation. The county franchise was left unchanged; but the borough franchise was extended to occupiers of houses rated at £4, and of lodgings of the annual value of £10 unfurnished.

Present Position of Parliamentary Reform.—That these changes in the representation—especially the household suffrage in boroughs—were a notable advance upon the reforms of 1832, in the direction of democracy, cannot be questioned. The enlarged constituencies speedily overthrew the ministry to whom these measures were due: and

the new parliament further extended the recent scheme of reform, by granting to electors the protection of the ballot, for which advanced reformers had contended since 1832. Nor was the representation, as lately determined, long suffered to continue without question. First, it was proposed, in 1872, by Mr Trevelyan, to extend the household franchise to counties, and this proposal found favour in the country and in the House of Commons; but, the Conservative party having been restored to power in 1874, no measure of that character could be promoted with any prospect of success. At the dissolution in 1880 a more general revision of the representation was advocated by leading members of the Liberal party, who were soon restored to power; and further measures of reform are now under the consideration of parliament. Meanwhile, trenchant enactments have been made in restraint of corrupt practices, and for reducing the excessive cost of elections.

Relations of the Commons to the Crown and the Lords.—Having brought this rapid sketch of the history and constitution of parliament to a close, a few remarks may be offered as to the relations of the House of Commons to the crown, the House of Lords, and the people. Prior to the reign of Charles I. the condition of society was such as naturally to subordinate the Commons to the crown and the Lords. After the Revolution of 1688, society had so far advanced that, under a free representation, the Commons might have striven with both upon equal terms. But, as by far the greater part of the representation was in the hands of the king and the territorial nobles, the large constitutional powers of the Commons were held safely in check. Since 1832, when the representation became a reality, a corresponding authority has been asserted by the Commons. For several years, indeed, by reason of the weakness of the Liberal party, the Lords were able successfully to resist the Commons upon many important occasions; but it was soon acknowledged that they must yield whenever a decisive majority of the Commons, supported by public opinion, insisted upon the passing of any measure, however repugnant to the sentiments of the Upper House. And it became a political axiom that the Commons alone determined the fate of ministries, and the policy of the state. The relations of the two Houses, however, can only be understood in connexion with the action of political parties. The Lords may be said, generally, to represent the opinions prevalent before 1832, while, during the greater part of the period since that time, the Commons, under leaders of the Liberal party, have represented the progressive views of a later generation. Hence, under Liberal administrations, the two Houses have been in frequent conflict; under Conservative administrations they have been brought into general agreement, the electors having supported the party which commanded a majority in both Houses. In the conflict of parties, the ultimate appeal is to the country. But as the representation of the people is further extended, an accord between the two Houses will be more difficult, while the power of resistance on the part of the Lords will be proportionately weakened.

Severe Pressure upon the House of Commons.—The House of Commons having thus become the centre of political power, it has been impelled to extraordinary activity. The legislation of the last fifty years affords the only example in history of so wide a reconstruction of institutions, and so bold a redress of grievances, having been accomplished without a revolution. But this prodigious work, of which the main burthen has rested upon the Commons, has formed only a part of their labours. The voting of supplies for the public service, and financial policy, are their exclusive province, and offer unbounded opportunities for debate. They have also assumed a large

share of executive power. Every act of administration is open to question, controversy, and censure. Matters of executive policy—foreign, colonial, and domestic—are eagerly discussed in this numerous and excited assembly. Nor are discussions mainly directed to such important topics. The close connexion of the Commons with the people, the publicity of debates, the rapidity of communications with all parts of the world, and the activity of the press, have made the floor of that House the popular platform of the country. On that arena are discussed every conceivable grievance, complaint, opinion, project, or delusion. Subjects the most trivial are forced upon the attention of the House, by means of questions and incidental debates; and after weary sittings, such as no other deliberative assembly has ever been willing to endure, matters of the first importance fail to obtain a hearing. These difficulties were apparent in the first reformed parliaments after 1832; and they have since been aggravated so seriously as to threaten the character and competency of the most powerful branch of the legislature.

Such difficulties, grave enough in themselves, have lately assumed more dangerous proportions under the pernicious tactics of obstruction. The liberal opportunities provided, by the rules of the House, for free discussion have been perverted and abused; and the effective power of the House has often been held in check, and sometimes nearly paralysed. Already some partial remedies have been applied to this acknowledged evil, but further measures are still needed for facilitating the action of parliament. It were strange, indeed, if the House of Commons, having attained pre-eminence in the legislature, should now prove unequal to the responsibilities of its freedom and its power. The methods of earlier times, and other political conditions, will assuredly be reviewed, and adapted to the multiplied obligations of an assembly whose fruitful labours are essential to the welfare of the country.

POWERS AND PRIVILEGES OF PARLIAMENT.

Such being the history and constitutional character of parliament, this survey would be incomplete without a more detailed view of the powers and privileges of each of its constituent parts, and of its ordinary proceedings.

Prerogatives of the Crown.—The crown, pre-eminent in rank and dignity, is also the legal source of parliamentary authority. The Queen virtually appoints the Lords Spiritual, and all the peerages of the Lords Temporal have been created by herself or her predecessors. Thus the entire House of Lords is the creation of the crown. The Queen summons parliament to meet, and prescribes the time and place of its meeting, prorogues and dissolves it, and commands the issue of writs for the election of members of the House of Commons. By several statutes, beginning with the 4th Edward III. c. 14, the annual meeting of parliament had been ordained; but these statutes, continually disregarded, were virtually repealed in the reigns of Charles II. and William and Mary (16 Ch. II., 31; 6 & 7 Will. and Mary, 32). The present statute law merely exacts the meeting of parliament once in three years; but the annual voting of supplies has long since superseded obsolete statutes. When parliament is assembled, it cannot proceed to business until the Queen has declared the causes of summons, in person or by commission. Other prerogatives of the crown, in connexion with parliament, will be noticed in reference to the proceedings of the two Houses.

Powers of the House of Lords.—The House of Lords, which at present consists of about five hundred and twenty members, is distinguished by peculiar dignities, privileges, and jurisdictions. Peers individually enjoy the rank and

precedence of their several dignities, and are hereditary councillors of the crown. Collectively with the Lords Spiritual they form a permanent council of the crown; and, when assembled in parliament, they form the highest court of judicature in the realm, and are a co-equal branch of the legislature, without whose consent no laws can be made. Their judicature is of various kinds, viz., for the trial of peers; for determining claims of peerage and offices of honour, under references from the crown; for the trial of controverted elections of Scotch and Irish peers; for the final determination of appeals from courts in England, Scotland, and Ireland; and, lastly, for the trial of impeachments.

Powers of the House of Commons.—The House of Commons also has its own peculiar privileges and jurisdictions. Above all, it has the paramount right of originating the imposition of all taxes, and the granting of supplies for the service of the state. It has also enjoyed, from early times, the right of determining all matters concerning the election of its own members, and their right to sit and vote in parliament. This right, however, has been greatly abridged, as, in 1868, the trial of controverted elections was transferred to the courts of law; but its jurisdiction in matters of election, not otherwise provided for by statute, is still retained intact. As part of this jurisdiction, the House directs the Speaker to issue warrants to the clerk of the crown to make out new writs for the election of members to fill up such vacancies as occur during the sitting of parliament.

Privileges of Parliament.—Both Houses are in the enjoyment of certain privileges, designed to maintain their authority, independence, and dignity. These privileges are founded mainly upon the law and custom of parliament, while some have been confirmed, and others abridged or abrogated by statute. The Lords rely entirely upon their inherent right, as having "a place and voice in parliament"; but, by a custom dating from the 6th Henry VIII., the Commons lay claim, by humble petition to the crown at the commencement of every parliament, "to their ancient and undoubted rights and privileges." Each House has its separate rights and jurisdictions; but privileges properly so-called, being founded upon the law and custom of parliament, are common to both Houses. Each House adjudges whether any breach of privilege has been committed, and punishes offenders by censure or commitment. This right of commitment is incontestably established, and it extends to the protection of officers of the House, lawfully and properly executing its orders, who are also empowered to call in the assistance of the civil power. The causes of such commitments cannot be inquired into by courts of law, nor can prisoners be admitted to bail. Breaches of privilege may be summarized as disobedience to any orders or rules of the House, indignities offered to its character or proceedings, assaults, insults, or libels upon members, or interference with officers of the House in discharge of their duty, or tampering with witnesses. Such offences are dealt with as contempts, according to the circumstances of the respective cases, of which numerous precedents are to be found in the journals of both Houses. The Lords may imprison for a fixed period, and impose fines; the Commons can only imprison generally, the commitment being concluded by the prerogation, and have long discontinued the imposition of fines.

Freedom of Speech.—Freedom of speech has been one of the most cherished privileges of parliament from early times. Constantly asserted, and often violated, it was finally declared by the Bill of Rights "that the freedom of speech, and debates and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament." Such a privilege is essential to the independence of parliament, and to the protection of members in discharge of their duties. But, while it protects

members from molestation elsewhere, it leaves them open to censure or other punishment by the House itself, whenever they abuse their privilege and transgress the rules of orderly debate.

Freedom from Arrest.—Freedom from arrest is a privilege of the highest antiquity. It was formerly of extended scope, but has been reduced, by later legislation, within very narrow limits. Formerly not only the persons of members but their goods were protected, and their privilege extended to their servants. At present members are themselves free from arrest, but otherwise they are liable to all the processes of the courts. If arrested, they will be immediately discharged, upon motion in the court whence the process issued. Peers and peeresses are, by the privilege of peerage, free from arrest at all times. Members of the House of Commons are free only for forty days after prorogation and forty days before the next appointed meeting; but prorogations are so arranged as to ensure a continuance of the privilege. Formerly, even suits against members were stayed, but this offensive privilege has been abolished by statute. Exemption from attending as witnesses upon subpoena, once an acknowledged privilege, is no longer insisted upon; but immunity from service upon juries is at once an ancient privilege and a statutory right. The privilege of freedom from arrest is limited to civil causes, and has not been suffered to exempt members from the operation of the criminal law, nor even from commitments for contempt by other courts. But, whenever the freedom of a member is so interfered with, the courts are required immediately to inform the House of the causes of his commitment. Witnesses, suitors, counsel, and agents in attendance upon parliament are protected from arrest and molestation, and from the consequences of statements made by them, or other proceedings in the conduct of their cases.

Conflicts between Privilege and Law.—As both Houses, in enforcing their privileges, are obliged to commit offenders or otherwise interfere with the liberty of the subject, the exercise of these privileges has naturally been called in question before the courts. Each House is the sole judge of its own privileges; but the courts are bound to administer the law, and, where law and privilege have seemed to be at variance, a conflict of jurisdiction has arisen between parliament and the courts. Many interesting controversies have arisen upon such occasions; but of late years privilege has been so carefully restrained within the proper limits of the law, and the courts have so amply recognized the authority of parliament, that unseemly conflicts of jurisdiction have been averted.

PARLIAMENTARY PROCEDURE.

We may now present a general outline of the proceedings of parliament during the transaction of its multifarious business.

On the day appointed by royal proclamation for the meeting of a new parliament, both Houses assemble in their respective chambers, when the Lords Commissioners for opening the parliament summon the Commons to the bar, by the gentleman usher of the black rod, to hear the commission read. The Lord Chancellor then states that, when the members of both Houses shall be sworn, Her Majesty will declare the causes of her calling this parliament; and, it being necessary that a Speaker of the House of Commons shall be first chosen, the Commons are directed to proceed to the appointment of a Speaker, and to present him, on the following day, for Her Majesty's royal approbation. The Commons at once withdraw to their own House and proceed to the election of their Speaker. The next day the Speaker-elect proceeds, with the House to the House of Lords, and, on receiving the royal approbation, lays claim, in the accustomed form, on

behalf of the Commons, "to their ancient and undoubted rights and privileges." The Speaker, now fully confirmed, returns to the House of Commons, and, after repeating his acknowledgments, reminds the House that the first thing to be done is to take and subscribe the oath required by law. Having first taken the oath himself, he is followed by other members, who come to the table to be sworn. The swearing of members in both Houses proceeds from day to day, until the greater number have taken the oath, or affirmation, when the causes of summons are declared by Her Majesty in person, or by commission, in "the Queen's speech." This speech being considered in both Houses, an address in answer is agreed to, which is presented to Her Majesty by the whole House, or by "the lords with white staves" in one House and privy councillors in the other.

Sittings of Both Houses.—The real business of the session now commences: the committees of supply and ways and means are set up; bills are introduced; motions are made; committees are appointed; and both Houses are, at once, in full activity. The Lord Chancellor presides over the deliberations of the Lords, and the Speaker over those of the Commons. A quorum of the House of Lords, including the Chancellor, is three; that of the House of Commons, including the Speaker, is forty. If forty members cannot be assembled at 4 o'clock, the House is at once adjourned; and so also if it be found, at a later hour, that less than that number are present. The Lords usually meet at 5 o'clock, but have recently changed that hour to a quarter past 4. The usual hour for the meeting of the Commons is a quarter before 4, except on Wednesdays, when the House meets at 12 and adjourns at 6, and on other morning sittings from 2 till 7. In both Houses accommodation is provided for strangers and reporters, and there are separate galleries for ladies.

Questions put from the Chair.—Every matter is determined, in both Houses, upon questions put from the chair, and resolved in the affirmative or negative, or otherwise disposed of by the withdrawal of the motion, by amendments, by the adjournment of the House, by reading the orders of the day, or by the previous question. Notices are required to be given of original motions; and the different stages of bills, and other matters appointed for consideration by the House, stand as orders of the day. Certain days in the week are appointed for notices of motions and orders of the day respectively; and on Monday and Thursday Government orders of the day have precedence. Questions of privilege are allowed precedence of all the business on any day; but this rule, being liable to grave abuses, is guarded by strict limitations. Debate arises when a question has been proposed from the chair; and at the close of the debate the question is put, with or without amendment, as the case may be, and is determined, when necessary, by a division. No question or bill, substantially the same as one upon which the judgment of the House has already been given, may be again proposed during the same session.

Rules of Debate.—Members claim to be heard in debate by rising in their places. When more than one member rises at the same time, in the Lords the member who is to speak is called by the House, in the Commons by the Speaker. Every member, when called, is bound to speak to the question before the House; and calls to order for irrelevance, or for referring to other matters which have been disposed of, or which stand for consideration on other days, are very frequent. A member may speak once only to any question, except to explain, or upon a point of order, or to reply when a member has himself submitted a motion to the House, or when an amendment has been moved which constitutes a new question. He may not refer to past debates, nor to debates in the other House; nor may he refer to any other member by name, or use offensive and disorderly language against the Queen, either House of Parliament, or other members. Members offending against any of the rules of debate are called to order by the Speaker, or the attention of the chair is directed to the breach of order by another member. Order is generally enforced by the authority of the chair; but in extreme cases, and especially when obstruction is being practised, the offending member is named by the Speaker, and suspended by an order of the House, or otherwise punished at the discretion of the House. And, when a debate has been unduly prolonged, the House may order it to be closed, but under such conditions and restrictions that this power can rarely be exercised. The rules to be observed by members in the House during a debate are such as to ensure the order and decorum becoming a deliberative assembly.

Divisions.—At the conclusion of a debate, unless the motion be withdrawn, or the question (on being put from the chair) be agreed to, or negatived, the House proceeds to a division, which effects the twofold purpose of ascertaining the numbers supporting and opposing the question, and of recording the names of members voting on either side. On each side of the House is a division lobby; and in the

Lords the "contents" and in the Commons the "ayes" are directed to go to the right, and the "not contents" or "noes" to the left. The former pass into the right lobby, at the back of the speaker's chair, and return to the House through the bar; the latter pass into the left lobby, at the bar, and return at the back of the chair. The opposing parties are thus kept entirely clear of one another. In each lobby there are two members acting as tellers, who count the members as they pass, and two division clerks who take down their names. After the division, the four tellers advance to the table, and the numbers are reported by one of the tellers for the majority. In case of an equality of numbers, in the Lords the question is negatived in virtue of the ancient rule "semper præsumitur pro negante"; in the Commons the Speaker gives the casting vote.

Committees of the Whole House.—For the sake of convenience in the transaction of business, there are several kinds of committees. Of these the most important is a committee of the whole House, which, as it consists of the entire body of members, can scarcely be accounted a committee. It is presided over by a chairman, who sits in the clerk's chair at the table, the mace, which represents the authority of the House itself, being for the time placed under the table. In this committee are discussed the several provisions of bills, resolutions, and other matters requiring the consideration of details. To facilitate discussion, members are allowed to speak any number of times to the same question; otherwise the proceedings are similar to those of the House itself. In the Lords, the chair is taken by the chairman of committees; and in the Commons by the chairman of the committee of ways and means, or in his absence by any other member. The quorum of such a committee is the same as that of the House itself. It reports from time to time to the House, but has no power of adjournment.

Grand and Standing Committees.—In the House of Commons there were formerly four grand committees, viz., for religion, for grievances, for courts of justice, and for trade. They were founded upon the valuable principle of a distribution of labours among several bodies of members; but, having fallen into disuse, they were discontinued in 1832. The ancient committee of privileges, in which "all who come are to have voices," is still appointed at the commencement of every session, but is rarely called into action, as it has been found more convenient to appoint a select committee to inquire into any question of privilege as it arises. In 1882 a partial revival of grand committees was effected by the appointment of two standing committees for the consideration of bills relating to law and courts of justice and to trade; and there is reasonable ground for hoping that this system may be widely extended, so as to lighten the labours of the House, and facilitate the arduous work of legislation.

Select Committees.—In select committees both Houses find the means of delegating inquiries, and the consideration of other matters, which could not be undertaken by the whole House. The reports of such committees have formed the groundwork of many important measures; and bills are often referred to them which receive a fuller examination than could be expected in a committee of the whole House. Power is given to such committees, when required, to send for persons, papers, and records. In the Lords the power of examining witnesses upon oath has always been exercised, but it was not until 1871 that the same power was extended to the Commons, by statute.

Communications between the Two Houses.—In the course of the proceedings of parliament, frequent communications between the two Houses become necessary. Of these the most usual and convenient form is that of a message. Formerly the Lords sent a message by two judges, or two masters in chancery, and the Commons by a deputation of their own members; but since 1855 messages have been taken from one House to the other by one of the clerks at the table. A more formal communication is effected by a conference, in reference to amendments to bills or other matters; but this proceeding has been in great measure superseded by the more simple form of a message. The two Houses are also occasionally brought into communication by means of joint committees and of select committees communicating with each other.

Communications between the Crown and Parliament.—Communications, in various forms, are also conducted between the crown and both Houses of Parliament. Of these the most important are those in which the Queen, in person or by commission, is present in the House of Lords, to open or prorogue parliament, or to give the royal assent to bills. Her Majesty is then in direct communication with the three estates of the realm, assembled in the same chamber. The Queen also sends messages to both Houses under the royal sign manual, when all the members are uncovered. Verbal messages are also sent, and the Queen's pleasure, or royal recommendation or consent to bills, or other matters, signified through a minister of the crown or a privy councillor. Messages under the sign manual are acknowledged by addresses, except where grants of money are proposed, in which case no address is presented by the Commons, who acknowledge them by making provision accordingly.

Both Houses approach the crown, sometimes by joint addresses, but usually by separate addresses from each House. Such addresses are presented to Her Majesty, either by the whole House, or by the lords with white staves in one House, and by privy councillors in the other. Her Majesty answers, in person, addresses presented by the whole House; but, when presented otherwise, an answer is brought by one of the lords with white staves, or by one of the privy councillors, by whom the address has been presented. Resolutions of either House are also sometimes directed to be laid before Her Majesty; and messages of congratulation or condolence are sent to other members of the royal family.

The Passing of Public Bills.—The passing of bills forms the most considerable part of the business of parliament; but a brief notice will suffice to explain the methods of procedure. These are substantially the same in both Houses; but the privileges of the Commons, in regard to supply and taxation, require that all bills imposing a charge upon the people should originate in that House. On the other hand, the Lords claim that bills for restoration of honours or in blood, or relating to their own privileges and jurisdiction, should commence in their House. An act of grace, or general pardon, originates with the crown, and is read once only in both Houses. Bills are divided into public and private; but here the former only are referred to. In the Lords any peer is entitled to present a bill, but in the Commons a member is required to obtain the previous leave of the House to bring in the bill; and, in the case of bills relating to religion, trade, grants of public money, or charges upon the subject, a preliminary committee is necessary before such leave will be given. A bill, when presented, is read a first time, and ordered to be printed; and a day is appointed for the second reading. At this latter stage, the principle of the bill is discussed; and, if disapproved of by an adverse vote, the bill is lost and cannot be renewed during the same session. If approved of, it is usually committed to a committee of the whole House, where every provision is open to debate and amendment. When the bill has been fully considered it is reported to the House, with or without amendments, and is ready to pass through its remaining stages. Sometimes, however, the bill is referred to a select committee before it is committed to a committee of the whole House.

By recent standing orders of the Commons, bills relating to law and courts of justice and to trade may be committed to standing committees, specially constituted, instead of to a committee of the whole House. When a bill has been reported from a committee of the whole House, or from a standing committee, with amendments, the bill, as amended, is ordered to be considered on a future day, when further amendments may be made, or the bill may be recommitted. The next and last stage is the third reading, when the principle of the measure, and its amended provisions, are open to review. Even at this stage the bill may be lost; but if the third reading be agreed to, it is at once passed and sent to the other House. There it is open to the like discussions and amendments, and may be rejected. If returned without amendment, the bill merely awaits the royal assent; but if returned with amendments, such amendments must be agreed to, or otherwise adjusted, by mutual concessions, by the two Houses, before it can be submitted for the royal assent; and in case of ultimate disagreement the bill is lost. The royal assent consummates the work of legislation, and converts the bill into an Act of Parliament.

Petitions.—Both Houses are approached by the people by means of petitions, of which prodigious numbers are presented to the House of Commons every session. They are referred to the committee on public petitions, under whose directions they are classified, analysed, and the number of signatures counted; and, when necessary, the petitions are printed *extenso*.

Parliamentary Papers.—Another source of information is found in parliamentary papers. These are of various kinds. The greater part are obtained either by a direct order of the House itself, or by an address to the crown for documents relating to matters in which the prerogatives of the crown are concerned. Other papers, relating to foreign and colonial affairs and other public matters, are presented to both Houses by command of Her Majesty. Again, many papers are annually presented, in pursuance of Acts of Parliament. In the House of Commons, these various printed documents occupy from eighty to one hundred volumes every year.

The Granting of Supplies.—The exclusive right of the Commons to grant supplies, and to originate all measures of taxation, imposes a very onerous service upon that House. This is mainly performed by two committees of the whole House, —the Committee of Supply, and the Committee of Ways and Means. The former deals with all the estimates for the public service presented to the House by command of Her Majesty; and the latter votes out of the Consolidated Fund such sums as are necessary to meet the supplies already granted, and originates all taxes for the service of the year. It is here that the annual financial statement of the chancellor of the exchequer, commonly known as "the Budget," is delivered. The resolutions of these committees are reported to the House, and, when agreed to, form the foundation of bills, to be passed by both

Houses, and submitted for the royal assent; and towards the close of the session an Appropriation Act is passed, applying all the grants for the service of the year.

Elections.—The extensive jurisdiction of the Commons in matters of election, already referred to, formerly occupied a considerable share of their time, but its exercise has now been contracted within narrow limits. Whenever a vacancy occurs during the continuance of a parliament, a warrant for a new writ is issued by the Speaker, by order of the House during the session, and in pursuance of statutes during the recess. The causes of vacancies are the death of a member, his being called to the House of Peers, his acceptance of an office from the crown, or his bankruptcy. When any doubt arises as to the issue of a writ, it is usual to appoint a committee to inquire into the circumstances of the case; and during the recess the Speaker may reserve doubtful cases for the determination of the House.

Controverted elections had been originally tried by select committees, afterwards by the committee of privileges and elections, and ultimately by the whole House, with scandalous partiality, but under the Grenville Act of 1770, and other later Acts, by select committees, so constituted as to form a more judicial tribunal. The influence of party bias, however, too obviously prevailed until 1839, when Sir Robert Peel introduced an improved system of nomination, which distinctly raised the character of election committees; but a tribunal constituted of political partisans, however chosen, was still open to jealousy and suspicion, and at length, in 1868, the trial of election petitions was transferred to judges of the superior courts, to whose determination the House gives effect, by the issue of new writs, or otherwise. The House, however, still retains and exercises its jurisdiction in all cases not relegated, by statute, to the judges.

Impeachments and Trial of Peers.—Other forms of parliamentary judicature still remain to be mentioned. Upon impeachments by the Commons, the Lords exercise the highest criminal judicature known to the law; but the occasions upon which it has been brought into action have been so rare, in modern times, that its procedure need not be dwelt upon. Another judicature is that of the trial of peers by the House of Lords. And, lastly, by a bill of attainder, the entire parliament is called to sit in judgment upon offenders.

Private Bill Legislation.—One other important function of parliament remains to be noticed,—that of private bill legislation. Here the duties of parliament are partly legislative and partly judicial. Public interests are promoted, and private rights secured. The vast industrial undertakings of the country—canals, docks, harbours, railways, waterworks, and the lighting and improvement of towns—have thus been sanctioned, at a cost far exceeding the amount of the national debt, while the rights of property have been jealously guarded. This whole jurisdiction has been regulated by special standing orders, and by elaborate arrangements for the nomination of capable and impartial committees. A prodigious legislative work has been accomplished,—but under conditions most costly to the promoters and opponents of private bills, and involving a serious addition to the onerous labours of members of parliament. Means have already been found, by general Acts and provisional orders, to lighten the pressure of private bill legislation; and further expedients will, doubtless, be devised for the relief of parliament from a branch of business which is scarcely compatible with the engagements of members in the weightier affairs of state.

Varied Functions of Parliament.—Such are the vast and varied functions of the imperial parliament,—to legislate for an empire, to control the executive government, to hear the complaints of the people, and to redress their grievances. To be equal to its high jurisdiction, it needs the guidance of accomplished statesmen, wisdom and patriotism in its members, and an organization which shall make fruitful the talents, the practical knowledge and experience, of the ablest men of their generation. Its history is bright with records of eloquence, of statesmanship, of wise legislation, and of generous sympathy with the people; and that its future greatness may be worthy of its past glories is the earnest hope of every good citizen.

PARMA, one of the finest cities of northern Italy, is situated in $44^{\circ} 48' N.$ lat. and $10^{\circ} 20' E.$ long., $35\frac{1}{2}$ miles by rail south-east of Piacenza and $32\frac{1}{2}$ north-west of Modena, in a fertile tract of the Lombard plain within view of the Alps, and sheltered by the Apennines. From south to north it is traversed by the channel of the Parma, crossed here by three bridges; and from east to west for a distance of 6700 feet runs the line of the Æmilian Way, by which ancient Parma was connected on the one hand with Ariminum (Rimini), and on the other with Placentia (Piacenza) and Mediolanum (Milan). The old ramparts and bastions (excluding the circuit of the citadel in the south-east) make an enceinte of about $4\frac{1}{2}$ miles, but the enclosed area is not all occupied by streets and houses; there is an extensive "royal garden" or public park in the north-west angle, as well as a botanical garden and public promenades in the neighbourhood of the citadel, and various open spaces in other parts. In the centre of the city the Æmilian Way widens out into the Piazza Grande, a large and picturesque-looking square which contains the Palazzo del Comune and a modern statue of Correggio, whose masterpieces form the chief artistic attraction of Parma. The cathedral of the Assumption (originally St Herculanus), erected between 1064 and 1074, and consecrated in 1106 by Pope Paschal II., is a Romano-Byzantine building in the form of a Latin cross, 230 feet long by 84 feet wide. The west front, 94 feet high and 90 feet broad, is relieved by three rows of semicircular arches, and has a central porch (there were at one time three) supported by huge red marble lions sculptured by Bono da Bisone. The walls and ceiling of the interior are covered with frescos; those of the octagonal cupola representing the Assumption of the Virgin are by Correggio, but much restored (see CORREGGIO, vol. vi. p. 437). The crypt contains the shrine of Bishop San Bernardino degli Uberti and the tomb of Bartolommeo Prato—the former by Prospero Clementi of Reggio. To the south-west of the cathedral stands the baptistery, designed by Benedetto Antelami; it was commenced in 1196 and completed in 1281. The whole structure, which has a height of 98 feet and a diameter of 76 feet, is composed of red and grey Verona marble. Externally it is an irregular octagon, each face consisting of a lower story with a semicircular arch (in three cases occupied by a portal), four tiers of small columns supporting as many continuous architraves, and forming open galleries, and above these a row of five engaged columns supporting a series of pointed arches and a cornice. Internally it is a polygon of sixteen unequal sides, and the cupola is supported by sixteen ribs, springing from the same number of columns. In the centre is an octagonal font bearing date 1298. To the east of the cathedral, and at no great distance, stands the church of San Giovanni Evangelista, which was founded along with the Benedictine monastery in 981, but as a building dates from the 16th century, and has a façade erected by Simone Moschino early in the 17th. The frescos on the cupola representing the vision of St John are by Correggio, and the arabesques on the vault of the nave by Anselmi. Madonna della Steccata (Our Lady of the Palisade), a fine church in the form of a Greek cross, erected between 1521 and 1539 after Zaccagni's designs, contains the tombs and monuments of many of the Bourbon and Farnese dukes of Parma, and preserves among a rich variety of paintings Parmigiano's Moses Breaking the Tables of the Law and Anselmi's Coronation of the Virgin. The ducal palace, usually called La Pilotta, is a vast and irregular group of buildings dating mainly from the 16th and 17th centuries; it now comprises the academy of fine arts (1752) and its valuable picture gallery (Correggio's St Jerome and Madonna della Scodella), the school's of painting, sculpture, and engraving, the

archæological museum (Trajan's *Tabula Alimentaria* and ruins from Velleia), and the great royal library (with De Rossi's Oriental MSS. and Zani's collection of engravings, Luther's Hebrew Psalter and Bodoni's types and matrices). The Teatro Farnese, a remarkable wooden structure erected in 1618–19 from Aleotti d'Argenta's designs, and capable of containing 4500 persons, has long been in a very ruined condition; the new theatre, opened in 1829, cost £80,000, and is celebrated as one of the best in Europe for the clear conveyance of sound. The royal university of Parma, founded in 1601 by Ranuccio I., and reconstituted by Philip of Bourbon in 1768, had 217 students in 1881–82. Among the benevolent institutions, in which the city is particularly rich, are a monte di pietà dating from 1488 and a hospital for incurables founded in 1332. Leather, silk-stuff for sieves, linen, hemp, and cotton stuffs, glass, crystal, and earthenware, wax candles, cast-iron wares, and pianofortes are all manufactured in or near the city: a very considerable trade is carried on in grain, cattle, and the dairy produce of the district. The "grana" cheese known as Parmesan is not now so well made at Parma as in some other parts of Italy—Lodi, for example. The population in 1861 was 47,067 for the city and 47,428 for the commune; the removal of the military and civil functionaries of the old duchy caused a considerable decrease, and the figures for 1881 were only 44,492 and 45,217.

The old Gallic town of Parma, which became a Roman colonia civium for 2000 colonists in 183 B.C., and after it had been plundered by Mark Antony's soldiers was recruited by Augustus, continued to be a place of importance till the later times of the empire. Under Theodoric its walls were rebuilt. The Greeks of the 6th century called it Chrysopolis or City of Gold, and this name appears in the mediæval chronicles as Crispopolis. In 872 Carloman granted the city to bishop Widiboldus with the title of count. During the 11th, 12th, and 13th centuries Parma had its full share of the Guelph and Ghibelline struggles, and also carried on repeated hostilities with Borgo San Donnino and Piacenza. As a republic its government was mainly in the hands of the Rossi, Pallavicino, Correggio, and Sanvitale families. The fruitless siege of Parma in 1248 was the last effort of the unfortunate Frederick II. In 1303 the city became a lordship for Gilberto da Correggio, who laid the basis of its territorial power by conquering Reggio, Brescello, and Guastalla, and was made commander-in-chief of the Guelphs by Robert of Apulia. The Correggio family never managed to keep possession of it for long, and in 1346 they sold it to the Visconti, and from them it passed to the Sforza. Becoming subject to Pope Julius II. in 1512, Parma remained (in spite of the French occupation from 1515 to 1521) a papal possession till 1545, when Paul III. (Alexander Farnese) invested his son Pierluigi with the duchies of Parma and Piacenza. There were eight dukes of Parma of the Farnese line—Pierluigi (died 1547), Ottavio (1586), Alessandro (1592), Ranuccio I. (1622), Odoardo (1646), Ranuccio II. (1694), Francesco (1727), Antonio (1731). See FARNESE, vol. ix. p. 36. Antonio and Francesco both having died childless, the duchy passed to Charles of Bourbon (Don Carlos), infante of Spain, who, becoming king of Naples in 1735, surrendered Parma and Piacenza to Austria, but retained the artistic treasures of the Farnese dynasty which he had removed from Parma to Naples. Spain reconquered the duchies in the war of succession (1745); they were recovered by Austria in 1746; and Maria Theresa again surrendered them to Don Philip, infante of Spain, in 1748. Ferdinand, Philip's son, who succeeded under Dutillo's regency in 1765, saw his states occupied by the revolutionary forces of France in 1796, and had to purchase his life-interest with 6,000,000 lire and 25 of the best paintings in Parma. On his death in 1802 the duchies were incorporated with the French republic and his son Louis became "king of Etruria." Parma was thus governed for several years by Moreau de Saint-Méry and by Junot. At the congress of Vienna, Parma, Piacenza, and Guastalla were assigned to Marie Louise (daughter of Francis I. of Austria and Napoleon's second consort), and on her death they passed in 1847 to Charles II. (son of Louis of Etruria and Marie Louise, daughter of Charles IV., king of Spain). The new duke, unwilling to yield to the wishes of his people for greater political liberty, was soon compelled to take flight, and the duchy was for a time ruled by a provisional Government and by Charles Albert of Sardinia; but in April 1849 Baron d'Aspre, with 15,000 Austrians, took possession of Parma, and the ducal government was restored under Austrian protection. Charles II. (who had in 1820 married Theresa, daughter of Victor Emmanuel of Sardinia) abdicated in favour of his son Charles III., March 14, 1849. On the

assassination of Charles III. in 1854, his widow, Marie Louise (daughter of Ferdinand, prince of Artois and duke of Berry), became regent for her son Robert. In 1860 his possessions were formally incorporated with the new kingdom of Italy.

The duchy of Parma in 1849 had an area of 2376 square miles, divided into five provinces—Borgo San Donnino, Valditara, Parma, Lunigiana Parmense, and Piacenza. Its population in 1851 was 497,343. Under Marie Louise (1815–47) the territory of Guastalla (50 square miles) formed part of the duchy, but it was transferred in 1847 to Modena in exchange for the communes of Bagnone, Filattiera, &c., which went to constitute the Lunigiana Parmense.

Parma has given birth to Sforza Pallavicino, Mazzola (Parmigiano) the painter, Autolami the architect, and Toschi the engraver. Guicciardini, the historian, was governor of the city under Leo X. See Affò, *Storia di Parma*, 1792–95; Scarabelli, *Storia dei ducati di Parma, Piacenza, e Guastalla*, 1858; Buttafuoco, *Dizion. corogr. dei ducati*, &c., 1863; *Mon. hist. ad provincias Parmensem et Placentinam pertinentia*, 1855. &c.; Ughelli, *Italia Sacra*, vol. II.

PARMENIDES OF ELEA, the most notable of the philosophers of the Eleatic succession, is said by Diogenes Laertius (presumably on the authority of Apollodorus) to have been "in his prime" in Olymp. 69 (= 504–500 B.C.); whence it would appear that he was born about 539. Plato indeed (*Parmenides*, 127 B; compare *Theatetus*, 183 E, *Sophist*, 217 C) makes Socrates, who was born 470 or 469, see and hear Parmenides when the latter was about sixty-five years of age, in which case he cannot have been born before 519; but, in the absence of evidence that any such meeting took place, it is reasonable to regard this as one of Plato's many anachronisms. However this may be, Parmenides was a contemporary, perhaps a somewhat younger contemporary, of Heraclitus, with whom the first succession of physicists ended; while Anaxagoras and Empedocles, with whom the second succession of physicists began, as well as Protagoras, the earliest of those humanists whose rejection of physical research prepared the way for the Platonic metaphysic, were very decidedly his juniors. Belonging, it is said, to a rich and distinguished family, Parmenides attached himself, at any rate for a time, to the aristocratic society or brotherhood which Pythagoras had established at Croton; and accordingly one part of his system, the physical part, is apparently Pythagorean. To Xenophanes, the founder of Eleaticism,—whom he must have known, even if he was never in any strict sense of the word his disciple,—Parmenides was, perhaps, more deeply indebted, as the theological speculations of that thinker unquestionably suggested to him the theory of Being and Not-Being, of the One and the Many, by which he sought to reconcile Ionian monism with Italiote dualism. Tradition relates that Parmenides framed laws for the Eleates, who each year took an oath to observe them.

Parmenides embodied his tenets in a short poem called *Nature*, of which fragments, amounting in all to about a hundred and sixty lines, have been preserved in the writings of Sextus Empiricus, Simplicius, and others. *Nature* is traditionally divided into three parts—the "Proem," "Truth" (*τὰ πρὸς ἀλήθειαν*), and "Opinion" (*τὰ πρὸς δόξαν*). In "Truth," starting from the formula "the Ent (or existent) is, the Nonent (or non-existent) is not," Parmenides attempted to distinguish between the unity or universal element of nature and its variety or particularity, insisting upon the reality of its unity, which is therefore the object of knowledge, and upon the unreality of its variety, which is therefore the object, not of knowledge, but of opinion. In "Opinion" he propounded a theory of the world of seeming and its development, pointing out, however, that, in accordance with the principles already laid down, these cosmological speculations do not pretend to anything more than probability. In spite of the contemptuous remarks of Cicero and Plutarch about Parmenides's versification, *Nature* is not without literary merit. The introduction, though rugged, is forcible and picturesque; and the rest of the poem is written in a simple and effective style suitable to the sub-

ject. It is, however, a summary rather than an exposition, and its brevity sometimes leads to obscurity. Partly for this reason, but partly also in consequence of the mutilations and the corruptions of the text, the interpretation of the system which *Nature* represents early became a matter of controversy.

"Proem."—In the "Proem" the poet describes his journey from darkness to light. Borne in a whirling chariot, and attended by the daughters of the Sun, he reaches a temple sacred to an unnamed goddess (variously identified by the commentators with Nature, Wisdom, or Themis), by whom the rest of the poem is spoken: He must learn all things, she tells him, both truth, which is certain, and human opinions; for, though in human opinions there can be no confidence, they must be studied notwithstanding for what they are worth.

"Truth."—"Truth" begins with the declaration of Parmenides's principle in opposition to the principles of his predecessors. There are three ways of research, and three ways only. Of these, one asserts the non-existence of the existent and the existence of the non-existent [i.e., Thales, Anaximander, and Anaximenes suppose the single element which they respectively postulate to be transformed into the various sorts of matter which they discover in the world around them, thus assuming the non-existence of that which is elemental and the existence of that which is non-elemental]; another, pursued by "restless" persons, whose "road returns upon itself," assumes that a thing "is and is not," "is the same and not the same" [an obvious reference, as Bernays points out in the *Rheinisches Museum*, vii. 114 sq., to Heraclitus, the philosopher of flux]. These are ways of error, because they confound existence and non-existence. In contrast to them the way of truth starts from the proposition that "the Ent is, the Nonent is not."

On the strength of the fundamental distinction between the Ent and the Nonent, the goddess next announces certain characteristics of the former. The Ent is uncreated, for it cannot be derived either from the Ent or from the Nonent; it is imperishable, for it cannot pass into the Nonent; it is whole, indivisible, continuous, for nothing exists to break its continuity in space; it is unchangeable [for nothing exists to break its continuity in time]; it is perfect, for there is nothing which it can want; it never was, nor will be, but only is; it is evenly extended in every direction, and therefore a sphere, exactly balanced; it is identical with thought [i.e., it is the object, and the sole object, of thought as opposed to sensation, sensation being concerned with variety and change].

As then the Ent is one, invariable, and immutable, all plurality, variety, and mutation belong to the Nonent. Whence it follows that all the states and processes which we commonly recognize—generation and destruction, being and not-being [predicated of things], change of place, alteration of colour, and the like—are no more than empty words.

"Opinion."—The investigation of the Ent [i.e., the existent unity, extended throughout space and enduring throughout time, which reason discovers beneath the variety and the mutability of things] being now complete, it remains in "Opinion" to describe the plurality of things, not as they are, for they are not, but as they seem to be. In the phenomenal world then, there are, it has been thought [and Parmenides accepts the theory, which appears to be of Pythagorean origin], two primary elements—namely, fire, which is gentle, thin, homogeneous, and night [for earth], which is dark, thick, heavy. Of these elements [which, according to Aristotle, were, or rather were analogous to, the Ent and the Nonent respectively] all things consist, and from them they derive their several characteristics. The foundation for a cosmology having thus been laid in dualism, the poem went on to describe the generation of "earth, and sun, and moon, and air that is common to all, and the milky way, and furthest Olympus, and the glowing stars", but the scanty fragments which have survived suffice only to show that Parmenides regarded the universe as a series of concentric rings or spheres composed of the two primary elements and of combinations of them, the whole system being directed by an unnamed goddess established at its centre. Next came a theory of animal development. This again was followed by a psychology, which made mind depend upon bodily structure, thought [as well as sensation, which was conceived to differ from thought only in respect of its object] being the excess of the one or the other of the two constituent elements, fire and night. "Such, opinion tells us, was the generation, such is the present existence, such will be the end, of those things to which men have given distinguishing names."

In the truism "the Ent is, the Nonent is not," *ὃν ἔστι, μὴ ὃν οὐκ ἔστι*, Parmenides breaks with his predecessors, the physicists of the Ionian succession. Asking themselves—What is the material universe? they had replied respectively—It is water, it is *μεταξύ τι*, it is air, it is fire. Thus; while their question meant, or ought to have meant

What is the single element which underlies the apparent plurality of the material world? their answers, Parmenides conceived, by attributing to the selected element various and varying qualities, reintroduced the plurality which the question sought to eliminate. If we would discover that which is common to all things at all times, we must, he submitted, exclude the differences of things, whether simultaneous or successive. Hence, whereas his predecessors had confounded that which is universally existent with that which is not universally existent, he proposed to distinguish carefully between that which is universally existent and that which is not universally existent, between $\delta\upsilon\nu$ and $\mu\eta\ \delta\upsilon\nu$. The fundamental truism is the epigrammatic assertion of this distinction.

In short, the single corporeal element of the Ionian physicists was, to borrow a phrase from Aristotle, a permanent $\sigma\upsilon\sigma\tau\alpha$ having $\pi\acute{\alpha}\theta\eta$ which change; but they either neglected the $\pi\acute{\alpha}\theta\eta$ or confounded them with the $\sigma\upsilon\sigma\tau\alpha$. Parmenides sought to reduce the variety of nature to a single corporeal element; but he strictly discriminated the inconstant $\pi\acute{\alpha}\theta\eta$ from the constant $\sigma\upsilon\sigma\tau\alpha$, and, understanding by "existence" universal, invariable, immutable being, refused to attribute to the $\pi\acute{\alpha}\theta\eta$ anything more than the semblance of existence.

Having thus discriminated between the permanent unity of nature and its superficial plurality, Parmenides proceeded to the separate investigation of the Ent and the Nonent. The universality of the Ent, he conceived, necessarily carries with it certain characteristics. It is one; it is eternal; it is whole and continuous, both in time and in space; it is immovable and immutable; it is limited, but limited only by itself; it is evenly extended in every direction, and therefore spherical. These propositions having been reached, apart from particular experience, by reflexion upon the fundamental principle, we have in them, Parmenides conceived, a body of information resting upon a firm basis and entitled to be called "truth." Further, the information thus obtained is the sum total of "truth;" for, as "existence" in the strict sense of the word cannot be attributed to anything besides the universal element, so nothing besides the universal element can properly be said to be "known."

If Parmenides's poem had had "Being" for its subject, it would doubtless have ended at this point. Its subject is, however, "Nature"; and nature, besides its unity, has also the semblance, if no more than the semblance, of plurality. Hence the theory of the unity of nature is necessarily followed by a theory of its seeming plurality, that is to say, of the variety and mutation of things. The theory of plurality cannot indeed pretend to the certainty of the theory of unity, being of necessity untrustworthy, because it is the partial and inconstant representation of that which is partial and inconstant in nature. But, as the material world includes, together with a real unity, the semblance of plurality, so the theory of the material world includes, together with the certain theory of the former, a probable theory of the latter. "Opinion" is then, no mere excrement; it is the necessary sequel to "Truth."

Thus, whereas the Ionians, confounding the unity and the plurality of the universe, had neglected plurality, and the Pythagoreans, contenting themselves with the reduction of the variety of nature to a duality or a series of dualities, had neglected unity, Parmenides, taking a hint from Xenophanes, made the antagonistic doctrines supply one another's deficiencies; for, as Xenophanes in his theological system had recognized at once the unity of God and the plurality of things, so Parmenides in his system of nature recognized at once the rational unity of the Ent and the phenomenal plurality of the Nonent.

The foregoing statement of Parmenides's position differs

from Zeller's account of it in two important particulars. First, whereas it has been assumed above that Xenophanes was theologian rather than philosopher, whence it would seem to follow that the philosophical doctrine of unity originated, not with him, but with Parmenides, Zeller, supposing Xenophanes to have taught, not merely the unity of God, but also the unity of Being, assigns to Parmenides no more than an exacter conception of the doctrine of the unity of Being, the justification of that doctrine, and the denial of the plurality and the mutability of things. This view of the relations of Xenophanes and Parmenides is hardly borne out by their writings; and, though ancient authorities may be quoted in its favour, it would seem that in this case as in others they have fallen into the easy mistake of confounding successive phases of doctrine, "construing the utterances of the master in accordance with the principles of his scholar—the vague by the more definite, the simpler by the more finished and elaborate theory" (W. H. Thompson). Secondly, whereas it has been argued above that "Opinion" is necessarily included in the system, Zeller, supposing Parmenides to deny the Nonent even as a matter of opinion, regards that part of the poem which has opinion for its subject as no more than a revised and improved statement of the views of opponents, introduced in order that the reader, having before him the false doctrine as well as the true one, may be led the more certainly to embrace the latter. In the judgment of the present writer, Parmenides, while he denied the real existence of plurality, recognized its apparent existence, and consequently, however little value he might attach to opinion, was bound to take account of it: "pour celui même qui nie l'existence réelle de la nature," says Renouvier, "il reste encore à faire une histoire naturelle de l'apparence et de l'illusion."

The teaching of Parmenides variously influenced both his immediate successors and subsequent thinkers. By his recognition of an apparent plurality supplementary to the real unity, he effected the transition from the monism of the first physical succession to the pluralism of the second. While Empedocles and Democritus are careful to emphasize their dissent from "Truth," it is obvious that "Opinion" is the basis of their cosmologies. The doctrine of the deceitfulness of "the undiscerning eye and the echoing ear" soon established itself, though the grounds upon which Anaxagoras, Empedocles, and Democritus maintained it were not those which were alleged by Parmenides. Indirectly, through the dialectic of his pupil and friend Zeno and otherwise, the doctrine of the inadequacy of sensation led to the humanist movement, which for a time threatened to put an end to philosophical and scientific speculation. But the positive influence of Parmenides's teaching was not yet exhausted. To say that the Platonism of Plato's later years, the Platonism of the *Parmenides*, the *Philebus*, and the *Timæus*, is the philosophy of Parmenides enlarged and reconstituted, may perhaps seem paradoxical in the face of the severe criticism to which Eleaticism is subjected, not only in the *Parmenides*, but also in the *Sophist*. The criticism was, however, preparatory to a reconstruction. Thus may be explained the selection of an Eleatic stranger to be the chief speaker in the latter, and of Parmenides himself to take the lead in the former. In the *Sophist* criticism predominates over reconstruction, the Zenonian logic being turned against the Parmenidean metaphysic in such a way as to show that both the one and the other need revision: see 241 D, 244 B sq., 257 B sq., 258 D. In particular, Plato taxes Parmenides with his inconsistency in attributing (as he certainly did) to the fundamental unity extension and sphericity, so that "the worshipped $\delta\upsilon\nu$ is after all a pitiful $\mu\eta\ \delta\upsilon\nu$ " (W. H. Thompson). In the *Parmenides* reconstruc-

tion predominates over criticism—the letter of Eleaticism being here represented by Zeno, its spirit, as Plato conceived it, by Parmenides. Not the least important of the results obtained in this dialogue is the discovery that, whereas the doctrine of the “one” and the “many” is suicidal and barren so long as the “solitary one” and the “indefinitely many” are absolutely separated (137 C sq. and 163 B sq.), it becomes consistent and fruitful as soon as a “definite plurality” is interpolated between them (142 B sq., 157 B sq., 160 B sq.). In short, Parmenides was no idealist, but Plato recognized in him, and rightly, the precursor of idealism.

Bibliography.—The fragments have been edited and annotated by G. G. Fülleborn (*Fragmente des Parmenides*, Züllichau, 1795), C. A. Brandis (*Commentationes Eleaticæ*, Altona, 1818), S. Karsten (*Philos. Græcor. Reliquiæ*, i., ii., Amsterdam, 1835), F. W. A. Mullach (*Aristotelis de Melis. Xenoph. et Gorg. disp. cum Eleaticorum fragm.*, Berlin, 1845; reprinted in the *Fragmenta Philos. Græcor.*, Paris, 1860, i. 109–130), T. Vatke (*Parmenidis doctrina qualis fuerit, diss. inaug.*, Berlin, 1864), and H. Stein (“Die Fragmente des Parmenides *περί φύσεως*,” in the *Symbola Philologorum Bonnensium in honorem F. Ritschii collecta*, Leipsic, 1867, ii. 763–806). The study of Karsten and Stein jointly is recommended. The well-known *Historia Philosophiæ Gr. et Rom.* of Ritter and Preller contains all the important fragments. The extant remains have been translated into English hexameters by T. Davidson (*Journal of Speculative Philosophy*, St Louis, Mo., 1870, iv. 1–16), and paraphrased in English prose by W. L. Courtney (*Studies in Philosophy*, London, 1882, pp. 1–25).

The philosophical system has been treated by several of the writers already mentioned, especially Brandis, Karsten, and Vatke, by F. Riaux (*Essai sur Parménide d'Elée*, Paris, 1840), and by the historians of Greek philosophy, of whom it will suffice here to mention C. A. Brandis (*Handb. d. Griechisch-Römischen Philosophie*, Berlin, 1835), G. W. F. Hegel (*Vorlesungen über d. Geschichte d. Philosophie*, Berlin, 1840), Ch. Renouvier (*Manuel de Philosophie Ancienne*, Paris, 1844), L. Strümpell (*Gesch. d. theoretischen Philosophie d. Griechen*, Leipsic, 1854), J. F. Ferrier (*Lectures on Greek Philosophy*, Edinburgh, 1866), J. E. Erdmann (*Grundriss d. Gesch. d. Philosophie*, 2d ed., Berlin, 1869), A. Schwegler (*Gesch. d. Griech. Philos.*, 2d ed., Tübingen, 1870), F. Ueberweg (*Grundriss d. Gesch. d. Philosophie*, 4th ed., Berlin, 1871; English translation, 3d ed., London, 1880), E. Zeller (*Die Philosophie d. Griechen*, 4th ed., Leipsic, 1876; English translation, *Presocratic Philosophy*, London, 1881). On the cosmology, see A. B. Krisehe (*Die theologischen Lehren d. Griechischen Denker*, Göttingen, 1840, pp. 97–116). On the relations of Eleaticism and Platonism, see W. H. Thompson, “On the Genuineness of Plato's *Sophist*,” in *Jour. of Philol.*, viii. 303 sq. (H. JA.)

PARMENIO (Παρμενίων), a distinguished Macedonian general, born about 400 B.C., was the son of Philotas, and first appears in history as a favourite counsellor of Philip, in the course of whose reign he obtained a great victory over the Illyrians (356 B.C.), successfully upheld, at the head of an army, the Macedonian influence in Eubœa (342), and was appointed one of the commanders of the force that was sent to secure a footing in Asia, and to prepare for the future reduction of that country (336 B.C.). His influence became still greater in the succeeding reign; at Alexander's council table he was always heard with deference, and in the field he was virtually second in command. He led the left wing of the army in the battles of the Granicus, Issus, and Arbela; and, while the king himself continued the pursuit of Darius into the wastes of Parthia and Hyrcania, Parmenio was entrusted with the task of completing the conquest of Media. Here he was stabbed by Cleander at the instance of the king, in 330, under circumstances which have been elsewhere described (see ALEXANDER, vol. i. p. 483).

PARMIGIANO (1504–1540). The name of this celebrated painter of the Lombard school was, in full, Girolamo Francesco Maria Mazzuoli, or Mazzola; he dropped the name Girolamo, and was only known as Francesco. He has been more commonly named Il Parmigiano (or its diminutive, Il Parmigianino), from his native city, Parma. Francesco, born on 11th January 1504, was the son of a painter. Losing his father in early childhood, he was

brought up by two uncles, also painters, Michele and Pier-Ilario Mazzola. His faculty for the art developed at a very boyish age, and he addicted himself to the style of Correggio, who visited Parma in 1519. He did not, however, become an imitator of Correggio; his style in its maturity may be regarded as a fusion of Correggio with Raphael and Giulio Romano, and thus fairly original. Even at the age of fourteen (Vasari says sixteen) he had painted a Baptism of Christ, surprisingly mature. Before the age of nineteen, when he migrated to Rome, he had covered with frescos seven chapels in the church of S. Giovanni Evangelista, Parma. Prior to starting for the city of the popes in 1523, he deemed it expedient to execute some specimen pictures. One of these was a portrait of himself as seen in a convex mirror, with all the details of divergent perspective, &c., wonderfully exact,—a work which, both from this curiosity of treatment and from the beauty of the sitter—for Parmigiano was then “more like an angel than a man”—could not fail to attract. Arrived in Rome, he presented his specimen pictures to the pope, Clement VII., who gladly and admiringly accepted them, and assigned to the youthful genius the painting of the Sala de' Pontefici, the ceilings of which had been already decorated by Giovanni da Udine. Patrons were willing to regard him as a second Raphael for art and for sweetness of manner, and he was almost as skilful at lute-playing as at painting; but, while fortune was winning him with her most insinuating smiles, the utter ruin of the sack by the Constable de Bourbon and his German and other soldiers overtook both Rome and Parmigiano. At the date of this hideous catastrophe he was engaged in painting that large picture which now figures in the London National Gallery, the Vision of St Jerome (with the Baptist pointing upward and backward to the Madonna and infant Jesus in the sky). It is said that through all the crash and peril of this barbarian irruption Parmigiano sat quietly before his vast panel, painting as if nothing had happened. A band of German soldiery burst into his apartment, breathing fire and slaughter; but, struck with amazement at the sight, and with some reverence for art and her votary (the other events of the siege forbid us to suppose that reverence for religion had any part in it), they calmed down, and afforded the painter all the protection that he needed at the moment. Their captain, being something of a connoisseur, exacted his tribute, however—a large number of designs. Rome was now no place for Parmigiano. He left with his uncle, intending apparently to return to Parma; but, staying in Bologna, he settled down there for a while, and was induced to remain three or four years. Here he painted for the nuns of St Margaret his most celebrated altarpiece (now in the Academy of Bologna), the Madonna and Child, with Margaret and other saints. This work became the idol of the Caracci and their school—Guido professing his preference for it even over the St Cecilia of Raphael.

Spite of the great disaster of Rome, the life of Mazzola had hitherto been fairly prosperous—the admiration which he excited being proportionate to his charm of person and manner, and to the precocity and brilliancy (rather than depth) of his genius; but from this time forward he became an unfortunate, and it would appear a soured and self-neglectful, man. Greatly to his chagrin, a number of his drawings were stolen by his assistant for engraving purposes, Antonio da Trento. He painted, from observation without sittings, a portrait of the emperor Charles V. crowned by Fame, but through some mismanagement lost the advantages which it had bidden fair to procure him. In 1531 he returned to Parma, and was commissioned to execute an extensive series of frescos in the choir of the

church of S. Maria della Steccata. These were to be completed in November 1532; and half-payment, 200 golden scudi, was made to him in advance. A ceiling was allotted to him, and an arch in front of the ceiling; on the arch he painted six figures—two of them in full colour, and four in monochrome—Adam, Eve, some Virtues, and the famous figure (monochrome) of Moses about to shatter the tables of the law. But, after five or six years from the date of the contract, Parmigiano had barely made a good beginning with his stipulated work. According to Vasari, he neglected painting in favour of alchemy—he laboured over futile attempts to “congeal mercury,” being in a hurry to get rich anyhow. It is rather difficult to believe that the various graphic and caustic phrases which Vasari bestows upon this theory of the facts of Mazzola’s life are altogether gratuitous and wide of the mark; nevertheless the painter’s principal biographer, the Padre Affò, undertook to refute Vasari’s statements, and most subsequent writers have accepted Affò’s conclusions. Whatever the cause, Parmigiano failed to fulfil his contract, and was imprisoned in default. Promising to amend, he was released; but, instead of redeeming his pledge, he decamped to Casal Maggiore, in the territory of Cremona. Here, according even to Vasari, he relinquished alchemy, and resumed painting; yet he still hankered (or is said by Vasari to have hankered) after his retorts and furnaces, lost all his brightness, and presented a dim, poverty-stricken, hirsute, and uncivilized aspect. A fever carried him off on 24th August 1540, before he had completed his thirty-seventh year. By his own desire, he was buried naked in the church of the Servites called La Fontana, near Casal Maggiore.

Grace has always and rightly been regarded as the chief artistic endowment of Parmigiano,—grace which is genuine as an expression of the painter’s nature, but partakes partly of the artificial and affected in its developments. “Un po’ di grazia del Parmigianino” (a little, or, as we might say, just a spice, of Parmigianino’s grace) was among the ingredients which Agostino Caracci’s famed sonnet desiderates for a perfect picture. Mazzola constantly made many studies of the same figure, in order to get the most graceful attainable form, movement, and drapery—the last being a point in which he was very successful. The proportions of his figures are over-long for the truth of nature—the stature, fingers, and neck; one of his Madonnas, now in the Pitti Gallery, is currently named “La Madonna del collo lungo.” He used to ponder long over a picture, and construct it in his head before he began actual work upon it; he then proceeded rapidly, with a resolute pencil, his great exercise in drawing standing him in good stead. His pictures were executed with diligence and finish, although he was not on the whole a sedulous worker. Neither expression nor colour is a strong point in his works; the figures in his compositions are generally few—the chief exception being the picture of Christ Preaching to the Multitude. He was good at portraits and at landscape backgrounds, and famous for drawings; he etched a few plates, being apparently the earliest Italian painter who was also an etcher; but the statement that he produced several woodcuts does not seem to be correct.

The most admired easel-picture of Parmigiano is the Cupid Making a Bow, with two children at his feet, one crying, and the other laughing. This was painted in 1536 for Francesco Boiardi of Parma, and is now in the gallery of Vienna. There are various replicas of it, and some of these may perhaps be from Mazzola’s own hand. Of his portrait-painting, two interesting examples are the likeness of Amerigo Vespucci (after whom America is named) in the Studj Gallery of Naples, and the painter’s own portrait in the Uffizi of Florence. One of Parmigiano’s principal pupils was his cousin, Girolamo di Michele Mazzola; probably some of the works attributed to Francesco are really by Girolamo. (W. M. R.)

PARNASSUS, a mountain of Greece, in the south of Phocis, rising over the town of Delphi. It had two prominent peaks, Tithorea and Lycoria, besides smaller ones, Hyampeia, Nauplia, &c. Parnassus was one of the most holy mountains in Greece, hallowed by the worship of Apollo, of the Muses, and of the Corycian nymphs, and by the orgies of the Bacchantes. The Delphic oracle, the Castalian fountain, and the Corycian cave were all situated among the clefts in its densely wooded sides.

PARNELL, THOMAS (1679-1718), has a place in literature among the minor Queen Anne poets. He was a man of some private fortune, being the head of an English family settled in Ireland, and inheriting landed property both there and in Cheshire. Born in Dublin in 1679, and educated at Trinity College, he took orders and obtained various preferments in the Irish Church. But both as a landowner and a clergyman he was an absentee, and spent most of his time in London, where he was patronized by Harley, and received into the intimate friendship of Swift and Pope. He was a member of the Scriblerus Club, and co-operated in burlesquing the “Dunces” and defending the Tory ministry, at the same time attaining some repute in the London pulpits as a preacher. An easy-going wit, with interests mainly in literature and society, he made his peace with the Whigs on the accession of George, but still continued his alliance with Pope. When Pope published his *Homer*, Parnell produced a translation of the *Battle of the Frogs and Mice* (1717), and indirectly defended Pope against his critics in the accompanying “remarks of Zoilus” on the principles of translation. After his death in 1718—he died on his way to a living in Ireland—Pope published a collection of his poems. They are nearly all translations and adaptations. The best known of them, *The Hermit*, is sometimes overpraised on the supposition that it is original; all that Parnell did was to trick out a tale from the *Gesta Romanorum* with reflexions in the “elevated diction” of the period. “His praise,” Johnson says with justice, “must be derived from the easy sweetness of his diction; in his verses there is more happiness than pains; he is sprightly without effort, and always delights, though he never ravishes; everything is proper, yet everything seems casual.”

PARNY, ÉVARISTE DÉSIRE DE FORGES, VICOMTE DE (1753-1814), was born in the Isle of Bourbon on 6th February 1753. He was sent to France at nine years old, was educated at Rennes, and in 1771 entered the army. He was, however, shortly recalled to Bourbon, where he fell in love with a young lady whom he celebrated poetically as Éléonore. His earlier biographers state her to have been called Esther de Baif, while the later give her the name of Mdlle. Troussaille. His suit was not favoured by the lady’s family. He returned to France, published his *Poésies Érotiques* in 1778, was saluted by Voltaire on his last visit to Paris as “Mon cher Tibullé,” and acquired at once a reputation for graceful and natural verse-writing which, though he lived many years and produced much inferior work, never entirely left him. He had some fortune, and he established himself near Paris. The Révolution impaired his means, but did not otherwise trouble him; indeed he obtained an appointment under it. In 1796 (he had published much else, but nothing of importance) appeared the *Guerre des Dieux*, a poem in the style of Voltaire’s *Pucelle*, directed against Christianity, and containing some wit, but much more that is simply dull and indecent. It commended itself to the times, however, and the author is said to have afterwards amplified it into a *Christiade*, the manuscript of which the Government of Louis XVIII., according to the story, bought for thirty thousand francs and destroyed. Parny devoted himself in his later years almost entirely to the religious or anti-religious and political burlesque. Under the consulate and the empire he turned his wrath from Christianity to England, and produced in 1805 an extraordinary allegoric poem attacking George III., his family, and his subjects, under the eccentric title of “Goddam! Goddam! par un French-dog.” The body of the poem is quite worthy of its title. Another and longer poem called *Les Rose-Croix*, though less extravagant, is still less readable; and indeed all Parny’s later work is valueless except

as a curiosity. His early love poems or elegies, nowever, and some slight miscellaneous work of his more mature years, show, with something of the artificiality of the time, a remarkable grace and ease, a good deal of tenderness, and not inconsiderable fancy and wit. One famous piece, the *Elegy on a Young Girl*, is scarcely to be excelled in its kind. In the natural comparison of Paros with his younger English contemporary, Moore, whom he in many ways resembles, the palm must be given to the French poet for precision and enduring elegance of style at his best, though he has less melody and tenderness, and though he condescended to much work far inferior both morally and artistically to the worst of Moore's.

There is no complete edition of Paros's works, and the loss is small. There are several good selections containing almost everything of real value, among which may be mentioned that of Garnier Frères.

PARODY (*παρωδία*, literally a song sung beside, a comic parallel) may be defined as an imitation of the form or style of a serious writing in matter of a meaner kind so as to produce a ludicrous effect. The lowest savages show a turn for comic mimicry, and it is almost as old in European literature as serious writing. The *Batrachomyomachia*, or "Battle of the Frogs and Mice," a travesty of the heroic epos, was ascribed at one time to Homer himself; and it is probably at least as old as the 5th century B.C. The great tragic poetry of Greece very soon provoked the parodist. Aristophanes parodied the style of Euripides in the *Acharnians* with a comic power that has never been surpassed. The debased grand style of mediæval romance was parodied in *Don Quixote*. Shakespeare parodied the extravagant heroics of an earlier stage, and was himself parodied by Marston, incidentally in his plays and elaborately in a roughly humorous burlesque of *Jenus and Adonis*. The wits of the Queen Anne age succeeded better in mock-heroics than in serious composition. A century later the most celebrated parodists were the brothers Smith, whose *Rejected Addresses* may be regarded as classic in this kind of artificial production. The Victorian age has produced a plentiful crop of parodists in prose and in verse, in dramatic poetry and in lyric poetry. By common consent, the most subtle and dexterous of metrical parodists is the late Mr C. S. Calverley, who succeeded in reproducing not merely tricks of phrase and metre, but even manneristic turns of thought. Johnson's dictum about pastoral poetry, that most of it is "easy, vulgar, and therefore disgusting," might be applied to parody; but Calverley would escape the censure.

PAROS, or PARO, an island in the Ægean Sea, one of the largest of the group of the Cyclades, with a population of 8000. It lies to the west of Naxos, from which it is separated by a channel about 6 miles broad, and with which it is now grouped together, in popular language, under the common name of Paronaxia. It is in 37° N. lat. and 25° 10' E. long. Its greatest length from north-east to south-west is 13 miles, and its greatest breadth 10 miles. It is formed of a single mountain about 2400 feet high, sloping evenly down on all sides to a maritime plain, which is broadest on the north-east and south-west sides. The island is composed of marble, though gneiss and mica-schist are to be found in a few places. Grey and bare rises the mountain, but on the level ground as well as on some of the lower slopes corn and vines are cultivated with success. A sweetish dark-red wine is exported in considerable quantities. The island is almost treeless; the olives, which formerly yielded abundance of oil, were cut down by the Venetians for firewood in the war of Candia. The capital, Paroikia or Parikia (Italian, *Parechia*), situated on a bay on the north-west side of the island, occupies the site of the ancient capital Paros. Its harbour admits small vessels; the

entrance is dangerous on account of rocks. Houses built in the Italian style with terraced roofs, shadowed by luxuriant vines, and surrounded by gardens of oranges and pomegranates, give to the town a picturesque and pleasing aspect. * Hero on a rock beside the sea are the remains of a mediæval castle built almost entirely of ancient marble remains. Similar traces of antiquity in the shape of bas-reliefs, inscriptions, columns, &c., are numerous in the town. Outside the town is the church of Katapoliani (ἡ Ἐκατοπυλιανή), well known in the Archipelago. On the north side of the island is the bay of Naousa (Naussa) or Agoussa, forming a safe and roomy harbour. In ancient times it was closed by a chain or boom. Another good harbour is that of Drios on the south-east side, where the Turkish fleet used to anchor on its annual voyage through the Ægean. The three villages of Tragoulas, Marmora, and Kepidi (Κηπίδι, pronounced Tschipidi), situated on an open plain on the eastern side of the island, and rich in remains of antiquity, probably occupy the site of an ancient town. They are known together as the "villages of Kephalos," from the steep and lofty headland of Kephalos. On this headland stands an abandoned monastery of St Anthony, amidst the ruins of a mediæval castle, which belonged to the Venetian family of the Venieri, and was gallantly though fruitlessly defended against the Turkish general Barbarossa in 1537. In antiquity the island contained a famous altar, the sides of which were said to be a stadium (606 feet) long. But the celebrated marble quarries are the real centre of interest of the island. They lie on the northern side of the mountain anciently known as Marpessa (afterwards Capresso), a little below a former convent of St Mina. The marble, which was employed by Phidias, Praxiteles, and other great Greek sculptors, was obtained by means of subterranean quarries driven horizontally or at a descending angle into the rock, and the marble thus quarried by lamplight got the name of Lychnites, Lychnen (from *lychnos*, a lamp), or Lygdos (Plin., *II. N.*, xxxvi. 5, 14; Plato, *Eryxias*, 400 D; Athen., v. 2050; Diod. Sic., 2, 52). Several of these tunnels are still to be seen. At the entrance to one of them is a celebrated bas-relief dedicated to the Nymphs by one Adamas, of the Thracian tribe of the Odryse; it represents a festival of Silenus or Pan.

History.—Like the rest of the Cyclades, Paros seems to have been peopled at an early date by Carians (Herod., i. 171; Thuc., i. 4) —perhaps also by the Phœnicians, whom we know from the Greek historians to have occupied other islands in the Ægean, including the neighbouring Thera (Herod., ii. 44; iv. 147; compare Thuc., i. 8). The institution of a form of sacrifice to the Græces, apparently peculiar to Paros, at which neither garlands nor flutes were made use of, was ascribed to Minos. The story that Paros was colonized by one Paros of Parrhasia, who brought with him a colony of Arcadians to the island (Heracles, *De Rebus Publicis*, 8; Steph. Byz., s.v. *Πάρος*), is one of those etymologizing fictions in which Greek legend abounds. Ancient names of the island are said to have been Plateia (or Pactia), Demetrias, Zæcynthus, Ilyria, Ilyessa, Minoa, and Cabarnis (Steph. Byz.). From Athens the island afterwards received a colony of Ionians (Schol. Dionys., *Per.*, 525; comp. Herod., i. 171), under whom it attained a high degree of prosperity. It sent out colonies to Thasos (Thuc., iv. 104; Strabo, 487) and Parium on the Hellespont. In the former colony, which was planted in the 15th or 18th Olympiad, the poet Archilochus, a native of Paros, is said to have taken part. As late as 385 B.C. the Parians, in conjunction with Dionysius of Syracuse, founded a colony on the Illyrian island of Pharos (Diod. Sic., xv. 13). So high was the reputation of the Parians that they were chosen by the people of Miletus to arbitrate in a party dispute (Herod., v. 28 sq.). Shortly before the Persian War Paros seems to have been a dependency of Naxos (Herod., v. 31). In the Persian War Paros sided with the Persians and sent a trireme to Marathon to support them. In retaliation, the capital Paros was besieged by an Athenian fleet under Miltiades, who demanded a fine of 100 talents. But the town offered a vigorous resistance, and the Athenians were obliged to sail away after a siege of twenty-six days, during which they had laid the island waste. It was at a temple of Demeter Thesmo-

phorus in Paros that Miltiades received the hurt of which he afterwards died (Herod. vi. 133-136). By means of an inscription Ross was enabled to identify the site of the temple, it lies, in agreement with the description of Herodotus, on a low hill beyond the boundaries of the town. Paros also sided with Xerxes against Greece, but after the battle of Artemisium the Parian contingent remained in Cythnos watching the progress of events (Herod., viii. 67). For this unpatriotic conduct the islanders were punished by Themistocles, who exacted a heavy fine (Herod., viii. 112). Under the Athenian naval confederacy, Paros paid the highest tribute of all the islands subject to Athens,—30 talents annually, according to the assessment of Olymp. 88, 4 (429 B.C.). Little is known of the constitution of Paros, but inscriptions seem to show that it was democratic, with a senate (*Boule*) at the head of affairs (*Corpus Inscript.*, 2376-2383; Ross, *Inscr. Ined.*, ii. 147, 148). In 410 B.C. the Athenian general Theramenes found an oligarchy at Paros; he deposed it and restored the democracy (Diod. Sic., xii. 47). Paros was included in the new Athenian confederacy of 378 B.C., but afterwards, along with Chios, it renounced its connexion with Athens, probably about 357 B.C. Thenceforward the island lost its political importance. From the inscription of Adule we learn that the Cyclades, and consequently Paros, were subject to the Ptolemies of Egypt. Afterwards they passed under the rule of Rome. When the Latins made themselves masters of Constantinople, Paros, like the rest, became subject to Venice. In 1537 it was conquered by the Turks. The island now belongs to the kingdom of Greece.

PARQUETRY is a kind of mosaic of wood used for ornamental flooring. Materials contrasting in colour and grain, such as oak, walnut, cherry, lime, pine, &c., are employed; and in the more expensive kinds the richly coloured tropical woods are also used. The patterns of parquet flooring are entirely geometrical and angular (squares, triangles, lozenges, &c.), curved and irregular forms being avoided on account of the expense and difficulty of fitting. There are two classes of parquetry in use—veneers and solid parquet. The veneers are usually about a quarter of an inch in thickness, and are laid over already existing floors. Solid parquet of an inch or more in thickness consists of single pieces of wood grooved and tongued together, having consequently the pattern alike on both sides. It forms in itself a sufficient floor of great strength and durability; but veneer, on the other hand, is generally more elegant and complex in design.

PARR. This name was originally applied to small Salmonoids which are abundant in British rivers, and were for a long time considered to constitute a distinct species (*Salmo salmulus*). They possess the broad head, short snout, and large eye characteristic of young Salmonoids, and are ornamented on the sides of the body and tail with about eleven or more, broad dark cross-bars, the so-called parr-marks. However, John Shaw proved, by experiment, that these fishes represent merely the first stage of growth of the salmon, before it assumes, at an age of two years, and when about six inches long, the silvery smolt-dress preparatory to its first migration to the sea. The parr-marks are produced by a deposit of black pigment in the skin, and appear very soon after the exclusion of the fish from the egg; they are still visible for some time below the new coat of scales of the smolt-stage, but have entirely disappeared on the first return of the young salmon from the sea. Although the juvenile condition of the parr is now almost universally admitted, it is a remarkable fact, which has not yet received a satisfactory explanation, that many male parr, from 7 to 8 inches long, have their sexual organs fully developed, and that their milt has all the fertilizing properties of the seminal fluid of a full-grown and sexually matured salmon. On the other hand, no female parr has ever been obtained with mature ova. Not only the salmon, but also the other species of *Salmo*, the grayling, and probably also the *Coregoni*, pass through a

parr-stage of growth. The young of all these fishes are barred, the salmon having generally eleven or more bars, and the parr of the migratory trout from nine to ten, or two or three more than the river-trout. In other respects these parr are very similar to one another and in the first year of their life it is very difficult and sometimes almost impossible to ascertain their parentage, whilst in the second year the specific characteristics become more and more conspicuous. In some of the small races or species of river-trout the parr-marks are retained throughout life, but subject to changes in intensity of colour.

PARR, SAMUEL (1747-1825), the son of Samuel Parr, surgeon at Harrow-on-the-Hill, was born there 15th January 1747. At Easter 1752 he was sent to Harrow School as a free scholar, where he made the acquaintance of many pupils, such as Bishop Bennet, Sir William Jones, and Warburton Lytton, who became eminent in after life. They read in the same class, they shared in the same sports, and their friendship lasted from youth to age. As Parr was destined for his father's profession, he was removed from school in the spring of 1761, and for the next few years assisted his father in his practice. When the old surgeon realized that his son was but ill-adapted for this pursuit, the boy was sent to Emmanuel College, Cambridge (autumn of 1765), but on his father's death shortly afterwards he was compelled, through lack of means, to return to Harrow. From February 1767 to the close of 1771 he acted as head assistant at Harrow School to Dr Sumner, a teacher whom he idolized, and had under his care many pupils, of whom Sheridan was the best known. When the headmaster died in September 1771 Parr became a candidate for the place, but was rejected, chiefly on account of his youth, whereupon he started another school at Stanmore, and drew after him about forty of his former scholars. After a trial of five years he found himself unable to bear up against the attractions of his old establishment, and dismissed the boys entrusted to his charge, becoming first the headmaster of Colchester Grammar School (1776-78) and then of Norwich School (1778-86). The small rectory of Asterby in Lincolnshire was conferred upon him in 1780, and it was followed three years later by the vicarage of Hatton near Warwick. Though he exchanged this latter benefice for Wadenhoe in Northamptonshire in 1789, he stipulated to be allowed to reside, as assistant curate, in the parsonage of Hatton. In this retirement he spent the rest of his days, cheered by the attractions of an excellent library, described by Mr H. G. Bohn in *Bibliotheca Parriana* (1827), and the converse of his classical friends, some of whom, like Porson and E. H. Barker, passed many months in his company. The degree of LL.D. was conferred on him by the university of Cambridge in 1781. Parr died at Hatton vicarage, 6th March 1825, and was buried in the chancel of its church. He had to middle age felt the pressure of poverty, but through the gift in 1788 of the prebendal stall of Wenlock Barns in St Paul's Cathedral (then worth only a reserved rent of £20 a year, but on the lapse of the lease in 1804 a preferment of considerable value), and through the purchase for him by his friends in 1789 of an annuity of £300, he died possessed of a large fortune.

Dr Parr's writings fill several volumes, but they are all beneath the reputation which he acquired through the variety of his knowledge and the dogmatism of his conversation. The chief of them are his character of Charles James Fox; his Latin preface, a long eulogy of Burke, North, and Fox, to a new edition of three books of Bellendenus; and his reprint of the *Tracts of Warburton and a Warburtonian*, not admitted into their works, a volume still not without interest for its scathing exposure of Warburton and Hurd. The character of Parr's compositions may be gathered from a passage in the *Edinburgh Review* (October 1802) on his *Spital sermon*, "a discourse of no common length . . . an immeasurable mass of notes which appear to concern every learned thing, every

learned man, and almost every unlearned man since the beginning of the world." Even amid the terrors of the French Revolution he adhered to Whiggism, and his correspondence included every man of eminence, either literary or political, who adopted the same creed. There are two memoirs of his life, one by the Rev. William Field (1828, 2 vols.), the other, with his works and his letters, by John Johnstone (1828, 8 vols.); and E. H. Barker published in 1828-29 two volumes of *Parriculus*, a confused mass of information on Parr and his friends. An essay on his life is included in De Quincey's works, vol. v., and a little volume of the *Aphorisms, Opinions, and Reflections of the late Dr Parr* appeared in 1826.

PARRAMATTA, a town of New South Wales, at the head of the navigation of the Parramatta river, and 14 miles to the west of Sydney, with which it is connected by railway, was one of the earliest inland settlements, and the seat of many of the public establishments connected with the working of the convict system. Many of these still remain in another form (the district hospital, the lunatic asylum, the gaol, two asylums for the infirm and destitute, the Protestant and Catholic orphan schools), involving a Government expenditure which partly sustains the business of the town. Parramatta was one of the earliest seats of the tweed manufacture, but its principal industrial dependence has been on the fruit trade. With the exception of Prospect and Pennant Hills, where there is an outburst of trap rock, the surface soil is the disintegration of the Wainamatta shale, which is well suited for orangeries and orchards. The value of the annual fruit crop is estimated at £100,000. The earlier governors had their country residence near the town, but the domain is now a public park in the hands of the municipality. Closé by was an early observatory where, in 1822, were made the observations for the *Parramatta Catalogue*, numbering 7385 stars, but it has long been abandoned. The Church of England grammar school (King's School), which accommodates ninety boarders, is on the north side of the river. The population in 1881 was 8453.

PARRHASIUS, of Ephesus, was one of the greatest painters of Greece. He settled in Athens, and may be ranked among the Attic artists. The period of his activity is fixed by the anecdote which Xenophon records of the conversation between him and Socrates on the subject of art; he was therefore distinguished as a painter before 399 B.C. Seneca relates a tale that Parrhasius bought one of the Olynthians whom Philip sold into slavery, 346 B.C. (see OLYNTHUS), and tortured him in order to have a model for his picture of Prometheus; but the story, which is similar to one told of Michelangelo, is chronologically impossible. Another tale recorded of him describes his contest with Zeuxis. The latter painted some grapes so perfectly that birds came to peck at them. He then called on Parrhasius to draw aside the curtain and show his picture, but, finding that his rival's picture was the curtain itself, he acknowledged himself to be surpassed, for Zeuxis had deceived birds, but Parrhasius had deceived Zeuxis. The arrogance and vanity of Parrhasius are the subject of many other anecdotes. He dressed himself in the purple robe, golden crown, and staff of a king, called himself the prince, and boasted his descent from Apollo. As to his artistic position, it is impossible for us in the entire absence of direct evidence to do more than repeat the opinion of ancient critics, as retailed by Pliny. He was universally placed in the very first rank among painters. His skilful drawing of outlines is especially praised, and many of his drawings on wood and parchment were preserved and highly valued by later painters for purposes of study. He first attained skill in making his figures appear to stand out from the background. His picture of Theseus adorned the Capitol in Rome. His other works, besides the obscene subjects with which he is said to have amused his leisure, are chiefly mythological groups. A picture of the Demos, the personified People of

Athens, is famous; according to the story, the twelve prominent characteristics of the people, though apparently quite inconsistent with each other, were distinctly expressed in this figure. The way in which this was accomplished is an insoluble riddle.

PARROT, according to Prof. Skeat (*Etymol. Dictionary*, p. 422), from the French *Perrot* or *Pierrot*, a proper name and the diminutive of *Pierre*,¹ the name given generally to a large and very natural group of Birds, which for more than a score of centuries have attracted attention, not only from their gaudy plumage, but, at first and chiefly, it would seem, from the readiness with which many of them learn to imitate the sounds they hear, repeating the words and even phrases of human speech with a fidelity that is often astonishing. It is said that no representation of any Parrot appears in Egyptian art, nor does any reference to a bird of the kind occur in the Bible, whence it has been concluded that neither painters nor writers had any knowledge of it. Aristotle is commonly supposed to be the first author who mentions a Parrot; but this is an error, for nearly a century earlier Ctesias in his *Indica* (cap. 3),² under the name of *βίττακος* (*Bittacus*), so neatly described a bird which could speak an "Indian" language—naturally, as he seems to have thought—or Greek—if it had been taught so to do—about as big as a Sparrow-Hawk (*Hierax*), with a purple face and a black beard, otherwise blue-green (*cyaneus*) and vermilion in colour, so that there cannot be much risk in declaring that he must have had before him a male example of what is now commonly known as the Blossom-headed Parakeet, and to ornithologists as *Palaornis cyanocephalus*, an inhabitant of many parts of India. Much ingenuity has been exercised in the endeavour to find the word whence this, and the later form of the Greek name, was derived, but to little or no purpose. After Ctesias comes Aristotle's *ψιττάκη* (*Psittace*), which Sundevall supposes him to have described only from hearsay, a view that the present writer is inclined to think insufficiently supported. But this matters little, for there can be no doubt that the Indian conquests of Alexander were the means of making the Parrot better known in Europe, and it is in reference to this fact that another Eastern species of *Palaornis* now bears the name of *P. alexandri*, though from the localities it inhabits it could hardly have had anything to do with the Macedonian hero. That Africa had Parrots does not seem to have been discovered by the ancients till long after, as Pliny tells us (vi. 29) that they were first met with beyond the limits of Upper Egypt by explorers employed by Nero. These birds, highly prized from the first, reprobated by the moralist, and celebrated by more than one classical poet, in the course of time were brought in great numbers to Rome, and ministered in various ways to the luxury of the age. Not only were they lodged in cages of tortoise-shell

¹ "Parakeet" (in Shakespeare, *1 Hen. IV.*, ii. 3, 88, "Paraquito") is said by the same authority to be from the Spanish *Periquito* or *Perroqueto*, a small Parrot, diminutive of *Perico*, a Parrot, which again may be a diminutive from *Pedro*, the proper name. Parakeet (spelt in various ways in English) is usually applied to the smaller kinds of Parrots, especially those which have long tails, not as *Perroquet* in French, which is used as a general term for all Parrots, *Perruche*, or sometimes *Perriche*, being the ordinary name for what we call Parakeet. The old English "Popinjay" and the old French *Papegaut* have almost passed out of use, but the German *Papagei* and Italian *Papagaio* still continue in vogue. These names can be traced to the Arabic *Babaghā*; but the source of that word is unknown. The Anglo-Saxon name of the Parrot, a river in Somerset, is *Pedrida* or *Pedrida*, which at first sight looks as if it had to do with the proper name, *Petrus*; but Prof. Skeat believes there is no connexion between them—the latter portion of the word being *rið*, a stream.

² The passage seems to have escaped the notice of all naturalists except Broderip, who mentioned it in his article "*Psittacidae*," in the *Penny Cyclopædia* (vol. xix. p. 83).

and ivory, with silver wires, but they were professedly esteemed as delicacies for the table, and one emperor is said to have fed his lions upon them! But there would be little use in dwelling longer on these topics. With the decline of the Roman empire the demand for Parrots in Europe lessened, and so the supply dwindled, yet all knowledge of them was not wholly lost, and they are occasionally mentioned by one writer or another until in the 15th century began that career of geographical discovery which has since proceeded uninterruptedly. This immediately brought with it the knowledge of many more forms of these birds than had ever before been seen, for whatever races of men were visited by European navigators—whether in the East Indies or the West, whether in Africa or in the islands of the Pacific—it was almost invariably found that even the most savage tribes had tamed some kind of Parrot; and, moreover, experience soon showed that no bird was more easily kept alive on board ship and brought home, while, if it had not the merit of “speech,” it was almost certain to be of beautiful plumage. Yet so numerous is the group that even now new species of Parrots are not uncommonly recognized, though, looking to the way in which the most secluded parts of the world are being ransacked, we must soon come to an end of this.

The home of the vast majority of Parrot-forms is unquestionably within the tropics, but the popular belief that Parrots are tropical birds only is a great mistake. In North America the Carolina Parakeet, *Conurus carolinensis*, at the beginning of the present century used to range in summer as high as the shores of Lakes Erie and Ontario—a latitude equal to that of the south of France; and even within the last forty years it reached, according to trustworthy information, the junction of the Ohio and the Mississippi, though now its limits have been so much curtailed that its occurrence in any but the Gulf States is doubtful. In South America, at least four species of Parrots are found in Chili or La Plata, and one, *Conurus patagonus*, is pretty common on the bleak coast of the Strait of Magellan. In Africa, it is true that no species is known to extend to within some ten degrees of the tropic of Cancer; but *Pionias robustus* inhabits territories lying quite as far to the southward of the tropic of Capricorn. In India the northern range of the group is only bounded by the slopes of the Himalaya, and further to the eastward Parrots are not only abundant over the whole of the Malay Archipelago, as well as Australia and Tasmania, but two very well-defined Families are peculiar to New Zealand and its adjacent islands (see KAKAPO, vol. xiii. p. 825; and NESTOR, vol. xvii. p. 354). No Parrot has recently inhabited the Palearctic Region,¹ and but one (the *Conurus carolinensis*, just mentioned) probably belongs to the Nearctic; nor are Parrots represented by many different forms in either the Ethiopian or the Indian Regions. In continental Asia the distribution of Parrots is rather remarkable. None extend further to the westward than the valley of the Indus,² which, considering the nature of the country in Baluchistan and Afghanistan, is perhaps intelligible enough; but it is not so easy to under-

stand why none are found either in Cochin China or China proper; and they are also wanting in the Philippine Islands, which is the more remarkable and instructive when we find how abundant they are in the groups a little further to the southward. Indeed Mr Wallace has well remarked that the portion of the earth's surface which contains the largest number of Parrots, in proportion to its area, is undoubtedly that covered by the islands extending from Celebes to the Solomon group. “The area of these islands is probably not one-fifteenth of that of the four tropical regions, yet they contain from one-fifth to one-fourth of all the known Parrots” (*Geogr. Distr. Animals*, ii. p. 330). He goes on to observe also that in this area are found many of the most remarkable forms—all the red Lories, the great black Cockatoos, the pigmy *Nasiterna*, and other singularities. In South America the species of Parrots, though numerically nearly as abundant, are far less diversified in form, and all of them seem capable of being referred to two or, at most, three sections. The species that has the widest range, and that by far, is the common Ring-necked Parakeet, *Palæornis torquatus*, a well-known cage-bird which is found from the mouth of the Gambia across Africa to the coast of the Red Sea, as well as throughout the whole of India, Ceylon, and Burmah to Tenasserim.³ On the other hand there are plenty of cases of Parrots which are restricted to an extremely small area—often an island of insignificant size, as *Conurus xantholæmus*, confined to the island of St Thomas in the Antilles, and *Palæornis exsul* to that of Rodriguez in the Indian Ocean—to say nothing of the remarkable instance of *Nestor productus* before mentioned (vol. xvii. p. 355).

The systematic treatment of this very natural group of birds has long been a subject of much difficulty, and the difference of opinion among those who have made it their study is most striking, for there is hardly an approach to unanimity to be found, beyond the somewhat general belief which has grown up within the last forty years that the Parrots should be regarded as forming a distinct Order of the Class, though there are some men, justly accounted authorities, who even question this much. A few systematists, among whom Bonaparte was chief, placed them at the top of the Class, conceiving that they were the analogues of the *Primates* among mammals. Prof. Huxley has recognized the *Psittacomorphæ* as forming one of the principal groups of Carinate birds, and, by whatever name we call them, that much seems to be evident. It will here, however, be unnecessary to discuss the exact rank which the Parrots as a group should hold, for sufficient on that score has already been said above (ORNITHOLOGY, p. 47), and it is quite enough of a task to consider the most natural or—if we cannot hope at present to reach that—at least the most expedient way of subdividing them. It must be admitted as a reproach to ornithologists that so little satisfactory progress has been made in this direction, for of that the existing differences of opinion—differences as wide as have ever existed in any branch of ornithic taxonomy—are sufficient proof. Moreover, the result is all the more disheartening, seeing that there is no group of exotic birds that affords equal opportunities for anatomical examination, since almost every genus extant, and more than two-thirds of the species, have within recent times been kept in confinement in one or another of our zoological gardens, and at their death have furnished subjects for dissection. Yet the laudable attempt

¹ A few remains of a Parrot have been recognized from the Miocene of the Allier in France, by Prof. A. Milne-Edwards (*Ois. Foss. France*, ii. p. 525, pl. cc.), and are said by him to show the greatest resemblance to the common Grey Parrot of Africa, *Psittacus erithacus*, through having also some affinity to the Ring-necked Parakeet of the same country, *Palæornis torquatus*. He refers them, however, to the same genus as the former, under the name of *Psittacus verreauxi*.

² The statements that have been made, and even repeated by writers of authority, as to the occurrence of “a green parrot” in Syria (Chesney, *Expéd. Survey Euphrates and Tigris*, i. pp. 443, 537) and of a Parrot in Turkestan (*Jour. As. Soc. Bengal*, viii. p. 1007) originated with gentlemen who had no ornithological knowledge, and are evidently erroneous.

³ It is right to state, however, that the African examples of this bird are said to be distinguishable from the Asiatic by their somewhat shorter wings and weaker bill, and hence they are considered by some authorities to form a distinct species or subspecies, *P. docilis*; but in thus regarding them the difference of locality seems to have influenced opinion, and without that difference they would scarcely have been separated, for in many other groups of birds distinctions so slight are regarded as barely evidence of local races.

of M. Blanchard (*Comptes Rendus*, xliii. 1097-1100 and xlv. 518-521) has not been regarded as successful, and it cannot be affirmed positively that the latest arrangement of the *Psittaci* is really much more natural than that planned by Buffon one hundred and twenty years ago. He was of course unaware of the existence of some of the most remarkable forms of the group, in particular of *Strigops* and *Nestor*; but he began by making two great divisions of those that he did know, separating the Parrots of the Old World from the Parrots of the New, and subdividing each of these divisions into various sections somewhat in accordance with the names they had received in popular language—a practice he followed on many other occasions, for it seems to have been with him a belief that there is more truth in the discrimination of the unlearned than the scientific are apt to allow. The result is that he produced a plan which is comparatively simple and certainly practical, while as just stated it cannot be confidently declared to be unnatural. However, not to go so far back as twenty years, in 1867-68 Dr Finsch published at Leyden an elaborate monograph of the Parrots,¹ regarding them as a Family, in which he admitted 26 genera, forming 5 Subfamilies:—(1) that composed of *Strigops* (КАРО, *ut sup.*) only; (2) that containing the crested forms or Cockatoos; (3) one which he named *Sittacinae*, comprising all the long-tailed species—a somewhat heterogeneous assemblage, made up of MACAWS (vol. xv. p. 130) and what are commonly known as Parakeets; (4) the Parrots proper with short tails; and (5) the so-called "brush-tongued" Parrots, consisting of the LORIES (vol. xv. p. 7) and NESTORS (*ut sup.*). Except in the characters of the last group he recognized none that were not external, and that fact is sufficient to cast suspicion on his scheme being natural.

In 1874 the late Prof. Garrod communicated to the Zoological Society the results of his dissection of examples of 82 species of Parrots, which had lived in its gardens, and these results were published in its *Proceedings* for that year (pp. 586-598, pls. 70, 71). The principal points to which he attended were the arrangement of the carotid artery, and the presence or absence of an ambiens muscle, an oil-gland, and a furcula; but except as regards the last character he unfortunately almost wholly neglected the rest of the skeleton, looking upon such osteological features as the formation of an orbital ring and peculiarities of the atlas as "of minor importance"—an estimate to which nearly every anatomist will demur; for, though undoubtedly the characters afforded by blood-vessels and muscles are useful in default of osteological characters, it is obvious that these last, drawn from the very framework of any vertebrate's structure, cannot be inferior in value to the former. Indeed the investigations of Prof. A. Milne-Edwards (*Ann. Sc. Nat. Zoologie*, ser. 5, vi. pp. 91-111; viii. pp. 145-156) on the bones of the head in various Psittacine forms make it clear that these alone present features of much significance, and if his investigations had not been carried on for a special object, but had been extended to other parts of the skeleton, there is little doubt that they would have removed some of the greatest difficulties. The one osteological character to which Garrod trusted, namely, the condition of the furcula, cannot be said to contribute much towards a safe basis of classification. That it is wholly absent in some genera of Parrots had long been known, but its imperfect ossification, it appears, is not attended in some cases by any diminution of volant powers, which tends to shew that it is an unimportant character, an inference confirmed by the fact that it is found wanting in genera placed geographically so far apart that the loss must have had in some of them an independent origin. Summarily

¹ *Die Papageien, monographisch bearbeitet.*

expressed, Garrod's scheme was to divide the Parrots into two Families, *Palæornithidæ* and *Psittacidæ*, assigning to the former three Subfamilies *Palæornithinæ*, *Cacatuinæ*, and *Stringopinæ*, and to the latter four, *Arinæ*, *Pyrrhulinæ*, *Platyercinæ*, and *Chrysotinæ*. That each of these sections, except the *Cacatuinæ*, is artificial any regard to osteology would shew, and it would be useless here to further criticize his method, except to say that its greatest merit is that, as before mentioned (LOVE-BIRD, vol. xv. p. 28), he gave sufficient reasons for distinguishing between the genera *Agapornis* and *Psittacula*. In the *Journal für Ornithologie* for 1881 Dr Reichenow published a *Conspectus Psittacorum*, founded, as several others² have been, on external characters only. He makes 9 Families of the group, and recognizes 45 genera, and 442 species, besides subspecies. His grouping is generally very different from Garrod's, but displays as much artificiality; for instance, *Nestor* is referred to the Family which is otherwise composed of the Cockatoos. Still more recently we have the arrangement followed by Mr Selater in the *List* of those exhibited of late years in the gardens of the Zoological Society, and published in 1883. This is more in accordance with the views that the present writer is inclined to hold, and these views may here, though with much diffidence, be stated. First there is *Strigops*, which must stand alone, unless, as before hinted (vol. xiii. p. 826), *Geopsittacus* and *Pezoporus* may have to be placed with it in a Family *Strigopidæ*. Next *Nestor*, from its osteological peculiarities, seems to form a very separate type, and represents a second Family *Nestoridæ*. These two Families being removed, all the Parrots that remain will be found to have a great resemblance among themselves, and perhaps it is impossible justifiably to establish any more Families. For the present at any rate it would seem advisable to keep them in a single Family *Psittacidæ*, but there can be no objection to separating them into several Subfamilies. The Cockatoos, for instance, can be without much difficulty defined, and may stand as *Cacatuinæ*, and then the brush-tongued Lories as *Lorinæ*, after which the Macaws, *Arinæ*—including possibly *Conurus* and its allies. *Platyercus* and its neighbours may form another section, and the same with *Palæornis*; but for the rest there is not yet material for arriving at any determination, though *Chrysotis* and *Psittacus* seem to furnish two different types, to the former of which *Psittacula* appears to bear much the same relation as *Agapornis* does to the latter. Amongst the genera *Chrysotis*, *Palæornis*, and *Psittacus* are probably to be found the most highly organized forms, and it is these birds in which the faculty of so-called "speech" reaches its maximum development. But too much importance must not be assigned to that fact; since, while *Psittacus erithacus*—the well-known Grey Parrot with a red tail—is the most accomplished spokesman of the whole group, it is fairly approached by some species of *Chrysotis*—usually styled Amazons—and yet its congener *P. timneh* is not known to be at all loquacious.³

Considering the abundance of Parrots both as species and individuals, and their wide extent over the globe, it is surprising how little is known of their habits in a wild state. Even the species with which Englishmen and their descendants have been more in contact than any other has an almost unwritten history, compared with that of many other birds; and, seeing how it is oppressed by and yielding to man's occupation of its ancient haunts, the

² Such, for instance, as Kuhl's treatise with the same title, which appeared in 1820, and Wagler's *Monographia Psittacorum*, published in 1832—both good of their kind and time.

³ In connexion with the "speaking" of Parrots, one of the most curious circumstances is that recorded by Humboldt, who in South America met with a venerable bird which remained the sole possessor of a literally dead language, the whole tribe of Indians, *Azura* by name, who alone had spoken it having become extinct.

extirpation of the Carolina Parakeet is certain, and will probably be accomplished before several interesting and some disputed points in its economy have been decided. The same fate possibly awaits several of the Australian species and all those in New Zealand—indeed the experience of small islands only foreshadows what will happen in tracts of greater extent, though there more time is required to produce the same result; but, the result being inevitable, those who are favourably placed for observations should neglect no opportunities of making them ere it be too late. (A. N.)

PARROT-FISHES, more correctly called PARROT-WRASSES, are marine fishes, belonging to the Wrasso family, and referred to four closely-allied genera, viz., *Scarus*, *Scarichthys*, *Callyodon*, and *Pseudoscarus*. They are easily recognized by their large scales, of which there are from twenty-one to twenty-five in the lateral line, by having invariably nine spines and ten rays in the dorsal fin and two spines with eight rays in the anal, and especially by their singular dentition, of jaws as well as pharynx. The teeth of the jaws are soldered together, and form a sharp-edged beak similar to that of a parrot, but without a middle projecting point, and the upper and lower beak are divided into two lateral halves by a median suture. In a few species the single teeth can be still distinguished, but in the majority (*Pseudoscarus*) they are united into a homogeneous substance with polished surface. By this sharp and hard beak parrot-fishes are enabled to bite or scrape off those parts of coral-stocks which contain the animalcules, or to cut off branches of tough fuens, which in some of the species forms the principal portion of their diet. The process of triturating the food is performed by the pharyngeal teeth, which likewise are united, and form plates with broad masticatory surface, not unlike the grinding surface of the molars of the elephant. Of these plates there is one pair above, opposed to and fitting into the single one which is coalesced to the lower pharyngeal bone. The contents of the alimentary canal, which are always found to be finely divided and reduced to a pulp, prove the efficiency of this triturating apparatus; in fact, ever since the time of Aristotle it has been maintained that the *Scarus* ruminates. Nearly one hundred species of parrot-fishes are known from the tropical and subtropical parts of the Indo-Pacific and Atlantic Oceans; like other coral-feeding fishes, they are absent on the Pacific coasts of tropical America and on the coast of tropical West Africa. The most celebrated is the *Scarus* of the Mediterranean. Beautiful colours prevail in this group of wrasses, but are subject to great changes and variation in the same species; almost all are evanescent, and cannot be preserved after death. The majority of parrot-fishes are eatable, some even esteemed; but they (especially the carnivorous kinds) not unfrequently acquire poisonous properties after they have fed on corals or medusæ containing an acrid poison. Many attain to a considerable size, upwards of 3 feet in length.

PARRY, SIR WILLIAM EDWARD (1790–1855), arctic navigator, was the fourth son of Dr Caleb Hillier Parry, a physician of some celebrity in Bath, and was born there 19th December 1790. He was educated at the Bath Grammar School, and was intended for the medical profession, but through the intervention of a lady friend of the family he was permitted, through the kindness of Admiral Cornwallis, to join the "Ville de Paris," the flagship of the Channel fleet, as a first-class volunteer. In 1806 he became a midshipman in the "Tribune" frigate, from which he was, in the spring of 1808, transferred to the "Vanguard" in the Baltic fleet. After obtaining his lieutenant's commission he joined the "Alexander" frigate, employed in the protection of the Spitzbergen whale

fishery. Taking advantage of the opportunity for the study of astronomy, and the observation of the fixed stars in the northern hemisphere, he afterwards published the result of his studies in a small volume on *Nautical Astronomy*. He also employed himself in preparing accurate charts of the northern navigation. Having joined the "La Hogue" at the North-American station, he remained there till 1817, distinguishing himself in an expedition up the Connecticut river, for which he received a medal. Shortly after his return to England he obtained an appointment to the "Alexander" brig in the expedition of Sir John Ross to discover the probabilities of a North-West Passage to the Pacific. Ross, mistaking clouds for the Croker mountains barring his way westwards, returned to England in the belief that further perseverance was hopeless; but Parry, confident, as he expressed it, "that attempts at polar discovery had been hitherto relinquished just at a time when there was the greatest chance of succeeding," obtained the command of a new expedition, consisting of two ships, the "Griper" and "Hecla," with which he sailed from the Thames in May 1819. Passing up Baffin's Bay, he explored and named Barrow's Straits, Prince Regent's Inlet, and Wellington Channel, and reached Melville Island at the beginning of September, having crossed longitude 110° W., thus becoming entitled to the reward of £5000 offered by parliament. After wintering in Melville Island he made an effort to force a passage to Behrings Straits, but, the state of the ice rendering this impossible, he returned to England, re-entering the Thames in November 1820. A narrative of the expedition appeared in 1821. Shortly after his return he was promoted to the rank of commander, presented with the freedom of Bath and Norwich, and elected a member of the Royal Society. With the "Fury" and the "Hecla" he set sail on a second expedition in May 1821, and after great hardships returned to England in November 1823 without achieving his purpose. During his absence he had in November 1821 been promoted to post rank, and on 1st December 1823 he was chosen acting hydrographer to the navy. His *Journal of a Second Voyage for the Discovery of the North-West Passage* appeared in 1824. With the same ships he, in May 1824, set sail on a third expedition, which, however, was also unsuccessful, and after the wreck of the "Fury" he returned home in October 1825 with a double ship's company. Of this voyage he published an account in 1826. Having obtained the sanction of the Admiralty to journey to the North Pole from the northern shores of Spitzbergen in boats that could be fitted to sledges, he set sail with the "Hecla," March 27, 1827, and in June set out for the Pole. He, however, failed to find the solid plain of ice he expected; and as, moreover, owing to the ice drift, he found his efforts at progress northwards in great degree frustrated, he was compelled, after reaching 82° 45' N. lat., to retrace his steps, and arrived in England in October. Of his journey he published an account under the title of *Narrative of the Attempt to reach the North Pole in Boats*, 1827. On April 29, 1829, he received the honour of knighthood, Sir John Franklin being also knighted on the same occasion. After continuing his duties as hydrographer till May 1829, he went to New South Wales as commissioner to the Australian Agricultural Company. On his return to England in 1835 he was appointed assistant poor-law commissioner in Norfolk. This he in little more than a year resigned, and in 1837 he was employed in organizing the packet service between Liverpool, Holyhead, and Dublin. For nine years from 1837 he was comptroller of the steam department of the navy. On retiring from active service he was appointed captain-superintendent of Haslar Hospital. He vacated this office in 1852 on obtain-

ing the rank of rear-admiral, and in 1853 he was appointed governor of Greenwich Hospital, which post he retained till his death, 8th July 1855. Besides the journals of his different voyages, Parry was the author of a *Lecture to Seamen*, and *Thoughts on the Parental Character of God*.

See *Memoirs of Rear-Admiral Sir W. E. Parry*, by his son Rev. Edward Parry, M.A., 3d ed., 1857.

PARSÍS, or PARSEES. The resident in Bombay who wanders to the Back Bay beach at sunset to inhale the fresh sea-breezes from Malabar Hill will there observe a congregation of the most interesting people of Asia. They are the Parsís, the followers of Zarathustra, and the descendants of the ancient Persians who emigrated to India on the conquest of their country by the Arabs, about the year 720 A.D.

The men are well-formed, active, handsome, and intelligent. They have light olive complexions, a fine aquiline nose, bright black eyes, a well-turned chin, heavy arched eyebrows, thick sensual lips, and usually wear a light curling moustache. The women are delicate in frame, with small hands and feet, fair complexions, beautiful black eyes, finely arched eyebrows, and a luxurious profusion of long black hair, which they dress to perfection, and ornament with pearls and gems.

The Parsís are much more noble in their treatment of females than any other Asiatic race; they allow them to appear freely in public, and leave them the entire management of household affairs. They are proverbial for their benevolence, hospitality, and sociability. They are good scholars, and usually learn several languages—Gujarátí, Hindústání, and English. The Parsís are notoriously fond of good living, and do not hesitate to spend their money freely for the best the market affords. They indulge in wines, but do not reach the vice of intoxication.

On getting out of bed in the morning, an orthodox Parsí first says his prayers. He then rubs a little *nirang* (cow-urine) upon his face, hands, and feet, reciting during the ceremony a prayer or incantation against the influence of *dévas*, or evil spirits, for which the "nirang" is considered a specific. He next takes his bath, cleans his teeth, and repeats his prayers. He then takes his morning meal, a light breakfast,—say, tea or chocolate, bread, and fruits. The dinner is more abundant, and is composed of the dishes of the country—meats, stews, vegetables, rice, fruits, &c. These dishes are seasoned with pungent sauces, curries, chutneys, pickles, &c., one of which, famous in Bombay, is marked with the mild initials H. F. (hell-fire). The evening meal is taken after sunset, when the labours and ceremonies of the day are over, and is the signal for licence in eating, drinking, and conversation. A *tat*, or parting drink for the night, is a time-honoured custom among the Parsís.

The costume of the Parsí is loose and flowing, very picturesque in appearance, and admirably adapted to the climate in which he lives. The *sadara*, or shirt, which is considered the most sacred garment, because it is worn next the skin, is a plain loose vest, usually made of muslin, or with the opulent of fine white linen. A long coat or gown is worn over the *sadara*, extending to the knees, and fastened round the waist with the *kusti*, or sacred cord, which is carried round three times, and fastened in front with a double knot. The *pyjamis*, or loose trousers, are fastened round the waist by a silken cord with tassels at the ends, which are run through a hem. The material of these *pyjamis* among the common classes is cotton, but the rich indulge in fancy-coloured silks and satins. The head is covered with a turban, or a cap of a fashion peculiar to the Parsís; it is made of stiff material, something like the European hat, without any rim, and has an angle from the top of the forehead backwards. It would

not be respectful to uncover in presence of an equal, much less of a superior. The colour is chocolate or maroon, except with the priests, who wear a white turban. The shoes are of red or yellow morocco, turned up at the toes.

The dress of Parsí ladies is something gorgeous. They are enveloped in a maze of mysteriously wound silk. They appear as houris floating about the earth in silk balloons, with a ballasting of anklets, necklaces, earrings, and jewellery. The dressmakers' bills, fortunately for the head of the family, are not exorbitant, as the costumes have not been through the hands of the modiste, but are composed of many yards of fancy-coloured silks wound round the nether limbs and gradually enfolding the body, covering part of the bosom, and then thrown over the shoulders and head, drooping on the left arm, as a shield against the inquisitive gaze of a stranger. The *pyjamis*, or drawers, are common to both sexes, but the ladies of course excel in the fine texture and fanciful colours of these garments.

A Parsí must be born upon the ground floor of the house, as the teachings of their religion require life to be commenced in humility, and by "good thoughts, words, and actions" alone can an elevated position be attained either in this world or the next. The mother is not seen by any member of the family for forty days. Upon the seventh day after the birth of the child, an astrologer is invited, who is either a Bráhmaṇa or a Parsí priest, to cast the nativity of the child. He has first to enumerate the names which the child may bear, and the parents have the right to make choice of one of them. Then he draws on a wooden board a set of hieroglyphics in chalk, and his dexterity in counting or recounting the stars under whose region or influence the child is declared to be born is marvelled at by the superstitious creatures thronging around him. All the relatives press forward to hear the astrologer predict the future life and prospects of the babe. This document is preserved in the family archives as a guidance and encouragement to the child through life, and may exert some influence in shaping its destiny. At the age of seven years or thereabouts, according to the judgment of the priest, the first religious ceremony of the Parsís is performed upon the young Zarathustrian. He is first subjected to the process of purification, which consists of an ablution with "nirang." The ceremony consists in investing the young Parsí with the cincture, or girdle of his faith. This cincture is a cord woven by women of the priestly class only. It is composed of seventy-two threads, representing the seventy-two chapters of the *Yásna*, a portion of the Zand-Avestá, in the sacredness of which the young neophyte is figuratively bound. The priest ties the cord around the waist as he pronounces the benediction upon the child, throwing upon its head at each sentence slices of fruits, seeds, perfumes, and spices. He is thus received into the religion of Zarathustra. After the performance of this ceremony, the child is considered morally accountable for its acts. If a child die before the performance of this ceremony, it is considered to have gone back to Ahurá-Mazdá, who gave it, as pure as it entered into this world, having not reached the age of accountability. The ceremony of the *kusti*, or encircling with the girdle, is closed by the distribution of refreshments to the friends and relatives of the family who have attended the investiture of the younger follower of Zarathustra with the sacred girdle of his faith.

The marriages of children engage the earliest attention of the parents. Though the majority of Parsí marriages are still celebrated while the children are very young, instances frequently occur of marriages of grown-up boys and girls. The wedding day is fixed by an astrologer, who consults the stars for a happy season. The wedding day being

fixed, a Parsi priest goes from house to house with a list of the guests to be invited, and delivers the invitations with much ceremony. The father of the bride waits upon near relatives and distinguished personages, soliciting the honour of their attendance. A little before sunset a procession is formed at the house of the bridegroom, and proceeds with a band of music, amid great pomp and ceremony, to the house of the bride's father. Here a number of relatives and friends are collected at the door to receive the bridegroom with due honour. Presents are sent before, according to the time-honoured customs of the East. Upon the arrival of the procession at the house of the bride, the gentlemen gallantly remain outside, leaving room for the ladies to enter the house with the bridegroom as his escort. As he passes the threshold, his future mother-in-law meets him with a tray filled with fruits and rice, which she strews at his feet. The fathers of the young couple are seated side by side, and between them stands the priest ready to perform the magic ceremony. The young couple are seated in two chairs opposite each other, their right hands tied together by a silken cord, which is gradually wound around them as the ceremony progresses, the bride in the meantime being concealed with a veil of silk or muslin. The priest lights a lamp of incense, and repeats the nuptial benediction first in Zand and then in Sanskrit. At the conclusion of the ceremony they each throw upon the other some grains of rice, and the most expeditious in performing this feat is considered to have got the start of the other in the future control of the household, and receives the applause of the male or female part of the congregation as the case may be. The priest now throws some grains of rice upon the heads of the married pair in token of wishing them abundance; bouquets of flowers are handed to the assembled guests, and rose-water is showered upon them. The bride and bridegroom now break some sweetmeats, and, after they have served each other, the company are invited to partake of refreshments. At the termination of this feast the procession forms, and with lanterns and music escorts the bridegroom back to his own house, where they feast until midnight. As midnight approaches, they return to the house of the bride, and escort her, with her dowry, to the house of the bridegroom, and, having delivered her safely to her future lord and master, disperse to their respective homes. Eight days after the bridal ceremony a wedding feast is given by the newly-married couple, to which only near relatives and particular friends are invited. This feast is composed entirely of vegetables, but wine is not forbidden; at each course the wine is served, and toasts are proposed, as "happiness to the young couple," &c.

The funeral ceremonies of the Parsis are solemn and imposing. When the medical attendant declares the case of a Parsi hopeless, a priest advances to the bed of the dying man, repeats sundry texts of the Zand-Avestâ, the substance of which tends to afford consolation to the dying man, and breathes a prayer for the forgiveness of his sins. After life is extinct, a funeral sermon is delivered by the priest, in which the deceased is made the subject of an exhortation to his relatives and friends to live pure, holy, and righteous lives, so that they may hope to meet again in paradise. The body is then taken to the ground floor where it was born, and, after being washed and perfumed, is dressed in clean white clothes, and laid upon an iron bier. A dog is brought in to take a last look at his inanimate master in order to drive away the evil spirits or *Nasus*. This ceremony is called *sagdâd*. A number of priests attend and repeat prayers for the repose of the soul of the departed. All the male friends of the deceased go to the door, bow down, and raise their two hands from touching the floor to their heads to indicate their deepest

respect for the departed. The body, when put upon the bier, is covered over from head to foot. Two attendants bring it out of the house, holding it low in their hands, and deliver it to four pall-bearers, called *nasasalar*, all clad in well-washed, clean, white clothes. All the people present stand up as the body is taken out of the house, and bow to it in respect as it passes by. A procession is formed by the male friends of the deceased, headed by a number of priests in full dress, to follow the body to the *dakhma*, or "tower of silence," the last resting-place of the departed Parsi. These towers are erected in a beautiful garden on the highest point of Malabar Hill, amid tropical trees swarming with vultures; they are constructed of stone, and rise some 25 feet high, with a small door at the side for the entrance of the body. Upon arriving at the "tower of silence" the bier is laid down, and prayers are said in the *sagri*, or house of prayer, containing a fire-sanctuary, which is erected near the entrance to the garden. The attendants then raise the body to its final resting-place, lay it upon its stony bed, and retire. A round pit about 6 feet deep is surrounded by an annular stone pavement about 7 feet wide, on which the body is exposed to the vultures, where it is soon denuded of flesh, and the bones fall through an iron grating into a pit beneath, from which they are afterwards removed into a subterranean entrance prepared for their reception. On the third day after death an assemblage of the relatives and friends of the deceased takes place at his late residence, and thence proceed to the *Atish-bahrâm*, or "temple of fire." The priests stand before the urns in which the celestial fire is kept burning, and recite prayers for the soul of the departed. The son or adopted son of the deceased kneels before the high-priest, and promises due performance of all the religious duties and obsequies to the dead. The relatives and friends then hand the priest a list of the contributions and charities which have been subscribed in memory of the deceased, which concludes the ceremony of "rising from mourning," or "the resurrection of the dead." On each successive anniversary of the death of a Parsi, funeral ceremonies are performed in his memory. An iron framework is erected in the house, in which shrubs are planted and flowers cultivated to bloom in memory of the departed. Before the frame, on iron stands, are placed copper or silver vases, filled with water and covered with flowers. Prayers are said before these iron frames two or three times a day. These ceremonies are called *mûktad*, or ceremonies of departed souls.

The numerical strength of the followers of Zarathustra at the present day does not exceed 82,000 persons, including the Parsis of Persia at Kermân, Yazd, and Teherân. The greater number is found in Bombay, and in some of the cities of Gujârât, as Now-sari, Surat, Bharoch, Ahmedâbâd, &c. Parsis have also settled for the purpose of trade in Calcutta, Madras, and in other cities of British India, in Burmah, Chiuâ, and in other parts of Asia. According to the census of 1881, there are in the Bombay presidency 72,065 Parsis, and in Persia 8499, according to Houtum-Schindler (see *Journal of the Oriental German Society*, vol. xxxvi. p. 54).

The Parsis of India are divided into two sects, the Shenshais and the Kadmis. They do not differ on any point of faith; the dispute is solely confined to a quarrel as to the correct chronological date for the computation of the era of Yazdagird, the last king of the Sasanian dynasty, who was dethroned by the caliph Omar about 640 A.D. The difference has been productive of no other inconvenience than arises from the variation of a month in the celebration of the festivals. The Shenshai sect, represented by Sir Jamsetji Jijibhai, Bart., greatly outnumbered the Kadmis, formerly headed by the late famous high-priest Mulla Firôz.

The Parsis, as stated above, compute time from the fall of Yazdagird. Their calendar is divided into twelve months of thirty days each; the other five days, being added for holy days, are not counted. Each day is named after some particular angel of bliss, under whose special protection it is passed. On feast days a division of five watches is made under the protection of five different divinities. In midwinter a feast of six days is held in com-emo-

vation of the six periods of creation. About the 21st of March, the vernal equinox, a festival is held in honour of agriculture, when planting begins. In the middle of April a feast is held to celebrate the creation of trees, shrubs, and flowers. On the fourth day of the sixth month a feast is held in honour of Sahrêvar, the deity presiding over mountains and mines. On the sixteenth day of the seventh month a feast is held in honour of Mithra, the deity presiding over and directing the course of the sun, and also a festival to celebrate truth and friendship. On the tenth day of the eighth month a festival is held in honour of Farvardin, the deity who presides over the departed souls of men. This day is especially set apart for the performance of ceremonies for the dead. The people attend on the hills where the "towers of silence" are situated, and perform in the *sagris* prayers for the departed souls. The Parsis are enjoined by their religion to preserve the memory of the dead by annual religious ceremonies performed in the house, as said above; but such of their friends as die on long voyages, or in unknown places, and the date of whose death cannot be known, are honoured by sacred rites on this day. The Parsi scriptures require the last ten days of the year to be spent in doing deeds of charity, and in prayers of thanksgiving to Ahurâ-Mazdâ. On the day of Yazdagird, or New Year's Day, the Parsis emulate the Western world in rejoicing and social intercourse. They rise early, and after having performed their prayers and ablutions dress themselves in a new suit of clothes, and sally forth to the "fire-temple," to worship the emblem of their divinity, the sacred fire, which is perpetually burning on the altar. Unless they duly perform this ceremony they believe their souls will not be allowed to pass the bridge "Chinuvâd," leading to heaven. After they have performed their religious services, they visit their relations and friends, when the ceremony of "hamijur," or joining of hands, is performed. The ceremony is a kind of greeting by which they wish each other "a happy new year." Their relatives and friends are invited to dinner, and they spend the rest of the day in feasting and rejoicing; alms are given to the poor, and new suits of clothes are presented to the servants and dependants.

There are only two distinct castes among the Parsis,—the priests (*dastûrs*, or high priests; *mobeds*, or the middle order of priests; and *herbads*, or the lowest order of priests) and the people (*behadîn*, *behidîn*, or "followers of the best religion"). The priestly office is hereditary, and no one can become a priest who was not born in the purple; but the son of a priest may become a layman.

The secular affairs of the Parsis are managed by an elective committee, or *Panchâyat*, composed of six *dastûrs* and twelve *mobeds*, making a council of eighteen. Its functions resemble the Venetian council of ten, and its objects are to preserve unity, peace, and justice amongst the followers of Zarathustra. One law of the *Panchâyat* is singular in its difference from the law or custom of any other native community in Asia; nobody who has a wife living shall marry another, except under peculiar circumstances, such as the barrenness of the living wife, or her immoral conduct. It is a matter of just pride that we find the Parsis have not imitated the barbarous and tyrannical custom of prohibiting widows from remarrying which is so prevalent among the Hindûs.

Their religion teaches them benevolence as the first principle, and no people practise it with more liberality. A beggar among the Parsis is unknown, and would be a scandal to the society. In the city of Bombay alone they have thirty-two different charitable institutions. The sagacity, activity, and commercial enterprise of the Parsis are proverbial in the East, and their credit as merchants is almost unlimited. They frequently control the opium production of India, which amounts annually to something like £10,000,000 sterling. They have some fifty large commercial houses in Bombay, fourteen in Calcutta, twenty in Hong-Kong, ten in Shanghai, four in London, three in Amoy, two in Yokohama, and many throughout India, Persia, and Egypt. Further, their interest in the extension of agriculture in India is prominent; they are also very much esteemed as railway contractors or railway guards. It is often said that the Parsis are superstitious about extinguishing fire, but this is a mistake. They are the only people in the world who do not smoke tobacco, or some other stimulating weed. Their reverence for fire as a symbol of Ahurâ-Mazdâ prevents them from dealing with it lightly. They would not play with fire, nor extinguish it unnecessarily; and they generally welcome the evening blaze with a prayer of thanksgiving. Their religion forbids them to defile any of the creations of Ahurâ-Mazdâ, such as the earth, water, trees, flowers, &c., and on no account would a Parsi indulge in the disgusting habit of excoercation. They have been accustomed to the refinement of finger-bowls after meals for several thousand years, and resort to ablutions frequently.

Of all the natives of India the Parsis are most desirous of receiving the benefits of an English education, and their eagerness to embrace the science and literature of the West has been conspicuous in the wide spread of female education among them. The difference between the Parsis of thirty years ago and those of the present day

is simply the result of English education and intercourse with Englishmen. The condition of the Parsi priesthood, however, demands improvement. Very few of them understand their liturgical Zand works, although able to recite parrot-like all the chapters requiring to be repeated on occasions of religious ceremonies, for which services they receive the regulated fees, and from them mainly they derive a subsistence. It is, however, very gratifying to notice an attempt that is now being made to impart a healthy stimulus to the priesthood for the study of their religious books. Two institutions, styled the "Mulla Firôz Madrasa" and the "Sir Jamsetji Jijibhai Madrasa," have been established under the superintendence of competent teachers. Here the study of Zand, Pâzand, Pahlavi, and Persian is cultivated; and many of the sons of the present ignorant priests will occupy a higher position in the society of their countrymen than their parents now enjoy. The present *dastûrs* are intelligent and well-informed men, possessing a sound knowledge of their religion; but the mass of the *mobeds* and *herbads* are profoundly ignorant of its first principles. As active measures are being devised for improvement, the darkness of the present will doubtless be succeeded by a bright dawn in the future. (A. F.)

PARSON is a technical term of English law, and is a corruption of *persona*, the parson being, as it were, the *persona ecclesiæ*, or representative of the church in the parish. Parson *imparsonee* (*persona impersonata*) is he that as rector is in possession of a church parochial, and of whom the church is full, whether it be representative or inappropriate (Coke upon Littleton, 300 b). The word parson is properly used only of a rector, though it is sometimes loosely extended to any one in holy orders. Though every parson is a rector, every rector is not a parson. A parson must be in holy orders; hence a lay rector could not be called a parson. The parson is tenant for life of the parsonage house, the glebe, the tithes, and other dues, so far as they are not appropriated. Further information on this subject will be found under ADVOWSON, BENEFICE, and TITHES.

PARSONS, or PERSONS, ROBERT (1546–1610), a celebrated Jesuit, was the son of a blacksmith, and was born at Nether Stowey, near Bridgwater, England, in 1546. His precocity attracted the attention of the vicar of the parish, who gave him private instruction, and procured his entrance in 1563 as an exhibitor to Balliol College, Oxford. He graduated B.A. in 1568, and M.A. in 1572. He was fellow, bursar, and dean of his college, but in 1574 he resigned his fellowship and offices, for reasons which have been disputed, some alleging improprieties of conduct, and others suspected disloyalty. Soon after his resignation he went to London, and thence in June to Louvain, where he spent some time in the company of Father William Good, a Jesuit. He then proceeded to Padua to carry out a previously conceived intention to study medicine, but further intercourse with English Jesuits so influenced his mind, that in July 1575 he entered the Jesuit Society at Rome. In 1580 he was selected along with Campian, a former associate at Oxford, and others, to undertake a secret mission to England against Elizabeth. Through the vigilance of Burghley the plot was discovered and Campian arrested, but Parsons made his escape to Rouen, and occupied himself for some time in the composition of treasonable tracts against Elizabeth, which he caused to be secretly sent to England. In 1583 he returned to Rome, where he was appointed prefect of the English mission, and in 1586 chosen rector of the English seminary. He also devoted much energy to the establishment of seminaries elsewhere on the Continent, for the training of priests to be despatched to England to aid in reviving the cause of Romanism. After the disaster to the Spanish Armada in 1588, he endeavoured to persuade the Spanish monarch to undertake a second invasion, and, unsuccessful in this, he incited various plots against Elizabeth, all of which were, however, abortive. On the death of Cardinal Allen in 1594 he made strenuous efforts to be appointed his successor, and, failing in this, he retired to Naples until

the death of Clement VIII. in 1606. From this time he continued his active intrigues against Protestantism in England until his death, 18th April 1610.

Parsons was the author of a large number of polemical tracts, a list of which, to the number of thirty-three, is given in Chalmers's *Biographical Dictionary*. For portrait, see *Gentleman's Magazine*, vol. lxiv.

PARSONSTOWN, formerly **BIRR**, a market-town of King's County, Ireland, is situated on an acclivity rising above the Birr, and on a branch of the Great Southern and Western Railway, 12½ miles north of Roscrea and 7½ south of Banagher. Cumberland Square, in which there is a Doric column, surmounted by a statue of the duke of Cumberland to commemorate the battle of Culloden, contains a number of good shops, and the streets diverging from it are wide and well built. The fine castle of Birr, besides its historical interest, has gained celebrity on account of the reflecting telescope erected there (1828-45) by the third earl of Rosse. The other principal buildings are the court-house, the Protestant Episcopal and Roman Catholic churches, the convent of the sisters of mercy, the model school, the mechanics' institute, the fever hospital, and the infirmary. There is a bronze statue by Foley of the late Lord Rosse. Some trade is carried on in corn and timber, and the town possesses a distillery and brewery. The population was 5401 in 1861, 4939 in 1871, and 4955 in 1881.

An abbey was founded at Birr by St Brendan. The district formed part of Ely O'Carroll, and was not included in King's County till the time of James I. A great battle is said to have been fought near Birr in the 3d century between Cormac, son of Cond of the Hundred Battles, and the people of Munster. The castle was the chief seat of the O'Carrolls. In the reign of James I. it and its appendages were assigned to Lawrence Parsons, brother of Sir William Parsons, surveyor-general. It was more than once besieged in the time of Cromwell, and was taken by Ireton in 1650. It also suffered assault in 1688 and 1690.

PARTÁBGARH, **PRATÁBGARH**, or **PERTABGURH**, a district of Oudh, India, situated between 25° 34' and 26° 10' 30" N. lat., and between 81° 22' and 82° 29' 45" E. long., is bounded on the N. by Rái Bareli and Sultánpur, and on the E., S., and W. by Jaunpur and Allahábád districts. The Ganges forms the south-western boundary line, while the Gumti marks the eastern boundary for a few miles. The area (1881) is 1436 square miles. The general aspect of Partábgarh is that of a richly wooded and fertile plain, here and there relieved by gentle undulations, and in the vicinity of the rivers and streams broken into ravines. The one important river (the Ganges and Gumti nowhere entering the district) is the Sáí, which is navigable in the rains, but in the hot season runs nearly dry. The only mineral products are salt, saltpetre, and *kankar* or nodular limestone. The manufacture of salt and saltpetre from the saliferous tracts is prohibited. Tigers and leopards are hardly ever met with; but wolves still abound in the ravines and grass lands. *Nílgaí*, wild cattle, hogs, and monkeys do much damage to the crops. Snakes are not numerous. Small game abounds.

The population in 1881 was 847,047 (420,730 males, 426,317 females; 763,054 Hindus, 83,944 Mohammedans, 48 Christians). The principal grain crops are barley, wheat, and rice. Other food crops are gram, peas, *arhar*, *joár*, and *bája*. Sugar-cane cultivation has largely increased of late years, and poppy is grown under the superintendence of the Opium Department. Miscellaneous crops include tobacco of superior quality, indigo, fibres, *pán*, &c. Irrigation is extensively carried on, and manure is made use of wherever procurable. Rents have steadily increased since the introduction of British rule, and still show a tendency to rise. Artisans and skilled labourers have much improved in circumstances of late years; but agricultural labour is still paid in kind at about the same rates that prevailed under native rule. Partábgarh is now well opened up by roads. Four large ferries are maintained on the Ganges, and two on the Gumti. Partábgarh forms a great grain-exporting district. Other important exports comprise

tobacco, sugar, molasses, opium, oil, *ghi*, cattle and sheep, hides, &c. The imports consist mainly of salt, cotton, metals and hardware, country cloth, and dyes. The manufactures of the district comprise sugar, blanket weaving, glass beads and bracelets, water-bottles, &c. The gross revenue of the district in 1882-83 was £175,735, of which the land revenue contributed £98,220. Education is afforded by 91 schools, on the rolls of which on 31st March 1883 there were 3493 scholars. The climate is healthy. The average rainfall for the fourteen years ending 1881 was 37 inches.

PARTÁBGARH, or **PERTABOURH**, a native state in Rájputána, India, lying between 23° 14' and 24° 14' N. lat., and between 74° 27' and 75° E. long., and entirely surrounded by native territory, has an estimated area of 1460 square miles, and an estimated population (1881) of 80,568, mostly Bhils and other aboriginal tribes. The revenue is about £60,000, of which about £20,000 are enjoyed by feudatory chiefs and nobles. It is a hilly country, mainly producing maize and *joár* (*Holcus sorghum*).

PARTHENIUS, a Bithynian poet, said to have been captured in the Mithradatic war and carried to Rome. He lived there for many years, as late as the time of Tiberius. His poems were on erotic subjects, and many of them treated of obscure mythological stories. The only work of his which is preserved is a collection of short love-tales in prose, dedicated to the poet Cornelius Gallus, but apparently not intended for publication.

PARTHENON. See **ATHENS**, vol. iii. p. 5.

PARTHIA. See **PERSIA**.

PARTINICO, a town of Sicily, in the province of Palermo, and 28½ miles W. of Palermo by rail, has a good trade in wine and oil, and in 1881 had 21,000 inhabitants.

PARTITION, in law, is the division between several persons of land or goods belonging to them as co-proprietors. It was a maxim of Roman law, followed in modern systems, that *in communione vel societate nemo potest invitus detineri*. Partition was either voluntary or was obtained by the *actio communi dividendo*. In English law the term partition applies only to the division of lands, tenements, and hereditaments, or of chattels real between coparceners, joint tenants, or tenants in common. It is to be noticed that not all hereditaments are capable of partition. There can be no partition of homage, fealty, or common of turbary, or of an inheritance of dignity, such as a peerage. Partition is either voluntary or compulsory. Voluntary partition is effected by mutual conveyances, and can only be made where all parties are *sui juris*. Since 8 & 9 Vict. c. 106, § 3, it must be made by deed, except in the case of copyholds. Compulsory partition is effected by private Act of Parliament, by judicial process, or through the inclosure commissioners. At common law none but coparceners were entitled to partition against the will of the rest of the proprietors, but the Acts of 31 Henry VIII. c. 1 and 32 Henry VIII. c. 32 gave a compulsory process to joint tenants and tenants in common of freeholds, whether in possession or in reversion, by means of the writ of partition. In the reign of Elizabeth the Court of Chancery began to assume jurisdiction in partition, and the writ of partition, after gradually becoming obsolete, was finally abolished by 3 & 4 Will IV. c. 27. The Court of Chancery could not decree partition of copyholds until 4 & 5 Vict. c. 35, § 85. By the Judicature Act, 1873, § 34, partition is one of the matters specially assigned to the Chancery Division. An order for partition is a matter of right, subject to the discretion vested in the court by the Partition Act, 1868 (31 & 32 Vict. c. 40, amended by 39 & 40 Vict. c. 17). By § 3 of the Act of 1868 the court may, on the request of a party interested, direct a sale instead of a partition, if a sale would be more beneficial than a partition. By § 12 a county court has jurisdiction in partition where the property does not exceed £500 in value. Under the powers of the Inclosure Act 1845,

8 & 9 Vict. c. 118, and the Acts amending it, the inclosure commissioners have power of enforcing compulsory partition among the joint owners of any inclosed lands. An order of the inclosure commissioners or a private Act vests the legal estate, as did also the old writ of partition. But an order of the Chancery Division only declares the rights, and requires to be perfected by mutual conveyances so as to pass the legal estate. Where, however, all the parties are not *sui juris*, the court may make a vesting order under the powers of the Trustee Act, 1850, 13 & 14 Vict. c. 60, § 30.

Partition is not a technical term of Scots law. In Scotland division of common property is effected either extra-judicially, or by action of declarator and division or division and sale in the Court of Session, or (to a limited extent) in the sheriff courts. Rights of common are not divisible in English law without an Act of Parliament or a decree of the inclosure commissioners, but in Scotland the Act of 1695, c. 38, made all commonities, except those belonging to the king or royal burghs, divisible, on the application of any having interest, by action in the Court of Session. By 40 & 41 Vict. c. 50, § 8, the action for division of common property or commonity is competent in the sheriff court, when the subject in dispute does not exceed in value £50 by the year, or £1000 value. Runrig lands, except when belonging to corporations, were made divisible by the Act of 1695, c. 23. A decree of division of commonity, common property, or runrig lands has the effect of a conveyance by the joint proprietors to the several participants (37 & 38 Vict. c. 94, § 35).

In the United States, "it is presumed," says Chancellor Kent, (4 *Comm.*, lect. lxiv.), "that the English statutes of 31 & 32 Henry VIII. have been generally re-enacted and adopted, and probably with increased facilities for partition." In a large majority of the States, partition may be made by a summary method of petition to the courts of common law. In the other States the courts of equity have exclusive jurisdiction. As between heirs and devisees the probate courts may in some States award partition. The various State laws with regard to partition will be found in Washburn, *Real Property*, bk. i. ch. xiii., § 7.

PARTNERSHIP, in law, is a voluntary association of two or more persons for the purpose of gain. This is of course not an exhaustive definition, but will serve to include most of the definitions of partnership which have been attempted.¹ The word *partner* is a contracted form of *partitioner*.

The partnership of modern legal systems is based upon the *societas* of Roman law. *Societas* is not defined by any of the Roman jurists. But the Roman view is no doubt sufficiently expressed in the definition by Voet:—*societas est contractus juris gentium, bonæ fidei, consensu constans, semper re honesta, de lucri et damni communione*. *Societas* was either *universorum bonorum*, a complete communion of property; *negotiationis alicujus*, for the purpose of a single transaction; *vectigalis*, for the collection of taxes; or *rei unius*, joint ownership of a particular thing. The prevailing form was *societas universorum quæ ex quæstu veniunt*, or trade partnership, from which all that did not come under the head of trade profit (*quæstus*) was excluded. This kind of *societas* was presumed to be contemplated in the absence of proof that any other kind was intended. *Societas* was a consensual contract, and rested nominally on the consent of the parties—really, no doubt (though this was not in terms acknowledged by the Roman jurists), on the fact of valuable consideration moving from each partner. No formalities were necessary for the constitution of a *societas*. Either property or labour must be contributed by the *socius*; if one party contributed neither property nor labour, or if one partner was to share in the loss but not in the profit (*leonina societas*), there was no true *societas*. *Societas* was dissolved on grounds substantially the same as those of English law (see below). The only ground peculiar to Roman law was change of *status* (*capitis deminutio*). Most of the Roman law on the subject of *societas* is contained in *Dig.* xvii. tit. 2, *Pro Socio*. The

main points of difference between the Roman and English law will be treated below.

There is no statutory or judicial definition of partnership in English law. It is defined by the Indian Contract Act, § 239,² as "the relation which subsists between persons who have agreed to share the profits of a business carried on by all or any of them on behalf of all of them." Sir N. Lindley declines to pledge himself to any definition, but lays down the following principles:—(1) partnership is the result of an agreement to share profits and losses; (2) partnership is *prima facie* the result of an agreement to share profits, although nothing may be said about losses, and although there may be no common stock; (3) partnership is *prima facie* the result of an agreement to share profits, although community of loss is stipulated against; (4) partnership is not the result of an agreement to share gross returns; (5) partnership is not the result of an agreement which is not concluded; (6) partnership is not the result of an agreement to share profits so long as anything remains to be done before the right to share them accrues (1 Lindley, bk. i. ch. i., § 1). It was held in 1793, in the case of *Waugh v. Carver*, (2 H. Blackstone, 235), that sharing in profits constituted partnership, though no partnership was in fact contemplated by the parties. But in 1860 the House of Lords in *Cox v. Hickman* (8 House of Lords Cases, 268), established the principle that persons who share the profits of a business do not incur the liabilities of partners unless the business is carried on by themselves or their real or ostensible agents. In 1865 the Act 28 & 29 Vict. c. 86 (which applies to the United Kingdom, and is commonly called *Bovill's Act*) was passed in order to remove certain difficulties arising from *Cox v. Hickman*. It enacts that the advance by way of loan to a person engaged or about to engage in any trade or undertaking, upon a contract in writing that the lender is to receive a rate of interest varying with the profits, or a share of the profits, is not of itself to constitute the lender a partner (§ 1); that no contract for the remuneration of a servant or agent by a share of the profits is of itself to render such servant or agent responsible as a partner or give him the rights of a partner (§ 2); that no widow or child of a partner of a trader receiving by way of annuity a portion of the profits is, by reason only of such receipt, to be deemed to be a partner (§ 3); that no person receiving by way of annuity or otherwise a portion of the profits in consideration of the sale of the goodwill is, by reason only of such receipt, to be deemed to be a partner (§ 4); that in the event of any such trader being adjudged bankrupt, &c., the lender of any such loan is not to be entitled to recover his principal or profits and interest, or the vendor of a goodwill his profits, until the claims of the other creditors for valuable consideration have been satisfied. Participation in profits has thus ceased to be an absolute test of partnership. Another test that has been proposed is the existence of such a participation as to constitute the relation of principal and agent. But this has been objected to on the ground that agency is deducible from partnership and not partnership from agency (see *Holme v. Hammond*, *Law Rep.* 7 Exch. 218). The principles laid down by Sir N. Lindley above no doubt form the best means of deciding the matter, but every case must depend to a large extent upon its own particular circumstances. Though participation in profits is of itself no evidence of partnership, on the other hand societies and clubs, the object of which is not to share profits, are not partnerships. The liability of clubs or provisional committee men depends entirely upon

¹ The difficulties of definition are pointed out by Sir N. Lindley, *On Partnership*, i., Intro.

² The definition was adopted in the Partnership Bill which was introduced into parliament in 1880; see Appendix to Pollock's *Digest of the Law of Partnership*.

the question of agency. They are not as a rule in the position of partners as against third persons. No partnership can exist in an office depending upon personal confidence, as the office of executor or trustee. Joint tenants or tenants in common are not necessarily partners. If A and B agree to contribute a sum for the purchase of goods to be divided between them, they are joint owners after purchase and before division. But if they resell the goods and divide the profits, they then become partners (Smith's *Mercantile Law*, bk. i. ch. ii.).

A valid contract of partnership can be entered into by any person not under the disability of minority or unsoundness of mind, or of being a convict within the Felony Act, 1870 (33 & 34 Vict. c. 23), or an alien enemy. It is presumed that the disability of coverture no longer exists since the Married Women's Property Act, 1882. An infant may nominally be a partner, but he incurs no liability, and may disaffirm past transactions when he comes of age. A clergyman becoming a partner for purposes of trade is (with certain exceptions) liable to ecclesiastical penalties, but the contracts of the partnership are not void, 1 & 2 Vict. c. 106, § 31. At common law there is no limit to the number of partners, but by the Companies Act, 1862 (25 & 26 Vict. c. 89, § 4), not more than ten persons can carry on the business of bankers, and not more than twenty any other business, unless (with some exceptions) they conform to the provisions of the Act. (See COMPANY.)

A partnership may be constituted by deed or other writing, or it may be implied from acts. It is usually, though not of necessity, evidenced by deed. The usual clauses in a partnership deed provide for the nature of the business, the time of the commencement of the partnership and its duration, the premium, the capital and property, the interest and allowances, the conduct and powers of the partners, the custody of the books, the taking of the accounts, retirement, dissolution, and expulsion, the valuation and transmission of shares, annuities to widows of deceased partners, prohibition against carrying on business in opposition after retirement, sale of goodwill, getting in debts, indemnity to outgoing partners, and arbitration clauses. Though a deed may serve to adjust the rights of the partners *inter se*, their liabilities to third persons cannot be affected by provisions in a deed of which the latter are ignorant. Whether a partnership exists in a particular case is a mixed question of law and fact. The partnership may last for any time agreed upon by the partners. It is determinable at will unless it has been agreed that it shall endure for a specified period, or unless it is dissolved by some of the circumstances which will be hereafter mentioned. A partnership may be general or special, e.g., the ownership of a single race-horse, or the conduct of a single case by a firm of solicitors. The rights and liabilities of partners may be considered as they affect the partners (1) *inter se*, and (2) in their relation to third persons.

1. The shares of partners are *prima facie* equal. Inequality must be proved by evidence. Each member of a partnership is entitled to take a share in its management, unless, as is frequently the case, one member is appointed managing partner. A partner is in a fiduciary position. It is therefore his duty to use reasonable diligence, to keep within the limits of his authority, and to observe good faith, e.g., not to compete with the partnership. He may be a partner in another firm, and the fact of his being a partner in firms A and B does not make A and B partners, for *socius mei socii non est meus socius*. In matters which are within the ordinary course of the business of the partnership, such as the period of division of profits, if the partnership articles be silent on the subject, the minority

must yield to the majority. In matters beyond the scope of the partnership business, such as a change in the character of the business, one dissentient can forbid a change, and can obtain an injunction to prevent the change from being carried out. A partner is entitled to have accounts kept, and to inspect them at proper times. Where a partner has as agent for the firm paid more than his share, he is entitled to contribution from the rest. One partner cannot be expelled by the others unless there is a special power of expulsion given by the articles. A partner has no right to assign his share without the express or implied consent of the other partners. If the partnership be one at will, the assignment *ipso facto* dissolves it; if not at will, the others are entitled to treat the assignment as a ground of dissolution. The assignee takes the share subject to the claims of the other partners. Each partner has an equitable lien upon the partnership property, enabling him within certain limits to control the disposition of it. On the death of a partner his share goes to his representatives, not, as in joint tenancy, by accretion to the survivors. It is an ancient maxim of law that *jus accrescendi inter mercatores non habet locum* (Coke upon Littleton, 182 a).

2. A more important and difficult question is the relation of partners to those not members of the partnership. From this point of view partnership is to a great extent a branch of the law of agency (see AGENT). As far as contracts are concerned, it is the rule that one partner is its general agent for the transaction of its business in the ordinary way, and the firm is responsible for whatever is done by any of the partners when acting for the firm within the limits of the authority conferred by the nature of the business which it carries on (1 Lindley, bk. ii. ch. i.). The authority is defined by the business, not by any private understanding between the partners. Thus a merchant can bind his partners by accepting a bill of exchange for the firm, but a solicitor or medical man cannot. A partner cannot execute a deed, except a simple release of a debt, so as to bind the firm. In many cases an act not warranted by authority, such as a submission to arbitration, may be adopted by ratification so as to bind the firm. And in other cases the rights of a *bona fide* claimant will prevail, even though the authority has been exceeded and there has been no ratification, e.g., where a bill given by a partner on his private account passes into the hands of a *bona fide* holder for value. Where the partner contracts on behalf of the partnership, it is the latter and not the individual who is primarily liable. If the name of a firm and an individual is the same, a bill drawn in that name for partnership purposes is *prima facie* a bill of the firm (Yorkshire Banking Co. v. Beaton, *Law Rep.*, 5 C. P. D., 109). But a partner may hold himself out as the sole partner, and so make himself separately liable. Every member of a partnership is at common law liable *in solido* for the debts of the firm, a liability co-extensive with his power to transfer the whole property of the firm. This liability cannot be restricted except by statute (as the Companies Act) or by express contract with the creditors. A dormant partner is liable, like an ostensible partner, for debts contracted during his partnership; if, however, the ostensible partners have been sued to judgment, an action cannot be brought to charge the dormant partner (Kendall v. Hamilton, *Law Rep.*, 4 App. Cas., 504). The liability of a dormant and an ostensible partner terminates in a different manner, in the former case by his simple retirement without notice, in the latter only after notice, a general notice in the *Gazette* being the usual means of informing the public of the change, while special notice is given to known customers. It is a question of fact whether the liability of the new

firm has been accepted in place of that of the previous firm. A guarantee to or for a firm ceases upon a change in the firm unless it appears by express stipulation or necessary implication that the guarantee is to continue, 19 & 20 Vict. c. 97, § 4. There are cases in which a relation of quasi-partnership is created, *i.e.*, in which persons not partners *inter se* become partners *qua* third persons. A person who holds himself out as a partner incurs the liability of a partner. This was clearly laid down by Lord Chief Justice Eyre in *Waugh v. Carver*, and is now an established principle of law. "Holding out" means that credit has been obtained by the use of his name, or even by permitting reference to him as one who wishes to have his name concealed.

Where the liability arises out of tort, the law is not quite the same as it is where the liability arises from contract. The presumption is against the authority of a partner to commit a tort, and so opposed to the presumption in the case of contract. But a partnership is liable jointly and severally for any wrongful act or omission of one of its members in conducting the business of the firm, *e.g.*, the neglect of a managing partner to keep the shaft of a mine in order, but not for a wilful wrong unconnected with the business, *e.g.*, malicious prosecution. With respect to fraud by misappropriation of money, some obligation on the part of the firm to take care of the money must be shown. A receipt from the firm *prima facie* imposes this obligation.

An action should be brought by all the partners (except merely nominal partners, who need not be joined unless in an action on a contract under seal). They cannot delegate a right of action to one of themselves for convenience. This can only be done by statute, as 7 Geo. IV. c. 46, enabling banking companies to sue and be sued by a public officer. All the partners ought to be sued, subject to any statutory exception, as that contained in the Carriers' Act, 11 Geo. IV., and 1 Will. IV. c. 68, §§ 5, 6. But misjoinder or nonjoinder of parties does not defeat an action (*Rules of the Supreme Court*, 1883, ord. xvi. r. 11). The method of procedure does not affect the principle of the liability of each partner *in solido*, a principle on which is based one of the main points of difference between a partnership and a corporation. In a corporation the collective whole is distinct from the individuals composing it (see CORPORATION). But in a partnership the firm, as distinct from the individual partners, is recognized by English law only to a very limited extent, and as matter of procedure rather than of substantive law. Since the Judicature Acts, in an action against a partnership, power is given to sue and be sued in the firm name, but the partners are bound to disclose the names of the persons constituting the firm, and, though judgment goes against the firm, execution may issue against a partner (*Rules of the Supreme Court*, 1883, ord. vii. r. 2, xvi. r. 14, xlii. r. 10). An adjudication of bankruptcy cannot be made against the firm in the firm name, but only against the partners individually (*Bankruptcy Rules*, 1883, r. 197).

A partnership at will is dissolved by determination of the will or assignment of the partnership share. A partnership other than a partnership at will is dissolved by (1) effluxion of time; (2) retirement of a partner; (3) alienation by operation of law of a partner's share, *e.g.*, by bankruptcy or (formerly) by marriage of a female partner; (4) death; (5) business becoming unlawful, as by a partner becoming an alien enemy; (6) assignment of partnership share; (7) lunacy; (8) liability of a partner to criminal prosecution; (9) impossibility of carrying on the business. In the last four cases the partnership is not *ipso facto* dissolved, but they are grounds on which the

court may order a dissolution (see Pollock, art. 47 *sq.*). Where a partner has been induced to enter into a partnership by fraud, he has in general the option of affirming or rescinding the contract at his election.

The dissolution of partnerships and the taking of partnership accounts are matters specially assigned to the Chancery Division (Judicature Act, 1873, § 34). After dissolution the persons who constituted the partnership become tenants in common of the partnership property until the division of assets, unless any other provision is made by agreement. The partnership debts are paid out of the partnership assets, and the private debts out of the private assets.

The principle of law that a partnership debt is joint and several comes into operation where the partnership is dissolved by bankruptcy or death. The joint estate is the primary fund for the payment of joint debts, but the joint creditors can look to any surplus of the separate estate (after payment of the separate debts) to satisfy any deficiency in the joint estate. See the Bankruptcy Act, 1883, § 59. Partners cannot compete with the creditors of the firm either against the joint estate or the several estate of a partner; that is to say, they cannot be satisfied until all the debts of the firm have been paid. In the case of death, although the partnership is dissolved by death, it is still treated as subsisting for the purposes of administration. The creditor has the same rights against the estate of the deceased as he would have had in his lifetime in some cases, so that he may proceed against this estate in the first instance, without recourse to the surviving partners, (see the judgment of Lord Selborne in *Kendall v. Hamilton*, *Law Rep.*, 5 App. Cas. 539). Further, the death of a partner has the result of converting the real property of the firm. "Whenever a partnership purchases real estate for partnership purposes, and with partnership funds, it is, as between the real and personal representatives of the partners, personal estate" (*Darby v. Darby*, 3 Drewry 506).

At common law no criminal prosecution was maintainable by one partner against another for stealing the property of the firm. But this difficulty has been removed by 31 & 32 Vict. c. 116.

Though the English law of partnership is based upon Roman law, there are several matters in which the two systems differ. (1) There was no limit to the number of partners in Roman law. (2) In *societas* one partner could generally bind another only by express *mandatum*; one partner was not regarded as the implied agent of the others. (3) The debts of a *societas* were apparently joint, and not joint and several. (4) The *heres* of a deceased partner could not succeed to the rights of the deceased, even by express stipulation. There is no such disability in England. (5) In actions between partners in Roman law, the *beneficium competentie* applied, that is, the privilege of being condemned only in such an amount as the partner could pay without being reduced to destitution. (6) The Roman partner was in some respects more strictly bound by his fiduciary position than is the English partner. For instance, a Roman partner could not retire in order to enjoy alone a gain which he knew was awaiting him. (7) There was no special tribunal to which matters arising out of *societas* were referred.

The law of Scotland as to partnership agrees in the main with the law of England. The principal difference is that Scots law recognizes the firm as an entity distinct from the individuals composing it. English law, as has been said, does this only to a very limited extent. The firm of the company¹ is either proper or descriptive. A proper or personal firm is a firm designated by the

¹ The term "company" is not confined, as in England, to an association existing by virtue of the Companies Act, 1862, or similar Acts.

name of one or more of the partners. A descriptive firm does not introduce the name of any of the partners. The former may sue and be sued under the company name; the latter only with the addition of the names of three at least (if there are so many) of the partners. A consequence of this view of the company as a separate person is that an action cannot be maintained against a partner personally without application to the company in the first instance, the individual partners being in the position of cautioners for the company rather than of principal debtors. The provisions of the Mercantile Law Amendment Act, 1856 (19 & 20 Vict. c. 60, § 8), do not affect the case of partners. But, though the company must first be discussed, diligence must necessarily be directed against the individual partners. Heritable property cannot be held in the name of a firm; it can only stand in the name of individual partners. Notice of the retirement of even a dormant partner is necessary. The law of Scotland draws a distinction between joint adventure and partnership. Joint adventure or joint trade is a partnership confined to a particular adventure or speculation, in which the partners, whether latent or unknown, use no firm or social name, and incur no responsibility beyond the limits of the adventure. In the rules applicable to cases of insolvency and bankruptcy of a company and partners, Scots law differs in several respects from English. Thus a company can be made bankrupt without the partners being made so as individuals. And, when both company and partners are bankrupt, the company creditors are entitled to rank on the separate estates of the partners for the balance of their debts equally with the separate creditors. But in sequestration, by 19 & 20 Vict. c. 79, § 66, the creditor of a company, in claiming upon the sequestrated estate of a partner, must deduct from the amount of his claim the value of his right to draw payment from the company's funds, and he is ranked as creditor only for the balance. (See *Erskine's Inst.*, bk. iii. tit. iii.; *Bell's Comm.*, ii. 500-562; *Bell's Principles*, §§ 350-403.)

In the United States the English common law is the basis of the law. Most States have, however, their own special legislation on the subject. Partnership is defined by Chancellor Kent to be "a contract of two or more competent persons to place their money, effects, labour, and skill, or some or all of them, in lawful commerce or business, and to divide the profit and bear the loss in certain proportions" (3 Kent's *Comm.*, lect. xliii.). The definition of the New York Civil Code, art. 1283, runs thus:—"partnership is the association of two or more persons for the purpose of carrying on business together, and dividing its profits between them." The most striking feature of the law in the United States is the existence of limited partnerships, corresponding to the *sociétés en commandite* established in France by the ordinance of 1673. The State of New York was the first to introduce this kind of partnership by legislative enactment. The provisions of the New York Act have been followed by most of the other States. In many States there can be no limited partnership in banking and insurance. In this form of partnership one or more persons responsible *in solido* are associated with one or more dormant partners liable only to the extent of the funds supplied by them. In Louisiana such partnerships are called partnerships *in commendam* (Civil Code, art. 2810). In New York the responsible partners are called *general* partners, the others *special* partners. Such partnerships must, by the law of most States, be registered. (In 1880 a bill providing for the legislation of such partnerships in the United Kingdom was introduced in the House of Commons, but failed to become law.) In Louisiana universal partnerships (the *societates universorum bonorum* of Roman law) must be created in writing and registered (Civil Code, art. 2800). In some States the English law as it stood before *Cox v. Hickman* is followed, and participation in profits is still regarded as the test of partnership, e.g., *Leggett v. Hyde* (58 New York Rep. 272). In some States nominal partners are not allowed. Thus in New York, where the words "and Company" or "and Co." are used, they must represent an actual partner or partners. A breach of this rule subjects offenders to penalties. In most States claims against the firm after the death of a partner must, in the first instance, be made to the survivors. The creditors cannot, as in England, proceed directly against the representatives of the deceased. The law as to the conversion of realty into personalty on the administration of the estate of a deceased partner in some States agrees with English law, in others does not. (See 3 Kent's *Comm.*, lect. xliii.; Story, *On Partnership*; Troubat, *On Limited Partnership*; and Angell, *On Private Corporations*.) (J. Wt.)

PARTRIDGE, in older English *PERTRICHE*, Dutch *Patrijs*, French *Perdrix*, all from the Latin *Perdix*, which word in sound does not imitate badly the call-note of this bird, so well known throughout the British Islands and the greater part of Europe as to need no description or account of its habits here. The English name properly denotes the only species indigenous to Britain, often nowadays called the Grey Partridge (to distinguish it from

others, of which more presently), the *Perdix cinerea* of ornithologists, a species which may be regarded as the model game-bird—whether from the excellence of the sport it affords in the field, or the no less excellence of its flesh at table, which has been esteemed from the time of Martial to our own—while it is on all hands admitted to be wholly innocuous, and at times beneficial to the agriculturist. It is an undoubted fact that the Partridge thrives with the highest system of cultivation; and the lands that are the most carefully tilled, and bear the greatest quantity of grain and green crops, generally produce the greatest number of Partridges. Yielding perhaps in economic importance to the Red Grouse, what may be called the social influence of the Partridge is greater than that excited by any other wild bird, for there must be few rural parishes in the three kingdoms of which the inhabitants are not more or less directly affected in their movements and business by the coming in of Partridge-shooting, and therefore a few words on this theme may not be out of place.

From the days when men learned to "shoot flying" until some forty years ago, dogs were generally if not invariably used to point out where the "covey," as a family party of Partridges is always called, was lodged, and the greatest pains were taken to break in the "pointers" or "setters" to their duty. In this way marvellous success was attained, and the delight lay nearly as much in seeing the dogs quarter the ground, wind and draw up to the game, helping them at times (for a thorough understanding between man and beast was necessary for the perfection of the sport) by word or gesture, as in bringing down the bird after it had been finally sprung. There are many who lament that the old-fashioned practice of shooting Partridges to dogs has, with rare exceptions, fallen into desuetude, and it is commonly believed that this result has followed wholly from the desire to make larger and larger bags of game. The opinion has a certain amount of truth for its base; but those who hold it omit to notice the wholly changed circumstances in which Partridge-shooters now find themselves. In the old days there were plenty of broad, tangled hedgerows which afforded permanent harbour for the birds, and at the beginning of the shooting-season admirable shelter or "lying" (to use the sportsman's word) was found in the rough stubbles, often reaped knee-high, foul with weeds and left to stand some six or eight weeks before being ploughed, as well as in the turnips that were sown broadcast. Throughout the greater part of England now the fences are reduced to the narrowest of boundaries and are mostly trimly kept; the stubbles—mown, to begin with, as closely as possible to the ground—are ploughed within a short time of the corn being carried, and the turnips are drilled in regular lines, offering inviting alleys between them along which Partridges take foot at any unusual noise. Pointers in such a district—and to this state of things all the arable part of England is tending—are simply useless, except at the beginning of the season, when the young birds are not as yet strong on the wing, and the old birds are still feeble from moulting their quill-feathers. Of late years therefore other modes of shooting Partridges have had to be employed, of which methods the most popular is that known as "driving"—the "guns" being stationed in more or less concealment at one end of the field, or series of fields, which is entered from the other by men or boys who deploy into line and walk across it making a noise. It is the custom with many to speak depreciatingly of this proceeding, but it is a fact that as much knowledge of the ways of Partridges is needed to ensure a successful day's "driving" as was required of old when nearly everything was left to the intelligence of the dogs, for the course

of the birds' flight depends not only on the position of the line of beaters, but almost on the station of each person composing it, in relation to the force and direction of the wind and to the points on which it is desired that the Partridges should converge. Again, the skill and alacrity wanted for bringing down birds flying at their utmost velocity, and often at a considerable height, is enormously greater than that which sufficed to stop those that had barely gone 20 yards from the dog's nose, though admittedly Partridges rise very quickly and immediately attain great speed. Moreover, the shooting of Partridges to pointers came to an end in little more than six weeks, whereas "driving" may be continued for the whole season, and is never more successful than when the birds, both young and old, have completed their moult, and are strongest upon the wing. But, whether the new fashion be objectionable or not, it cannot be doubted that to go back to the old one with success would necessitate a reversion to the slovenly methods of agriculture followed in former years, and therefore is as impossible as would be a return to the still older practice of taking Partridges in a setting-net, described by Gervase Markham or Willughby.

The Grey Partridge has doubtless largely increased in numbers in Great Britain since the beginning of the present century, when so much down, heath, and moorland was first brought under the plough, for its partiality to an arable country is very evident. It has been observed that the birds which live on grass lands or heather only are apt to be smaller and darker in colour than the average; but in truth the species when adult is subject to a much greater variation in plumage than is commonly supposed, and the well-known chestnut horse-shoe mark, generally considered distinctive of the cock, is very often absent. In Asia our Partridge seems to be unknown, but in the temperate parts of Eastern Siberia its place is taken by a very nearly allied form, *P. barbata*, and in Tibet there is a bird, *P. hodgsoniae*, which can hardly with justice be generically separated from it. The relations of some other forms inhabiting the Indian Region are at present too obscure to make any notice of them expedient here.

The common Red-legged Partridge of Europe, generally called the French Partridge, *Caccabis rufa*, seems to be justifiably considered the type of a separate group.¹ This bird has been introduced into England within little more than one hundred years ago, and has established itself in various parts of the country, notwithstanding a widely-spread, and in some respects unreasonable prejudice against it. It has certainly the habit of trusting nearly as much to its legs as to its wings, and thus incurred the obloquy of old-fashioned sportsmen, whose dogs it vexatiously kept at a running point; but, when it was also accused of driving away the Grey Partridge, the charge only shewed the ignorance of those that brought it, for as a matter of fact the French Partridge rather prefers ground which the common species avoids—such as the heaviest clay-soils, or the most infertile heaths. But even where the two species meet, the present writer can declare from the personal observation of many years that the alleged antipathy between them is imaginary, and unquestionably in certain parts of the country the "head of game" has been increased by

the introduction of the foreigner.² The French Partridge has several congeners, all with red legs and plumage of similar character. In Africa north of the Atlas there is the Barbary Partridge, *C. petrosa*; in southern Europe another, *C. saxatilis*, which extends eastward till it is replaced by *C. chukar*, which reaches India, where it is a well-known bird. Two very interesting desert-forms, supposed to be allied to *Caccabis*, are the *Ammoperdix heyi* of North Africa and Palestine and the *A. bonhami* of Persia; but the absence of the metatarsal knob, or incipient spur, suggests (in our ignorance of their other osteological characters) an alliance rather to the genus *Perdix*. On the other hand the groups of birds known as Francolins and Snow-Partridges are generally furnished with strong but blunt spurs, and therefore probably belong to the *Caccabine* group. Of the former, containing many species, there is only room here to mention the Francolin, which used to be found in many parts of the South of Europe, *Francolinus vulgaris*, which also extends to India, where it is known as the Black Partridge. This seems to have been the *Attagas* or *Attagen* of classical authors,³ a bird so celebrated for its exquisite flavour, the strange disappearance of which from all or nearly all its European haunts has been before noticed (BIRDS, vol. iii. p. 736, note), and still remains inexplicable. It is possible that this bird has been gradually vanishing for several centuries, and if so to this cause may be attributed the great uncertainty attending the determination of the *Attagen*—it being a common practice among men in all countries to apply the name of a species that is growing rare to some other that is still abundant. Of the Snow-Partridges, *Tetraogallus*, it is only to be said here that they are the giants of their kin, and that nearly every considerable range of mountains in Asia seems to possess its specific form.

By English colonists the name Partridge has been very loosely applied, and especially so in North America. Where a qualifying word is prefixed no confusion is caused, but without it there is sometimes a difficulty at first to know whether the Ruffed Grouse (*Bonasa umbellus*) or the Virginian Colin (*Ortyx virginianus*) is intended. (A. N.)

PASCAL, BLAISE (1623-1662), was born at Clermont Ferrand on the 19th June 1623. His father was Étienne Pascal, president of the Court of Aids at Clermont; his mother's name was Antoinette Bégon. The Pascal family were Auvergnats by extraction as well as residence, and they had for many generations held posts in the civil service. They were ennobled by Louis XI. in 1478, but, as in many other cases, no attempt seems to have been made to assume the privileged particle *de*. The earliest anecdote of Pascal is a singular story recorded by his niece, Marguerite Perier (the heroine of the Holy Thorn miracle), of his being bewitched, and freed from the spell by the witch with strange ceremonies. His mother died when he was about four years old (the exact date is differently stated), and left him with two sisters—Gilberte, who afterwards married M. Perier, and Jacqueline. Both sisters are of importance in their brother's history, and both are said to have been beautiful and accomplished. When Pascal was about seven years old, his mother having been already dead for some time, Étienne Pascal the father gave up his official post at Clermont, and betook himself

¹ Prof. Parker first (*Trans. Zool. Soc.*, v. p. 155) and, after him, Prof. Huxley (*Proc. Zool. Soc.*, 1868, pp. 299-302) have pointed out that the true *Gallina* offer two types of structure, "one of which may be called Galline, and the other Tetraonine," to use the latter's words, though he is "by no means clear that they do not graduate into one another"; and, according to the characters assigned by him, *Caccabis* lies "on the Galline side of the boundary," while *Perdix* belongs to the Tetraonine group. Further investigation of this matter is very desirable, and, with the abundant material possessed by zoological gardens, it might easily be carried out.

² It is a singular fact that the game-preservers who object most strongly to the Red-legged Partridge are not agreed on the exact grounds of their objection. One party will declare that it vanquishes the Grey Partridge, while the other holds that, though the latter, the "English" Partridge, is much vexed by the introduced species, it invariably beats off the "Frenchman."

³ However, many naturalists have maintained a different opinion—some making it a Woodcock, a Godwit (q.v.), or even the Hazel-hen (see GROUSE, vol. xi. p. 223). The question has been well discussed by Lord Lilford (*Ibis*, 1862, pp. 352-356).

to Paris for the education of his children and for his own indulgence in scientific society. It does not appear that Blaise, who went to no school, but was taught by his father, was at all forced, but rather the contrary. Nevertheless he has a distinguished place in the story of precocious children, and in the much more limited chapter of children whose precocity has been followed by great performance at maturity, though he never became what is called a learned man, perhaps did not know Greek, and was pretty certainly indebted for most of his miscellaneous reading to Montaigne. How, purposely kept from books, he worked out the more elementary problems of geometry for himself; how at sixteen he wrote a treatise on conic sections which Descartes refused to believe in except as the work of a master and not of a student; how he wrote treatises on acoustics at twelve, and began elaborate calculating machines when he was still a boy,—are things dwelt upon in all biographies of him. In this notice his attainments in mathematical and physical science, except those which have some special connexion with his life and history, will be dealt with separately and later.

The Pascal family, some years after settling in Paris, had to go through a period of adversity. Etienne Pascal, on leaving Clermont, had bought certain of the *Hôtel de Ville rentes*, almost the only regular investment open to Frenchmen at the time. Richelieu reduced the interest and the investors protested, Pascal amongst them. But the great cardinal did not understand such protests, and to escape the Bastille Pascal had to go into hiding. He was, according to the story, restored to favour owing to the good acting and graceful appearance of his daughter Jacqueline in a representation of Scudery's *Amour Tyrannique* before Richelieu. Indeed Jacqueline, who was only fourteen, herself gives the account in a pleasant letter which is extant, and which contains an allusion to her brother's mathematical prowess. Madame d'Aiguillon's intervention in the matter was perhaps as powerful as Jacqueline's acting, and Richelieu not only relieved Etienne Pascal from the necessity of keeping out of the way, but gave him (in 1641) the important and lucrative though somewhat troublesome intendency of Rouen. The family accordingly removed to the Norman capital, though Gilberte Pascal shortly after, on her marriage, returned to Clermont. At Rouen they became acquainted with Corneille, and Blaise Pascal pursued his studies with such vehemence that he already showed signs of an injured constitution. Nothing, however, of importance happened till the year 1646. Then Pascal the elder was confined to the house by the consequences of an accident on the ice, and was visited by certain gentlemen of the neighbourhood who had come under the influence of St Cyran and the Jansenists. It does not appear that up to this time the Pascal family had been contemners of religion, but they now eagerly embraced the creed, or at least the attitude of Jansenism. One of the more immediate results of this conversion has rather shocked some modern admirers of Pascal, who forget that toleration, except of the Gallic kind, is an idea which had no place in men's minds in Pascal's day. He came into contact with a Capuchin known as Pere St Ange, but whose real name was Forton, and who seems to have entertained some speculative ideas on theological points which were not strictly orthodox. Thereupon Pascal with some of his friends lodged an information against the heretic with the representative of the archbishop of Rouen. There seems to have been no lack of zeal about the accusers, but the accused made no difficulty whatever in making profession of orthodoxy, and the judge appears to have been by no means anxious to push the matter home. No doubt Pascal was perfectly sincere, and like most of his contemporaries held the

opinion attributed to a great English nonconformist contemporary of his, that, while it was very shocking that men who were in the right should not be tolerated, it was almost equally shocking that men who were in the wrong should be.

His bodily health was at this time very far from satisfactory, and he appears to have suffered, not merely from acute dyspepsia, but from a kind of paralysis. He was, however, except when physicians positively forbade study, and probably sometimes when they did so forbid, indefatigable in his mathematical work. In 1647 he published his *Nouvelles Expériences sur le Vide*, and in the next year the famous experiment with the barometer on the Puy de Dome was carried out for him by his brother-in-law Perier, and repeated on a smaller scale by himself at Paris, to which place by the end of 1647 he and his sister Jacqueline had removed, to be followed shortly by their father. In a letter of Jacqueline's dated the 27th of September, an account of a visit paid by Descartes to Pascal is given, which, like the other information on the relations of the two, gives strong suspicion of mutual jealousy. Descartes, however, gave Pascal the very sensible advice to stay in bed as long as he could (it may be remembered that the philosopher himself never got up till eleven) and to take plenty of beef tea. But the relations of Pascal with Descartes belong chiefly to the scientific achievements of the former. He had, however, other relations, both domestic and miscellaneous, which had nothing to do with science. As early as May 1648 Jacqueline Pascal was strongly drawn to Port Royal, and her brother frequently accompanied her to its church. She desired indeed to join the convent, but her father, who at the date above mentioned returned to Paris with the dignity of counsellor of state (his functions at Rouen having ceased), disapproved of the plan, and took both brother and sister to Clermont. Pascal stayed in Auvergne for the greater part of two years, but next to nothing is known of what he did there. Fléchier, in his account of the *Grands Jours* at Clermont many years after, speaks of a "belle savante" in whose company Pascal had frequently been—a trivial mention on which, as on many other trivial points of scantily known lives, the most childish structures of comment and conjecture have been based. It is sufficient to say that at this time, despite the Rouen "conversion," there is no evidence to show that Pascal was in any way a recluse, an ascetic, or in short anything but a young man of great intellectual promise and performance who was not indifferent to society, but whose aptitude both for society and study was affected by weak health and the horse-doctoring of the time. He, his sister, and their father returned to Paris in the late autumn of 1650, and in September of the next year Etienne Pascal died. Almost immediately afterwards Jacqueline fulfilled her purpose of joining Port Royal—a proceeding which led to some soreness, finally healed, between herself and her brother and sister as to the disposal of her property. Perhaps this difference, but more probably the mere habitual use of the well-known dialect of Port Royal, led Jacqueline to employ in reference to her brother expressions which have led biographers into most unnecessary excursions of fancy. For these they have seemed to find further warrant in similar phrases used by the Periers, mother and daughter. It has been supposed that Pascal, from 1651 or earlier to the famous accident of 1654, lived a dissipated, extravagant, worldly, luxurious (though admittedly not vicious) life with his friend the Duc de Roannez and others. His *Discours sur les Passions de l'Amour*, a striking and characteristic piece, only recently discovered and printed, has also been assigned to this period, and has been supposed to indicate a hope-

these passion for Charlotte de Roannez, the duke's sister. It cannot be too decidedly said that all this is sheer romancing. The extant letters of Pascal to the lady show no trace of any affection (stronger than friendship) between them. As to Pascal's worldly life, it might be thought that only the completest ignorance of the usual dialect of the stricter religious sects and societies (and it may be added of Port Royal in particular) could induce any one to lay much stress on that. A phrase of Jacqueline's about the "horribles attaches" which bound her brother to the world may pair off with hundreds of similar expressions from Bunyan downwards. It is, however, certain that in the autumn of 1654 Pascal's second "conversion" took place, and that it was lasting. He betook himself at first to Port Royal, and began to live a recluse and austere life there. Madame Perier simply says that Jacqueline persuaded him to abandon the world. Jacqueline represents the retirement as the final result of a long course of dissatisfaction with mundane life. But there are certain anecdotic embellishments of the act which are too famous to be passed over, though they are in part apocryphal. It seems that Pascal in driving to Neuilly was run away with by the horses, and would have been plunged in the river but that the traces fortunately broke. To this, which seems authentic, is usually added the late and more than doubtful tradition (due to the Abbé Boileau) that afterwards he used at times to see an imaginary precipice by his bedside or at the foot of the chair on which he was sitting. Further, from November 23, 1654, dates the singular document usually known as "Pascal's amulet," a parchment slip which he wore constantly about him, and which bears the date followed by some lines of incoherent and strongly mystical devotion.

But, whatever may have been the immediate cause of Pascal's conversion and (for a time) domestication at Port Royal, it certainly had no evil effect on his intellectual or literary powers. Indeed, if he had been drowned at Neuilly he would hardly be thought of now as anything but an extraordinarily gifted man of science. It must also be noted that though he lived much at Port Royal, and partly at least observed its rule, he never actually became one of its famous solitaries. But for what it did for him (and for a time his health as well as his peace of mind seems to have been improved) he very soon paid the most ample and remarkable return that any man of letters ever paid to any institution. At the end of 1655 Arnauld, the chief light of Port Royal, was condemned by the Sorbonne for heretical doctrine in a letter which he had published on the question of the famous five propositions attributed to Jansen, and, as much was made of this condemnation, it was thought important by the Jansenist and Port Royal party that steps should be taken to disabuse the popular mind on the whole controversy. Arnauld would have undertaken the task himself, but his wiser friends knew that his style was anything but popular, and overruled him. It is said that he personally suggested to Pascal to try his hand, and that the first of the famous *Provincial Letters* (properly *Lettres Ecrites par Louis de Montalte à un Provincial de ses Amis*) was written in a few days, or, less probably, in a day. It was printed on the 23d January 1656, and, being immensely popular and successful, was followed by others to the number of eighteen. The method and facts may have been partly taken from a book on the moral theology of the Jesuits published some years earlier, and attributed in part at least to Arnauld.

In the *Provinciales* Pascal, who it must be remembered published under a strict incognito, denies that he belongs to Port Royal, and in fact, though during the last years of his life he was wholly devoted to its interests, he was

never a regular resident there, and usually abode in his own house at Paris. Shortly after the appearance of the *Provinciales*, on May 24, 1656, occurred the miracle of the Holy Thorn, a fragment of the crown of Christ preserved at Port Royal, which cured the little Marguerite Perier of a fistula lacrymalis. The Jesuits were much mortified by this Jansenist miracle, which, as it was officially recognized, they could not openly deny. Pascal and his friends rejoiced in proportion. But the details of his later years after this incident are somewhat scanty, and as recorded by his sister and niece they tell of increasing ill health, and of ascetic practices and beliefs increasing still more. One curious incident, contrasting equally with this state of things and with Pascal's studious character and renown, is what Madame Perier calls "l'affaire des carrosses," a scheme of the Duc de Roannez and others for running omnibuses in Paris, which was actually carried out, of which Pascal was in some sort manager, and from which he derived some profit. This, however, is an exception. Otherwise, for years before his death, we hear only of acts of charity and of, as it seems to modern ideas, extravagant asceticism. Thus Madame Perier tells us that he disliked to see her caress her children, and would not allow the beauty of any woman to be talked of in his presence. What may be called his last illness began as early as 1658, after which year he never seems to have enjoyed even tolerable health, and as the disease progressed it was attended with more and more pain, chiefly in the head. In June 1662, having given up his own house to a poor family who were suffering from small-pox, and being unwilling that his sister should expose herself to infection, he went to her house to be nursed, and never afterwards left it. His state was, it seems, mistaken by his physicians, who to the last maintained that there was little danger—so much so that the offices of the church were long put off. He was able, however, to receive the eucharist, and soon afterwards died in convulsions on August 19th. A *post mortem* examination was held, which showed not only grave derangement in the stomach and other organs, but a serious lesion of the brain.

Eight years after Pascal's death appeared, in a small volume, the book which has given most trouble to all students of Pascal, and most pleasure to some of them. It purported to be Pascal's *Pensées*, and a preface by his nephew Perier gave the world to understand that these were fragments of a great projected apology for Christianity which the author had in conversation with his friends planned out years before. The editing of the book was peculiar. It was submitted to a committee of influential Jansenists, with the Duc de Roannez at their head, and, in addition, it bore the imprimatur of numerous unofficial approvers who testified to its orthodoxy. It does not appear that there was much suspicion of the garbling which had been practised,—garbling not unusual at the time, and excused in this case by the fact of a lull in the troubles of Port Royal and a great desire on the part of its friends to do nothing to disturb that lull. But as a matter of fact no more entirely factitious book ever issued from the press. The fragments which it professed to give were in themselves confused and incoherent enough, nor is it easy to believe that they all formed part of any such single and coherent design as that referred to above. But the editors omitted, altered, added, separated, combined, and so forth entirely at their pleasure, actually making some changes which seem to have been thought improvements of style. As an instance of their anxiety to avoid offence, it may be noticed that they rejected, apparently as too outspoken, Madame Perier's invaluable life of her brother, which was written to accompany the second edition of the *Pensées*, but did not actually appear with them till 1684.

This rifacimento remained the standard text with a few unimportant additions for nearly two centuries, except that by a truly comic revolution of public taste Condorcet in 1776 published, after study of the original, which remained accessible in manuscript, another garbling, conducted this time in the interests of unorthodoxy. It was not till 1842 that Victor Cousin drew attention to the absolutely untrustworthy condition of the text, nor till 1844 that M. Faugère edited that text from the MS. in something like a condition of purity, though, as subsequent editions have shown, not with absolute fidelity. But even in its spurious condition the book had been recognized as remarkable and almost unique. Its contents, as was to be expected, are of a very chaotic character—of a character so chaotic indeed that the reader is almost at the mercy of the arrangement, perforce an arbitrary arrangement, of the editors. But the subjects dealt with concern more or less all the great problems of thought on what may be called the theological side of metaphysics:—the sufficiency of reason, the trustworthiness of experience, the admissibility of revelation, free will, foreknowledge, and the rest. The peculiarly disjointed and fragmentary condition of the sentiments expressed by Pascal aggravates the appearance of universal doubt which is present in the *Pensées*, just as the completely unfinished condition, from the literary point of view, of the work constantly causes slighter or graver doubts as to the actual meaning which the author wished to express. Accordingly the *Pensées* have always been a favourite exploring ground, not to say a favourite field of battle, to persons who take an interest in their problems. Speaking generally, their tendency is towards the combating of scepticism by a deeper scepticism, or, as Pascal himself calls it, Pyrrhonism, which occasionally goes the length of denying the possibility of any natural theology. Pascal explains all the contradictions and difficulties of human life and thought by the doctrine of the fall, and relies on faith and revelation alone to justify each other. Comparison of the *Pensées* with the *Provinciales* is, considering the radical differences of state (the one being a finished work deliberately issued from the master's hands, the other not even a rough draught, scarcely even "heads" or "outlines," but a collection of loose and uncorrected notes settled neither as to the exact form of each nor as to the relation of each to any whole), impossible. But it may be said that no one can properly perceive how great a man of letters Pascal was from the *Pensées* alone, and that no one can perceive how deep if not wide a thinker he was from the *Provinciales* alone. An absolute preference of either argues a certain on-sidedness in the relative estimate of matter and form. The wiser mind distinctly prefers both, and recognizes that if either were lacking the greatness of Pascal would fail to be perceived, or at least to be perceived fully.

Excluding his scientific attainments, which, as has been noted above, will be the subject of separate notice, Pascal presents himself for comment in two different lights, the second of which is, if the expression be permitted, a composite one. The first exhibits him as a man of letters, the second as a philosopher, a theologian, and a man. If this last combination seems to be audacious or clumsy, it can only be said that in hardly any thinker are theological thoughts, and thoughts more strictly to be called philosophical or metaphysical, so intimately, so inextricably blended as in Pascal, and that in none is the colour of the theology and the philosophy more distinctly personal. This latter fact adds to the difficulty of the problem; for, though Pascal has written not a little, and though a vast amount has been written about him, it cannot be said that his character as a man, not a writer, is very distinct.

The accounts of his sister and niece have the defect of all hagiology (to use the term with no disrespectful intention); they are obviously written rather with a view to the ideas and the wishes of the writers than with a view to the actual and absolute personality of the subject. Except from these interesting but somewhat tainted sources, we know little or nothing about him. Hence conjecture, or at least inference, must always enter largely into any estimate of Pascal, except a purely literary one.

On that side, fortunately, there is no possibility of doubt or difficulty to any competent inquirer. The *Provincial Letters* are the first example of French prose which is at once considerable in bulk, varied and important in matter, perfectly finished in form. They owe not a little to Descartes, for Pascal's indebtedness to his predecessor is unquestionable from the literary side, whatever may be the case with the scientific. But Descartes had had neither the opportunity, nor the desire, nor probably the power, to write anything of the literary importance of the *Provinciales*. The unanimity of eulogy as to the style of this wonderful book has sometimes tempted foreigners, who feel or affect to feel an inability to judge for themselves, into a kind of scepticism for which there is absolutely no ground. The first example of polite controversial irony since Lucian, the *Provinciales* have continued to be the best example of it during more than two centuries in which the style has been sedulously practised, and in which they have furnished a model to generation after generation without being surpassed by any of the works to which they have shown the way. The unfailing freshness and charm of the contrast between the importance, the gravity, in some cases the dry and abstruse nature, of their subjects and the lightness sometimes almost approaching levity in its special sense of the manner in which these subjects are attacked is a triumph of literary art of which no familiarity dims the splendour, and which no lapse of time, affecting as that lapse has already done to a great extent the attraction of the subjects themselves, can ever impair. The tools of phrase and diction by which this triumph is achieved were not in all cases of Pascal's invention—Descartes and Corneille had been beforehand with him to some extent—but many of them were actually new, and all were newly and more skilfully applied. Nor perhaps is this literary art really less evident in the *Pensées*, though it is less clearly displayed, owing to the fragmentary or rather chaotic condition of the work, and partly also to the fact that the subject here for many readers and in many places claims attention almost to the disregard of the form. The vividness and distinction of Pascal's phrase, his singular faculty of inserting in the gravest and most impassioned meditation what may be almost called quips of thought and diction without any loss of dignity, the intense earnestness of meaning weighting but not confusing the style, all appear here, and some of them appear as they have no chance of appearing in at least the earlier *Provinciales*.

No such positive statements as these are, however, possible as to the substance of the *Pensées* and the attitude of their author towards "les grands sujets." In the space and circumstances of the present notice nothing more can be attempted than a summary of the opinions hitherto advanced on the subject, and an indication of the results which may seem most probable to unprejudiced inquirers who possess a fair knowledge of and interest in the problems concerned. Hitherto the widest differences have been manifested in the estimate of Pascal's opinions on the main questions of philosophy, theology, and human conduct. He has been represented as a determined apologist of intellectual orthodoxy animated by an almost fanatical "hatred of reason," and possessed with a purpose

to overthrow the appeal to reason; as a sceptic and pessimist of a far deeper dye than Montaigne, anxious chiefly to show how any positive decision on matters beyond the range of experience is impossible; as a nervous believer clinging to conclusions which his clearer and better sense showed to be indefensible; as an almost ferocious ascetic and paradoxer affecting the *credo quia impossibile* in intellectual matters and the *odi quia amabile* in matters moral and sensuous; as a wanderer in the regions of doubt and belief, alternately bringing a vast though vague power of thought and an unequalled power of expression to the expression of ideas incompatible and irreconcilable. In these as in all other matters the first requisite seems to be to clear the mind of prepossession and commonplace. It has already been hinted that far too much stress may be laid on the description of Pascal by his family as a converted sinner, and it may be added that at least as much stress has been laid on the other side on the notion of him as of a clear-headed materialist and expert in positive science, who by ill-health, overwork, and family influence was persuaded to adopt, half against his will, supernaturalist opinions. An unbiassed study of the scanty facts of his history, and of the tolerably abundant but scattered and chaotic facts of his literary production, ought to enable any one to steer clear of these exaggerations, while admitting at the same time that it is impossible to give a complete and final account of his attitude towards the riddles of this world and others. He certainly was no mere advocate of orthodoxy; he as certainly was no mere victim of terror at scepticism; least of all was he a free-thinker in disguise. He appears, as far as can be judged from the fragments of his *Pensées*, to have seized much more firmly and fully than has been usual for two centuries at least the central idea of the difference between reason and religion. Where the difficulty rises respecting him is that most thinkers since his day who have seen this difference with equal clearness have advanced from it to the negative side, while he advanced to the positive. In other words, most men since his day who have not been contented with a mere concordat, have let religion go and contented themselves with reason. Pascal, equally discontented with the concordat, held fast to religion and continued to fight out the questions of difference with reason. The emotion, amounting to passion, which he displays in conducting this campaign, and the superfluous energy of his debate on numerous points which, for instance, such a man as Berkeley was content to leave in the vague must be traced to temperament, aggravated no doubt by his extreme intellectual activity, by ill health, and by his identification comparatively late in life and under peculiar circumstances with a militant and so to speak sectarian form of religious or ecclesiastical belief. Surveying these positions, we shall not be astonished to find much that is surprising and some things that are contradictory in Pascal's utterances on "les grands sujets." But the very worst method that can be taken for dealing with these contradictions is to assume, as his critics on one side too often do, that so clever a man as Pascal could not possibly be a convinced acceptor of dogmatic Christianity, or to assume, as too many of his critics on the other do, that so pious and orthodox a man as Pascal could not entertain any doubts or see any difficulties in reference to dogmatic Christianity. He had taken to the serious contemplation of theological problems comparatively late; for the Rouen escapade noted above is merely a specimen of the kind of youthful intolerance which counts for nothing when justly viewed. The influence exercised on him by Montaigne is the one fact regarding him which has not been and can hardly be exaggerated, and his well-known *Entretien* with Sacy on the subject (the restoration of

which to its proper form is one of the most valuable results of recent criticism) leaves no doubt possible as to the source of his "Pyrrhonian" method. The atmosphere of somewhat heated devotion in which he found himself when he retired to Port Royal must naturally count for something in the direction and expression of his thoughts; his broken health for something more. It is unfortunately usual with societies like Port Royal to generate a kind of mist and mirage which deceives and distorts even the keenest sight that looks through their eyes. But it is impossible for any one who takes Pascal's *Pensées* simply as he finds them in connexion with the facts of Pascal's history to question his theological orthodoxy, understanding by theological orthodoxy the acceptance of revelation and dogma; it is equally impossible for any one in the same condition to declare him absolutely content with dogma and revelation. Excursions into the field beyond formularies were necessary to him, and he made them freely; but there is no evidence that these excursions tempted him to remain outside, and it appears particularly erroneous to take his celebrated "wager" thoughts (the argument that, as another world and its liabilities, if accepted, imply no loss and much possible gain, they should be accepted) as an evidence of weakened belief or a descent from rational religion. It is of the essence of an active mind like Pascal's to explore and state all the arguments of whatever degree of goodness which make for or make against the conclusion it is investigating, and this certainly is neither the least obvious nor the weakest of the arguments which must have presented themselves to him.

In ecclesiastical questions as distinguished from theological Pascal appears to have been an ardent Jansenist, adopting without very much discrimination the standpoint of his friends and religious directors Sacy, Arnauld, Singlin, and others. In one point he went beyond them, boldly disputing the infallibility of the pope, and hinting not obscurely at the propriety of agitation against erroneous papal decisions. The Jansenists as a body could not muster courage to adopt this attitude. But it is not easy to discuss isolated points of this kind here; indeed their discussion belongs more properly to the general subject of Jansenism, and the history of Port Royal.

To sum up, the interest and value of the *Pensées* is positively diminished if they are taken as gropings after self-satisfaction or feeble attempts at freethinking. They are excursions into the great unknown made with a full acknowledgment of the greatness of that unknown, but with no kind of desire for something more known than the writer's own standpoint. If to any one else they communicate such a desire that is not Pascal's fault; and, if it seems to any one that without such a desire they could not have been indulged in, that comes mainly from an alteration of mental attitude, and from a want of familiarity with the mental attitude of Pascal's own time. From the point of view that belief and knowledge, based on experience or reasoning, are separate domains with an unexplored sea between and round them, Pascal is perfectly comprehensible, and he need not be taken as a deserter from one region to the other. To those who hold that all intellectual exercise outside the sphere of religion is impious, or that all intellectual exercise inside that sphere is futile, he must remain an enigma.

There are few writers who are more in need than Pascal of being fully and competently edited. The chief nominally complete edition at present in existence is that of Bossut (1779, 5 vols., and since reprinted), which not only appeared before any attempt had been made to restore the true text of the *Pensées*, but is in other respects quite inadequate. The edition of Lahure, 1858, is not much better, though the *Pensées* appear in their more genuine form. An

edition has been long promised for the excellent collection of *Les Grands Écrivains de la France*; it has been understood to be under the charge of M. Faugère. Meanwhile, with the exception of the *Provinciales* (of which there are numerous editions, no one much to be preferred to any other, for the text is undisputed and the book itself contains almost all the exegesis of its own contents necessary), Pascal can be read only at a disadvantage. There are four chief editions of the true *Pensées*: that of M. Faugère (1844), the *editio princeps*; that of M. Havet (1852, 1867, and 1881), on the whole the best; that of M. Victor Rochet (1873), good, but arranged and edited with the deliberate intention of making Pascal first of all an orthodox apologist; and that of M. Molinier (1877-79), a carefully edited and interesting text, the important corrections of which have been introduced into M. Havet's last edition. Unfortunately, none of these can be said to be exclusively satisfactory. The minor works must chiefly be sought in Bossut or reprints of him. Works on Pascal are innumerable: Sainte-Beuve's *Port Royal*, Cousin's writings on Pascal and his *Jaqueline Pascal*, and the essays of the editors of the *Pensées* just mentioned are the most noteworthy. Principal Tulloch has contributed a useful little monograph to the series of *Foreign Classics for English Readers* (Edinburgh and London, 1878).

Pascal as Natural Philosopher and Mathematician.—Great as is Pascal's reputation as a philosopher and man of letters, it may be fairly questioned whether his claim to be remembered by posterity as a mathematician and physicist is not even greater. In his two former capacities all will admire the form of his work, while some will question the value of his results; but in his two latter capacities no one will dispute either. He was a great mathematician in an age which produced Descartes, Fermat, Huygens, Wallis, and Roberval. There are wonderful stories on record of his precocity in mathematical learning, which is sufficiently established by the well-attested fact, that he had completed before he was sixteen years of age a work on the conic sections, in which he had laid down a series of propositions, discovered by himself, of such importance that they may be said to form the foundations of the modern treatment of that subject. Owing partly to the youth of the author, partly to the difficulty in publishing scientific works in those days, and partly no doubt to the continual struggle on his part to devote his mind to what appeared to his conscience more important labour, this work (like many others by the same master-hand) was never published. We know something of what it contained from a report by Leibnitz, who had seen it in Paris, and from a résumé of its results published in 1640 by Pascal himself, under the title *Essai pour les Coniques*. The method which he followed was that introduced by his contemporary Desargues, viz., the transformation of geometrical figures by conical or optical projection. In this way he established the famous theorem that the intersections of the three pairs of opposite sides of a hexagon inscribed in a conic are collinear. This proposition, which he called the mystic hexagram, he made the keystone of his theory; from it alone he deduced more than four hundred corollaries, embracing, according to his own account, the conics of Apollonius, and other results innumerable.

Pascal also distinguished himself by his skill in the infinitesimal calculus, then in the embryonic form of Cavalieri's method of indivisibles. The cycloid was a famous curve in those days; it had been discussed by Galileo, Descartes, Fermat, Roberval, and Torricelli, who had in turn exhausted their skill upon it. Pascal solved the hitherto refractory problem of the general quadrature of the cycloid, and proposed and solved a variety of others relating to the centre of gravity of the curve and its segments, and to the volume and centre of gravity of solids of revolution generated in various ways by means of it. He published a number of these theorems without demonstration as a challenge to contemporary mathematicians. Solutions were furnished by Wallis, Huygens,

Wren, and others; and Pascal published his own in the form of letters from Amos Dettonville (his assumed name as challenger) to M. Cercavi. There has been some discussion as to the fairness of the treatment accorded by Pascal to his rivals, but no question of the fact that his initiative led to a great extension of our knowledge of the properties of the cycloid, and indirectly hastened the progress of the differential calculus.

In yet another branch of pure mathematics Pascal ranks as a founder. The mathematical theory of probability and the allied theory of the combinatorial analysis were in effect created by the correspondence between Pascal and Fermat, concerning certain questions as to the division of stakes in games of chance, which had been propounded to the former by the gaming philosopher De Méré. A complete account of this interesting correspondence would surpass our present limits; but the reader may be referred to Todhunter's *History of the Theory of Probability* (Cambridge and London, 1865) pp. 7-21. It appears that Pascal contemplated publishing a treatise *De Alex Geometria*; but all that actually appeared was a fragment on the arithmetical triangle ("Properties of the Figurative Numbers") printed in 1654, but not published till 1665, after his death.

Pascal's work as a natural philosopher was not less remarkable than his discoveries in pure mathematics. His experiments and his treatise (written 1653, published 1662) on the equilibrium of fluids entitle him to rank with Galileo and Stevinus as one of the founders of the science of hydrodynamics. The idea of the pressure of the air and the invention of the instrument for measuring it were both new when he made his famous experiment, showing that the height of the mercury column in a barometer decreases when it is carried upwards through the atmosphere. This experiment was made in the first place by himself in a tower at Paris, and was afterwards carried out on a grand scale under his instructions by his brother-in-law Perier on the Puy de Dôme in Auvergne. Its success greatly helped to break down the old prejudices, and to bring home to the minds of ordinary men the truth of the new ideas propounded by Galileo and Torricelli.

Whether we look at his pure mathematical or at his physical researches we receive the same impression of Pascal; we see the strongest marks of a great original genius creating new ideas, and seizing upon, mastering, and pursuing farther everything that was fresh and unfamiliar in his time. After the lapse of more than two hundred years, we can still point to much in exact science that is absolutely his; and we can indicate infinitely more which is due to his inspiration. (G. CH.)

PASCHAL I., pope from 817 to 824, a native of Rome, was raised to the pontificate by popular acclamation, shortly after the death of Stephen V., and before the sanction of the emperor (Louis the Pious) had been obtained—a circumstance for which it was one of his first cares to apologize. His relations with the imperial house, however, never became cordial; and he was also unsuccessful in retaining in Rome itself the popularity to which he had owed his election. He died at Rome while the imperial commissioners were investigating the circumstances under which two important officers of Lothair, the eldest son of Louis, had been seized at the Lateran, blinded, and afterwards beheaded; Paschal had shielded the murderers but denied all personal complicity in their crime. The Roman people refused him the honour of burial within the church of St Peter, but he now holds a place in the Roman calendar (May 16). Like one or two of his more immediate predecessors he was liberal in his donations to several churches of the city, St Cecilia in Trastevere having been restored and St Maria in Domnica

rebuilt by him; he also built the church of St Prassede. The successor of Paschal I. was Eugenius II.

PASCHAL II., pope from 1099 to 1118, was the successor of Urban II. Of his early history nothing is known except that his proper name was Rainieri, that he was of Tuscan origin, and that in early life he became a monk, probably of Cluny. He was raised to the cardinalate by Gregory VII. about 1076, and was elected to the papal chair on August 13, 1099. In the long struggle with the imperial power about INVESTITURE (*q.v.*) he zealously carried on the Hildebrandine policy, but hardly with Hildebrandine success. One of his first acts was to expel from Rome the antipope Clement III., otherwise known as Guibert of Ravenna, and to renew his predecessor's sentence of excommunication against the emperor Henry IV., by the help of whose rebellious son it seemed at one time as if the claims of the church were to become wholly triumphant. But Prince Henry, who succeeded to the purple in 1106 (see HENRY V.), proved a still more active and persistent opponent of papal pretensions than ever his father had been. Paschal was courteously invited to Germany to assist in arranging definitely the affairs of the empire (1107), but, while the pope delayed his journey, the emperor proceeded actually to exercise all the rights of investiture to the fullest extent, and, having disposed of various wars in Bohemia, Hungary, and Poland, announced in 1110 the intention of proceeding to Rome to be crowned and to re-establish order in Italy. From Arezzo he sent ambassadors to Rome, and the pope after negotiation agreed to his coronation on the footing that the church should surrender all the possessions and royalties it had received of the empire and kingdom of Italy from the days of Charlemagne, while Henry on his side gave up the form of investiture. But on Henry's arrival in Rome (Feb. 1111), where feeling was strong against this pact, Paschal was slow to implement it, and the emperor ultimately found it necessary to withdraw from the city,—not, however, until he had compelled the pope and many of the cardinals to accompany him. After two months the pope yielded; the coronation took place in the church of St Peter on April 13, and forthwith the emperor withdrew beyond the Alps after exacting a promise that no revenge should be taken for what had passed. The Lateran council, however, held in March 1112, repudiated as void, under penalty of excommunication, the concessions that had been extorted by the violence of Henry; and a council held at Vienne some months afterwards actually excommunicated him, the pope himself ratifying the decree. On the death of the Countess Matilda of Tuscany, who had bequeathed her whole possessions to the church (1115), the emperor at once laid claim to them as imperial fiefs, and, descending into Italy, drove the pope first to Monte Casino and then to Benevento. Paschal returned to Rome, after the emperor's withdrawal, in the beginning of 1118, but died within a few days (January 21, 1118). His successor was Gelasius II.

PASCHAL CONTROVERSY. See EASTER, vol. vii. p. 614.

PASCO. See CERRO DE PASCO, vol. v. p. 347

PAS DE CALAIS, a maritime department of northern France, formed in 1790 of nearly the whole of Artois and the northern maritime portion of Picardy, including the Boulonnais, Calaisis, Ardrésis, and the districts of Langlo and Bredenarde, lies between 50° 2' and 51° N. lat. and 1° 35' and 3° 10' E. long., and is bounded N. by the Straits of Dover ("Pas de Calais"), E. by the department of Nord, S. by that of Somme, and W. by the English Channel. The distance from England is only 21 miles. Nord, which separates Pas de Calais from Belgium, is at one place only 3 miles wide, and from Arras (the chief

town) to Paris in a direct line is about 100 miles. Except in the neighbourhood of Boulogne, with its côtes de fer or "iron coasts," the seaboard of the department, which measures 65 miles, consists of dunes. From the mouth of the Aa (the limit towards Nord) it trends west-south-west to Gris Nez, the point of France nearest to England; in this section lie the port of Calais, Cape Blanc Nez, rising 440 feet above the sandy shores, and the port of Wissant (Wishant). Beyond Gris Nez the direction is due south; in this section are the port of Ambleteuse, Boulogne at the mouth of the Liane, and the two bays formed by the estuaries of the Canche and the Authie (the limit towards Somme). The highest point in the department (700 feet) is in the west, between Boulogne and St Omer. From the uplands in which it is situated the Lys and Scarpe flow east to the Scheldt, the Aa north to the German Ocean, and the Slack, Wimereux, and Liane to the Channel. Farther south are the valleys of the Canche and the Authie, running from east-south-east to west-north-west, and thus parallel with the Somme. Vast plains, open and monotonous, but extremely fertile and well cultivated, occupy most of the department. The greenest and most picturesque valleys are in the west. To the north of the hills running between St Omer and Boulogne, to the south of Gravelines and the south-east of Calais, lies the district of the Wattergands, fens now drained by means of canals and dykes, and turned into highly productive land. The climate is free from extremes of heat and cold, but damp and changeable. At Arras the mean annual temperature is 47°; on the coast it is higher. The rainfall in the one case is 22 inches, in the other 31.

With a total area of 2550 square miles, the department has 1899 square miles (more than two-thirds) of arable land, while woods and pasture land each occupy only about a twentieth. The live stock in 1880 comprised 76,224 horses, 9642 asses or mules, 156,060 cows, 35,272 calves, 5080 bulls or oxen, 256,031 sheep, 131,722 pigs, 26,760 goats. The sheep in 1880 yielded 857 tons of wool, worth £57,398. The national sheepfolds of Tingry are in Pas de Calais. The 22,260 beehives of the department yielded in 1878 1753 tons of honey and 39½ tons of wax. No department except Somme breeds fowls so extensively. Wheat, beetroot, and oil seeds are the principal crops. In 1882 wheat gave 9,855,433 bushels, meslin 920,023 bushels; in 1879, rye 781,150 bushels, barley 2,362,133 bushels, oats 9,421,818 bushels, beetroot 1,576,355 tons (almost entirely consumed by the sugar works), potatoes 7,250,813 bushels, vegetables 531,727, and colza seed 30,263. Besides there were considerable quantities of poppy-seed, flax (of excellent quality), hops, hemp, and tobacco (1275 tons). There are two great coal-fields, that of Pas de Calais proper, a continuation of the coal-field of Valenciennes and Hainault, and that of Boulonnais. The former contains a total area of 134,270 acres; the latter is about a tenth of that size. Taken together they number 72 pits, 57 of which are active. In 1882 5,036,455 tons of coal were extracted and 1,378,818 consumed in the department; the industry gives employment to 22,925 persons. Peat (to the amount of 375,034 tons in 1882) is obtained in the valleys of the Scarpe and the Aa. Iron-mines in the arrondissement of Boulogne employ 162 workmen (26,074 tons); the stone and marble quarries 2130 workmen; and about 800 are engaged in obtaining phosphates of lime (295,500 tons), which are exported for manure. Blast furnaces, foundries, engineering works, naileries, boiler-works, agricultural implement factories, and steel-works are all carried on in the department. In 1883 305 tons of iron, 16,355 tons of steel, 65,025 tons of cast iron were manufactured; and the average production of pigs is 400,000,000 per annum. The establishments at Biache St Vast melt, refine, and roll copper and zinc, and also work lead and auriferous silver. The shipyards do not launch any large vessels, but in 1831 they built eighty luggers or sloops, with an aggregate burden of 2458 tons. The eighty-nine sugar works in 1880 produced 42,121 tons of sugar and 29,730 of molasses; the distilleries 4,658,934 gallons of spirits; the oil works 15 tons of hempseed oil, 389 tons of linseed oil, 3060 tons of poppyseed, rapeseed, and cameline oil, &c., and 797 tons of colza oil. There are 553 breweries in the department. Cotton-spinning and weaving employ 116,364 spindles and 625 looms; wool spinning 26,300 spindles; and the flax, hemp, and jute manufacture 35,700 spindles and 407 looms. St Pierre-les-Calais carries on the weaving of tulle in linen, cotton, and silk, employing 10,000 hands, and producing with its 1500 looms goods to the value of £2,400,000 per annum. There are besides in the department establishments

for the manufacture of paper and cardboard, hosiery, embroidery, boots and shoes (for exportation), flooring, pipes, glass wares, chemical products, pottery, chicory, starch, biscuits (300 to 400 workmen), and gin. The national powder-mills of Esquerdes are among the largest in France. The port towns fit out a considerable number of vessels for the mackerel, cod, and herring fishing—a growing industry. In 1882 Boulogne and Étaples had 340 boats (13,919 tons) and 4586 fishermen, and Calais 37 boats (265 tons) and 281 fishermen, and their united take was 2356 tons. There is a large export of sugar, spirits, calves, sheep, and eggs to England. In 1882 the port of Boulogne had a movement of 8614 vessels and that of Calais 4436, with a total burden for the two ports of 2,212,920 tons. In 1878 404,769 travellers passed by this way between France and England. Calais is emphatically a transit port; Boulogne has besides an export trade in local products such as marble, freestone, minerals, and Boulogne horses, remarkable for size and strength. The roads of the department (national, departmental, &c.) make a length of 9393 miles, the waterways 105½ miles, the railways 546 miles, and the industrial railways 60 miles. The canal system comprises part of the Aa, the Lys, the Scarpe, the Deule (a tributary of the Lys passing by Lille), the Lawe (a tributary of the Lys passing by Bethune), and the Sensée (an affluent of the Scheldt), as well as the various canals proper from Aire to La Bassée, Neufossé, Calais, &c., and in this way a line of communication is formed from the Scheldt to the sea by Bethune, St Omer, and Calais, with branches to Gravelines and Dunkirk in Nord. The total tonnage of the whole inland navigation was 2,124,442 tons in 1878.

In 1881 Pas de Calais had 819,022 inhabitants (311 per square mile), ranking sixth among the departments in density of population. It forms the diocese of Arras in the archbishopric of Cambrai, belongs to the district of the first (or Lille) corps d'armée, and is within the jurisdiction of the Douai court of appeal. There are six arrondissements bearing the names of their chief towns—Arras (27,041 inhabitants), Bethune (10,374), Boulogne (44,842), Montreuil (3352), St Omer (20,479), and St Pol (3694). Other places of importance are St Pierre-lès-Calais (30,786 inhabitants), the industrial town of Calais (13,529), Lens (10,515), Lievin (8281), Carvin (6430)—the last three with important coal-mines, and Aire (5000), formerly a fortified place.

PASIPHAE. See MINOS.

PASKEWITCH, IVAN FEDOROWITCH (1782–1856), prince of Warsaw, and general-in-chief of the Russian army, was descended from an old and wealthy family, and was born at Poltava 8th May 1782. He was educated at the imperial institution for pages, where his progress was so rapid that after his first examination he received the promise of a lieutenant's commission in the guards, and was named aide-de-camp to the emperor. His first active service was in 1805, in the auxiliary army sent to the assistance of Austria against France, when he took part in the battle of Austerlitz. From 1807 to 1812 he was engaged in the campaigns against Turkey, and distinguished himself by many brilliant and daring exploits. During the French war of 1812–14 he was present, in command of the 26th division of infantry, at all the most important engagements; at the battle of Leipsic he took 4000 prisoners. On the outbreak of war with Persia in 1826 he was appointed second in command, and, succeeding in the following year to the chief command, gained rapid and brilliant successes which compelled the shah to sue for peace 19th February 1828. In reward of his services he was raised by the emperor to the rank of count of the empire, with the surname of Erivan, and received a million of roubles and a diamond-mounted sword. From Persia he was sent to Turkey in Asia, and, having captured in rapid succession the fortresses of Kars, Erzeroum, and Akalkalaki, he was at the end of the campaign made a field marshal. In 1831 he was entrusted with the command of the army sent to suppress the revolt of Poland, and after the fall of Warsaw, which gave the death-blow to Polish independence, he was raised to the dignity of prince of Warsaw, and created viceroy of the kingdom of Poland. In this position he is said to have manifested the highest qualities as an administrator, and in his relations with the kings of Prussia and Austria he secured their confidence and esteem. On the outbreak of the insurrection of Hungary in 1848

he was appointed to the command of the Russian troops sent to the aid of Austria, and finally compelled the insurgents to lay down their arms at Vilagos. In April 1854 he again took the field in command of the army of the Danube, but on the 9th June, at Silistria, where he suffered defeat, he received a contusion which compelled him to retire from active service. He died 29th January 1856.

Tolstoy, *Essai Biographique et Historique sur le Feld-Maréchal Prince de Varsovie*, Paris, 1835; *Notice Biographique sur le Maréchal Paskevitch*, Leipsic, 1856.

PASQUIER, ÉTIENNE (1529–1615), one of the glories of the French bar, and one of not the least remarkable men of letters of the 16th century, was born at Paris on the 7th June 1529 by his own account, according to others a year earlier. Nothing is known of his family, and hardly anything of his youth, but he seems to have inherited a small property at Châtelet in the district of Brie. He certainly studied law early, and in 1547 was a pupil of the famous Cujas at Toulouse. Thence, like many of his contemporaries, he went to finish his studies in Italy. He was called to the Paris bar in November 1549, having not yet (or at most barely) reached his majority. He practised diligently and with success, but by no means neglected literature. Some of his work both at this time and later is light and almost frivolous. A treatise on love, the *Monophile*, appeared in 1554, and not a few similar publications followed it, one of them, the *Ordonnances d'Amour*, being somewhat Rabelaisian in character. Pasquier, however, though not a stoic, was a man of perfectly regular life, and he married early; his wife, who was of his own age, affluent, and, it is said, handsome, being a widow for whom he had gained a lawsuit. The next year he had the misfortune to eat some poisonous mushrooms and very nearly died of them; indeed he did not recover fully for two years. This lost him his practice for the time, and he again betook himself to general literature, publishing in 1560 the first book of his great work the *Recherches de la France*. Before very long, however, clients once more came to him, and in 1565, when he was thirty-seven, his fame was established by a great speech still extant, in which he pleaded the cause of the university of Paris against the Jesuits, and won it. He was thenceforward constantly employed in the most important cases of the day, and his speeches, many of which we possess, displayed a polished eloquence which was new in his time. But he did not neglect general literature, pursuing the *Recherches* steadily, and publishing from time to time much miscellaneous work. His literary and his legal occupations coincided in a curious fashion at the Grands Jours of Poitiers in 1579. These Grand Jours (an institution which fell into desuetude at the end of the 17th century, with bad effects on the social and political welfare of the French provinces) were a kind of irregular assize in which a commission of the parlement of Paris, selected and despatched at short notice by the king, had full power to hear and determine all causes, especially those in which seigniorial rights had been abused. At the Grands Jours of Poitiers of the date mentioned, and at those of Troyes in 1583, Pasquier officiated; and each occasion has left a curious literary memorial of the kind of high jinks with which he and his colleagues relieved their graver duties. The Poitiers work was the celebrated collection of poems on a flea, of which English readers may find a full account in Southey's *Doctor*. Up to this time Pasquier had held no regular office except the lieutenant-generalship of Cognac, where his wife had property; but in 1535 Henry III. made him advocate-general at the Paris Cours des Comptes, an important body having political as well as financial and legal functions. Pasquier distinguished himself here

particularly by opposing, sometimes successfully, the mischievous system of selling hereditary places and offices, which more perhaps than any single thing was the curse of the older French monarchy. He was present at the famous States of Blois, where Guise was assassinated, and he met Montaigne there. The civil wars brought him much personal sorrow. His wife and children had remained in Paris much harassed by the Leaguers; Madame Pasquier was even imprisoned, and, though she regained her liberty, she died shortly afterwards, in 1590. Her youngest son was killed fighting on the royalist side the year before. For some years Pasquier lived at Tours, working steadily at his great book, but he returned to Paris in Henry IV.'s train on the 22d March 1594. He continued until 1604 at his work in the *Chambre des Comptes*; then he retired. He survived this retirement more than ten years, producing much literary work, and died after a few hours' illness on September 1, 1615, at the age of at least eighty-six.

In so long and so laborious a life Pasquier's work was naturally considerable, and it has never been fully collected or indeed printed. The standard edition is that of Amsterdam, 1723, 2 vols. folio. But for ordinary readers the selections of M. Léon Feugère, published at Paris in 2 vols. 8vo, 1849, with an elaborate introduction, are most accessible. As a poet, though very far from contemptible, Pasquier is chiefly interesting as a minor member of the *Pléiade* movement. As a prose writer he is of much more account. The three chief divisions of his prose work are his *Recherches*, his letters, and his professional speeches. All are of much value as important documents in the history of the progress of French style. The *Recherches* and the letters have a value independent of this. The letters are of much biographical interest and historical importance, and the *Recherches* contain in a somewhat miscellaneous fashion invaluable information on a vast variety of subjects, literary, political, antiquarian, and other.

PASQUINADE is a variety of libel or lampoon, of which it is not easy to give an exact definition, separating it from other kinds. It should, perhaps, more especially deal with public men and public things. The distinction, however, has been rarely observed in practice, and the chief interest in the word is in its curious and rather legendary origin. According to the received tradition, Pasquino was a tailor (others say a cobbler) who had a biting tongue, and lived in the 15th century at Rome. His name, at the end of that century or the beginning of the next, was transferred to a statue which had been dug up in a mutilated condition (some say near his shop) and was set up at the corner of the Palazzo Orsini (*al. Palazzo Braschi*). To this statue it became the custom to affix squibs on the papal Government and on prominent persons. At the beginning of the 16th century Pasquin had a partner provided for him in the shape of another statue found in the Campus Martius, said to represent a river god, and dubbed Marforio, *a foro Martis*. The regulation form of the pasquinade then became one of dialogue or rather question and answer, in which Marforio usually addressed leading inquiries to his friend. The proceeding soon attained a certain European notoriety, and a printed collection of the squibs due to it (they were long written in Latin verse, with an occasional excursion into Greek) appeared in 1510. In the first book of *Pantagruel* (1532 or thereabouts) Rabelais introduces books by Pasquillus and Marphurius in the catalogue of the library of St Victor, and later he quotes some utterances of Pasquin's in his letters to the bishop of Maillezais. These, by the way, show that Pasquin was by no means always satirical, but dealt in grave advice and comment. The 16th century was indeed Pasquin's palmy time, and in not a few of the rare printed collections of his utterances Protestant polemic (which was pretty certainly not attempted on the actual statue) is mingled. These utterances were not only called pasquinades but simply pasquils (*Pasquillus, Pasquillo, Lasquille*), and this form was sometimes used for the mythical personage himself. Under this title a con-

siderable satirical literature of quite a different kind from the original personal squibs and political comments grew up in England at the end of the 16th and the beginning of the 17th century under the titles of *Pasquil's Apology*, *Pasquil's Nightcap*, &c. The chief writers were Thomas Nash and, after his death, Nicholas Breton. These pieces (of extreme rarity, but lately reissued by the Rev. A. B. Grosart, in private reprints of the works of their authors) were in prose. The French pasquils (examples of which may be found in Fournier's *Variétés Historiques et Littéraires*) were more usually in verse. In Italy itself Pasquin is said not to have condescended to the vernacular till the 18th century. During the first two hundred years of his career few mornings, if any, found him unplaced, and the institution supplied a kind of rough and scurrilous gazette of public opinion. But the proceeding gradually lost its actuality, and was, moreover, looked on with less and less favour by the authorities. Indeed a sentinel was latterly posted to prevent the placarding. It is said, however, that isolated pasquinades, having at least local appropriateness, occurred not many years ago. Marforio, it should be added, was soon removed from his companion's neighbourhood to the Capitol. Contemporary comic periodicals, especially in Italy, still occasionally use the Marforio-Pasquin dialogue form. But this survival is purely artificial and literary, and pasquinade has, as noted above, ceased to have any precise meaning.

PASSAU, an ancient town and episcopal see of Bavaria, lies in the district of Lower Bavaria, and occupies a highly picturesque situation at the confluence of the Danube, the Inn, and the Ilz, 90 miles to the north-east of Munich, and close to the Austrian frontier. It consists of the town proper, on the rocky tongue of land between the Danube and the Inn, and of the three suburbs of Innstadt, on the right bank of the Inn, Ilzstadt, on the left bank of the Ilz, and Anger, in the angle between the Ilz and the Danube. Passau is one of the most beautiful places on the Danube, a fine effect being produced by the way in which the houses are piled one above another on the heights rising from the river. The best general view is obtained from the Oberhaus, an old fortress now used as a prison, which crowns a hill 300 feet high on the left bank of the Danube. A detailed inspection of the buildings of the town, most of which date from the 17th and 18th centuries, scarcely fulfils the expectation aroused by their imposing appearance as a whole. The most noteworthy are the cathedral, a florid rococo structure on the site of an earlier church, which claims to have been founded in the 5th century; the post-office, in which the treaty of Passau was signed; the episcopal palace; the old Jesuit college, with a library of 30,000 volumes; the arsenal; the Romanesque church of the Holy Cross; and the double church of St Salvator. The old forts and bastions have been demolished, but the Niederhaus, at the base of the Oberhaus, is still extant, though no longer maintained as a fortress. The chief products of the insignificant industry of the town are tobacco, leather, and paper. It also possesses iron and copper foundries and a few barge-building yards. The well-known Passau crucibles are made at the neighbouring village of Oberzell. Trade is carried on in iron and timber, large quantities of the latter being floated down the Ilz. The inhabitants (15,365 in 1880) are nearly all Roman Catholics.

Passau is a town of very ancient origin. The first settlement here is believed to have been the Celtic Boindurum, on the site of the present Innstadt; and the Romans afterwards established a colony of Batavian veterans (*Castra Batava*) on the site of the town proper. The bishopric was founded in the 8th century, and most of the subsequent history of Passau is made up of broils between the bishops and the townsmen. The fortress of Oberhaus was erected by the former in consequence of a revolt in the 13th century, and at a later

period its guns were often turned on the town. In 1552 Charles and Elector Maurice of Saxony here signed the treaty of Passau, by which the former was constrained to acknowledge the principle of religious toleration. The town was a frequent object of dispute in the war of the Spanish succession, and it was taken by the Austrians in 1806. The bishopric was secularized in 1803, and its territory annexed to Bavaria two years later. The present bishopric was established in 1817.

PASSERAT, JEAN (1534–1602), a poet of merit and a contributor to the *Satire Ménippée*, was born at Paris in 1534. He was well educated, but is said to have played truant from school and to have had some curious adventures—at one time working in a mine. He was, however, a scholar by natural taste, and after a time he returned to his studies. Having finished them he became in his turn a teacher at the Collège de Plessis, and at the death of Ramus was made professor of Latin in the Collège de France. This, however, was not till 1572. In the meanwhile Passerat had studied law, and had composed much agreeable poetry in the Pléiade style, the best pieces being his short ode "On the First of May," and the charming villanelle "J'ai perdu ma tourterelle." Like most of the men of letters and learning at the time, Passerat belonged to the *politiques* or moderate royalist party, and was strongly opposed to the League. His exact share in the *Ménippée*, the great manifesto of the *politique* party when it had declared itself for Henry of Navarre, is differently stated; but it is agreed that he wrote most of the verse, and the charming harangue of the guerilla chief Rieux is sometimes attributed to him. Towards the end of his life, after he had re-entered on the duties of his professorship, he became blind. He died at Paris in 1602, and his poems were not published completely till four years later. Passerat united with his learning abundant wit and a faculty of elegant and tender verse, and was altogether a good specimen of the man of letters of the time, free from pedantry while full of scholarship, and combining a healthy interest in politics and a taste for light literature with serious accomplishments. He had also a considerable reputation as an orator.

PASSIONFLOWER (*Passiflora*) is the typical genus of the order to which it gives its name. The species are mostly natives of western tropical South America; others are found in various tropical and subtropical districts of both hemispheres. The tacsonias, by some considered to form part of this genus, inhabit the Andes at considerable elevations. They are mostly climbing plants (fig. 1) having a woody stock and herbaceous or woody branches, from the sides of which tendrils are produced which enable the branches to support themselves at little expenditure of tissue. Some few form trees of considerable stature destitute of tendrils, and with broad magnolia-like leaves in place of the more or less palmately-lobed leaves which are most generally met with in the order. Whatever be the form of leaf, it is usually provided at the base of the leaf-stalk with stipules, which are inconspicuous, or large and leafy; and the stalk is also furnished with one or more glandular excrescences, as in some cases are the leaf itself and the bracts. The inflorescence is of a cymose character, the terminal branch being represented by the tendril, the side-branches by flower-stalks, or the inflorescence may be reduced to a single stalk. The bracts on the flower-stalk are either small and scattered or large and leafy, and then placed near the flower forming a sort of outer calyx or epicalyx. The flower itself (seen in section in fig. 2) consists of a calyx varying in form from that of a shallow saucer to that of a long cylindrical or trumpet-shaped tube, thin or fleshy in consistence, and giving off from its upper border the five sepals, the five petals (rarely these latter are absent), and the threads or membranous processes constituting the "corona." This coronet forms

the most conspicuous and beautiful part of the flower of many species, and consists of outgrowths from the tube formed subsequently to the other parts, and having little morphological significance, but being physiologically useful in favouring the cross-fertilization of the flower by means of insects. Other outgrowths of similar character, but less conspicuous, occur lower down the tube, and

FIG. 1.—*Passiflora corulea*, var., showing leaf, stipule, tendril, and detached flower. Their variations afford useful means of discriminating between the species. From the base of the inner part of the tube of the flower, but quite free from it, uprises a cylindrical stalk surrounded below by a small cup-like out-

FIG. 2.—Flower of Passionflower cut through the centre to show the arrangement of its constituent parts.

growth, and bearing above the middle a ring of five filaments each attached by a thread-like point to an anther. Above the ring of stamens is the ovary itself, upraised on a prolongation of the same stalk which bears the filaments, or sessile. The stalk supporting the stamens and ovary is called the "gynophore" or the "gynandrophore," and is a special characteristic of the order, shared

in by the Capparids and no other order. The ovary of passionflowers is one-celled with three parietal placentas, and bears at the top three styles, each capped by a large button-like stigma. The ovary ripens into a berry-like, very rarely capsular, fruit with the three groups of seeds arranged in lines along the walls, but embedded in a pulpy arillus derived from the stalk of the seed. This succulent berry is in some cases highly perfumed, and affords a delicate fruit for the dessert-table as in the case of the "granadilla," *P. quadrangularis*, *P. edulis*, *P. macrocarpa*, and various species of *Tacsonia* known as "curubas" in Spanish South America. The fruits in question do not usually exceed in size the dimensions of a hen's or of a swan's egg, but that of *P. macrocarpa* is a gourd-like oblong fruit attaining a weight of 7 to 8 lb. Many species are cultivated for the beauty of their flowers, and one or two species are nearly hardy in south and western Britain and Ireland, the commonest, *P. cœrulea*, being, singular to say, a native of southern Brazil. Many species of the *Tacsonia* would probably prove equally hardy. The name passionflower—*flos passionis*—arose from the supposed resemblance of the corona to the crown of thorns, and of the other parts of the flower to the nails, or wounds, while the five sepals and five petals were taken to symbolize the ten apostles,—Peter, who denied, and Judas, who betrayed, being left out of the reckoning. In some of the botanical books of the 16th and 17th centuries curious illustrations of these flowers are given, in which the artist's faith or imagination has been exercised at the expense of actual fact.

PASSION PLAYS. See **DRAMA**, vol. vii. p. 404. On the Oberammergau Passion Play, see **OBERAMMERGAU**.

PASSION WEEK, the fifth week in Lent, begins with Passion Sunday (*Dominica Passionis* or *de Passione Domini*), so called from very early times because with it begins the more special commemoration of Christ's passion. In non-Catholic circles Passion Week is often identified with **HOLY WEEK** (*q.v.*), but incorrectly.

PASSOVER AND FEAST OF UNLEAVENED BREAD. It is explained in the article **PENTATEUCH** (p. 511) that the ancient Israelites were accustomed to open the harvest season by a religious feast. No one tasted the new grain, not even parched or fresh ears of corn, till the first sheaf had been presented to Jehovah, and then all hastened to enjoy the new blessings of divine goodness by eating unleavened cakes, without waiting for the tedious process of fermenting the dough. This natural usage became fixed in custom, and at a comparatively early date a new significance was added to it by a reference to the exodus from Egypt, when, as tradition ran, the people in their hasty departure had no time to leaven the dough already in their troughs. The two elements of a thankful recognition of God's goodness in the harvest, which every one was eager to taste the moment that Jehovah had received His tribute at the sanctuary, and of grateful remembrance of the first proof of His kingship over Israel, went very fittingly together. A similar combination is found in the thanksgiving of Deut. xxvi. 5 *sq.*, in the law, Deut. xxiv. 19–22, and elsewhere; the yearly blessings of the harvest were the proof of the continued goodness of Him who brought Israel forth from Egypt to set him in a fruitful and pleasant land.

The feast of unleavened bread (Hebrew מצות, *maṣṣōth*), with the presentation of the harvest sheaf, which is its leading feature, presupposes agriculture and a fixed residence in Canaan. In the pastoral life the same religious feelings find their natural expression in thank-offerings for the increase of the flocks and herds, consisting of sacrifices "of the firstlings of the flock and the fatlings thereof," such as Gen. iv. 4 makes to date back from the very

beginnings of human history. The firstlings answer to the first fruits; the increase of cattle falls mainly in the spring; and spring is also the time of the best pasture in a climate where the harvest-tide lies between Easter and Whitsunday, the time therefore when a fat sacrifice can be selected and when vows would generally be fulfilled; especially as the latter, among the pastoral Hebrews as among the Arabs, would frequently have reference to the multiplication of the flock. Abel's sacrifice of firstlings and fatlings corresponds in fact exactly to the old Arabic *fara* and *attra*, the former of which was the firstborn of the herd and the latter a sacrifice offered in the spring month Rajab in fulfilment of a vow conditional on the good increase of the herd.¹ The accumulation of the sacrifices of firstlings and fatlings at one season of the year would readily give rise to a spring feast, and it appears from the Jehovist that something of this kind existed before the exodus (see **PENTATEUCH**), and gave occasion to the request of Moses for leave to lead the people out into the wilderness to sacrifice to Jehovah. Pharaoh's refusal was appropriately punished by the destruction of the firstborn of man and the firstlings of beasts in Egypt. The recollection of this fact reacted on the old Hebrew usage, and supplied a new reason for the sacrifice of all male firstlings after the Israelites were settled in Canaan (Exod. xiii. 11 *sq.*). Up to the time of Deuteronomy this sacrifice was not tied to any set feast (contrast Exod. xxii. 30 with Deut. xv. 20); the old sacrificial spring feast, like the Arabic feast of Rajab, was not wholly dependent on the firstlings, but might also be derived from vows. But when Israel was thoroughly united under the kings the tendency plainly lay towards a concentration of acts of cultus in public feasts at the great sanctuaries; and the final result of this tendency, which appears to some degree in earlier laws, but reached its goal only through the Deuteronomic centralization of all sacrifices at the one sanctuary, was that the spring pastoral feast coalesced with the agricultural *Maṣṣōth*, and that its sacrifices were swollen by the prohibition of continued private sacrifices of the male firstlings. This is the form of the Deuteronomic passover (Deut. xvi. 1 *sq.*). The passover is a sacrifice drawn from the flock or the herd, presented at the sanctuary and eaten with unleavened bread. It is slain on the evening of the first day of the feast, so that the sacrificial feast is nocturnal; and the pilgrims may return to their homes next morning, but the abstinence from leaven lasts seven days, and the seventh day, observed as a day of rest, is the *ʿašereth* or closing day of the feast. The passover is now viewed specially as a commemoration of the Exodus; and by and by, in Exod. xii. 27, its name (Heb. פסח, Gr. *πάσχα*, Lat. *pascha*) is explained from Jehovah "passing over" the Israelites when he smote Egypt. That this was the original meaning is by no means clear; there is no certain occurrence of the name before Deuteronomy (in Exod. xxxiv. 25 it looks like a gloss), and the corresponding verb denotes some kind of religious performance, apparently a dance, in 1 Kings xviii. 26. A nocturnal ceremony at the consecration of a feast is already alluded to in Isa. xxx. 29, who also perhaps alludes to the received derivation of פסח in ch. xxxi. 5. But the Deuteronomic passover was a new thing in the days of Josiah (2 Kings xxiii. 21 *sq.*). It underwent a farther modification in the exile, when sacrifices in the proper sense of the word were impossible, but the commemorative side of the feast was perpetuated in the household meal of the paschal lamb, eaten with unleavened bread and bitter herbs (Exod. xii.—from the Priestly Code). The paschal lamb is quite different from the paschal

¹ Zúzent on Hārith's *Mo'all.* i. 69; Bokhávi. vi. 207 (Bulak vocalized edition).

sacrifices of Deuteronomy and from the ancient firstlings. In Deuteronomy, for example, the sacrifices may be either from the flock or from the herd, and are boiled, not roasted (A.V. in Deut. xvi. 7 mistranslates); the paschal lamb is necessarily roasted, and the only traces of sacrificial character that remain to it are the sprinkling of the blood on the lintel and door-posts,¹ and the burning of what is not eaten of it. After the restoration the passover seems to have retained its domestic character, for, though the feast at the sanctuary was renewed, its public features now consisted of a series of holocausts and sin-offerings continued for seven days (Num. xxix. 16 sq.). The feast is now exactly dated.² The paschal lamb is chosen on the tenth day of the first month (Abib or Nisan) and slain on the evening of the fourteenth. Next day—that is, the fifteenth—is now the first day of the feast proper (a change from the Deuteronomic ordinance naturally flowing from the fact that the properly paschal ceremony is now not festal but domestic), so that the seven days end with the twenty first and close with a “holy assembly” at Jerusalem. The old ceremony of presenting the first sheaf had been fixed, in Lev. xxiii. 11, for the “morrow after the Sabbath.” This naturally means that the solemn opening of harvest was to take place on a Sunday. But when the feast was fixed to set days of the month the “Sabbath” was taken to mean the first day of the feast or of unleavened bread (Nisan 15), and the sheaf was presented on the sixteenth.³ As the feast was now again a great pilgrimage occasion, there was a natural tendency to restore to the paschal lamb a more strictly sacrificial character. This tendency does not appear as yet in the Pentateuch, where the latest provisions are those put in historical form in Exod. xii.; but in 2 Chron. xxxv., which must be taken as describing the practice of the author’s own time, the paschal lamb is slain before the temple, the blood is sprinkled and the fat burned (? verse 14) on the altar; and at the same time we find the Deuteronomic paschal sacrifices existing side by side with the paschal lamb of the later law as subsidiary sacrifices. The later Jewish usage followed this practice; the Deuteronomic sacrifices in their new subsidiary form constituted the so-called *ḥagiga*. The pre-eminent importance which the passover (with the feast of unleavened bread) acquired after the exile, from the fact that its rites, like those of the Sabbath and of circumcision, could be in great part adapted to the circumstances of the dispersion, was still further increased by the fall of the second temple, and the ritual of the Mishna (Pesāḥim) was supplemented by the later paschal Haggada. The lamb, however, not being slain at the temple, is not in later praxis regarded as strictly the paschal lamb of the law. Some of the post-Biblical features are of interest in connexion with the New Testament, and especially with the last supper. The company for a single lamb varied from ten to twenty; the bitter herbs and unleavened cakes were dipped in a kind of sweet sauce called *harōseth*; and the meal was accompanied by the circulation of four cups of wine and by songs of praise, particularly the Hallel (Ps. cxiii.—cxviii.).

The history of the passover is one of the most complicated subjects in Hebrew archaeology, and has been a great battlefield of Pentateuch criticism. The present article should therefore be read with the article PENTATEUCH. The older books on Hebrew archaeology are of little use, except for the later Jewish practice;

¹ The sprinkling of blood on a tent in order to put it under divine protection appears also among the Arabs; Wākidi, ed. Kremer, p. 28.

² In everything that has to do with sacrifice a day means the daytime with the following night; in other words, the feast days do not begin in the evening. Compare Reland, *Ant. Heb.*, iv. § 15.

³ This exegesis and practice are as old as the LXX. version of Leviticus. The passage of Leviticus has given rise to much controversy; see the commentaries and Lightfoot’s *Horæ* on Luke vi. 1, Acts ii. 1.

on this full details will be found in Bartolucci’s *Bibliotheca Rabbinica*, or in Bodenschatz’s *Kirchliche Verfassung der Juden*. The Biblical data can only be understood in connexion with a critical view of the Pentateuch, and have been discussed in this connexion by Kucen (*Goldsdienst*), Wellhausen (*Prolegomena*), and others. The present position of those who oppose the Grafian hypothesis may be gathered from Delitzsch’s art. “Passah” in Richm’s *Handwörterbuch*, and from Dillmann’s commentary on Exodus and Leviticus. Hupfeld, *De vera et primitiva Festorum . . . ratione*, 1852–65, and Ewald’s *Antiquities*, may also be consulted. (W. R. S.)

PASSPORT. A passport or safe conduct in time of war is a document granted by a belligerent power to protect persons and property from the operation of hostilities. In the case of the ship of a neutral power, the passport is a requisition by the Government of the neutral state to suffer the vessel to pass freely with her crew, cargo, passengers, &c., without molestation by the belligerents. The requisition, when issued by the civil authorities of the port from which the vessel is fitted out, is called a sea-letter. But the terms passport and sea-letter are often used indiscriminately. A form of sea-letter (*literæ salvi conductus*) is appended to the treaty of the Pyrenees, 1659. The passport is frequently mentioned in treaties, e.g., the treaty of Copenhagen, 1670, between Great Britain and Denmark. The violation of a passport, or safe conduct, is a grave breach of international law. The offence in the United States is punishable by fine and imprisonment where the passport or safe conduct is granted under the authority of the United States (Act of Congress, April 30, 1790). In time of peace a passport is still necessary for foreigners travelling in certain countries, and is always useful, even when not necessary, as a ready means of proving identity. It is usually granted by the foreign office of a state, or by its diplomatic agents abroad. Passports granted in England are subject to a stamp duty of sixpence. They may be granted to naturalized as well as natural-born British subjects. Sweden was the first country to abolish passports in time of peace, and Russia is one of the last to retain them. * They are demandable from foreigners in England on their arrival from abroad by 6 & 7 Will. IV. c. 11, § 3; but this provision is not enforced in practice.

PASTE, or STRASS. See GLASS, vol. x. p. 665.

PASTON LETTERS. This invaluable collection of documents consists of the correspondence of the principal members of the Paston family in Norfolk between the years 1424 and 1506, including several state papers and other documents accidentally in their possession. The papers appear to have been sold by William Paston, second earl of Yarmouth, the last representative of the family, to the antiquary Le Neve early in the 18th century. After Le Neve’s death in 1729 they came into the hands of Mr Thomas Martin of Palgrave, who had married his widow, and upon Martin’s death in or about 1771 were purchased by Worth, a chemist at Diss, from whose executors they were subsequently bought by Mr (afterwards Sir) John Fenn. In 1787 Fenn published two volumes of selections from the MSS., whose extreme value was at once recognized by Horace Walpole and other competent judges. In acknowledgment of his services Fenn received the honour of knighthood, and on this occasion, May 23, 1787, presented to the king three bound volumes of MSS. containing the originals of the documents printed by him. Most unfortunately these volumes have disappeared, and the originals of two more subsequently published by Sir John Fenn, and of a fifth edited after his death by Mr Serjeant Frere, were also lost until very recently. Under these circumstances it is not surprising that doubts should have been raised as to the authenticity of the papers. Their genuineness was impugned by Mr Herman Merivale in No. 8 of the *Fortnightly Review*, but

satisfactorily vindicated on grounds of internal evidence by Mr James Gairdner of the Record Office in No. 11 of the same periodical. Within a year Mr Gairdner's position was established by the discovery (1865) of the originals of the fifth volume at Mr Serjeant Frere's house at Dugate, Cambridgeshire. In 1875 the original MSS. of the third and fourth, with many additional letters, were found at the family mansion of the Freres at Roydon Hall, near Diss. The MSS. presented to the king have not been found, and were probably appropriated by some person about the court. In 1872-75 Mr Gairdner published a most careful and accurate edition in three volumes in Arber's English reprints, accompanied with valuable introductions to each volume, including an historical survey of the reign of Henry VI., notes, and index, and incorporating more than four hundred additional letters derived from Magdalen College, Oxford, and other quarters. Abstracts of some of the additional letters discovered at Roydon were added in an appendix. The total number of documents printed wholly or in abstract is one thousand and six.

A thousand family letters of the 15th century must in any case be full of interest; the Paston letters are peculiarly interesting from the importance and in some respects the representative character of the family. The founder was Clement Paston, a humble peasant living at the end of the 14th century, who throve in the world and gave his son William the sound education which enabled him to rise to the position of justice of the common pleas. Judge Paston acquired much landed property in Norfolk, and in the days of his son John, in 1459, the family was greatly enriched by a bequest from the stout old soldier but grasping usurer Sir John Fastolf, a kinsman of Sir John Paston's wife. The Pastons, however, were even at that time greatly harassed by rival claimants to their estates; and Sir John's legacy involved them in a fresh set of troubles and contentions, which were not allayed until the time of the third Sir John Paston, about 1480. This perturbed state of affairs imparts especial interest to the correspondence, causing it to reflect the general condition of England during the period. It was a time of trouble, when the weakness of the Government had disorganized the administration in every branch, when the succession to the crown itself was contested, when great nobles lived in a condition of civil war, when the prevalent anarchy and discontent found expression in tumultuary insurrections like Cade's, countenanced, as the Paston letters show, by persons of condition, when any man's property might be assailed with or without colour of law by covetous rivals, and upstart families like the Pastons were especially exposed to attack. The correspondence therefore exhibits them in a great variety of relations to their neighbours, friendly or hostile, and abounds with illustrations of the course of public events, as well as of the manners and morals of the time. Nothing is more remarkable than the habitual acquaintance of educated people with the law, which was evidently indispensable to a person of substance. In its broader aspects the correspondence exhibits human nature much as it is now, except for the notable deficiency in public spirit, and the absence of large views or worthy interests in life. The contrast with our own times is instructive, showing how largely commerce and literature, art and travel, have contributed to augment moral and intellectual as well as material wealth. After the death of the second Sir John Paston, grandson of the judge, in 1479, the letters become scanty and of merely personal interest. The family continued to flourish. In the next century it produced Clement Paston, a distinguished naval commander under Henry VIII.; and in the days of Charles II. Sir Robert Paston was raised to the peerage as earl of Yarmouth. His son dissipated

the hereditary property, and the title and the family became extinct upon his death in 1732. (R. G.)

PASTORAL is the name given to a certain class of modern literature in which the "idyl" of the Greeks and the "eclogue" of the Latins are imitated. It was a growth of humanism at the Renaissance, and its first home was Italy. Virgil had been imitated, even in the Middle Ages, but it was the example of THEOCRITUS (*q.v.*) that was originally followed in pastoral. Pastoral, as it appeared in Tuscany in the 16th century, was really a developed eclogue, an idyl which had been expanded from a single scene into a drama. The first dramatic pastoral which is known to exist is the *Favola di Orfeo* of Politian, which was represented at Mantua in 1472. This poem, which has been elegantly translated by Mr J. A. Symonds, was a tragedy, with choral passages, on an idyllic theme, and is perhaps too grave in tone to be considered as a pure piece of pastoral. It led the way more directly to tragedy than to pastoral, and it is the *Il Sacrificio* of Agostino Beccari, which was played at the court of Ferrara in 1554, that is always quoted as the first complete and actual dramatic pastoral in European literature.

In the west of Europe there were various efforts made in the direction of non-dramatic pastoral, which it is hard to classify. Early in the 16th century Alexander Barclay, in England, translated the Latin eclogues of Mantuanus, a scholastic writer of the preceding age. Barnabe Googe, a generation later, in 1563, published his *Eglogs, Epytaphes, and Sonnettes*, a deliberate but not very successful attempt to introduce pastoral into English literature. In France it is difficult to deny the title of pastoral to various productions of the poets of the Pléiade, but especially to Rémy Belleau's pretty miscellany of prose and verse in praise of a country life, called *La Bergerie*. (1565). But the final impulse was given to non-dramatic pastoral by the publication, in 1504, of the famous *Arcadia* of G. Sannazaro, a work which passed through sixty editions before the close of the 16th century, and which was abundantly copied. Torquato Tasso followed Beccari after an interval of twenty years, and by the success of his *Aminta*, which was performed before the court of Ferrara in 1573, secured the popularity of dramatic pastoral. Most of the existing works in this class may be traced back to the influence either of the *Arcadia* or of the *Aminta*. Tasso was immediately succeeded by Alvisio Pasqualigo, who gave a comic turn to pastoral drama, and by Cristoforo Castelletti, in whose hands it grew heroic and romantic, while, finally, Guarini produced in 1590 his famous *Pastor Fido*, and Ongaro his fishermen's pastoral of *Alceo*. During the last quarter of the 16th century pastoral drama was really a power in Italy. Some of the best poetry of the age was written in this form, to be acted privately on the stages of the little court theatres that were everywhere springing up. In a short time music was introduced, and rapidly predominated, until the little forms of tragedy, and pastoral altogether, were merged in opera.

With the reign of Elizabeth a certain tendency to pastoral was introduced in England. In Gascoigne and in Whetstone traces have been observed of a tendency towards the form and spirit of eclogue. It has been conjectured that this tendency, combined with the study of the few extant eclogues of Clément Marot, led Spenser to the composition of what is the finest example of pastoral in the English language, the *Shepherd's Calendar*, printed in 1579. This famous work is divided into twelve eclogues, and is remarkable because of the constancy with which Spenser turns in it from the artificial Latin style of pastoral then popular in Italy, and takes his inspiration direct from Theocritus. It is important to note that this is the first effort made in European litera-

ture to bring upon a pastoral stage the actual rustics of a modern country, using their own peasant dialect. That Spenser's attempt was very imperfectly carried out does not militate against the genuineness of the effort, which the very adoption of such names as Willie and Cuddie, instead of the customary Damon and Daphnis, is enough to prove. Having led up to this work, the influence of which was to be confined to England, we return to Sannazaro's *Arcadia*, which left its mark upon every literature in Europe. This remarkable romance, which was the type and the original of so many succeeding pastorals, is written in rich but not laborious periods of musical prose, into which are inserted at frequent intervals passages of verse, contests between shepherds on the "humile fistula di Coridone," or laments for the death of some beautiful virgin. The characters move in a world of supernatural and brilliant beings; they commune without surprise with "i gloriosi spirti degli boschi," and reflect with singular completeness their author's longing for an innocent voluptuous existence, with no hell or heaven in the background.

It was in Spain that the influence of the *Arcadia* made itself most rapidly felt outside Italy. Gil Vicente, who was also a Portuguese writer, had written Spanish religious pastorals early in the 16th century. But Garcilaso de la Vega is the founder of Spanish pastoral. His first eclogue, *El dulce lamentar de los pastores*, is considered one of the finest poems of its kind in ancient or in modern literature. He wrote little and died early, in 1536. Two Portuguese poets followed him, and composed pastorals in Spanish, Francisco de Sá de Miranda, who imitated Theocritus, and the famous Jorge de Montemayor, whose *Diana* (1524) was founded on Sannazaro's *Arcadia*. Gaspar Gil Polo, after the death of Montemayor in 1561, completed his romance, and published in 1564 a *Diana enamorada*. It will be recollected that both these works are mentioned with respect, in their kind, by Cervantes. The author of *Don Quixote* himself published an admirable pastoral romance, *Galatea*, in 1584. The rise of the taste for picaresque literature in Spain towards the close of the 16th century was fatal to the writers of pastoral. In Portugal it can hardly be said that this form of literature has ever existed, although Camoens published idyls.

In France there has always been so strong a tendency towards a graceful sort of bucolic literature that it is hard to decide what should and what should not be mentioned here. The charming *pastourelles* of the 13th century, with their knight on horseback and shepherdess by the roadside, need not detain us further than to hint that when the influence of Italian pastoral began to be felt in France these earlier lyrics gave it a national inclination. We have mentioned the *Bergerie* of Rémy Belleau, in which the art of Sannazaro seems to join hands with the simple sweetness of the mediæval *pastourelle*. But there was nothing in France that could compare with the school of Spanish pastoral writers which we have just noticed. Even the typical French pastoral, the *Astrée* of Honoré d'Urfé (1610), has almost more connexion with the knightly romances which Cervantes laughed at than with the pastorals which he praised. D'Urfé had been preceded by Nicolas de Montreux, whose *Bergeries de Juliette* are just worthy of mention. The famous *Astrée* was the result of the study of Tasso's *Aminta* on the one hand and Montemayor's *Diana* on the other, with a strong flavouring of the romantic spirit of the *Amadis*. To remedy the pagan tendency of the *Astrée* a priest, Camus de Pontearré, wrote a series of Christian pastorals. Of the romances which followed in the wake of the *Astrée*, and in which the pastoral element was gradually reduced to a minimum, a succinct but admirable account is given in Mr Saintsbury's

Short History of French Literature. The main authors in this style were Mademoiselle de Scudéry, La Calprenède, and Gomberville. Racon produced in 1625 a pastoral drama, *Les Bergeries*, founded on the *Astrée* of D'Urfé.

In England the movement in favour of Theocritean simplicity which had been introduced by Spenser in the *Shepherd's Calendar* was immediately defeated by the success of Sir Philip Sidney's *Arcadia*, a romance closely modelled on the masterpiece of Sannazaro. So far from attempting to sink to colloquial idiom, and adopt a realism in rustic dialect, the tenor of Sidney's narrative is even more grave and stately than it is conceivable that the conversation of the most serious nobles can have ever been. In these two remarkable books, then, we have two great contemporaries and friends, the leading men of letters of their generation, trying their earliest flights in the region of pastoral, and producing typical masterpieces in each of the two great branches of that species of poetry. Henceforward, in England, pastoral took one or other of these forms. It very shortly appeared, however, that the Sannazarean form was more suited to the temper of the age, even in England, than the Theocritean. In 1583 a great impetus was given to the former by Robert Greene, who was composing his *Morando*, and still more in 1584 by the publication of two pastoral dramas, the *Gallathea* of Lyly and the *Arraignment of Paris* of Peele. It is doubtful whether either of these writers knew anything about the *Arcadia* of Sidney, which was posthumously published, but Greene, at all events, became more and more imbued with the Italian spirit of pastoral. His *Menaphon* and his *Never too Late* are pure bucolic romances. While in the general form of his stories, however, he follows Sidney, the verse which he introduces is often, especially in the *Menaphon*, extremely rustic and colloquial. In 1589 Lodge appended some eclogues to his *Scilla's Metamorphosis*, but in his *Rosalynde* (1590) he made a much more important contribution to English literature in general, and to Arcadian poetry in particular. This beautiful and fantastic book is modelled more exactly upon the masterpiece of Sannazaro than any other in our language. The other works of Lodge scarcely come under the head of pastoral, although his *Phyllis* in 1593 included some pastoral sonnets, and his *Margarite of America* (1596) is modelled in form upon the *Arcadia*. The *Six Idyllia* of 1588, paraphrases of Theocritus, are anonymous, but conjecture has attributed them to Sir Edward Dyer. In 1598 Bartholomew Young published an English version of the *Diana* of Montemayor.

In 1585 Watson published his collection of Latin elegiacal eclogues, entitled *Amyntas*, which was translated into English by Abraham Fraunce in 1587. Watson is also the author of two frigid pastorals, *Melibæus* (1590) and *Amyntæ Gaudia* (1592). John Dickenson printed at a date unstated, but probably not later than 1592, a "passionate eclogue" called *The Shepherd's Complaint*, which begins with a harsh burst of hexameters, but which soon settles down into a harmonious prose story, with lyrical interludes. In 1594 the same writer published the romance of *Arisbas*. Drayton is the next pastoral poet in date of publication. His *Idea: Shepherd's Garland* bears the date 1593, but was probably written much earlier. In 1595 the same poet produced an *Endimion and Phoebe*, which was the least happy of his works. He then turned his fluent pen to the other branches of poetic literature; but after more than thirty years, at the very close of his life, he returned to this early love, and published in 1627 two pastorals; *The Quest of Cynthia* and *The Shepherd's Sirena*. The general character of all these pieces is rich, but vague and unimpassioned. The *Queen's Arcadia* of Daniel must be allowed to lie open to the same

charge, and to have been written rather in accordance with a fashion, than in following of the author's predominant impulse. It may be added that the extremely bucolic title of Warner's first work, *Pan: his Syrinx*, is misleading. These prose stories have nothing pastoral about them. The singular eclogue by Barnfield, *The Affectionate Shepherd*, printed in 1594, is an exercise on the theme "O crudelis Alexi, nihil mea carmina curas," and, in spite of its juvenility and indiscretion, takes rank as the first really poetical following of Spenser and Virgil, in distinction to Sidney and Sannazaro. Marlowe's pastoral lyric *Come live with Me*, although not printed until 1599, has been attributed to 1589. In 1600 was printed the anonymous pastoral comedy in rhyme, *The Maid's Metamorphosis*, long attributed to Lyly.

With the close of the 16th century pastoral literature was not extinguished in England as suddenly or as completely as it was in Italy and Spain. Throughout the romantic Jacobean age the English love of country life asserted itself under the guise of pastoral sentiment, and the influence of Tasso and Guarini was felt in England just when it had ceased to be active in Italy. In England it became the fashion to publish lyrical eclogues, usually in short measure, a class of poetry peculiar to the nation and to that age. The lighter staves of *The Shepherd's Calendar* were the model after which all these graceful productions were drawn. We must confine ourselves to a brief enumeration of the principal among these Jacobean eclogues. Nicholas Breton came first with his *Passionate Shepherd* in 1604. Wither followed with *The Shepherd's Hunting* in 1615, and Braithwaite, an inferior writer, published *The Poet's Willow* in 1613 and *Shepherd's Tales* in 1621. The mention of Wither must recall to our minds that of his friend William Browne, who published in 1613-16 his beautiful collection of Devonshire idylls called *Britannia's Pastorals*. These were in heroic verse, and less distinctly Spenserian in character than those eclogues recently mentioned. In 1614 Browne, Wither, Christopher Brook, and Davies of Hereford united in the composition of a little volume of pastorals entitled *The Shepherd's Pipe*. Meanwhile the composition of pastoral dramas was not entirely discontinued. In 1606 Day dramatized part of Sidney's *Arcadia* in his *Ile of Gulls*, and about 1625 the Rev. Thomas Goffe composed his *Careless Shepherdess*, which Ben Jonson deigned to imitate in the opening lines of his *Sad Shepherd*. In 1610 Fletcher produced his *Faithful Shepherdess* in emulation of the *Aminta* of Tasso. This is the principal pastoral play in our language, and, in spite of its faults in moral taste, it preserves a fascination which has evaporated from most of its fellows. The *Arcades* of Milton is scarcely dramatic; but it is a bucolic ode of great stateliness and beauty. In the *Sad Shepherd*, which was perhaps written about 1635, and in his pastoral masques, we see Ben Jonson not disdaining to follow along the track that Fletcher had pointed out in the *Faithful Shepherdess*. With the *Piscatory Eclogues* of Plinias Fletcher, in 1633, we may take leave of the more studied forms of pastoral in England early in the 17th century.

When pastoral had declined in all the other nations of Europe, it enjoyed a curious recrudescence in Holland. More than a century after date, the *Arcadia* of Sannazaro began to exercise an influence on Dutch literature. Johan van Heenskirck led the way with his popular *Batavische Arcadia* in 1637. In this curious romance the shepherds and shepherdesses move to and fro between Katwijk and the Hague, in a landscape unaffectedly Dutch. Heenskirck had a troop of imitators. Hendrik Zoeteboom published his *Zaanlandsche Arcadia* in 1658, and Lambertus Bos his *Dordtsche Arcadia* in 1662. These local imitations of the suave Italian pastoral were followed by still more crude

romances, the *Rotterdamsche Arcadia* of Willem den Elger, the *Walcherse Arcadia* of Gargon, and the *Noordwijker Arcadia* of Jacobus van der Valk. Germany has nothing to offer us of this class, for the *Diana* of Werder (1644) and *Die adriatische Rosamund* of Zesen (1645) are scarcely pastorals even in form.

In England the writing of eclogues of the sub-Spenserian class of Breton and Wither led in another generation to a rich growth of lyrics which may be roughly called pastoral, but are not strictly bucolic. Carew, Lovelace, Suckling, Stanl y, and Cartwright are lyrists who all contributed to this harvest of country-song, but by far the most copious and the most characteristic of the pastoral lyrists is Herrick. He has, perhaps, no rival in modern literature in this particular direction. His command of his resources, his deep originality and observation, his power of concentrating his genius on the details of rural beauty, his interest in recording homely facts of country life, combined with his extraordinary gift of song to place him in the very first rank among pastoral writers; and it is noticeable that in Herrick's hands, for the first time, the pastoral became a real and modern, instead of being an ideal and humanistic thing. From him we date the recognition in poetry of the humble beauty that lies about our doors. His genius and influence were almost instantly obscured by the Restoration. During the final decline of the Jacobean drama a certain number of pastorals were still produced. Of these the only ones which deserve mention are three dramatic adaptations, Shirley's *Arcadia* (1640), Fanshawe's *Pastor Fido* (1646), and Leonard Willan's *Astr a* (1651). The last pastoral drama in the 17th century was Settle's *Pastor Fido* (1677). The Restoration was extremely unfavourable to this species of literature. Sir Charles Sedley, Aphra Behn, and Congreve published eclogues, and the *Pastoral Dialogue between Thirsis and Strephon* of the first-mentioned was much admired. All of these, however, are in the highest degree insipid and unreal, and partook of the extreme artificiality of the age.

Pastoral came into fashion again early in the 18th century. The controversy in the *Guardian*, the famous critique on Ambrose Philips's *Pastorals*, the anger and rivalry of Pope, and the doubt which must always exist as to Steele's share in the mystification, give 1708 a considerable importance in the annals of bucolic writing. Pope had written his idylls first, and it was a source of infinite annoyance to him that Philips contrived to precede him in publication. He succeeded in throwing ridicule on Philips, however, and his own pastorals were greatly admired. Yet there was some nature in Philips, and, though Pope is more elegant and faultless, he is not one whit more genuinely bucolic than his rival. A far better writer of pastoral than either is Gay, whose *Shepherd's Week* was a serious attempt to throw to the winds the ridiculous Arcadian tradition of nymphs and swains, and to copy Theocritus in his simplicity. Gay was far more successful in executing this pleasing and natural cycle of poems than in writing his pastoral tragedy of *Dione* or his "tragi-comico pastoral farce" of *The What d'ye call it* (1715). He deserves a very high place in the history of English pastoral on the score of his *Shepherd's Week*. Swift proposed to Gay that he should write a Newgate pastoral in which the swains and nymphs should talk and warble in slang. This Gay never did attempt; but a northern admirer of his and Pope's achieved a veritable and lasting success in Lowland Scotch, a dialect then considered no less beneath the dignity of verse. Allan Ramsay's *Gentle Shepherd*, published in 1725, was the last, and remains the most vertebrate and interesting, bucolic drama produced in Great Britain. The literary value of this play has been exaggerated, but it is a very clever and natural essay, and

the best proof of its success as a painting of bucolic life is that it is still a favourite, after a hundred and fifty years, among lowland reapers and milkmaids.

With the *Gentle Shepherd* the chronicle of pastoral in England practically closes. This is at least the last performance which can be described as a developed eclogue of the school of Tasso and Guarini. It is in Switzerland that we find the next important revival of pastoral properly so-called. The taste of the 18th century was very agreeably tickled by the religious idyls of Salomon Gessner, who died in 1787. His *Daphnis und Phillis* and *Der Tod Abel's* were read and imitated throughout Europe. In German literature they left but little mark, but in France they were cleverly copied by Arnaud Berquin. A much more important pastoral writer is Jean Pierre Clovis de Florian, who began by imitating the *Galatea* of Cervantes, and continued with an original bucolic romance entitled *Estelle*. His eclogues had a great popularity, but it was said that they would be perfect if only there were sometimes wolves in the sheepfolds. The tone of Florian, as a matter of fact, is tame to fatuity. Neither in France nor in Germany did the shepherds and shepherdesses enjoy any considerable vogue. It has always been noticeable that pastoral is a form of literature which disappears before a breath of ridicule. Neither Gessner nor his follower Abbt were able to survive the laughter of Herder. Since Florian and Gessner there has been no reappearance of bucolic literature properly so-called. The whole spirit of romanticism was fatal to pastoral. Voss in his *Luise* and Goethe in *Hermann und Dorothea* replaced it by poetic scenes from homely and simple life.

Half a century later something like pastoral reappeared in a totally new form, in the fashion for *Dorfgeschichten*. About 1830 the Danish poet S. S. Blicher, whose work connects the grim studies of our own Crabbe with the milder modern strain of pastoral, began to publish his studies of out-door romance among the poor in Jutland. Immermann followed in Germany with his novel *Der Oberhof* in 1839. Auerbach, who has given to the 19th-century idyl its peculiar character, began to publish his *Schwarzwälder Dorfgeschichten* in 1843. Meanwhile George Sand was writing *Jeanne* in 1844, which was followed by *La Mare au Diable* and *François le Champi*, and in England Clough produced in 1848 his remarkable long-vacation pastoral *The Bothie of Tober-na-Vuolich*. It seems almost certain that these writers followed a simultaneous but independent impulse in this curious return to bucolic life, in which, however, in every case, the old tiresome conventionality and affectation of lady-like airs and graces were entirely dropped. This school of writers was presently enriched in Norway by Björnson, whose *Synnöve Solbakken* was the first of an exquisite series of pastoral romances. But perhaps the best of all modern pastoral romances is Fritz Reuter's *Ut mine Stromtid*, written in the Mecklenburg dialect of German. In England the Dorsetshire poems of Mr Barnes and the Dorsetshire novels of Mr Hardy belong to the same class, which has finally been augmented by the appearance of Mr Munby's remarkable idyl of *Dorothy*. It will be noticed of course that all these recent productions have so much in common with the literature which is produced around them that they almost evade separate classification. It is conceivable that some poet, in following the antiquarian tendency of the age, may enshrine his fancy once more in the five acts of a pure pastoral drama of the school of Tasso and Fletcher, but any great vitality in pastoral is hardly to be looked for in the future. (E. W. G.)

PASTORAL EPISTLES, the name given to three epistles of the New Testament which bear the name of St Paul, and of which two are addressed to Timothy and one to Titus. The reason of their being grouped together

is that they are marked off from the other Pauline epistles by certain common characteristics of language and subject-matter; and the reason of their special name is that they consist almost exclusively of admonitions for the pastoral administration of Christian communities. None of the Pauline epistles have given greater ground for discussion, partly on account of the nature of their contents, partly on account of their philological peculiarities, and partly on account of their historical difficulties.

1. *Contents*.—The Pastoral Epistles are chiefly distinguished from the other Pauline epistles by the prominence which they give to doctrine. From an objective point of view Christian teaching is "the word" (2 Tim. iv. 2), or "the word of God" (2 Tim. ii. 9), or "the doctrine of God our Saviour" (Tit. ii. 10), or "the truth" (1 Tim. iii. 15, 2 Tim. ii. 18; iv. 4; Tit. i. 14), or "the faith" (1 Tim. iv. 1). From the point of view of the individual it is "the knowledge of the truth" (2 Tim. ii. 25; iii. 7); and Christians are those who "believe and know the truth" (1 Tim. iv. 3). It had existed long enough to have become perverted, and hence a stress is laid upon "sound" doctrine¹ (1 Tim. i. 10; 2 Tim. iv. 3; Tit. i. 9; ii. 1; in the plural, "sound words," 1 Tim. vi. 3; 2 Tim. i. 13). It had also tended to become dissociated from right conduct; hence a stress is laid upon a "pure conscience" (1 Tim. i. 19; iii. 8), and the end which it endeavours to attain is "love out of a pure heart, and out of a good conscience, and out of unfeigned faith" (1 Tim. i. 5). Consequently the "things that befit the sound doctrine" are moral attributes and duties (Tit. ii. 1 sq.), and the things that are "contrary to the sound doctrine" (1 Tim. i. 10) are moral vices. This combination of sound doctrine and right conduct is "piety" (εὐσέβεια, 1 Tim. ii. 2; iii. 16; iv. 7, 8; vi. 5, 6, 11; 2 Tim. iii. 4) or "godliness" (θεοσεβεία, 1 Tim. ii. 10); and sound doctrine is, in other words, "the doctrine," or "the truth, that is in harmony with piety" (1 Tim. vi. 3; Tit. i. 1). This doctrine or truth is regarded as a sacred deposit in the hands of the church or community (1 Tim. vi. 20; 2 Tim. i. 14), and is therefore a "common faith" (Tit. i. 4), of which the church is the "pillar and stay" (1 Tim. iii. 15). Its substance appears to be given in 1 Tim. iii. 16, which has been regarded, not without reason, as an rudimentary form of creed, and possibly part of a liturgical hymn. But the church is no longer identical with "them that are being saved" or "the elect"; it is compared to "a great house" which contains vessels "some unto honour, and some unto dishonour" (2 Tim. ii. 20). It is in other words no longer an ideal community, the "Israel of God" (Gal. vi. 16), but a visible society. And, being such, its organization had come to be of more importance than before. But the nature of the organization to which these epistles point is an unsolved problem. The solution of that problem is attended by the preliminary question, which in the absence of collateral evidence cannot be definitely answered, of the relation in which Timothy and Titus are conceived to stand to the other or ordinary officers. According to a tradition mentioned by Eusebius, but for which he gives no definite authority, Timothy was "bishop" of Ephesus and Titus of Crete; according to others their position was rather that of the later "metropolitans"; and some modern writers, accepting one or other of these views, take it as part of the proof that the epistles belong to a period of the 2d century in which the monarchical idea of the episcopate was struggling to assert itself. On the

¹ Most commentators have omitted to note that the word rendered "sound" is a common expression of some of the later Greek philosophers, denoting simply "true," e.g., Epictet., *Dissert.*, i. 11, 28; ii. 15, 2.

other hand, it appears from the epistles themselves that the positions of Timothy and Titus were temporary rather than permanent, and that they were special delegates rather than ordinary officers (1 Tim. iii. 14, 15; iv. 13; Tit. iii. 12). For the ordinary officers the qualifications are almost all moral, and they are so similar to each other, and to the moral qualifications of all Christians, as to imply that the sharp distinctions of later times between one grade of office and another, and between the officers and the other members of the communities, were not yet developed (1 Tim. iii. 2-12; Tit. i. 6-9, possibly also ii. 2-6). The most probable solution of the difficulties which present themselves in relation to the apparent interchange of the names "bishop" and "elder," and to the apparent double use of the word "elder," sometimes as a title and sometimes as a designation of age, is that in these epistles there is an imperfect amalgamation of two forms of organization, Jewish and Gentile: in the former the distinction between the governing and the governed classes was mainly that of age, and the functions of the governing class were mainly those of discipline; in the latter the distinction was mainly that of functions, and the functions were mainly those of administration. (1) The distinction between elder and younger appears in regard to both men and women (1 Tim. v. 1, 2; Tit. ii. 2-6). Out of the elder men some appear to have been chosen or appointed to preside (*οἱ προεστώτες*, 1 Tim. v. 17; a cognate form of the designation is found in Rom. xii. 8, 1 Thess. v. 12, and constitutes almost the only link of connexion between the organization of these and that of the other Pauline epistles), and to have constituted a collective body or "presbytery" (1 Tim. iv. 14, the word was in use to designate the Jewish councils of elders, for which the more common word was *γερονσία*). Their functions, like those of the corresponding officers in the Jewish communities, were probably for the most part disciplinary; to these some of them added the function of teaching (1 Tim. v. 17). The elder women also were charged with disciplinary functions; they had to "train the young women to love their husbands, to love their children, to be sober-minded" (Tit. ii. 3, 4). Out of such of them as were widows some were specially entered on the roll of church-officers (*κατάλογος*), and formed a class which, though it did not long survive the growth of monasticism, is mentioned in almost all early documents which refer to ecclesiastical order (see Smith and Cheetham, *Dict. of Chris. Antiq.*, s.v. "Widows"). Whether the younger men and women, or a selected number of them had, as such, corresponding duties is not clear, but an inference in favour of the supposition may be drawn from a comparison of 1 Tim. v. 1, 2, 13, Acts v. 6, 10. (2) Side by side with this, and sometimes, but not always, blended with it, was the organization which was probably adopted from the contemporary civil societies, especially those in which, as in the Christian communities, there were funds to be administered; the presiding elders, or some of them, were also "bishops" or administrators, and some of the younger men were "deacons" or servants. A bishop was "God's steward" (Tit. i. 7); a deacon was the active helper of the bishops in both administration and discipline.

2. *Language*.—These epistles are distinguished from the other Pauline epistles by many peculiarities of language, of which only a few can be mentioned here. (1) In 1 Timothy there are seventy-four words which are not elsewhere in the New Testament; in 2 Timothy there are forty-six such words, and in Titus forty-eight. In the three epistles taken together there are one hundred and thirty-three words which are not found in the other Pauline epistles, though they are found elsewhere in the New Testament; and many of the most marked and

frequent expressions of St Paul are absent. (2) There is a tendency which is not found elsewhere in the Pauline epistles to form unusual compounds, e.g., *λογομαχεῖν*, *ἐτεροδιδασκαλεῖν*, *ἐψηλοφρονεῖν*, *αὐτοκατάκριτος*. (3) Words are used for which the other Pauline epistles invariably substitute a different, though nearly synonymous, word; e.g., *δεσπότης* is used for *κύριος*, *κτίσμα* for *κτίσις*. (4) The particles, which are even better tests of identity of style than nouns and verbs, are different: the Pauline *γάρ* is rare; *ἄρα*, *ἄρα οὖν*, *εἰ*, *μήπως*, *πάλιν*, *ὥσπερ*, are absent. (5) "In the other Pauline epistles the fulness of the apostle's thought struggles with the expression, and causes peculiar difficulties in exposition. The thoughts slide into one another, and are so intertwined in many forms that not seldom the new thought begins before a correct expression has been given to the thought that preceded. Of this confusion there is no example in the Pastoral Epistles" (Huther, *Introduction*, Eng. tr., p. 10). A complete account of the linguistic peculiarities of these epistles will be found in Holtzmann, pp. 84-117.

3. *Historical Difficulties*.—The historical difficulties to which these epistles give rise are of two kinds:—(1) that of finding a place for them in any period of the recorded life of St Paul, and (2) that of determining the state of theological opinion to which they are relative.

(1) In regard to the first kind of difficulties, each of the three epistles has its own problems.

The data of the historical position of 1 Timothy appear to be (a) that St Paul had gone into Macedonia, (b) that he had left Timothy at Ephesus (i. 3). The chief hypotheses which have been framed to satisfy the conditions which these data imply are the following. (1) The majority of older writers suppose that St Paul left Timothy at Ephesus when he went into Macedonia after the émeute in the theatre (Acts xx. 1). The difficulties in the way of this hypothesis are that Timothy had been sent into Macedonia (Acts xix. 22), and probably at the same time to Corinth (1 Cor. iv. 17), that he had not returned when St Paul himself reached Macedonia, inasmuch as St Paul waited for him there (1 Cor. xvi. 11), that the two were together in Macedonia when 2 Corinthians was written (2 Cor. i. 1), and that they returned together to Asia Minor (Acts xx. 4). Some of these difficulties have been met by the conjecture that Timothy never reached Corinth, but returned to St Paul at Ephesus and rejoined him in Macedonia; but the conjecture implies that Timothy disobeyed the apostle's exhortation to tarry at Ephesus almost as soon as he had received it, and that the apostle, so far from "hoping to come unto him shortly" (1 Tim. iii. 14), was in reality intending to go to Jerusalem and to Rome (Acts xix. 21), not even calling at Ephesus on his way (Acts xx. 17). (2) It has been supposed that there was an unrecorded journey of St Paul into Macedonia during his long stay in Ephesus (Acts xix. 1-20; so Mosheim, Schrader, Wieseler, and Reuss, the last of whom makes the journey extend to Crete and Illyricum). There is little difficulty in the supposition of such a journey into Macedonia, but there is great difficulty in supposing that the epistle was written in the course of it,—first, because its language is not compatible with the idea that Timothy was merely left in temporary charge during a short absence of the apostle, and, secondly, because the epistle implies the existence of an organized community which had existed long enough to have had errors growing up in it (whereas in Acts xx. 29-30 the coming of heretical teachers is regarded as still future), and in which it was possible that a bishop should be "not a novice" (1 Tim. iii. 6). (3) It has been supposed that St Paul wrote the epistle during his imprisonment at Casarea or at Jerusalem; but this does not

avoid the difficulty which is fatal to the two preceding hypotheses, that Timothy had been left at Ephesus when the apostle was "going into Macedonia." (4) In order to avoid this fatal difficulty some writers (especially Otto, *Die geschichtlichen Verhältnisse der Pastoralbriefe*, Leipsic, 1860, and Kölling, *Der erste Brief Pauli an Timotheus*, Berlin, 1882) have attempted a new but impossible translation of 1 Tim. i. 3, so as to make it appear that it was Timothy and not Paul that was going into Macedonia (for criticisms of this attempt see Huther's edition of Meyer's commentary *ad loc.*, and Weiss in the *Studien u. Kritiken* for 1861, p. 577).

The data of the historical position of 2 Timothy appear to be (a) that St Paul either was or had been in Rome (i. 17), (b) that he was in prison (i. 16; ii. 9), (c) that he had already had a trial (iv. 16), (d) that he believed himself to be near the end of his life (iv. 6), (e) that he was expecting shortly to see Timothy (i. 4; iv. 9, 21), (f) that he had been, apparently not long before, at Troas, Corinth, and Miletus (iv. 13, 20). Upon these data two hypotheses have been framed. (1) It has been supposed that the required historical position is to be found at the beginning of the "two whole years" of Acts xxviii. 30, and that consequently the epistle was written before those to the Philippians and Colossians (so, among others, Schrader, Otto, and Reuss). The difficulties in the way of this hypothesis are chiefly two,—first, that of accounting for the complete change of tone between the close anticipation of death of 2 Tim. iv. 6 and the hopefulness of Philippians ii. 23, 24, Philemon 22, and, secondly, that of accounting for the "first defence" of 2 Tim. iii. 16; this Otto does by supposing it to be the process before Festus at Cæsarea, a supposition which implies the very improbable further supposition that the process before Felix was not what was technically known as an "actio," and that the term "make my defence" (Acts xxiv. 10) was wrongly applied by St Paul himself to his own speech. (2) It has been supposed that the required position is to be found in the period immediately succeeding the "two whole years" of Acts xxviii. 30, and that the epistle was written after those to the Philippians and Colossians (so, among others, Wieseler). One of the main difficulties in the way of this hypothesis is that it implies an interval of at least four years since the journey referred to in chap. iv., and that it is incredible that St Paul should have written to a disciple in Asia Minor to mention the casual incidents of a voyage—such as the leaving a cloak at Troas and a companion sick at Miletus—which had occurred several years before; the difficulty would not be much lessened even if the ingenious conjectures were adopted by which Wieseler endeavours to identify this voyage with that of Acts xxvii.

The data of the historical position of the epistle to Titus are (a) that Paul and Titus had been in Crete together, and that Titus had been left there, (b) that Paul was intending to winter at Nicopolis (wherever that may be, places of that name being found in several Roman provinces). Upon these data many conjectures have been built. It has been supposed that St Paul visited Crete either (1) at the commencement of this second missionary journey (Acts xv. 41), or (2) during his residence at Corinth (Acts xviii. 1, 8; so Michaelis and Thiersch). Each of these conjectures is met, in addition to other difficulties, by the fact, which seems fatal to it, that Apollos, who is mentioned in Titus iii. 13, was not known to Paul and his company until after the second missionary journey (Acts xviii. 24). (3) The same fact is also fatal to the supposition of Hug and others that the visit to Crete took place during the journey from Corinth to Ephesus (Acts xviii. 18, 19), a supposition which is also inconsistent with the apostle's apparent desire to reach Syria without much

delay, and which requires for its support the further supposition that, although on his way to Antioch and Cæsarea, he had selected the almost unknown town of Nicopolis in Cilicia to winter in. (4) It has been supposed (Credner) that the visit to Crete was made as a detour in the course of the journey from Antioch to Ephesus (Acts xviii. 22, 23; xix. 1); this is not only improbable in itself but also inconsistent with the summary of that journey: "Paul, having passed through the upper," i.e., the inland, "country, came to Ephesus." (5) It has been supposed that St Paul called at Crete in the course of a journey which he probably made to Corinth during his long sojourn at Ephesus (so Wieseler, who thinks that he went first to Macedonia, 1 Tim. i. 3, and thence to Corinth, Crete, and back to Ephesus; and Reuss, who thinks that the route was Ephesus, Crete, Corinth, Illyricum, Macedonia, Ephesus); but this supposition seems to be excluded by the inconsistency between the expressed intention to winter in Nicopolis (Tit. iii. 12) and the similar intention to pass the same winter at Corinth (1 Cor. xvi. 6), unless the ingenious hypothesis of Wieseler be adopted that he intended to spend part of the winter in one place and the rest in the other. (6) It has been supposed that he made his journey from Macedonia to Greece (Acts xx. 1–3) by way of Crete (so Matthies); but this supposition seems to be excluded by the fact that in 2 Cor. viii. 6, 17 (which was written from Macedonia), Titus who had been with Paul in Macedonia had gone forward on his own account not to Crete but to Corinth. And all these endeavours to find a place for the epistle in St Paul's life before his voyage to Rome are met by the improbability that, if Crete had been already so far Christianized as to have communities in several cities (which is implied in Tit. i. 5), there should be no hint of the fact in Acts xxvii. 7–13.

The difficulties of all endeavours to find a place for these epistles in the recorded history of St Paul have been so strongly felt by most of those modern writers who support their authenticity that such writers have generally transferred them to an unrecorded period of his life, subsequent to the close of the Acts of the Apostles. The external authorities for the belief that there was such a period, and that in the course of it St Paul underwent a second imprisonment, are chiefly the statement of Clement of Rome that he went to "the goal of the West," and that of the Muratorian fragment that he went to Spain (see PAUL, *infra*, p. 422). Both these statements admit of much dispute, the one as to its meaning, the other as to its authority; and their value as evidence is weakened by the fact that Irenæus, Tertullian, and Origen, though they mention the death of the apostle at Rome, say nothing of any journeys subsequent to his arrival there. In the 4th century Eusebius, for the first time, mentions a second imprisonment, but prefixes to his statement the ambiguous words λόγος ἔχει, "there is a story" or "tradition holds." Several fathers subsequent to his time repeat and amplify his statement; but that statement, if accepted, involves the further difficulties on the one hand of finding room for St Paul's journeys before the great Neronian persecution of 64 A.D., and on the other hand of accounting for the fact that, supposing the apostle to have survived that persecution, he makes no mention of it. For all these difficulties more or less plausible answers have been framed, and many narratives of St Paul's unrecorded travels have been written; but, although it may be admitted that such narratives are conceivably true, yet it must be conceded on the other hand that they rest rather upon conjecture than upon evidence. It may be added that the hypothesis of a second imprisonment is rejected not only by writers like Baur and Hilgenfeld, who deny the authenticity of

both the Pastoral Epistles and the other "Epistles of the Captivity," but also by conservative writers, such as Meyer, Elbrard, Otto, Wieseler, Thiersch, and De Pressensé.

(2) The second kind of historical difficulties, that of determining the state of theological opinion to which these epistles are relative, arises partly from the incidental nature of the references to false teachers in the epistles themselves and partly from the fragmentary character of our knowledge of contemporary teaching. The characteristics of the false teachers are mainly the following. (i.) They once held "sound doctrine" but have now fallen away from it (1 Tim. i. 6, 19; vi. 5, 21; 2 Tim. ii. 18); and, puffed up with self-conceit (1 Tim. vi. 4) and claiming to have a special "knowledge" (*γῶσις*, vi. 20; implied also in Tit. i. 16), they oppose the truth (Tit. i. 9; 2 Tim. ii. 25; iii. 8) and teach a different doctrine (1 Tim. i. 3); yet they remain within the church and cause factions within it (Tit. iii. 10). (ii.) They profess asceticism, "forbidding to marry and commanding to abstain from meats," apparently on the ground that some "creatures of God" are evil (1 Tim. iv. 3), and at the same time their moral practice is perverted, they are "unto every good work reprobate" (1 Tim. vi. 5; 2 Tim. iii. 13; Tit. i. 16), and they make their teaching of religion a means of gain (1 Tim. vi. 5; Tit. i. 11). (iii.) Their teaching is concerned with "fables and endless genealogies" (1 Tim. i. 4; Tit. i. 14), with questionings and disputes of words (1 Tim. vi. 4), with empty sounds and contradictions (1 Tim. vi. 20), with "profane and old wives' fables" (1 Tim. iv. 7), with "foolish questionings and genealogies, and strifes and fightings about the law" (Tit. iii. 9), and they held that the "resurrection is past already" (2 Tim. ii. 18). It has been sometimes held that these statements refer rather to errors of practice than errors of doctrine, and rather to tendencies than to matured systems (Reuss); and it has also been sometimes held that different forms of opinion are referred to in either different epistles or different parts of the same epistle (Credner, Thiersch, Hilgenfeld); but the majority of writers think that the reference is to a single definite form of error. The main question upon which opinions are divided is whether the basis of this false teaching was Judaistic or Gnostic, *i.e.*, whether that teaching was a rationalizing form of Judaism or a Judaizing form of Gnosticism. (1) The former of these views branches out into many forms, and is held on various grounds. It is sometimes held that the reference is to the allegorizing and rationalizing school of which Philo is the chief representative, and which was endeavouring to take root in Christian soil, the "fables" being the allegorical interpretations of historical facts, the "genealogies" those of the Pentateuch, or possibly the Pentateuch itself, which served as the basis of philosophical speculations (Wiesinger, Hofmann). It is sometimes held that the reference is to what in later times was known as the Kabbalah, the assumption being made that the Kabbalah must be dated many centuries earlier than other testimony warrants us in believing (so Vitringa, Grotius, Schöttgen, and more recently Olshausen and Baumgarten). It is sometimes held that the false teachers were not so much theosophic as thaumaturgic, allied to the Judeo-Samaritan school of which Simon Magus is the typical representative, and that this is the point of the reference to Jannes and Jambres and to "jugglers . . . deceiving and being deceived" (2 Tim. iii. 8, 13). It is sometimes supposed that they combined Essenism with a form of Ebionism, and this view (the ablest supporter of which is Mangold, *Die Irrlehrer der Pastoralbriefe*, 1856) is that which now prevails among those who contend for the early date of the epistles, if not for their authenticity. (2) It is contended on the other hand that none of these theories quite

cover the facts. It is maintained that genealogies did not take the place in the Jewish speculative schools which they evidently had in the false teaching to which these epistles refer; that even if they had done so it is difficult to account for the epithet "endless" which is applied to them; that there is no sufficient proof that the Essenes held a dualistic theory of the relation of spirit to matter, or that they denied the resurrection (the testimony of Hippolytus on this point being more probable than that of Josephus), or that they taught for gain, or that they prosecuted a propaganda among women (2 Tim. iii. 6). It is further contended that all these points are generally characteristic of Gnosticism. The use of the epithet "falsely so called," it is urged, shows that "knowledge" (*γῶσις*) is used in a technical sense; in the "endless genealogies" writers so early as Irenæus and Tertullian recognized Gnostic systems of æons, to which the phrase seems exactly to apply; the abstinence from meats and from marriage belongs not to any form of Judaism but to Gnostic theories of the nature of matter; the description of the teachers as making a gain of their teaching and as "taking captive silly women laden with sins" suits no one so well as the half-converted rhetoricians who brought into Christian communities the practices as well as the beliefs of the degenerate philosophical schools of the empire. It is probable that this view is substantially correct; at the same time it may be granted that the evidence is too scanty to allow of the identification of the Gnostics to which reference is made with any particular Gnostic sect, and that the several attempts which have been made so to identify them have failed.

The result of this combination of difficulties—the differences between the pastoral epistles and the other Pauline epistles in respect of the character of their contents, their philological peculiarities, the difficulty of reconciling the historical references with what is known from other sources of the life of St Paul, the difficulty of finding any known form of belief which precisely answers to the opinions which they attack, and the further difficulty of believing that so elaborate a debasement of Christianity had grown up in the brief interval between St Paul's first contact with Hellenism and his death—has been to make the majority of modern critics question or deny their authenticity. The first important attacks were that of Schleiermacher, who, however, only rejected 1 Timothy, and a few years afterwards that of Eichhorn, who rejected all three; but the modern criticism of them practically begins with Baur's treatise *Die sogenannten Pastoralbriefe des Apostels Paulus* in 1835. Since then the controversy has been keenly waged on both sides; the history of it will be found in Holtzmann, *Die Pastoralbriefe* (Leipsic, 1880), which is by far the ablest work on the negative side of the controversy, and which, whether its conclusions be accepted or not, is more full of accurate information than any other. The most available works on the conservative side, for English readers, are the translation of Luther's edition of Meyer's *Commentary* (Edinburgh, 1881); Dr Wace's introduction to the Pastoral Epistles in the *Speaker's Commentary* (London, 1881); and Archdeacon Farrar's excursus on "The Genuineness of the Pastoral Epistles" in his *St Paul* (vol. ii. p. 607). (E. H.A.)

PASTORAL LETTER, a letter addressed, in his pastoral capacity, by a bishop to his clergy, or the laity of his diocese, or both. In the Church of Rome it is usual for every bishop to issue at least one pastoral annually, the Lenten Mandates or Instructions, containing exhortations relating to that fast, and enumerating the dispensations granted and devotions prescribed. Others are issued in connexion with the principal solemnities of the church, or as occasion arises.

PATAGONIA, in the widest application of the name, is that portion of South America which, to the east of the Andes, lies south of Rio Negro (mouth in $41^{\circ} 5' \text{ S. lat.}$), and, to the west of the Andes, south of the Chilean province of Chiloe,¹ with a total area of 322,550 square miles (306,475 continental, 16,075 insular) according to Dr E. Wisotzki's measurement (Behm and Wagner, *Bevölkerung der Erde*, 1880). By the treaty of 22d October 1881 this vast region was divided between Chili and the Argentine Republic, the boundary being the unexplored watershed of the Andes down to $52^{\circ} \text{ S. lat.}$, and then continuing along the parallel to $70^{\circ} \text{ W. long.}$, thence to Point Dungeness, and so southwards (through Tierra del Fuego) along the meridian of $68^{\circ} 34' \text{ W. long.}$ ² In this way about 62,930 of the 322,550 square miles fall to Chili and 259,620 to the Argentine Republic.³

The Chilean portion, the main bulk of which is comprised under the title of Magellan Territory (*Territorio Magallanes*), is chiefly remarkable for the way in which the combined action of glacier and sea has cut up the country into a multitude of rugged and irregular islands and peninsulas, separated by intricate channels and fjords. South of Chiloe, the first great island of the Chilean coast, the islands are grouped under the name of the Chonos Archipelago, which is bounded on the south by the spacious Gulf of Peñas. The Chonos Islands (upwards of 1000 in number, without counting mere islets and rocks) are without exception mountainous, and in some cases the summits remain white throughout the year, though in the lowlands snow lies only a few days. The general temperature is remarkably even. A thick covering of vegetation (low and stunted on the seaward parts) is spread over nearly all the surface, but the layer of vegetable soil is very thin. Potatoes grow wild, and cabbage, onions, radish, &c., are cultivated. The sea-elephant appears to be exterminated; seals still abound. On Taytao peninsula is found the pudu, the smallest known deer. The old Indian inhabitants—Chonos—are practically extinct, though their sitting mummies give name to Momias Bay, and they still occupy some of the islands far south near Magellan's Strait. There are only one or two permanent settlements in the whole archipelago—on the Guaitecas Islands ($43^{\circ} 52' \text{ S. lat.}$) and at Puerto Americano or Tangbac ($45^{\circ} \text{ S. lat.}$). Woodcutters, however, visit the islands in considerable numbers for the sake of their valuable timber, mainly ciprés (*Libocedrus tetragon*). Besides Magdalena—which is by far the largest of the whole group and contains the extinct volcano of Motalat, 5400 feet high—it is enough to mention Chaffers, Forsyth, Johnson, Tahuenahuec, Narborough (named after the old English explorer), Stokes, Benjamin, James, Melchor, Victoria, Luz, and Rivero Islands. The broad Moraleda Channel, from 75 to 175 fathoms deep, which may be said to separate the rest of the archipelago from Magdalena and the mainland, is continued south by the Costa and Elefantes Channels, and would have proved of great service to navigation had it not been that the southern exit is barred by the narrow isthmus of Ofqui, which alone prevents the strangely formed Taytao peninsula from being an island. The glacier of San Rafael, which discharges into the lagoon of the same name on the north side of the isthmus, is nearer the equator than any other coast-glacier in the world.⁴

South of the Gulf of Peñas a navigable channel exists between the mainland and the long succession of islands which, under the names of Wellington Island (150 miles long), Madre de Dios Archipelago, Hanover Island, and Queen Adelaide Archipelago, extend for about 400 miles to the mouth of Magellan's Strait; and it is now regularly used by steamers, which are thus protected from the terrible western storms that make the deep-sea passage along this coast so dangerous. At one or two points only is the navigation difficult—at the English Narrows in Messier Channel (as the northern division is called), and at the Guia Narrows farther south. The scenery throughout is of the most beautiful and picturesque description. Among the serviceable inlets are Connor Cove, Port Grappler, Puerto Bueno (pointed out by Sarmiento), and Isthmus Harbour.⁵

The southern coast of Patagonia is bounded for 365 miles by Magellan's Strait,⁶ which separates the mainland from the countless islands of the Tierra del Fuego archipelago and breaks it up into a number of very irregular peninsulas. Of these the largest are King William IV. Land and Brunswick Peninsula, and between them lies the extensive inlet of Otway Water, which is further connected westward by Fitzroy Channel with Skyring Water. On the east coast of Brunswick Peninsula, opposite the Broad Reach of the strait, and in the finest part of the straitward district, lies the Chilean military post and penal settlement of Punta Arenas or Sandy Point. It was founded in 1851 as a substitute for the unfortunate Port Famine settlement, which lay farther south on the same coast. In spite of convict mutinies (as in 1878) and the questionable character of many of the settlers (chiefly Chilotes), Punta Arenas begins to flourish; in 1875 its population was 915, and since that date a series of "factories" or cattle-stations have been established along the coast to north and south. The country behind the settlement, unlike the districts at either end of the strait, is well wooded, mainly with Chilean beech (*Fagus antarctica*) and Winter's bark (*Drimys Winteri*, so called after Captain Winter, Drake's companion), and considerable quantities of timber are exported. Coal also, though of inferior quality, is worked in the neighbourhood.⁷

Patagonia east of the Andes is for the most part a region of vast steppe-like plains. Unlike the pampas of the Argentine Republic, with which it is conterminous on the north, it rises in a succession of abrupt steps or terraces about 300 feet at a time, and is covered, not with soft stoneless soil, but with an enormous bed of shingle, which instead of luxuriant grass supports, where it is not absolutely bare, only a thin clothing of coarse and often thorny brushwood and herbage. So peculiar is this, the largest tract of shingle in the world, that from D'Orbigny downwards geologists have generally characterized it simply as the Patagonian formation. It is of Tertiary marine origin; but, whilst Bove makes it correspond to the Miocene subdivision, Doering (Roca's expedition) assigns it to the somewhat older Oligocene. Beneath the shingle, which is sometimes at least 200 feet thick, and has its pebbles whitewashed and cemented together by an aluminous substance, there stretches a vast deposit, sometimes more than 800 feet thick, of a soft infusorial stone resembling chalk. In the hollows of the plain as far south as

¹ Chiloe is sometimes considered part of Patagonia.

² Of the Tierra del Fuego archipelago 20,341 square miles are Chilean and 7890 Argentine.

³ Documents in regard to the disputed possession will be found in Quesada, *La Patagonia y las Tierras Australes*, Buenos Ayres, 1875. By a treaty in 1856 the *uti possidetis* of 1810 was accepted.

⁴ The Chonos Archipelago was explored by E. Simpson of the Chilean navy in 1871-72. See map and text in *Petermann's Mittheil.*, 1878

⁵ See Lieut. Eardley-Wilmot, *Our Journal in the Pacific*, 1873, especially the appendix; and *The Voyages of the "Adventure" and the "Beagle."*

⁶ Magellan's Strait was first named, probably by its discoverer, *Canal de Todos los Santos*, and in older writers often appears as *Estrecho Patagónico* and *Estrecho de la nave Victoria* (Magellan's ship).

⁷ Punta Arenas was a German station for the observation of the transit of Venus in 1882.

Santa Cruz there are frequently lakes or ponds; they are generally impregnated with common salt, Epsom salts, or some other mineral ingredient, the substance varying from lake to lake without any regularity of distribution (see Burmeister, *La République Argentine*, vol. ii. (1876) appendix). Certain limited tracts with finer soil and richer vegetation occur, especially in the river-valleys, but the general aspect of the plains is one of sterility and desolation.

The most ordinary bushes are the jume (*Salicornia*) and the calafate (*Berberis burifolia*); the ashes of the former contain 41 per cent. of soda, and the latter makes excellent fuel and bears a pleasant bluish-purple berry known to the older English explorers as Magellan's grape. Among the perennial herbs may be named *Strongyloma struthium*, Chuquiragas, Adesmas, Azorellas. The palm-tree mentioned by many travellers as growing on the south coast is really a kind of fern, *Lomaria boryana*.¹

The guanaco, the puma, the zorro or *Canis Azara* (a kind of fox), the zorrino or *Mephitis patagonica* (a kind of skunk), and the tuco-tuco or *Ctenomys magellanicus* (a kind of rodent) are the most characteristic mammals of the Patagonian plains. Vast herds of the guanaco roam over the country, and form with the ostrich (*Rhea americana*, and more rarely *Rhea Darwinii*) the chief means of subsistence for the native tribes, who hunt them on horseback with dogs and bolas.

Bird-life is often wonderfully abundant. The carranca or carrion-hawk (*Polyborus Tharus*) is one of the characteristic objects of a Patagonian landscape; the presence of long-tailed green parrots (*Conurus cyanolysis*) as far south as the shores of the strait attracted the attention of the earlier navigators; and humming-birds may be seen flying amidst the falling snow. Of the many kinds of water-fowl it is enough to mention the flamingo, the upland goose, and in the strait the remarkable steamer duck.

As the Andes are approached, a great change is observed in the whole condition of the country. The shingle is replaced by porphyry and granite and vast masses of basalt and lava; vegetation becomes luxuriant, majestic trees—evergreen beeches, alerces, ciprés, araucarias, &c.—combined with jungle-like underwood clothing the ravines and hillsides; and, with the richer plant life, animal life grows more abundant and varied, deer, peccaries, wild cattle, and wild horses² finding fitting pasture. The fruit trees planted by the Jesuits in the neighbourhood of Lake Nahuel-Huapi have spread into vast natural orchards, which furnish the local tribes of Araucanians with food and wine, and have given rise to the designation Manzanos or apple-folk by which they are distinguished.

Eastern Patagonia is traversed from west to east by a considerable number of rivers, but few if any can ever be of much use as highways. In their passage seawards they are joined by comparatively few tributaries from the low country; rain falls seldom, and the water sinks away among the shingle and sand. The Rio Negro, which separates the pampas from Patagonia proper, is formed by the junction of the Neuquen and the Limay. The former collects by numerous channels the drainage of the Andes between 36° 25' and 38° 40'; the latter has its main source in the great Nahuel-Huapi Lake, which was discovered in 1690 by Mascordi the Jesuit (whose station on the lake was maintained till 1723), and is reached from Chili by the Bariloche pass, rediscovered by Jorge Rohde in 1882. For some distance the Rio Negro is navigable for steamers drawing 12 feet, but only vessels with powerful engines can make head against the current. South of this river there stretches north and south a chain of hills—the Valehita and Uttak range—which, lying from 50 to 100 miles from the coast, forms a secondary watershed, draining westward into the plain as well as eastward to the Atlantic. The next great Andean river is the Chubut (Chubut or Chuba, i.e., crosion), which gives its name of

Chubut Territory to the northern division of Argentine Patagonia, and is well known from the Welsh colonies established in its valley in 1865 by Mr. Lewis Jones. Its northmost affluent rises probably a little south of Nahuel-Huapi, about 41° 25', and its southmost between 46° and 47°. The latter stream, the Sengel or Senguer (explored by Durnford 1877, Moyano 1880), has this peculiarity, that, before entering the shallow basin of Lake Colguapa (Huapi), Colhne, or, as Thomas and Moreno call it, Dillon, the volume of water is so much larger than when it issues again that the Welsh settlers distinguish the lower course of the stream as Sengellen or the Little Sengel.³ Rio Deseado, which disembogues at Port Desire (Puerto Deseado), well known in the early history of the coast, has its source about 46° 42', in the vicinity of a large lake, Buenos Ayres (20 miles long by 14 broad), which lies, however, 600 feet below the level of the river, and consequently has no connexion with it. Of the rivers which unite in the Santa Cruz estuary the Rio Chico (explored by Musters, Moyano, and Lista) and the Chatta or Sheuen (explored by Moyano and Moreno) have little that calls for notice; but the Santa Cruz is connected with the most remarkable cluster of mountain-lakes in the country. The largest of these is Capar or Viedma Lake (discovered by Viedma in 1782); northward it communicates by a narrow channel with what may be distinguished as Moreno Lake, which again opens into San Martin, and southward it discharges into the very irregular Lago Argentino or Fitzroy Lake (discovered, according to Musters, by an adventurer called Holstein in 1868, and next visited by Fallberg), which in its turn probably has extensive ramifications. From the east end of Lago Argentino issues the rapid current of the Santa Cruz. Round these lakes the mountains rise with glaciers and snow-fields from 3000 to 3500 feet, and at the north-west end of Viedma stands the active volcano of Chalten. At the time of Moreno's visit in March (the latter part of summer) gigantic icebergs rising 70 feet above the water continued to float about Lago Argentino. With the melting of the snows the river rose rapidly, and by 17th March was 63 feet above its ordinary level. So swift was its current that the explorers sped down the whole length of its course in twenty-four hours, though they had taken a month to ascend. In some parts the rate was at least 15 miles per hour. The Rio Gallegos, the last of the rivers of Patagonia which flow west and east, is comparatively insignificant except during thaw-floods, when it completely interrupts communication by its wide and raging torrent (see Beerbohm's exciting narrative). The eastern coast of Patagonia contrasts strikingly with the western; hardly an island of any considerable size exists on all the 2036 miles of its development, and it is scooped out into spacious and open gulfs. The peninsula of San José or Valdes to the south of the Gulf of San Matias is quite exceptional. But the whole seaboard offers only one or two safe harbours; and submerged reefs, strong tides, currents, and overfalls combine to render it highly perilous. Besides El Carmen or Patagones, near the mouth of the Rio Negro, a place of 1690 inhabitants in 1869, there is hardly a permanent settlement of any size from the river to the strait; but, since the partition between Chili and the Argentine Republic, beginnings of colonization have been made at the more promising points. A notice of the native Patagonians is given in the article INDIANS (AMERICAN), vol. xii. p. 829; and the history of the Araucanian tribes of the Chilean side has been sketched under AMERICA, vol. i. pp. 701-702.

History.—Patagonia was discovered in 1520 by Magellan, who called the country Tierra de Patagones from the large footsteps observed near his winter quarters at San Julian, and on his passage along the coast named many of the more striking features—Bay of San Matias, Bay of Santa Cruz, Cape of 11,000 Virgins (now simply Cape Virgin or De la Vierge), &c. By 1611 the Patagonian god Setebos (Settaboth in Pigafetta) was familiar to the hearers of the *Tempest*. Rodrigo de Isla, despatched inland in 1535 from San Matias by Alcazava Sotomayor (on whom western Patagonia had been conferred by the king of Spain), was the first to traverse the great Patagonian plain, and, but for the mutiny of his men, he would have struck across the Andes to the Chilean side. Pedro de Mendoza, on whom the country was next bestowed, lived to found Buenos Ayres, but not to carry his explorations to the south. Camargo (1539), Ladrilleros (1557), Hurtado de Mendoza, and Ereilla (1558) helped to make known the western coasts, and Drake's voyage in 1577 down the eastern coast through the strait and northward by Chili and Peru was memorable for several reasons; but the geography of Patagonia owes more to Pedro Sarmiento de Gamboa, who, devoting himself especially to the south-west region, made such careful and accurate surveys that from twenty to thirty of the names which he affixed still appear in maps (Kohl). The settlements which he founded at Nombre de Dios and San Felipe were neglected by the Spanish Government, and the latter was in such a miserable state when Thomas Cavendish visited it in 1587 that he called it Port Famine. The district in the neighbourhood of Port Desire, explored by John Davis about

¹ See Dr Karl Berg, "Eine Naturhist. Reise nach Patagonien," in *Petermann's Mittheilungen*, 1875; and the botanical part of the report of Roca's expedition (résumé in *Nature*, 1884).

² Hence the name Cordillera de Bagnales applied to the southern extremity of the Andes.

³ See Durnford's account in *The Field*, 23d and 30th Dec. 1882, and *Proc. Roy. Geogr. Soc.*, 1883.

the same period, was taken possession of by Sir John Narborough in name of King Charles II. in 1669. In the latter half of the 18th century our knowledge about Patagonia was considerably augmented by Byron (1764-65), Wallis (1766), Bougainville (1766); Thomas Falkner, a Jesuit who "resided near forty years in those parts," published his *Description of Patagonia* (Hereford, 1774); Francesco Viedma founded El Carmen, and Antonio advanced inland to the Andes (1782); and Villarino ascended the Rio Negro (1782). The "Beagle" and "Adventure" expeditions under King (1826-30) and Fitzroy (1832-36) were of first-rate importance, the latter especially from the participation of Charles Darwin; but of the interior of the country nothing was observed except 200 miles of the course of the Santa Cruz. Captain Musters wandered in company with a band of natives through the whole length of the country from the strait to the Manzanos in the north-west, and collected a great deal of information about the people and their mode of life. Since that date explorations of a more scientific character have been carried on by Moreno (1873-80), Rogers (1877), Lista (1878-80), and Moyano (1880, &c.), a convenient survey of which will be found in *Petermann's Mittheilungen*, 1882.

Bibliographical lists for Patagonia are given in Wappäus, *Handbuch der Geogr. u. Stat. des ehemal. span. Mittel- und Süd-Amerika* (Leips., 1863-70); in Quesada's work already quoted; and in Coan, *Adventures in Patagonia* (New York, 1880). It is enough to mention Darwin's *Journal of Researches* (1845) and *Geological Observations on South America* (1846); Snow, *A Two Years' Cruise off . . . Patagonia* (1857); Musters, *At Home with the Patagonians* (1871); Cunningham, *Nat. Hist. of the Strait of Magellan* (1871); Moreno, *Viage a la Patagonia austral* (1879); Lady Florence Dixie, *Across Patagonia* (1880); Lista, *Mis exploraciones . . . en la Patagonia* (Buenos Ayres, 1880); Beerbohm, *Wanderings in Patagonia* (1878); *Informe Oficial . . . de la Exp. al Rio Negro* (under General Roca, 1879, Buenos Ayres, 1882); Giacomo Bove, *Patagonia, Terra del Fuoco* (Genoa, 1883).

(H. A. W.)

PATARENES, a name apparently first used in Milan about the middle of the 11th century to denote the party most extremely opposed to the marriage of priests; besides Patareni, the forms Paterini, Patarelli, Pataræi occur among others. Various etymologies, more or less far-fetched, have been offered; it seems, however, pretty well established that the party was so called because, under the leadership of Arialdus, a deacon of Milan, its members used to assemble in the Pataria, or ragmen's quarter of that city (*pates* being a provincial word for a rag). The name ultimately came to be applied to the dualistic sect of the Cathari, who were opposed to marriage altogether, and indeed was one of their most common designations in Italy, France, and Bosnia.

PATENTS. Patents for inventions, instruments which formerly bore the great seal of the United Kingdom, are now issued at the Patent Office in London under the seal of that office. By their means inventors obtain a monopoly in their inventions for fourteen years, a term which, if insufficient to remunerate the inventor, can be extended. This monopoly is founded on exactly the same principle as the copyright enjoyed by authors and artists. There are persons who argue that no such privilege should be permitted; there are others who think that the most trifling exertions of the inventive faculties should be protected. The right course lies between these extremes. All civilized nations have in modern times considered it desirable to give inventors an exclusive right to their inventions for a limited period, not only as a matter of justice to individuals but as a piece of sound policy tending to the advantage of the whole community. The monopoly is granted in the expectation that the inventor will derive some profit from it; and the hope of profit is known to be a great stimulus to invention. When an author writes a book, or an artist designs a picture, the law allows a right of property to those persons in their productions, and accompanies the recognition of this right with the power to repress infringements. If this were not so, probably very few persons would employ their time in writing books or creating works of art; and hardly any one will be bold enough to assert that the extinction of the race of authors and artists is to be desired. The same principle applies to inventors, who ought to have the works of their brain protected from piracy fully as much as the other classes of mental producers. By holding out to them the prospect of gain they are induced, at a present loss of time

and money, to attempt to discover improvements in the useful arts, in machinery, in manufacturing processes, &c.; and thus the interests of the community are advanced more rapidly than if such exertions had not been brought into play. Just as the rule of rewarding inventors is in theory attended with some difficulty, so is the practical application of it. To grant a very long term of exclusive possession would be detrimental to the public, since it would tend to stop the progress of improvement. A limited property must therefore be allowed,—large enough to give the inventor an opportunity of reaping a fair reward, but not barring the way for an unreasonable period. And, when this compromise has been decided on, it will be seen how difficult it may be to determine beforehand what is the real merit of an invention, and apportion the time to that merit. Hence it has been found necessary to allot one fixed period for all kinds of inventions falling within the purview of the patent laws. This regulation appears to be open to the complaint that the least valuable and the most meritorious inventions are placed on the same footing. But it may be replied that in the result this is of little consequence, since meritorious inventions alone obtain the patronage of the public, those which are destitute of value being neglected. Besides, if the complaint were well founded, there is here no sound argument against the policy of privileges of this nature, seeing that it is impossible to weigh beforehand one invention against another in the scale of merit, or to obtain a true standard of comparison.

Leaving the discussion of general considerations, we will now give an outline of the law affecting patent privileges in the United Kingdom. Formerly the reigning prince considered himself entitled, as part of his prerogative, to grant privileges of the nature of monopolies to any one who had gained his favour. These grants became so numerous that they were oppressive and unjust to various classes of the commonwealth; and hence, in the reign of James I., a statute was wrung from that king which declared all monopolies that were grievous and inconvenient to the subjects of the realm to be void. (See MONOPOLY.) There was, however, a special exception from this enactment of all letters patent and grants of privilege of the "sole working or making of any manner of new manufacture within the realm to the true and first inventor of such manufacture, which others at the time of making such letters patent and grants should not use, so they be not contrary to law, nor mischievous to the state by raising of the prices of commodities at home or hurt of trade or generally inconvenient." Upon these words hangs the whole law of letters patent for inventions. Many statutes were afterwards passed, but these were all repealed by the Patent Act of 1883 (46 and 47 Vict. c. 57), which, besides introducing a new procedure, modified the law in several particulars. When the law remains unaltered, it has to be gathered from the numerous decisions of the courts, for patent law is for the most part "judge-made law." Of the law as it now stands we proceed to give an outline.

The inventions for which patents are obtained are chiefly either vendible articles formed by chemical or mechanical operations, such as cloth, alloys, vulcanized india-rubber, &c., or machinery and apparatus, or processes. It may be remarked here that a scientific principle cannot form the subject of a valid patent unless its application to a practical and useful end and object is shown. An abstract notion, a philosophical idea, may be extremely valuable in the realm of science, but before it is allowed to form a sound basis for a patent the world must be shown how to apply it so as to gain therefrom some immediate material advantage. With regard to processes, the language of the statute of James has been strained to bring them within

the words "any manner of new manufacture," and judges on the bench have admitted that the exposition of the Act has gone much beyond the letter. However, it is undoubted law that a process is patentable; and patents are accordingly obtained for processes every day.

The principal classes of patentable inventions seem to be these:—(1) new contrivances applied to new ends, (2) new contrivances applied to old ends, (3) new combinations of old parts, whether relating to material objects or processes, (4) new methods of applying a well-known object.

With regard to a patent for the new application of a well-known object it may be remarked that there must be some display of ingenuity in making the application, otherwise the patent will be invalid on the ground that the subject-matter is destitute of novelty. For example, a machine already in use as an excavator on land cannot be separately patented as an excavator under water; nor can a machine employed in the finishing of cotton goods be afterwards patented without alteration as applied to the finishing of woollen fabrics. A small amount of invention is indeed sufficient to support a patent where the utility to be derived from the result is great. A small step in advance, a slight deviation from known processes, may have been apparently brought about by the exercise of little ingenuity; but, if the improvement be manifest, either as saving time or labour, a patent in respect of it will stand. The mere omission of a step from some commonly practised process has been held sufficient to support a patent for a new method of manufacture; and how often do we see what appears to be a very trifling degree of novelty attended with very advantageous consequences, sometimes resulting in the entire revolution of a manufacture, or in a lowering of price appreciable in every pound of an article extensively used by the public?

Whatever be the nature of the invention, it must possess the incidents of utility and novelty, else any patent obtained in respect of it will be invalid. The degree of utility need not, however, be great. As to novelty, this is the rock upon which most patents split; for, if it can be shown that other persons have used or published the invention before the date of the patent, it will fall to the ground, although the patentee was an independent inventor deriving his ideas from no one else. The difficulty of steering clear of this rock will be apparent at once. Suppose A in London patents an invention the result of his own ingenuity and patient study, and it afterwards appears that B, in some distant part of the kingdom, had been previously openly using the same thing in his workshop, A's patent is good for nothing. Thus, in one of the cases which arose out of Heath's carburet of manganese patent—a patent celebrated in the law-courts—it appeared that three firms had used a process in the manufacture of steel which was substantially the same as that forming the subject of the patent. They had used the process openly in the way of their trade previous to the date of the patent, although it had not become generally known. This prior use of the invention was held to deprive the patent of validity. It is therefore a very frequent subject of inquiry, whether an invention has been previously used to such an extent as to have been publicly used in the sense attached by the courts to this phrase. The inventor himself is not allowed to use his invention, either in public or secretly, with a view to profit, before the date of the patent. Thus, if he manufactures an article by some new process, keeping the process an entire secret, but selling the produce, he cannot afterwards obtain a patent in respect of it. If he were allowed to do this he might in many cases easily obtain a monopoly in his invention for a much longer period than that allowed by law. The rule that an inventor's use of the "invention

invalidates a subsequent patent does not, however, apply to cases where the use was only by way of experiment with a view to improve or test the invention. And it has been repeatedly decided that the previous experiments of other persons, if incomplete or abandoned before the realization of the discovery, will not have the effect of vitiating a patent. Even the prior discovery of an invention will not prevent another independent discoverer from obtaining a valid patent if the earlier inventor kept the secret to himself, the law holding that he is the "true and first inventor" who first obtains a patent.

When an invention is the joint production of more persons than one, they must all apply for and obtain a joint patent, for a patent is rendered invalid on showing that a material part of the invention was due to some one not named therein. The mere suggestion of a workman employed by an inventor to carry out his ideas will not, however, require that he should be joined, provided that the former adds nothing substantial to the invention, but merely works out in detail the principle discovered by his employer. In certain cases in which patents taken out by the celebrated Sir Richard Arkwright came to be inquired into, it was proved that the inventions were really made by persons in Arkwright's employment. Their value being perceived by him, he adopted them, and obtained the patents in question; but under these circumstances they were adjudged invalid.

If it can be shown that the invention in respect of which a patent has been obtained was previously described in a printed book in circulation in Great Britain, whether such book be in the English or a foreign language, the patent is also invalid, because a man has no right to obtain a monopoly in that which is already a part of the stock of public information; and it is not necessary to prove that the patentee was acquainted with the book, and derived his ideas from that source. The most usual prior publication fatal to a patent is a prior specification of a similar invention. But persons are allowed to obtain patents for inventions imported from abroad, if such inventions are new within the realm, and if they acknowledge, on the face of their applications, that the inventions are imported, not original. Such patents are now common.

The attributes of novelty and utility being possessed in due degree by an invention, the chief remaining difficulty with which a patent has to contend resides in the complete specification, the instrument by which the inventor describes the nature of the invention and the means by which it may be carried into effect. An inventor is bound, in return for the monopoly conceded to him, to instruct the public how to work the invention when the monopoly shall have expired, and to inform them in the meantime what it is they are shut out from using; and now the patent is not granted till the complete specification is filed. The patentee is bound to make by this instrument a full disclosure of his secret; he must not keep anything back either wilfully or accidentally; he must render everything plain and clear, showing no attempt to mislead, and leaving nothing ambiguous; he must distinguish what is old from what is new; he must point out distinctly what it is that he claims as his own exclusive property, and he must take care that he claims no more than he is entitled to. Very many patents have been invalidated by a disregard of the requirements of the law, the most common fault being that the specification claims too much; in other words, it claims something that is already public property, or another man's patented invention. And here we are brought back to the question of novelty. If a patentee discovers that his specification claims more than he is entitled to, he may put the matter right by filing an amendment, and excising the superfluous parts; but he will not be allowed to extend

his claims in any degree. He may cut out anything, but he can insert nothing, except matter which is of the nature of correction or explanation.

The term for which a patent is originally granted is fourteen years, but the crown has been empowered by parliament and through the intervention of the judicial committee of the privy council, before which the proceedings take place, to extend the time of a patent from its expiration for any additional time not longer than fourteen years. But an extension will only be granted on the patentee showing that the invention is meritorious, and that he has not been adequately rewarded in spite of his best efforts directed to that end. What is adequate reward depends on the special circumstances of each case. The crown has hitherto had a right to the free use of a patented invention, but this right has been abolished by the new Act.

Patent privileges, like most other rights, can be made the subject of sale. Partial interests can also be carved out of them by means of licences, instruments which empower other persons to exercise the invention, either universally and for the full time of the patent (when they are tantamount to an assignment of the patentee's entire rights), or for a limited time, or within a limited district. By an exclusive licence is meant one that restrains the patentee from granting other licences to any one else. By means of a licence a patentee may derive benefit from his patent without entering into trade and without running the risks of a partnership.

One of the regulations of the recent Act is that a patentee can be compelled by the Board of Trade to grant licences to persons who are able to show that the patent is not being worked in the United Kingdom, or that the reasonable requirements of the public with respect to the invention cannot be supplied, or that any person is prevented from working or using to the best advantage an invention of which he is possessed.

A patentee's remedy for an infringement of his rights is by civil suit, there being no criminal proceedings in such a case. In prosecuting such suit he subjects those rights to a searching examination, for the alleged infringer is at liberty to show that the invention is not new, that the patentee is not the true and first inventor, &c., as well as to prove that the alleged infringement is not really an infringement. But it may here be remarked that a patentee is not bound down (unless he chooses so to be) to the precise mode of carrying the invention into effect described in the specification. If the principle is new, it is not to be expected that he can describe every mode of working it; he will sufficiently secure the principle by giving some illustrations of it; and no person will be permitted to adopt some mode of carrying the same principle into effect on the ground that such mode has not been described by the patentee. On the other hand, when the principle is not new, a patentee can only secure the particular method which he has invented, and other persons may safely use other methods of effecting the same object. Instances of this occur every day; and it is well known that scores of patents have been taken out for screw-propellers, steam-hammers, water-meters, &c., each of which is limited to the particular construction described, and cannot be extended further. Again, where the invention patented consists of a combination of parts, some old and some new, the whole constituting a new machine or a new process, it is not open to the world to copy the new part and reject the rest. A man is not permitted to allege that the patent is for a combination, and that, the identical combination not having been used, there has been no infringement. If he has borrowed the substance of the invention, it will be held that he has infringed the patent.

A patent may be revoked by a court of law on any one taking proceedings for that purpose, and showing good ground for a revocation, such as want of novelty or utility in the invention, the fact of the patentee not being the inventor, insufficiency of the specification, fraud, or the like.

Patents are not now extended to the colonies, and such of the English colonies as possess a legislature are gradually acquiring patent laws for themselves (see *infra*).

The new Act enables the crown to make arrangements with foreign states for the mutual protection of inventions, under which a person who has applied for protection for any invention in a foreign state will be entitled to apply for a patent in England within a limited time in priority to other applicants (see p. 358).

The patent business of the United Kingdom is transacted at the Patent Office in London under the superintendence of the comptroller, an officer appointed by the Board of Trade, under whose direction he performs his duties. At this office is kept a register of all patents issued, of assignments of patents, licences granted under them, &c. An illustrated journal of patent inventions is published at the same office, where printed copies of all specifications can also be obtained. The proceedings taken with a view to obtain a patent commence with an application drawn up in a special form and accompanied by a description of the invention and a declaration as to its originality. Any person, whether a British subject or not, may apply for a patent. The actual inventor must always be a party to the application, but he may join other persons with himself, and the patent when issued will be granted to them all jointly. The fees payable to Government on patents have been considerably reduced by the new Act, and they may now be paid by convenient annual instalments.

During the ten years ending with 1882 the average annual number of patents issued was 3506. There has been a large increase under the new law, the number of patents applied for in the first three months of 1884 being 5748.

Patents are frequently obtained through the intervention of persons termed patent agents, who devote themselves to this branch of business.

United States.—Under an Act passed in 1874 a patent must in all cases be applied for in the name of the original inventor, although he may contemporaneously execute an assignment of the invention, and the patent will thereupon be issued to the assignee. Every application is referred to an official examiner. The patent will be refused if any part of the invention is wanting in novelty, or if the application is not in proper form. The applicant may, however, make a re-application, and if the inventor is dissatisfied with the report of the examiner he can appeal. Patents are issued for the term of seventeen years, but expire with any earlier foreign patents for the same invention. A foreign inventor may obtain a patent if his invention has not been in public use or on sale in the United States for more than two years prior to his application.

Patent Laws in India and the British Colonies.

Prior to 1852 British letters patent extended to all Her Majesty's colonies, but the Patent Act of 1852 restricted the rights granted to Great Britain and Ireland, the Channel Islands, and the Isle of Man. Soon after the date of this Act the legislatures of the colonies began to pass Acts of their own for the protection of inventions, and at the present time most English colonies have patent laws. As a rule, the application in the colony must be made by petition accompanied with a specification and drawings of similar nature to those used in the British application; and in most cases the application must be made by the inventor himself or by his assignee, or by some person holding his power of attorney. The patents are in all cases assignable and the deeds of assignment must be registered in the respective colonies. The patents are usually granted for a term of fourteen years, and the inventions must not have been publicly used in the colony prior to the date

of the application. Inventions may be protected in most if not all the other British colonies by special Acts of the colonial legislatures.

Australian Colonies.—The colonial Act for New South Wales is dated 14th September 1852. Applications are referred to a board consisting of two scientific men, and upon their report and the payment of £20 the governor will grant letters patent of registration, which have the effect of letters patent. These letters of registration are granted for the term of fourteen years. The New South Wales Act of 1852 still continues in force in Queensland. By an order in council of 6th November 1859 patents similar in terms to those granted in New South Wales can be obtained, and at the same cost. By an Act passed in 1867 inventions can be provisionally protected, but the provisional protection only appears to be useful to residents in the colony. In South Australia the law of patents is governed by the Acts of 1877 and 1881. The application is submitted to an official examination. The patent is granted for a term of fourteen years, and is subject to taxes of £2 10s. to be paid before the end of the third year and £2 10s. before the end of the seventh year. The invention must be worked in the colony within three years from the date of the grant. In Victoria power is given to the governor to issue letters patent by Act No. 240, 1865. The sum of £15 must be paid before the expiration of the third year, and £20 before the expiration of the seventh year. For Western Australia the colonial Act is dated 15th August 1872 under which *bona fide* holders of letters patent in any other country can obtain letters of registration having the force of patents and expiring with the original patent. The government fee is £25. The governor has also power to grant original patents, but these are seldom applied for except by residents in the colony. The government fee on these is £50. The application for a patent must be made before the application is made in any other colony or country.

British Guiana.—The law of patents is governed by an ordinance dated 12th July 1861. Patents are granted very much in the same form and on the same conditions as British letters patent. A duty of \$100 is payable before the end of the seventh year. The governor has power to prolong the term for a period not exceeding seven years.

British Honduras.—The Act for amending the law for granting patents for inventions dated 10th September 1862 rules here. This Act has provisions very similar to the British Patent Law Amendment Act 1852. The government fee on sealing is \$30, and the further government duties payable are \$50 at the end of the third year and \$100 at the end of the seventh year. Prolongations of the original term of fourteen years may be obtained for an additional term not exceeding seven years.

Canada.—The Acts in force are those of 1872, 1875, and 1883. Inventors or their assignees may obtain patents for fifteen years for all inventions not having been in public use or on sale in Canada for more than a year prior to the application. When a period of more than twelve months has elapsed since the date of any other patent for the same invention the application will be refused. A government duty of \$20 must be paid for the first five years, \$40 for the second five years, and \$60 for the last five years. These duties can be paid either altogether on application or by three instalments. The invention must be worked in Canada within two years from the date of the patent. The patent is void if after the expiration of twelve months from the grant the patentee imports into Canada the objects of the invention manufactured elsewhere.

Cape of Good Hope.—The Act of 1860 prescribes a system very similar to that laid down by the English Patent Act of 1852. A stamp duty of £10 is payable at the expiration of the third year and £20 at the expiration of the seventh year of the grant. The patent will expire with the expiration of any earlier patent in any other country for the same invention.

Ceylon.—The inventions ordinance of 1859 governs the law of patents here. Patents are granted for a term of fourteen years from the time of filing the specification, and the governor has power to grant prolongations not exceeding fourteen years. The fee on filing the specification is £10.

Hong-Kong.—By the law of 3d July 1862 the governor in council may grant patents for inventions which have already been patented in England to the inventor or to the owner by assignment of the British patent. The patent will extend over the same term as the British patent. Subjects of foreign states not having British patents cannot obtain patents in Hong-Kong.

India.—The law of patents is governed by an Act dated 17th May 1859. Where there is no prior English patent the invention must not have been used or published before filing the application. Where an English patent has already been obtained, the application must be made within twelve months from the date of the English patent. The exclusive privilege is acquired by merely filing a specification of the invention upon leave obtained from the governor-general for that purpose, and no patent is issued. The governor-general has power to extend the original term for another term not exceeding fourteen years. The government fees on application amount to £10; no further duties are payable.

Jamaica.—Chap. 30, 21 Viet. 1857, governs the law of patents here. The invention must be brought into operation in the island within two years from the date of the patent. A patent bears a stamp duty of £6 10s., and there is a reference to the attorney-general, upon which he is paid a fee of £5. The duration of the patent is limited to that of any previous foreign patent. Improvements on the original invention may be protected by certificates of addition. Patents may be extended for a further period of seven years beyond the original term of fourteen years.

Leeward Islands.—The law is regulated by the Acts of 1876 and 1878, the provisions being similar to those of the English Patent Act of 1852. The patent expires with the termination of any earlier patent elsewhere for the same invention. The payments amount to £28 on every application which is not opposed, and a duty of £10 is payable at the termination of the third year and £20 at the termination of the seventh year.

Mauritius.—The law is regulated by an ordinance dated 22d May 1875. The governor has power to extend patents for any period not exceeding fourteen years beyond the original term of fourteen years. A patent may be applied for by the executors or administrators of a deceased inventor. Payments of £12 are required to be made upon application for the patent and upon sealing.

Natal.—The provisions of the colonial Act of 1870 are similar to those of the English Patent Act of 1852. The fees on sealing are £1 10s., and there is a third year's duty of £5, and a seventh year's duty of £10. The patent expires with the termination of any British or foreign patent of earlier date. The lieutenant-governor can grant a prolongation of the original term for a fresh term not exceeding fourteen years.

Newfoundland.—Under an Act passed in 1856 patents are granted for fourteen years, but may be extended upon application for a further period of seven years. The patent expires with the expiration of any previous foreign patent for the same invention. Improvements may be protected by certificates of addition. The invention must be worked in the colony within two years from the date of the patent.

New Zealand.—Under the New Zealand Patent Act of 1883 inventors can obtain either letters patent or letters of registration as they think fit. The fee for letters of registration is £10, and for letters patent £2 10s., with a further duty of £10 at the end of five years. Letters of registration are granted as of course upon proof of the applicant being the actual owner of the foreign patent. The invention patented must be worked in the colony within two years from the date of the patent.

Tasmania.—The colonial Act for Tasmania is dated 5th November 1858. The proceedings prescribed are very similar to those in England. The government fees are £7 10s. on application, £15 at the end of the third year, and £20 at the end of the seventh year.

Patents may also be obtained in St Helena, the Straits Settlements, and Trinidad.

Foreign Patent Laws.

Argentine Republic.—Patents are granted under a law dated 11th October 1864, for five, ten, or fifteen years, to the inventor or to his assignee. The applications are subjected to an official examination, and the patent when granted is liable to government fees and stamp duties, which vary from about £20 to £60, according to the term of the patent. The invention must not have been published either at home or abroad prior to the application, and must be worked in the republic within two years from the date of the issue of the patent.

Austria-Hungary.—By an imperial decree of the 15th August 1852, although separate patents are issued, they are made upon one application. The protection extends to Bosnia and Herzegovina. Where the applicant for a patent is a foreigner he must have obtained a patent in his own country for the same invention, and patents are only granted to the original inventor or his assignee. Inventions are considered new when at the time of the applications for patents they have not been put into operation or made public in the empire. The government taxes commence at the rate of 26 florins per annum for the first five years, and gradually increase until in the fifteenth year the duty is 132 florins. If the patent is originally granted for less than fifteen years it may at any time be prolonged for that term. The invention must be worked in the empire within a year from the date of the patent, and the working must not be suspended for more than two years; during its continuance there is no objection to the patented articles being imported from a foreign country.

Belgium.—Patents are granted to the inventor or to his assignee, or to any one holding the authority of the inventor for that purpose. The term is fixed at twenty years, except in the case of inventions previously patented elsewhere, when the Belgium patent expires with the previous foreign patent of the greatest length. Patents are subject to an annual tax beginning at 10 francs for the first year, and increasing annually at the rate of 10 francs. Patents of addition expiring with the original patent may be obtained. The invention must be worked in Belgium within one year from its

being worked abroad, but patented articles manufactured abroad may be introduced into Belgium.

Brazil.—By a statute passed in 1882 patents are granted alike to natives and to foreigners. In the case of a foreigner the application must be made in Brazil within seven months from the date of his foreign patent. The specification must be in the Portuguese language. Patents are granted for a term of fifteen years, subject to the payment of a duty of £1 for the first year, and increasing £1 yearly. The patent must be put into operation in Brazil within a year from the date of the grant, and the working must not be interrupted for more than a year. The Brazilian patent expires on the expiration of any earlier foreign patent for the same invention. The foreign patentee must appoint an accredited agent to represent him in Brazil.

Chili.—Patents are granted for a term of ten years, subject to a tax of £10 to be paid on application. An extension of a patent may be obtained when the importance of the invention is considered sufficient to warrant it. The invention must be worked in Chili within a term fixed in the patent, and the working must not be discontinued as long as the patent is valid.

Denmark.—Native inventors may obtain patents for fifteen years, but patents granted to foreigners are limited to five years. A tax of 60 francs is payable on every patent. The invention must be worked in the country during the first year of the patent, and must be continued without interruption, but the patentee can import the patented article into the country from abroad.

France.—Grants of patents (*brevets d'invention*) are regulated in France by the law of 5th July 1844. Patents are granted to inventors or their assignees, whether natives or foreigners, and the French patent expires with any foreign patent of earlier date. Applications for French patents must be made prior to the filing of the complete specification in any foreign country. Patents are granted for a term of fifteen years upon payment of an annual duty of £4. All the duties must be paid up prior to an assignment of the patent being registered. Alterations, additions, or improvements may be protected by patents of addition which expire with the original grant. The subject of the patent must be manufactured entirely in France, and cannot be imported from a foreign country without invalidating the patent. The invention must be put into execution within two years from the date of the grant, and the working must not then cease for any period of two consecutive years. The patent extends to all the French colonies.

Germany.—By a law dated 25th May 1877 patents are granted for fifteen years to natives and foreigners. The invention must not have been previously described in a printed publication in any way. The patentee may obtain supplementary patents for improvements expiring with the original patent. A government duty of £1 10s. is paid on the issue of the patent, together with an annuity commencing at £2 10s. and increasing by £2 10s. each year for the whole term. The Government may revoke the patent if the invention has not been carried out in Germany within three years from the date of the patent.

Italy.—Patents are granted only to inventors or their assignees for terms varying from one to fifteen years. The publication of a previous foreign patent does not invalidate the grant provided the application is made during the continuance of the foreign patent, but the Italian patent will expire with the previous foreign patent. Patents of addition are granted expiring with the original patent. Patents are liable to taxes amounting to about 50 francs for each of the first three years of the patent, and increasing gradually. The invention must be worked in Italy within two years from the date of the grant. The description of the invention may be either in the Italian or the French language.

Norway.—By laws of 15th July 1839 and 9th May 1842 patents are granted for a term not exceeding ten years to inventors only. The invention must not have been published in Norway prior to the application, which is subject to an official examination, not usually of a stringent character. A payment of 10 specie dollars must be made in respect of each application. The invention must be put in practice in the country within two years from the date of the grant.

Paraguay.—Under a law of 20th May 1845 citizens or foreigners are alike entitled to protection, and the term of the grant varies from two to ten years. Where there is a previous foreign patent for the same invention the patent is not valid for more than six months beyond the termination of the foreign patent. The invention patented must be worked within two years from the date of the grant.

Portugal.—By a royal decree of 31st December 1852 inventors, whether natives or foreigners, may obtain patents for terms varying from one to fifteen years. Certificates of addition are also granted, but expire with the original patent. A patent will not be granted to an inventor for a longer term than that of his original patent. The government taxes amount to about £1 8s. per annum, in addition to which certain official fees are payable. The patent becomes void if the invention is not carried into practice within two years from the date of its grant.

Russia.—The law is set forth in several imperial decrees, under which patents are granted to natives and foreigners alike for the term of three, five, or ten years, and upon payment of government duties of 90 roubles for three years, 150 roubles for five years, and 450 roubles for ten years. The patent also covers the kingdom of Poland. There is great delay in obtaining patents. A period of from one to two years usually elapses between the application and the date of the grant. The specification must be written in the Russian language. The invention must be worked in Russia within one quarter of the time for which the patent is granted. Separate patents are issued for Finland.

Spain.—The law is dated 1st August 1878. Patents are granted to foreigners as well as to natives for terms varying from five to twenty years. The application must be made prior to the publication of the specification of the invention in another country. The annual taxes begin with 10 francs for the first year, and increase at the rate of 10 francs a year. The patent covers the Spanish colonies of Cuba, Porto-Rico, and the Philippine Islands. The specification must be made in the Spanish language. Certificates of addition are granted for improvements, expiring with the original patent. The invention must be put into operation within two years from the date of the grant.

Sweden.—Patents are granted to natives and foreigners for terms varying from three to fifteen years, but the patent of a foreigner expires with the expiration of the foreign patent. The invention must be put into operation within the country before the expiration of two years from the date of the grant.

Turkey.—Under a law dated 2d March 1880 patents are granted to natives or foreigners for five, ten, or fifteen years, subject to an annual payment of two Turkish pounds. A patent expires with the termination of any earlier foreign patent for the same invention. Certificates of alteration, addition, or improvement are granted, and expire with the termination of the original grant. The invention must be worked within two years from the date of the patent, and the working must not be discontinued for two consecutive years subsequently. Patented articles manufactured abroad cannot be imported into Turkey without invalidating the patent.

In addition to the above-mentioned countries the following also have laws for the protection of inventions under which foreigners may obtain patents:—United States of Colombia, Guatemala, Grand Duchy of Luxemburg, Mexico, Nicaragua, and San Salvador.

International Patents.

The Governments of Belgium, Brazil, France, Guatemala, Holland, Italy, Portugal, San Salvador, Servia, Spain, and Switzerland have recently signed, and Great Britain is about to sign, an international convention relating to patents, the salient points of which are:—

(1) that the subjects of each of the above states shall in all the other states, as regards patents, enjoy the advantages that their respective laws grant to their own subjects; (2) that any person who has duly registered an application for a patent in any one of the states shall enjoy a right of priority protecting the first patentee against any acts accomplished in the interval for a term of six months—a month longer being allowed for countries beyond the sea; (3) that the introduction by the patentee into the country where the patent has been granted of objects manufactured in any of the other states shall not entail forfeiture; but the patentee remains bound to work his patent in conformity with the laws of the country into which he introduces the patented objects; (4) that the states agree to grant temporary protection to patentable inventions for articles appearing at officially recognized international exhibitions.

It is understood that Holland and Switzerland, where there are at present no patent laws, will shortly adopt measures in pursuance of the terms of the above convention whereby inventions may be protected.¹

(J. H. J.)

PATERCULUS, MARCUS² VELLEIUS, a Roman historian, was probably born about 19 B.C. His father, a cavalry officer, belonged to a good Capuan family, several members of which had risen to some military or magisterial distinction. The historian himself served as military tribune in Thrace, Macedonia, Greece, and the East, and in 2 A.D. was present at the interview on the Euphrates between C. Cæsar (grandson of Augustus) and the Parthian king. Afterwards as præfect of cavalry and legatus he served for eight years (from 4 A.D. onward) in Germany and Pannonia under Tiberius, in whose triumph (12 A.D.) he and his brother bore a conspicuous part. For his services

¹ For further information on the subject the reader is referred to Johnson's *Patentee's Manual*, fifth edition, 1884.

² Marcus is the name given by Priscian; but Renier identifies the historian with the "C. Velleio Paterulo" of a North-African milestone (*Acad. des Inscr.*, Dec. 1875; *Rev. Archéol.*, 1875), the date of which he places (on inconclusive grounds) in 36 A.D.

he was rewarded with the quaestorship in 7, and, along with his brother, with the praetorship in 15. He was still alive in 30, for his history contains many references to the consulship of M. Vinicius in that year. The date and manner of his death are unknown. It has been conjectured that he was put to death in 31 as a friend of Sejanus, whose praises he celebrates.

He wrote a compendium of Roman history in two books dedicated to M. Vinicius, from the dispersion of the Greeks after the siege of Troy down to the death of Livia in 29 A.D. The first book brings the history down to the destruction of Carthage, 146 B.C.; portions of it are wanting, including the beginning. The later history, especially the period from the death of Caesar, 44 B.C., to the death of Augustus, 14 A.D., is treated in much greater detail. Brief notices are given of Greek and Roman literature, but, strange to say, no mention is made of Plautus, Horace, and Propertius. The author is a vain and shallow courtier; "full of wise saws," he is nevertheless entirely destitute of true historical insight. His knowledge is superficial, his blunders numerous, his chronology inconsistent. He labours at portrait-painting, but his portraits are daubs. On Caesar, Augustus, and above all on his patron Tiberius, he lavishes praise or flattery. The repetitions, redundancies, and slovenliness of expression which disfigure the work may be partly due to the haste with which (as the author frequently reminds us) it was written. Some blemishes of style, particularly the clumsy and involved structure of his sentences, may perhaps be ascribed to insufficient literary training. The inflated rhetoric, the straining after effect by means of hyperbole, antithesis, and epigram, mark the degenerate taste of the Silver Age, of which Paternulus is the earliest example. He purposed to write a fuller history of the later period, which should include the civil war between Caesar and Pompey and the wars of Tiberius; but there is no evidence that he carried out this intention.

Paternulus was little known in antiquity. He seems to have been read by Lucan and imitated by Sulpicius Severus, but he is mentioned only by the scholiast on Lucan, and once by Priscian. All we know of his life is derived from his own statements. The text of his work, preserved in a single badly-written MS. (now lost), is very corrupt, and its restoration has tasked the ingenuity of many learned men. The editio princeps appeared at Basel in 1520; subsequent editors have been J. Lipsius, Leyden, 1591; J. Gruter, Frankfurt, 1607; N. Heinsius, Amsterdam, 1678; P. Burmann, Leyden (2d ed.), 1744; D. Ruhnken, Leyden, 1779; J. C. Orelli, Leipsic, 1835; F. Kritz, Leipsic, 1840 and 1848; F. Haase, Leipsic (2d ed.) 1853; C. Halm, Leipsic, 1876.

Beside the literary histories of Bernhardt and Teuffel, see the prolegomena to Kritz's edition; H. Sauppe, in *Schweiz. Museum*, l. p. 133; A. Pernice, *De Vellei fide historica*, Leipsic, 1862; contributions to the criticism of the text by J. C. M. Laurent, *Loca Velleiani*, Altona, 1836; J. Jeep, *Emendationes Velleianae*, Wolfenbüttel, 1839; N. Madvig, *Adversaria*, li. p. 297 sq.; English translations by Newcomb, Paterson, and Watson; German by Jacobs, Walther, and Eysenhardt; French by Després and Gréard; Italian by Manzi, Bocanera, and Spiridione Petretti.

PATERINES. See **PATARENES.**

PATERNÓ, a town of Sicily, in the province of Catania, stands at the south-west foot of Mount Aetna, 10 miles north-west of Catania near the railway from that city to Leonforte. It is a long straggling place with a mediæval castle (1073) and several churches and suppressed convents. The surrounding country is fertile, producing corn, oil, wine, flax, hemp, and timber, in which articles an active trade is carried on. Paternó gives the title of "prince" to a Sicilian family. In the neighbourhood the remains of ancient baths, tombs, and aqueduct, and a bridge across the Simeto have been discovered. The town is supposed to occupy the site of the ancient Hybla Major. Population 15,230.

PATERSON, the "Lyons of America," a city of the United States, capital of Passaic county, New Jersey, is situated on the Passaic river and the Morris Canal, 17 miles north-west of New York by the Erie and the Dela-

ware, Lackawanna, and Western Railroads. As the river, which forms the boundary of the city for a distance of 9 miles, has at one place a sheer fall of 50 feet, it is an unfailing source of abundant water-power; and Paterson ranks second among the manufacturing cities of the State. Silk, iron, and cotton are the great industrial staples, giving employment to 15,000, 7000, and 3000 hands respectively. One of the next chief industries is the making of locomotives. Further, iron bridges, brass wares, flax, hemp, and jute goods, calico-prints, paper, and chemicals are all manufactured. The population was 11,334 in 1850, 19,586 in 1860, 33,579 in 1870, and 51,031 in 1880. Founded in 1792 by a cotton company under the patronage of Alexander Hamilton and named after Governor William Paterson, who signed its town charter, Paterson obtained the rank of a city in 1851.

PATERSON, WILLIAM (1658-1719), founder of the Bank of England, projector of the Darien scheme, and a voluminous writer on subjects connected with finance, was born in April 1658 at the farmhouse of Skipmyre, parish of Tinwald, Dumfriesshire. His parents occupied the farm there, and with them he resided till he was about seventeen. A desire to escape the religious persecution then raging in Scotland, and a wish to find a wider field for his energies than a poor district of a poor country afforded, led him southward. He went through England with a pedlar's pack ("whereof the print may be seen, if he be alive," says a pamphleteer in 1700), settled for some time in Bristol, and then proceeded to America. There he lived chiefly in the Bahamas, and is said by some to have been a predicant or preacher, and by others to have been a buccaneer. The truth is that his intellectual and moral superiority to the majority of the British settlers naturally caused his selection as their spiritual guide, whilst his intense eagerness for information led to intercourse with the buccaneers, from whom alone much of the information he wanted could be had. It was here he formed that vast design which is known in history as the Darien scheme. On his return to England he was unable to induce the Government of James II. to engage in his plan. He went to the Continent and pressed it in Hamburg, Amsterdam, and Berlin, but unsuccessfully. A countryman of his own talks of him as a well-known figure "in the coffee-houses of Amsterdam" in 1687, and gives us some idea of the strange impression that this thoughtful-looking foreigner produced, as with fluent speech he unfolded to his astonished hearers a scheme which seemed wild and dazzling as a dream of Eastern romance. On his return to London he engaged in trade and rapidly amassed a considerable fortune. His activity was not confined to private business. About 1690 he was occupied in the formation of the Hampstead Water Company, and in 1694 he founded the Bank of England. The Government of the day required money, and the country, rapidly increasing in wealth, required a bank. The subscribers lent their money to the nation, and this debt became the bank stock. The credit of having formulated the scheme and persuaded the Government to adopt it is certainly due to Paterson. He was one of the original directors, but in less than a year, in consequence of some dispute with his colleagues, he withdrew from the management. He had already propounded a new plan for an orphan bank (so called because the debt due to the city orphans by the corporation of London was to form the stock). This, they feared, might prove a dangerous rival to their own undertaking, and besides they looked with considerable suspicion and dislike on this Scotsman whose brain teemed with new plans in constant succession.

At that time the people of the northern kingdom were engaged in considering how they might share in the bene-

fits of that trade which was so rapidly enriching their southern neighbours. Paterson embraced the opportunity thus offered. He removed to Edinburgh, unfolded his Darien scheme, and soon had the whole nation in favour of it. He, it is supposed, drew up the Act of 1695 which formed the "Company of Scotland trading to Africa and the Indies." This company, he arranged, should establish a settlement on the isthmus of Darien, and "thus hold the key of the commerce of the world." There was to be free trade, the ships of all nations were to find shelter in this harbour not yet erected, differences of race or religion were to be made nothing of; but a small tribute was to be paid to the company, and this and other advantages would so act that, at one supreme stroke, Scotland was to be changed from one of the poorest to one of the richest of nations.

On the 26th of July 1698 the first ships of the expedition set sail "amidst the tears and prayers and praises of relatives and friends and countrymen." Some financial transactions in which Paterson was concerned, and in which, though he had acted with perfect honesty, the company had lost, prevented his nomination to a post of importance. He accompanied the expedition as a private individual, and was obliged to look idly on whilst what his enemies called his "golden dream" faded away indeed like the "baseless fabric of a vision" before his eyes. His wife died, and he was seized with a dangerous illness, "of which, as I afterwards found," he says, "trouble of mind was not the least cause thereof." One who knew him in this evil time tells us "he hath been so mightily concerned in this sad disaster, so that he looks now more like a skeleton than a man." Still weak and helpless, and yet protesting to the last against the abandonment of Darien, he was carried on board ship, and, after a stormy and terrible voyage, he and the remnant of the ill-fated band reached home in December 1699.

In his native air Paterson soon recovered some of his strength, and immediately his fertile and eager mind was at work on new schemes. First he did all he could to prevent the Darien scheme already engaged in from being finally abandoned, then he prepared an elaborate plan for developing Scottish resources by means of a council of trade, and then he tried to induce King William to enter on a new Darien expedition. About the beginning of the century he removed to London, and here by conferences with statesmen, by writing, and by personal persuasion helped on the Union, of which his far-reaching mind enabled him, perhaps better than any other man then living, to see the advantages. At the Union one of the last acts of the Scottish parliament was to recommend him to the consideration of Her Majesty Queen Anne for all he had done and suffered. The united parliament, to which he was returned as a member for the Dumfries burghs, though he never took his seat, decided that his claim should be attended to, but it was not till 1715 that an indemnity of £18,241 was ordered to be paid him. Even then he found considerable difficulty in obtaining his due. His last years were spent in Queen Square, Westminster, but he removed from his house, though probably to some other part of London, shortly before his death, which happened 22d January 1719.

As many as twenty-two works, all of them anonymous, are attributed to Paterson. These are classified by Bannister under six heads, as dealing with (1) finance, (2) legislative union, (3) colonial enterprise, (4) trade, (5) administration, (6) various social and political questions. Of these the following deserve special notice. (1) *Proposals and reasons for constituting a Council of Trade* (Edinburgh, 1701).¹ This was a plan to develop the resources of his country. A council, consisting of a president and twelve

members, was to be appointed. It was to have a revenue collected from a duty on sales, lawsuits, successions, &c. With these funds the council was to set the Darien scheme going again, to build workhouses, to employ, relieve, and maintain the poor, and to encourage manufactures and fisheries. It was to give loans without interest to companies and shippers, it was to remove monopolies, it was to construct all sorts of vast public works. Encouragement was to be given to foreign Protestants and Jews to settle in the kingdom, gold and silver were to be coined free of charge, and money was to be kept up to its nominal standard. All export duties were to be abolished and import regulated on a new plan. By means like these Paterson believed the disasters lately undergone would be more than retrieved. (2) *A proposal to plant a colony in Darien to protect the Indians against Spain, and to open the trade of South America to all nations* (1701). This was a proposal to King William to establish the Darien scheme on a new and broader basis. It points out in detail the advantages to be gained: free trade would be advanced over all the world, and Great Britain would derive great profits. (3) *Wednesday Club dialogues upon the Union* (London, 1706). These were imaginary conversations in a club in the city of London about the union with Scotland. Paterson's real opinions were put into the mouth of a speaker called May. The result of the discussion is that till the Darien business all Scots were for the Union, and that they were so still if reasonable terms were offered. Such terms ought to include an incorporating union with equal taxes, freedom of trade, and a proportionate representation in parliament. A union with Ireland "as likewise with other dominions the queen either hath or shall have" is proposed. (4) Along with this another discussion of the same imaginary body, *An inquiry into the state of the Union of Great Britain and the trade thereof* (1717), may be taken. This was a consideration of the consequences of the Union, which, now "that its honeymoon was past," was not giving satisfaction in some quarters, and also a discussion as to the best means of paying off the national debt,—a subject which occupied a great deal of Paterson's attention during the later years of his life.

Paterson's plans were vast and magnificent, but it is a great mistake to suppose that he was a mere dreamer. Every one of his designs was worked out into minute detail,² and every one was possible and practical. The Bank of England was a stupendous success. The Darien expedition failed from hostile attacks and bad arrangements. But the original design was that the English and Dutch should be partakers in it, and, if this had occurred, and the arrangements, against many of which Paterson in letter after letter in vain protested, had been different, Darien might have been to Britain another India, whose history was shadowed by the memory of no wrong.³ Paterson was a zealous almost a fanatic free-trader long before Adam Smith was born, and his remarks on finance and his argument against an inconvertible paper-currency, though then novel, now hold the place of economic axioms. In his description of the "merchants in an extended sense" Paterson has drawn his own character for us. They are those "whose education, genius, general scope of knowledge of the laws, governments, polity, and management of the several countries of the world allow them sufficient room and opportunity not only to understand trade as abstractly taken but in its greatest extent, and who accordingly are zealous promoters of free and open trade, and consequently of liberty of conscience, general naturalization, unions, and annexions."

Paterson's works are well written, and the form as well as the matter are excellent. As already noticed, they are all anonymous, and they are quite impersonal, for few men who have written so much ever said so little about themselves. There is no reference to the scurrilous attacks made on him. They are the true products of a noble and disinterested as well as vigorous mind. Paterson was not rewarded for his labours. The Bank of England was a great success, but he lost rather than gained by it. In the Darien scheme he was ruined, and this ruin he never quite retrieved. The credit of his other schemes has been usually ascribed to other and inferior men. There is thus singular fitness in the motto "sic vos non vobis" inscribed under the only portrait of him that we possess.

See *Life of W. Paterson*, by S. Bannister (Edinburgh, 1858); *Paterson's Works*, 3 vols., by S. Bannister (London, 1859); *The Birthplace and Parentage of W. Paterson*, by W. Pagan (Edinburgh, 1865). The brilliant account in the fifth volume of Macaulay's *History* is incorrect and misleading. That in Burton's *Hist. of Scotland* (vol. viii. ch. 84) is much truer. A list of a number of fugitive writings on Paterson will be found in *Foot's Mag. Index*. (F. W.A.)

² The books of the Darien company were kept after a new and very much improved plan, which it is believed was an invention of Paterson's (Burton's *Hist. Scot.*, vol. viii. p. 36, note).

³ The revival of the Darien scheme in our own day is a signal proof of Paterson's foresight. Of a canal he says: "From Venta Crucis to Panama upon the South Sea there is by land about eight short French leagues, six whereof is so level that a canal might easily be cut through, and the other two leagues are not so very high and impracticable ground, but that a cut might likewise be made were it in these places of the world, but considering the present circumstances of things in those it would not be so easy" (*Works*, Bannister's ed., vol. i. p. 140).

¹ This work was attributed to John Law (see *Law*, vol. xiv. p. 367, note), who certainly borrowed some of his ideas from it. To Law's "system" Paterson was strongly opposed, and it was chiefly due to his influence that it made no way in Scotland.

PATHOLOGY

PATHOLOGY (*πάθος, λόγος*, the doctrine of disease or (lit.) of that which is suffered) holds a peculiar place among the natural sciences. Although it is laid down, in the opening sentences of the Hippocratic treatise *De prisca medicina*, that the medical art, on which all men are dependent, should not be made subject to the influence of any hypothesis (such as that of the four cardinal qualities, hot, cold, moist, and dry), that the care and cure of the sick should not be subordinated to pathological theory, but should be guided by experience; yet the practitioners of medicine have at no time been able to dispense with theory, not even those avowed followers of the Hippocratic tradition who, while they professed a kind of quietism amidst the rise and fall of systems, have none the less been profoundly influenced by theory at every step of their practice. The position of Cullen is the only rational one: "You will not find it possible to separate practice from theory altogether; and, therefore, if you have a mind to begin with theory, I have no objection. . . . To render it safe, it is necessary to cultivate theory to its full extent."

§ 1.—PROGRESS AND SCOPE.

The progress of pathology hitherto has been exactly parallel with the progress of philosophy itself, system succeeding system in genetic order. No other department of biological science has shown itself so little able to shake off the philosophical character, or to run in the career of positivism or pure phenomenalism. This unique position of pathology among the natural sciences is doubtless owing to the fact that it is a theory of practice, a body of truth and guess-work existing for the benefit of a working profession which is daily brought face to face with emergencies and is constantly reminded of the need of a reasoned rule of conduct. It is idle to attribute the philosophizing habit in medicine, or the habit of system-making, to an unscientific method in past times. The extremely various points of view from which the problems of diseased life are approached in the very latest and most authoritative writings are an evidence that the difficulty is really inherent in the subject-matter.

The positive progress of the biological sciences does not essentially depend on the philosophical conception of life as action and reaction; but the notion of action and reaction comes to the front in every page of a pathological treatise, and at every step of practice. In considering the forms of diseased life, if not in the study of living things themselves, we are constantly driven back to that ultimate analysis. The influences from without, which make up ætiology or the doctrine of causes of disease, assume a position in medicine the urgency or immediate interest of which far exceeds that of the biological problem, "the correspondence between life and its circumstances." The standing difficulty in pathology has been its relation to ætiology, or the relation of the *ens morbi* to the *agens morbi*. One of the most singular ways of meeting the difficulty is that of Paracelsus, who boldly perpetrated the paradox: "*Ens ist ein Ursprung, welches Gewalt hat, den Leib zu regiren.*" The five classes of *entia* of Paracelsus are a composite catalogue, of which (1), (2), and (5) stand for influences from without, and (3) and (4) for spontaneities, dispositions, or liabilities within. From time to time the centre of interest has been shifted to within the body, as in the "animism" of Stahl, in the "vitalism" of the school of Montpellier (end of 18th century), and in the "cellular pathology" of Virchow. A discussion of the inherent difficulty of

holding the balance fair between that which is "exopathic" in disease and that which is "endopathic" may be read in Virchow's article, "*Krankheitswesen und Krankheitsursachen*," written in reply to objections that the cellular pathology was inadequate. "What I wished to treat of in the *Cellular Pathology*," he says, "was the behaviour of the elements of the living body in the usual kinds of illness, or, to put it more briefly, the history of the elementary processes of disease. Upon that basis, it seemed to me, the doctrine of the nature of disease should be built. The respective causes I adverted to only now and then; thus I spoke of poisons, and even fungi had a place in the cellular pathology, although a very modest one. If the *Cellular Pathology* had ever pretended to be a general pathology it would have contained also the whole of ætiology." Thus far Professor Virchow writing in 1880. If we now turn to a text-book of the same date, which does bear the title of *General Pathology*, that of Professor Cohnheim, we find pathology defined as "an explanatory science which seeks (1) to discover the causes of disease, and (2) to ascertain the esoteric connexion subsisting among disease-manifestations." It is only (2) that forms the subject of Professor Cohnheim's two volumes; ætiology, he remarks, is absolutely without limits. It "comes into relation with" cosmical physics, meteorology, geology, sociology, chemistry, botany, and zoology; from these sciences it gets its subject-matter. In the general pathology of Cohnheim, accordingly, ætiology is omitted; and with it are omitted many of the problems underlying the philosophical systems of the past, which have "only an historical interest," as well as much of the natural history of disease. General pathology, he says, knows no other direction and no other order than physiology, "and accordingly we shall take up successively, and in the same order as physiology would take them, the pathology of the circulation, digestion, respiration, tissue-nutrition, and the like" (the pathology of the nervous system is not included in the two volumes). Without adducing other instances of eclecticism in the contents of modern pathological text-books, it will be convenient to give a brief notice of the latest attempt at a philosophical scheme of diseases,—the *Elemente der Pathologie* of Rindfleisch, 1883.

There are certain groups of symptoms, says Rindfleisch, which recur with the uniformity of a type in the most various diseases, depending as they do upon one constant factor,—the human body and its structural and functional tendencies. The larger number of maladies do not arise antequothonously or "under a whole skin," they are generated by certain morbid causes; and it is the variety of causes that corresponds to the variety of disease-species, or to those ever-changing sequences and coexistences of symptoms in which the experienced eye of the practitioner learns to distinguish one disease from another. The morbid cause is an invasion upon the normal course of our life, usually a strong and forcible interference with the physical and chemical constitution of a particular part of the body. The disease as a whole stands for the effects of this interference, and these effects flow in part from the nature of the morbid cause and in part from the nature of the body which suffers. That which is uniform in these effects flows from the nature of the sick body; that which is various flows from the variety of morbid causes. It is above all the seat of the disease, its duration, the sequence and combinations of the type-groups of symptoms which are determined by the morbid cause. Only this varying element can be used to distinguish one disease from another. Therefore there is only one truly natural prin-

ciple of subdividing diseases and only one point of view in special pathology from which the construction of a natural system may be approached,—namely, the ætiological principle of classification and the ætiological system. In each group of diseases, and in each individual disease, the causation has to be inquired into as closely as possible and described after the natural-history manner; we have to ask how and where the cause acts upon the organism, and finally to show how, from this action and from the reaction of the organism towards the same, we may explain those special features of disease and that special morbid process which are peculiar to each group of maladies or to each malady individually. In a word, the *species morbi* are made by the morbid causes; all that separates one disease from another is contained in the cause; only the causal differences, and no other, furnish those units of disease-life which can be brought under genera and species.

If we now inquire into the categories of causation, according to Rindfleisch, we find that they are five in number, as were the categories of Paracelsus. They are (1) injury from without, (2) parasitism, (3) deficient rudiments and defective growth, (4) over-exertion, and (5) premature involution or obsolescence. It is impossible not to discover heterogeneous elements in this enumeration; it is a composite catalogue like that of Paracelsus, and we shall find it hard to say in the case of (3) and (5) whether we are dealing with the *ens morbi* or with the *agens morbi*.

A statement of the definition and scope of pathology similar to that of Rindfleisch had been given by John Simon in his *Lectures on General Pathology*. Diseases were for the most part the normal phenomena of life under abnormal circumstances. "When you know the whole case you are obliged to admit that, according to the normal constitution of the body, the symptoms in question ought to have followed the operation of those several causes." The doctrine of disease, accordingly, is mostly an "exopathic" one, although a small residue of it may be "autopathic." It is impossible, says Simon, absolutely to exclude autopathic diseased states; there may be some such, mostly developmental, which "are actual caprices and spontaneities of life, without any exterior causation whatsoever."

The exopathic point of view may be said to be the dominant one at present; more particularly, it is from the ætiological side that the enormous aggregate of contagious and infective sickness is mostly studied. Thus in the nosology of Rindfleisch the whole of the specific fevers and infections (including even climatic fevers) are placed (tentatively) under the head of "Parasitism," the parasites being minute living organisms having their independent place in the scale of being. The numerous researches of the parasitic school may be regarded as the most formal attempt as yet made to separate the study of the *agens morbi* from that of the *ens morbi*.¹

§ 2.—INTRODUCTION.

The plan of this article will be to take diseases as they occur in the concrete, and to apply an analytical method to them. In a given disease, or in an individual case of the same, the object would be to find the point of divergence from the beaten path of health, or, failing that, to seek out the nearest analogies in the physiological life for the unaccustomed and even grotesque things of disease. The effects of disease in man's body may be likened, in a too pleasing figure, to the effects of a magician's wand; there is

"nothing of him but is changed into something rich and strange." This fascinating region of science is well outlined by Buckle in his remarks on the genius of Hunter:—

"In nature, nothing is really irregular or disorderly; if we are apt to fancy that the chain is broken, it is only because we cannot see every link in it. . . . Being satisfied that everything which happens in the material world is so connected and bound up with its antecedents as to be the inevitable result of what had previously occurred, Hunter looked with a true philosophical eye at the strangest and most capricious shapes. To him they were neither strange nor capricious. They were deviations from the natural course; but it was a fundamental tenet of his philosophy that nature, even in the midst of her deviations, still retains her regularity."

Hunter's own words are: "Nature is always uniform in her operations, and, when she deviates, is still regular in her deviations. . . . It certainly may be laid down as one of the principles or laws of nature to deviate under certain circumstances." The interest of this science, says Buckle, "depends simply on the fact that, when it is completed, it will explain the aberrations of the whole organic world." The same science of deviations was provided for by Bacon in his classification of the sciences; and, after him, by D'Alembert, under the head of "Prodigies, or deviations from the usual course of nature," in his classification for the *Encyclopédie*.

The science of deviations begins, in the writings of Hunter and of Paget, with the erratic forms of crystals, and with the indwelling power of crystals to repair injuries on the lines of their growth if they be placed in the proper mother-liquor. In the hands of each of these two pathologists this science next proceeds to elemental aberrations in the life of plants, where there is neither heart nor nervous system to complicate matters; and, so advancing from the simpler to the more complex, we should have a science of the abnormal coextensive with life itself. Without attempting to treat of pathology in that evolutionary order, which proceeds from elemental pathology upwards, we may still adopt, for the narrower subject of human pathology, a somewhat analogous order, that is to say, a method based upon the facts of embryonic development. Confining our attention, then, to the processes of disease within the human body, and seeking out from among these the broadest of the facts, we shall find evidence, as we proceed, that the life of the body retains vividly the memories of its past. Nothing marks so generally the disease-incidents of life as crudity or recrudescence in the activities of cells, tissues, organs, and mechanisms. In other words, we shall find much in pathology to show that, when the organism goes wrong, it retreats to broader ground, or reverts to modes of life which it had come through. But, even in the normal functional and structural processes of the mature body, we find occasional evidences of the same reversion to embryonic modes of life. These are practically limited, in health, to the reproductive system, or to that part of life which goes to the maintenance of the species. Here we find periodicity still in full force, the same periodicity, primarily following the seasons, which underlies the life of plants and of most animals. The greatest example in the human body is the building up anew, from time to time, of an entire organ, the placenta, for the intra-uterine nourishment of the child; in this periodical formation we have a reversion, in the midst of mature life, to vessel-making and blood-making such as the body goes through otherwise only during its development. The provision for the nourishment of the child after it is born is a somewhat modified instance of the same kind. The full structure and function of the breast also develop periodically (although the framework is permanent), and each of these periodical developments is a repetition of the incidents in the original embryonic development of structure and function.

¹ Literature.—Häser, *Lehrbuch der Geschichte der Medicin und der epidemischen Krankheiten*, 3d ed., 3 vols., Jena, 1875-82; Virchow, "Krankheitswesen und Krankheitsursachen," in *Virchow's Archiv*, vol. lxxix., 1880; Cohnheim, *Vorlesungen über allgemeine Pathologie*, 2 vols., Berlin, 1877-80; Rindfleisch, *Die Elemente der Pathologie, ein natürlicher Grundriss der wissenschaftlichen Medicin*, Leipzig, 1883; Simon, *Lectures on General Pathology*, London, 1850.

It is when we come to the several tissues that we meet with the most striking reminders of persisting developmental characters, the most universal fact of the kind being the indwelling embryonic character of the common binding tissue. In that tissue, indeed, we have a constant reminder that in the midst of the very highest or most perfected modes of cellular life we are but a step removed from the most rudimentary. Thus in the brain and in the retina the elaborate nervous mechanism is supported on a framework of connective tissue; there is a morbid condition of these organs, called glioma, in which the connective tissue, or neuroglia, absolutely usurps the place of the nervous mechanism of which it is ordinarily the mechanical support; and this it may so completely do, as in disease of the pons Varolii, that even the outward form and markings of the part are not interfered with. An equally striking instance of a return to embryonic characters and predominance may sometimes be observed in the primitive nuclei of muscle; the muscle-fibres will be found to have surrendered their high function, to have retraced the steps of their development, and to have sunk their identity in a rudimentary form of cell-life.

Thus the body nowhere loses altogether the memory of the past, even when the periods of development and growth are, strictly speaking, ended. Among the normal processes of mature life there are such as amount to a recrudescence of structure and function; and an analogous recrudescence in the tissues is one of the most fundamental facts in the processes of disease. There are several advantages in proceeding in an exposition of pathological principles from this evolutionary or developmental basis. It enables us to take up, in an order not unsuited to their importance, the sections relating to repair, to new growth of tumours, to errors of growth, such as rickets, to errors of blood-making, and the like. At the outset comes the process of repair, for which Paget has formulated the embryological principle as follows: "The powers for development from the embryo are identical with those exercised for the restoration from injuries; in other words, the powers are the same by which perfection is first achieved, and by which, when lost, it is recovered."

§ 3.—THE PROCESS OF REPAIR.

The spontaneity of certain polyps under injury is a good example of the indwelling power of all the cells and tissues to return to the established order, to the order and harmony which had been slowly acquired, and of which the memory is vividly retained. Trembley cut a hydra longitudinally, and "in an hour or less," says Paget, "each half had rolled itself and seamed up its cut edges so as to be a perfect hydra. He split them into four; he quartered them; he cut them into as many pieces as he could; and nearly every piece became a perfect hydra. He slit one into seven pieces, leaving them all connected by the tail, and the hydra became seven-headed, and he saw all the heads eating at the same time. He cut off the seven heads and, hydra-like, they sprang forth again." The recovery of perfection may be more gradual. Thus, Sir J. G. Dalyell (as quoted by the same writer) cut a specimen of *Hydra tuba* in halves; each half regained the perfect form, but only very slowly, and, as it were, by a gradual improvement of parts that were at first ill formed. In *Tubularia indivisa*, after the natural fall of its head, the stem was slit for a short distance down; an imperfect head was first produced, at right angles to the stem, from one portion of the cleft; "after its fall another and more nearly perfect one was regenerated, and, as it grew, improved yet more. A third appeared, and then a fourth, which was yet more nearly perfect, though the stem was thick and the tentacula imperfect. The cleft was almost

healed, and now a fifth head was formed, quite perfect; and after it, as perfectly, a sixth and a seventh head. All these were produced in fifteen months." This spontaneity resides in every living thing, and its efforts are directed by the memory of what the species had come through in reaching its place in the scale of organization; it is able, indeed, to make perfect reparation for injuries or losses only where the cells are little differentiated into tissues, or where the tissues are little specialized for diverse functions. In all animals, and most notably in the higher, this spontaneity is most effective for repair in the periods of development and growth. With reference to the degree of reparative power possessed, Paget formulates the rule as follows: "The amount of reparative power is in an inverse ratio to that of the development, or change of structure and mode of life, through which the animal has passed in its attainment of perfection, or on its way thitherward."

Healing by Granulations.—It will now be convenient to advance *Grandin medias res*, and to give some account of the process of repair in man, where there is a breach of continuity in the course of the blood-carrying and lymph-carrying vessels, of the nerves, sinews, binding tissue, bone, fat, and skin. What is the effort that they each and all make to adapt themselves to the circumstances, in the case, let us say, of a stump after amputation? (The repair between the two ends of a broken bone will be discussed separately.) Disregarding the cases where the most perfect coaptation of parts is secured by the surgeon, and selecting the extreme case where the wound is "left to granulate," the following is the order of events. The divided vessels being sealed up either by ligature or by clots of blood (which are in the end absorbed), there oozes from the raw surface a blood-tinged serous-looking fluid. Becoming paler by degrees, it sets on the surface as a greyish-white film or glazing, especially on the exposed surface of muscle. The film of surface glazing will be found to contain numerous corpuscles embedded in it resembling the colourless corpuscles of the blood. They have probably the same formative or reparative value as the granulation-cells proper, but it will appear from the facts about to be given that they are practically superseded by the latter in all cases where a wound is "left to granulate." After an interval of two or three days of apparent rest reddish points are seen on the edges of skin, on the muscular substance, and on the marrow of the bone; these are the beginnings of the granulation-tissue, which in the end covers the whole surface and grows until it fills up the gap somewhat beyond the level of the edges of skin. When the growth of granulations projects considerably beyond the skin it is known as "proud flesh." Usually the surface begins to skin over when the defect of substance has been sufficiently made good, the new skin showing as a delicate bluish border or frill to the old skin. This frill becomes broader and broader until the growing points meet in the centre, and the continuity of the skin is restored. Meanwhile the granulation-tissue beneath has been changing into more characteristic forms of mature tissue, although the *status quo ante* is never quite restored.

Notwithstanding the regularity of this process, and its daily occurrence in surgical practice, there is an almost incredible amount of conflicting opinion as to its details,—radical differences as to the source or sources of the reparative material, and as to the mode of development of the new blood-vessels and of the new skin; and these differences of opinion must be the measure of the difficulty of analysis where the interference takes place in the highly complex and subtly integrated life of man. Direct observation of the reparative process does not of itself suffice to discover the law of it; it is necessary to seek elucidation from the nearest analogies, both among the regular processes of life and growth and among the deviations therefrom. Among the former there is in particular one rich source of analogous detail to be found in the periodical new formation on the surface of the uterus for the purposes of the embryo—in the placenta; among the latter are certain kinds of tumours and cysts. Hunter sought for a parallel to the new vessels of granulation-tissue in the first formation of vessels in the embryo; but these arise in the continuity of development, and not as a somewhat abrupt incident in the mature life. On the other hand, the formative process of the placenta is an example—and a unique example—of an extensive new growth of vascular tissue occurring periodically in the adult, and as somewhat of an interruption on the ordinary course of life. It matters little for this parallelism whether we accept the extreme position of Ercolani, that a total destruction of the uterine mucosa precedes the placental new growth, or whether we adopt the more likely view that the new formation takes place under an intact surface. In either case we have to do with a remarkable spontaneity of the body, a spontaneity which

reveals the indwelling power of the tissues, and especially the vessel-making power.

Analogy of Placental new Formations.—The first adaptations for the placenta are not in the pre-existing vessels, but in the pre-existing tissues around. The elongated and almost fibre-like cells become more plump, they join to form cylinders of nucleated protoplasm, the adjoining cylinders open out to form meshes between them, and all this takes place in the intervals between the vessels and their capillaries (fig. 1). The cells of the tissue return to that embryonic state which preceded the formation of blood-vessels, supplying their own juices, as it were, and opening out so as to form plasmatic canals in their midst. In the placental rudiment it is a mucus-like albuminous fluid that they mostly yield, but there is some evidence that they also yield blood-corpuscles. Meanwhile, the same process of enlargement has been taking place in the cells immediately surrounding the blood-vessels; and at a later stage it is the perivascular cells that keep up this activity (fig. 2). The phase of development in which the cells supply their own juices, retaining them in meshes of the tissue, is succeeded by a new formation of vessels, a more permanent provision. Certain tracts of cells are told off to form the walls of blood-vessels, the channel of the vessel being the space between two such adjoining tracts (fig. 3). These selected cylinders of cells become the new and enlarged system of blood-vessels, adequate to the requirements of the part. In this placental process the original capillaries play a

FIG. 1.—a, uterine tissue at early stage of decidua; b, c, the same at later stages.

FIG. 2.—From deeper part of placenta (guinea-pig), showing active cell-growth in and around the wall of a vessel.

very subordinate part; the thin cell-plates that form their walls are far outrun in the hyperplastic race by the cells of the tissues around, and it is the latter which furnish the materials for the new vessels. That which distinguishes the placental new formation is the enormous thickness of the walls of the new vessels and their terminal capillary loops. It remains to consider whether this placental new formation of vascular tissue—the only instance of the kind in the ordinary course of adult life—offers any help to the understanding of granulation-tissue.

FIG. 3.—New formation of vessels in placenta (guinea-pig).

very subordinate part; the thin cell-plates that form their walls are far outrun in the hyperplastic race by the cells of the tissues around, and it is the latter which furnish the materials for the new vessels. That which distinguishes the placental new formation is the enormous thickness of the walls of the new vessels and their terminal capillary loops. It remains to consider whether this placental new formation of vascular tissue—the only instance of the kind in the ordinary course of adult life—offers any help to the understanding of granulation-tissue.

Tendon in a Granulating Stump.—It is at once evident that the tissues of a stump after amputation have a very unequal value for formative purposes, and probably all of them a lower value than the uterine tissue, which is at no time far removed from embryonic characters. This inequality is seen in the order in which granulations appear—first on the vascular layer of the skin, on the ends of muscle, and on the marrow of bone, and last on the ends of tendon. The attempt of a severed tendon to cover itself with a cap of granulations is somewhat feeble, and its slowness gives us an opportunity of marking points of detail. Tendon consists of wavy bundles of fibres in close order, and in full-grown animals its cellular elements are reduced to small dimensions. They are thin plates folded round the bundles, presenting in the face view the appearance in a, fig. 4, and in the side view the appearance in b, fig. 4. In the granulating end of a tendon the appearance is that of c, fig. 4; the thin plates have become solid or cubical, and where

they have increased in number at the free end of the tendon they have lost their orderly arrangement; they have, in fact, become granulation-cells. The tendon has drawn upon its reserve of cells and placed them at the disposal of the reparative process. All the

FIG. 4.—a, tendon-bundle covered by cell-plates, detached plate beneath (highly magnified, after Ranvier); b, ordinary appearance of normal tendon in section, the plates being seen in profile as linear thickenings; c, tendon from a granulating stump of the leg,—the cell-plates have become cubical.

other tissues of the part have already done the same, some much earlier and more extensively than others. Wherever capillaries are most numerous there the cellular activity is greatest, the cells nearest to the wall of the capillary becoming more plump or more embryonic. The cellular material for the purposes of repair is supplied first around the severed vessels (according to some it is even supplied from within the vessels in the form of colourless blood-corpuscles) of the highly vascular muscle, of the marrow of bone, and of the subcutaneous tissue, and ultimately even by the ends of the tendons. In the placental process the formative materials had been furnished much more evenly over the whole area.

Blood-vessels of Repair.—The next step is towards the nutrition of the formative cells. Whether their nutrition is for a time plasmatic (as in fig. 1, from the placental growth) does not appear; about the third day the formative tissue begins to be furnished

FIG. 5.—Blood-vessels in the surface-layer of chronic granulations.

These vessels are different in several respects from the vessels in a vascular area of the normal organism of corresponding extent, unless it be in the decidua uterina. They are not branching arterioles ending in a fine capillary network, but they are of somewhat uniform and exceedingly simple structure throughout, and their calibre is often greater at the distal than at the proximal end. We have next to consider how these vessels have originated.

The youngest granulations that can be prepared for examination consist of a uniform mass of cells, mostly round, and of somewhat wide vascular channels separated from the mass of cells by thin walls of more elongated cells (fig. 6). The most probable analogy for these new and wide vessels is not the embryo nor the tadpole's tail, but the placenta; that is to say, certain of the cells along predetermined lines agminate to form the opposite sides of a tube, becoming adapted in shape to that end (fig. 3). According to Billroth, there is hardly ever in granulations an extension of the pre-existing capillaries by outgrowth of branching cells from their walls such

as may be observed in the tadpole's tail (*Untersuchungen über die Entwicklung der Blutgefäße*, Berlin, 1856, p. 30); and the circumstances are so little analogous in the two cases that this statement may be readily credited. How the new vessels join on to the old is not easily made out, whether in the placenta or in granulations.

As the granulations get older, the vessels acquire a considerable longitudinal coat of spindle-cells. The individual granulation-points on the surface become fused into a more uniform fleshy stratum, the lower layers contract as the cells approximate to fibrous tissue, and skin begins to form on the surface. If a healed surface be examined long after, in microscopic sections through the skin and subjacent tissue, the parallel vessels will still be observed running at intervals towards the surface, only more obliquely than in the granulation-tissue. They are invested by a certain quantity of fibrous tissue arranged parallel to their course, while all the rest of the space between two of them is occupied by horizontal lines of fibrous tissue, with spindle-shaped cells lying regularly among the bundles. This change has been, first of spherical granulation-cells into spindle-shaped cells, with development of intercellular or perinuclear substance (fig. 7), and then fibrillation of the latter. It is worthy of note that a development into elastic fibres goes on in the scar for months or even years after healing is complete. Hair-follicles, and sebaceous glands are not reproduced in the skin of scars, nor are sweat-glands. On the other hand, fat develops readily in the usual situations.

Suppuration in Repair.—Meanwhile there has been a remarkable, concomitant of the growth and adaptation of the reparative material, namely, a flow of *pus* or *matter* from the surface. Matter or *pus* varies in its physical characters somewhat; it may be creamy and yellowish-white (*pus laudabile*) or greenish-white, or it may be thin and watery or more viscid. It has an alkaline reaction and a faintly sweetish odour. Standing in a vessel, it separates into two parts,—a supernatant fluid or serosity, clear, and of a yellowish tint, and a sediment of pus-cells. The serum coagulates when boiled, and it may even happen that a fibrinous clot forms in *pus* after death, just as in drawn blood. The serum of *pus* contains from 1 to 4 per cent. of albumen, and very much the same salts as blood-serum. The cells of *pus* are spherical elements of somewhat uniform size, of the greyish colour of protoplasm, granular on the surface, and disclosing the presence of two, three, or four nuclei when treated with acetic acid (fig. 8). They are capable of amoeboid movements, and they may be seen to take into their substance such particles as charcoal with which the wound may be dressed.

Physiological Analogy of Pus.—Pus is a very remarkable adjunct of the reparative process—to go no farther into the inflammatory processes for the present. The pus-cells are evidently a condition or product of the granulation-cells on the extremities and sides of the vascular outgrowths, and they are detached from these situations, carrying with them a certain amount of fluid. Is there anything analogous to this in other formative processes of the body? The following analogy is very close in some at least of the circumstances. The interior of a cyst removed by operation from the neck region is found to be covered with vascular tufts, which have precisely the character of granulations as regards the blood-vessels. Each vascular tuft is covered by a cap of cells like a granulation, and the same investment of cells can be followed as a cylindrical column down the vessel into the depth of the cyst-wall. These cells are somewhat peculiar. They are cubical or polyhædric elements, with a

FIG. 6.—Young granulation-tissue, where the vessels are spaces bounded by rows of flattened cells. (After Billroth.)

FIG. 7.—Vessels of granulation-tissue, their walls invested by longitudinal spindle-cells; the interval occupied by round cells or transverse spindle-cells.

FIG. 8.—Pus-corpuscles. a, fresh; b, under acetic acid—the nuclei visible; c, blood-disks, to compare in size.

nucleus and a broad zone of protoplasm (fig. 9, a). On the summit and sides of a vascular tuft they are found becoming detached and disintegrated, the nucleus being cleft into fragments, which afterwards coalesce, while the cell-substance flows off in the form of spherical or oval or pear-shaped vesicles of a reddish tint (fig. 9, b). The cyst is a blood-cyst,—its contents, a clear brownish fluid with many red blood-disks floating in it, having been produced by the disintegration of the cells covering the vascular tufts. The cells are hematoblasts; their cell-substance is disengaged in drops which afterwards become red blood-disks, and their nucleus, after being cleft into several fragments of unequal size, is remade and survives as a cell of the size of a pus-cell, and containing several nuclei like a pus-cell (fig. 9, c). This is a curious instance of blood-making from connective-tissue cells late in life, and it is not so much inexplicable in its characters as it is rare in its occurrence. The formation of *pus* on the granulations of repair is one of the commonest of incidents, but it is open to elucidation even by a rare analogy. In the one case a blood-like fluid is formed, and in the other *pus*; the fluid part of *pus* corresponds to the plasma together with the red blood-disks in the cyst, and the cellular part of *pus*, the pus-corpuscle, corresponds to the surviving but broken-up nucleus of the hematoblast. The granulation-cell is comparable to the perivascular cell of this blood-making process, and in passing into the condition of a pus-cell with several small nuclei it disengages merely a fluid plasma and no red blood-disks. The cells of the injured part having returned to an embryonic state, their first activity is a revival of early embryonic activity; if they do not make blood, they yield that which may be regarded as its substitute, namely, *pus*.

This analogy will appear all the closer from a consideration of another cyst. In this new growth, which occurred under the skin of the back, and was removed, like the former, by operation, the wall is lined by a certain thickness of tissue which is practically the same as the granulation-tissue of repair; there are the same parallel vessels ending in loops, the same cells, and the same deliquescence of the surface. The fluid in the cyst is indeed the result of this liquefaction—a somewhat turbid brownish fluid. In a small recess of the cyst there is a formation of a considerable layer of epidermis-like scales on the surface. One important point of difference is that the deeper layers of cells show no tendency to become spindle-shaped, to take a transverse order in the intervals between the parallel vessels, and so to become fibrous tissue. On the contrary, one finds in the depths of the tissue the stems of vessels surrounded by zones of young cells, perivascular sources of the new growth by which the loss of substance around the terminal loops of the vessels is constantly made good. On these terminal loops the process is not one of pus-formation, nor is it altogether one of blood-formation as in the former cyst; but it is an intermediate process which helps us still further to understand the significance of the *pus*-in-repair. The new formation is comparable to that of the blood-cyst in the obvious perivascular grouping of its cells, and it is comparable to the granulations of repair in the forms of its cells; and it thus supplies the link between the blood-yielding tufts of the former and the *pus*-yielding vascular points of the latter. What, then, is the nature of the deliquescence in the interior of this cyst? It is partly blood; and there may be seen also the large cells from whose protoplasm the blood-disks have been derived. There are also seen the remarkable cells with nucleus cleft into three or four, so like the cells of *pus* (fig. 10, b); the latter are the surviving nucleus of the hematoblast, the peculiar form of which is best explained by watching the more perfect process of blood-formation on the wall of the blood-cyst. Fewer of the cells in the second cyst undergo this transformation; fewer of them ever attain the perfect form of hematoblasts so as to be able to undergo it. For the most part they pursue a devious development, and it is in this that they resemble granulation-cells. The difference is only one of degree; the type or law of the process is the hematoblastic type, which may be more or less perfectly attained. We are accordingly confirmed in the impression that *pus*-cells are the surviving nuclei of embryonic cells whose perfect law is blood-making, and that the fluid which accompanies them is the cell-protoplasm which has failed to disengage itself in the form of individual buds that easily pass into red blood-disks, but has become a veritable albuminous fluid. *Pus*, then, may be said to be blood absolutely

FIG. 9.—a, perfect hematoblasts; b, disintegrated hematoblasts, the nucleus cleft, the protoplasm flowing off to become blood-disks; c, remains of the hematoblasts, resembling pus-corpuscles in the cleavage or dispersion of the nuclear particles.

FIG. 10.—a, large blood-yielding cells from the wall of a cyst; b, their nuclei surviving after the detachment of c, the red blood-disks.

wanting in red blood-disks, and with the colourless corpuscles in enormously disproportionate numbers. We shall afterwards see that there is a kind of blood—leucocythæmic blood—which approximates to pus in these its essential characters.

That which distinguishes the process of repair from the formative process in the two cysts, and in all tumours whatsoever, is that the former is self-limited; after a time skin forms on the surface of the granulations, and the lower layers of cells pass into the resting condition of fibrous tissue. Each of these adaptations has now to be described.

Formation of Skin on a Granulating Surface.—The new skin appears as a delicate bluish frill extending gradually over the raw surface from the margin of the old skin. Nothing is more natural, therefore, than to suppose that it is a continuous growth from the cells of the rete mucosum of the old skin; and, according to the embryological-dogma of an impassable gulf between the epiblast, mesoblast, and hypoblast for histogenetic purposes, the new epidermis can have no other source than proliferation from corresponding cells of the old. But, dogma apart, there is a radical difference of opinion as to the origin of the epidermic or epithelial cells on the surface of granulations. Notwithstanding the fact that the new epithelium springs up alongside the old, it has appeared to many observers with the microscope that it was derived, not from subdivision of the latter, but from the granulation-cells becoming flat and otherwise adapted to surface purposes. In considering these difficulties let us, as before, seek analogies among other formative incidents of mature life. In the first place it should be mentioned that the new skin may be peculiar. The accompanying figure (fig. 11) is drawn from a section through the

FIG. 11.—Loop-like arrangement of rete mucosum in the skin of a scar.

scar of an ulcer of the leg which had broken out and healed repeatedly. The peculiarity is that the epithelial cells are everywhere a narrow belt which bends down and encloses the terminal vessels as in a loop; in other words, the surface vessels are driven through the midst of the rete mucosum of the new skin. For an analogy to this epitheliation of granulation-tissue we may take the case of the cyst already referred to; it was covered in part with a thick layer of epidermic scales. The origin of these in the cyst is not difficult to trace; they are the granulation-cells enlarged, with two, three, or four nuclei, and with a more homogeneous protoplasm. The surface-layer is in fact largely made up of multinuclear blocks, some of which become excavated in their interior, while their nucleated periphery forms a narrow belt of surface-cells with a descending loop enclosing a space, in which collections of blood-corpuscles may sometimes be seen (fig. 12). If we imagine the plexus of vessels ramifying on the granulating surface to form communications with these excavations in the multinuclear blocks, we should be able to understand how it is that they are driven through the rete mucosum of a scar, as in fig. 11.

Giant-cells in Repair.—These multinuclear blocks are the so-called *giant-cells*. Their occurrence in fungous granulations was described by Billroth (*op. cit.*, p. 32) in 1856, he having previously seen them in the granulations of bone and taken them to be elements "necessary for the new formation of vessels in osteophytes or in calus." The accompanying figure (fig. 13) shows several examples of them from the granulations of a slow-healing stump. Precisely the same forms occur in the wall of the cyst whose structure has been already referred to in order to illustrate the granulations of repair. But for these multinuclear blocks of tissue we have a clear physiological parallel in that un failing source of analogies for the formative processes of mature life, namely, the placenta. The accompanying

FIG. 12.—From surface of a cyst lined with epidermis; above, a continuous piece of the cyst-wall; below, individual multinuclear cells excavated.

FIG. 13.—Giant-cells from chronic granulations.

examples (fig. 14) are drawn from the deepest layer of a discoloured placenta (the guinea-pig's). Here it is evident that they result

from the subdivision of a single nucleus within a growing cell of the inner muscular coat; and their place in the placental process is as clear as their histogenesis. They enter into the formation of the blood-sinuses of the deeper parts of the organ, sometimes forming a considerable part of the wall of a vessel by being excavated in their interior (the nuclei being driven to the side), at other times forming one side of a blood-channel,—a corresponding multinuclear block forming the other, and the lumen of the vessel being the space between them. They represent a somewhat feeble continuation of those vaso-formative processes in the placenta which we have already used as the analogy for the production of the new vessels of granulations. That their function and significance in granulations is not wholly vaso-formative will appear from the fact of their co-operating to build up the surface epithelium.

FIG. 14.—Vaso-formative giant-cells from deeper layers of placenta (guinea-pig).

Conversion of Granulation-tissue into Scar-tissue.—The skin of a scar is never perfect; it is always thin, wanting the descending processes and papillæ of the natural skin, and wanting also the hair-follicles, hairs, sebaceous glands, and sweat-glands. Its blood-vessels never become the orderly capillary loops of the original type; they remain for a time as an extensive plexus of large vessels close to the surface, giving a recent scar its livid appearance; afterwards the channels of the vessels become narrower, and many of them quite occluded; and the scar has in the end a somewhat blanched appearance, which continues even when the surrounding skin is thrown into a state of ruddy glow. The underlying tissue, however, gradually acquires more of the natural type. If a section be made through an old scar it will be seen that the subcutaneous tissue is fibrillar and fibrous, with more or less of fat-cells. In the figure (fig. 15), drawn from a section

FIG. 15.—Scar-tissue of an ulcer of the leg which had broken out and healed repeatedly; spindle-cells with brown pigment in the inter-fibrillar spaces.

through the scar of an ulcer of the leg which had broken out and healed more than once, the tissue is composed of parallel wavy fibres, with spindle-cells between them at regular intervals, the cells having (as a characteristic of scar-tissue after repeated healing) brown pigment-grains in their substance. The successive changes which have led up to this horizontal fibrillation are not difficult to follow. While the ascending vessels acquire more and more of elongated cells on their walls, the granulation-cells in the intervals between them become extended horizontally or obliquely (see fig. 7), the spindle-cells among the fibrillar bundles in the figure being the surviving representatives of them. The change of the spherical cells into spindle-cells, which precedes the fibrillation, takes place first in the deepest or oldest stratum of the granulation-tissue, and it appears to be accompanied by a certain dragging down or obliquity of the vessels running to the surface. There is always a considerable thickness of spindle-cells parallel to the vessels, so that these, together with the horizontal tracts between the vessels, make up a kind of warp and woof. But as the scar-tissue matures the horizontal bands come to overshadow the vertical or oblique. The fibrillation takes place, as it does in ordinary growth, in an intercellular or perinuclear homogeneous protoplasm, which becomes more extensive as the embryonic or purely cellular character of the granulation-tissue fades. One of the most striking facts in this development of embryonic tissue into mature tissue in the adult is its shrinkage, corresponding to the well-known contraction of the area of a healing surface.

Repair of a Broken Bone.—The reparative process in bone is much simpler and it may be said to be much easier than in the healing of a stump. The bones retain even to old age the materials out of which new bone may be produced; these are the somewhat

embryonic membrane covering the bone, or the periosteum, and these two tissues retain

the marrow. During the growing period pronounced embryonic characters, and at all times they take on a formative action readily. However unlikely an object, then, a bone may seem for repair, it has within and around it the materials for a tolerably direct renewal of osseous substance. The most orderly or intelligible form of the reparative process is that seen in animals. A long bone, such as the tibia or shin-bone, after having been broken and carefully set, presents an appearance such as is drawn in the figure (fig. 16, *a*). Opposite the line of fracture there is a fusiform thickening all round the bone, which is bulky and cartilaginous for a time, and afterwards becomes greatly reduced in extent, and, at the same time, osseous in its structure. It is called the callus. It will be convenient to describe the details of this process of repair from actual specimens of the tibia of a young frog which was found undergoing repair after fracture. The tibia, when cleared of the muscles, was found to have a spindle-like enlargement about its middle of the size and shape of an oat (fig. 16, *b*) and of a whitish colour. It was easily cut up into sections passing through its whole length, as well as through the projecting ends of the spindle representing the normal shaft of the bone (fig. 17). The bulk of this fusiform enlargement is made up of cartilage developed between the upraised periosteum and the dense substance of the bone. But there is another and independent new-formed mass projecting from the canal of the bone, and clearly marked off from the wide extent of cartilage around it,—this is the direct osseous formation from the marrow. The cartilage has been produced from the periosteum, each spindle-cell of the latter altering its form and developing a disproportionate amount of cell-substance, which becomes the hyaline matrix of the cartilage, while the nucleus of the original cell, generally excavated or reduced to a crescentic shape, remains as the cartilage-cell. From this cartilage, again, bone is formed very much as it is formed from the central rod of cartilage in the foetal bone, and it also resembles the latter in being formed only to be reabsorbed. In these preparations from the frog, narrow spicules of bone may be seen starting from the thin end of the spindle and spreading over the surface of the cartilaginous callus. In the deeper strata of the latter, and still at the thin end of the spindle, the cartilage-cells group themselves round the walls of alveolar spaces, as in the ossification of epiphyseal cartilage, and that is doubtless the process which extends throughout the whole mass of cartilage. Meanwhile there has arisen a fungus-like protrusion of new bone from the medullary canal of the bone; it lines the inner walls of the medullary cavity for a short distance up from the line of

FIG. 16.—*a*, broken tibia of a dog undergoing repair, ensheathing ring of cartilage-callus opposite the fracture (from Paget); *b*, tibia of a young frog with fusiform thickening of cartilage covering a fracture.

FIG. 17.—Section through broken tibia of a young frog. —upper fragment. *a*, ensheathing callus (cartilage) between periosteum and shaft; *b*, intermediate callus (bone), growing from the cells and vessels of the marrow.

from the medullary canal of the bone; it lines the inner walls of the medullary cavity for a short distance up from the line of

fracture, and projects for a greater distance into the midst of the cartilaginous callus. This centre of ossification is intimately connected with the blood-vessels of the marrow; they form the framework of the osseous growth, the embryonic marrow-cells (themselves the lineal descendants of cartilage-cells) becoming the osteoblasts or future bone-corpuscles. The whole of the new growth of bone is ultimately moulded into a more compact form; but the seat of an old fracture will always retain a certain roughness of exterior, and a certain want of regularity in its Haversian systems.

The repair of bone in man is not altogether the same as in animals; the ensheathing cartilage is not usually found except in broken ribs, and the uniting osseous substance corresponds mostly to that part of the new bone (in the preparation from the frog) which issues from the medullary cavity in association with the blood-vessels of the marrow. The callus in man is accordingly said to be chiefly "intermediate" or between the broken ends, and partly also "interior," or extending into the medullary canal; and it is naturally permanent and not subject to removal like the "ensheathing" callus developed from cartilage. But the sources of new bone in man depend upon the amount of displacement of the broken ends; if the displacement be very considerable, the connective tissues around may be drawn upon for bone-forming materials, their cells becoming embryonic in form and ultimately osteoblasts. Comparing the repair of a bone with the repair of soft parts, the former is much more direct; the osteoblastic tendency or memory is strong in the tissues within and around a bone, above all in the periosteum and in the young or red marrow; and true osseous union is readily effected except in such fractures as the neck of the thigh-bone and the knee-cap, where the union is often merely ligamentous or fibrous. In the "greenstick" fractures of children the periosteum is still a succulent layer engaged in the natural growth of the bones, and there is reason to suppose that it is the chief source of whatever reparative materials may be needed.

Repair of Nerves and Muscles.—When a nerve, such as the ulnar, is divided by a cut near the wrist, sensibility is lost over the area of skin to which the nerve is distributed, and, under ordinary circumstances, it is restored in about three weeks. The severed ends of the nerve are joined by a band of tissue, which has been proved by examination of it at various stages of the reparative process in animals to be at first composed of embryonic spindle-cells arranged in the line of the nerve-bundles (fig. 18); these cells are derived from the nuclei of the neurilemma, they pass through the original embryonic phases, and ultimately become more or less perfect nerve-tubes filling the gap in the divided nerve,—a gap which may be a quarter or half an inch in length. In muscle, also, a corresponding process is described; but the repair of a ruptured muscle such as the rectus extensor of the thigh is commonly fibrous only, and the gap can be felt even through the skin.¹

Muscle-repair.

§ 4.—ERRORS OF EMBRYOLOGICAL GROWTH IN CERTAIN TISSUES—MESOBLASTIC TUMOURS.

No chapter or section treating of tumours as a whole can be homogeneous, and, in order to preserve the developmental or evolutionary order already sketched, it will be convenient to consider here only a part of the morbid processes which result in tumours, leaving the rest to be introduced at appropriate points in the sequel. The disadvantage of applying the developmental or embryological idea to all tumours whatsoever comes out in the tumour-hypothesis of Cohnheim. According to that hypothesis, the tumours of the body are due to the awakened growth of small centres or foci of embryonic tissue which had

¹ Literature.—Paget, *Lectures on Surgical Pathology*, 4th ed., Lond., 1876; Darwin, *Animals and Plants under Domestication*, vol. li. chap. xxvii., new ed., Lond., 1882; Billroth, *Ueber die Entwicklung der Blutgefässe*, &c., Berlin, 1856; Id., in *Beiträge zur pathol. Histol.*, Berlin, 1858, and in his *Allgem. Chirurg. Pathol.* (Engl. transl.); Ziegler, *Untersuch. über pathol. Bindegewebs- und Gefässneubildung*, Würzburg, 1876, and in his *Pathol. Anat. und Pathogenese*, Jena, 1880-84 (Engl. transl.); Rindfleisch, *Lehrbuch der pathol. Gewebelehre* (Engl. transl., 1872-73); Golding Bird, "Constructive Inflammation and Ulcers," in *Guy's Hosp. Reports*, vol. xxiv., 1879, p. 525.

remained over from the foetal development, persisting in their embryonic characters while all else around them had assumed the characters of maturity. For the arguments and illustrations of this hypothesis the reader may refer to the section beginning at p. 622, vol. i., of Cohnheim's *Vorlesungen über allgemeine Pathologie*. It must suffice to say here that groups of resting embryonic cells in the various organs and parts of the body, or embryonic rudiments in the sense of Cohnheim, are not known to exist at all generally. That which we are well assured of is an indwelling power of all the mesoblastic tissues to revert to embryonic characters,—the spontaneity of the tissues never quite worn out, or the memory of development more or less deeply rooted in them to the end of life. From this point of view we have traced the process of repair, finding a developmental analogy even for pus. From the same point of view we have now to consider certain kinds of new formation as arising, not to make good defects, but under an erratic impulse, or in the course of an erratic spontaneity. Congenital tumours have always been regarded as errors of development, and it will be convenient to select a simple congenital tumour to begin with.

Fibroma.—The texture drawn in the figure (fig. 19) occurred in a tumour of the back of the neck in a young child having been there since birth. It is a fibroma, and consists essentially of bundles of wavy fibres crossing or decussating in direction, sometimes thick bundles, sometimes only a few strands, the whole forming a dense warp-and-woof texture. The peculiarity is that such a tissue should have formed under the skin as a tumour or lump the size of a hen's egg; spread out in thin layers, the same warp-and-woof texture of fibres occurs naturally in the aponeuroses and the sheaths of muscles, and in other fibrous membranes, such as the dura mater; and the large number of nuclei among the fibres, as shown in the figure, would be appropriate to the fibrous tissue at the early period of life to which the tumour belonged. At various centres these embryonic cells had developed into fat-cells, so that the tumour may be called a fibro-lipoma. The tissue has increased in three dimensions, and so has resulted in a palpably distinct object in the body, which could be dissected out from among the surrounding structures as an individual thing. The overgrowth had taken place probably in one of the aponeuroses of the trapezius muscle, and the noteworthy point is that it has faithfully adhered to the warp-and-woof texture proper to the tissue on which it is based. The new formation possesses length, breadth, and thickness, and its fibres are interwoven in the three dimensions as if it had been constructed at some unusual kind of loom. The same interlacing of bundles of wavy fibres is found very commonly in the fibromata,—their favourite seats, besides the flat fibrous sheaths, aponeuroses, and membranes, being the uterus and its appendages, where the tumours may be stalked or sessile. Sometimes the fibres are concentrically arranged round a number of centres, or the bundles may pursue a sinuous course.

One variety may be specially mentioned as exemplifying a modification of fibrous structure which is often met with in various normal and pathological processes. In this modification the fibres become as if fused into broader homogeneous bundles, the nuclei being left lying as if in spaces or holes in a structureless

FIG. 19.—Congenital fibroma from a child's back; warp-and-woof fibrous texture, with embryonic nuclei—bundles of fibres seen also in cross-section.

FIG. 20.—Recurrent ossifying fibroma of lower jaw.

ground-substance. This variety of fibroma is generally found in the bones of the jaws; it may be ossified at some points, the nuclei becoming the bone-corpuscles, and the homogeneous ground-substance becoming impregnated with the earthy substance of bone. The accompanying figure (fig. 20) is drawn from a preparation of a fibrous tumour, ossified in part, within the medullary space of the lower jaw in an adult. It had been removed once, and grew again (recurrent fibroma or fibroid).

Where the modification takes the direction of an increase of the cells at the expense of the fibres, we have a *fibro-cellular* tumour. The tumour is composed of elongated elements, which are virtually nucleated cells with very long bodies, amounting almost to fibres. The figure (fig. 21) is made from an extensive tumour deeply seated in the carotid region of the neck in a woman aged twenty-two.

FIG. 21.—Fibro-cellular tumour; decussating bundles.

There is nothing more remarkable in all these varieties of tumour than the constancy of the warp-and-woof texture, and we shall find that the same is an important characteristic of the class of tumours where the fibrous structure is wanting and everything becomes cellular.

Tumours of the latter kind form the group of *sarcomata* or flesh-like tumours. Proceeding from the fibro-cellular tumour last mentioned and sketched, we come to the variety of *spindle-celled sarcoma*, in which the cells differ from the fibro-cellular elements of the former, chiefly in the greater prominence of the nucleus and the greater delicacy of the tapering prolongation of cell-substance. It is sometimes called a small spindle-celled sarcoma. The figure (fig. 22) shows the structure to be purely cellular, without any fibrous supporting tissue. In the cross-section the spindle-cell appears as a small round cell:

FIG. 22.—Tumour composed of small spindle-cells in decussating bundles.

In the *sarcoma with large spindle-cells* we have a form of tumour not uncommon in certain regions of the body, often associated with brown pigmentation, and very generally malignant in its course.

One common seat of it is the choroid coat of the eye, where large pigmented cells, both spindle-shaped and branched, exist naturally. Another common seat is the subcutaneous tissue, where pigmentation is not a normal occurrence. The illustration (fig. 23) is taken from a case where there was, however, brown pigmentation of the skin for a considerable distance round the tumour.

FIG. 23.—Tumour composed of large spindle-cells in decussating bundles.

The situation was the shin, the common seat of chronic ulcers, and the tumour seemed to have begun in the scar-tissue of an ulcer of that kind. The cells are very large spindle-like elements grouped in decussating bundles, the distribution of pigment being partial (omitted entirely in the cut), and not uncommonly confined to the narrow bands of cells separating two broader or thicker bundles. The developmental or embryonic character of these cells is sufficiently obvious; but the occasion for their reappearance in mature life is not so clear. For the particular case of tumour over the shin

the following may be conjectured. In the pigmented scar of an old ulcer of the same region the subcutaneous fibroblastic tissue is found to be thickly occupied with large spindle-cells full of brown pigment granules (see fig. 15). Now, the skin for some distance round the tumour in question had precisely the brown pigmentation of a scar that had re-formed repeatedly, and the brown colour resided presumably in the same embryonic elements as are drawn in fig. 15. It cannot be supposed, however, that that explanation applies to all spindle-celled sarcomas with pigment, even if we do not include those of the choroid tunic of the eye. A more general explanation must be sought for the pigmentation, which will apply also to the pigment in scar-tissue itself.

Cystic Sarcoma.—The activity of tumours, even of those classes that we have hitherto considered, is not purely structural or formative; it may be obviously functional, involving an instability of the structure. Even the fibrous tumours may become cystic in their interior, as notably in the case of fibroids of the uterus; and it may be stated generally that all such traces of cyst-formation in solid masses of embryonic tissue are so many traces of the deeply-rooted embryonic function of those tissues. This important principle of tumour pathology may be conveniently introduced through a particular case of spindle-celled sarcoma, which grew to a great size on the outer side of the thigh of a boy aged fifteen, having its root deep down in the interval between the tensor fasciæ muscle and the vastus externus. In no part of this tumour were traces wanting of an embryonic function residing in its component cells. Although the section of the tumour was close and firm, yet one found under the microscope the appearance drawn in the figure (fig. 24). The tracts of spindle-celled tissue are interrupted by spaces lined by cubical cells, which are the surface-modification of the spindle-cells. These are the blood-spaces of the tumour, and blood is to be seen in them here and there. Where the excavation has been extensive the spaces have formed communications, and left the spindle-celled tissue projecting into them as free cylinders or columns, with rounded ends covered with the same cubical epithelial-like elements. A central area of the tumour was more spongy in consistence; and that character is found to depend upon the greater development of the spaces, approaching remotely to a cystic development. It is here that one sees the true physiological or embryological significance of the interstitial spaces, of their contents, and of the cubical cells round their walls. The surface-row of cubical cells loosen from their attachment, fall into the space, and are succeeded by another row, which are detached in turn; and so the excavation proceeds at many centres. The detached cells do not remain free solid elements; they may sometimes change *in toto* into a mucous fluid, but their full physiological activity is the hæmatoblastic or blood-making. The spaces contain the hæmatoblastic cells and their derivatives in various forms. One may see the cubical cells on the margin of the space (fig. 24) acquiring a yellowish tint, then the same cells disengaged and lying free in the space and probably increased in size (fig. 25), then red blood-disks of the same colour as the protoplasm of the hæmatoblasts, and cells with several nuclei corresponding to those already described as the surviving nuclei of the disintegrated hæmatoblast, the whole lying in the midst of a mucus-like coagulum. This is neither more nor less than the early blood-making function of the mesoblast revived. The result is not by any means always or altogether blood, and in cysts it is indeed for the most part a mucous or serous fluid.

FIG. 24.—Sarcomatous tumour growing from the inter-muscular septum of the thigh; spaces lined by cubical epithelial-like cells.

FIG. 25.—Hæmatoblastic process in the spaces of sarcomatous tumour as above. a, cells with yellowish protoplasm, granular or homogeneous; b, blood-disks of various shapes; c, the surviving nuclei.

In one direction this process goes on to the ultimate destination of a *thin-walled cyst*; and the following case of spindle-celled sarcomatous tumour may be regarded as an interesting intermediate phase. The tumour is the size of an orange, from the neck region of a dog; the peculiarity of it is that it is excavated completely on the side next the skin, while the deeper half of the spheroid is made up partly of a firm texture with slits or spaces lined by cubical cells, as already described, and partly of a beautiful interlacing system

of polished cylinders crossing the cavity from side to side, or hanging free into it. The process of excavation has merely been an extension of that drawn in fig. 24; it may be compared to the excavation of the heart in the embryo,—the columnæ carneæ and musculi papillares and pectinati of the latter corresponding to the columns and free projecting cylinders of the cyst. It is noteworthy that a trabeculated interior is characteristic of many cysts.

Myxoma or Mucous Sarcoma.—In another direction the hæmatoblastic softening process goes on to the variety of tumour called *myxoma* or *mucous sarcoma*; and this change may be actually observed in parts of the above-mentioned extensive spindle-celled sarcoma from the outer side of the thigh. A myxoma is that particular modification of embryonic mesoblast in which the softening or fluid disintegration takes place, not along definite or selected tracts, but uniformly over a particular area. The cells become excavated somewhat as in fat formation, the nucleus remaining at one side, and their thin membranous walls appearing as branching processes, which join with those of the next cell. Hence the nuclei often lie as if at nodal points of a meshwork of fibres, and they are often triangular or lozenge-shaped. This is one common form of myxomatous tissue. But the mucous transformation taking place in each individual cell may result in a tumour presenting a very different appearance. The figure (fig. 26) is taken from a soft gelatinous tumour of the subcutaneous tissue. Nothing could be more orderly than the grouping of its large mucus-yielding cells in rows following the wavy course of the bundles of fibres or fibrils; they are as regular as the cell-plates of tendon. Their origin can be traced to the fixed connective-tissue cells of the part, which have emerged from their inconspicuous state, and have acquired breadth and thickness, a cubical form, and mucus-yielding protoplasm. Precisely the same process may end in a cystic excavation. The relation of this change to the indwelling tendency of the mesoblastic cells towards blood-making is revealed in the actual hæmatoblastic character of the cells here and there, and in the blood-disks and cells with cleft nucleus lying around. Another intermediate or occasional form of the cells in this tumour reveals also the true affinities of spindle-cells filled with yellow or brown or black pigment. Such pigmented spindle-cells replace the mucous cells here and there; we must consider them to be also a somewhat devious development in the hæmatoblastic process, their pigment being practically the same as blood-pigment.

FIG. 26.—Mucous sarcoma of subcutaneous tissue (dog).

Alveolar Sarcoma.—In this connexion also we must take the kind of tumour that is often called *alveolar sarcoma*. The epithelial-like form of cell, which lines the spaces among the spindle-cells in the case already mentioned, now comes to predominate. The following is an instance, with figure (fig. 27).

A tumour the size of a large walnut, deeply pigmented, with the skin drawn tightly over it as if it had grown in the position of a mole or congenital mark, was removed from a man's leg. Although the tumour is somewhat black throughout, the pigment is found to reside only in certain narrow tracts or clusters of cells. The structure is divided into oblong or alveolar spaces by narrow bands of fibres, the cells within the spaces being all of the epithelial type. Some of the cells are much larger than others, and these largest elements are tinted bright yellow or brown. It is no great step from this singular structure to the embryonic structure and function of former cases. Instead of a few cells at a time forming an epithelial-like surface to an alveolar space (the great bulk of the tissue remaining as tracts and columns of spindle-cells), here the alveolation has been general through the whole area, and all the cells have become as if surface-cells. Furthermore, they have been fixed in that condition, proceeding to no further development, whether mucus-forming or blood-forming,—only certain groups of them, and these by far the largest and most epithelial-like, acquiring the yellow colour of hæmatoblasts, or a brown colour. The pigment is otherwise contained in spindle-cells which occupy the interval alveolar septa, and in them it is in a more granular form.

FIG. 27.—Melanotic alveolar sarcoma of subcutaneous tissue.

Cavernous Blood-tumours.—The pigmented alveolar sarcoma is sufficiently common in the situation of congenital mother-marks of the skin to be one of their characteristic developments. Another of their developments or equivalents is the *nævus* or *angioma* or *cavernous tumour*, whose structure may be said to consist, in general terms, of a spongy meshwork of alveolar spaces, bounded by coarse and elastic trabeculae and filled with blood. Arteries open into such tumours and veins pass out from them, the cavernous territory being intermediate; but, according to several authorities, this connexion with the circulation is not primary to the cavernous tumour but acquired. Without entering upon a discussion of details, the analogy of the alveolar sarcoma growing on the same basis of a congenital pigment-spot may be kept in view. The alveolation is the same in both cases, although the trabeculae in the cavernous tumour are somewhat stouter, the grand difference being in the contents. If, however, we suppose the epithelial-like cells of the alveolar sarcoma all to become large and filled with a yellowish colouring matter, as indeed many of them do, and if we suppose that these hæmatoblasts (for such they are) go on to fulfil their destiny, then we should have a cavernous blood-tumour, that is to say, the alveoli would be filled with red blood-corpuscles. It will not be possible to offer evidence of this process except for the cavernous blood-tumour of the liver, an organ in which such tumours are comparatively frequent, and mostly in later life. The cylinders of liver-cells appear to become narrower and narrower, as if from pressure of the capillaries, and ultimately to disappear. From the supporting tissue a new growth of cells takes place (fig. 28). These are hæmatoblasts; their protoplasm becomes red blood-disks, and their nucleus survives with the remarkable trefoil arrangement of cleavage which has been described for several other instances of the hæmatoblastic process. There can be no mistaking the identity of this process with that of the blood-cyst of the neck already mentioned; it is essentially a manifestation of hæmatoblastic function late in life, differing from that of the blood-cyst in the fact that the centres of blood-formation are separated from one another within alveolar boundaries. These cases illustrate another striking property of cavernous blood-tumours, namely, to *heal spontaneously* in parts or to develop embryonic scar-tissue through more or less of their extent (fig. 29, a). The ordinary cavernous texture of an angioma is produced by the formative process stopping short of embryonic connective tissue or scar-tissue. The accompanying figure (fig. 29, b) is from an enormous angiomatous

FIG. 28.—Hæmatoblastic process in cavernous growths of liver (dog). a, the supporting tissue producing hæmatoblasts b; c, nuclear remains of hæmatoblasts and red blood-disks side by side.

FIG. 29.—a, cicatricial tissue from cavernous tumour of liver (dog); b, meshwork occupied by red blood-disks, from cavernous tumour of head (ox).

tumour on the side of an ox's head; the structure is very like that of the young connective tissue of the former figure, except that the meshes are densely packed with red blood-corpuscles. There are, however, other parts of the tumour where the fibres are broader, the meshes narrower, and with embryonic cells lying in them, instead of or along with blood-corpuscles.

There is no definite limit between such cavernous blood-tumours and true blood-cysts; in the latter the numerous hæmatoblastic centres open communications, and the further process takes place in the cellular tissue forming the cyst-wall.

The blood-making office of the mesoblast is the earliest and greatest of the functions of embryonic cells, and it is not surprising that it should come out more or less obviously in those formative processes in the common binding tissue of the body where there is a persistence or revival of embryonic activity. We seem to find traces of it in the pigmentation, in the cystic excavation, in the alveolation, in the mucous or myxomatous transformation, and in the cavernous structure of mesoblastic new growths. The embryonic spontaneity in the middle layer is, of course, wider than mere blood-making; but the hæmatoblastic function or tendency is certainly the most fundamental, and the traces of it in the foregoing tumours are our best help towards a rational interpretation of them. Persisting or

revived embryonic activity in subcutaneous and other homologous tissues cannot but bring to light more or less of this all-important mesoblastic function; the memory of it is too strong to be ignored. We come next to a function of embryonic cells which is only second to the hæmatoblastic, namely, the osteoblastic or bone-making function; and even with the bone-making process the earlier blood-making process is deeply interwoven, for in the marrow of the bones the hæmatoblastic activity of cells persists long after it has ceased elsewhere.

The bone-making function of embryonic tissue—if function it may be called—comes into a large number of tumours; or, in other words, a large proportion of all mesoblastic tumours are *tumours of the bones*. In all of these the embryonic law of development and growth is clearly present. The results, however, are frequently more complex than in the tumours hitherto considered, or, in other words, tumours of the bones are exceedingly liable to have a structure so mixed as almost to baffle systematic description. One reason of this is that the osteoblastic and hæmatoblastic functions of embryonic cells go hand in hand in their production; and the complexity of structure is, accordingly, greatest in those which grow from that part of the bone where the blood-making resides, namely, the marrow. The other great formative tissue of bone is the periosteum, a tissue which retains its embryonic structural features long after the mesoblastic tissues elsewhere in the body have lost theirs. The marrow and the periosteum are frequently involved in the same tumour; or an essentially similar morbid product may be derived from either. That is notably the case with the tumours of the bones which we come to first, the cartilaginous tumours or enchondromata.

Enchondroses.—It is only rarely that a cartilaginous tumour grows from cartilage, the observed instances having occurred at the cartilaginous lines of union of the base of the skull, at the epiphyseal lines in long bones, and in such permanent cartilages as those of the larynx and trachea. To these direct outgrowths of cartilage-cells Virchow has given the distinctive name of *enchondroses*. Usually the cartilaginous tumours do not grow from pre-existing cartilage; they grow either from the periosteum or the marrow of the bones, or they form in certain glandular organs, especially the salivary glands (parotid, labial, &c.), the mammary gland (oftenest in the dog), the lacrimal gland, the testis, &c. These latter enchondromata are a class apart, involving considerations of disordered everyday secretion rather than of the revival of embryonic activity (see "Errors of Secretion," p. 379 below). The enchondromata that fall to be considered here are those which grow within or upon the metacarpal bones and the finger-bones, more rarely in the corresponding bones of the foot, not unfrequently in the bones of the face, and, it may be, in the leg-bones and arm-bones, or in bone anywhere.

Enchondroma.—The simplest cases (but the least frequent) are those that form between the periosteum and the hard bone from the growth and transformation of the cells of the periosteum, being directly homologous to the ensheathing cartilage-callus of repair. They differ from the cartilage of repair in precisely the same way that a granulation-like sarcoma differs from the granulation-tissue of repair,—that is to say, the existence of the tissue is not self-limited, or it has no tendency, or only a feeble tendency, to cicatricial modification, shrinkage, or absorption. These purely subperiosteal enchondromata are said by Paget to be nearly characteristic of the ends of long bones, although they do not encroach on the articular cartilage. When a cartilaginous tumour occurs in the shaft of the bone it is partly subperiosteal and partly in the marrow; and in the most characteristic seat of enchondromata, the bones of the fingers, the growth is entirely in the marrow if the tumours are multiple; but, curiously enough, it is subperiosteal if there is only a single tumour (Paget). There are also cases where islands of cartilage form in the compact substance of the bones, corresponding to Haversian systems.

The tissue-affinities of a cartilaginous tumour growing between the periosteum and the hard bone are not difficult; the homologue, as we have said, is the callus-cartilage of repair. The histogenesis and physiological analogies of an enchondroma of the medullary canal of a bone are less easy. We know that the marrow was preceded, in the development, by a bluish rod of fetal cartilage, of which all characteristic traces had disappeared before birth. As the blood-vessels entered it, it had changed into a spongy kind of bone, in whose spaces lay many spherical nucleated cells retaining a hæmatoblastic or blood-making function; all the spongy bone is gradually absorbed in the shaft, the last traces of it being a few spicules on the hard inner wall of the medullary canal, and the cavity is occupied by a highly vascular substance, the red marrow characteristic of young bones. The spherical cells of the red marrow become excavated into fat-cells, and the red colour changes to yellow. It is probably in this final phase of the development inside the shaft of a bone that we must look for the opportunity of the central enchondromata forming. The secret of the return to cartilage in some cases, and at certain spots, probably lies in the change of red marrow into yellow; instead of becoming fat, it

becomes a kind of cartilage. The tumours in question are most common, at least, just at the time of life when that change in the character of the marrow takes place. Again, at the spongy ends of bones, where the marrow remains red, the internal enchondromata rarely occur (a case is quoted by Paget at the lower end of the fibula), but chiefly the subperiosteal. If the enchondromata were composed of a definite type of cartilage, and, above all, if they were stable in their structural characters, the relation of them to the marrow of bones, which these facts point to, would not be a very intelligible one. But the enchondromata are rather a kind of new growth in which there is a good deal of gristly substance of one kind or another, associated with a good deal of mucous or myxomatous tissue, with cystic spaces containing mucous or honey-like fluid, and even with blood-spaces. Besides the myxomatous tissue, there may also be tracts and areas of other soft tissue made up of spindle-cells, multinuclear-cells, and various

Fig. 30.

FIG. 30.—Foetal or parenchymatous cartilage from enchondroma of upper jaw (horse). (The hyaline intercellular substance is left out.)

Fig. 31.

FIG. 31.—From enchondroma of upper jaw of woman; a few large cartilage-cells in a tissue consisting mostly of branched cells.

nondescript forms; and, most significant of all, there may be much of the cartilaginous substance quite foetal in its characters,—that is to say, consisting almost entirely of cells, with a small amount of more or less tough hyaline intercellular substance. Fig. 30 shows a highly cellular kind of cartilage from a tumour of the upper jaw of a horse. The next cut (fig. 31) is from a cartilaginous tumour of the upper jaw of a woman; it shows cartilage-cells with definite capsules, and surrounded by a kind of tissue which would be called myxomatous. The shades of difference among the tissues of enchondromata are indeed endless. They may be said to be all possibilities open to the red marrow (haematoblasts) on the way to become fat; sometimes one devious route is taken, sometimes another, and the result may be soft mucous tissue, various forms of cartilage, or true bone as an ulterior development of the cartilage.

Osteoma.—Next to the enchondromata among the tumours of bone we may take the *osteomata*, or outgrowths from the bone which have themselves the structure of true bone. Their most common form is the exostosis, an osseous node or spine, or rounded tumour generally, on the outer surface of a bone. Sometimes an exostosis is found covered by a considerable cap of cartilage; and, whether it be or had been partly cartilaginous, or whether it be entirely osseous, it is a product of the periosteum, and it illustrates the ordinary osteoblastic function of that tissue. Sometimes the exostosis is spongy, at other times it is hard as ivory, the flat bones of the head being the favourite seat of the latter variety.

Osteoid Tumours (Subperiosteal Malignant Tumours).—By far the most important of the tumours of bone are those which are composed of a crude kind of bone, or of various kinds of soft tissue which show a more or less feeble tendency to osseous transformation. These tumours of the bones are apt to occur during the growing period, or shortly after growth has ceased; they are by no means rare, and are often fatal. Like the enchondromata, they are divided into those which grow under the periosteum, or the external tumours of bone, and those which begin in the medullary canal, or the internal. The former are much the least complex; and, like the subperiosteal enchondromata, they are mostly found at the ends of long bones, especially at the end of

FIG. 32.—Structure of osteoid tumour.

the femur. The growth is clearly subperiosteal; the outlines of the compact bone of the shaft can often be seen running through it. The structure of this kind of tumour is tolerably uniform; it is not bone, but an irregular product of the periosteum to which the name of "osteoid" has been given. The structure is that shown in fig. 32. There is a network of slender trabeculae, mostly forming long parallel meshes, and with numerous but less conspicuous cross subdivisions; these are impregnated with osseous salts; but it can hardly be said that bone-corpuscles are embedded in them, as in the normal growth of bone from periosteum (fig. 33). The cells which correspond to the osteoblasts are ranged along the sides of these trabeculae and in the spaces between them; but they fall short of the true osteoblastic grouping, and they seldom become bone-corpuscles embedded in an osseous ground-substance. This is a peculiar error of the osteoblastic process, but a not unintelligible one. It may be further illustrated by another form of periosteal tumour in which there was no deposition of the hardening matter at all. This tumour (fig. 34) grew around the metatarsal bone of the little toe, and, like the osteoid kind of tumour last described, it had a power of infecting the neighbouring tissues and even distant organs, which need not be dwelt upon at present. The structure is a strange reminder of the inherent osteoblastic function of the periosteum from which it grew. There is not a particle

FIG. 33.—Spicula from ossifying parietal bone (kitten); osteoblasts becoming included as bone-corpuscles.

of osseous or earthy matter in its substance; but it has the trabecular type of osteoid tissue, and the cells have the surface-grouping of osteoblasts. They are the elongated or spindle-shaped cells of the periosteal tissue, which have become more cubical and angular, and have formed rows of free cells round the walls of the interstitial slits or alveolar spaces. The difference between this and an osteoid tumour is that a certain attempt has been made in the latter towards true bone in the deposition of earthy or bone salts in the trabeculae. In the case of the soft tumour of the periosteum there were clear traces of rickets in infancy, and the essential thing in rickets is the tardy or inadequate deposition of earthy matter in the growing bone. In both tumours the formative activity of the periosteal cells outruns their osteoblastic and ossifying functional activity, so that the latter is always behind, and the perfect result of hard bone is never attained. How this error makes a malignant tumour is another and more difficult question.

FIG. 34.—Periosteal tumour of fifth metatarsal bone.

Myeloid and other Internal Tumours of Bone.—The foregoing are representative instances of external or subperiosteal tumours of bone in addition to the enchondromata and osteomata. There remains an important group of internal tumours, or tumours of the bone-marrow; and these, with the corresponding group of internal enchondromata, exhaust the morbid new formations incidental to the growth of the skeleton. There is, indeed, no hard-and-fast line between the enchondromata and the internal tumours of bone; the latter have almost the same mixture and confusion of structure in various parts that the cartilaginous tumours have. The principal seat of the soft tumours of the bone-marrow is the lower end of the thigh-bone, the ends of the other long bones being the next most favourite seats. A certain tumour of the jaws, the *myeloid epulis*, is also classed with them. The tumour often grows quickly, and may attain an enormous size; it causes the absorption or transformation of the hard walls of the bone, and there may be nothing between it and the skin, muscles, and tendons but a more or less continuous thin shell of bone. The interior has a most diversified aspect. Many patches are friable and yellowish, other areas are a livid purple and gelatinous, and there are often blood-clots and cystic spaces filled with a tenacious brownish mucous or colloid fluid. Amidst these softer parts there run tracts of more spindle-celled or fibrous tissue, and there are often islands of cartilage, or fragments of osteoid substance. The only clue to this puzzling diversity of texture is the inherent range of possibilities in the function of the bone-marrow. Derived from embryonic mesoblast,

Soft periosteal tumour.

Myeloid bone tumour

it began as a temporary foetal cartilage; it then became spongy bone filled with red marrow, in which state it remains in the ends of long bones, in the diploe of flat bones, and in the interior of bones like the vertebrae. In the shafts of long bones the trabeculae of bone are all removed and only red marrow remains, with a pronounced haematoblastic function; but, when growth is well advanced, the cells of the red marrow become excavated to fat-cells, their blood-forming function ceasing therewith. We have also seen that, in the process of repair, the marrow and its blood-vessels together are able to produce new bone between the broken ends. There are here memories enough to produce very fantastic results if anything should arise to recall the developmental activity. Disregarding the livid or blood-like patches, the mucous areas (whether myxomatous tissue or colloid fluid), and the fragments of cartilage and of osteoid tissue, some of which have been spoken of above, let us consider the tissue that is most characteristic of this group of internal bone-tumours. It is the yellowish or sand-coloured areas of friable texture, corresponding to the tissue named by Paget "myeloid," or marrow-like. Its name is due to the fact that it always contains a number of multinuclear cells, giant-cells or myeloplaxes, such as are found in the marrow of young bones. Its yellowish colour is almost sufficient of itself to indicate the presence of these elements. The cut (fig. 35) shows several of these

FIG. 35.—Myeloid tissue of tumour of thigh.

myeloplaxes lying among cells of various shapes with a single nucleus. In one direction it is no great step from this to myxomatous tissue or other haematoblastic modifications; and in another direction it is no great step back to cartilage. We shall probably not go very wide of the mark if we take the common starting-point of the various tissues to be foetal cartilage, as drawn in fig. 30 from an enchondroma of the upper jaw; and, given foetal cartilage, it is not difficult to follow it along the various lines of its historical development in the shaft of a bone, to imagine the development taking a devious turn at one point or another, and so to account for the heterogeneous structure of the tumour,—some of the structure, indeed, being strange to the normal types of growth.

Dermoid Cysts.—Having now illustrated two great instances of embryonic function revived in after life to the production of tumours—namely, the blood-making and the bone-making functions—and having therewith disposed of a considerable number of all the tumours that have a mesoblastic homology, it will be convenient to advert to a remarkable kind of tumour which shows to the fullest extent what the embryonic mesoblast can do in the way of fantastic new productions, namely, *dermoid cysts*. Not only blood and bone, but teeth, skin, hair, glands, muscle, and nerve are produced as the tumour-constituents in these remarkable new growths. Their usual seat, and the invariable seat of the most perfect of them, is the ovary; and the ovarian is just that mesoblastic tissue upon which the memories of development are as if concentrated; for it is from an ovarian cell that the embryo grows in the perfect likeness of the parent. These selected cells of the ovary, or, in other words, the ova, are specially charged with the recollections of the past history of evolution and growth; and the rest of the ovary appears to possess the same lively memory, if not to the same extent, yet to a much greater extent than mesoblastic tissue elsewhere. The stroma of the ovary is the best example in the body of embryonic spindle-celled mesoblast; only in some animals does it become normally fibrous, and in any animal it may revert to embryonic characters with the greatest ease at the generative periods or at other times, and even in extreme old age. But for the fact that the tissue keeps within normal limits of form and extent it might pass muster for spindle-celled sarcoma, in all respects, including the warp-and-woof arrangement of the tracts of cells. From this tissue cysts are developed interstitially, and they are not the less interstitial in their development that their homologue is often, if not always, a Graafian follicle. That, however, is a region of controversy, and it will be more convenient to take an unambiguous case first. Such would be a dermoid cyst under the skin, say in the neighbourhood of the orbit. It is true that even these cases are sometimes explained by assuming that the skin has somehow become involutioned at the particular spot during development; but no observed facts warrant this assumption, and the histogenetic facts of the new growth itself are entirely against it. Fig. 36 shows a portion of new-formed skin on the wall of a small congenital dermoid cyst over the external angular process of the frontal bone; adjoining the actual skin there may be seen the interstitial cells of the connective tissue becoming adapted in form and arrangement to continue the layer of rete mucosum over the cyst-wall beyond. The adaptation is very

much the same which has already been mentioned with reference to the new skin of a granulating surface; the connective-tissue cells become large and cubical, often multinuclear, and elongated towards

FIG. 36.—Wall of dermoid cyst, showing how the surface-stratum is produced from interstitial connective-tissue cells.

the surface. The supply of these formative cells comes from the connective-tissue elements lying among the varial fibrous bundles of the cyst-wall.

For a dermoid of the ovary it is impossible in a brief space to give any idea of the marvellous textures that are being woven side by side in various parts of the cyst-wall,—the areas of foetal cartilage, the interlacing bundles of plain muscular fibres, the long rows of pigment-cells, and, not far off, the rows of mucous cells developed interstitially, and maturing so as to be fused into the fluid of subordinate cysts. At one place there is a piece of skin, underneath which will be found an enormous development of sebaceous glands; where the skin ends a brownish velvety patch begins, with no sebaceous glands, although there are rudimentary hairs at various depths. This under the microscope will be found to approximate to granulation-like tissue, with many variously-shaped pigment-cells, and corresponding probably to the congenital mother-marks of the skin proper. It must suffice to give a single illustration of the strange formative activity of this mesoblastic tissue, namely, the *formation of hairs*. Hairs in dermoid cysts are formed in a very peculiar manner. It is usual in subcutaneous dermoids to find them embedded parallel to the surface at various depths in the midst of cysts, multinuclear or giant-cells. Some of these multinuclear masses may be seen undergoing a vitreous transformation down the middle, as in fig. 37, *a*; elsewhere may be seen the same peculiar central rod extending through a succession of giant-cells; and, most remarkable of all, there is the appearance drawn in *c*. In this last case the vitreous rod is capped at each end by a giant-cell, and the characteristic imbrication of scales has developed on it over the intervening length. The cross section of such a hair is seen in *d*. The section of hair is evidently a part of the multinuclear cylinder; it is in this instance well to one side, but it is still enclosed by the marginal nuclei of the cell, which are flattened into plates upon it; in other instances it is found lying outside the largest of a cluster of giant-cells and surrounded by the smaller ones. The nature of the transformation in the heart of these multinuclear blocks is not easy to determine; the most striking circumstance is that other giant-cells, which appear to be advancing in the same direction, or to have diverged from the same kind of development, have an area of deep-brown or orange pigment in their centre instead of the vitreous or horny transformation,—the marginal belt being free from pigment. This is a peculiar formative use of giant-cells. We have already seen that they are used in the vessel-making processes of the placenta and of repair; we have seen also that they may be the media through which a granulation-surface acquires a covering of epidermis; and here we find them playing the part of hair-follicle.

FIG. 37.—*a*, vitreous transformation along a central line in interior of giant-cell; *b*, hairs lying among giant-cells in wall of dermoid cyst; *c*, hair in dermoid cyst, capped by giant-cells; *d*, cross-section of a hair in substance of a giant-cell (dermoid cyst).

A dermoid cyst reveals the surprising spontaneities of a collection of embryonic cells of the mesoblast,—the inherited traditions of their life,—manifested in diverse ways side by side, and manifested often feebly and grotesquely. There is no reason to seek for the source of these various products beyond the stroma of the ovary itself; and the variety of the products must be a measure of what that kind of tissue can do in the way of new formation. When various kinds of structure are thus brought together in their development we have an evidence, not only of the indwelling power of mesoblastic tissue to revert to embryonic modes of life, but also

of a common starting-point for structures that come to be very unlike. We may note, among other things, how small a step there is from the production of blood and blood-pigment on the one hand to that of hair on the other.¹

§ 5.—ERRORS OF DEVELOPMENT AND GROWTH IN GENERAL.

The more usual departures from the normal type in the embryological rudiments or in the growth of particular organs and parts of the body have been already described in the article MONSTER. The present section will be devoted to those errors of development and growth which amount practically to constitutional diseases.

Rickets.—We have hitherto considered the indwelling spontaneities of the cells and tissues as manifested in the process of repair, and manifested capriciously in some tumour-processes; in these it has seemed as if the blood-making function of the embryo were the most fundamental of all its primitive tendencies, traces of it being found in the reparative process and in the new growth of tumours. Next to it, and even bound up with it, is the bone-making function; and we now come to a general or universal disorder of the bone-making function in which these developmental doctrines will be found to have a useful application. This disorder is rickets, a common malady of infancy and childhood. Attention was first drawn to it in 1650 by Glisson, who spoke of it as a disease of children that had been known to be endemic for thirty years in Somersetshire, and had been brought from the country to London. It is very common in all great cities; in Vienna it is still known as "die Englische Krankheit." A child developing this error of growth becomes profoundly affected in its health generally. It is tender all over, dislikes to be touched or handled, throws off the bedclothes even in cold weather, perspires profusely about the head, moves its head restlessly in sleep, so as even to wear the hair off, and in its waking hours sits perfectly still and subdued under a kind of suffering which can be but half-realized by its consciousness. Such children give little trouble, seldom crying even when left alone. They are very sensitive to cold, and proportionately liable to catarrh; their nervous impressibility also is heightened, making a peculiar liability to convulsions and to laryngismus stridulus. They are "backward children," and, in particular, late in getting their teeth.

The conspicuous error in such subjects is in the growth of the bones everywhere throughout the body. The rickety condition often begins in children who are plump and apparently well nourished; and, if the nutritive and other processes are involved at length, it is the osteoblastic process that is primarily at fault. The details are somewhat different for the two kinds of ossification—in membrane or periosteum, and in cartilage. Regarding the former, the error will be readily understood by reference to the accompanying cut (fig. 38) of normal ossification of the

is of that gradual and co-ordinated kind that there is always a set of free cells left on the surface to keep up the succession of formative elements. It is not until growth is completed that osteoblasts cease. The error in rickets is that the multiplication of spindle-shaped cells and osteoblasts far outruns the calcifying process. Instead of these elements being produced only as fast as they are wanted for inclusion as bone-corpuscles, they are produced regardless of the forwardness of the calcifying process, upon whose exact co-operation with the cellular formative process all true periosteal bone-making depends. The error, or part of the error, of rickets is that the calcifying process is behindhand. A large quantity of soft bone-making material accumulates, which would, under ordinary circumstances, have become hard bone as soon as it was formed; sooner or later it becomes bone, even in rickets, but the deposition of earthy salts is slow, and in the meantime the bones have become bent. Not only is there a relative slowness in the calcifying process, but there is an absolute excess of the cellular elements or of the osteoblasts; and, in the flat bones of the skull, this is shown in the thickness of the bones ultimately, especially along their growing edges. The same excess of formative material beyond what can be used up for bone is seen in the ossification from cartilage at the epiphysal line. The cartilage-cells divide and multiply at an excessive rate, and the columns of them, instead of keeping in the line of the axis of the bone, radiate to the sides, so that there is often a bulbous enlargement where the epiphysis joins the shaft. The want of harmony in the calcifying and osteoblastic parts of the process is shown by the irregularity of the epiphysal line (fig. 39); it is a straight line normally, but in rickety growth it runs out and in, cutting off islands of cartilage in the midst of spongy bone; and this irregularity is due to the fact that the blood-channels in the cartilage are formed sooner at some points than at others, the calcification following close on them. In the shaft of a long bone the process is the same as in a flat membrane-bone of the skull; the periosteum is thick and its inner layers are blood-red, and in extreme cases there is what looks like a stratum of blood between it and the bone. Bone is at length formed from this layer, but it is of the spongy kind, so that the shaft is softer and more porous on the outside than on the inside. In the flat bones of the head, also, the structure is apt to be of the spongy kind throughout, so that they consist as if of diploe entirely, and not of a layer of diploe between two hard plates. Sooner or later, under favourable circumstances, the spongy bone is replaced by compact bone, and in the end the bones of a rickety subject are harder and thicker than usual. In the worst cases deformities remain, notably the bent spine, the pigeon-breast, and the deformed pelvis. In the very worst cases the stature is dwarfed and the long bones are bent and twisted.

Analysing these phenomena and filling in details, we come in the last resort to an indwelling disposition, probably acquired in most cases, or in largest measure, before birth. These tendencies come to an issue in the skeleton, because the growth of the bones is of a nature to tax the organism. The growth of the bones is the great instance of metaplasia; it is a succession of tissue-changes long kept up, and it requires a peculiar co-ordination or orderliness at each step, owing to the fact that stiffness has to be combined with plasticity. The requisite stiffness can only be got step by step through the sacrifice of that plasticity which goes with growth, and hence the special adaptation of a free row of osteoblasts on the surface of bone-trabeculae to ensure the apposition of new layers. Cartilage gives the stiffness for a time in all the bones except the clavicle and those of the vault of the skull, having served its purpose, it becomes spongy bone, blood, and marrow, the spongy bone being finally removed in the shafts of long bones, the marrow remaining, and the blood continuing to be added to the general blood of the body. In these adaptations the early importance of blood-making among the embryonic cells is duly asserted. When the fetal cartilages have served their turn the hematoblastic function becomes prominent in the cells, and a large part of all that was cartilage literally becomes blood. According to numerous observers, it even becomes blood without the accompanying formation of blood-vessels with definite walls. Some of it becomes bone; but the bone is in thin plates only, and much of it is ultimately removed. In the periosteal process, also, where the cartilage-stage of the formative tissue is never gone

FIG. 38.—Ossifying parietal bone of fetal kitten. *a, a*, spindle-celled membrane, corresponding to periosteum; *b*, spicule of calcified ground-substance, with free osteoblasts at one end and imprisoned bone-corpuscles at the other; *c*, broader bars of bone.

parietal bone. The spindle-cells of the membrane are becoming cubical along a line a little below the surface, and a few of them are half-included or imprisoned in the thin bar of bone; most of them are free on the surface of the calcified bar, as osteoblasts, the included ones being bone-corpuscles. Increase of the osseous tissue takes place through other osteoblasts becoming surrounded by calcifying ground-substance; and, in the broader bars of bone below, the bone-corpuscles may be seen to be two or three rows deep. This process goes on until the whole of the osteoblasts (derived from spindle-cells) have been included one by one within the calcifying matrix; once included, these cells are incapable of growth; the multiplication is always in the spindle-shaped cells of the membrane, or on the surface of the bony bars or trabeculae; and the inclusion

(From J. B. Sutton, in *Path. Trans.*, xxiv.)

through, there are not wanting indications that the same hæmatoblastic function is present concurrently with the osteoblastic.

Coming, then, to the actual facts of rickets, we shall find that those features of the process on which the greatest stress has been laid in the recent elaborate researches of Kassowitz are of the nature of over-vascularization or hyperæmia. In the ossification from cartilage he finds that the vessels from the perichondrium extend inwards to a greater extent and with less orderliness than usual; then there is a development in the cartilage of colossal vessels, and finally of blood-spaces, packed full of red blood-disks, and with no very definite walls, so that it looks, at the first glance, as if hæmorrhage had taken place into the bone-marrow. In many cases there is no sharp line of separation of the embryonic marrow from the contents of these blood-spaces; it is probable that the gelatinous tissue of the former had "passed direct into hæmatoblastic substance and so into blood-corpuscles." In the periosteum also there is much more blood than usual, and the same large blood-spaces are sometimes found. These errors of vascularization Kassowitz places at the foundation of the rickety process. Deposition of calcareous salts, he points out, cannot take place where there is so much blood; the calcification follows in an orderly way only where the movements of the blood and juices are restrained or distant, the best example of this law being the gradual reduction of the wide central space of an Haversian system to a narrow channel containing a single twig of blood-vessel.

The excess of vascularity in rickets is, by Kassowitz, put down to "inflammation," or to the hyperæmia of the same; but we have seen that he also invokes, as a detail in the process, an excessive hæmatoblastic activity in the embryonic marrow-cells. The latter is a more fundamental and intelligible fact than "inflammation" (which begs all the fundamental questions), and we shall do well to give it prominence accordingly. We should then interpret the observations of Kassowitz as follows.

The due regulation of the blood-supply, the restriction of it to definite and ever-narrowing channels, is necessary for the proper deposition of the earthy matter and for the building up of bone in Haversian systems. The embryonic cells surrender their individual hæmatoblastic function, while certain tracts of them become definite vessels for the supply of all the rest; and in proportion as they give up individually their primitive function of blood-making, they are in a position to take on individually the function of bone-making. In compact bone this change of direction is carried out most completely; the cells become osteoblasts in successive rows, a ground-substance impregnated with earthy matter closes in around them, and they are imprisoned for ever as bone-corpuscles. In spongy bone, however, there is still a reserve of hæmatoblastic force; only thin laminae of bone are formed out of some of the cells, while many of them continue to be hæmatoblasts and to form the familiar red marrow. Adopting, then, the figure of a struggle between the hæmatoblastic and osteoblastic tendencies in embryonic cells, or the perception of a divided duty, we shall conclude that rickets is the undue preponderance of the former. It means spongy bone where there should be hard bone, and much wider spaces than usual, with much more blood in them in the proper seats of spongy bone itself; and it means in general a retardation of the hardening process.

All this enormous hæmatoblastic energy or local blood-formation is unfortunately wasted; the child is no better for it, and is more likely than not to be anæmic. The formative powers are diverted from bone-making, and spent upon blood-making; and the lime-salts in the organism that should have gone to make bone are actually thrown out with the urine, which has been known to have as much as four or even six times its due amount of phosphates. The organism, when rickets overtakes it, is in this fix, that it makes blood which it can no longer profit by, and has meanwhile to part with bone-salts which it will want again. The disease is, in fact, an unfortunate contretemps.

Many of the facts of rickets are thus secondary to an initial error in the embryonic functions of the tissues, and the evidence seems to show that the error must have begun in most cases before birth. Although it is well known that the obvious phenomena of rickets are not usually remarked until the child is a few months old, yet, as Kassowitz has ascertained, the condition "begins much more frequently than has hitherto been assumed in the later months of intra-uterine development." The facts point very clearly to the health of the mother as being primarily at fault. "The health of the mother," says Sir William Jenner, "has a decided influence on the development of rickets in the child. Whatever renders her delicate, whatever depresses her powers of forming good blood, that tends to produce rickets in an offspring. . . . The child of an ill-nourished mother is disposed to become rickety when placed under unfavourable circumstances after birth, or even under favourable circumstances in some cases." The disposition must be in most cases, and in the worst cases, congenital in the child's tissues. We should therefore seek in the intra-uterine connexion between mother and child for some defect on the maternal side which would induce that which would appear to be essential

to rickets in the child, namely, a preponderance of the hæmatoblastic function of embryonic cells over the osteoblastic, a reversion in the cell-life of the growing frame towards independent blood-making. In seeking for this source of error, it will be necessary to recall for a moment the nature of the intra-uterine connexion between mother and child, or the part played by the placenta.

Placental Function in Congenital Disorders.—The embryo makes its own blood and establishes the connexion with the mother by its own blood-vessels. Its blood is carried to the placenta to be aerated, as the phrase goes; but it is much more than aerated. The placenta is a glandular or secreting organ of the mother, inasmuch as the maternal blood, flowing slowly through the sponge-like tissue of thick-walled vessels, receives additions of mucus-like drops from the deliquescence of the large nuclei in the protoplasmic vessel-walls (fig. 40). This mucus-like addition is clearly an adaptation for the foetus; and the surfaces of the placenta, where the fetal vessels touch it, are further adapted, through a thick-set cap of nuclei, for exuding it where it can be taken up by the plasmatic tissue of the chorion. This placental contribution is the "uterine milk" furnished by the mother for the use of the foetus, so that, although the latter makes its own blood (and blood-vessels), it receives material additions to its blood from the mother. It is obvious, therefore, that

FIG. 40.—Secreting structure of placenta (guinea-pig): the walls of the maternal blood-channels are themselves the secreting structure, their substance yielding drops of mucus *a*, which mix with the blood *b*.

the secretion of the placenta is very essential to the foetus, and the due endowment of the latter must depend greatly upon the structural and functional sufficiency of that organ. It supplies the foetus with much of the fluid that circulates in the latter's vessels; it may be said to spare the foetus to that extent the need of producing such fluid itself, or to dispense with the hæmatoblastic activity of its tissues, so that they may take other formative directions, such as bone-making. Or it may be contended that there are ingredients in the normal placental secretion which are specially adapted to bone-making. Now, if there should be any interference with these placental contributions, we are left to suppose that there must then be a reversion on the part of the foetal cells to self-helping tendencies, and especially to local blood-making. The excessive blood-making of rickets, and the retardation of bone-making consequent thereon, would thus be traced to failure in the placental function.

But, if there be such a change in the direction of the formative processes of the foetus as an adaptation to its special intra-uterine conditions, why should rickets not become declared until several months after birth? In the first place, we have the evidence collected by Kassowitz that there are plain indications of the rickety process to be observed where death of the child has occurred before the full term; and, further, there are analogies to show that it requires all the extra-uterine functions to have been in action for some little time before a congenitally-acquired tendency manifests itself. Although the intra-uterine life comes to an end, and the child ceases to be dependent on the placental function of the mother, yet the acquired tendency, or the adaptation to a deficient performance of that function, remains for a certain time longer. It comes to an end, however, from the second to the fourth year; the bone-forming tissues cease to follow the devious direction, the bone-salts present in the organism are put to their proper use, ossification resumes its normal course, and, as the soft formative material of bone had accumulated in excess, the bones of the once rickety child are in the end harder and thicker than those of normal growth.

There is an assumption in the foregoing which calls for remark, the assumption, namely, that the placental function has been inadequate on the mother's side or that the requisite additions to the blood have not been made. Our almost complete ignorance of the pathology of the placenta is the reason why the above-mentioned facts and principles have to be eked out by an assumption. We do, indeed, know that the placenta suffers in syphilis of the parent; and we know that in congenital syphilis of the child the growth of the bones is affected in many ways analogous to the shortcomings of rickets, and that, as in rickets, the error of growth may not show

itself for some time after birth. It is highly probable that the placental structure and function suffer under many less special conditions of ill-health and mal-nutrition of the mother. The placenta is, in fact, a great formative effort, and the formative power cannot always be adequate. There are in particular two conditions in the mother favourable to rickets in the child, in each of which an absence of structural and functional perfection in the new-formed organ of intra-uterine nutrition is *a priori* probable. The one is the extreme youth or immaturity of the mother, assigned by Schönlein as the chief cause of rickets; the other is child-bearing up to a comparatively late period, the latest of a succession of pregnancies being often found to be those which yield the rickety members of a family. But amongst the poor there must be many other causes of general ill-health in the mother operating from time to time. Whatever makes the mother's milk poor cannot but have told at an earlier stage upon the placental structure and function; and that earlier stage is a vastly more critical time for the endowments of the child,—for all its formative, nutritive, and functional tendencies.

Osteomalacia.—A sort of counterpart to rickets occurs in the disease known as osteomalacia or mollities ossium; and, curiously enough, this is a disease (as distinguished from senile softening) almost exclusively of women during mature life, apt to occur in the gravid state, and especially if there have been repeated pregnancies. It is mostly a disease of poor and hard-worked women, just as rickets is a disease of the children of poor and hard-worked women; it is not very common, although it is said to be endemic in some localities. The bones become soft or friable, owing to the encroachment of the medullary cavity upon the compact substance and the further absorption of spongy bone; the encroachment may be so extensive that only a thin shell of bone or parchment-like membrane remains. This enormous medullary space is filled with marrow, but not the marrow of adult life. The marrow is of the foetal kind, red, and often containing areas of blood, abounding in nucleated marrow-cells, and with a decreasing number of fat-cells. Ultimately the marrow becomes gelatinous. The process consists essentially of a reduction of the bone to red marrow, as in the first formation of the medullary cavities of long bones; the earthy salts are removed, and all the cells of the tissue acquire an embryonic character. Although there are some facts to show that this process takes place sometimes in the young, especially in young animals under confinement, yet its characteristic occurrence is in women during one of their later pregnancies. It is generally admitted that there is some intimate connexion between the outbreak of mollities ossium and the gravid state. We have found reason to conclude that there is an equally intimate connexion between rickets and the gravid state, only that the rickets is in the child. If, in rickets, the child is deprived of something maternal which it should have received, then in osteomalacia the mother parts with something for the child which she ought to have kept. In both cases the organism of the mother is overtaxed; but in the more general case, where the child becomes rickety, the tax has not been met. In the rarer case, the welfare of the child *in utero* takes precedence of the welfare of the parent; one may conceive that the formative effort for the placenta had been so great that the organism in general was impoverished. As a matter of fact, the bones of the mother are robbed of their earthy matter, and the commencement, at least, of that diversion of substance is somehow connected with the gravid state. It is noteworthy, in this connexion, that a fractured bone in a pregnant woman repairs badly, owing to the deficient production of bony callus. Having once begun, the disease progresses, and the patient dies bedridden; only in rare instances do the bones become hard again. The loss of osseous matter in mollities is accompanied by a return to embryonic characters and function on the part of all the cells that now form the very extensive marrow; the hematoblastic function is conspicuous in the process, and there are also numerous myeloplaxes. Both the unmaking of bone in the parent and the diversion of embryonic tissue from bone-making in the child would appear to be correlated with the hematoblastic function of the cells. In both diseases phosphates are discharged in excess in the urine, and in neither is there any advantage from the excessive formation of blood. In osteomalacia the embryonic state of the marrow changes after a time to a more gelatinous state; sometimes a wall forms round the red pulpy fluid, producing a cyst of the bone with brownish contents, and in these cases the disease is said not to progress farther.

Cretinism.—A much more profound error or defect of all the developmental powers of the body than that of rickets is found in cretinism. Certain aspects of this subject have already been treated of in the articles CRETINISM and INSANITY; and another aspect of it is referred to in the section of this article dealing with the thyroid gland (see p. 335). It remains to mention here a few of the anatomical and external characters of the disease. With the low mental development there usually go a large tongue, a broad and flat nose, loose and thick skin, and stunted limbs. The error of growth in the bones, which is only a part of a very extensive range of erroneous development, is somewhat different from that of

rickets. In the bones of the skull there is usually found synostosis, or premature union at one suture or another, not unfrequently at the sphenobasilar, giving the base of the skull an up-and-down direction. The premature union along one line or other leads to compensating expansion elsewhere, so that the skull is misshapen; the forehead usually retreats, the top of the head is flat, and the occiput small, the type of skull being markedly brachycephalic or broad. One distinctive point in the bone-lesions of cretinism relates to the stunted limbs, which are not at all characteristic of rickets. The stunted growth depends upon a complete departure from the ordinary relation of the epiphysis to the shaft. A bone such as the thigh-bone grows normally to the length, chiefly by the activity of the cartilage of the epiphysis along the epiphysal line; the cartilage-cells multiply on the surface of the epiphysis next to the shaft; they become grouped in long perpendicular columns; and, as ossification proceeds, the new bone becomes an integral part of the shaft. Meanwhile the epiphysis itself is becoming ossified radially from the centre outwards. In the cretin the activity along the epiphysal line is somehow checked, and it has been found that a fibrous band extending inwards from the periosteum forms a kind of barrier in the position of the proliferating epiphysal line, cutting off the shaft from the epiphysis; thus the shaft is deprived of those accretions at each end upon which its elongation mainly depends. At the same time the cartilaginous epiphysis spends its proliferative force within itself; it expands in all directions, becoming a large knob, and part of its ossification may be effected by a sort of inverted activity of the epiphysal line, which proliferates towards the interior of the epiphysis, instead of growing towards the contiguous shaft. No analysis of these peculiarities of bone-growth in cretins need be attempted, but some remarks are offered on p. 385 with reference to the mother's share in this congenital condition.

Chlorosis.—Contrasting with rickets, in which the tendency Chlorosis is born with the child produces symptoms of ill-health in children of both sexes within the first year, and seldom later than the second, chlorosis is a congenital condition of which there are symptoms first at the age of puberty, and almost exclusively in the female sex. The congenital nature of this condition has been made probable by the anatomical observations of Virchow, which go to show that in chlorotic subjects there is very uniformly found a narrow or inadequate aorta, much more elastic than usual, with its inner coat irregular in thickness and disposed to degenerative changes, and with its intercostal branches coming off in a more than ordinarily irregular manner. These anatomical peculiarities are naturally part of the congenital endowment of the individual. The full force of the chlorotic state is not felt until the time of puberty, and in the male sex it is hardly felt at all. It is, indeed, associated in the most intimate way with the remarkable periodicity of ovulation to which the female sex is subject; it manifests itself in the years when that function begins, and chiefly at each successive period of the function. After a few years the indications of it become feebler and tend to disappear. Want of sunlight in the daily life of the individual is the chief aggravating circumstance of the anæmia of chlorosis. The vascular system is on a small scale, to begin with, and there is too much blood in the body for the size of the vessels; the blood is not quite normally constituted, having too few corpuscles in proportion to the plasma, and in the red disks there is too little hæmoglobin or colouring matter. While the blood and blood-vessels are poor, the fat of the body, and especially the subcutaneous, is abundant.

Hæmophilia.—This is another general state of the vascular system, which is always congenital, and often runs in families, one or more of whose members are "bleeders." It is a disorder of the boys of a family just as distinctively as chlorosis is a disorder of the girls. A remarkable disposition to bleed, with or without the provocation of an injury, is the whole disease; neither structural change of the blood-vessels nor peculiar composition of the blood has been made out, and there is nothing remarkable in the ordinary appearance of a bleeder. When the bleeding is spontaneous it comes from the mucous membranes, especially from the nose, but also from the mouth, bowel, and bronchial tubes; one of the most common and fatal traumatic occasions of bleeding is the extraction of a tooth. Even slight bruises are very apt to be followed by extravasations of blood into the tissues; the swollen joints (knee especially) of a bleeder are probably due, in the first instance, to the escape of blood into the joint-cavity or into the synovial membrane. It is always from the very smallest vessels that the blood escapes, and from these it may escape in such quantities as to cause death within a few hours. It appears that the same extensive capillary hæmorrhage may occur anywhere in the body provided the opportunity is furnished, by a slight injury or otherwise, for the blood to escape.¹

§ 6.—ERRORS OF BLOOD-MAKING IN MATURE LIFE.

The words quoted above from Sir William Jenner—"Whatever depresses the mother's powers of forming good blood tends to produce rickets in an offspring"—are a special application of a general doctrine of blood-making which has been held empirically by the medical profession at all times. It is not easy to discover with scientific precision the facts of blood-making in mature life upon which this doctrine, otherwise amply justified, is based. It is remarked by Sir Thomas Watson: "Although we cannot doubt that any considerable modification or defect of the fluids that feed and renovate the blood, and particularly of the chyle, must have a direct influence upon its composition and quality, we really know but little about them except in their effects. We seldom have any means of procuring these the first products of nutrition so as to examine them, or to test their qualities, yet we can perceive causes that are likely to deteriorate or deprave those fluids (unfit aliment, impure air), and we know that, under the continued operation of such causes, the blood, replenished by these fluids, is actually and sensibly modified." The more recent development of the physiology of metabolism has been followed by an extension of our knowledge of the state of the blood in disease; thus the text-books speak of such conditions as glycæmia (glucose in the blood), acetonæmia, cholæmia (jaundice), lipæmia (fat in the blood), uræmia, &c., some of which fall to be spoken of in sections following. In the present section it is rather the corpuscular part of the blood that has to be considered with reference to its renewals in mature life. It is now known that red blood-disks are continually being added to the blood, continually perishing in a like ratio; the red marrow of bone is unquestionably a source of the red disks, and so probably is the pulp of the spleen; again, the liver plays some part, not yet precisely determined, in the cycle of changes that the solid elements of the blood undergo. Confining the attention, then, to the corpuscular elements of the blood, we shall best approach the question from the side of the colourless or white blood-corpuscles, the undue proportion of which is the most obvious fact in the important disease called leukæmia.

Leukæmia.

Leukæmia, or Leucocythæmia.—The relation of the colourless corpuscles of the blood to the red disks is variously explained; all that we know, however, from such occasional cases as blood-cysts points to the red blood-disks being the detached protoplasm of the hæmatoblast,—the nucleus surviving. Appearances in the subcutaneous tissue of the fetus, in the thymus, in the spleen, and in bone-marrow point in the same direction. The colourless corpuscles of the blood would thus be the surviving nuclei of the original hæmatoblasts, the red disks being detached portions of the protoplasm of the same. There would be in any case several red disks for one surviving nucleus; but in actual blood the proportion of cells of the latter kind is very much smaller than that. The proportion varies in health from time to time, and it is usually increased during pregnancy, making a physiological leucocytosis. Ordinarily the colourless corpuscles are in the proportion of from 1 in 300 red (after a meal) to 1 in 1000 red (in the fasting state). If the colourless cells are the surviving nuclei of hæmatoblasts, we must suppose that the protoplasm continues to be renewed around the old nucleus, so that the same hæmatoblast gives off successive generations of red disks. The cells of red marrow, of the thymus (while it lasts), and of the splenic pulp would thus be standing sources of new red corpuscles. Evidences that they are so are not wanting in fine sections of these tissues, although the process of budding of the hæmoglobin-

tinted fragments of protoplasm is not so marked in all its stages as in those abnormal instances of hæmatoblastic activity to which reference has been made (blood-cysts, angioma of liver). In the normal process there seems to be less cleavage of the nucleus, although the nucleus is not unfrequently seen to be constricted or half-divided; the marginal protoplasm detaches itself from one side as if with little trouble, new protoplasm gathers around the nucleus, and so the supply is kept up just as if it were secretion from the cells of a gland. If the cell which had disengaged its red-dish protoplasm in the form of one or more disks or globules were thereupon to continue in its nuclear state, and to acquire no further investment of cell-substance, it would practically amount to a colourless corpuscle of the blood. There are, as we have seen, always a few such cells in the blood—one in several hundred red disks—and the real difficulty about them is to understand why they should be present in the circulating fluid at all. In the disease of leucocythæmia they increase enormously, so as to be in the ratio of twenty, fifty, or even one hundred to the hundred red disks, which are themselves absolutely fewer; and, if we interpret that phenomenon according to the view that they are residual nuclei of hæmatoblasts, we shall conclude that the hæmatoblasts have very generally ceased to produce new generations of red disks, have stood still at the lower grade, and have passed bodily from their blood-forming habitat into the blood-stream. There would be, in short, an arrest of function, manifesting itself not only in the great falling off in the number of red disks but also in the presence within the vessels of these sluggish or crippled elements of the blood-making organs and tissues, as if in lieu of the red disks themselves. What, then, is the actual condition of the proper seats of blood-making in the leucocythæmic disease?

The interest centres in the state of the spleen and of the bone-marrow; according to modern views the so-called lymphatic leucocythæmia belongs to another class of processes and may be here disregarded. The spleen is in all cases enlarged, from twice up to fifty times its normal size; it retains its form, but its structure is firmer, less sanguineous, streaked with pale or yellowish lines, or mottled with yellowish patches. The marrow in the bones is often changed in appearance: it has become grey or reddish grey and diffuent; and this change may be observed even in the marrow-fat of long bones. These changes are essentially in the hæmatoblastic tissue,—in the splenic pulp and in the bone-marrow; the cells of that tissue have to a great extent ceased to form blood, their activity has taken another and formative direction, from which no functional product results (red blood-disks), but mere overgrowth of tissue and of cellular nuclei. The hæmatoblasts have, in fact, become constructive when they should have continued functional. The enormous number of colourless corpuscles thrown into the blood has to be traced to the same diversion of the hæmatoblastic forces which has in the spleen led to textural overgrowth; instead of remaining in the seats of blood-making, and continually reclothing themselves with hæmoglobin-tinted protoplasm, the hæmatoblasts have passed bodily into the blood-current in their naked nuclear condition. The colourless cells of leukæmia may be said to have the same relation to the hæmatoblastic process that was claimed, in a former section (see p. 365), for the pus-cells of granulations. The peculiar state of the bone-marrow characteristic of leukæmia has often been compared to granulation-tissue; in some cases it has even the appearance of puriform infiltration. Again, the first cases of leucocythæmia were described by Hughes Bennett as cases of "suppuration of the blood"; and, if the pus of granulations is an analogy for the cells of leukæmic blood, the textural developments of granulations may be held to be an analogy for those formative changes in the spleen which are found in its enlarged state.

Pseudo-leukæmia.—Leucocythæmia is a definite and generally fatal disease wherein the increase of colourless corpuscles of the blood and the decrease of the red disks are referable, in the last resort, to disordered hæmatoblastic function in the spleen or bone-marrow, or in both. There may be a state of *leucocytosis* without this profound and fatal hæmatoblastic disorder, wherein the increase of colourless corpuscles is referable to organs and tissues which have no blood-making function. Affections of the lymphatic glands are the principal occasion of this leucocytosis or pseudo-leukæmia, and such affections may occur in the course of morbid processes so various as scrofula, cancer, and typhoid fever. A considerable degree of leucocytosis occurs also in the later months of pregnancy as a perfectly normal incident. The lymphatic glands and the lymphatic follicles of the mucous membranes are collections of lymphoid cells which have no true blood-making function, however closely their cells may resemble those of the bone-marrow, of the spleen-pulp, and of the thymus; they are rather related to the cellular by-products, or the solid waste of secretion (see section 7). From them, or through them, the colourless cells in the blood may receive considerable additions from time to time; but these have a significance quite different from the profound disturbance of blood-making which constitutes leucocythæmia, and they are better classed under the heading of

leucocytosis or pseudo-leucoeythæmia. The difference is even discoverable, according to Virchow, in the morphological character of the colourless corpuscles in the two cases. In true leukaemia (splenic) the corpuscles in the blood are somewhat large, with multiple nuclei, and more rarely with a single nucleus; in the pseudo-leukaemia (lymphatic) the cells are small, the nucleus single and large for the cell, the cell-substance being often so narrow a zone as to be hardly appreciable around the nucleus. These are practically the differences between the cells of lymph-glands or follicles and the residual nuclei of hæmatoblasts (or pus-cells).

This pseudo-leukaemia connects, on the one hand, with *Hodgkin's disease*, a general condition of lymph-gland overgrowth, and, on the other hand, with solitary *lymphomatous tumours*, such as grow, mostly perhaps, in children in the kidney, or in the follicular tissue of the intestine, or elsewhere.

Pernicious Anæmia.—This is another serious and generally fatal error of blood-making, which presents both an instructive parallel to leucoeythæmia and an instructive contrast. The onset of this disease is often sudden, it may be with symptoms of chills and heats and other febrile manifestations. It occurs at all periods of life, and in both sexes. The body seems to become strangely bloodless, so that even the point of the finger will not bleed if cut. There is much listlessness, often giddiness, tendency to hæmorrhages, especially into the retina, and pains in the bones. Recoveries, temporary or permanent, are more usual than in leucoeythæmia, especially under the administration of arsenic. The blood is profoundly altered, and the state of it may vary much within a space of weeks or even of days. The red disks are enormously reduced in number, and many of those that are left have departed from the usual type; they may be either very large or very small, two or three times larger than usual, or two or three times smaller. Some of them are oval and flat, and some of them pear-shaped vesicles (fig. 41). They may have also an increased colouring power, which means an undue concentration of hæmoglobin. When the two chief blood-making tissues are investigated in such cases after death they do not always furnish a rational explanation, of the state of the blood. It is, in fact, somewhat rare to find anything elucidative in the state of the spleen, and the interest is thrown mostly upon the bone-marrow. Not always, but very often, this tissue is profoundly altered; even the yellow marrow of the long bones is red or jelly-like, few or no fat-cells are visible, red blood-disks are everywhere, along with granulation-like marrow-cells, in a fine reticulum, and traversed by blood-sinuses which have been compared to the sinuses of the spleen. Sometimes the nuclear cells of the marrow are found with a zone of reddish protoplasm round them or in the state of perfect hæmatoblasts. In this peculiar disorder of the blood-making process the salient facts appear to be the following. Red disks are formed from hæmatoblasts with difficulty; they are mostly either much too large or much too small; the hæmoglobin is too concentrated in them; the bone-marrow makes quite unusual hæmatoblastic efforts; but the vessels at large remain ill supplied with blood, while the marrow itself is everywhere full of blood, and sometimes even tends to organize itself into a structure like the spleen. Degeneration follows in the muscular structure of the heart and in the walls of blood-vessels; to the former are owing some prominent symptoms, and probably to the latter the hæmorrhages. One of the most singular things in this remarkable disease is the power of recovery, either temporary or permanent, that the organism may acquire, chiefly under the stimulus of arsenic. As compared with leucoeythæmia the striking fact is that the part played by the colourless corpuscles is from first to last a subordinate and even unrecognizable one.

Scurvy.—In scurvy we have a blood-disease of a kind somewhat different from leucoeythæmia and pernicious anæmia, inasmuch as it depends, not upon unaccountable and seemingly capricious errors in the blood-making tissues, but upon errors in the ingesta, upon well-understood defects of diet. (See SCURVY.)

Irregularities of Blood-distribution.—While the facts of blood-making are among the most fundamental in pathology, the facts of blood-distribution come more visibly into the every-day manifestations of disease. The speed and force with which the blood is driven round its whole circuit vary much; as measured by the pulse at the wrist these conditions of the circulation have at all

FIG. 41.—Red blood-disks from a case of pernicious anemia; in the left lower corner is a group of normal red blood-disks for comparison. (After Laache.)

times been held by practitioners to be of the first importance in diagnostics and prognostics. The local distribution of blood, or the amount of it within and the rate of its passage through particular organs and parts, is a more recently investigated subject bound up with the doctrine of vaso-motor nerves. One of the most striking facts in this chapter of physiology is the varying amount of blood within the "splanchnic area" from time to time. In pathology the question of the varying distribution of blood comes largely into the doctrine of fever and of inflammation; the further discussion of it is reserved for a later part of the article.¹

§ 7.—ERRORS OF SECRETION.

The pathology of secreting structures is concerned, not only with deviations from their normal activities as described in physiological treatises, but also with an additional series of phenomena recalling the more elementary or embryonic kinds of cellular activity. Besides those great disorders of glandular structure and function which fall to be considered in the next section as errors of metabolism, there is a large part of the sum-total of disease which is merely an affair of elementary cellular irregularities in the mucous surfaces and glandular organs of the respiratory, digestive, and reproductive systems. In the foregoing illustrations of pathological processes it has often occurred to notice the obstruction, as it were, of earlier phases of cellular activity into later life, or the revival of embryonic characteristics, both structural and functional. The illustrations already given have related chiefly to blood-making and bone-making; we now come to a corresponding class of illustrations from the epithelial parts of the body. In the latter also there is a liability to revert to rudimentary forms of cell-life, wherein the epithelial cells reveal their inherent power to act as independent units, or their spontaneity and their self-governing properties. Thus, among the morbid conditions of the respiratory apparatus there are only a few, such as asphyxia, the Cheyne-and-Stokes breathing, and the like, which are directly in contact with the physiology of the respiratory mechanisms. On the other hand, pulmonary catarrhs and their structural after-effects (together with laryngeal and tracheal inflammations) enter largely into the pathology of the respiratory organs, although they are hardly deviations from those respiratory functions that have the engrossing interest for physiology. There is the same class of elementary cellular deviations among the morbid states of the digestive organs, and, most of all, in the pathology of the genito-urinary system,—of the uterus, bladder, and prostate,—and of the breasts. The most universal error that epithelial surfaces or organs are liable to is catarrh; and closely related to their liability to catarrh is their liability to polypous and simple-glandular tumours, and under special circumstances, to cancer.

Catarrh in general.—The term catarrh (*κατά*, down; *ῥέω*, flow) was originally applied to a running from the nose; the mucus was called "pituita," and in the Hippocratic doctrine of the humours it was exalted to a place side by side with the blood and the bile. The vague importance assigned to this humour in the medical philosophy of the Greeks is further shown in the curious fiction which made it to issue from the *hypophysis cerebri* or "pituitary" body. The mucus of the nose may stand for the mucus of the air-passages generally, and it differs only in degree from that which is expectorated when there is considerable bronchial catarrh. It is now usual, and the usage is scientifically justified, to include all other mucous or muco-purulent or purulent discharges from epithelial surfaces as the result of a "catarrhal" process.

Those mucous surfaces that are most liable to catarrh are ordinarily kept moist by an exhalation or secretion; in the mucous

Reports*, xxvi.; Eichorst, *Progressive perniziöse Anämie*, Leipzig, 1878; Laache, *Die Anämie*, Christiania, 1883; Bizzozzero, Rindfleisch, and others on the hæmatoblastic function.

membrane of the stomach and intestine the surface-moisture amounts to a definite layer of glairy or tenacious mucus. In some of the mucous membranes, such as those of the pharynx and oesophagus, trachea and bronchi, there are distinct racemose glands which appear to subserve solely the purpose of lubricating or keeping moist. In every case the normal mucus of an epithelial surface may be taken to be a product of the epithelial cells; it is as if it were a common and rudimentary function of surface-epithelium anterior to the specific secretions of organs. It is in this common and rudimentary function that the catarrhal process has its roots, a process which not only exceeds the physiological limits of surface-moisture, but may even throw into the shade the specific secretion of the part or organ. The catarrhal secretion is always characterized by the large preponderance of cells, and the proportion of cellular elements increases as the mucous substance becomes muco-purulent and purulent. It is important to observe that there is no definite line where the limits of normal moistness end and "inflammation" begins; and, as it is desirable to put off as long as possible the introduction of that entity into pathology, we shall best proceed in the study of catarrh by advancing from the physiological activities of cells.

The catarrhal process.

Nature of the Catarrhal Process.—The catarrhal process, like all the so-called inflammatory processes, has been rendered ambiguous by the undoubted share in it that is taken by hyperæmia or afflux of blood to the particular epithelial region. By some the hyperæmia has been taken to be the primary fact, the increased rush of blood to the part and the local stagnation of the same being traced to an upset of the controlling and equalising nervous mechanism of the vessels and to alteration of their walls; by others the local cellular process has been regarded as determining the afflux of blood, as if by a kind of attraction. Whether the afflux of blood precedes the unusual activity of the epithelial cells, and whether some of the catarrhal cells may not be emigrated colourless corpuscles, are questions that may be considered open; but there can be no question that catarrh is essentially a hypersecretion of the epithelium, or the secretory activity so modified that it becomes to a great extent formative, or its product to a great extent cellular. The difficulty of proving this is owing to the fact that the normal production of mucus from epithelium is a very subtle and rapid process, the morphological phases of which are hardly to be detected; in this respect it must be considered analogous to the formation of red blood-disks from hæmatoblasts. And, as the details of the hæmatoblastic process are best seen in certain abnormal manifestations of it, and even in those cases where the morbid condition is one of anaemia, so the complete physiological paradigm of mucus-production is best seen where there has been some interference with the perfection of function. We shall perhaps not go wide of the mark if we describe the catarrhal process as a reversion to a more embryonic or more elementary type of cellular activity. The higher the type of secretion, the less obvious are the morphological changes in the secreting cell; in an organ like the liver, which had been early acquired in the evolution of the animal body, the secretion has become so elaborated in the higher animals that the steps of it present hardly any morphological features at all; on the other hand, in an organ like the breast, which is a late (mammalian) acquisition, the changes in the secreting cell can be followed at leisure. Catarrh in any mucous surface is the same primitive kind of secretion, and it may be said, in a word, to consist of a fluid product and of an additional by-product of cells. The original epithelial cell is detached bodily, nucleus and all; the protoplasm becomes the more or less viscid or semi-fluid part of the mucus; and the nucleus goes with it as the catarrhal cell. The more the cellular elements predominate, the farther does the secretion deviate from the normal, until we reach the limit of pus, where we invoke the entity of "inflammation."

Succulence and Thickening of the Catarrhal Mucous Membrane.—A mucous membrane which has been the subject of catarrh for some considerable time becomes thicker and more succulent. If it be examined in microscopic sections it will be found that the underlying connective tissue has become involved; the tissue is "infiltrated" with round nuclear cells (fig. 42); the fibres are becoming

FIG. 42.—Epithelial surface and submucous tissue in a state of catarrh (tubular gland of the dog's skin). a, a', collections of catarrhal cells in the epithelial layer; b, the same in the underlying connective tissue.

thicker; and the fineness, delicacy, and translucency of the tissue are disappearing. At certain spots where the "infiltration" and associated changes are greatest the surface breaks or ulcerates, and a

"catarrhal ulcer" remains. The central fact in this process is the infiltration of the round nuclear cells beneath the epithelial surface. The facile way of accounting for them is to assume that the colourless corpuscles of the blood had escaped through the walls of the small veins; but it is more in accordance with observed facts and with unambiguous analogies to regard them as catarrhal cells which have found their way into the depths of the tissue instead of flowing off by the surface. The presence of these cells in the spaces of the connective tissue is not without effect on that tissue itself; they rouse it to a formative activity which conducts to the succulence and thickening of the mucous membrane, and, it may be, to ulceration at particular spots. To enter on this subject at present would be to open up the question of the infective action of one kind of cell upon cells of another kind (see pp. 382, 383).

Physiological Analogies of Catarrhal Infiltration.—The infiltration of catarrhal cells beneath the mucous surface has close analogies in the normal processes of the body. It is exactly paralleled in one of those crude forms of secretion to which the catarrhal process has been compared, namely, the kind of secretion, gradually rising in intensity, which goes on in the breast during the period of gestation. This process can be most conveniently observed in the mamma of the cat or dog, where the crude secretory products are for a time cells of considerable size filled with yellow or brown pigment; the pigmented cells can be followed from the secreting structure into the spaces of the surrounding connective tissue, and thence into lymphatic glands. It would not be carrying this analogy too far to regard the lymphatic follicles of the mucous membranes as collections of or receptacles for the cellular by-products of the mucous secretion; such are the tonsils, the follicles on the back of the tongue and pharynx, the lymphatic follicles of the stomach of some animals (but not of man, unless it be in infancy), the extensive stratum of lymphoid cells in the villi of the small intestine and the more definite collections of the same (Peyer's patches), and the lymphatic follicles of the great intestine.

Certain it is that all these collections of round nuclear cells are subject to very considerable increase when there is catarrh in the corresponding mucous surface. Not only so, but in catarrh they will show themselves prominently even where they are hardly known to exist normally; thus, in the intestinal catarrh (summer diarrhoea) of young children, even the thin folds of the mucous membrane (valvule conniventes) will be found studded with round nodular or somewhat flattened lymphatic follicles. In intense catarrh these follicles are the favourite seats of ulceration, their substance changing into a "follicular ulcer." In other cases the catarrhal process makes its influence felt in the nearest lymphatic glands, which may be regarded as the second line of receptacles for the by-products of secretion (as well as for the matters of absorption), the submucous follicles being the first line; and, under these circumstances, the lymphatic glands may even suppurate (as in the axillary lymph-glands of the breast after weaning).

Tumour-diseases of Mucous Membranes and of Secreting Structures generally.—If catarrh of mucous membranes enters, as Rindfleisch says, into the larger half of all the morbid conditions to which mankind is subject, the tumour-diseases of the epithelial surfaces and organs may be said to rank among the most formidable of all maladies, inasmuch as they include cancer. Cancers are diseases primarily of mucous membranes and other secreting structures, most commonly of the stomach, next to it of the uterus, of the female breast, and of the intestine; another variety of cancers (epithelioma) is diseases of modified epithelial surfaces, namely, the skin in general, and the lip and tongue. There are, however, much simpler tumour-disorders of epithelial surfaces which it will be convenient to take first.

Warts (Papillomata).—Papillomata of the moist epithelial surfaces are found almost exclusively in those situations where there is a transition from skin to mucous membrane. The rule may not be universal, but there are many instances in which these wart-like growths have an undoubted relation to a catarrhal process of the surface, where the removal of the catarrhal products has been interfered with. One of the most striking illustrations of this law occurs in veterinary practice; in the horse, especially when he is overworked and ill cared for, the natural smegma of the prepuce gets retained, owing to the fixity of the sheath; the accumulation has more than a mechanical effect, for it appears to induce a papillomatous condition sometimes of the whole mucous surface. The papillomata are new growths, either in a broad layer of the uniform thickness of a quarter of an inch or more, or they are large dendriform masses arising at various points and each attached by a narrow stem. It is hardly a catarrhal process that we have here to deal with, but it is none the less a disorder of secretion. The natural secretion not finding an outlet, the secreting surface adapts itself gradually to the unusual conditions. The surface becomes ridged or thrown into folds, or papillae arise at isolated points; blood-vessels run in the central parts of all these reduplications of the membrane; and the epithelium, instead of disengaging itself in successive generations of cells after the manner of the natural smegma, takes on a formative activity and builds up an

Tumour diseases of epithelial surface

Warts

secretory tissue on the surface the pattern of which is determined by the looping or dendriform branching of the blood-vessels (fig. 43). These formative aberrations of secretion are apt to return after removal, even although the conditions which gave rise to them are obviated; the new development and persistence of the blood-vessels entering their stems appear to be the occasion of recurrence in these cases.

FIG. 43.—Portion of a dendriform papilloma or wart (horse); blood-vessels run in the central stem and in the branches of fibrous tissue.

Mucous Polypi.—In many cases mucous polypi have an undoubted connexion with those states of the mucous membranes which are included under catarrh. An approximation to a multiple polypous condition may be found in the stomach subject to long-standing catarrh, where the ridges and furrows of the mucous membrane amount to an actual *polyposis ventriculi*. Multiple polypi are sometimes met with also in the intestine. The commonest seats of the isolated and stalked mucous polypus are the nasal passages and the cervix uteri. Their structure is after the same plan as the more epidermic papilloma, everywhere tubular mucous glands, the epithelium of which is wonderfully perfect (fig. 44); these may branch or communicate more than do the normal gland-tubes of the part, and they are separated by tracts of connective tissue which appear to the naked eye as dendriform white lines. In these morbid products the line is definitely crossed from functional to formative, but we cannot assume any other force than the indwelling secretory activity of the part; the unique fact that presents itself here is that a perversion of that force gives rise to an organ-like new formation whose plan of structure is plainly determined by the blood-vessels. It is worthy of note that the bronchial mucous membrane, which is the most liable to catarrhs, has practically no liability to mucous polypi; and the bronchial mucosa is distinguished, not only by its investment of cartilaginous rings and plates, but by the density of its elastic and muscular coats.

FIG. 44.—From a mucous polypus of the rectum.

Simple Glandular Tumour (Adenoma).—As the mucous polypus is characteristic of the wide expanse of mucous membrane, so the simple glandular tumour or adenoma is the formative result of functional disorder in the definitely bounded epithelial organs with racemose systems of ducts. The glands that are most liable to this condition are the breast, the salivary glands (including the buccal and labial), the lacrymal glands, and the skin-glands in certain regions. Whenever the more uniform expanses of glandular structure, such as those of the stomach and the intestine, take on a formative activity to the depth (instead of to the surface, in the form of polypi), the result is a cancer, involving other considerations besides those primary or direct deviations from the secreting activity which we are now considering.

Intra-canalicular Papilloma.—The simple or non-cancerous tumour-disease of glands may be represented in most cases in the light of deviations from the normal secretory activity,—deviations which take a formative direction. They connect not remotely with catarrhal states of the secreting structure; but, speaking generally, they stand for irregularities of the apparatus and process of secretion which transcend the notion of catarrh. It will be convenient, however, to proceed in the analysis of them from that familiar basis. The nearest approach to the effects of catarrh is shown in the folded or uneven state of the wall of the terminal secreting recesses or acini of a gland; this condition may be observed in certain skin-glands and in the breast. The cut (fig. 45) is taken from a tumour of the skin-glands of the dog. The lining of columnar or cubical epithelial cells, which is ordinarily a perfectly even surface, is raised into distinct papillary eminences. These may even meet across the space, changing its interior into a nearly solid or at least trabecular tissue. The next cut (fig. 46) shows precisely the same process in the breast, this time not in an acinus but in a

duct: the result is what is called an "intra-canalicular papilloma,"

FIG. 45.—Papillary outgrowths of epithelial lining in a tubular gland.

FIG. 46. Intra-canalicular papilloma of breast.

and it is not different in its origin and nature from the papillomata of expanded mucous surfaces which we have already considered.

Cartilaginous Tumours of Glands.—Another formative result of disordered function, which takes us quite beyond the limits of catarrhal effects, is the occupation of the walls and interior of the acinus, not with papillae of the lining epithelium nor with the epithelial cells shed into the free space as solid by-products of the secretion, but with a new tissue foreign to the gland. This occurs in the mamma (more often in the dog than in man), in the salivary glands (parotid, submaxillary, and labial), in the lacrymal gland, and in skin-glands (e.g., of the scalp); the new tissue may be of the mucous or myxomatous kind, and it is not rarely cartilaginous, or even osseous, at a few points in the midst of the cartilage. The occurrence of myxomatous and cartilaginous areas is common in the parotid tumours of man and in the mammary tumours of the dog, and it is usually explained as an arbitrary and unaccountable overgrowth and transformation of the supporting connective tissue of those organs. It remains to inquire whether it may not be brought into a rational connexion with disorder of the proper secretory function.

The cut (fig. 47) is taken from a case of extensive tumour-disease in the mamma of the bitch, in which much cartilage had formed. It represents several acini of the gland, having their interior occupied with large spherical or

FIG. 47.—Group of acini of mamma (dog), occupied in part firm hyaline with large vesiculated hyaline cells which are practically cartilaginous.

can be no question that these are epithelial cells strangely changed; but the change will not seem so strange if we keep in mind the range of transformation which the secreting cells of the breast are normally liable to. There is a stage in the unfolding of this gland from its periodical state of rest in which the cells become vesicles filled with mucus, just as there is a more mature period when they are still vesicles but filled with a more fatty or milk-like fluid. The change in the tumour is, after all, only from the mucus-filled vesicles to vesicles occupied by a firm hyaline substance; and, if it were connective-tissue cells that we were dealing with, the explanation would be at once accepted, according to the well-known correlation between fat, myxomatous tissue, and cartilage. The facts seem to require that the same formative possibilities be granted to epithelial cells; so that the myxomatous and cartilaginous formations in secreting structures would be traced to their active elements. The supporting tissue of the glands is *a priori* passive, and, as a matter of fact, it has not been proved by any detailed observations to be the source of those myxomatous and cartilaginous new formations. The occurrence of vesiculated epithelial cells with firm hyaline contents is not the only piece of positive evidence. It is much more common to find the columnar epithelial cells elongating into fibre-like elements, straight or crescentic, and developing mucous or hyaline intervals of intercellular substance; in this way there results the myxomatous and fibro-cartilaginous tissue that is so often found in the tumour-disorders of the salivary glands and more rarely in the labial mucous glands. The glandular plan of the structure in these cases very soon becomes obliterated, and the limits between supporting tissue and secreting apparatus removed; in a considerable area of hyaline cartilage or fibro-cartilage there are naturally few or no traces left of the apparatus and process of secretion; and there may some-

times be seen (as in the mamma of the bitch) the most remarkable development of all, the change of the cartilage into bone, with perfect medullary spaces lined by perfect osteoblasts. There are, indeed, no limits, other than the fundamental embryological limits, to the formative possibilities of cells which have reverted to primitive embryological function. We have already seen that the standing example of an embryonic tissue, the spindle-celled tissue of the ovary, contains within itself the whole range of development which is expressed in the grotesque variety of a dermoid cyst.

Another common effect of disordered glandular function is the excessive formation of solid by-products of the secretion, which are either retained in the recesses of the gland or are infiltrated into the spaces of the underlying and supporting connective tissue. Where the products are retained within the gland-space we have the familiar and simple result of *cysts from retention*, of which the sebaceous cysts or "wens" of the scalp are good examples. But a far more momentous occurrence is the infiltration of these crude products or by-products of secretion into the depth. We have already found reason to believe that the same kind of infiltration below the surface takes place in catarrhs, that the nuclear cells found in the deeper layers of a thickened mucous membrane are of the same origin as the catarrhal cells of the surface-discharge, and that their presence in the spaces of the connective tissue had been the exciting cause of the fibres becoming thick and coarse, or, in other words, of the "inflammatory" changes in that tissue. The infiltration which comes under our notice in tumours of secreting structures is different from this as regards the characters and properties of the cells: as regards their characters, the cells retain more of the epithelial type, that is to say, they are not naked nuclei, but they have a considerable investment of cell-substance; as regards their properties, these epithelial cells infiltrated below the mucosa do not excite "inflammation," but they excite cancer. What remains to be said of the infiltration of by-products of glandular secretion will be included in the section on cancer immediately following.

§ 8.—CANCER.

The popular estimate of the nature of cancer is so well founded that a definition is superfluous. Cancer in pathological anatomy differs from cancer as commonly understood in being restricted to the malignant tumour-diseases of secreting structures and epithelial surfaces generally, to the exclusion of a certain number of equally malignant tumours which grow from the periosteum or the marrow of bone, or from other mesoblastic tissues. The great majority of all the cases which have the fatal progressiveness of cancer are diseases of the stomach, the uterus, the breast, the intestine, and the skin; this group makes so large an element in the sum-total of tumour-disease, and is so homogeneous within itself, that it may justly appropriate the name of cancer, leaving the other cases of tumour-malignancy to be described by more technical names. At the same time it should be clearly understood that the smaller detached group does contain cases where the particular manner of fatal progression is not different from the progressiveness of the epithelial tumour-disorder, such, for example, as the cases of periosteal tumours becoming parosteal.

Chief Seats of Cancer.—The absolute and relative frequency of cancer in the various seats of secretion has been ascertained by D'Espine, from the mortality returns of the canton of Geneva, for both hospital patients and the well-to-do treated at home, to be as follows over the period from 1838 to 1855:—

| | |
|---------------------------------|----------------------------|
| Stomach | 399 cases, or 45 per cent. |
| Uterus | 139 " 15 " |
| Liver | 93 " 10.5 " |
| Breast | 76 " 8.5 " |
| Small and large intestine | 30 " 3.3 " |
| Rectum | 25 " 3 " |

being 762 or 85.3 per cent in a total of 889 cases of malignant tumours of all sorts. Most cases of cancer of the liver are really secondary to cancers in the stomach or elsewhere, so that the leading position of the stomach, and after it of the uterus, the breast, and the intestine, becomes more marked. According to the facts collected by Virchow from the mortality returns of the town of Würzburg from 1852 to 1855, the deaths from malignant tumours were 5.3 per cent. of the total mortality, and the percentages among malignant tumours were as follows:—

| | |
|---------------------|----------------|
| Stomach | 34.9 per cent. |
| Uterus, &c. | 18.5 " |
| Intestine | 8.2 " |
| Liver, &c. | 7.5 " |
| Face and lips | 4.9 " |
| Breast | 4.3 " |

78.2 per cent. of all malignant tumours

It may be accepted, then, that the digestive tract is the seat in about one-half of the cases of malignant tumour-disease, and the female sexual organs (excluding the ovaries, but including the breasts) in about one-fourth, while the remaining fourth has to be apportioned among other epithelial organs or parts and the bones and other mesoblastic tissues. It must not be supposed that these ratios hold good equally for all localities; the breast sometimes appears to usurp a larger share, and sometimes the rectum. Again it is a noteworthy fact that cancer is a comparatively rare disease among the vast populations within the tropics.

The beginnings of cancer have to be sought for in disturbances of the apparatus and process of secretion. Even in the cases where hereditary or congenital predisposition plays a part there must have been local irregularities of structure and function to determine the seat of the disease; thus, of four sisters of whom three were married and had families, one died of cancer of the breast, another of cancer of the stomach, a third of cancer of the rectum, and the fourth of cancer of the uterus,—the incidence of the disease in them all happening about the age of fifty to sixty. Cancer in secreting structures is essentially one process; but each of the favourite seats of cancer has its own special liability, as well as points of structure special to itself. The liability of the female breast is an entirely different thing from the liability of the stomach; and the liability of the uterus is more closely allied to that of the stomach than to that of the breast, although the breast and the uterus have a closer systemic relationship. There is, however, something in the cellular law of secretion common to them all, and it is that common feature of the secretory process which first engages the attention.

Relation of Cancer to Secretory Process.—The product of secretion is not, under all circumstances, a fluid; in the simpler forms of animal life, and in more recent or less elaborated glands of the higher forms, it may be thrown off in cellular shape, just as it is always cellular in its origin. We have already seen that in the catarrhal state the cellular admixture is considerable, and there can be hardly any question that the cells of a catarrhal discharge are derivatives of the epithelial cells, being indeed little other than their nuclei. We have also seen reason to believe that the infiltration of nuclear cells in the thickened mucous membrane of chronic catarrh had been a real infiltration of the catarrhal cells beneath the surface. Now the favourite seats of chronic catarrh, the stomach and the uterus, are also the favourite seats of cancer. What, then, is the relation between these two very different diseases, both of them primarily disorders of the apparatus and process of secretion?

A particular case will bring out the points of resemblance and the points of difference. In a fatal case of cancer of the stomach the whole organ is found to be uniformly thickened, the mucous membrane being much ridged and furrowed; but its epithelium is unbroken. The interval of submucous tissue, ordinarily a loose layer between the mucosa and the muscular coats, is occupied throughout the whole extent of the organ by a nearly uniform stratum of firm whitish tissue. This is an exceptional case of cancer of the stomach, but it is a very instructive one; the morbid condition is as uniformly diffused over the organ as if it had been the thickening of chronic catarrh, and it wants the usual tumour-character of cancer. The microscopic examination proves, what the whiteness and almost gristly firmness of the submucous interval had suggested, that the disease is hard cancer.

The white stratum under the mucosa has the structure shown in the cut (fig. 48), and it is an average example of the infiltration of scirrhus cancer. Epithelial-like cells, with a disproportionately large nucleus, are as if packed in rows in the spaces of a very dense fibrous tissue, which contains a large number of elastic fibres. Besides the linear processions of cells, there are elsewhere groups of them arranged round the walls of spaces like the epithelium of a gland. Throughout the whole thickness of the coats of the stomach in this case such collections of cells are found; in the muscular coats they are met with chiefly where there are fibrous septa; and it is noteworthy that the gland-like collections are by far the most numerous in the tissue most

FIG. 48.—Infiltration of scirrhus cancer uniformly diffused throughout the whole sub-mucosa of the stomach.

Cancer and the secretory process.

Diffused cancer of whole stomach.

remote from the physiological glandular surface, namely, the connective tissue of the serous or external coat (fig. 49). It is impossible to trace a continuous growth of these subserous gland-like groups of cells from the actual glands of the mucous surface; they are separated from the latter by nearly a quarter of an inch of muscular and other tissue, in which the "infiltration" occurs only here and there. The wide extension of the cancerous process is not mere overgrowth or protrusion of the secreting structure, nor is it even an infiltration, in the literal sense, of the cast-off secreting cells; it is an infection of the cells of the subjacent tissue to become epithelial cells and gland-like cell-groups. And therein lies the essence of cancer.

FIG. 49.—Diffused cancer of stomach; tubular-gland grouping of cells in sub-peritoneal tissue.

Cancerous infection.

Extension of Cancer from the Surface to the Depth.—Whereas, under commoner circumstances, the catarrhal by-products of the process of secretion find their way to the underlying textures and there give occasion to an "inflammatory" reaction, to hardness and coarseness of the connective tissue, under other circumstances the less nuclear or more epithelial by-products of the glandular activity have the power to induce the remarkable formative process in the neighbouring tissues which we know as cancer. The cancerous process implies, accordingly, such a condition of the secreting structure and function, or of its individual cells, as can excite this formative reaction, and it involves also the changing of the surrounding tissue (or of its cells) into epithelial forms of cells, either in rows or groups or in gland-like systems. As regards the former, there is no lack of evidence that cellular by-products of secretion are often the antecedent or concomitant of cancer in an epithelial organ or part; they may be seen sometimes in the stomach heaped up between the glandular tubules, or in the mammary gland (especially of the bitch) infiltrated into the surrounding stroma. The cut (fig. 50) is an illustration from the mamma; the rows of cells which lie in the spaces of the connective tissue are the cellular products of the secretory function characteristic of an immature or low-powered intensity of secretion, and they are easily identified in all phases of the mammary secretion in the dog, whether regular or irregular, by their yellowish-brown pigmentation. It is not to be expected that such an infiltration of by-products of secretion can be proved for every case of cancer, nor is there reason to suppose that there is always such an infiltration. The elements of the secreting structure may serve *in situ* to excite or infect the neighbouring tissue, and this they usually do for the connective tissue on which they immediately rest. But we have to take due account of the much more important fact that the infection also manifests itself at a number of remote and isolated centres, within each of which the new growth arranges itself as if implicitly according to a design, the pattern being the more or less regular epithelial type proper to the organ or part. Thus in fig. 49, from a diffuse cancer of the whole stomach, the glandular tube-like structures have arisen at a number of points in the connective tissue of the outer coat. The pattern of tubular glands is often more complex than in that figure, both in other stomach cases and in cancers of the great intestine and rectum. This remarkable breaking out, as it were, of very perfect epithelial tubules, disconnected from the physiological tubules and often in the midst of dense tracts of plain muscular fibre, appeared to Johannes Müller to be so extraordinary that he ascribed them to an invisible *seminum* dispersed through the tissues; according to him, the *seminum* was a literal seed whose particles themselves grew to be the new epithelial cells. We do not now admit the possibility of cells so arising by *generatio equestris*; every cell must be the descendant of some pre-existing cell. And, although it is neces-

FIG. 50.—Infiltration of pigmented epithelial cells into the stroma of the mamma in a case of tumour (dog).

sary to retain the doctrine of the *seminum*, the part played by that hypothetical element is not formative within its own particles; but it is a fertilizing or infecting influence upon the pre-existing cells of the neighbourhood. In most cases the cells so fertilized are the corpuscular elements of the common binding-tissue of the body, or the connective-tissue cells.

Cancerous Infection of the Connective-tissue Cells.—The cut (fig. 51) is an exact drawing of a piece of cancerous tumour where the connective-tissue cells can be seen in the act of transforming into epithelial cells, or in various stages of that transformation-process. The process carries us once more back to that embryonic activity

FIG. 51.—Cancerous infection of connective tissue in a case of tumour of skin-glands of the dog.

of cells in mature life which we have had frequently occasion to discover in other elementary processes of disease. The cells of the connective tissue are ordinarily quiescent in the form of plates more or less compressed laterally, the cell-plates of tendon being extreme examples. Just as, in the process of repair, they become plump and granular, developing in the third dimension as well, and ultimately becoming granulation-cells, so in cancerous infection they start from their obscurity among the bundles of fibres, passing by rapid transitions into the form and semblance of the epithelial cells proper to the occasion; and they may even go on to assume a glandular grouping round the wall of a space, acting as if harmoniously or according to an implicit design. There is no fact in pathology more noteworthy than this; if it has any analogy among the facts of normal biological processes, we shall probably have to go to the very lowest groups of animals or to the earliest stages of evolution to find it. Whatever the infective influence may have been, it touches all the quiescent cells over a certain area simultaneously; a "territory" of tissue, larger or smaller as the case may be, but always involving a number of cells, assumes the embryonic life throughout its whole extent, and goes through all the steps of the transformation towards the epithelial type and grouping, as if its cells had received one common impact.

States of the Connective Tissue predisposing to Infection.—There are, indeed, reasons for thinking that the special factor in the production of cancer, and of the production of it at particular spots in a large area of choice, is not so much the presence of cellular by-products of the secretion as a particular disposition of the connective tissue of the particular spot to be easily acted on by them. Catarrhal products are often present without any infection following; but the two favourite seats of repeated or chronic catarrh, namely the stomach and the uterus, may at length become the seats of cancer. Cancer is hardly ever a disease of the first half of life; it is very distinctively a disease apt to occur after the meridian is passed. In those who are liable to uterine and gastric catarrh the mucosa and the submucosa at length become thick and succulent. This happens at particular spots, notably just within the pylorus of the stomach; the epithelial surface may not be appreciably different from the surface elsewhere, but the underlying tissues are thickened and, it may be, contracted to a stricture. It is in such dense new formations of connective tissue that cancer is most apt to form; what is called cicatricial tissue is proverbially liable to cancer, and a tissue may be to all intents and purposes "cicatricial" (and apt to shrink) even if it underlie an unbroken surface. Some cancers of the stomach form entirely below the surface, in the thickened floor of a healed ulcer, or even in the not unfrequent dense adhesions between the serous membrane of the back of the stomach and the piece of peritoneum which is drawn over the anterior surface of the pancreas. A cancerous stricture of the intestine or rectum is not unlikely to have been to some extent a stricture before it became a cancer. The condition of the connective tissue in all such circumstances is not easy to define; it is often spoken of as young connective tissue or "embryonic," and there is probably in it a smaller preponderance of the fibrous element over the cellular than is usual in mature life. A general change in the connective tissue of the body has been asserted to take place as age advances, a senile change which has been described by Thiersch, for the corium, as a relaxed state. The epithellated localities subject to persistent functional disturbance do at least seem to undergo a change in their underlying or surrounding connective tissue, whereby that tissue becomes predisposed to cancerous infection. The infection emanates from the secreting structure proper, for it carries with it the likeness of such structure (in its more or less irregular or morbid state). The cellular waste or by-products of the secretion would appear to acquire something of the property of sperm-cells; and, inasmuch as the infected or impregnated connective tissue produces not merely individual epithelial

cells of the appropriate type but also the appropriate grouping of such cells, the sperm-cells must be held to carry more than the influence of cell-units, and in fact to be representative of the whole structural and functional process in which they had played a part.

Varieties of Cancer.—The two main varieties of cancerous texture are the hard and the soft, or the scirrhous and the medullary. *Scirrhous cancer* is very often the "infiltrating" kind, with the epithelial cells lying in scattered groups or in single file within the spaces of a peculiarly dense and elastic connective tissue. It is common in the breast and not rare in the stomach. The *medullary cancer* consists of very much larger and closer groups of cells, which may be in nondescript heaps or in the more regular arrangement of glandular structure. When the glandular type is very distinct the tumour is sometimes called a "destructive adenoma." *Colloid cancer* is a very peculiar variety, apt to occur in the stomach but not unknown in the breast; most of the structure is changed into a brownish jelly-like substance which forms more or less definite spherical or alveolar masses separated by narrow bands of stroma. Under the microscope (fig. 52) little of cellular structure of any kind is found remaining, but in place of it there are an immense number of spherical pearl-like bodies, each of which consists of several delicate concentric laminae arranged round a more dense nuclear point.

FIG. 52.—Colloid cancer of the breast.

Cancer of the skin, and of the lips and tongue, is generally termed *epithelioma*; it is not a disorder of secretion in the same sense as other cancers are, but it is a disorder incidental to the constant waste and repair of the epithelium of the skin. It is characterized by the encroachment of processes of the rete mucosum upon the corium and subcutaneous tissues, or, in the lips, tongue, upper part of the œsophagus, &c., of epithelial columns of cells upon the subepithelial region. The type of this encroachment is the papillary arrangement of the normal rete mucosum, where the appearance of regular columns of epithelium reaching down into the corium is equally due to the reciprocal protrusion of loops of blood-vessels upwards.

The interlocking of epithelial columns and connective-tissue tracts in epithelioma is much more extensive and irregular than in the normal skin, and it is always difficult to decide, from the superficial microscopic appearances, whether the encroachment of the epithelium is merely a displacing or a transforming encroachment (fig. 53). In some cases, such as destructive epitheliomas of the tongue, or of chimney-sweep's cancer, it is possible to find reliable evidence in the microscopic sections that the progressiveness of the disease is really an infection, like that of cancer elsewhere—

FIG. 53.—Epithelial cancer of skin deeply involving the side of the neck. The cylinders of epithelial cells, resembling those of the rete mucosum, are surrounded by fibrous tissue infiltrated with small nuclear cells.

that is to say, the neighbouring tissues, and more especially the connective-tissue cells, are infected so that they assume the epithelial type proper to the locality—and that infection tends to spread without limit. But the doctrine of continuous growth from the rete mucosum downwards, by mere subdivision of pre-existing epithelium, appears to be justified as a part, at least, of the pathology of cancer of the skin. As in cancers of the stomach and uterus, the regions liable to skin-cancer are especially those subject to repeated irritation or to prolonged functional disturbance. One of the most striking instances of this law used to be the cancer of the skin of the scrotum and groins in chimney-sweeps, a form of disease which has become much less common of late. Again, it is nearly always the lower of the two lips that suffers, and the rare cases of epithelioma of the lip that occur in women are among those of the sex who smoke pipes. Like other cancers, the cancer of the skin, lips, and tongue, &c., is a disease of later life; according to

Thiersch, it is due to a "disturbance of the histogenetic equilibrium between epithelium and stroma, to the disadvantage of the stroma." The perfect balance of tissues would be exemplified by that regular interlocking of vascular papillae from below and epithelial processes from above which the skin ordinarily shows; as age advances the downward force of the epithelial growth prevails, owing to a certain decreased "turgor vitalis," or to loss of resistance on the part of the tissue carrying the blood-vessels, so that, when long-standing irritation of a particular spot is added, we should have the two great determining causes of cancer of the skin. But the question will always remain, whether the essence of the disease is not really an infective transformation of the quiescent cells of the connective tissue into the type and pattern of the irritated epithelial structure.

The female breast is peculiar among the glands of the body in its great liability to cancer; the disease is of essentially the same nature as that which we find in the stomach and other epithelial organs, but the occasion of it is quite different. It will therefore be convenient to reserve further remarks on cancer of the female breast until the next section—that on the "liabilities of obsolescence."

Extension of Cancer to Lymphatic Glands and other Discontinuous Parts.—If the beginnings of cancer are to be sought for in some tinuous disorder of the apparatus and process of secretion, the disease very infection soon passes the limits of the primarily disordered organ or part. The cancerous property of a tumour, as we have concluded, is from the first an affair of infection of the neighbouring tissues by epithelial products; the infected neighbourhood is the seat of the primary tumour, the progressiveness or infiltrating character of which may soon cause a large area to be involved and a large growth to result. Sooner or later there is *discontinuous infection*, or the infection of more or less remote centres, whereby *secondary tumours* arise. This phase of cancerous infectiveness is by no means dependent on the extent of the primary infection or the infection of the original neighbourhood. That which distinguishes secondary cancerous nodules, wherever they are found, is the very close mimicry of the pattern of structure in the indigenous seat of disease, a pattern which is itself determined by the structural and functional characters of the secreting organ or part concerned. In the majority of cases the nearest lymphatic glands become the subject of this mimetic process first; the liver also is very liable to discontinuous infection, not only in cancers of the stomach and intestine, but even in cases of cancer of the breast, submaxillary glands, &c. There is always an interval of time before this secondary infection is set up; and, although the cellular process is not different in kind from the infection of the neighbourhood of the indigenous disease, it is necessary to regard the latter as, in a sense, the parent of the former. This parental relationship is made all the more probable by the fact that sarcomatous tumours, which depend in many cases upon a reversion sarcoma to or survival of embryonic characters in the mesoblastic cells of a and particular locality, are also apt to be followed by tumours in distant cancer parts, particularly in the lungs. In cancers, accordingly, we should distinguish three factors, and in sarcomas only two: in the former we have first the accumulation of cellular by-products of the secretion, next the infection of the predisposed connective tissue by these epithelial products, and lastly the parental influence of the whole primary seat of infection; in the latter we have the embryonic reversion of cells over a particular region, together with their increase or growth, and then the parental influence of the tumour which had so arisen. In both cases the primary tumour acquires a kind of individuality and a power to reproduce itself; but it is only in some cases of sarcoma, especially those soft tumours of periosteal origin which become parosteal, that there is infection of the neighbourhood, whereas a cancer is not a cancer at all until the tissues adjoining or supporting the epithelial secreting structure are epithelially infected. This difference between sarcoma and cancer corresponds to the familiar fact that the former are only occasionally "infiltrating" tumours, being in most cases marked off from the neighbouring tissues by a definite capsule.

The simplest case of discontinuous cancerous infection is in the *lymphatic glands* near the original seat of disease. It is only exceptionally that the lymphatic glands are infected in sarcomatous tumours, and those cases appear to be mostly the infiltrating sarcomas which have the distinctively cancerous property of infecting the neighbourhood. Infection of the axillary lymphatic glands is the common sequel of cancer of the breast, while the epigastric, portal, mesenteric, and other abdominal lymph-glands receive the infection in cancer of the stomach and intestine. In epithelioma of the lip and tongue the infection of lymph-glands is much slower, and is often so slight as to be undetected during life; it specially affects the lymph-glands under the chin. In all cases the tendency is to reproduce the exact pattern of the primary tumour. In some, including those sarcomatous cases where this kind of infection does take place, the lymph-gland seems to have been transformed *en masse*, very rapidly and directly, so that steps in the process are hardly to be detected. But in other cases it is possible to find, either within the same gland or among the various glands of a cluster, a certain amount of instructive histogenetic detail as to the

mode of infection. The lymphoid cells become affected, not certainly in the way of atrophy, but in the way of transformation. There is indeed nothing more wonderful in the whole range of biological phenomena than to observe the adaptation of the cells and tissues of a lymph-gland to assume the cancerous structure already established in the organ to which they are related, an adaptation always close in its mimicry, involving the co-operation of large groups of cells and fibres, and directed as if by a presiding intelligence. In many instances the infecting substance may even want the perfect cellular character; it may be no more than the detritus or the juices of cells and tissues. The most obvious form of infection, although probably the rarest, is where the new growth extends continuously along the sides or in the interior of lymphatic vessels from the secreting structure to the lymph-gland; but even this continuous extension has been shown to be, not a protrusion of the primary tumour by increase or subdivision of its elements, but a succession of infective transformations along the line of cells constituting the lymph-vessel or investing it. Under all circumstances the lymph-gland becomes changed ultimately into a texture which reproduces with astonishing fidelity the particular pattern of the primary cancer, a pattern which is never quite the same in any two cases of tumour-disease even of the same organ. In some cases it is not always uniform throughout the same tumour; thus preparations might be described from a cluster of infected lymph-glands under the cancerous mamma of the bitch wherein two kinds of structure in the extensive strip of primary disease are severally reproduced in different lymph-glands.

The infection of the liver is a very common sequel of cancer of the digestive tract, as well as of other cancers, and even of sarcomas (especially the melanotic) and lymphomas. Opinions differ as to the share which the liver-cells take in the building up of the new texture; but there is hardly any room for doubting that it is from the pre-existing cells of each infected area, even if it be exclusively from the cells of the supporting tissue and the capillary walls, that the elements of the secondary tumours are derived by infective transformation. The infection breaks out and proceeds *pari passu* at a number of areas throughout the liver-substance, affecting the whole of an area as if at one blow; there is an absolute lack of evidence in favour of the assertion often made, that the secondary tumours are due to the mere increase, by division, of cells detached from the primary mass and lodged here and there in the liver. There is a certain amount of evidence in favour of some such embolic theory for the secondary tumours of the lungs, which are usually a sequel of sarcomatous growth in some bone or in other mesoblastic tissue. Sarcomatous tumours are apt to grow through the walls of neighbouring veins, and pieces of them doubtless get detached and carried into the pulmonary circulation; but it is more than doubtful whether even these emboli give rise to the secondary tumours of the lungs merely by continuous proliferation of their cells, and not rather by the infective action of their presence.

Another seat of secondary tumour-formation, both epithelial and melanotic sarcomatous, is the serous membranes. The accompanying figure (fig. 54), from a nodule on the diaphragm in a case of cancer of the colon in the horse, may be set beside fig. 51 as showing the substantial identity of the infective process in the secondary and primary seats of disease; in both cases the cells of the connective tissue are seen in the stages of transformation towards the epithelial form and grouping. The infection of the neighbourhood is the essence of the cancerous process. But the discontinuous infection of distant parts is not different from it in kind. It is merely "Wirkung in der Ferne," and it is more mysterious only because it is more remote.

The disorder of secretion thus eventually assumes a cancerous character in which traces of its origin may be hard to find. As the disease persists or extends the patient's colour becomes sallow or dull grey, the colourless cells are increased in the blood, the bones may become fragile, and general wasting (curiously associated sometimes with local production of fat at the seat of disease) puts an end to a life of suffering. In abdominal cancers death may be hastened by dropsy of the peritoneum; in various forms of the disease there may be fatal bleeding from an eroded vessel. It has often been remarked that an appearance of exceptionally blooming health goes with the liability to cancer; and the blooming appearance of the face and plump condition of the tissues will sometimes

persist when the local ravages of the disease have made considerable progress.¹

§ 9.—THE LIABILITIES OF OBSOLESCENCE.

We have seen in the foregoing sections that various liabilities to error underlie the embryological tissue-developments, the process of blood-making, the process of bone-making, and the process of secretion. But there are functions of the body, of its tissues and organs, in which the morbid liability is something special. The most striking instance of this is in the reproductive organs, particularly those of the female; the obsolescence of the function, and in part of the structure, in the ovaries, uterus, and breasts of women long before the natural term of life creates a peculiar liability to disease. There are two other organs, the thyroid and the suprarenal, which hold a somewhat special position; it cannot be doubted that each of these organs plays an important part in the economy, but there are suggestions in their morphology of survivalship from a former state of things, and their diseased conditions are not only peculiar in their occasion but also peculiarly important in their consequences. Lastly, there are two minute bodies situated at the bifurcation of great arterial trunks, the coecygeal gland and the intercarotid body, which are clearly marked as survivals; and the former, at least, of these carries a peculiar liability to tumour-disease during the period of intra-uterine life. These instances do not include the so-called "involution-diseases" or the liabilities of old age. The self-limitation of life may be said to be too large a problem for the present purpose; but sexual involution is a part of this problem which comes directly into pathology.

Cancer of the Breast in connexion with Obsolescence of Structure and Function.—The diseases of the climacteric period in women cease to make an important chapter in the special pathology of the sex; namely, together with the disorders incidental to maturation, they stand many for the larger part of the special ill health of women. It will not be possible in this article to give more than a single illustration of the morbid effects of this peculiar periodicity, namely, the obsolescence of the mammary function. The statistics collected by Paget clearly show that cancer of the breast in women is peculiarly a disease of the climacteric and post-climacteric period; throughout the whole period from the age of about fifteen to about forty-five, during which the breast is capable of lactation, the cancerous disorder is rare in it, the tumour-disorders to which the organ is then liable being comparatively tractable. A few words about the physiology will serve to indicate the pathology of the simpler as well as of the more formidable malady.

The reproductive functions in the female are not only peculiar among other functions of the organism in their maturation and obsolescence, but they are further remarkable for their periodicity within the period of vigour itself. In the lower species of the vegetable and animal kingdoms seasonal periodicity is in everything, in the higher it is only in the sexual and secondary sexual characters, and in the human species it is practically confined to the reproductive system. The consequences, as regards the breast, are that its structure and function unfold during the term of gestation, continue in full vigour for a longer or shorter period (which may be arbitrarily limited), and then go through definite stages of subsidence and upfolding to the resting state. This periodical reduction of structure in an orderly way is a peculiar and unique thing; it is "as though a rose should shut and be a bud again." The upfolding and unfolding of structure have corresponding functional aspects; there are crude secretory products formed and discharged, and hence it is that the breast is a peculiarly suitable organ in which to investigate the question of cellular by-products or waste of secretion, and their disposal by the lymphatic system. Compared with other secreting organs and parts the breast is not peculiarly liable to catarrh, but it has a physiological liability of its own which puts it on the same footing, as regards tumour-disease, with the great seats of catarrhal disorder, the stomach and the cervix uteri. Like these organs, it is not generally subject to cancer until after middle life; but, whereas in them the predisposition appears to depend on long-continued functional irregularities, the liability of the breast arises out of its

FIG. 54.—Cancerous nodule on the peritoneal surface of diaphragm, secondary to cancer of the colon (horse).

¹ See Paget, *Lectures on Surgical Pathology*; Rindfleisch, *Die Histologie der Carcinome, dargestellt als eine Folge ihrer örtlichen Destruktivität*, Leipzig, 1877; various contributors in *Pathol. Trans.*, xxv., 1874; C. H. Moore, *The Antecedents of Cancer*, 1884, 1885; K. Thiersch, *Der Epithelialkrebs, namentlich der Haut*, Leipzig, 1865.

normal involution. Its secreting mechanism becomes finally broken up, so that one may find little left besides traces of the larger ducts in the midst of wide areas of fibrillar tissue and fat. Traces of the glandular structure persist to a very various extent in different women, and even in different parts of the same breast. It is obvious that the process is one which offers numerous opportunities for a devious course; it may be retarded, or advance unequally, or be in the end incomplete. That which in all cases must be held to create the peculiar liability to cancerous infection is the readiness of the preponderant connective tissue to be acted on by epithelial cells dispersed throughout it or otherwise in direct contact with its corpuscles.

§ 10.—SPECIAL LIABILITIES OF THE SUPRARENAL AND THYROID.

(1) *Of the Suprarenal—Addison's Disease.*—The peculiar condition of ill health—always fatal—which Addison discovered to be associated with caseous degeneration of both suprarenal bodies was described by himself as "anæmia, general languor and debility, remarkable feebleness of the heart's action, irritability of the stomach, and a peculiar change of colour in the skin." Some of these symptoms appear to be due to interference with the function of the sympathetic nervous system; the disease, as a whole, however, is almost certainly the direct effect of withdrawal from the general life of the body of those services which the suprarenals are adapted to render. Where there is no caseous degeneration (and consequent non-circulation of blood) in each of the suprarenals the peculiar group of symptoms constituting Addison's disease does not occur; there may be hyperplasia (*struma suprarenalis*) of one or both suprarenals, or even true cancer of one or both, but these morbid conditions do not seem to be able to produce the same effect on the organism which is produced by caseous degeneration. On the other hand, Addison's disease has resulted in a few cases where the suprarenals had not been destroyed by caseous degeneration, but had undergone extreme atrophy. We shall best approach this somewhat intricate disease by considering it from the point of view of suprarenal function, and of the peculiar relation of the present probable function of the organ to its past morphological history.

Evidence of Suprarenal Function.—A simple experiment will show that the blood passing through the suprarenal receives important additions. If the organ taken quite warm from a recently-killed animal, such as the horse, be cut into pieces and placed in a solution of potassium bichromate the central region assumes a rich brown colour. Under the microscope the brown colour will be found to reside in the coagulated plasma filling the numerous lacunar spaces and large veins of the central region and in the cells adhering outside their walls. At the same time it will be seen that the groups of red blood-disks, wherever they occur in the coagulated plasma, form areas of bright green colour. These colour-reactions with chromium are not known to occur anywhere else in the tissues and fluids of the body; there is that in the outgoing blood of the suprarenal which reduces the orange-red chromium-salt to a brown oxide, and (in the case of the red blood-disks with more oxygen) to a green oxide. It will hardly prove an easy task to isolate the substance whose existence is thus indicated, but it is not difficult to follow in the suprarenal structure the adaptations for supplying some such substance to the blood. It is precisely analogous to the adaptation of the placenta, as described above (p. 374), for supplying its metabolic product to the blood destined for the fetus. Several arteries reach the suprarenal all round its circumference; they break up into capillaries which radiate to the centre, carrying the suprarenal cells closely adherent to their walls; towards the centre certain lacunar spaces form, and from these the central outcarrying vessel receives its blood, being provided with contractile muscular walls (in man, the horse, &c.). Whatever is added to the blood passing through the suprarenal must come from the suprarenal cells. There is reason to suppose that this addition is an actual exuded plasma, just as it is in the placenta. In the latter case the added fluid drops from the protoplasmic wall of the vessel into the circulating blood; in the suprarenal a membrane is interposed between the lumen of the vessel and the cylinders of secreting cells, namely, the wall of the vessel itself. In this respect the suprarenal cells are as well placed for contributing to the blood flowing past them as are the liver-cells for exercising their glycogenic function. We shall conclude, at least, that the suprarenal blood has received additions whilst in the organ, and that these

additions have been a material exudation (plasma) from the suprarenal cells.

The caseous or putty-like or cretaceous change which overtakes the suprarenals in Addison's disease involves the complete suppression of this function, for it practically amounts to the arrest of circulation through the organ; blood neither enters the organ nor passes out of it, and there can be therefore no metabolism. Whatever be the nature of the services that this remarkable organ is adapted to render to the general life, Addison's disease is the evidence that such services cannot permanently be withdrawn with impunity. The most striking effect is the formation of brown pigment, often so abundant as to appear almost black, in the lower cells of the rete mucosum in certain regions of predilection of the skin, and here and there in the mucous membranes. Doubtless a large part of the symptoms of Addison's disease might be traced vaguely to disorder of the sympathetic nervous system; but, while it is difficult to prove the existence of such disorder of the solar plexus, except as an inference from the symptoms, we have the patent fact that the full train of symptoms in Addison's disease is associated with loss of suprarenal structure and function, including naturally so much of the structure and function of the sympathetic nerve as properly belongs to the organ.

The causes of the molecular decay of the suprarenals and consequent cessation of their function are various. It may be the mere contiguity to a lumbar abscess, or it may be a part of general tuberculous disease in the body, or it may be associated with no extrinsic morbid condition whatsoever. Enlargement seems usually to have preceded the final molecular break-down. The liability of the suprarenals (with or without preceding enlargement) to caseous degeneration must be considered to be somewhat special to the pair of organs, just as the suppression of their function is of special significance for the life of the body. The cessation soon overtakes the whole structure on both sides, so that a relatively small amount of that not very rare degeneration is of fatal import if the suprarenals be the seat of it. There is a good deal of morphological and developmental evidence that the suprarenals are in one sense obsolete, their structure being, however, adapted or utilized for new functions; associated with this adaptation of the organs we have the peculiar instability of their protoplasm, the absence of any power of recovery, and the very marked and fatal effects that follow the withholding of their contributions to the metabolism of the body.

(2) *Special Liabilities of the Thyroid Gland.*—The thyroid is in the same respects parallel with the suprarenals. Its cells furnish a thyroid mucus-like plasma which is, in the first instance, poured into the gland, closed vesicles of the organ, but is taken up again and carried into the circulation (as Baber's observations tend to prove, *Phil. Trans.*, 1876, 1881) by the lymphatic vessels in their walls. We have now to consider those not unimportant or infrequent morbid conditions which are associated with the peculiar functional position of this organ.

Goitre.—The grand disease in which the functional activity of Goitre the thyroid is implicated is goitre. Under certain conditions of locality a large part of the population become goitrous, that is to say, their thyroids undergo enlargement. (See GOITRE.) There have also been epidemics of temporary enlargement of the thyroid in garrisons. The simple enlargement undergoes a considerable variety of subsequent changes in the different cases: it may be general or partial at the outset, it may become cystic or "aneurismal," gelatinous or hemorrhagic, it may become fibrous, very generally it becomes petrified at various centres, sometimes there is a kind of osseous framework developed through its substance, and there may be amyloid concretions. These transformations are too many and complex to be entered upon, although they are full of interest for the elucidation of indwelling embryonic tendencies. The primary fact is enlargement of the thyroid among populations whose food, water, air, or environment generally has something defective or unsuitable. The enlargement of the thyroid means that the organ has greater calls upon its ordinary function, that it makes an effort to meet the circumstances of the case. And there can be no doubt that in most cases the effort is successful; for goitre, apart from the inconvenient size of the thyroid and the mechanical consequences of pressure, is a harmless condition. The subsequent changes in the enlarged organ are the inevitable consequences of hyperplasia; but the primary enlargement is conservative and adaptive. The adaptation has the effect of elaborating from the blood brought to the thyroid more of the mucous substance which it is the office of the thyroid to elaborate, the same being probably returned to the blood more or less directly. There is that in the water, food, or air of these populations, and in the nutrition of men and animals in isolated cases elsewhere, which calls for more of this peculiar metabolism.

Myxœdema.—Surgeons have in some places practised removal of the enlarged thyroid; and attention has lately been called in Switzerland to the after-effects of such removals. The connective tissue in all parts of the body has become occupied with a mucus-like substance or has shown evidence of unwonted functional and

plastic activity in its cells and fibres. Of eighteen cases of complete removal of the enlarged thyroid at the hospital of Bern, this condition followed in sixteen, and in the two which escaped it an "accessory" thyroid had arisen. The condition is that which had been described by Ord as *myxœdema* (from the mucous dropsy of the skin), a progressive disease, with hebétude and other symptoms of impaired higher functions, and tending to a fatal result in a few years. The interesting fact is that in such cases of idiopathic myxœdema the thyroid has very generally been observed to be small or wanting; where the diminished organ has been examined after death it has been found practically reduced to a mass of connective tissue infiltrated with mucus, like the connective tissue elsewhere. The relation then between the cases of myxœdema following operative removal of a goitre and the idiopathic cases would seem to be that, in the one, a mucous condition of the whole connective tissue of the body follows when the thyroid, enlarged to meet the metabolic needs of the body, has been removed by the surgeon, while, in the other, the same condition has followed where the thyroid has either proved too small for the ordinary metabolic ends that it is adapted to serve, or has degenerated under an unusual call upon its metabolism. Of the nature of this metabolism we are ignorant; we know only that a material fluid is elaborated, and that the fluid is of the mucous kind.

Cretinism.—If reference be made to fig. 40, showing the more spongy tissue of the placenta, it will be seen that there also a fluid is elaborated and added to the blood from the richly protoplasmic walls of the vessels; and that fluid is also of the mucous kind. It is the "uterine milk" of earlier authors, and it would appear to exude through the densely nucleated marginal tracts of the placenta where the fetal vessels and their plasmatic supporting tissue touch it. It is this great metabolic function, so essential to the vigorous development of the child, that is probably at fault in the poor and over-worked or otherwise over-taxed mothers whose offspring become rickety; and the fault may be said more particularly to be deficient quantity or quality of the placental mucous secretion. The similarity of the thyroid and placental metabolisms cannot but come into account in considering the very peculiar condition of cretinism, proper to the offspring of goitrous mothers, or of mothers who had resided during their pregnancy in a goitrous district.

Under the same endemic circumstances which cause the compensatory enlargement of the thyroid in the parents we meet with cretinism in the offspring. Although the defects of development and growth in cretinism are on the whole different from and much more universal than those of rickets, yet there is a certain parallelism between the two conditions. The cretin, like the child who becomes rickety, must have been born with the disposition. The condition is not inherited, but it is congenital,—that is to say, it is derived from the mother in respect of her pregnancy only, and that means that it is derived most of all from the placenta. *Cretinism is to goitrous districts what rickets is to other localities.* And, although there is no positive evidence as to the placental function either in the one case or in the other, yet the placenta is clearly pointed to in both cases; and we may conjecture that cretins are the offspring of those mothers whose maternal nutriment is impaired, not by the general hardships of those who bear rickety children, but by the special endemic conditions which serve also to tax that other mucus-producing organ, the thyroid gland. The endemic conditions may not have caused goitre in the mother, although, as a matter of fact, they generally do; but, under a special concurrence of circumstances, as common in goitrous districts as are the determining causes of rickets elsewhere, they have caused a cretinous habit of body in the child, and to do so they must have affected the placental efficiency in some manner as yet unknown.

This mode of associating goitre and cretinism assumes an error in the placental function, which has not been shown by direct observation of the placenta to have existed. It has probably not been looked for; and, even if it had been, there would have been some difficulty in making out its morphological characters. Under the circumstances of the case the evidence can hardly be other than deductive.

Graves's Disease, or Exophthalmic Goitre.—In certain cases of anæmia in women there is enlargement of the thyroid, fluctuating in amount or permanent, but not liable to the common developments or degenerations of endemic goitre. Associated with the anæmia and the enlarged thyroid there are disturbance of the functions of the sympathetic nervous system and a remarkable prominence of the eyeballs. It is probable that another aspect of the thyroid function than the mucus-making is involved here. It is an old contention of Kohlrusch, that the droplets of hyaline substance, often with a yellowish or pale reddish tint, that are found in the thyroid mixed with the ordinary mucus of its alveoli were an embryonic form of blood-globules. In the thyroid of the dog these droplets may be often seen of a more uniform size, and so like blood-corpuscles (allowing for irregularities of form and size) that they have been actually regarded as such, and put down, when in considerable quantities, to "hæmorrhage" from the vessels that run on the other side of the epithelial wall of cells. There is not the slightest reason to sup-

pose that these droplets have escaped from the blood-vessels; they are produced from the epithelium of the organ along with the other mucus-like fluid. They point indeed, to a hæmatoblastic function of the cells, somehow correlated to their ordinary mucus-yielding function. There are analogies among the connective tissues, at least, for this correlation between mucous and hæmatoblastic production, in new growths, and there is an analogy in the early stage of embryonic fat-formation, in the production of red blood-disks from the same mesoblastic cells at one stage of their existence and of mucus-like fluid within them at the next. Now, although there is no evidence that the enlargement and increased functional activity of the thyroid in these peculiar cases of anæmia has a more special relation to the hæmatoblastic side of the function than to the mucous, yet the coexistence of an enlarged thyroid with certain cases of anæmia becomes intelligible in the light of these indications of hæmatoblastic function. The enlargement of the thyroid may be considered a special effort, comparable to the effort of the bone-marrow in pernicious anæmia. The profound disturbance of the vascular system which goes with this condition must stand as an empirical fact, but it may be classed with the analogous sympathetic disturbances in Addison's disease; both the suprarenal and the thyroid are to be considered as organs in which disorder of function has a special relation to the sympathetic,—the abdominal sympathetic in the one case and the cervical in the other. It is to be observed that in common goitre, where there is not so much an alteration, diversion, or disorder of function as a compensating increase of the ordinary function, there are no symptoms referable to the sympathetic; so that the relation in the enlarged thyroid of anæmia cannot be a mere mechanical one.

Secondary Tumours of the Thyroid.—The last special liability of the thyroid to be mentioned is a very peculiar one; there is a number of well-authenticated cases in which a simple enlargement or hyperplasia of the organ has been associated with the new formation of masses of the proper thyroid-texture, with the proper mucous secretion, in the lungs and at various points of the subcutaneous tissue. In these cases the hyperplastic thyroid exhibits the property of an infective tumour, the new-growth of thyroid-tissue at remote points being the secondary products of infection. Is there anything in the normal overgrowth of the thyroid to account for its infectiveness as manifested on rare occasions? One of the unsettled questions of thyroid physiology is the mode of development of the new alveoli when the organ enlarges. It is apt to be too readily assumed that the new structure is formed by continuous extension from the pre-existing, by expansion or germination; but the point has been raised by observers whether the new alveoli are not formed interstitially at numerous independent centres throughout the stroma or supporting tissue of the organ, at first as small groups of cells which come to develop a space in their midst, and to group themselves as epithelium round the periphery. This is the ordinary mode of interstitial development in cancerous infection; and, if that mode be substantiated for the physiological increase of the thyroid (and the facts in the dog's thyroid point that way), it would enable us to understand how it is that sometimes, as if in a freak, the simple hyperplastic thyroid plays the part of an infective tumour, reproducing its own likeness at discontinuous and even distant centres.¹

§ 11.—ERRORS OF METABOLISM.

In the foregoing sections metabolic functions have been claimed for the placenta, for the suprarenal, and for the thyroid. Connected with these obscure and hitherto almost unregarded metabolic functions are several important morbid conditions, which are mostly of the so-called constitutional sort; with errors of the placental metabolism we connect such defective intra-uterine endowments of the fœtus as gave rise to rickets and cretinism in the child (and, it may be added, to some of the manifestations of congenital syphilis); with loss of the suprarenal metabolism we connect Addison's disease; and with a compensating or conservative increase of the thyroid metabolism we connect goitre, a condition which is harmless but for its mechanical effects.* It will now be convenient to pass to those greater but hardly better understood metabolic

Trans.*, 1882-84.

functions with whose disorders are associated some of the severe diseases of common occurrence, taking them according to the organs, and taking the liver first.

The liver-structure is very much that of a blood-gland; its system of bile-ducts is subordinate to its blood-system, just as its biliary function, though the amount of its product be great, is in modern physiology subordinate to its glyco-genic. Except in connexion with JAUNDICE (*q.v.*), the biliary function does not concern us; we come at once to the not uncommon and very serious malady which may be regarded as an error of the glycogenic function, namely, diabetes.

Diabetes.—Like the errors of metabolism treated of in previous sections, diabetes is a "constitutional" or general disease. It depends essentially upon the circumstance that the blood passing to the kidney is overcharged with sugar; the kidney drains off the sugar along with an immense quantity of water, so that the prominent symptom is copious urine loaded with sugar. Diabetes can hardly be called a disease of the kidneys; these organs are but the ministers of disordered metabolism whose seat is elsewhere, and their structure is not even materially altered in the disease. In pronounced diabetes sugar is everywhere. There may be half a per cent. of it in the blood, it is in all the tissue-juices and in all secretions, and it may enter into the composition of the urine to as much as 10 per cent. The diabetic patient drinks enormously (the thirst being due, it is conjectured, to the more concentrated state of the sugary blood), and eats or desires to eat two or three times more than in health; the amount of urine voided is proportionately great, and it contains a total of urea in the twenty-four hours which corresponds approximately to the high feeding. All the while there is no proper nutrition; the body wastes, the skin becomes dry, the hair falls out, the muscles become flabby, the heart's action is weak, and the secreting organs become reduced in bulk and enfeebled in function. Wounds tend to become gangrenous, boils and carbuncles are apt to form, and pulmonary consumption is a frequent complication. The saccharine state of the fluids is favourable to the lodgment of fungi (moulds), and these are found in the centres of disease in the lungs. The disease is an example of those paradoxes that we frequently come to in the last resort in the analysis of constitutional disturbances; in spite of the enormous supplies that the organism demands (and receives), the tissues and organs are not nourished. It is only in some cases that the disease is checked by a pure nitrogenous diet. There is some maladaptation in the economy whereby there is an enormous quantity of sugar produced which is not wanted, and a great lack of that which is wanted. Where does the divergence occur from the physiological track?

The blood ordinarily contains a trace of sugar, and traces of it may be discovered in the urine. It may be permitted to regard these traces as no more than the slight margin of non-perfect adaptation which is discoverable in many structural and functional effects. But the antecedent of this sugar, namely glycogen, exists in considerable quantity in animals the moment after death, and is assumed to exist in them during life. Although this assumption must be granted, it is not so justifiable to admit, with some authors, that the glycogen of the body is normally changed into sugar, the latter being at once disposed of in the further course of combustion.

Glycogen is now known to exist in various tissues, more particularly in inactive muscle; but it is impossible not to conclude, on the evidence, that the liver is still the organ of its choice; and Bernard's original position, that diabetes is a disorder of the glycogenic function of the liver, may be regarded as the reasonable one. The structure of the liver is in great part an adaptation to some such metabolic function, an adaptation to take somewhat from the blood and to add somewhat to the blood again. The intermediate state of this metabolism is glycogen, a starchy substance which changes to sugar under the action of a ferment out of the body, and changes to sugar sometimes in the body. Various kinds of interference cause glycogen to change to sugar within the body—puncturing the medulla oblongata at a particular spot with a fine spear-like point; the administration of curare, whose chief action is to paralyse the muscles through their nerves; the administration of nitrite of amyl, whose more obvious effect is vaso-motor paralysis of the surface-vessels, causing dilatation of them. These interferences produce a passing diabetes. It has been objected that the diabetes so produced is too transitory to be counted as analogous to the grave human malady; but it is well known that the same transitory effects are not uncommonly met with in medical practice. The true and serious diabetes is merely the established and confirmed habit of turning everything to sugar, and it cannot be doubted that Bernard's original experimental analogies are still the best clue to the nature of the disease.

These experimental interferences point to some profound upset of the nervous control. The spot in the medulla where puncture causes temporary diabetes is otherwise known to be the vaso-motor centre; the effects of nitrite of amyl are otherwise such nerve-effects as

blushing; the several effects of curare are identical with the muscular limpness of fear. The observations of clinical medicine point in the same direction; a large proportion of all the cases of diabetes where the antecedents have been ascertained with any degree of relevancy are cases of profound emotional and intellectual strain, of shocks and jars and worries to the mind, and especially to the primary instincts and affections. Along with these we have a few significant cases of tumour in, or upon, or in the neighbourhood of the medulla. These clinical facts point clearly enough to some upset of the nervous control, although there are certainly few or none of the usual concomitants of nervous disturbance. The nerve-paths that are implicated are the same as the vaso-motor; but the effects themselves are not vaso-motorial. Nitrite of amyl causes artificial blushing, and it also causes diabetes; in like manner those subjective states of the mind (or mechanical states of the brain) which ordinarily take such outward directions as blushing and pallor, or the vaso-motorial direction, sometimes spend themselves otherwise, causing an upset of the glycogenic adaptation. It is certainly not a simple affair of vaso-motor paralysis, even if the path of influence be the same. Some nervous mechanism allied to the vaso-motor, or using the same path of influence, is probably concerned, the same kind of unknown nervous mechanism which would appear to be concerned in Addison's disease (of the suprarenal) and in Graves's disease (of the thyroid). The upset of this controlling nerve-force is followed by the production of a substance from the liver-cells which is directly added to the blood as sugar, and is removed as sugar in the urine. This substitution of sugar in the blood for some other substance is fatal to nutrition; it is so wasteful an expenditure that the physiological bankruptcy cannot be averted even when the patient receives the enormous amount of food and drink for which he craves.

For the pathology of diabetes the obvious desiderata are to know the normal sources and normal ways of disposal of the glycogen of the liver. It seems to be premature to infer that, because glycogen, as its name implies, may easily become sugar, therefore it ordinarily does become sugar as a transition-stage towards some other product. If the regular conversion of glycogen into sugar be assumed, the cause of diabetes would be referred to the inadequate disposal of the sugar (*e.g.*, its inadequate combustion in the lungs). Cohnheim, after summing up the evidence from all sources, concludes that such inadequate disposal of sugar, properly present in the body, does occur in diabetes; and he would seek for the reason of the failure in the want of some "ferment" which, in health, brings about the further breaking up of the sugar. The question, however, is a sufficiently open one for us to contend that the initial error lies in the making of sugar at all; or, in other words, that the failure of the ferment (or of the nerve-control of metabolism) has to be assigned to an earlier stage of the metabolic process.

It is probably more than an accidental coincidence that the pancreas has often been found shrunken and indurated in diabetes, the shrinkage having followed apparently on an earlier hyperplasia. According to analogy it would mean that the error of the hepatic function had thrown more work upon the pancreas. Apart from the state of the pancreas there is nothing distinctive in the structural conditions associated with diabetes.

Acute Yellow Atrophy of the Liver.—Here we have another severe constitutional disorder, but much rarer than diabetes, in which the yellow hepatic functions are chiefly, and perhaps primarily, concerned. Atrophy. It arises under a variety of circumstances, the chief of which are of liver; respectively poisoning by phosphorus, profound emotional troubles, and the state of pregnancy. The early implication of the hepatic functions is shown by the existence of a degree of common jaundice for some time before the distinctive and fatal onset. The disease may be said to consist in a complete disorganization of the whole hepatic activity,—in the arrest of its biliary secretion and of its other metabolism. The liver-cells fall into a state of molecular disintegration, and the organ shrinks bodily, sometimes to a mere fraction of its original volume. The ducts contain no bile, but a colourless plasma in place of it; the cells, where they keep their outlines, are full of albuminous granules; large quantities of leucine and tyrosine are found in the organ after death. What is there common to phosphorus-poisoning, profound emotional troubles, and the state of pregnancy which can be brought into relation with this remarkable upset of function and rapid disintegration of structure?

As regards the effects of phosphorus, they belong to a remarkable class of effects, counterfeiting idiopathic diseased states, which it is the property of certain of the chemical elements, including arsenic, antimony, and lead, to induce. The action of this element may be said to be an arrest of metabolism, falling with special stress upon the great seat of such functional activity (and on the secreting cells of the stomach and kidney as well). As regards the acute yellow atrophy of the liver which follows profound emotional troubles, we have many slighter analogous instances of nervous inhibition of visceral function due to more transitory states of emotion; the disorganization of the liver-function would be the proportionate effect of a more profound and more lasting mental

trouble. As to the acute yellow atrophy of the pregnant state the circumstances are doubly complex. In all the incidents of pregnancy we must take into account the placental function, a metabolism almost as great for the time as that of the liver itself; and, if we are to find any link of connexion between the seemingly diverse conditions here in question, we should have to resort to the somewhat vague generality that, in a rare concurrence of circumstances, the placental function makes demands upon the maternal blood and tissues, or upon the ordinary metabolisms of the mother, which are of an upsetting kind, the incidence falling sometimes on the metabolic functions of the liver.

Albuminuria.—The waste of albumen in the course of the urinary excretion is a much more frequent and a hardly less serious factor in disease than the sugar-waste; but albuminuria differs from diabetes in two important respects: firstly, the albumen which escapes is, in great part at least, the proper albumen of the blood (serum-albumin and globulin); and secondly, there goes hand in hand with the error of function a series of progressive structural changes fatal to the general efficiency of the kidney itself. Albuminuria is the functional error that corresponds on the whole closely to *Bright's disease*; but it would be a mistake to suppose that Bright's disease can be measured by the amount of albumen lost. A consideration of these complex forms of constitutional disturbance may proceed, however, from the side of albuminous leakage, and from the point of view of the adaptations in the kidney whereby the leakage is ordinarily prevented or reduced to a minimum.

The problem, as it may be called, of the renal excretion is how to discharge from the blood and from the body absolutely the washings of the tissues, or the waste-matters of metabolism, without allowing other dissolved substances of the blood to be discharged at the same time. In adaptation hereto, the kidney is in part a secreting organ and in part a mechanical filter. Those parts or regions of its structure where its epithelium is in the form of very large and richly protoplasmic cells have a true secretory function, so that nothing passes from the blood to be cast out from the body except through the interior of a very considerable cell, and in all probability through a metabolic selective process therein. This is known to be the urea-region of the kidney; and the separation of urea from the blood may be said to be the greatest of the renal functions. But by far the largest part of the urine, namely the water of it, is strained off from the blood by another kind of kidney-structure, which is more truly a mechanism; not all the water of the urine, but the greater part of it, is filtered from the blood as it passes through the remarkable coils or glomeruli of small vessels which are placed at the farther end of the tubular system. In these the structural adaptations all point to mechanical filtration and not to selective secretion. The circulation in the vascular coils of the kidney is unique as regards the balance of driving force and resisting force; the lateral pressure in these spherical coils of small vessels is greater than in any other capillary region of the body. It is indeed great enough to cause a transudation of water; but is it so nicely balanced as not to allow an escape of albumen? There can be no question that albumen does often find its way into the urine without amounting to a serious functional error or to a clinical condition of disease; and it is equally certain that the leakage takes place at the glomeruli. Albumen is found so often in the urine when it is looked for systematically from day to day that we may admit, with Senator, that any one may be more or less albuminuric from time to time. In 119 healthy soldiers, 19, or 16 per cent., had albumen in the urine; in 200 seemingly healthy persons examined for life assurance there were 24 with albumen, or 12 per cent.; in 61 healthy children, 7, or 11.5 per cent.; in 32 hospital attendants in good health, 14, or 44 per cent. Add to these experiences the difficulty of detecting small quantities of albumen in ordinarily dilute urine and the impossibility of detecting certain varieties of albumen (known to occur in the urine) except by special tests, and we may safely conclude that the filtration of water from the blood in the renal capillaries is very apt to be attended with a slight leakage of albumen also. The adaptation that water should drain off, but not albumen, is a very nicely balanced one, and therefore very easily upset. As a matter of fact it is frequently upset; the physiological albuminuria, like the physiological glycosuria, and like the small admixture of colourless cells among the multitude of blood-disks proper, is the narrow margin of non-perfect adaptation which meets us frequently in the economy of living organisms. The nicely-adjusted balance of driving force and resisting force in the vascular tufts is constantly exposed to disturbing influences, so that one may reckon to find a certain small average of albuminous leakage.

The great occasion of this leakage is sluggish circulation through the glomeruli, whether from over-distension of the veins beyond or from other cause. The faster the blood passes through these capillaries the greater the quantity of water drained off, and the more minimal the quantity of albumen that escapes; but when the blood travels slower there is absolutely less water filtered off in a given time, and the proportion of albumen that passes with it is increased from a minimal quantity to something considerable. Thus a con-

gested state of the kidney, whether the embarrassment be traced to the side of influx or of efflux, to the arterial or the venous side, is favourable to the leakage of albumen, and a large part of all the albuminuria of medical practice is of that nature. The congested state has been often experimentally induced in animals by various devices, and the laws of albuminous leakage have thus been determined with an exactitude which is very considerable. In these experiments the embarrassment of the circulation has been induced in various ways—by clamping the renal vein so as to dam up the blood in the kidney, by clamping the renal artery, by interfering with the nervous mechanisms, either at the spot or more centrally, and by introducing toxic substances into the circulating blood. Probably all of these forms of experimental interference have their analogies in disease, although the gross mechanical impediments are a rare type. The albuminuria of the pregnant state—not certainly an invariable occurrence, but rather a liability of that condition—may be referred in great part, if not altogether, to embarrassed venous reflux, for there are analogous cases of temporary albuminuria in which the cause is not the gravid uterus, but a uterine or ovarian tumour. In pregnancy it is specially apt to occur in primiparae and in cases of twins, and in the later months. Again, the albuminuria of some forms of heart-disease, of emphysema, and of chronic bronchitis is an affair of difficult venous reflux. It is on the arterial side that we have to place the determining forces of a considerable number of albuminuric cases, and these the most insidious. In all those cases where the congestion of the kidney is "inflammatory" there are the irregularities of circulation usual in inflammation, the parenchymatous cellular changes of inflammation, and the somewhat difficult correlation between these two factors in the process. These cases may be said to exhaust the instances of albuminuria due to heightened blood-pressure. The albuminuria of cachectic subjects is known to be dependent mostly on the impaired integrity of the glomerular vessel-walls,—on an amyloid change in them which permits the transudation of albumen under the ordinary conditions of pressure. But there is still a third determining cause of albuminuria, namely, a changed state of the blood when both the pressure and the state of the vessel-walls are constants.

It has been mentioned that there are two instructive points of contrast between the drain of sugar and the drain of albumen; the sugar is not ordinarily present in the blood, and its discharge by the kidney is unattended with structural changes in that organ. The albumen of albuminuria is to a great extent the ordinary albumen of the blood (serum-albumin and globulin); but in the urine there are other albumins found which are not ordinarily present in the blood, such as the variety identical with pepton, and another variety, hemialbumose, or "propepton." The latter is found in cases of osteomalacia, and it may be detected under other circumstances as well. Even when there are no new and specially diffusible albumins in the blood, it is probable that some alteration in the relative composition of the blood—in the proportion of its salts and the like—will make its albumen more liable to transude in the renal glomeruli.

The albuminuria of phosphorus-poisoning and of acute yellow atrophy of the liver raises another possibility,—the possibility, namely, that the albumen is produced in the course of the metabolic process in the proper secreting epithelium of the kidney-tubules. Certainly the large epithelial cells of the kidney in these two conditions are filled with peculiar granules of "albuminous" matter. The question has to be at least entertained, whether certain cases of albuminuria may not be due to a primary disorder of the renal metabolism, to some interference with its "ferment."

Four factors, then, are concerned in the waste of albumen, and they may act either singly or in combination. In the order of their importance they are:—(1) disorder of the vascular pressure, whereby the nicely-adjusted filtering mechanism in the glomeruli is deranged; (2) states of the blood exceptionally favourable to the diffusion of its albumen, or even the presence in the blood of peculiar forms of albumen with high diffusibility; (3) a more permeable condition of the vessel-wall (as in amyloid disease); and (4) an error in the proper metabolism of the secreting epithelium whereby an albuminous by-product is formed from it. It now remains to consider briefly the other distinctive point in the acquired habit of albuminous waste, namely, the associated structural changes.

Structural Changes in the Kidney.—If the kidneys be examined from a case in which the symptoms, sometimes lasting for years, had been albumen in the urine (with cylindrical casts of the kidney-tubules), a more or less scanty amount of urine, and a small proportion of urea, together with dropsy and marked anemia, they will most likely be found to be enormously enlarged, and of a pale fawn colour, compared by Watson to the cut surface of a parsnip. This is the "large white kidney" of chronic Bright's disease, the enlargement being in the outer zone of the organ, in the region of the glomeruli and secreting tubules. "The incised surface gives one the notion of some deposit whereby the original texture of the part is obscured." How comes it that an attack of congestion at some more or less remote period, or repeated congested states of the

organ, have led to so remarkable a result! It does not help us, for the purpose of rational analysis, to turn to "inflammation" as a last resource; what the analysis really conducts us to is the correlation between the disordered function and the structural changes.

It is impossible not to connect the remarkable form of hyperplasia in the large white kidney (or where there is also the amyloid complication) with the albuminous character of the exudation in which the organ, and more especially its cortex, is bathed. Sugar, as we have seen, has no such effect on structure, nor has uric acid, as we shall see in speaking of the kidney in gout; the albumen has a special influence on the local centres of nutrition, on the cells and tissues of the organ. Again, the excess of nutrition does not conduct to increase on the normal lines. There are such cases of normal increase in the kidney's bulk, as when one kidney has to do the work of two, owing to removal or congenital absence of the other. But in the large white kidney of albuminuria the increase is of an unprofitable kind; it is a hyperplasia that not only does not add to the efficiency of the organ but even seriously impairs it. The large epithelial cells of the secreting region are clouded with albuminous deposit, and their nuclei show a fainter reaction to the colouring agents; or they fall into an unstable granular condition and into molecular detritus; or they are shed bodily into the lumen of the tubule. The flattened cells of the Bowman's capsule are less apt to degenerate; they are more likely to multiply *in situ*, and to build up an unnaturally thick wall around the capsule. Further, the interstices of the tubules and the margins of the glomeruli are occupied by collections of round nuclear cells, like the collections underlying a catarrhal mucous membrane. All this activity is misdirected; it does not help the function, but overwhelms it. The urine is scanty and the proportion of urea small; and these consequences may be traced, firstly to the sluggish circulation within the organ, and secondly to the complete obliteration of some glomeruli and the cumbrous thickening of others, and to the degeneration of the secreting epithelium interfering with its proper metabolism. There is hardly any tendency to *restitutio ad integrum* in the large white kidney, the unprofitable overfeeding of its elements continuing to the end.

Granular contracted kidney.

Contrasting with the large white kidney is the *contracted kidney* in another variety of chronic Bright's disease. For the present purpose it is necessary to follow the broader lines of distinction, and to avoid the transitions and finer shades in the pathology; and it may be stated as a general truth that the large white kidney goes with scanty urine and much waste of albumen (the waxy modification having only the latter), while the small granular contracted kidney is associated with even copious urine and a waste of albumen which is often small, and in any case variable. The error in these latter cases appears to lie with the arterial side of the circulation; the left heart is hypertrophied, and so is the muscular coat of the arteries in the kidney, if not also elsewhere. It is essentially an interstitial disease of the kidney, leading to enormous development of its supporting tissue; whole tubules become obliterated, but in those that remain the epithelium is not degenerated. Obliteration also overtakes the glomeruli, but there must be a compensating increase in the work done by those that survive to account for the copious urine; it often happens, also, that numerous small cysts are produced.

Shrinkage of the connective tissue after a period of revived embryonic activity is the cause of all these changes; it is the ordinary shrinkage of cicatricial tissue, and it has the effect of compressing the proper urinary apparatus—the filtering and the secreting—to its destruction. The kidneys may be reduced even to one-fourth of their natural size, and their uneven surface shows that there has been mechanical dragging along certain lines. In the end the urea-waste accumulates in the blood to such an extent that death results, usually from uræmic coma and convulsions. In some cases cerebral hæmorrhage anticipates the fatal effect of uræmia.

The small granular contracted kidney is usually of a reddish-brown colour, but it may be whitish, in which case the lobulation of its surface is larger. It is one of the standing difficulties of renal pathology to decide whether the small contracted kidney is not often a later stage of the large white. But there can be hardly any doubt that it is oftener the structural manifestation of an entirely different disease, an arterial disease. That which has been emphasized by some pathologists as the distinctive process in this affection is the overgrowth of cells on the inner wall of the arteries, the so-called endo-arteritis or arterio-capillary sclerosis, whereby the lumen of the vessel tends to be occluded. But it may be made a question whether this is not really a part of the revived embryonic activity in the connective tissue, whose shrinkage gives the organ its granular contracted character. The interest would thus come to centre in the error of nutrition whereby so much activity is diverted to the connective tissue, an activity that takes the embryonic formative direction. We have a close analogy in cirrhosis of the liver, a disease associated with the drinking of raw spirits; and it is noteworthy that the insidious form of Bright's disease, whose morbid anatomy is summed up in the small contracted and puckered kidney, occurs most frequently in those who sustain

themselves more by ardent spirits than by ordinary food, and next most frequently in the subjects of gout and of lead-poisoning, although there are a good many cases of the disease remaining to be accounted for by less obvious causes.

The *dropsy* of Bright's disease is difficult in its pathology. The watery state of the blood, or the hydræmia, consequent on the loss of much of its albumen does not suffice by itself. A subsidiary hypothesis, adopted by Cohnheim, is that the blood-vessels of the skin become unusually permeable. Sometimes the dropsy appears first round the ankles, at other times it shows itself in puffiness of the eyelids and a somewhat bloated pallor of the face.

Gout and the Uric Diathesis.—Many other states of the system besides podagra—the disease which usually begins in the night with pain and redness of the great-toe joint—are now reckoned as belonging to gout. The disease, in the extended use of the name, is indeed a widespread error of metabolism which may manifest itself in very various ways. The particular liabilities to error arise during the metabolism of proteids, from the first stage of digestion in the stomach to the last stage of excretion in the kidney. Hence it is that gout, in its widest meaning, has been taken to be a form of "dyspepsia." The opportunity for going wrong may be said to depend on the fact that there are two chief forms of nitrogenous waste remaining to be got rid of in the end, which are somehow correlated to one another,—the highly soluble substance urea, and the highly insoluble substance uric acid. There are remarkable differences in the proportions of these two waste-products throughout the animal kingdom; in most reptiles and in birds the form of nitrogenous waste is mostly uric acid, whereas in man (and other mammals) it is mostly urea. But in man the waste is still to a small extent in the form of uric acid. In normal human urine the proportions are:—to 1500 grammes (52·91 ounces) of water in the urine of twenty-four hours the total of solids is 72 grammes (2·54 ounces), of which 33·18 (1·17 ounces) are urea, and only 5·55 (0·19 ounce) uric acid, or not more than one-sixtieth of the quantity of urea. Whether or not we are to regard this small margin of uric acid as another of those instances of non-perfect adaptation of which we have previously found instances in the physiological traces of sugar and of albumen in the urine, and of colourless corpuscles in the blood, there can be no doubt that the adaptation, such as it is, whereby the nitrogenous waste is mostly the highly soluble urea, but to a very small amount also the less soluble uric acid, is the occasion of many and serious morbid conditions. The liability to these gouty and calculous disorders depends partly on the increase of uric acid at the expense of the urea, together with the low solubility of the former, but it seems to depend also on an abnormally low power of the animal fluids to dissolve uric acid, or of the kidney to eliminate it when its quantity is not excessive.

The peculiar liability from uric acid is sometimes called the uric-acid or uratic diathesis or constitution; some persons have it much more than others, and it is exceedingly apt to be handed down from parent to offspring, so that the stock, in countries and among classes where gout is common, may be said to be widely inoculated with it. Where the acquisition of it can be traced at first hand it is often found that the associated circumstances are high-feeding and a life of physical inaction and feeble intellectual zest. These are among the best-known conditions of gout, admitted equally by the ancients and the moderns. It is now known, however, that practically the same gouty constitution may be and often is induced by conditions which have hardly anything in common with luxury. Thus gout is a common liability of workers in lead, being one of the various manifestations of lead-poisoning; it is also common among those classes of labourers, such as dock-labourers on the Thames, whose habitual drink is porter; and it is said to have become common among the working-class in Dublin, where it was rare twenty or thirty years ago, according as they have taken to drinking porter instead of ardent spirits. There are still other cases of gouty constitution for which neither heredity, nor luxury, nor lead-poisoning, nor porter-drinking can be invoked as an explanation; and these are the cases which justify the somewhat wide definition of gout as a form of dyspepsia.

In order to have the gouty effect there need be no great increase in the amount of uric acid formed in the course of the metabolism of proteids. During an acute attack of gout, and previous to it, the amount of uric acid in the urine will probably be much below the average; it is the kidney that has failed in its function, so that the uric acid is retained in the blood to be deposited elsewhere. The presence of uric acid (urate of soda) in the blood in gout is the well-known discovery of Garrod, who has also pointed out that its proportion in the urine is at the same time reduced. But there need not even be failure of the kidney's function, although, as a matter of fact, there often is; the error may lie in the heightened insolubility of the uric acid. It is observed that the uric acid of urine is apt to be deposited in the form of urates, as a brick-red sediment, even when there is no excess of it; a more acid state of the urine seems to favour the precipitation of the uric acid; and it has been conjectured (from the success of the

uratic diathesis.

alkaline treatment) that there may be some analogous acidity introduced into the blood and lymph in the form of organic acids (produced in the course of faulty digestion), which would cause the uric acid to be deposited from the blood as it circulates generally. It is in the cartilages of the joints that the deposition usually takes place, the great-toe joint (metatarso-phalangeal) having a quite remarkable and inexplicable liability. The surface of the cartilage is erusted with patches of a whitish opaque substance, which proves to be needle-shaped crystals of urate of soda; the deposition extends deeper and affects the fibrous structures of the joint; it may be so extensive in other fibrous structures as to amount to tophi or chalk-stones. In some rare cases of gout such organs as the parotid glands may be completely disorganized by the chalky deposit, or there may be numerous centres of its deposition in the membranes of the spinal cord.

Albuminuria and Eczema of Gout.—Two morbid conditions are so frequently associated with gout as to be part of its natural history, namely, eczema of some regions of the skin (eyelids, back of neck, &c.) and albuminuria. We have absolutely no clue to the connexion between the skin-disease and the uratic diathesis; for the albuminuria a connexion may be suggested. The albumen will at first be absent in the intervals of gouty attacks, showing itself during the attack, or for a few days previously; its appearance in the urine thus coincides, so far as it goes, with the decrease of uric acid in the urine. It is impossible to exclude the possibility that the albumen is here an error of the renal metabolism. All the facts of the gouty constitution point to a far-reaching disturbance of the metabolic functions, which may be induced by causes so different as lead-poisoning and a luxurious life; uric acid is not the only metabolic product concerned, although it is the chief, for there is even an occasional implication of the glycogenic metabolism, as shown by the presence of sugar in the urine, and there is the much more common albuminuria. It is impossible to believe that there are structural changes in the kidney to account for the earliest occurrences of albumen in the urine in gout, for the urinary secretion may be normal for long intervals; and it is by no means certain that the albumen is a leakage from the glomeruli owing to the altered pressure of congestion.

The kidney in chronic gout may be affected in obvious characters; it will show, on section, streaks of white opaque substance within or between the tubules,—that which is between them being composed of crystals of urate of soda often in fan-shaped bundles, while that which is within them is an amorphous mixture of urates of ammonia and soda and uric acid. The so-called gouty kidney may and often does assume the progressive structural changes which lead to the state of contraction and puckering. (There are other renal deposits of uric acid, as in new-born children, which are transitory.)

The uric-acid diathesis may manifest itself, not in gout, but in *gravel*. In this case the excess of uric acid is thrown into the tubules of the kidney, where it forms concretions; these may either be washed out by the urine as fine grains, or may remain for a time to increase by accretion, forming renal and vesical calculi.

Obesity, Local Formations of Fat.—The significance of fat under all circumstances in the animal body is by no means well understood, but it may be conveniently approached from the side of metabolism. Adipose tissue is a somewhat special development of mesoblastic tissue, and most usually of the common binding tissue. The embryonic cell transforms the greater part of its protoplasm into an oily fluid which contains no nitrogen, the nucleus being retained on one side along with a narrow fringe of cell-substance; a fat-cell in its early stage thus resembles a signet-ring, and in its later development it becomes a thin-walled vesicle which may be distended by its oily contents much beyond the limits of even the largest cells of other tissues. This transformation may happen to the cells of the connective tissue in almost any part of the body; but in the ordinary course of development it has certain seats of election, such as the stratum of gelatinous tissue underlying the kidney and the subcutaneous tissue. All synovial and serous membranes, except those of the liver and lungs, are favourite seats of fat-formation. In the subcutaneous tissue the first formation of fat appears to be associated with local formation of blood, the same mesoblastic elements being at one stage hæmatoblasts and afterwards, in their vesiculated state, fat-cells. It cannot be doubted that there is a close adaptation to the needs of the economy in the vicissitudes of the fat-tissue; but it must be admitted at the same time that the adaptation is often singularly obscure. In many cases the changes in the fat-tissue seem rather to be a correlated necessity.

One of the earliest facts that we meet with in this connexion is the gradual replacement of the thymus gland by fat, the fluid being absorbed in its turn, and the mass of tissue shrinking. Another fact of the same kind is the change into fat-cells of "lymphoid" cells elsewhere, as the change of red marrow into yellow marrow in the central canals of the long bones. Both of these changes have a prototype or an analogy in the transition that one sees in groups of the subcutaneous spindle-shaped cells from a hæmatoblastic activity to a fat-making activity. The season of

puberty is a time of active fat-formation, more especially in women, and notably in the breast-region. A still more remarkable development of fat occurs in many cases of sterility, and in many women after the child-bearing period has ceased in ordinary. Such instances of a greater or less degree of obesity are so clearly associated with the obsolescence of an important function that they may be called physiological. Other instances of obesity have no such obvious or uniform association. Thus, an obese habit may follow one or more attacks of malarial fever; it sometimes occurs as one of the lifelong changes induced by an attack of typhoid fever. There is often a great degree of plumpness along with the extreme ill health of chlorosis. Idiocy and some forms of insanity are apt to be associated with fatness; in the pseudo-hypertrophic muscular paralysis of boys the connective-tissue cells between the muscular bundles become so active in fat-making that they usurp the place of the muscle. As an effect of dietetic errors obesity usually follows the inordinate consumption of starchy and saccharine substances, and especially the drinking of much beer, stout, and even other forms of alcohol. As a racial character obesity is found among the negro populations in some parts of Africa (South Africa and the Upper Nile).

Among the most extraordinary developments of true fat are those cases where it develops locally in association with cancers or other malignant tumours. Thus, in a boy who had suffered amputation of the leg for a malignant tumour of the tibia there was a recurrence of the disease in the stump and in the ilium; he died in a state of extreme emaciation of all the body except the thigh of the affected side, which was enveloped in a layer of ordinary subcutaneous fat half an inch thick all round, contrasting strangely with the wasted limb of the other side. To take another unambiguous case, an extensive development of fat through all its embryonic phases can actually be traced in the serous covering of the rectum in a case of cancerous stricture of the part. There is usually much local development of fat round the sac of an old hernia. In certain glandular organs, such as the pancreas, the supporting connective tissue sometimes takes on an extensive fat-forming activity, so that the organ is half transformed into adipose tissue; the same may be found around the pelvis of the kidney in old age.

Lipomatous Tumours.—It is not always possible to say whether a local development of fat should be called a lipoma or not; thus, the fat around an old hernia may be so circumscribed as practically to amount to a fatty tumour, and that may be the case also with the fat around the breast or behind the eyeball. On the intestine, notably the transverse colon, the masses of fat do become pendulous fatty tumours (much more often in the domestic quadrupeds than in man) of a uniform or lobulated structure, which may hang by a long and slender vascular stem, like an apple or a cherry on its stalk; when the vascular supply is kept up with difficulty these pendulous masses of fat tend to become calcified or otherwise sclerosed, and to fall off into the abdominal cavity as "loose bodies." The loose bodies of the joints originate sometimes in the same manner from the pendulous masses of subsynovial fat. On the peritoneal surface the pendulous growth of fat may have a short stem and abundant blood-vessels, and go on to form a large lobulated tumour; but more usually in that situation the tumour-habit is established at a number of points, leading to the condition of multiple lipomata. The lipomata of the subcutaneous tissue may be single or multiple; if they are not congenital they are most often associated with a general obese habit; and they may grow to an enormous size. The submucous tissue of the stomach or intestine is a comparatively rare seat of fatty tumour. The most inexplicable lipomata are those which form, under very rare circumstances, as circumscribed nodular masses in the interstitial connective tissue of the cortex of the kidney, and in the subarachnoid tissue of the brain and spinal cord.

It is convenient to place these occurrences of obesity, of local overgrowths of fat, and of lipomatous tumours under the head of errors of metabolism, but it is difficult to find one physiological rationale for them all. Where obesity is due to dietetic errors we may say that the carbohydrates supplied to the body have been more than the combustion could overtake, and that the residue is "stored up" as fat. Where there is a degree of *embonpoint* in such a malady as chlorosis we may say that the feeble oxygen-carrying capacity of the red-blood corpuscles has led to an inadequate combustion of the carbohydrates supplied in due quantity, and that the residue has been stored up in that case also. In the unhealthy fattening that sometimes follows malarial or typhoid fever it does not appear why there should be the residue requiring to be stored up. Again, there are persons of an obese habit (probably congenital) who avoid a diet of carbohydrates, but turn even their meat diet to fat, just as there are confirmed diabetics who turn everything to sugar. Still further, we have the very remarkable tendency to make fat when the reproductive functions have ceased either prematurely or in the ordinary course; and that is a frequently occurring case which can hardly be brought into the doctrine of inadequate combustion of carbohydrates. The peculiar liability of the connective tissue between or upon the bundles of

muscle to become fat-tissue may point to some defective combustion in the work done by muscles. In the cases of pseudo-hypertrophic paralysis of the leg-muscles in children we are confronted with an enormous development of the same process. Other cases of local fat-formation, as in the interstitial tissue of the pancreas or around the kidney, are still more inexplicable. Lipomatous tumours, where they are congenital, may be referred to an early error of tissue-growth; where they are acquired, we have usually a coexisting or previous obesity (local or general) to resort to, and the only difficulty is to understand how the lobules of fat came to acquire the delimitation or individuality of a tumour.

Degenerations.—In a nosological outline there is perhaps no more convenient place for some remarks on the general subject of degenerative changes than at the end of sections dealing with the liabilities of obsolescence, the special liabilities of the suprarenal and thyroid, and the larger errors of metabolism.

The usual healthy appearance of the most elementary kind of protoplasm is a soft translucent grey; under the microscope this greyish protoplasm is uniformly and finely granular. From that standard of health there are various deviations, representing various kinds or degrees of degeneration. The chief degenerations are the mucous, the albuminous, the fatty, the calcareous, the caseous, and the amyloid.

mucous. The *mucous* change proceeds on more obvious physiological lines than most of the others; it is, as we have seen, the proper destiny of surface-epithelium in many situations; and we have found also, in treating of myxomatous tumours, that even in these it has not very remote affinities to the hematoblastic function. A somewhat obscure form of it, the *colloid* change, has been mentioned in connexion with cancer of the stomach and breast.

albuminous. The *albuminous* change is that which is often found in the large glandular cells of the liver, kidney, &c., in disorders accompanied by a rise of temperature. The cells are somewhat swollen, and their substance is clouded so as to obscure the central nucleus.

fatty. Merging imperceptibly with the albuminous degeneration is the *fatty*, in which numerous small droplets appear in the cell-substance, which is no longer uniform but diversified with highly-refracting granules; these droplets are of the nature of fat. In the liver-cells the droplets may run together, so that the liver-cell has the ordinary appearance of a physiological fat-cell. But there is in general a broad line of distinction between the transformation of protoplasmic substance into fat (usually in the connective-tissue cells) and fatty degeneration as above described. The latter occurs under many circumstances. It is an accompaniment of phosphorus-poisoning and of those idiopathic states which run parallel with the former, such as acute yellow atrophy of the liver. It is apt to occur in the inner coat of arteries in chlorotic subjects, producing yellowish opaque patches, which sometimes give rise to erosions. The arteries of the brain are liable to a similar degeneration more universally and under other circumstances than chlorosis. The very common condition of *atheroma* of the large arteries (especially aorta) is a more extensive degeneration of a fatty kind, on the basis of antecedent swelling or increase of tissue in the deeper part of the inner coat, or in the interval between the inner and the middle coats. This variety of fatty change is often associated with the production of cholesterol scales, and with a subsequent calcareous transformation. Although it is most common after middle life, it is not a senile change proper, inasmuch as the most long-lived persons have none of it.

The *calcareous* degeneration is most often found in the cartilages of the ribs after middle life; but, like the atheromatous change, it is not properly senile, as the very aged sometimes have their costal cartilages quite soft. The deposition of lime-salts (carbonate of lime) is in the capsules of the cartilage-cells; on applying a drop of hydrochloric acid to a thin slice of such cartilage an effervescence of carbonic-acid gas will occur. Lime is often deposited in the enlarged thyroid of goitre, and it is sometimes found in degenerated areas of the placenta. In the suprarenal it is much rarer than the cheesy degeneration. Fatty tumours in the lower animals, especially in the bovines, are liable to become calcareous; and the presence of granules of lime is a very common feature (along with the cheesy degeneration to be next mentioned) of the peculiar form of tuberculous growths of the serous membranes, or tuberculous nodules and infiltrations of the viscera and lymphatic glands, in those animals. In other tumours, of man or of animals, it is much less common. Lastly, foreign bodies lodged in the tissues, and the encysted trichina-parasite in the muscles, acquire a deposit of lime in the thickening of tissue which forms their capsule.

The *caseous* or cheesy form of degeneration is the characteristic disintegration that the cells and tissues undergo in tuberculous and scrofulous disease. Collections of pus, as in chronic abscess of the liver or in chronic empyema (pus in the pleural cavity), are liable to the same process of drying up and molecular disintegration. In the central parts of hard cancers also it is not unusual to find cheesy areas. A form of degeneration not very unlike the caseous may be observed as a perfectly normal incident in the deeper parts of the placenta. It is by far the most common degen-

eration of the suprarenal cells, whether in association with general tuberculous disease or not. Under all these circumstances the caseous change follows upon a certain amount of hyperplasia of the tissue, for the maintenance of which there has been no adequate provision in the way of new blood-vessels.

The *gummatous* degeneration of the products of syphilitic infection is not always easily distinguished from the caseous; but, for the most part, the substance is firmer and more cohesive, as the name implies, less dry and friable in the section, and of a brown colour rather than of the yellowish or fawn colour of cheesy degeneration.

A *vitreous, hyaline, or waxy* degeneration of muscular fibre occurs in the course of some fevers, as well as in progressive muscular atrophy.

The *amyloid* degeneration is the most peculiar of them all. The degenerate substance was thought to be allied to starch (whence the name) on account of the reaction with iodine (mahogany-red), but it is now known to be a nitrogenous principle. When it is present in large quantity, as in the amyloid liver, it gives the cut surface a peculiar glance, like that of fat bacon, and hence it has been called lardaceous or waxy degeneration. Its proper seat is the walls of the smaller arteries and the capillaries; these undergo a kind of hyaline swelling, like the swelling of boiled sago, so that the aggregate effect in such an organ as the liver is to make it very much larger, firmer, and more rigid in its outlines. This alteration in the vessel-wall facilitates the escape of the fluid part of the blood; hence the amyloid change in the kidney is a cause of albuminuria and in the intestine of diarrhoea. In the wall of the intestine the course of the amyloid vessel may be tracked by the mahogany-red line left by iodine. This remarkable form of degeneration of the vessels is associated with long-standing suppuration (especially in diseases of bone), with chronic dysentery, syphilis, and other of the constitutional states called cachectic.¹

§ 12.—ERRORS OF THE NERVOUS CONTROL.

Reference has already been made to the obscure implication of nerve-control in such disorders as Addison's disease, Graves's disease, diabetes, and acute yellow atrophy of the liver; the integrity of the controlling nerve-force may be said to be necessary to the perfect carrying out of the give-and-take of metabolism, or to the full effect of the "ferment" in each of the breaking-up processes. In a subsequent section (p. 393 sq.) reference is made to another controlling nervous mechanism, whose paralysis or disorder is immediately accountable for a very large part of the sum-total of sickness in the world, namely, the mechanism which regulates the animal heat. The present section will be devoted to a few morbid conditions of the cerebro-spinal system, selected to illustrate pathological principles.

Neuralgia and Tetanus.—One or two instances of neuralgia and of tetanus will serve to illustrate a peculiarity of the disorders of the nervous system among morbid processes of the body. A person in getting up from a stooping posture before the fire hits the right eyebrow hard against the edge of the mantelpiece; the blow has touched the filaments of the supra-orbital nerve, and there is more or less of pain for a time over the limited area to which these small sensory twigs are distributed. Several weeks afterwards, when the accident had been forgotten, there is an attack of severe neuralgia over the whole of that side of the face; the pain shoots along all the nerve-branches above the eyebrow, along all the branches below the eye-socket (infra-orbital), and along the branches going to the skin of the lower-jaw region or chin. The sequence of events means that the injury to the branch of the trigeminus above the eyebrow has touched the trunk of the nerve in such a manner that, after a considerable interval, intermittent attacks of pain are felt along all three sets of branches covering the whole of one side of the face. In other words, a molecular condition of nerve, originally peripheral and limited, has become central and diffusive. Another instance is as follows. A person seated at a high desk day after day exposes the outer side of the ankle and region of the Achilles-tendon to currents of cold air from the opening and shut-

¹ See Cl. Bernard, *Nouvelle fonction du Foie, comme Organe producteur de Matière sucrée*, Paris, 1853, and *Leçons sur le Diabète et la Glycogénèse animale*, Paris, 1877; Pavy, *Researches on the Nature and Treatment of Diabetes*, Lond., 1862; Senator, *Die Albuminurie*, Berlin, 1882; Cohnheim, *Allg. Pathol.*, vol. ii., Berlin, 1881; Grainger Stewart, *Practical Treatise on Bright's Disease of the Kidneys*, Edin., 1868, and in *Trans. Internat. Med. Congr.*, Lond., 1881, vol. ii.; S. Rosenstein, *Die Pathologie und Therapie der Nierenkrankheiten*, Berlin, 1863, and in *Trans. Internat. Med. Congr.*, Lond., 1881, vol. ii.; Garrod, *Treatise on Gout*, &c., 3d ed., Lond., 1876, and on "Eczema and Albuminuria in relation to Gout," in *Trans. Internat. Med. Congr.*, Lond., 1881, vol. ii.; Virchow, "Lipoma," in *Krankhaft. Geschwülste*, vol. i.

ting of a door, some occasional pains being felt where the external saphenous nerve runs behind the outer ankle and over the outside of the heel. After a lapse of time there is an attack of sciatica, the first of a series continuing for years, in which the course of the diffusive pain can be tracked, as if it had had an anatomical knowledge of the nerves of the limb, along all the branches of the great sciatic nerve to the thigh, leg, and foot. In this case the sequence of events is the same as in the former: the original excitant had touched the terminal twigs of the external saphenous branch of the great sciatic nerve; after an interval intense neuralgic pain begins to be felt far up the great nerve-trunk itself; and the pain diffuses itself not only to the filaments belonging to the external saphenous branch but along all the branches. A limited peripheral disturbance has, after an interval, become central and diffusive, and the pain apt to recur intermittently for years after.

Let us now take a case of *tetanus* involving the very same peripheral nerve as the last case. A boy engaged on a farm chafes the outer side of one heel by wearing boots too large for his feet; the abrasion, which is exactly over the course of the external saphenous nerve, is disregarded, and the irritation of the boot permitted to continue. In a few days he is admitted into hospital with tetanus, that is to say, with the neck-muscles rigid, the jaw locked, the features drawn, the recumbent body bent forwards from time to time like a bow, its whole weight resting on the head and heels, occasional wild jerkings of the limbs, and the muscles everywhere as hard as boards. This horrible and painful state of the muscular system usually ends in the patient dying after a week or ten days or less, exhausted by hunger and thirst and want of sleep, or by inability to breathe under the vice-like grip in which the chest is held by the muscles of respiration. The sequence of events is here closely parallel with that in the cases of neuralgia: an irritated condition of a small outlying nerve-twigg, which is not a motor nerve, has, after a short interval, touched the *spinal cord* in such a manner that motor force is freely and continuously let loose over the whole muscular system, with occasional discharges of a more intense kind. Spasm commencing in the muscles near the injury has been spoken to by the patients or attendants sometimes; but the observation has been recorded, on the whole, seldom. Strangely enough, it is in the muscles of the face, neck, and throat that the tetanic rigidity shows itself first, in whatever part of the body the injured nerve may be. There probably always is an injured nerve somewhere, although it is necessary to admit a few cases of "idiopathic" tetanus in which the nerve-injury is unknown. Gunshot-wounds of nerves are most likely to be followed by tetanus, as well as lacerated, contused, and punctured wounds generally, including the bites inflicted by canine teeth. The tetanic onset may follow the wound immediately, or it may come on while the wound is "cleaning" or suppurating, or during the stage of scarring, or some time after the cicatrix has formed. A wound which has been neglected in the healing, in which foreign particles have been left, or in which the nerve has been involved in the tightening of the scar is most apt to be followed by tetanus. A certain temperament, or state of the mind and body, predisposes to it; the frequency of tetanus in war may be due to more than one cause, but it seems necessary to include among the predisposing factors the excitement or preoccupation of the battlefield. Certain states of climate predispose to it; in the dry Australian air it is not uncommon for wounds to be followed by tetanus, and the disease is equally common within the tropics, especially under the circumstances which ordinarily cause chill. Among animals the horse is particularly liable to it, especially as a sequel of castration. The rise of temperature in tetanus is probably the effect of the excessive muscular metabolism.

Explosive Discharges of Nerve-force on slight Provocation.—Instances of neuralgia and of tetanus as the sequel of a peripheral injury, or series of scarcely observed excitations, are illustrations of that remarkable property of the nervous system which Rindfleisch speaks of as involving a "disproportion between cause and effect." The central nervous system, he says, "has a capacity for absorbing enormous quantities of centripetal or ingoing excitations as if they left no trace; but in reality it stores them up in the form of potential energy. It is this that enables an impression which may hardly exceed the limits of physiological excitation, but is aided in various ways by circumstances, such as inherited feebleness, lowered nutrition, or blood-poisoning, suddenly to let loose the whole store of these accumulated forces and to give rise to an outbreak of the most acute feelings and the most powerful movements." The want of outlet at the time is an error that underlies much of nervous disease, both purely psychological and other. The breeding upon wrongs, real or imagined, the unsatisfied hunger for sympathy, pent-up or unexpressed emotion under many circumstances, even the solitude of shepherds on the Australian and New Zealand downs, are among the causes tending to a total unwhinging of the mind. Such illustrations of the general principle are beyond the scope of this article; the illustrations that concern us most at present are found rather in the province of reflex nervous activity, where the response is automatic, not always recorded by

the consciousness, and little if at all controlled by the will. Some disorders in this group are purely functional, that is to say, there are no concurrent structural changes. In others, the functional disorder is attended or closely followed by degeneration; and these are mostly diseases of the spinal cord. Representative instances from each of these two classes will now be adverted to briefly.

Convulsions (Eclampsia).—Apart from the convulsions of uræmic poisoning, there are two prominent divisions of eclampsia—the convulsions of infancy and childhood and the convulsions of the pregnant or puerperal state. In infancy the reflex movements and uncontrolled spontaneities are predominant, just as the impressions from the outer world are but little discriminated or retained. It takes little to throw some infants into a fit; the irritation of teething, of ill-digested food, of worms, and the like will suffice. Whether in these cases the excitations have been accumulating or not, the discharge of outgoing energy is always explosive. The muscles that straighten the back are contracted to the utmost, and the air is forcibly expelled from the chest with a prolonged cry; the head is thrown back, and the arms and legs kept rigid. The state of rigid spasm (tonic contraction) is succeeded by rapid contractions and relaxations (clonic) of the muscles of the face and limbs and whole body, which gradually become more comprehensive in sweep and slower in rhythm until they cease. Consciousness has meanwhile been suspended, and does not return until some ten or twenty minutes after the convulsive movements have ceased; with the return of consciousness the patient "comes out of the fit." The liability to such attacks diminishes very strikingly as the intelligence and the will develop and the body hardens. It is not until the circumstances of pregnancy and childbed arise that any liability to convulsions at all comparable to that of infancy is again met with. No analysis of the circumstances of puerperal convulsions can be attempted here; if they are in some cases of "uræmic" origin, in association with the albuminuria of pregnancy, there are other cases that are primarily disorders of reflex innervation.

Epilepsy.—An epileptic fit does not differ materially in its phenomena from a fit of convulsions as above described; the tongue is more apt to be caught between the teeth in the rapid movements of the lower-jaw muscles, and the spectacle of a grown person in a fit is more distressing in every way. That which really distinguishes epilepsy from eclampsia is that it is a *habit* of the nervous system, with a good deal of regularity in its recurrences. Fits of convulsions in infancy will cease when the cause is removed, when teething is over, or worms expelled, or after the probationary state of the nervous system has been outgrown. The convulsions of childbed also, if the patient happily survive the attack, come to an end when the critical state of the system has passed. But it is the distinctive mark of epilepsy that it tends to become an ingrained habit, that the fit is there *in posse*, as if detached from its exciting cause, established, permanent, and self-existent on the paths of ingoing and outgoing nerve-influence. This tendency of a disordered reflex action to repeat itself is the same "memory" that has been claimed by Hering for the cells and mechanisms of the body generally. That which is implied in the original use of the word, namely, retentiveness or the resurrection of past impressions, and the contagion of associated ideas, is a mystery large enough to cover the minor mystery of morbid habit. Epilepsy is, as it were, the self-existent memory of a disordered reflex; and this is what we may understand by the term "neurosis." It is true that a primary disorder of reflex action due to an adequate cause, such as infantile or puerperal convulsions are, cannot be always shown to have occurred at one time or another in epileptics. In a certain proportion of cases there has been an injury to the skull, or there are evidences of tumour or other new formation within the skull, or there is a tumour of a peripheral nerve, or a nerve involved in the scar of a wound or sore; but there are many more epileptics in whom such antecedents cannot be made out. The habit, in fact, is one which tends to be ingrained not only in the individual who has begun it but also in his or her family. Epilepsy is one of the clearest instances of a liability transmissible from parent to offspring. The heredity of epilepsy has even been proved by Brown-Séquard for the guinea-pig; when an epileptic habit was induced in guinea-pigs by injuring the spinal cord or the medulla oblongata, or by cutting the sciatic nerves, the litters of such epileptic guinea-pigs were apt to have epileptic seizures, attributable to nothing but inherited liability. According to Hesse's figures, epilepsy has begun before the age of twenty in by far the larger number of cases, and that fact is doubtless an index of the extent of hereditary influence. If we do not assign all such cases to heredity, the advent of puberty in girls may be held to be itself a cause of epilepsy; that time of life is distinguished by the somewhat abrupt acquisition of a much wider emotional and intellectual range, and presumably by some special liability to explosions of reflex nerve-force upon slight provocation.

Chorea (St. Vitus's Dance).—This is another variety of uncontrolled movement which is also a habit, like epilepsy, and is practically confined to girlhood and boyhood. It may occur in pregnant

women, but it disappears with delivery. The movements are intermittent, beginning from a state of repose with a certain fidgety restlessness, and going on to the most irrelevant and unrhythmical jerkings, hitches, and twistings of the limbs, head, and body, or of one limb only, or one shoulder, or of the head only, or of the tongue. The muscles do not cease to be the ministers of the will, but voluntary movements are performed with some want of aim and certainty; and the gait in walking may be seriously affected. The choreic movements themselves cannot be restrained by the will; excitement and self-consciousness intensify them; and they cease during sleep. One of the most singular facts in this strange nervous habit is its association with rheumatic fever; a significant proportion of those subject to it are found to have had rheumatic fever, but there are others, curiously enough, who afford indications only of that state of the endocardium (or lining membrane of the heart and its valves) which often goes with rheumatic fever. This fact of endocarditis has suggested a theory that the disease is due to the minute arteries of the corpus striatum being blocked with small fibrinous plugs washed off from the inflamed interior of the left ventricle, or from the surface of its valves. It is more accordant, however, with all the phenomena to regard the disease as a functional habit of muscle and nerve, with the usual intermissions of a nervous habit and the usual exacerbations, in which the implication of the heart-muscle creates a peculiar liability to endocarditis. A further analysis is offered at the end of the remarks on rheumatic fever (p. 398).

Mimetic
and epi-
demic
chorea.

Mimetic and Epidemic Chorea.—The choreic habit has, like hysteria, a singular power of becoming a fixed idea in others; there is no doubt that choreic movements are involuntarily mimicked by young persons who witness them in orphanages or other institutions where a number of girls are living under the same circumstances of work and leisure. Chorea may thus be said to be contagious, while epilepsy is hereditary. It is no great step from these cases, which depend solely upon the fantastic trick being caught under the influence of the *idée fixe*, to the remarkable epidemics of dancing frenzy of which some are historical, and of which there are still instances occurring from time to time under some general excitement, particularly the vivid prepossession of a large number of persons at once by the same religious hopes and fears.

In this connexion come certain other diseases—*ecstasy, catalepsy, and hysteria*—of which the details are given in the respective articles, ECSTASY, &c.

Diseases of the Spinal Cord.—In the foregoing group of errors of the nervous control we have had to consider a mere functional condition,—a molecular state, no doubt, but one which cannot be seen any more than can the electricity in a wire. Structural changes, when they occur at all, are a very late effect, as in some cases of epilepsy. But there is a very large and important part of the functional errors in the controlling nervous mechanisms which are associated with textural changes or degenerations. The most obvious of these are disorders of the reflex functions of the spinal cord. In respect of these structural changes accompanying functional irregularities, the spinal cord approximates to the organs and parts of the body which we have already considered. But there is one character in the textural changes of the spinal cord (and of the brain) which is in a sense unique, namely, their tendency to spread up and down in the particular tracts of fibres. Hence the ascending and descending degeneration and sclerosis of the cord, the extensions of bulbar paralysis, and the like.

Loco-
motor
ataxia.

Locomotor Ataxia, or Tabes Dorsalis.—The muscles of the body act ordinarily in groups, so that complex movements, such as carrying a spoonful of soup to the mouth, are performed by a number of independent voluntary muscles as if by a mechanism or automaton. The highest point attained by the muscles in this direction is the precision of military drill. In the disease called locomotor ataxia the muscles that are ordinarily grouped together in their action become slow to act in concert, the want of co-ordination being most obvious in the legs and hips in walking. Progression is not of the usual well-considered kind, but the leg is thrown outwards as well as forwards, and the foot is brought down as if the intention were to strike the ground with it, the knee having been previously straightened. With so little ease are these muscular combinations initiated that the patient requires to look at his feet as if the sense of effect were failing and had to be aided by the sight. Later on the muscles of the upper extremity are in like manner unable to act consentaneously, so that the patient cannot fasten a button, pick up a pin, or the like. Still later there is not only loss of the nicely-adjusted harmonious action among the muscles, but there is a loss of all moderation or gradation in the movements instituted. Whether or not this also be due to loss of the sense of effect, the movement is not adapted to the effect required; it is quick and of short range even when it should be slow and sweeping, and the time and range of the movement of the given limb are practically the same under all circumstances. These errors of the locomotor control are so conspicuous as to have given the disease one of its names; to them we have to add other symptoms varying in the different cases, such as flying pains in the limbs,

numbness, squinting and double vision, and functional disorders of the abdominal and pelvic organs. A certain painless structural alteration of the joints (especially the knee), first described by Charcot, is now and then met with, and the remarkable condition known as perforating ulcer of the foot is sometimes found (but not every case of it) to be associated with locomotor ataxia.

The structural changes in the spinal cord begin in the lumbar region and spread upwards; they are in the posterior columns, and especially on their outer limits. Grey degeneration is the name given to the structural condition, and it depends essentially upon the loss of the opaque white substance that invests the axis-cylinder of each nerve like an insulating stratum; this layer gives the colour to the white tracts of the cord, and the loss of it reduces these tracts to the grey condition of the central columns of cord where the nerves are normally without the white insulating layer.

The degenerations of the spinal cord, however caused, have little variety; the loss of the white substance may be followed by hardening of the tract of tissue (sclerosis), or there may be a development of the cells of the supporting tissue or neuroglia, keeping pace with the decay of the nerves themselves, whereby the tract acquires a gelatinous appearance. Sometimes the degeneration is not perfectly continuous, but occurs at many isolated spots (multiple disseminated sclerosis).

The causes of the degeneration in locomotor ataxia are various. Cause According to the statistics of Erb, it is nearly always associated of these with constitutional syphilis; other causes are probably always degenerate peripheral somewhere within the region supplied with nerves from the lumbar part of the cord.

The causes of degeneration other than that of tabes dorsalis are also various, and associated with various groups of symptoms, which need not further be considered. Mechanical injury to the cord is followed by degeneration, and the pressure of a tumour may have the same effect. It is found that the solution of continuity of a nerve causes the same loss of the white substance in its peripheral portion as in these degenerations of the cord, and the degeneration of the nerve is set down to its being cut off from its "trophic centre." The same "trophic" hypothesis is applied to the spinal decay. If the structural degeneration in the cord differs from the degenerations that elsewhere go with disordered function, in its remarkable tendency to spread up or down, that is a difference which may be itself associated with the distinctive conducting function of the nerves and nerve-centres.

In so-called *bulbar paralysis*, associated with inarticulateness of speech, there is described a certain decay of the ganglion-cells in paralysis the nucleus of the hypoglossal nerve, situated in the "bulb" or medulla oblongata, together with general shrinkage of the nucleus; this condition progresses both structurally and functionally towards a more general paralysis.

In *infantile paralysis* the structural degeneration is found pervading the anterior horns of grey matter of the cord (anterior poliomyelitis), and it includes the ganglion-cells.

Pseudo-hypertrophic Paralysis, Progressive Muscular Atrophy.—Pseudo-These are two closely allied conditions, the one in young children and hyper- the other mostly in male adults, which afford the most instructive trophic contrasts. There is gradual loss of muscular power in both, in the paraly- case of the children's malady chiefly in the coarse or static muscles, pro- that keep the body erect, and in the nimble and richly inner-gressive vated muscles of the hand, forearm, and tongue in the progressive muscular muscular atrophy of male adults. In both the loss of muscular atrophy. power goes hand in hand with a loss of muscular structure; but in the coarse and sluggish groups of muscles which are mostly affected in growing children the loss of muscular structure is more than made up for, in mere bulk, by the development of interstitial connective tissue and fat, while in the nimble muscles of the hand and tongue, chiefly and primarily implicated in the characteristic disease of maturity, there is visible shrinkage of the part. It is only in the limbs, when the affection extends to them, that the bulk and outline are preserved in adults. Hence the affection in children is called pseudo-hypertrophic paralysis, and in adults progressive muscular atrophy. A few cases of great interest have been recorded in which adults have had the two conditions in combination. Children so affected walk as if on tiptoe, with a waddling gait, balancing the body for a perceptible interval on one foot; when they are stripped the dorsal contour is peculiar, the shoulders being thrown back and the belly forward, the calves and hips standing out prominent and hard. In the muscular atrophy of adults the ball of the right thumb is nearly always wasted, and if the other muscles of the hand are equally attenuated there is produced the characteristic appearance of a bird's claw; the tongue also is often shrivelled.

In contrast to locomotor ataxia, and to paralysis from injury to or pressure on the brain and spinal cord, these two diseases are illustrations of the peripheral relationship of muscle and nerve, of a loss of integrity in that executive relationship, which brings with it both loss of power in the muscle and concomitant failure of its nutrition. They may be quoted as instances of tropho-neuroses,

so long as it is clearly understood that the term really explains nothing. There are, indeed, changes described for them in the anterior cornua of the grey matter of the cord, with wasting of the anterior roots of the spinal nerves.

"*Dissolution*" *Principle of Nervous Diseases*.—It is known from physiological experiment that a muscle is capable of excitation when the nerve-force is withdrawn from it; muscular substance is not only a contractile form of protoplasm under the control of nerves, but it has proper irritability when the nervous influence is paralysed (as by the action of the curare poison). The condition of the motor nerves in pseudo-hypertrophic muscular paralysis and in progressive muscular atrophy is such that the muscles are left to their indigenous contractility, being deprived of their innervating force. We shall find these two diseases a convenient opportunity of stating a principle in nervous diseases which has been expounded by Hughlings Jackson under the name of the "*dissolution*" principle. Morbid states of the nervous system (or many of them) are said to be of the nature of a breaking up of the acquisitions of evolution, with loss of the more finished acquisitions, and a falling back to a simpler type, whose unsuitability to the individual in his then general circumstances amounts to a disease. The illustrations already given (§§ 4, 5) of "memories" of development inherent in the cellular life of the body belong to the same class of facts or the same order of ideas.

In applying this principle to the diseases in question we have to consider both the electrical reaction of the muscles and the retrograde changes in their structure. The "reaction of degeneration" is a peculiar one, and it is the diagnostic mark of paralysis of peripheral origin. The degenerated muscle shows a considerable increase of irritability for a time under the galvanic current; the contraction is sluggish and sustained; the anodal closure gives a stronger contraction than the kathodal, while, conversely, the kathodal opening has the advantage. These peculiarities of the electrical reaction in "degenerated" muscles are analogous to the physiological reaction when the nerve-influence has been abrogated. We may take it that a "degenerating" muscle falls back upon its proper irritability, that the contractility becomes "ideo-muscular" as contrasted with "neuro-muscular." The muscle, so to speak, takes lower ground by way of adapting itself to circumstances.

In the disease in question, as it affects children, the groups of muscles that suffer are precisely those in which the contractility is already of the sluggish, sustained, and ideo-muscular kind,—such muscles as the erector spinae, glutai, and others, which have an extremely limited nerve-supply in proportion to their bulk. Side by side with this fact we have the other fact of an increase of bulk, as shown in the seemingly strong and hard back, hips, and calves. The paralysis of the muscles has brought with it extreme dilatation of their small arteries, and consequent venous hyperemia; and this presence of the blood in increased quantity has given an enormous impetus to the growth of the interstitial tissue, in the form of young connective tissue and more particularly in the form of fat-tissue. On the other hand, in the muscular atrophy as it affects adults (mostly of the male sex), it is the very nimblest of all the muscles of the body that are picked out first—the muscles of the right hand—in which the ideo-muscular contractility is naturally small and the neuro-muscular contractility naturally great; and those muscles, with those of the tongue, undergo a remarkable atrophy with little or no spurious compensation from the interstitial tissue. When the disease progresses to other muscles, however, there may be so much new-formed interstitial tissue (fibrous and adipose) that there may be no actual loss of volume in the limb. The precise significance of these differences in the two diseases is not easy to state; in both the males are very much more often affected than the females, being in the one mostly very young boys beginning to walk, and in the other men whose manual dexterity is a formed habit.

The structural changes in the muscular fibre itself are very much the same in both; as the striation of the fibres disappears the quiescent muscle-nuclei become numerous and prominent. The muscle may be said to fall back upon the more embryonic condition, upon the individual life of the cell-units which had been fused in the fibre; it retreats to earlier ground, and, as the proper texture of muscle finally goes, the life of the part takes the still more elementary direction of the common binding-tissue and fat. In this sequence of functional and structural events we may discover an illustration of the dissolution principle. The muscles, having lost, or beginning to lose, their innervation, fall back upon the more primitive kind of irritability; as the downward course of failure proceeds, they retreat still farther to an embryonic structural condition; when the muscle itself is practically lost the commoner forms of mesoblastic tissue take up the retrograde succession; and, last stage of all, even the fat and the fibrous tissue waste.¹

§ 13.—ERRORS IN THE REGULATION OF THE BODILY HEAT.

The constancy of the bodily temperature under all circumstances of external heat and cold—of torrid and arctic zones, of summer and winter, of sunshine and darkness—is not the least remarkable instance in nature of a self-adapting mechanism. The average internal heat of the human body or of the blood is from 98° to 99° Fahr., and the healthy range in different individuals, or in the same individual at various periods of life, or in various circumstances of exercise and repose, sleeping and waking, is not more than a degree or two below or above the mean. It will be at once apparent that the sensations of heat and cold are no measure of the bodily temperature. The mechanism by which the body's heat is kept uniform is a co-operation of a number of agencies. It is an equation, of which the two sides are the amount of heat produced in the organism and the amount of heat dissipated. In hibernating mammals the former of these is the side to which adaptation is most directed, in such wise that the whole fires of the animal burn lower while the winter cold lasts. But in man the work and waste go on always, and therefore the heat of combustion is practically uniform at all times, so that the adaptation to seasonal and climatic changes of temperature is mainly on the other side of the equation, the regulation of the amount of heat given off from the body. In cold weather the amount of bodily heat parted with is limited by warm clothing (or clothing which conducts heat with difficulty), by keeping up the temperature of the air artificially by fires, and by the contraction of the surface-vessels and other muscular structures in the skin, which has the effect of diminishing the insensible perspiration and makes the familiar sensation of cold. While these adaptations to external cold are decidedly the greatest, it is not to be supposed that there are no adaptations on the other side of the account. There is, in fact, an increased production of animal heat also, so that more can be parted with, and the constant temperature of 98°·5 be still unaffected. The increased production is often in the way of increased muscular exercise, which every one is prone to in cold weather; it is to some extent also through the more active circulation in all the internal organs, especially brain and liver, their greater functional activity being attended with a larger amount of the heat of metabolic combustion. A heat-forming diet of carbohydrates (chiefly fats), and the physical benefit of the subcutaneous fat resulting therefrom, are well-known elements of the adaptation in colder latitudes.

When it comes to be an adaptation to great solar heat, the adaptation is again mostly in the way of regulating the heat lost. The vessels of the skin are dilated, and its other muscular elements (in the sweat-glands, &c.) relaxed (making the familiar sensation of heat), so that perspiration flows freely; the evaporation of the sweat on the surface of the body is constantly consuming heat, and the clothing is worn light, and of such colour and texture as will readily conduct heat (both of radiation and of evaporation). There is now as much effort to part with the body's heat as in winter there was effort to retain it. At the same time the heat of combustion in the body is kept down as much as possible; muscular exertion is avoided, the brain and the digestive functions are less active, and fatty substances are partaken of more sparingly.

The various parts of this conservative adaptation are somehow co-ordinated through the central nervous system. The vascular system is obviously a chief means by which the body's heat is kept constant, not only by the quick transit of the blood to all parts and the free mixture and

¹ See Wilks, *Lectures on Diseases of the Nervous System*, Lond., 1878; James Ross, *Treatise on the Diseases of the Nervous System*, 2 vols., 2d ed., Lond., 1883; Buzzard, *Clin. Lect. on Dis. of Nervous Syst.*, Lond., 1883; Gowers, *Epilepsy and other Chronic Convulsive*

Diseases, Lond., 1881, and *Morbid Conditions of the Spinal Cord*, 3d ed., Lond., 1884; J. Hughlings Jackson, "Evolution and Dissolution of the Nervous System," in *Brit. Med. Journ.*, i., 1884.

interchange of its particles, but also by the control of the amount of blood sent to the skin on the one hand (say, in warm weather) and to the muscles and viscera on the other (say, in cold weather). The vaso-motor nervous mechanism, therefore, is an integral part of the nervous control of the bodily temperature. But there is reason to think that the regulation of the bodily heat is committed to the charge of a still higher and more commanding centre in the nervous system than the vaso-motor. It is a remarkable fact, observed from time to time in clinical practice, that certain cases of injury to the brain, from fracture of the skull or internal hæmorrhage, are attended with a quite phenomenal rise of the body-temperature—a rise to 107° or 108° Fahr.—and that, too, when there is nothing strikingly unusual in the vaso-motor effects, as revealed in the skin or elsewhere. In such cases it is the surface-region of the pons Varolii, the great cerebellar commissure, that has been injured or compressed by the effusion and coagulation of blood. The evidence of specially devised experiments confirms and amplifies the clinical evidence; and it is considered in physiology to be a well-grounded fact that there are thermic or heat-regulating centres in the brain, one, at least, being in the region of the pons Varolii. Bernard would further assume the existence of "calorific" and "frigorific" nerves side by side with vasodilator and vaso-constrictor.

Thermic Fever and Heat-Stroke.—Such, then, being the nicely balanced and carefully safeguarded mechanism for keeping man's internal heat about 98° Fahr. under all circumstances, the question arises whether we may trace any considerable part of the sickness and mortality of the globe to a marked and conspicuous failure or break-down of this mechanism of adaptation:—

"But errs not Nature from this gracious end,
From burning suns when livid deaths descend?"

Thermic Undoubtedly the ardent or thermic fever of Indian practice, the fever. heat-apoplexy, heat-stroke, or sunstroke, is the direct result of an upset or disintegration of the heat-regulating nerve-centre. Either the disorder of innervation is shown in sudden syncope or depression of the heart's action, as among labourers working or soldiers marching in the sun; or the effect of atmospheric heat, direct solar or other, is a universal state of venous engorgement, indicating profound vaso-motor paralysis, and ending in death from asphyxia, literally the "livid death" alluded to in the couplet; or the heat-stroke leads to an attack of thermic or "ardent" fever, coming on perhaps in the night within a few hours of exposure, or after a longer interval, having a prodromal stage of malaise, a rise of the body-heat to as much as 108° or 110° Fahr., embarrassments of the lungs and heart, profound brain troubles, and probably a fatal termination in general venous engorgement and asphyxia. These various forms of heat-stroke all point to a profound disorganization of the nervous centres by the more or less direct action of solar heat,—to cardiac depression in the syncopal form, to more general vaso-motor paralysis in the asphyxial form, and to disorganization of the thermic nerve-mechanism in the hyperpyrexial form. When recovery takes place, as it does in a large proportion of cases, there are often lasting traces of injury to the nervous system in other functions than the vaso-motor or thermogenic.

These cases of heat-stroke or thermic fever are the most obvious illustrations of a break-down of the heat regulating mechanism, but they are by no means the most usual illustrations of it. It is in a vastly more common form of sickness, in malarial fevers of all kinds that we discover the typical failure of the heat-regulating centre under circumstances that tax the self-adapting powers of the body. The enormous prevalence of malarial or climatic fever may be said to be the greatest indication of failure or imperfection in the adaptation of man to his surroundings. In some few spots, which even the instinct of the brutes leads them to desert for a season, the effects of heat and moisture are such as to induce an endemic diseased habit of body, so universal in its incidence and so insidious in its development as practically to amount to an ethnological distinction (see Heber's description of villagers in the Terai, *Indian Journal*, vol. i. p. 251). Throughout the whole intertropical zone, and for 5° beyond it in the southern hemisphere and 20° beyond it in the northern, the climatic fever, in its various forms, stands for almost as much sickness and mortality as all other diseases put together. So stupendous a power has it always been that its pathology has with difficulty emerged from the stage of gross materialism and superstition. But malarial or climatic fever is the true "essential" or "primary" fever of the older writers; its paroxysm is the abstract fever of pathological treatises, which is

discussed without reference to communicability from person to person; and, if it has a periodicity which seems to give it specific characters of its own, a little analysis serves to show that its periods of waxing and waning are no other than the cosmical periods of the earth itself.

Cullen's Theory of Fever.—According to Cullen's theory of fever (which was a modification of Hoffmann's), "the first incident in the chain of sequences constituting fever is a depressed state of the brain and nervous system; spasm of the extreme capillaries results from this depression, and reaction of the circulation, with its accompanying phenomena, is an effort of the system to overcome the spasm. The Cullenian theory, in a modified form, continues still to be the prevailing creed of those who adhere to the tenets of solidism, and who believe at the same time in the existence of primary or essential fever." This is the language of Christison in 1840 (*Tweedie's Library of Medicine*, vol. i. p. 116); and he adds that the chief rival to this doctrine is one which "denies the existence of any primary or essential fevers, and holds them all to be merely symptomatic of some local disorder." Cullen did not ignore the differences among fevers in respect of the local condition, exanthematous or other; but his desire for a broad generalization led him to find something common in the antecedents of them all. This was "diminished energy of the brain," and the nervous depression was caused by "human and marsh effluvia." When the disentanglements of the century following are credited to Cullen's doctrine the latter will be seen to be still radically sound. The collocation of "human and marsh effluvia" is nothing but a verbal one; there is no uniformity of effect among human "effluvia" themselves, but rather specific differences; in marsh effluvia nothing has ever been found but common watery vapour; and the characteristic effects of "marsh effluvia" are by no means rare on barren uplands where there is no standing water or decaying vegetation for miles around. The modern disentanglement has put into a class by themselves all the communicable infective diseases which bring more or less of febrile disturbance, and has fixed the attention on the specific features and evolutionary antecedents of each. Hence the existence of "primary or essential fever" has come to be denied, except as the abstract febrile state. But it had been forgotten that, for malarial or climatic fevers, there is no communicability, and no specific virus bred in the body or in the body's discharges; and to them therefore belongs the heritage of "primary or essential fever." The common aguish intermittent is the source of all the concepts that enter into the doctrine of fever,—the initial malaise, the cold fit and the hot fit, the crisis and the deservescence. It is to it that the classical description of a febrile paroxysm applies, in paragraphs 16 to 23 of Cullen's *First Lines*, just as the fever pathology of Hippocrates and Sydenham applies to it; and the first incident in the chain of sequences, according to Cullen, was an "enfeebled energy of the brain." It will be found that this doctrine of primary or essential fever, understanding climatic or malarial fever therein, is fundamentally in agreement with modern physiological teaching as to the animal heat and the errors in its regulation.

Malarial or Climatic Fevers.—Turning, then, to the analysis of a Paroxysm of ague, we find that there is a preceding sense of languor and of unfitness for a few hours; all at once the patient begins to ague. He feels cold, he shivers, his teeth chatter, his skin becomes "goose-skin" from the powerful contraction of all the muscular elements in it. If this occurred in the orderly course of regulating the body-heat it would mean that the internal temperature was falling below the mean; the vigorous contraction of the blood-vessels on the surface of the body is by way of preventing the escape of heat. But the truth is that the body-heat is rising much beyond the normal all the while that the skin is acting so as to keep in the heat. This procedure at cross purposes goes on for a few hours, during which the internal heat may rise to 104° or 105° Fahr. The cold fit passes into the hot, and then the crisis is reached; there is a violent rebound, the muscular elements of the skin and its vessels relax, perspiration flows freely, the kidneys begin to remove all the products of excessive and uncalled-for combustion, and in the morning the patient awakes with probably no very serious effects after his feverish night. Assuming the case to be a common quartan, the individual goes to his work next day feeling tolerably well; on the day after he has probably forgotten all about his feverish-paroxysm, if it be his first ague; and it is not until the afternoon of the third day that he is again reminded of it. Let us say that he is returning from work towards the end of an ordinarily active day; suddenly he has the same uncontrollable feeling of chills, he shivers, and seeks warmth by crouching over the fire or by wrapping himself in warm clothes. The drama of three days before is repeated, he awakes again from a feverish night, the morning urine being again full of brick-red urates; he now knows that he is the subject of quartan ague, and that another paroxysm is due three days later, which he is fortunately able to prevent or at least to mitigate by taking quinine in the meantime. Whatever may have induced the first paroxysm, the second is a mere imitation of it, an affair of habit, just as a return of an epileptic con-

vulsion is. It can hardly be doubted that in the repetition of a simple ague-paroxysm we are concerned, not with the nervous system as co-ordinating the two sides of the account in the production and discharge of animal heat, but with an acquired habit of the nervous system, with a usurpation of the power committed to it for the purposes of control only. This acquired faculty of the heat-regulating centre to act quasi-autocratically is often exemplified in those persons who, having suffered from malarial fever under its usual exciting circumstances, experience a return of it under widely different circumstances. Thus, a pronounced ague-shako has occurred to a person crossing an ice-slope 10,000 feet above the sea-level, the original ague having been contracted several years before in a malarious locality.

We come next to the circumstances under which the heat-regulating centre suffers this disorganization, the memory of which may remain with it for long after. The circumstances of intermittent and remittent fevers have been already discussed in the article *MALARIA*, and it remains to give here only a brief epitome. Wherever and whenever malarial fevers occur there are considerable degrees of solar heat and of moisture in the lowest stratum of the air, and a considerable drop of the temperature after sunset. So far as the individual is concerned, he incurs risk by working in the sun and resting or sleeping in the chill of the evening, by letting a wind such as the monsoon blow upon his fatigued body, by passing suddenly from the relaxing conditions of heat to the constricting conditions of cold, by arriving from cooler latitudes in the hot season, and by doing one or all of these things when his nervous power, as Cullen said, is enfeebled by such causes as anxiety, intemperance in drinking, "and other circumstances which evidently weaken the system." A high degree of moisture in the lowest stratum of the air is the most universal of the external factors within the malarious latitudes, and it may be produced either by the extreme dampness of the soil or by the extremely rapid cooling of a dry soil (even bare rocks) by radiation of heat after sunset, whereby a moderate degree of atmospheric moisture gives a fall of dew. On the other hand, wherever the atmosphere is exceptionally dry, as on the southern littoral of Australia, there is no malaria notwithstanding the great solar heat; and wherever there are only a few degrees of difference between the day and night temperature and a very slight range throughout the year, as at sea within the tropics, or at such localities as Singapore and the Amazon valley under the line, malaria is far less active than the great solar heat and moisture might lead one to expect. Whatever in the telluric and atmospheric surroundings taxes the nervous mechanism which keeps the heat of the body always about 98° or 99° Fahr. is a cause of malarial fever.

The Cold Fit of Fever.—The central point of interest in a paroxysm of fever, the grand paradox of fever-pathology, is the rise of the heat of combustion, as shown by the clinical thermometer, and the simultaneous closing of the natural outlets of excessive heat, as shown by the shivering and the feeling of "goose-skin." The value of any pathological doctrine of intermittent and remittent fever may be estimated by its success in dealing with this paradox. We may conveniently approach this subject through the following concrete instance, as given by Oldham. "At Jhansi, in June 1860, a young officer of the battery of artillery to which I belonged was exposed for some time to the sun at mid-day; he then, in a profuse perspiration, came into the house, through which a hot wind was blowing, as all the woodwork had been burned by the rebels, and the tatties, which served for doors and windows, were almost dry; in a few minutes he complained of being chilly, and in a few more he was in the cold stage of a sharp attack of intermittent. This officer had never previously suffered from fever; when he went out a short time before he was in perfect health, and he had not, whilst away, been into any malarious locality; in fact, at that season, the whole country round was parched and dry." This case illustrates an important point,—antecedent exposure to great solar heat. Exercise in the sun means active internal combustion in the muscles, liver, &c., and the body warmed at the same time by the sun's rays; the equalizing of the heat made and the heat lost is accordingly a difficult task, which falls mostly on the skin (and lungs) to execute, and the heat-regulating centre to order and control. We may take it that both the regulating function of the nerve-centre and the executive function of the skin are strained to the utmost. In the case quoted, where there was no interval between the cause and the effect, the body in its glowing state is suddenly exposed to a slight abstraction of heat through the draught in the house; the sudden loss of heat, however slight the amount, is the signal for the skin to close its pores so as to lose no more heat, and hence the passing feeling of chill. But the passing feeling of chill is in this case succeeded, at only a few minutes' interval, by the prolonged state of contraction of the cutaneous vessels, sweat-glands, and other muscular structures which corresponds to the rigors and the cold fit of ague; and, all the while that the skin is thus vigorously adapting itself to prevent the escape of heat, the heat of the body is rising several degrees. The skin and the nervous centre,

the executive and the central authority, are at cross purposes so far as the object is to keep the temperature at the level of 98° or 99° Fahr. Now, the rise of temperature in this case can have had no other source than internal combustion (in the liver, muscles, brain, &c.); but the combustion is an unnatural one, inasmuch as no proper physiological work has been got as its equivalent out of the muscles, brain, or liver, although there has been the due physiological waste (carbonic acid and urea). A slight chill, or the sudden abstraction of a not very large amount of heat from the surface of the body, has excited the heat-regulating centre in such a way that it lets loose an extravagant amount of its "thermogenic" force.¹ The nervous centre has been called upon to equalize the slight abstraction of heat at a moment when it is still in the state of strain from its previous and well-sustained efforts to keep the balance, and it is upset by the sudden call. It answers by an altogether disproportionate discharge of its force, which is both ill adapted to the momentary needs of the body and continues in operation much beyond the occasion for it.

Under ordinary circumstances of taking the ague there is usually an interval between the exposure to heat and the exposure to chill. Usually, also, the exposure to heat is more or less prolonged or habitual; the heat-regulating centre is taxed over and over again, and it is taxed so much the more if there is moisture in the air along with solar heat, the dissipation of the body's heat by the insensible perspiration and by radiation being much more difficult in a damp atmosphere than in a dry. Whenever the chill comes, it finds the heat-regulating centre without that tone which would enable it to act according to the emergency, so that the abstraction of heat, even if it be slight, is the signal for an enormous stirring up of all the internal fires and a rapid combustion to meet a loss of heat which is not greater than the body endures under other circumstances with impunity. This phenomenal burst of heat-making is, so to speak, misunderstood by the motor nerves of the skin; whenever, under the same circumstances of repose, there is the same thermogenic activity, it means that the heat is wanted to keep up the level of 98° or 99° Fahr., and all the muscular elements in the skin and in its vessels contract to keep the heat in, producing the feeling of external cold, or of shivering if the contraction be extreme. The same thing happens under the incoherent and extravagant action of the heat-regulating centre; and hence the paradox of the body shivering all the while that its internal heat is rising to 5° or 6° Fahr. above the average of health.

Another way of expressing the paradox is to employ Bernard's A long language of "thermic nerves"; we should then say that stimulation of "caloric nerves" goes with a stimulation of "vaso-constrictor" nerves in the skin, so that a violent discharge of force mild along the one path is associated with a violent discharge along the fever other. Whether, as Traube has suggested, the extravagant action of the heat-regulating centre might be altogether counteracted by the usual heat-discharging mechanism but for the inopportune constriction in the cutaneous vessels and the surface of the body generally, is a curious question, but hardly a practical one. In that degree of shock to or disorganization of the nerve-centre which occurs in ordinary tertian or quartan intermittent the duration and degree of the shivering fit are the index of the mildness of the attack; the more pronounced the cold stage, the more prompt is the crisis and the more certain the defervescence. But in the much more severe shock which brings a quotidian or a remittent, the cold stage is short and feeble, and the crisis and defervescence are proportionately undecided and uncertain. The remittent degree of climatic fever approximates, indeed, to the forms of continued fever in which the rigor is a mere survival of the great cold fit of intermittent; the initial rigors even of pneumonia are little more than formal, and the hot stage of the process is practically the whole. It would thus appear that the vaso-motor constriction, upon which the phenomena of the cold fit depend, is the due accompaniment of a certain moderate degree of upset in the thermogenic nerve-mechanism; the paradox of the body shivering while its internal heat is rising is after all a paradox, and not an antagonism. The severer types of climatic fever are those in which the primary shock has been most severe or least well sustained. "Degrees of fever," says Ferguson, "might be almost measured by degrees of solar heat, from the agues of Lincolnshire to the malignant remittents of the West Indies."

The periodicity of agues is a reflex of the normal periodicities of the bodily heat; in health the temperature rises to its highest point in the course of the afternoon and falls to its lowest a little after midnight, and in a typical intermittent these are usually the

¹ "There is no *a priori* reason," says Foster (*Text-book of Physiology*, p. 377), "positively contradicting the hypothesis that the metabolism of even muscular tissue might be influenced by nervous or by other agency in such a way that a large decomposition of the muscular substance, productive of much heat, might take place without any contraction being necessarily caused. If we were to permit ourselves to suppose that the contractile material whose metabolism when resulting in a contraction gives rise to so much heat, could undergo the same amount of metabolism, in so far a different fashion that all the energy thereby set free took on the form of heat, variations in the temperature of the body, at present difficult to understand, would become readily intelligible."

hours when a paroxysm begins and ends respectively. These normal maxima, and minima of the body's heat within a diurnal revolution are probably in their origin an adaptation to the periods of labour and rest, both muscular and digestive; but the habit is an ingrained one, and it obtains when the ordinary round of work and repose, of waking and sleeping, is departed from. In short, it follows the sun and not the vicissitudes of human occupation. Again, the periodical recurrences of the febrile paroxysm appear to follow the lunar intervals. In the United States an ague is observed which has only a weekly paroxysm; and the quartan of northern latitudes is the bi-weekly interval. Tertian and quotidian agues would not of themselves suggest lunar periodicity, but they are related to the types with obvious lunar intervals. The "critical days" of continued fevers, which were closely observed in former times, have been brought with much ingenuity under a law of cosmical periodicity. It is observed in climatic fevers that, if there be an interval of one or more weeks in which the paroxysms are in abeyance, the next succeeding paroxysm will occur at its due time, and that various minor indications of constitutional disturbance in the interval (perhaps neuralgias) will have marked the periods when the full paroxysm should have developed.

It is necessary to pass over the changes in the blood and in the secretions which accompany the febrile paroxysm. In ague there is a remarkable production of free pigment traced to the red blood-disks, which accumulates in the spleen, the bone-marrow, and elsewhere. The spleen undergoes also an enlargement, and so does the liver; these are permanent where the malarial cachexia exists. The malarial cachexia, marked by hydræmia and lassitude, occurs most frequently in those who reside on a waterlogged soil, and are permanently subject to the difficulties of heat-regulation during their work which an atmosphere saturated with watery vapour entails. In such cases there may be no febrile paroxysms from first to last, but a state of adaptation of the body which is at once a disease and almost an ethnological character.

Dysentery.—It is universally admitted that the causes which produce intermittents in one man of an exposed party may produce remittents in another, dysentery in a third, and abscess of the liver in a fourth. The incidence in the form of dysentery is apparently capricious; we have simply the fact that, in a certain proportion of cases, the shock resolves itself into a profound disorganization of the function of the great intestine, which may pass off in a few days or become chronic. The dysenteric seizure is most frequent where there is extreme atmospheric moisture as well as extreme heat, and where the surface of the body is most directly exposed. The region of the loins is somehow a region of great liability, just as the head is, the urban or pith helmet and the loin-cloth of hot countries being the indications of these liabilities. One important point of difference between dysentery and intermittent and remittent is that the former disease runs its course in one attack, whereas in the latter there is the remarkable habit of repetition. The return of the ague paroxysm is an evidence that the disorder is fundamentally one of the nerve-centres; it is an instance of the "memory" or "habit" which disordered nerve-mechanisms are peculiarly apt to fall into and to retain. In dysentery the disorder is localized; it is not so much central as peripheral. Whoever has had dysentery once is apt to have it again, and it may become chronic from the first seizure. But it has obvious points of difference from climatic fever, and these differences are associated with the localized incidence of the primary disturbance.

Dysentery may arise under other circumstances than exposure to tropical heat and moisture and to tropical chill, as in wars and famines, in cold, and amidst privations and overcrowding. In such cases it is correlated rather to typhus fever than to malarial, but it is probable that there is the same kind of primary effect produced through the nervous mechanisms as when the vicissitudes of a tropical climate are the cause. Again, the dysentery of slave-ships (formerly) and of coolie-ships (at present), in tropical waters, would appear to be a mixed effect.

The effluvia from dysenteric dejecta (or water contaminated by the dejecta) appear to have the power of exciting, in persons who have not been directly exposed to the causes of dysentery, either dysentery itself or some vicarious infection, such as typhus fever or yellow fever, according to the source of the dejecta, or the kind and degree of putrefaction which they had undergone, or according to racial differences in the exposed persons. This question belongs to another part of the subject.

Tropical Abscess of the Liver.—This is intimately associated with dysentery in its causation; it may be either a primary effect, as it were, instead of dysentery, or it may be an after-effect of one or more attacks of the latter. The primary effect has been dwelt upon by some, and the after-effect by others (notably W. Budd), but there is really no antagonism between them. As a primary effect tropical abscess of the liver is closely parallel with tropical dysentery and with malarial fever. It is not the effect of heat by itself, but of chill as the sequel of great exposure to heat. Solar heat is trying to the hepatic function, there being an increase of bile; when the organ has been thus overtaxed it is sensitive to the vicissitudes of

heat and cold. It is pointed out by Dr James Johnson (*The Influence of Tropical Climates*, p. 177) that genuine hepatitis is even more frequent in the Carnatic, with uniform but high temperature, than in Bengal with a more variable and damp climate. "The casual visitor may well wonder how cold can be often applied on the burning coast of Coromandel, where the temperature is high and steady by day, where the nights are, for months together, hot, and seldom raw or damp as at Bombay or Bengal. . . . The European soldier or sailor, exhausted by exercise in the heat of the day and by profuse perspiration, strips himself the moment his duty is over, and throws himself down opposite a window or port to inhale the refreshing sea-breeze, his shirt in all probability dripping with sweat," and the consequences are likely to be an attack of hepatitis or abscess of the liver. A slight abstraction of heat completely upsets the organ which had been most taxed under the particular climate; the incidence is not so much upon the heat-regulating central government as upon a most important member of its executive. As the sudden abstraction of a small amount of heat from a fatigued and perspiring body can produce an extravagant discharge of heat-producing force, or a paroxysm of fever, by touching the nerve-centre, so it can produce a peripheral effect in the most important of the heat-forming organs, which had under the special circumstances been overtaxed in its function. But the effect on this peripheral part of the heat-producing mechanism is not, for the most part, an increased production of heat as in fever; it is, in fact, local congestion of blood and suppuration. When the strain falls on the central government the effect is fever; when the strain falls on an important member of the executive the effect is inflammation.

Pneumonia.—Congestion of the lungs and pneumonia are not unfrequent accompaniments of remittent fever in India, especially in those whose health had been previously enfeebled, and among the more ill-clad natives. Pneumonia is liable to occur in those who had been acclimatized to heat, on their exposure to unusual degrees of cold, as among the negroes in the United States. It has been also observed to become widely prevalent, and in a form which amounted almost to pneumonia pure and simple, among the troops from India employed in Afghanistan in 1838-39, and again in 1878, when they were exposed to the winter cold.

Pneumonia is indeed an effect of chill proper to higher latitudes, just as intermittents and remittents, dysentery, and hepatic abscess are most characteristically the effects of disorder, either central or peripheral, in the heat-regulating mechanism as adapted to tropical and sub-tropical conditions. That pneumonia is nearly always caused by chill is generally believed (the pneumonias of contagious origin being excepted); but it may not be so readily admitted that we have here to deal with a disorder of the heat-regulating mechanism. Pneumonia is, at all events, a fever; it has an initial period of rigors, more pronounced than in most continued fevers, although far behind the cold fit of intermittent; the pyrexia is sometimes present for some hours before the other symptoms become marked; it usually comes to an end abruptly some time before the consolidation of the lung is all cleared up; and that crisis in the disease is apt to fall within a week of the onset, and is seldom delayed more than a day or two over the week. The stress of this disease falls upon the lung, usually upon one lung, and more particularly upon the lower half of the lung. Leaving, for the present, the question why the lung is in this case the organ of metabolism upon which the stress falls, let us consider the nature of the pulmonary condition.

First, there is engorgement of blood, a condition which is due, according to all analogies, to paralysis of the vaso-motor nerves. The abundant capillary vessels round the air-cells are greatly distended with blood, and the mucous membrane of all the bronchial tubes is also much injected. Accompanying this state of the pulmonary circulation there is more or less obvious distress of breathing, or dyspnoea, together with a strong, full, and quickened action of the heart. If the action of the heart be weak and the distress

of breathing great it is a sign that the shock has been more severe than the patient, as he is then circumstanced, can stand, and death may result merely from congestion of the lung. Usually the extreme congestion of the vessels is relieved by exudation from them into the air-cells which they surround; if the patient should die at this, the second stage of pneumonia, the lung, or lobe of the lung, is found to be solid enough to sink in water; it is still red, as in the stage of engorgement, but the cut surface is firm, and under a lens looks to be finely granulated. Each little granule corresponds to an air-cell,

FIG. 55.—Pneumonic lung, stage of red hepatization; alveoli occupied by fibrinous threads and a few cells.

the air-cell no longer containing air, but a solid coagulum consisting of numerous threads of fibrin, with a homogeneous plasma as the basis, and a few red blood-disks and white blood-corpuscles (fig. 55). The whole of this is an escape from the overloaded blood-capillaries. The lung is just one of those organs where such an escape from the blood is possible; the engorged vessels are distributed as a plexus over the thin walls of air-filled spaces, and the fluid part of the blood, together with a certain proportion of its solid particles, passes through the walls of the vessels into the air-space. If the lung be examined from a case of pneumonia fatal a day or two later, or in the third stage, it is still solid, but the redness is mottled with grey, or has become uniformly grey.

The number of round nuclear cells in the air-vesicles has increased enormously, usurping the place of the fibrin and plasma (fig. 56). There is no good reason to suppose that this enormous accumulation of cells is due to successive additions of colourless corpuscles from the blood; they are now, many of them, much larger than the blood-cells, and we may take it that they are the product either of subdivision of the few original blood-cells or of the epithelium of the air-vesicles. The solidity now begins to give way, the contents of the air-vesicles undergoing a mucoid or other disintegration, and they are gradually removed for the most part by expectoration. In ten days from the onset the lung may have returned to its normal condition.

FIG. 56.—Pneumonic lung, stage of grey hepatization; alveoli filled with cells.

We have now to consider briefly this disease as an error in the heat-regulating mechanism, in which the strain falls upon an important peripheral or executive part. Hepatitis may be taken to be this kind of effect where the chill is a slight abstraction of the body's heat under tropical conditions; pneumonia is this kind of effect where the chill is caught under the vicissitudes of the weather in spring, or in changeable weather generally, within the temperate zone. Why should the liver be the organ of choice in the one case and the lung in the other? It may be said at least that each organ, in the respective circumstances, is the *locus minoris resistentie*. A sudden abstraction of heat is a strain or shock to the heat-regulating centre, and, if the incidence is to be on the executive, it will fall on that member of the executive whose function had been, under the circumstances, most taxed. It is to be remarked that such cases of so-called peripheral incidence are associated with individual predisposition; hence these diseases are generally sporadic. Something in the antecedents of the individual has determined the local character of the effects of chill, whereas the great climatic fevers more uniformly befall those who expose themselves.

Rheumatic Fever.—Rheumatic fever is universally admitted to be an effect of chill. "I know of no other exciting cause of acute rheumatism," says Watson, "than exposure to cold, and especially cold combined with moisture." The conditions, both external and predisposing in the individual, which constitute the peculiar liability to rheumatic fever are nowhere found more distinctively than in the variable climate of the British Islands, and in the habit of body of the people. It is especially a disease of early manhood and womanhood, and of the working class; when it occurs before puberty it is associated in a remarkable way with the liability to chorea.

The onset of the fever is preceded for a few days by general ill health, chilliness, furred tongue, "break-bone" pains, flying pains in the joints, some quinsy, and disturbed sleep. If these symptoms proceed no farther, the patient would be judged to have had a chill, a catarrhal attack, a quinsy, or the like. When the initial upset has been more considerable the pains "settle" in one or more of the larger joints, often the ankles at first, the knees subsequently, or the wrists, elbows, and shoulders. The patient lies flat on his back, not daring to move, and following the objects around with his eyes only. Profuse sweats leak out from time to time, having a peculiar acrid smell, by which rheumatic fever can even be diagnosed. The joints where the acute pain is seated for the time being are swollen, tender, and often red and hot, the swelling being either in the fibrous structures around the joint or in its synovial cavity. The *locale* both of pain and swelling shifts from joint to joint; the disease often "flies to the heart" (pericardium and endocardium), more rarely it "flies to the brain" (membranes). The urine is scanty, high-coloured, depositing brick-red urates, and with an excess of urea on analysis; it is, in fact, the urine of disordered heat-regulation. The temperature is 100° or 101° up

to 104° or 105°, and in some exceptional cases (of "hyperpyrexia") rising to 109° Fahr. There is an afternoon rise of 1° or more, and a corresponding fall in the night. The severity of the case—apart from its danger, which really depends on the pericardial or endocardial part of the disease, or on complications with pneumonia and the like—is measured by the height of the temperature, with which, again, the intensity of the pain in the joints goes hand in hand. The outbreaks of sweat do not follow any obvious law, and they are not "critical," as in intermittents; but they seem to give the patient relief for the time, even if they leave weakness behind. Nine days is considered an average time for such an attack to run its course if the patient be well cared for; but deservence is gradual, and complete restoration to health is often slow, much weakness and anæmia remaining to be made good. Warren, a physician of a former generation, when asked what was the best remedy for rheumatic fever, answered "Six weeks." Relapse is not uncommon, a very slight chill or sudden abstraction of heat sufficing to bring the fever back.

Now if we assume that the occasion of an attack of rheumatic fever is chill—that is to say, a sudden shock or injury to, or disorganization of, the nervous centre which presides over the uniform body-temperature—we enter upon a profoundly interesting problem in following out the constitutional manifestations. Everything points to the mechanisms of locomotion, to the structures and surfaces where muscular work is applied; even the heart, as Watson remarks, is in its perpetual to-and-fro movement comparable to "one of the large joints." There is heat of combustion from some source or another to account for the rise of temperature, which is sometimes enormous; but it is not the heat of work done. We are again confronted with that most fundamental of all the questions relating to fever, the question, as stated by Foster, whether the "metabolism of even muscular tissue might be influenced by nervous or by other agency in such a way that a large decomposition of the muscular substance, productive of much heat, might take place without any contraction being necessarily caused . . . in such a way that all the energy set free would take on the form of heat." Is rheumatic fever one of those cases where disorder of the heat-regulating mechanism falls on an important member of the executive, namely, the muscular system, just as it falls on the liver in tropical abscess, and on the lungs in pneumonia?

Certainly we know of no muscle but the heart itself which The shows appreciable structural changes in rheumatic fever; the heart articula is liable to "myocarditis," as well as to endocarditis and pericarditis, nerves. but, for all other muscles, the changes are in the tendons, ligaments, and synovial membranes only, or, in fact, in those structures by which the work of muscles is applied. These structures have nerves, some of them large enough to be looked for in the dissecting-room, although less is made of them in physiology. The function of the nerves of the joints is not sensory in the ordinary use of the term, but it may be said to be to convey to the centres the *sense of effect* of the work done by muscles. When there is intense metabolism of the muscular substance, but no work done, the same nerves, having no sense of effect to convey, convey an *acute sense of pain*. The pain of rheumatic fever is altogether more acute than in inflammations. In tropical abscess pain is subordinate, and its place is taken by a vague feeling of trouble, or tightness, or weight, or heat in the hypochondrium, and the same substitution is sometimes made for the pain in pneumonia; but in rheumatic fever pain may be said always to be the grand symptom, and a measure of the very remarkable power of recovery. Reversing the maxim which applies to tropical abscess and to the worst cases of pneumonia, we may say of rheumatic fever: "Affert plus doloris quam periculi."

Sweating is the other grand symptom of rheumatic fever. It can hardly be said to be critical for the disease as a whole, because the temperature does not fall; but the joints affected for the time being are relieved by it, and it is critical to that extent. We may, indeed, say that the temperature does not fall because the heat goes on being generated in some other group or groups of muscles in whose joint or joints the pain is next felt.

We may regard, then, the sequence of events in rheumatic fever somewhat as follows. There is an upset of the heat-regulating centre by chill, owing to which an extravagant amount of heat-generating nerve-influence is sent out; this falls, for some reason of the body's habit (inherited or proper to the individual's occupation, or otherwise special), upon the muscular system, whose metabolism produces heat without work; the articular nerves which are ordinarily employed to convey the sense of effect of work done, from the surfaces where the movement is applied, convey, under the changed circumstances of the muscles' activity, a sense of pain. One set of muscles after another generates heat without work, so that one joint becomes painful after another; and, although there are perspirations by which the heat of the body is parted with, other sets of muscles take up the work of combustion in their turn, so that the excessive temperature is maintained. Among other muscles the heart is affected; and, just as in the voluntary muscles the structural effects are in the synovial membranes, ligaments,

tendons, and aponeuroses, so in the heart they are in the pericardium and in the more fibrous parts of the endocardium. But they are sometimes in the cardiac muscular tissue itself, the muscular substance of the heart being peculiar.

The association with chorea may now be noticed. Chorea is not a disorder of heat-regulation, and it is not due to chill; it is a disorderly habit of some nervous centre or centres whereby the ordinary work of muscles is made irregular, and it is due to some feebleness in, rather than to injury of, the nervous mechanism. The considerable liability of choreic subjects to rheumatic fever, the actual endocarditis that they suffer from even if they have never had rheumatic fever, the occasionally observed choreic movements of the muscles in the course of true rheumatic fever in adults, the occurrence of chorea as a sequel of rheumatic fever—all these associated things go to show that the disordered nerve-centre is the same in both diseases, and that the discharge of its force may pass readily from one path to another. It may either set free muscular heat without muscular work, excessive in degree and attended by unique pain in the joints; or it may spend itself in those gratuitous displays of muscular work which amount to chorea.

The foregoing diseases have been regarded as errors of the heat-regulating nervous mechanism. In rheumatic fever we have seen that there is a singular relationship to a truly nervous disorder, namely, chorea. It remains to mention another implication of the nervous system which several of them have in common, namely, an herpetic eruption about the corners of the mouth. Herpes is now accepted as an affair of certain cutaneous nerve-areas; and in malarial fever, pneumonia, and acute attacks of quinsy due to chill there are very apt to be eruptions of herpes labialis. Why the labial region should be involved is not obvious.¹

§ 14.—INFLAMMATION.

The inflammations may be regarded as an empirically made-up group of disordered states which have somewhat in common. Although inflammation is certainly a provisional category, there has always been a tendency to overcrowd it with newly-described morbid conditions, rather than to empty it of its temporary occupants. Whenever pathologists have become impatient to say the last word about the endless perplexities of disease the class of inflammations has become unusually full; this happened in the period of Broussais, when even the specific infections were placed therein, as gastro-enteritis and the like; and the frequent resort to the termination *itis* in more recent pathology may be taken as an evidence of a corresponding habit of mind. Thus there is much fairness in the bold criticism of Andral: "Reçu dans le langage, sans qu'aucune idée précise lui ait jamais été attachée, sous le triple rapport des symptômes qui l'annoncent, des lésions qui la caractérisent, et de sa nature intime, l'expression *inflammation* est devenue une expression tellement vague, son interprétation est tellement arbitraire, qu'elle a réellement perdu toute valeur; elle est comme une vieille monnaie sans empreinte, qui doit être mise hors de cours, car elle ne causerait qu'erreur et confusion." It is at least the duty of pathology to reduce the congeries of inflammations to as small a bulk as possible, to follow up the analysis of the inflammations one after another until they are reduced to the scientific position of errors of the respective structures and functions. Inflammations, indeed, are best regarded as an ever-diminishing residue; there is always the residue, because the correlated structural and functional aspects of the life of the tissues cannot be stated with equal clearness for all of them. It is the great binding tissue of the body that gives occasion for this nosological residue; the connective tissue is the one tissue about whose dual life of structure and function there is a difficulty. We shall appreciate its unique position best by comparing it with so direct a modification of

itself as fat-tissue. But even these phlegmasiæ are capable of some further analysis in the direction of disordered structure and function if we have regard to the functions of the embryonic mesoblast, and to the "memories" of the same that the common binding tissue never quite loses.

The earliest and most fundamental notions about inflammation, and those which pertain to the residue above spoken of, were derived from the external parts of the body when injured by blows, wounds, scalds, the lodgment of foreign bodies, and such-like palpable irritations. Along with simple inflamed wounds were taken cases of erysipelas, a disease which has now become the sole heir of the original Greek name for inflammation, namely, phlegmon. It will be convenient to begin with a brief reference to erysipelas.

Erysipelas.—Besides phlegmonous erysipelas, or diffuse inflammation and suppuration of the cutaneous and subcutaneous connective tissues, there is a common form consisting of redness, swelling, pain, and heat of the surface only, and stopping short of suppuration.

This condition often follows a wound, especially in the region of the scalp or face; it may occur also when there is no obvious wound, although there will probably have been a catarrhal state of the nearest mucous membrane. Fever or constitutional disturbance usually precedes the inflammation twenty-four hours or less, and in this respect erysipelas is comparable to the effects of chill already treated of. Wounds received in a drunken brawl are especially apt to become erysipelatous; also the wounds of those suffering from kidney-disease or liver-disease. Erysipelas is most apt to occur in cold weather with east winds, or in cold and damp weather. One attack predisposes to others. It often arises spontaneously or autochthonously, but it is perhaps equally often induced by contagion and inoculation from pre-existing cases. Of its origin *de novo* from time to time there need be no question; thus, it has been observed in a single individual of a ship's company at sea off Cape Horn. The redness and swelling advance with a well-marked border from the wound or other starting-point until they have invaded, it may be, a large cutaneous area. There is exuded plasma in the spaces of the connective tissue, and there are also nuclear cells (leucocytes) in the lymphatic spaces and vessels, and in the tissue generally. An increase of the colourless cells in the blood is also described. Since attention has been called to the presence of minute living organisms in disease there have not been wanting authentic descriptions of micrococci in the lymphatic spaces of the advancing margin in erysipelas, although they are said to be absent in the older areas of the inflammation, and during the stage of subsidence generally.

In *phlegmonous erysipelas* the connective tissues to a considerable depth beneath the skin are soaked in serous fluid, which becomes turbid, like thin pus; at a later stage the lines of pus extend in all directions along the tracts of binding tissue, fragments of the latter being found as detached shreds in the larger purulent centres. The skin, usually of a limb, may thus become involved over a large area and to a great depth, considerable pieces of tissue falling at once into a state of slough. The temperature is often as high as 105°, and delirium, with other symptoms of nervous disorganization, is common. Death from failure of the heart is probable. This disease is the most extreme form of phlegmon, by far the most formidable inflammation that exists. It is usually the sequel of a wound, but not invariably. Chilliness and all the other symptoms of commencing fever precede the local phlegmon, so that the condition is comparable to those errors in the regulation of the animal heat, previously mentioned, in which the incidence falls upon a peripheral part. That it is itself a local effect of general temperature disorder cannot be maintained, inasmuch as there is usually nothing in the antecedent circumstances to implicate directly the heat-regulating centre. However, it is not the extent of the local injury that serves to account for the inflammation, but the habit of body of the patient, especially the drinking habit. It is not an overtaxed heat-regulating centre that is implicated, but a nervous system overtaxed in more general respects. A peripheral injury, not necessarily a severe one, tells in an unusual way upon the unstable centres, just as in tetanus; and the outgoing response falls in a peculiar way or with a peculiar force upon the wounded part, producing phlegmon there and fever generally. Whether the rise of the body-temperature is mainly due to over-combustion within the injured area is open to discussion. The connective tissue as a source of heat has not hitherto come into our consideration; if it is to be regarded as a member of the heat-producing executive, under the central nervous control, its membership is at least not important except when the redness, swelling, heat, and pain of inflammation are present.

¹ See Senator, *Untersuch. über den fieberhaften Process*, Berlin, 1873 (abstract and criticism by Sanderson, in *Rep. Med. Off. Privy Council*, 1875); C. F. Oldham, *What is Malaria, and why is it most intense in Hot Climates?* Lond., 1871; Cl. Bernard, *Leçons sur la Chaleur animale*, Paris, 1876; Morehead, *Clinical Researches on Diseases in India*, 2 vols., Lond., 1856; Jas. Johnson, *Influence of Tropical Climates*, 4th ed., Lond., 1827.

The same state of the tissues as in phlegmonous erysipelas is brought about, all but the redness of the surface, by a very different cause—the introduction of a minute quantity of *venom*, either the cadaveric venom introduced in a dissection-wound or the venom of the rattlesnake and adder. The bites or stings of many other animals produce more transitory inflammatory effects.

In *common inflammation*, such as follows the lodgment of a splinter of broken glass under the skin of the hand or arm (to borrow Watson's illustration), there is first pain; soon there is redness around the point of entrance, with swelling and heat; the skin becomes of a bright-red colour; the swelling increases, becoming hard and firm at the centre of the inflamed area, and exquisitely tender, or painful to the touch. If these local effects are at all considerable (according to the nature and extent of the injury, and to the susceptibility or habit of body of the individual) there is *inflammatory fever* some hours later. At first there is usually chilliness and feebleness, then there is a general feeling of heat and dryness, with a quick, full, and hard pulse, headache, wandering pains in the limbs, restlessness, some mental confusion, disturbed sleep, a white tongue, thirst, and loss of appetite. If the piece of glass be removed all these symptoms, local and general, may subside quickly. If the source of irritation remain, or even, notwithstanding its removal, if the primary shock has been severe, the symptoms continue and intensify. Relief to the constitutional disturbance comes with the further developments in the injured area—with suppuration or, at the latest, with the bursting or letting out of the matter. Healing then proceeds as described under "repair."

This is the usual sequence of events in common inflammation, in the inflammation of moderate degree in a healthy person. It differs from erysipelas or phlegmon in the important respect that the fever follows the local effects at an interval of several hours. Where the injury is of the most violent kind, as in some machinery accidents, neither the local effects nor the fever are pronounced; the "reaction" is said to be in abeyance, and death is apt to occur from shock. In these cases the face is blanched, the action of the heart and lungs feeble, and the mental faculties profoundly oppressed; the presiding control has been so upset by the injury to even a limb that the forces of the body do not rally.

The heat of an inflamed part is not merely in the feelings of the patient; it is actually several degrees (up to 6° or 7° Fahr.) higher than the temperature of the part in health or of the corresponding part on the opposite side, although it is never above the central blood-heat of health. It is not solely dependent, therefore, on the general state of fever. Neither can it be said that the general state of fever is solely dependent on the increased local combustion. In erysipelas, as we have seen, the general fever usually precedes the local, and must depend upon some general error of heat-making. Again, in a common inflamed wound, the general fever may, and usually does, subside some time before the cellular changes in the part, degenerative or formative or both, have passed their climax.

Implication of the Nervous Control in Inflammation.—From slight inflammations, with little more than redness and pain at the seat of injury, to the most shattering strokes there is a succession of steps. The nervous system is implicated in them all, for the reason that the nerves are everywhere, and everywhere ready to transmit impressions to the centre. It is not surprising, then, that in every doctrine of inflammation since the time of Cullen the events have been largely traced to the direct action of the nerves and nerve-centres. Amidst all the conflicting views taken of the nature of inflammation in current writings, there is agreement on this point at least, that the nervous control has much to do with it,—if not always the central control, yet some local control whose existence would hardly be suspected but for the phenomena of inflammation. The differences of opinion begin when we come to the details of the nervous control. Does the nervous system preside over the action of the vessels only, or does it preside over the whole cellular life or the nutrition of the part? Opinions have had a tendency to range themselves on two sides, corresponding in the main to the more mechanical or to the more "vitalist" conception of life as a whole. The afflux of blood, which every one recognizes as the first conspicuous event in an inflamed part, has been attributed in the latter view to an attraction exercised by the cells of the part, to a hunger for blood comparable to that which causes a determination of blood in an organ that is going to be physiologically active. "The facts," says Alison, "afford a strong presumption that the impressions made on the capillaries, and on the blood contained in them, solicit the flow through them on the principle of a *vital attraction of the blood* rather than of relaxation of the vessels." This is the "solicitation of fluids," the "movement of turgescence" or the "vital erection of vessels" of the older authors. If the needs of nutrition are the ordinary attraction, they may be simulated by such incidents as wounds, scalds, and the like; and it is the peculiarity of inflammation that the incidence of these is on a tissue whose physiological interest is ordinarily of little or no account, namely, the common binding tissue. It is with justice that *Kindfleisch* emphasizes the intimate connexion between the common binding

tissue and the peripheral nerves and nerve-plexuses. "They run exclusively in the connective tissue; in it they divide and form plexuses, which ultimately join, without any definite demarcation, with the network of connective-tissue corpuscles. Their distribution in the connective tissue designates these nerves for some definite function; they are admirably adapted to play a part in the general physical and chemical changes of the organs, to give information of the same to the central nervous system through their corresponding states of excitation. With the connective tissue they participate in the most intimate structure of organs, with the connective tissue they are stretched and pressed upon, with it also they suffer those chemical excitations which any considerable accumulation of waste matters brings with it." Now, it is known from numerous experiments that, if a nerve of common sensation be stimulated, the outgoing-response from the centre is by way of removing the tonicity of the arteries of the part, so that they dilate and transmit much more blood. This outgoing influence is assumed to travel by a special set of fibres called, for convenience, "depressor fibres," because the effect has been to take off the tonic contraction of the arteries. The same effect is strikingly seen (although it is there accompanied by a conscious mental state) in the rising wattles of a cock, for which class of erectile effects the nerves are called "nervi erigentes."

But if this kind of turgescence is the best physiological analogy for the redness of inflammation it goes but a little way with us into the morbid condition. The tonic contraction of the arteries is no doubt taken off, and the vessels become distended with blood passing through them; but the next event is peculiar to inflammation,—the current of blood becomes slower, slow even to a stop in some of the numerous cross-channels of the capillaries. There is nothing in the mechanics of the circulation to account for this dallying of the blood at the seat of injury. The further discussion of the subject will be made easier by a reference to slight degrees of inflammation set up experimentally in transparent and delicate parts where the process can be watched through the microscope,—in a piece of frog's mesentery drawn out through an aperture of the abdomen, or in the everted membrane-like tongue of the same animal. When the microscope was first applied to the study of inflammation these same effects were often observed by Paget and Wharton Jones in the wing of the bat, an animal which has the advantage of being comparatively warm-blooded.

Experimental Study of Inflammation.—The frog having been Experimentally paralysed by curare, a loop of the intestine is pulled out through a rent in slit in the abdomen, and its mesentery stretched over a ring of inflammation-cork, so that the light may be reflected to it from the mirror of the microscope. It hardly wants an irritant, such as a drop of weak acid, to produce the inflammatory effects on this thin membrane; mere exposure to the air suffices. In ten or fifteen minutes the arteries begin to dilate and then the veins, and the vessels go on dilating for the next two hours, when they will have reached about twice their ordinary calibre. They remain so dilated, and in an hour or two the current of the blood becomes slower in them. In the older observations on the bat's wing acceleration of the current through the dilated vessels was first noted; then came the transition to the peculiar inflammatory action, namely, slowing of the current, the vessels still remaining dilated. This slowing of the stream is most obvious close to the injured point, where there may be complete stagnation in the capillaries, the crowded corpuscles giving the central area a brilliant carmine appearance. Farther away from this area the streams are more rapid; and at the farthest limits there is the unusually full and rapid flow of normal hyperemia. The fulness of these dilated vessels exhausts their elasticity, so that the pulse-wave of the blood, which should be felt only in larger vessels, becomes perceptible also in the smallest.

In the area of retardation in the frog the blood-disks and the white corpuscles cling to the sides of the capillaries and small veins, instead of forming, as usual, a procession in the central line of the tube. Most of all do the colourless corpuscles adhere to the walls, in the experiment on the frog, until they form a kind of outlined mosaic on the side of the vessel. Then, if a particular spot be watched for several hours continuously, it will be found that some of these cells have actually worked their way slowly through the wall of the small vein. This is the important phenomenon of emigration of the cells of the blood, known to Gendrin and W. Addison, accurately followed by Waller, and rediscovered by Cohnheim.

Incontinence of the Vessel-walls.—The incontinence of the vascular walls in inflammation is proved, not only by this emigration of cells from the small veins, but also by the escape of red blood-disks from the capillaries, and by the familiar and old-established fact of exudation of the fluid part of the blood,—the plasma or serosity. In the words of Alison: "First, the surrounding textures are loaded with a serous fluid; but gradually change take place in this fluid, which indicate that other constituents of the blood have exuded from the vessels; or part of the fluid effused assumes a gelatinous consistence, and forms flakes or layers which gradually become solid. In the semi-fluid matter first effused, according to Gendrin and others, decolorized globules of the blood may often be per-

Common inflammation

Nervous control in inflammation

ceived; and in many cases globules of pus, known by their larger size and freer motion on one another (and, when observed in mass, by their yellow colour), soon appear in this effused matter; and it assumes more or less rapidly, and more or less generally, the form of purulent matter. . . . Along with the semi-fluid lymph effused in the earlier stage of inflammation there is often extravasation of the colouring matter of the blood, and sometimes of entire blood." This, then, is the central fact of inflammation,—the incontinence of the vessels and the exudation from them.

Addison adopted the theory that the pus of inflammation was nothing but the colourless cells of the blood that had been washed out with the plasma; and that doctrine has been revived by Cohnheim with little or no reserve. There have been serious objections to this doctrine of the origin of pus; practical surgeons have always failed to understand how all the pus could come from the blood, which has not only a mere trace of colourless cells in it, but, moreover, contains neither more nor less of these cells during suppuration than at other times. Again, in cases of leukaemia, where the number of them is enormously increased, the course of inflammation does not appear to be affected thereby. Lastly, it is pointed out that we cannot infer altogether fully from the extremely susceptible transparent membranes of the frog to the subcutaneous and other connective tissues which are the usual seats of the inflammations met with in practice. So far, then, we are justified in admitting only the incontinence of the vessel-walls, the escape of some colourless cells, and of plasma, the latter yielding fibrin under some circumstances, in combination with the paraglobulin and the ferment known to reside in the white corpuscles.

The cause of the incontinence of the vessel-walls naturally engrosses attention. In an experiment of Cohnheim's a similar condition was produced in the vessels of the frog's tongue by ligaturing the tongue bodily at the root, so as to stop the circulation in it altogether. If the ligature were kept on for six days the tongue began to mortify, and the circulation showed no power to re-establish itself; if it were removed after forty-eight hours the current slowly resumed its flow, the arteries returned from their dilated condition, but not the veins, and the colourless cells began to escape from the latter; on removing it after twenty-four hours only, the circulation quickly resumed its normal course without any transient emigration of cells. The conclusion was that the walls of the vessels suffered a certain loss of "integrity" if the circulation through them were stopped beyond a certain limit of time, and this loss of integrity seemed to be analogous to the alteration of the vessel-walls under the blow of an inflammation. On the other hand, it has been pointed out that not the vessel-walls only, but the cells in closest proximity to and in intimate nutritive relation with them, are affected by the stroke of inflammation; where such cells have processes, and can be seen, they are found to draw in their processes under an irritant. In the exposition of Cohnheim, however, these changes in the cells of an inflamed part are not admitted to be other than regressive or passive; according to him, the walls of the vessels only are affected, and affected in their molecular constitution.

Suppuration. *Suppuration.*—We have seen that there still remains the difficulty of accounting for the large quantity of pus; and it will probably be found that to account for the pus we shall have to ascribe a more than passive attitude to the connective-tissue corpuscles of the inflamed area. Where the suppuration is diffuse, as in phlegmon, and still more where it is discontinuous, as in secondarily inflamed lymphatic glands, it is not to be supposed that the pus is a mere aggregate of blood-cells brought thither. Something from the primary seat of inflammation has caused the more distant parts, whether they be continuous or discontinuous, to take on the inflammatory and suppurative action; but it is quite clear, if we examine a lymphatic gland beginning to suppurate, that its own cells yield the pus. There has been an *action of presence* on the parenchyma of the lymphatic gland; and it will be difficult to account for the production of pus in acute primary inflammation without assuming the same action of presence. In inquiring after the catalytic agent suspicion falls on the substances exuded from the vessels, and mostly upon the emigrated colourless cells. Suppuration, when it occurs, is subsequent to and secondary to the exudation. When no suppuration occurs, as in what is called *adhesive inflammation*, which is the commonest kind on free surfaces, the exuded blood-plasma simply coagulates, forming a fibrinous layer, in the meshes of which are a larger or smaller number of colourless blood-corpuscles. In the further development these blood-cells are probably themselves the active elements; they produce the tissue of adhesions, which is a form of the tissue of repair. In situations which are not free surfaces—that is to say, in the subcutaneous tissue, or more generally in the tracts or planes of the common binding tissue—the exuded substances are less apt to coagulate or to take the adhesive fibrinous course. It is in these deeper situations that we ordinarily get appuration, an event subsequent to exudation and undoubtedly dependent thereon. It is true that "inflammation" may be excited on the surface of articular cartilages and in the cornea, where there are no blood-

vessels to yield an exudation; but the inflammation is not of the ordinary kind, and in particular there is no true suppuration until the nearest blood-vessels have projected their system as far as, or close up to, the irritated area. Artificial keratitis has been the chosen ground of controversy to determine whether it is the vessels, or not rather the cells, of the part that are primarily and actively concerned in the inflammatory process; but it will probably be found that the two sides of the controversy correspond to two different sets of facts. The transparent superficial ulcer of the cornea has hardly anything to do with inflammation; it does not suppurate, although there is some formative action in the cells of the part to enable it to heal. Whenever there is true inflammation of the cornea it is accompanied by or preceded by extension of the nearest vessels to the transparent and non-vascular surface.

Changes in the Connective Tissue.—In the events of true inflammation, therefore, exudation from the vessels precedes suppuration; and it can hardly be doubted that they are cause and effect, to the extent, at least, that exudation is a necessary antecedent. At the same time the connective-tissue cells of the part can hardly have escaped that molecular injury, or injury to their nutrition, which the elements of the vascular wall would appear themselves to have suffered; they are, as Rindfleisch points out, intimately bound up with the plasmatic circulation or the ultimate diffusion of the juices; they are in closest relation with the terminal nerve-plexuses; and, histogenetically, they are the remains of that "parablastic" embryonic tissue from which the blood-channels themselves were made. It would be surprising, indeed, if they escaped the shock which had deeply affected the integrity of the cells in the vascular wall. A concurrent alteration, at least, must be postulated for them; but that can hardly account for more than a preparedness in them to form pus. According to Stricker, the elements of the connective tissue revert to an embryonic character before pus is formed from them. If the hardness of the central core of an inflammation under the skin be analysed, it will be found to depend, says Stricker, upon the following things: the tissue is thickened, the network of cells in it is swollen, the intercellular substance is reduced, the network of cells has broken up into independent pieces of nucleated protoplasm. This is the swelling of the tissues which precedes abscess-softening; it is essentially a return to a more protoplasmic and less fibrillar state, and accordingly to a more embryonic state. Of this power of reversion to an embryonic state, which the common binding tissue of the body retains as a memory of development, we have already had illustrations in the processes of repair, of tumour formation, and of cancerous infection. In all these cases the tissue falls back upon a more elementary condition, or we may say that it retreats to broader ground, where, however, it cannot stand still. Its special destiny is settled for it in each case by the circumstances, and, for the particular case of inflammation (as distinguished from the process of repair), its special destiny is to form pus. If the analogy adduced in the section on "repair" has any value, pus is the by-product of a kind of blood-making from the embryonic cells, a hæmatoblastic activity in which no red disks are formed, but only pus-corpuscles and a fluid, the corpuscles standing for the residual nucleus of the hæmatoblast (with evidence of cleavage in it) and the *liquor puris* for both the red disks and the plasma. This hæmatoblastic doctrine of pus would correspond, in form at least, to Hunter's conjecture that "the new-formed matter peculiar to suppuration is a remove further from the nature of the blood." So long as the intensity of the process lasts, the connective tissue uses its reacquired embryonic powers only to make pus; when the effects of the blow have subsided (or if they have been from the first slight, as in the reparative process) the formative powers of the tissue make granulation-cells and new blood-vessels (including even new blood within the vessels), and so the incident ends in repair. The pus of a granulating surface would thus differ from the pus of acute inflammation only in degree. In like manner, common inflammation with a moderate degree of fever differs only in degree from phlegmon, or diffuse suppuration, with its peculiar fever. The diffuse suppuration of phlegmon is the case where the infection or action of presence extends by continuity along the tracts of connective tissue; the implication of lymphatic glands (it may be at the outset) is the case where the infection is carried to a distance by the lymph-drainage of the tissues. Contrasting with such cases, the area of suppuration in a healthy subject (where there has been no extrinsic poison introduced) is a limited one; but, however limited the focus, it seems necessary to resort to infection of the connective tissue for an explanation if the exuded fluid turn to pus or the inflammatory swelling turn to abscess. It is in this sense that every inflammation may be said to be infective.

Assuming, then, that pus-formation is due to an infective influence impressed upon the protoplasmic connective tissue, and knowing, as we do, that the exudation from the blood-vessels is an invariable antecedent, the rôle of infecting cells would precisely suit those elements of the exudation about whose share in the inflammatory process there has been much controversy, namely, the emigrated colourless cells of the blood. As a material contribution to the pus all the cells that escape from the blood would go but a little

way; as infecting cells they might be the agents of much suppuration, and, through their wandering propensities, of suppuration at discontinuous points. They would thus have a power in inflammation analogous to that which has been claimed in a former section for catarrhal and other epithelial cells of a mucous membrane (or of a gland) which had found their way into the supporting connective tissue.

Among the things that determine the degree and course of an inflammation, besides the kind and extent of the injury, may be mentioned the florid or anæmic habit of body, the gouty habit, the alcoholic dyscrasia, the diabetic cachexia, the scrofulous inherited constitution, and the syphilitic taint. There are even cases where the predisposing cause is, as it were, strong enough to dispense with all but the slightest exciting cause; where, accordingly, the inflammation would be called idiopathic. But, however much the "crisis" of the blood or influence of the nerve-force may determine the degree and kind of inflammation, it is clear that the stagnation of the blood, the incontinence of the vessel-walls, the exudation, and the suppuration may all follow an injury where the crisis and the general nervous control are perfectly normal. The significance of micro-organisms in the inflamed area must be judged from the same point of view; all the events of inflammation may happen without them, but they may help to determine the kind and extent of the inflammatory effects.¹

§ 15.—INFECTIVENESS.

One of the most dreaded results of a wound, or an inflammation from other causes, happily rarer in modern surgical practice than in former times, is pyæmia, septicæmia, or purulent infection. About a week, more or less, after the injury, the patient has a shivering fit followed by a perspiration; he may feel comparatively comfortable for a time, but there soon begin to be grave symptoms of constitutional disturbance. He becomes uneasy, has pains in the limbs, a weak and quick pulse, fever, loss of appetite and thirst, a dry and brown tongue, a somewhat jaundiced skin, and sometimes diarrhoea. The shivering fit returns at intervals followed by the sweating, the temperature rising to a great height and falling rapidly to a corresponding degree. Death usually ensues, sometimes not for two, three, or four weeks, being preceded by muttering delirium and unconsciousness. A curious symptom accompanying these phenomena is the sweetish odour of the breath. Meanwhile the wound, where there is one, will have ceased to discharge pus freely, becoming dry and brownish and yielding only a thin ichor; at a distance from the wound one or more joints may become swollen and painful, or an abscess may form at one or more points under the skin, or there may be pustules and discoloured patches on the skin.

In the examination after death the secondary abscesses may be very various in their seat, oftenest perhaps in the lungs, under certain circumstances in the liver, or in one or more joints, or in the substance of the heart, or at the back of one or both wrists. The parotid glands are peculiarly liable to diffuse secondary inflammation. In a class of cases called septicæmia for distinction, no secondary inflammations or products of inflammation can be discovered anywhere; in these cases the periodical shivering fits are not marked, although there may be profuse sweatings from time to time. In another class of cases, to which Paget has called special attention, the course of the disease is very protracted, being marked by relapses from time to time; and the chances of recovery are found to be in proportion to the chronicity.

In the pathology of these cases attention has always been fixed on the state of the veins leading from the wounded part, and of the blood in them. The old doctrine was that the veins secreted pus from their walls, which was carried into the blood-stream. This pre-microscopic opinion has given way to the modern doctrine of thrombosis and infective embolisms elaborated by Virchow. Not only the veins leading from an external wound, but the veins of the uterus after delivery, and other internal veins under various circumstances, may become lined by a layer of coagulum, or even blocked in their entire lumen; the coagulum undergoes puriform (although not purulent) degeneration; pieces of it, or molecular

particles of it, get washed off, carried into the blood-stream, and lodged as emboli in the small vessels of a terminal vascular area of the lungs or other organ or part, where an unhealthy form of inflammation arises secondarily. These events will become more intelligible by reference to a particular case.

A woman undergoes an operation for internal piles—secular dilatations of the inferior hæmorrhoidal veins. The hæmorrhoids had been ligatured, and for some reason there ensues an altogether unusual course of events. In a few days the patient has symptoms of pyæmia, and death follows in a fortnight. At the examination the inferior mesenteric vein, all the way up from its ligatured inferior hæmorrhoidal branch to where it joins the splenic on its way to the liver, is found much dilated, lying along the left side of the lumbar vertebrae as thick as the little finger, of a greyish appearance externally, and filled with greyish puriform detritus. In the liver, to which this vein conducts, there are a number of inflammatory centres, some of them merely dark-red or livid circular areas, others of them purulent centres or true pyæmic abscesses.

In this case the wall of the ligatured vein had taken on some action which had affected the clot formed naturally within it; instead of the clot organizing, it had become a semi-fluid mass of puriform detritus; it had extended by continuity far up the main trunk of the inferior mesenteric vein, the puriform softening following it; particles or larger pieces of this unnatural clot had passed into the portal vein, and had become impacted in certain capillary territories of the liver, where they had infected the elements of the part (probably the connective tissue exclusively) to take on an inflammatory and suppurative action.

It is questioned by some whether there may not be a class of pyæmic and septicæmic cases in which no thrombosis (with puriform softening of the thrombus) of peripheral veins occurs; but it cannot be doubted that this kind of thrombosis, and the discharge of particles or pieces of the thrombus into the general circulation, are very general accompaniments of pyæmia and septicæmia, puerperal and other. The interest centres in the state of the vein-wall, which causes the blood to clot within it, where it would not otherwise have clotted, and causes the clot to undergo a puriform degeneration, or to acquire an infective power. The state of the primary wound must be held answerable in general for all the secondary events, from the thrombosis onwards. In the wound the ordinary products of inflammation cease to be formed, and, instead of them, there is an ichorous foul-smelling discharge, or a dry and semi-gangrenous condition of the parts; whatever this action may be, it communicates itself to the walls of the vessels, and the thrombosis (with detachment of the puriform particles) follows.

There are certain well-understood circumstances in which wounds take on such an action: the crowding of a number of cases of suppurating wounds in a limited space without adequate attention to the removal of the putrid discharges from the wounds, great nervous prostration of the subjects of wounds, the coexistence of kidney-disease, and such-like constitutional states personal to the case. The situation of the wound or exposed surface comes also into account; thus injuries of the bones (as in compound fractures), and especially injuries of the cranial bones, are more liable to take the pyæmic direction. Above all, the surface of the uterus after delivery, or contused wounds of the labia, or other lacerations, will take on an unhealthy action, either from the circumstances of the patient, or owing to a very minute quantity of infective substance (cadaveric or other) having reached it from without, or from the putrescence of portions of retained placenta. The liabilities of child-bed are increased by the circumstance that the blood in the puerperal condition is unusually liable to clot in the veins, even when their walls are in good condition, and also by the fact that the venous sinuses of the uterus after delivery are such as to afford opportunities for stagnation of the blood in them (unless the vigorous contraction of the organ have practically obliterated them, in which respect they resemble the venous sinuses of the dura mater).

Experimental Septicæmia.—The injection of small quantities of putrid substance into the circulation in animals, such as the dog, produces symptoms of septic poisoning corresponding somewhat to the symptoms as observed in practice. In this experimental septicæmia, as well as in the septic processes of man, there are many facts to show that bacteria are concerned. How these micro-organisms are concerned is another and much more difficult question. According to one view the lowered vitality of the tissues in a certain class of injuries, or in the injuries of a certain class of subjects, gives these ubiquitous organisms their opportunity. In this view the organisms initiate nothing; they are incidental to the morbid state of the tissues, and their presence in large numbers is rather the index of the liability to septic infection than the cause of any septic infection that may occur. The most extreme claim made for these organisms in purulent and septicæmic infection (as well as in erysipelas, ulcerative endocarditis, and diphtheria) is that their physiological activity (if not even their mechanical presence) determines the nature of the morbid process, including the tissue-changes, the type of constitutional disturbance, and, in general, the development, course, and termination of the infection. In judging

¹ See Paget, *Surg. Path.*; Simon, "Inflammation," in Holmes's *Syst. of Surg.*, vol. i., 2d ed.; Sanderson, *ib.*, vol. v.; Cohnheim, *Neue Untersuchungen über die Entzündung*, Berlin, 1872; Stricker, *Vorles. über allg. und exper. Pathologie*, Vienna, 1878-83, and in Ashurst's *Internat. Encycl. of Surg.*, vol. i., Philad. and Lond., 1882; Van Buren, *ibid.*

between the two extreme positions it should be remembered that there is nothing morphologically distinctive in these organisms found in diseased or injured tissues, that their so-called physiological activity in disease is merely begging the question, and that their mechanical presence, even if they were always present in sufficient numbers, has not yet been brought into any intelligible relation with the symptoms and the morbid anatomy. On the other hand, there cannot be the slightest doubt that one of the greatest desiderata of surgical practice is to keep them out of wounds (see SURGERY).

Tumour-infection.—This subject has already been treated of in the section on "cancer," but it will be convenient to add a few remarks on the parallelism between tumour-infection and purulent infection. In both cases we have a primary seat of morbid action and a secondary infection, and in each case the seats of secondary infection correspond on the whole closely. The closest correspondence is perhaps with sarcomatous tumours, which have the same relation to veins that primary infective inflammations have, and the same predilection for the lungs. Again, where the liver becomes the seat of secondary tumours, the first steps of the process of infection are on the whole parallel with those that may be observed in multiple abscesses of that organ, that is to say, the liver-tissues at a number of points undergo changes which are practically simultaneous within a certain radius, leading to a circumscribed abscess in the one case and to a circumscribed tumour-nodule in the other. Both the abscess-area and the tumour-area may be found at half-way stages of their development, the former being often recognizable in the section of a pyæmic liver as a somewhat livid circular spot. In the tumour-process the morphological characters are always very definite, and the exciting agent has plainly come from the primary disease, carrying the structural marks of the primary disease in it. The primary inflammatory process wants the definite structural characters of the primary tumour-process, and still more does it want the endless variety of the latter; but it is still a textural process of the body, and its secondary processes are like it. The tumour-analogy, therefore, is strongly in favour of the idea that purulent infection, and inflammatory infection in general, has an autochthonous origin in the life of the cells and tissues.

Melanone infection. **Melanosis.**—The term "melanosis" is used in pathology in at least two distinct senses. It is applied, in the first place, to the generalization or secondary extension of a primary tumour (usually sarcomatous), containing black or brown pigment; and, in the second place, it has reference to a remarkable generalization or widespread deposition of black pigment in the bone-marrow and elsewhere in the horse, particularly in those horses which are apt to lose whatever hair-pigment they may have had. Each of these two very different cases has its interest for general pathology.

The generalization of a melanotic tumour, even a very small one, is one of the most remarkable facts of infection. It is not unfrequently seen in the case of the spindle-celled sarcomatous tumours which grow from the pigmented connective-tissue cells of the choroid tunic of the eye (not the choroidal epithelium of the retina). In such cases the primary tumour is serious enough from its pressure effects, but it is infinitely more serious from its infectiveness. The liver may be full of large tumour-masses, black throughout or in part, and there may be other secondary growths elsewhere. Even more striking is the generalization which is apt to ensue from a subcutaneous melanotic sarcoma, or from a small spot of pigmented new growth on the basis of an old pigmentary mole, or nævus, or mother-mark (melanotic alveolar sarcoma). The secondary tumours occur at other points under the skin, often widely remote from the primary, and in the axilla, in the membranes of the spinal cord, in the liver, in the lungs, and even on the serous membranes. We have here to do with the ordinary considerations of tumour-infection, as already spoken of; but the presence of pigment in the cells and partitions of the new growth raises a further consideration. If we collect all the secondary tumours from a case where infection has been extensive, and express from them all the pigment, we should get a very considerable quantity, perhaps half a pint, of a thick black fluid not unlike printers' ink. The source of all this pigment has been perhaps a small speck of melanotic tumour-tissue in the skin, or, to mention a particular case, in the granulation-like tumour-tissue in the bed of the thumb-nail after an injury. How is it that from so small a source so much of this black substance has been produced?

The pigment is, of course, contained within the individual cells of the secondary tumours; these cells are a mimicry of the primary tumour-elements, and, as they reproduce the form and size of these, so also they reproduce their pigment-granules. So stated, there is nothing remarkable in the quantity of black fluid that may be collected from a case of generalized melanotic sarcoma. The primary tumour impresses the type of its own life upon a number of distant centres of cellular activity, so that these grow to be tumours, their cells at the same time becoming each a laboratory for the manufacture of pigment, extracting it from the blood for their erratic purpose. The true suggestiveness of these events is really in the way of analogy for another class of infections. It is often

said that, in an infection like smallpox, the virus must be an independent living-organism, because it multiplies within the body during the evolution of the disease, the body which had received a most minute quantity of virus becoming in its turn a centre from which a thousandfold of the virus may issue. But, if a small speck of melanosis may yield half a pint of inky fluid by so impressing the cells of the body that they become so many laboratories of black pigment, then we can understand how, in smallpox, the cells of the skin at many points become laboratories in like manner, not indeed yielding black pigment, but supplying that which has to the primary contagion of a case of smallpox the same relation that the generalized pigment of melanosis has to the primary speck or nodule of pigmented spindle-celled or alveolar sarcoma. It is not necessary *a priori* to go so far afield as the ferment-action of living organisms for an analogy of this thousandfold multiplication; there is an analogy nearer home in the marvellous metabolic capabilities of the body's own protoplasm.

Melanosis of the Horse.—It sometimes happens that we find, in the carcase of an aged grey or white horse which had been originally brown or black or other shade of colour, that the marrow of all the bones in its body is changed into a uniform black inky pulp or fluid, that the clusters of lymphatic glands are full of the same in a drier form, and that there are black patches on the more exposed parts of the mucous membranes. This remarkable malady is not found except in horses whose coat had lost its originally abundant hair-pigment. Troussseau and Leblanc, who investigated the facts on a large scale at the Paris horse-knackers', were of opinion that in every horse which had turned white, more particularly if it had been originally black or brown or roan, the inguinal lymphatic glands were full of black pigment; and they concluded that the pigment there deposited was the equivalent of the colouring matter that the hair had lost, and that the blood being, as it were, overcharged with colouring matter, had deposited pigment in unusual places.

It is difficult to suppose that the melanosis in these cases is a mere quantitative equivalent of the pigment lost from the hair. The pigment of melanosis is more probably a true metabolic product of cells; and it is significant that it is most abundant, in the horse, in the old seats of hæmoglobin-formation, namely, the red bone-marrow. The bone-marrow (with other tissues as well) takes on a pigment-making activity, coincidently with the blanching of the horse's coat, and vicariously thereto. The melanosis of the horse is a striking instance of a *constitutional malady*, that is to say, it illustrates the very important pathological doctrine that an error in one part or function of the organism entails vital consequences elsewhere.¹

§ 16.—SPECIFIC INFECTIONS.

Infective disease of one kind or another stands for a very large part of the total sickness and mortality of mankind. It is entitled, therefore, to a larger space in a nosological outline than a single section at the end of an article. Each infective disease has to be considered by itself, from the natural-history point of view, and the salient facts of its history, geography, and ethnology, and its other particular circumstances to be taken along with its morbid anatomy and clinical history. It will be necessary, for the present purpose, to adopt a much more restricted programme, and to indicate little more than the place of the specific infections in the general scheme of disease.

Of diseases that have the property of infectiveness we have already dealt with cancers and other malignant tumours, and with the common infective inflammations. Reference has also been made to erysipelas, which is sometimes not merely infective as regards the individual body in which it arises, but a source of infection (or contagion) also for other bodies through conveyance of a virus. In the communicable class of infections we have to include so ordinary and simple a malady as a common cold, which is notoriously apt to go through a whole household, having been acquired in the usual way by some one member of it. The great historical epidemics of influenza which have overrun whole continents from time to time are held by some to be little else than colossal

¹ See Virchow, *Gesammelte Abhandl. aus dem Gebiete der wissenschaftl. Med.*, Frankfurt, 1856, *Cellular-pathologie*, chaps. x. and xi., and *Krankhaften Geschwülste*, vol. i. chap. 3, and vol. ii. ("Melanosis"); Billroth, *Allgemeine chirurgische Pathologie*, 8th ed., Berlin, 1876 (Engl. transl., New Syd. Soc., 2 vols., 1877); R. Koch, *Ätiologie der Wundinfections-Krankheiten*, Leipzig, 1878 (Engl. transl., New Syd. Soc., 1880).

developments of those catarrhal epidemics which we meet with on a homely scale within single households. Another example of the same kind of communicability of a simple catarrhal affection of a mucous membrane is the Egyptian form of "cold in the eye" or ophthalmia, which was brought to England by a few of the troops returning from the expedition of 1801, and which spread by contagion for several years through the home-garrisons with a virulence quite unknown in the Egyptian climate, so that more than two thousand soldiers had to be pensioned for total blindness due to it.

In such instances a common and, it may be, trivial malady becomes a *species of disease*; it acquires the remarkable power of reproducing itself in persons who had not been exposed to the primary exciting causes. Not one in a hundred of the soldiers who were blinded by ophthalmia during the first ten years of the century had ever been in Egypt, just as, in a household where catarrh has become prevalent, perhaps not more than one member of it had sat in a draught, or been caught in the rain, or otherwise been subject to the conditions that ordinarily bring on a common cold. It is the acquired catarrhal condition that spreads from person to person, being faithfully reproduced in each new victim. The morbid condition becomes a kind of individual thing, of which the seminal particles are scattered abroad and induce the same morbid condition where they find a favouring soil or a favourable lodgment.

If all the instances of infection could be reduced to the same category as these, we should simply have to regard the specific infective diseases as the spreading or communicable forms of morbid conditions of the body otherwise accounted for—as states of disease leading a kind of independent life, but traceable in the last resort each to its origin in certain structural and functional errors of the body. The great problem of the species of disease would thus become an evolutionary problem. While this evolutionary problem would always have underlying it the unique difficulty of conceiving how a morbid state of the body could be integrated to become a semi-independent existence, with the power of reproducing itself by its germs as in the generation of living things, the interest for each specific disease would be to follow up, historically, geographically, ethnologically, sociologically, and otherwise, the conditions of body out of which the complex natural history of the disease-species had grown.

Proceeding, then, in the natural-history manner, and attempting, in the first instance, a grouping of the species of disease, the broad lines of division are into the chronic and the acute, and, among the acute themselves, into exogenous and endogenous.

Acute Infective Diseases—Exogenous and Endogenous.—The endogenous species of disease are those in which the infecting particles pass directly from the sick body to the sound, giving rise in the latter to a morbid state which follows the same order of unfolding, and attains the same type as in the former. The exogenous species of disease are those in which the infecting or germinal particles have an intermediate state of ripening in the soil, or in water, or amidst other favouring conditions, producing a definite set of morbid phenomena in the exposed body, but a set of phenomena which may be, and often are, different in important respects from those of the primarily-ailing subject. These contrasts between the endogenous and the exogenous infections may be illustrated by a reference to smallpox on the one hand and to cholera on the other. Any person whose skin is covered with the drying crusts of smallpox pustules may give off infecting particles which will set up the same disease if they find a lodgment in a susceptible person, the contagiousness of such a case of smallpox being somewhat heightened, no doubt, by a close atmosphere and the like. But for cholera, speaking generally, much more than this is wanted for the development of the communicated disease; the infecting particles have in most cases to undergo an intermediate stage of ripening in the soil or in other outside media. Yellow fever is even more than an exogenous infection; it is also vicarious, inas-

much as, over and over again, it has been from the emanations of dysenteric dejecta of the negro (who can hardly take yellow fever), and not necessarily from the effluvia of pre-existing yellow fever cases, that the infective power has proceeded. The vicariousness of yellow fever brings it into close relation with *typhus fever*, which is not otherwise counted as an infection of the exogenous group. No attempt to trace all cases of typhus to pre-existing cases of the same fever can possibly succeed; the succession has been broken repeatedly, and repeatedly started anew, amidst well-known circumstances of cold, hunger, filth, and general misery. In the larger proportion of typhus cases it is the miserable themselves who have suffered from the disease in addition to their other miseries; but there are numerous classical instances in which the more wretched of mankind have imparted typhus to their more comfortable fellows without themselves exhibiting the symptoms of the disease. The best-known historical cases are the Black Assizes, when prisoners who were brought into court from filthy dungeons so tainted the air of the court-house that the judges, the members of the bar, the jurymen, and the public were seized with a virulent typhus infection. If, in such cases, it should be contended that the prisoners carried the specific effluvia of typhus about their persons, although they themselves did not suffer with the specific symptoms of the fever, there are other cases where such a contention is entirely inadmissible. Perhaps the most remarkable of these is the case of the Egyptian ship-of-war which brought an epidemic of typhus to Liverpool in 1861. (*Epidem. Trans.*, i. p. 246, 1862.) More usually, however, it is the miserable themselves who first develop this *morbus miserie*, afterwards communicating it to the physicians and others who enter their dwellings or otherwise come near them. The *de novo* development of the symptoms of typhus, and subsequently of the independent contagion of typhus, has been abundantly illustrated in the naval and military history down to the close of the Napoleonic wars. The writings of Huxham, Lind, Pringle, D. Monro, Blane, and others, who served in the great typhus period, are full of evidence of that kind; the doctrine of the continuous reproduction of the typhus virus always from pre-existing cases is a purely academical affair, which dates from the ingenious dialectic of Bancroft's *Essay on the Yellow Fever*, &c., 1811. The rational doctrine of this kind of infective disease, based upon the practical experience of all times, is that which is stated by Pliny: "*Primo, temporis ac loci vitio, et ægri erant et moriebantur; postea, curatio ipsa et contactus ægrorum vulgabat morbos*" (xxv. 26).

Relapsing Fever.—Closely related to typhus in the circumstances of its origin is *relapsing fever*, which has extremely slight power of spreading among the well-to-do. Its synonym of *famine fever* is on the whole a sufficiently accurate designation of its circumstances of origin. Its more recently-acquired synonym, *spirillum fever*, is derived from the presence in the blood of a minute spiral living organism, as to which the standing question arises whether it is there because the particular state of fever is favourable to it, or whether the fever is there because the organism has, for some reason, invaded the body. Here, again, the conflict arises between academical dialectic and the more tangible facts of experience. It is maintained that relapsing fever can be given to the monkey by injecting the spirilla; but that circumstance by no means serves to show that the pre-existing cases of relapsing fever had occurred because spirilla had invaded the bodies of a certain number of persons. Relapsing fever is sometimes, though rarely, conveyed by infection to those who had not been living in a state of overcrowding and of semi-starvation; and such an incidence of the disease is so entirely arbitrary that even the spirilla, if they came from other cases, might be accepted as the active agents. The spirilla would have a real interest if it could be shown that they could initiate relapsing fever *proprio motu*. As the case stands, the predisposing causes of relapsing fever completely overshadow all other elements in the causation. The disease is always and everywhere *morbus pauperum*, and very often it is *typhus famelicus*.

Typhoid fever.—This fever holds a peculiar place in the history of specific diseases. It is unquestionably a far more common disease at present than it was fifty years ago, and it is certain that it was prevalent in Paris for some time before it began to occur, except as a rarity, in London and Edinburgh. The evidence of Christison and of other highly observant pathologists may be implicitly accepted that, while Louis and others in Paris were finding ulceration of the small intestine in fatal cases of typhus-like fever, no such lesion was ordinarily found in the Edinburgh practice. More generally, it may be said that typhoid fever has been a prominent factor in the mortality during the periods when typhus has been an insignificant one. The coincidence of decided typhoid years with the cholera years is perhaps irrelevant. But there can be little doubt that there is a close connexion between the rise of typhoid and the more or less considerable diminution of intermittent fever; there is indeed much evidence in a certain number of localities in favour of the opinion of Boudin, that malarial fever and typhoid fever are mutually exclusive in a given place.

Typhoid fever is undoubtedly a disease associated with the manner of disposal of human excrement. Whether the typho-

malarial fever of the American Civil War, and of Rome, Naples, and other localities, is also an excrementitious infection is not so clear. The ordinary typhoid is peculiarly bound up with the modern system of water-closets and sewers, and with the faulty construction of the same; it was a familiar observation in Edinburgh that the Old Town, with its closes and huge tenement-houses, without the water-closet system, remained practically free from typhoid for many years after the disease began to be common in the New Town. The association with faulty sewerage is, however, not an invariable one. The disease occurs among remote and primitive communities, such as Norfolk Island in the Pacific, in Fiji, in Greenland, and elsewhere.

According to the contention of Murchison, and of many other living authorities, typhoid fever may, and often does, develop *de novo* in an individual who has received, either by the breath or in his food or drink, some peculiar or not altogether ordinary product of faecal decomposition. It is not alleged by this school that faecal decomposition under ordinary circumstances (especially under the free access of air) is attended with the risk of typhoid fever; but that a virulent property may, and often does, develop under some peculiar concurrence of circumstances, especially when faecal matters percolate and accumulate where little air reaches. If the process of typhoid fever be so induced in an isolated case, the dejects of the patient are specifically virulent; and from one such case many may be poisoned by means of specifically tainted water or milk distributed in common. The possibility of a *de novo* origin of typhoid fever now and then is vehemently objected to by the more doctrinaire school of pathologists; according to them there is always a pre-existing case, the virus of typhoid having been continuously reproduced *ab aeterno*.

The Exanthemata.—Another class of acute infections is those which are virtually independent of external circumstances, which affect all classes equally, and which pass by direct contact from the sick to the sound. The chief diseases of this class are smallpox, measles, and scarlet fever. As to smallpox, it has been contended, on the historical and geographical evidence, that it is primarily an African and Indian skin-disease which has acquired spreading power; and there is really no rival hypothesis of its origin. For measles the evolutionary clue would appear to be entirely lost. The old notion about it, expressed in the name "morbilli," was that it corresponded to a lesser kind of smallpox. There can be no doubt, however, of its present absolute nosological distinctness. It is as universal in its distribution as smallpox, sparing no race, and, like smallpox, committing its greatest ravages among virgin communities and among the dark-skinned. The natural history of scarlet fever is altogether different. It is peculiarly a disease of northern Europe; it is practically unknown as an epidemic throughout the whole continent of Asia (except Asia Minor), and the whole of Africa (except Algiers); and in North and South America and Australasia it seems to have followed the European immigration. One of the most remarkable facts concerning it is that it may occur in quite sporadic or isolated cases in extra-European countries. Some favourable concurrence of circumstances had given it a permanent hold in Europe, or had enabled an occasional erythema of the skin, with fever, to develop into a species of disease, in which the almost diphtheritic affection of the throat, the brawny swelling of the neck (with tendency to sloughing), and the acute affection of the kidneys may be so pronounced in certain individuals, and in all the cases of certain epidemics, or of the epidemics of certain localities, that the simple type of disease is obscured and the line of evolution lost. Perhaps one clue to the development of scarlatina from non-specific states of the body may be found in the cases of scarlet rash in children, in the surgical wards of hospitals. The evidence seems to show that in such cases there is something different from a merely heightened predisposition to the specific scarlatinal poison, and the supposition that the latter is ubiquitous; that there is, in fact, an inherent liability in some children to develop a scarlet rash, with fever, near a wound or sore, the condition so developed becoming communicable to others, as in the analogous case of erysipelas.

Chronic Infective Diseases.—The greatest of the chronic infections is syphilis, unless, indeed, we admit tubercle unreservedly into the same class. Its enormous prevalence in modern times dates, without doubt, from the European libertinism of the latter part of the 15th century. It is almost certain that the same disease, with symptoms of constitutional infection, had developed in various parts of the ancient world under similar circumstances; but it is not less certain that a great redevelopment came in about the year 1490 in France, Italy, and Spain, so that we do not even require to assume a continuity of the virus from earlier times. The historical evidence may be read, in a convenient abridgment, in the third volume of Häser's *Geschichte der Medicin und der epidemischen Krankheiten*.

Two forms of sore are described concurrently in all writings upon syphilis, and, although it has been usual during the last thirty years to regard only one of these as truly syphilitic, there has always been a certain inability in the profession at large to apprehend the reason

for making a radical distinction. One of the forms is a considerable and quickly-developed ulceration. Sometimes multiple and with a marked tendency to extend its borders: it heals under treatment, like any other ulcer, and in many cases there are no after-effects throughout the body generally. The same person may develop such sores repeatedly. For a considerable time after the establishment of the doctrine of "true" or indurated infecting sore it was taught that these simple ulcers were never followed by constitutional infection; but it is now very generally admitted that such teaching is too rigid or dogmatic, not according with the facts of experience. A recent writer on the subject in Berlin, who has kept records of his private practice, estimates that no fewer than 40 per cent. of all the cases which developed constitutional symptoms were consequent on primary ulcerations that would not have been included in the definition of "true" or Hunterian sores. It is not seriously disputed that these simpler ulcerations may arise independently of conveyance, as the direct results of gross personal negligence. It is at the same time admitted that they may become inveterate, that the process of healing may become irregular, and that they may gradually acquire that character of "induration" which is distinctive of the "true" sore. The various circumstances under which this change of type or development of characters may take place have, for obvious reasons, escaped being recorded with scientific accuracy; but of the fact of some such evolution there can be hardly any doubt.

The "true" or Hunterian sore is usually at first a small indurated papule, which breaks after a time, but causes little trouble in healing. The after-effects are, in their severity and long-continuance, in striking contrast to the disease at the outset. This form of the disease is an affair of infection from beginning to end, from the primary papule to the "gummatous" internal nodules years after; there is no evolution in the individual of an infective virus out of a common and unclean ulceration. The simple sore, the result of common inflammation under circumstances of gross personal negligence is not without a degree of infectiveness of its own. It has a tendency to spread, to enlarge its borders by including the margin of sound tissue in the ulcerative process, and it has also a tendency to infect the nearest packet of lymphatic glands with a suppurative action. Further, it is highly communicable to the persons of others by contact, reproducing one or more sores very like itself, and such communication is accountable for its wide distribution. But that degree of infectiveness is a very different thing from the true and full syphilitic infection. The latter is often an affair of years, and, it may be, of a lifetime, and it passes directly to the offspring. Its earlier constitutional manifestations are in the throat, the skin, and the hair; its later, in the bones, some muscular structures and some of the viscera, and more particularly in their blood-vessels, or in the blood-vessels of their coverings. It infects the lymphatic glands with an indurative rather than a suppurative process, and not only the nearest packet of them but also the lymph-glands in the neck and elsewhere.

In seeking for the beginnings of this profound constitutional taint, for the first steps in the evolution of the infection out of a common morbid state of the body, we naturally arrive at that irregular process of healing, or the inveterate soreness which the granulations of a simple ulcer (due to personal uncleanness or contact with the same) sometimes assume. The tissue of syphilitic formations, whenever occurring, has been named by Virchow "granuloma," being a persistent state of granulation-like tissue, not proceeding to ordinary cicatrization, but to indurative and degenerative changes. In true syphilis, as we have said, this kind of formation is from first to last the product of an infective virus, equally the primary hard papule, the indurated lymph-glands, the thickening and destruction of mucous surfaces, the nodes and inflammatory products in the periosteum, and the gummata in and upon the viscera. But the type of all this mimetic formative action must have been somewhere acquired or evolved; and we shall probably not err if we seek for the acquisition of the granulomatous type in the inveteracy and irregular healing of the granulations of an ordinary foul sore under the peculiar circumstances of its own degree of local infectiveness, and in the continuous reproduction of such sores. In this way we should have granulations becoming specifically infective towards the body, or its distant parts, just as the products of simple acute inflammation may be infective to a distance, or as melanotic and other slight primary tumours are apt to propagate their texture and characters far and wide, or even as a common granulating sore under certain circumstances of irritation may develop the characters of tumour-tissue and a high degree of tumour-infectiveness. The products of syphilis have a near affinity to new growths of the tumour kind; and it is with justice that Virchow includes them among tumours as one of the granulomata, and Klebs makes provision for them, along with tubercle, glanders, and leprosy, in a class of "infective tumours." If we take the primary type to be the granulation tissue of repair we shall assign it an intermediate position, and, at the same time, do justice to the circumstances in which this infective granulation-like new growth

probably had its origin, namely, the reparative process in inveterate or neglected ulcers of common and every-day origin, but with a contagiousness of their own, and with a certain infectiveness of their own towards the adjoining tissues and the nearest pocket of lymphatic glands.

The most characteristic form of the generalized syphilitic infection, which may not manifest itself for several years after the reception of the virus, is a nodular or infiltrating new growth in various organs—in the liver, in the testes, in or upon the brain, in the muscles (tongue and jaw-muscles especially), in the pericestum, and in the lungs. These nodules are called gummata from the somewhat tenacious, firm, opaque brownish appearance of the fresh-cut surface. The structure, where its vascularity is perfect, consists of small round cells lying mostly in rows among thin fibres, and it closely resembles granulation-tissue, only that the cells are smaller and the intercellular substance (fibres) harder or denser. Molecular death, or necrosis, overtakes this new formation at various central points, owing to the inadequacy or suppression of the blood-supply. One of the most remarkable features of the process is the enormous overgrowth of cells in the inner coat of the arteries within the affected area, leading to an accumulation of elongated cells and intercellular substance, which may even obliterate the channel of the vessel altogether.

Over the later products of syphilitic infection, both the nodular and the infiltrated, there are two drugs, mercury and iodide of potassium, which have a remarkable power, causing their absorption and conducting the infective process to a safe issue. Syphilis has been compared by Hutchinson to a very prolonged fever, with its stages separated by intervals of months; like a fever, it burns itself out, so that a time comes in the course of years, if the patient have not succumbed to the effects, when the system is practically free of the virus, just as it is free of the virus of smallpox in three weeks. In a certain proportion of cases only the secondary symptoms occur, and not the tertiary, the virus having presumably exhausted itself in the earlier manifestations.

In the *syphilis of the offspring* it is necessary to distinguish two classes of effects. On the one hand, there are the effects of general intra-uterine mal-nutrition, due to the placental syphilis of the mother; and, on the other hand, there are the true specific effects acquired by inheritance from either parent and conveyed, along with all other inherited qualities and tendencies, in the sperm-elements or in the ovum. These two classes of effects are commingled in such a way as not to be readily distinguished; but it is probable that the erroneous growth of bone, at the epiphyseal line in the long bones (sometimes amounting to suppurative), and on the surfaces of the membrane-bones of the skull, is a result of general placental mal-nutrition, like the corresponding errors of growth in rickets. The rashes and fissures of the skin, the snuffles, and such-like well-known symptoms in the offspring of syphilitic parents are to be counted among the true mimetic effects of the specific taint; so also the peculiar nuclear overgrowth in the supporting tissue of the liver, the interstitial pneumonia alba of the lungs, and the like. As in rickets, it is in many cases some months after birth before the congenital syphilitic effects show themselves, while other effects, such as interstitial keratitis, the mal-formations of the permanent teeth, and the rarer occurrence of laryngitis, come to light during childhood and youth. Injury to a syphilitic child is apt to have unusual consequences; thus a blow on the arm may be followed by a gummatous growth in one of the muscles.

Tubercle and Scrofula.—Tubercle and scrofula are among the commonest and most fatal diseases of mankind. No chapter in pathology has a more pressing interest; none is surrounded by so much theoretical difficulty, or concluded by so much practical failure. It is not only in Europe, but in America and the British colonies, as well as throughout the whole inter-tropical zone, that this remarkable wasting disease is found. The most considerable degree of immunity is said to be in Iceland and on the Asiatic steppes. While the mortality from this disease is very great, in some European countries amounting to one-seventh of the death-rate, and that, too, among the youth and flower of the people, there is everywhere evidence that a very much larger proportion had incurred a slight degree of the malady and had survived it. Nothing is more common in the course of post-mortem examinations than to find traces of "obsolete tubercle" in the lungs and lymphatic glands. Cohnheim recalls with some approval a saying that used to be current at Greifswald, that almost every one proved to have been "a little bit tuberculous"; and Kindfleisch bases his pathology of the disease on the assumption that a tuberculous disposition has become practically universal throughout the human stock, so that inflammations, under certain aggravated circumstances, may light up the disease in almost any one. It is peculiarly common in prisons, barracks, and workhouses; and, in the last-mentioned, tubercle and scrofula are not rare among the aged. There are instances within the knowledge of most people where the marriage of first cousins, and still more certainly of double cousins, has been followed by a very pronounced consumptive tendency in

the offspring, even if there had been no very clear history of consumption on either side before. No disease runs more in families than tubercle. While there are all these evidences of a widespread constitutional liability to tubercle, it is at the same time clear that the victims of the hereditary taint are only here and there,—perhaps one out of a large family, or one member of a family in childhood and another in the second half of life, according as they had been exposed to sufficient exciting causes. In the most extreme cases of heredity, which are not so rare but that one or more are familiar to every circle, the members of a family fall into consumption one after another as they grow up, as if by an inevitable fate.

The relation of scrofula to tubercle is a subject of much intricacy. The familiar instances of scrofula are the enlarged clusters of lymphatic glands of the neck in boys and girls, who are either of the fair and delicate type or of the dark and coarse type. Another large class of scrofulous cases are subject to white swellings or other chronic diseases of joints, usually the knee, hip, or elbow. But many slighter conditions, such as eczema of the head and face in children, are set down to scrofula. Again, serious visceral disease leading to a fatal result, especially in the kidneys, testes, ovaries, and bladder, is for some reason reckoned scrofulous rather than tubercular. But this latter class of cases is certainly tubercular, as much as anything can be said to be tubercular. A great part of all that is reckoned scrofulous may be said to be inherited tubercle, affecting the lymphatic glands of the neck most conspicuously, running a very chronic course, often disappearing at puberty, and associated with a delicate skin, fair hair, large eyes, and other features of a well-known type. Of the cases of scrofulous disease in the genito-urinary system and in the joints there may be some in which the disease had been inherited, but there are others in which it had been acquired. The senile scrofula of workhouses and the like is almost certainly an acquired condition. Whether as an inherited disease or as an acquired, scrofula can be separated from tubercle by no very definite line.

Tubercle, as the name implies, is a small tuber or round nodule; the nodules are often "miliary" or the size of millet-seed. For the variety of diffuse or "infiltrated" tubercle, which is often found in the lungs, it has been made a question whether it should be reckoned as tubercle at all, by reason of its wanting from first to last the character of distinct small nodules. Tubercles are sometimes large, especially the tubercles of the genito-urinary organs and of the brain; and these are generally made up of a number of smaller nodules fused together, and surrounded by a common capsule. The larger tubercular masses, or conglomerates of tubercles, are those that have been claimed as in a peculiar sense scrofulous. The fusion of numerous small tubercular centres into one large area can often be seen in lymphatic glands in all its stages under the microscope. The prevalent modern opinion is that all these various manifestations are due to the infective action of a virus, just as in syphilis; and, as the effects of the syphilitic virus include not only gummatous nodules but also "inflammatory" of the skin, mucous membranes, periosteum, and other textures, so the effects of the tubercular virus include not only "tubercles," properly so called, but also a variety of diffuse "inflammatory" conditions.

The most common seat of the tuberculous process is the lungs, so that tubercle and phthisis pulmonalis have almost come to be synonymous. In a certain proportion of cases the tubercles and tuberculous "infiltrations" are found in the lungs only; but in many cases the pulmonary tuberculosis is only a part of a general infection which includes the serous membranes and lymphatic glands, the intestine, the liver, the spleen, the kidneys, the brain-membranes, the choroid coat of the eye, the bones, and the joints. Cases have been described also of tuberculous ulcers of the tongue and stomach, and of tubercles in and around the thoracic duct. On the assumption that tubercle is due to an introduced virus, it has been attempted to classify the cases according to the probable way of ingress of the virus; those with the pulmonary condition most prominent would have received the infection with the breath, while another class, including the numerous cases where miliary tubercles are found in the liver when carefully looked for with the microscope, would have absorbed the virus along with the food from one part or another of the digestive mucous membrane: the tuberculous kidney (with ureters and bladder), again, would be explained on the hypothesis of that organ attempting to eliminate the virus from the system. But even among the pulmonary cases there are some in which the tubercles had arisen from infection brought by the venous blood, just as in the dissemination of sarcomatous tumours, it has been shown by the very elaborate dissections of Weigert that tubercles may grow into the walls of veins, the tuberculous substance so getting carried into the blood-current, wherein the first resting-place would be the pulmonary capillaries, except when the vein was tributary to the portal system.

It is difficult to say what is the most characteristic structure of a tubercle. In the class of small grey translucent tubercles, all the same (miliary) size, the cells are practically granulation-cells; these are not uncommon in childhood and youth, where the attack is sudden and the progress rapid. In another kind, which Kind-

fleisch would regard as distinctively "scrofulous," the substance is opaque and yellowish-white; there are many epithelial-like cells, or cells with a considerable zone of protoplasm round the nucleus, and, mixed with these, giant-cells or cells with many nuclei, usually marginal. Except in the most acute cases of miliary tuberculosis, the new formation, whether in the shape of isolated nodules or continuous tracts of "infiltration," undergoes changes. Sometimes it becomes a fibrous substance, but by far the most common change is into a yellow cheesy matter. This degeneration is comparable to the gummatous change in syphilitic formations, but in tubercle the degenerate tissue is much less cohesive, more friable, drier, more apt to fall into a molecular detritus. The caseous change is the distinctive degeneration of tubercle, the more occasional fibrous and calcareous changes being either its associates or its modifications. The reason of this change is the insufficient blood-supply of the new formation. Nothing so clearly accounts for the structural as well as the degenerative characters of tubercle as growth of tissue without adequate provision for admitting the blood into it.

Bovine Tubercle.—In the corresponding disease of the domesticated bovines—a very common disease of cows in town dairies—the characters of the new formations are equally determined by the kind and degree of blood-supply. In this form of tubercle the nodules are, in the first instance, on the serous membranes of the thorax and abdomen; they often attain a considerable size, and sometimes the size of quite large tumours; the vascularity of their surface is very considerable, and it is around their periphery that they grow, as in the case of sarcomatous tumours; but the blood-vessels do not go all through the nodules, their central parts being either calcareous, or caseous, or reduced to a thick mortar-like substance. The chief differences between this form of tubercle and the varieties ordinarily met with in man are that it is a more vascular structure, more like a sarcomatous or fibromatous tumour, with a power of growth from its surface (where the vessels are numerous), and sometimes attaining a great size, often suspended from the serous membrane by a vascular stalk or pedicle, and, in the interior of organs such as the lung, surrounded by a translucent capsule of vascular tissue, or excavated into a smooth-walled cavity, the thick translucent capsule being all that remains of the original nodule.

The origin of these peculiar multiple new formations in the domesticated bovines is a more likely subject of inquiry than the origin of human tubercle. The bovine disease is generally admitted to have its nodules referable to two distinct classes—primary and secondary: the primary are the multiple nodular tumour-like growths of the serous membranes, and the secondary are the infective descendants of these in the lymphatic glands, the lungs, the liver, spleen, kidneys, Fallopian tubes, bones, and joints. The secondary infectiveness of primary new growths is otherwise intelligible, according to analogies, and the interest therefore centres in the conditions of origin of the primary, parent, or infecting growths on the serous membranes. They occur by far most frequently in the cows of town dairies, that is to say, in animals closely confined for long periods, deprived of pure air and sunlight, forced in their feeding and milking, and altogether placed under such conditions of nutrition as commend themselves, not to an intelligent acquaintance with ruminant requirements, but to the short-sighted maxims of profit and loss which govern the policy of the cowkeeper. The vicissitudes of nutrition are pretty clearly indicated as the starting-point of tubercle in the cow.

In human tubercle we have no such indications of a division into primary new formations arising out of errors or vicissitudes of nutrition in some tissue, and into secondary new formations due to the infectiveness of the primary. On the other hand, the various new formations in a case of tubercle in man would appear to be co-ordinate, or all of them due to a common cause. Human tubercle is not by any means a multiple nodular eruption on the serous membranes first and in the lymphatic glands and lungs afterwards; if the disease occur in these three localities it is necessary to assume the same infective cause for it in them all. Most usually the first indications of human tubercle are at the apex of one or both lungs, and, in a considerable proportion of cases, the disease never goes beyond the lungs. But it is not on that account a purely pulmonary disease. For some reason the lungs are most apt to become the seat of the infection; but there are many cases in which the infection locates itself elsewhere as well, and there are some cases in which it avoids the lungs altogether. An infective virus has to be assumed, and yet we are unable, as in bovine tubercle, to discover any primary source of it in the physiological aberrations of the human body itself. The problem of human tubercle, therefore, may be said to be: Does the infection reach the body from without? and, if so, whence are its structural or morphologically mimetic characters originally derived? While some such question as that has to be stated for human tubercle in the last resort, it has to be kept in mind that a very large part of the sum-total of human tuberculous disease is an affair of strong hereditary predisposition, and even of direct inheritance. In bovine tubercle itself, which is often acquired *de novo* by cows subjected to grossly artificial con-

ditions of life, inheritance is credibly estimated to be answerable for more than one-half of its present very considerable total.

The pathology of tubercle (bovine and other) has had much light thrown on it by experiments to produce it artificially in animals by inoculation of minute quantities of tuberculous matter under the skin, or by mixing considerable quantities of tuberculous matter with the food for a length of time, or by feeding with the milk of tuberculous cows. A very suggestive proportion of all such experiments have succeeded. It has been boldly alleged by Koch that the active agent in the inoculative production of tubercle is not the tuberculous matter from a previous case, but a minute rod-like living parasite belonging to the order of schizomycetes (see SCHIZOMYCETES). According to this view tubercle is from first to last an affair of a parasite, equally the human tubercle and the bovine, although these two forms of tubercular disease are widely different in their anatomy. The weak point in the experimental evidence of Koch is that we are not sufficiently assured of the absolute separation of the tuberculous matter from the parasites. There is not reason enough to suppose, from the published details of these experiments, that the original tuberculous matter had all been got rid of; and there is therefore not reason enough to suppose that the induced tuberculous infection is due to anything but that matter itself, whose infective power, although not initiated by the organisms present, would probably be multiplied by their cultivation.

In the same class with syphilis and tubercle should be taken *glanders*, primarily a disease of the horse, but now and then communicated to man. There are various tropical and sub-tropical granulosomatous infections of great scientific interest which can only be mentioned, such as *yaws*, *verruca Peruviana*, *Aleppo boil*, *Delhi boil*. There is also the *button-scurvy* of Ireland, now probably extinct. *Lupus* holds a peculiar place in this class of diseases. The position of *leprosy* also is an intermediate one, and its pathology the most difficult of all the constitutional endemic infective diseases. It was with reference to leprosy, and with particular reference to its enormous mediæval prevalence and subsequent extinction in most parts of Europe, that Sir James Y. Simpson wrote as follows in 1841 ("Antiquarian Notices of Leprosy and Leper Hospitals in Scotland and England," *Edin. Med. and Surg. Journ.*, vol. lvi.):—"The *generatio de novo* of a really new species of disease," says Dr Mason Good (*Study of Med.*, i. pref. p. xxiii.), "is perhaps as much a phenomenon as a really new species of plant or of animal." Dr Good's remark is probably too sweeping in its principle; for, if necessary, it might be easy to show that, if the particular diseases of particular animal species are liable to alteration at all, they must necessarily alter more frequently than those animal species themselves. In pursuing such an inquiry the pathologist labours under comparative disadvantages. The physiologist can, by the aid of geological research, prove that the individual species of plants and animals inhabiting this and other regions of the earth have again and again been changed. The pathologist has no such demonstrative data to show that, in the course of time, the forms and species of morbid action have undergone great mutations, like the forms and species of normal life. But still we have strong grounds for believing that, in regard to our own individual species alone, the diseases to which mankind are subject have already undergone, in some respects, marked changes within the historic era of medicine."

§ 17.—TOXIC DISEASES.

In various parts of the world and at various periods there have been widespread outbreaks of sickness due to

Other chronic infections

Simpson on the origin of disease species

certain toxic or poisonous substances mixed with the staple food of the people. Perhaps the best known of these is *gangrene caused by ergot of rye*. One form of the disease is characterized by acute pain and gangrenous destruction of the skin, the gangrene sometimes spreading to the deeper structures and to the bones, and leading to loss of the limbs. At times the mortality from this disease has been great. Numerous epidemics of it have occurred in France (rarely during the present century); in other parts of the continent of Europe (Sweden, Norway, Russia) the effects of ergotism have taken the form of a nervous (convulsive) disease called "Kriebelkrankheit." The effects are those due to ergot, the compact mycelium of *Claviceps purpurea*, produced within the paleæ of the common rye. This substance, well known in medicine, is accidentally ground with the rye, and produces gangrene by contracting the muscular coats of the arteries of the skin so as to seriously diminish the amount of blood sent to it, or it affects the nervous system. (See ERGOT.)

Another toxic effect closely allied to ergotism is the *pellagra* of Lombardy. (See PELLAGRA.)

A third disease of the same kind is *acrodynia*, having a resemblance to ergotism on the one hand and to pellagra on the other. It appears to be somehow connected with bad grain, but the actual poison has not been traced, as in the case of ergot. The observations relating to it have been mostly made in France, and in the French army in Syria, in Algiers, and in Mexico. The succession of symptoms is somewhat complex, including disorders of the stomach and intestine, conjunctivitis, oedema of the face, disorders of sensibility and locomotion, and erythematous rashes, mostly on the hands and feet.

In Colombia (South America) a peculiar disease, characterized by the hair coming out (*pelade*), is traced to the ergot-parasite of maize.

In the prairie States of the American Union there is a disease of cattle (and sheep) called "*the trembles*," supposed to be due to some toxic substance in the pasturage. In the human subject in those localities there is a corresponding malady called "*the milk-sickness*," and suspected of being caused by partaking of the milk or flesh of cows which had been primarily affected.

Among toxic diseases we have to include also *lead colic*, or "dry belly-ache," to which workers in the various compounds of lead are liable, as well as communities here and there whose food or drink, in the course of its preparation or storage, has been contaminated by lead. Workers with *phosphorus*, also, are liable to necrosis of the lower jaw. More occasional effects are produced by some other chemical elements used in manufacture.

By far the most important toxic agent is *alcohol*, which is often sold in public-houses when it has all the powerfully injurious properties of new spirit in it. The enormous excise duty of 10s. per gallon is apt to make us forget the coarse and cheap nature of the alcohol often sold as whisky; this product of distillation may be purchased new from distilleries at as low a rate

as 1s. 6d. per gallon. The retailing of such new whisky is answerable for an amount of disease—to say nothing of violence and crime—which an equal quantity of mellowed spirit would by no means produce. There are some not uncommon forms of kidney-disease and of liver-disease which are, in the great majority of cases, the direct results of raw spirits. Both in the liver and the kidney the effect of such spirits is to cause an active growth of the supporting tissue of the organ at the expense of its proper metabolic or glandular tissue. In the case of the liver it causes cirrhosis or hobnailed liver, which is accompanied by abdominal dropsy; in the case of the kidney it causes a contracted condition, to which the name of cirrhosis is also applied, being one of the forms of Bright's disease. Besides these organs the stomach is apt to become affected by coarse spirits taken frequently; it falls into a state of chronic catarrh on the basis of which cancer is apt to plant itself.

§ 18.—PARASITIC DISEASES.

Reference has been made to the occurrence of a spiral micro-organism in the blood in cases of relapsing fever, to the so-called "bacillus of tubercle," and to the occurrence of micrococci in erysipelas and infective inflammations. For the splenic fever and other anthracous diseases of the domestic animals, very conclusive experimental evidence has been brought forward by Pasteur and others that the virus somehow goes with or resides in the bacilli which are apt to swarm in the blood. These bacilli also occur in the malignant pustule and wool-sorters' disease of man,—forms of anthrax which are produced by handling the hides and fleeces of animals. In diphtheria and ulcerative endocarditis micrococci are abundant in the tissues of the affected localities. They are also described for malignant osteomyelitis, and a peculiar double form (*diplococcus*) has been discovered in pneumonia. The doctrine of infective parasitism is applied by some pathologists to the whole of the specific infective diseases, acute and chronic, as well as to malarial fevers, which are non-communicable. There can be no doubt of the occurrence of very various forms of micro-organisms in the tissues after death from diseases, specific and other, and in the blood and tissues during the course of some diseases, and even in states of fair health. It is premature to call all these bacteria "pathogenic." Their significance in morbid states of the body will be considered, along with their natural history, in the article SCHIZOMYCETES.

The animal parasites infesting the human body and the fungi concerned in some skin-diseases and in actinomycosis are treated of in the articles PARASITISM, NEMATODEA, and TAPEWORM. (C. C.)

PATIALA, one of the *cis-Sutlej* states, Punjab, India, lying between 29° 23' 15" and 30° 54' N. lat., and between 74° 40' 30" and 76° 59' 15" E. long., has an area of 5887 square miles, and a population (1881) of 1,467,433. The estimated gross revenue is £471,624. The larger portion of the state is situated in the plain south of the Sutlej, while the other is hill country stretching up to Simla, which formerly belonged to Patiala. The usual cereals form the principal agricultural products. The ruling family are Sikhs of the Sidhu Ját tribe.

PATMOS (now pronounced by the natives "Patino"), an island in the east of the *Ægean Sea*, one of the group of the *Sporades*, about 28 miles south-south-west of Samos. It lies in 37° 20' N. lat and 26° 35' E. long. Its greatest length from north to south is about 10 miles, its greatest breadth 6, its circumference, owing to the winding nature of the coast, about 37. The island, which is volcanic, is bare and rocky throughout; the hills, of which the highest rises to about 950 feet, command magnificent views of the neighbouring sea and islands. The woods which once covered the island have disappeared; of the palms, from which it formerly received its Italian name of *PalMESSA*, not more than one is left. Some poor olive trees and a few specimens of the mulberry, the fig, the orange, the lemon, the carob, the cypress, the oak, and the pine here and there refresh by their verdure an eye wearied by the prospect of barren mountains, only relieved in places by scrubby bushes or clumps of thyme. The skill of the natives as seamen is proverbial in the archipelago. The deeply-indented coast, here falling in huge cliffs sheer into the sea, there retiring to form a beach and a harbour, is favourable to commerce, as in former times it was to piracy. Of the numerous bays and harbours the chief is that of *La Scala*, which, running far into the land on the eastern side, divides the island into two nearly equal portions, a northern and a southern. A narrow isthmus separates *La Scala* from the Bay of Merika on the west coast. On the belt of land between the two bays, at the junction between the northern and southern half of the island, stood the ancient town. To judge from its traces, it may have contained 12,000 to 13,000 inhabitants. On the hill above are still to be seen the massive remains of the citadel, built partly in the polygonal style known as *Cyclopean*. The modern town stands on a hill-top in the southern half of the island. A steep paved road leads to it in about twenty minutes from the port of *La Scala*. The town clusters at the foot of the monastery of St John, which, crowning the hill with its towers and battlements, resembles a fortress rather than a monastery. Of the 600 MSS. once possessed by the library of the monastery only 240 are left, badly preserved, and none of them of value. The houses of the town are better built than those of the neighbouring islands, but the streets are narrow and winding. The population is about 4000. The port of *La Scala* contains about 140 houses, besides some old well-built magazines and some potteries. Scattered over the island are about 300 chapels.

Patmos is mentioned first by *Thucydides* (iii. 33) and afterwards by *Strabo* and *Pliny*. From an inscription it has been inferred that the name was originally *Patnos*. There are some grounds for the conjecture that the island was first colonized by *Carians*. Another ancient inscription seems to show that the *Ionians* also settled there at an early date. The chief, indeed the only, title of the island to fame is that it was the place of banishment of St John the Evangelist, who according to *Jerome* (*De Scr. Ill.*, c. 9) and others, was exiled thither under *Domitian* in 95 A.D., and released about eighteen months afterwards under *Nerva*. Here he is said to have written the *Apocalypse*; to the left of the road from *La Scala* to the town, about half-way up the hill, a grotto is still shown (*τὸ σπήλαιον τῆς Ἀποκαλύψεως*) in which the apostle is said to have received the heavenly vision. It is reached through a small chapel dedicated to St Anne. In the library of the monastery there is a Greek MS. containing a curious history of St John, purporting to be by Pro-

chorus, one of his disciples but apparently composed in the 4th century. It narrates the miracles wrought by the apostle during his stay on the island, but, strangely enough, while describing how the Gospel was revealed to him in *Patmos*, it does not so much as mention the *Apocalypse*. During the Dark Ages *Patmos* seems to have been entirely deserted, probably on account of the pirates. In 1088 the emperor *Alexis Comnenus*, by a golden bull, which is still preserved, granted the island to St *Christodulus* for the purpose of founding a monastery. This was the origin of the monastery of St John, which now owns the greater part of the southern half of *Patmos*, as well as farms in *Crete*, *Samos*, and other neighbouring islands. The embalmed body of the saintly founder is to be seen to this day in a side chapel of the church. The number of the monks, which amounted to over a hundred at the beginning of last century, is now much reduced. The abbot (*ἡγούμενος*) has the rank of a bishop, and is subject only to the patriarch of Constantinople. There is a school in connexion with the monastery which formerly enjoyed a high reputation in the Levant. The lay population was originally confined by St *Christodulus* to the northern part of the island, but at the beginning of the 13th century the people received permission to build their houses near the monastery for protection against the pirates. Hence arose the modern town. It was recruited by refugees from Constantinople in 1453, and from *Crete* in 1669, when these places fell into the hands of the Turks. The trade of the island seems to have been considerable. It was in intercourse with *Genoa* and *Venice* that the port received its modern name of *La Scala*; its ancient name seems to have been *Phora*. The island is subject to Turkey; the governor is the pasha of *Rhodes*. The population is Greek. The women, who are handsome, are chiefly engaged in knitting cotton stockings, which, along with some pottery, form the chief exports of the island.

See *Tournefort, Relation d'un Voyage du Levant*, Lyons, 1717; *Walpole, Memoirs* (relating to Turkey), London, 1820; *Ross, Reisen auf den griechischen Inseln*, Stuttgart and Halle, 1840-52; and especially *Guerin, Description de l'île de Patmos*, Paris, 1856.

PATNA, a district in the lieutenant-governorship of Bengal, and in the division or commissioner'ship of *Patna*,¹ lying between 24° 58' and 25° 42' N. lat., and between 84° 44' and 86° 5' E. long., is bounded on the N. by the river *Ganges*, which separates it from *Sáran*, *Muzaffarpur*, and *Darbhanga*, on the E. by *Monghyr*, on the S. by *Gayá*, and on the W. by the *Son*, which separates it from *Sháhábád*. *Patna* district, with an area (1881) of 2079 square miles, is, throughout the greater part of its extent, a level plain; but towards the south the ground rises into hills. The soil is for the most part alluvial, and the country along the bank of the *Ganges* is peculiarly fertile. The general line of drainage is from west to east; and high ground along the south of the *Ganges* forces back the rivers flowing from the district of *Gayá*. The result is that, during the rains, nearly the whole interior of the district south of a line drawn parallel to the *Ganges*, and 4 or 5 miles from its bank, is flooded. There are no forests or jungles of any extent, but fine groups of trees are found in many places. In the south-east are the *Rájágríhí Hills*, consisting of two parallel ridges running south-west, with a narrow valley between, intersected by ravines and passes. These hills, which seldom exceed 1000 feet in height, are rocky and clothed with thick low jungle, and contain some of the earliest memorials of Indian Buddhism. Hot springs are common on the *Rájágríhí Hills*. The chief rivers are the *Ganges* and the *Son*. The total length of the former along the boundary of *Patna* is 93 miles. The *Son* first touches the district near *Mahábalpur* village, and flows in a northerly direction for 41 miles, till it joins the *Ganges*. The only other river of any consequence is the *Púnpún*, which is chiefly remarkable for the number of petty irrigation canals which it supplies. So much of the river is thus diverted that only a small portion of its water ever reaches the *Ganges* at *Fatwá*. Great changes have from time to time taken place in the course of the *Ganges*, and the point at which the *Son*

¹ The division of *Patna* lies between 24° 17' 15" and 27° 29' 45" N. lat., and between 83° 23' and 86° 46' E. long., and comprises the districts of *Patna*, *Gayá*, *Sháhábád*, *Darbhanga*, *Muzaffarpur*, *Sáran*, and *Champáran*. The area (1881) was 23,647 square miles, and the population 15,063,944, viz., *Hindus* 13,327,728, *Mohammedans* 1,730,093, *Christians* 5875, and "others" 248.

joined this river was once several miles east of its present position. Large game is not abundant except on the Rājāgrīhā Hills, where bears, wolves, and jackals are common, and hyænas are sometimes seen. Of smaller game, duck, quail, and ortolan are abundant, and partridges and wild geese are also found.

The census of 1881 returned the population at 1,756,856 persons (males 858,783, and females 898,073). Hindus numbered 1,541,061, Mohammedans 213,141, Christians 2588, and "others" 66. Of high-caste Hindus there are 47,041 Brāhmans and 64,332 Rājputs. Ranking next to these two castes are the Bābhans, a class who number 121,381 in Patna district, and whose origin is much disputed. They assert themselves to be Sarwarīa Brāhmans, but, although they are held in high respect, this rank is not generally accorded to them. Among the Sūdras the most numerous are the Goḷās or Ahīrs, the great herdsmen class, of whom there are 217,845; and the Kurnīs, an agricultural caste, who number 194,222. Among the semi-Hinduized aboriginal tribes the Dośādh, the ordinary labouring class of Behar, number 99,976. The Wahābis form the most interesting section of the Mohammedan community. They are a numerous body, and include several wealthy traders, though the majority belong to the lower classes. The following towns in the district contained a population in 1881 exceeding 10,000—Patna city (170,654); Behar (48,968); Dināpur, including the cantonment (37,893); Bārī (14,689); Khagaul (14,075); Mukāma (13,052); Fatwā (10,919).

Rice, which forms the staple of the district, is divided into two great crops—the *kartikā* or early rice, sown in June or July and reaped in October or November; and the *aghānt* or winter rice, sown after the commencement of the rains and cut in November or December. The *boro* or spring rice is also cultivated to a limited extent, being sown in November or December and reaped in April or May. By far the most important of these is the *aghānt* crop, of which forty-six varieties are named. Among the other principal crops are wheat and barley, *khesārt*, gram, pease, cotton, tobacco, sugar-cane, a little indigo and mustard, several other oil-producing plants, and poppy. All the poppy grown in the province of Behar is manufactured at Patna city.

Patna is subject to blights, floods, and drought, but seldom to such an extent as to seriously interfere with the general harvest. There are abundant facilities for importations of grain in case of distress. The trade of the district centres in Patna city, which, next to Calcutta, is the largest river-mart in Bengal. The total length of district and provincial roads is 454 miles. The East Indian Railway traverses the entire length of the district for 86 miles. Several newspapers are published at Patna, the most important being the *Behar Herald*, published weekly and conducted by the native pleaders of the Patna bar.

Patna is one of the two places in British India where opium is manufactured. The poppy cultivated is exclusively the white variety (*Papaver somniferum album*), and the crop requires great attention. The amount of produce from various lands differs considerably. Under favourable circumstances of soil and season, the out-turn per acre may be as high as 41 lb. of standard opium (*i.e.*, containing 70 per cent. of pure opium and 30 per cent. of water), paid for by the Government at the rate of 5s. per lb.; but the average is from 21 to 27 lb. per acre. The opium is made up into cakes weighing about 4 lb. and containing about 3 lb. of standard opium. These cakes are packed in chests (forty in each), and sent to Calcutta for exportation to China. The price which they fetch varies every year; the average rate per chest in 1880-81 was about £135 and the cost £39.

The net revenue of Patna in 1882-83 amounted to £278,550, of which £147,205 was derived from the land-tax. In 1874-75 there were, exclusive of the Patna college, 309 Government and aided schools with 9003 pupils; by 1877-78 the number had risen to 816, and the pupils to 16,396. The Patna college was founded in 1862, and is the only institution for superior instruction in Behar; the total number of pupils in 1881-82 was 166. The climate of Patna is considered remarkably healthy. The average annual rainfall is 35·66 inches.

PATNA, chief city of the above district, is situated in 25° 37' 15" N. lat. and 85° 12' 31" E. long., on the right or south bank of the Ganges, and adjoining Bānkīpur, the civil station and administrative headquarters of the district. Its central position at the junction of three great rivers, the Son, the Gandak, and the Ganges, where the traffic of the North-Western Provinces meets that of Bengal, gives it great natural advantages. The city proper comprises the large business quarters of Mārūfganj, Mān-sūrganj, the Kilā or fort, the Chauk, with Mirchaiganj, Mahārājganj, Sādīkpur, Alābakhsapur, Gulzārbāgh, Colonel-

ganj, and other petty bazaars extending westwards as far as Bānkīpur civil station. According to the census of 1881 its population was 170,654—Hindus 127,076, Mohammedans 43,086, "others" 492.

History.—Patna city has been identified with Pātāliputra (the Palibothra of Megasthenes, who came as ambassador from Seleucus Nicator to Chandragupta about 300 B.C.). Megasthenes describes Palibothra as being the capital city of India. He adds that its length was 80 stadia, and breadth 15, that it was surrounded by a ditch 30 cubits deep, and that the walls were adorned with 570 towers and 64 gates. According to this account the circumference of the city would be 190 stadia or 25½ miles. When Hwen T'sang visited the place in 637 A.D. the kingdom of Magadha was subject to the rule of Kanauj. The old city had then been deserted for a long time, and was in ruins, although a new Pātāliputra had sprung up close to it. In the south-east of Patna district, in the Rājāgrīhā Hills, are found some of the earliest remains of Indian Buddhism. During the early years of Mohammedan rule the governor of the province resided at Behar town in the south-east of the district. During Sher Shāh's revolt against the Mughals, Patna became the capital of an independent state, which was afterwards reduced to subjection by Akbar. The two events in the modern history of the district are the massacre of Patna (1763) and the Sepoy Mutiny in 1857. The former occurrence, which may be said to have settled the fate of Mohammedan rule in Bengal, was the result of a quarrel between the nawāb, Mīr Kāsim, and the English authorities regarding transit duties, which ultimately led to open hostilities. The company's sepoys, who had occupied Patna city by the orders of the company's factor, were driven out by the nawāb's troops and nearly all killed. The remainder afterwards surrendered, and were put into confinement, together with the European officers and the entire staff of the Kāsimbāzār factory, who had also been arrested on the first outbreak of hostilities. Mīr Kāsim was defeated in two pitched battles at Gheriā and Udhānālā (Oodeynullah) in August and September 1763, and in revenge ordered the massacre of the whole of his prisoners, which was carried out with the help of a Swiss renegade in his employment, named Walter Reinhardt (afterwards the husband of the famous Begam Samru). About sixty English prisoners were murdered on this occasion, the bodies being thrown into a well belonging to the house in which they were confined.

At the outbreak of the mutiny in May 1857 the three sepoy regiments stationed at Dināpur (the military cantonment of Patna, adjoining the city) were allowed to retain their arms till July, when, on an attempt being made to disarm them, they broke into open revolt. Although many who attempted to cross the Ganges in boats were fired into and run down by a pursuing steamer, the majority crossed by the Son river into Shāhābād, where they joined the rebels under Kuar Sinh, who were then besieging a small European community at Arrah.

PATNA, a native state in the Central Provinces of India, lying between 20° 5' and 21° N. lat., and between 82° 45' and 83° 40' E. long., has an estimated area of 2399 square miles, of which 550 are under cultivation, and other 950 are returned as cultivable. The country is an undulating plain, rugged and isolated, with ridges of hills crossing it here and there, and shut in on the north by a lofty irregular range. Rice forms the staple produce, but pulses, oil-seeds, sugar-cane, and cotton are also grown. A vast forest extends for 30 miles around Patna village containing valuable large timber, but infested by tigers, leopards, and other wild animals. Iron ore exists in many parts of the state, but no mines are regularly worked. The only means of communication are a few bullock or pony tracks. The estimated population in 1881 was 257,959, nearly all of whom were Hindus. Patna was formerly the most important of the cluster of chiefships known as the *Athāra Garljāt* (The Eighteen Forts), but under its later rulers it greatly declined. Since 1871, however, when it was taken under direct British management, it has gradually been regaining prosperity.

PATRAS, or PATRÆ (Ital. *Patrasso*, Turkish *Balia-badra*), a fortified city of Greece, the principal port of the Morea, and the chief town of the nomos of Achaia and Elis, lies on the north coast of the Morea on the east side of the Gulf of Patras, which opens into the Gulf of Corinth by the Little Dardanelles, marked by forts Kastro Morcas and Kastro Rumelias. Since the War of Independence Patras has been one of the most prosperous cities in the

kingdom; the quarters of the new town are well laid out; its old harbour being considered hardly safe in winter, a new harbour defended by a breakwater was commenced in 1880; new roads (to Kalavryta, for example) are opening up communication with the interior; a railway to connect the city with Corinth and Athens is in process of construction (1884); and the proposed cutting of the canal across the isthmus of Corinth would add new elements to its commerce. The population, which had sunk to 8000 at the time of the war, was 16,641 in 1870, and 24,993 in 1879. Patras is the seat of one of the four courts of appeal in the kingdom, and the residence of the archbishop of Patras and Elis. The custom-house is the most important in all Greece. Like the ancient city, the modern Patras previous to the revolution occupied the high ground of Scatovuni (a hill connected with Mount Voidia or Panachaicum, the dominant summit in this region), but since then it has spread out over the plain towards the sea. The two most interesting buildings are the castle, a mediæval structure on the site of the ancient acropolis, and the cathedral of St Andrew, which is highly popular as the reputed burial-place of the saint, and has been rebuilt since the revolution. The commerce of Patras consists mainly in the export of currants, valonia, olive-oil, wine, and sheepskins (value in 1881, 19,369,270 francs, of which 18,104,046 francs were for currants alone), and the import of cotton and woollen goods, grain, flour, and colonial wares (value in 1881, 16,560,600 francs). Great Britain and Austria almost divide the foreign shipping trade, with a preponderance in favour of the former country, which takes more than half of the currants. August and September are the months when the port is at its busiest with British vessels. Famous even in antiquity for its flax manufactures (whence the number of females in the city was double that of the males), Patras at present contains several steam factories with about 4000 spindles producing coarse cotton twist from cotton grown in northern Greece; and there are also sulphur-crushing mills, flour and macaroni mills, and an iron-foundry. Gas-works and water-works were constructed about 1874.

The foundation of Patras goes back to prehistoric times, the legendary account being that Eumelus, having been taught by Triptolemus how to grow grain in the rich soil of the Glaucus valley, established three townships, Aroe (i.e., ploughland), Antheia (the flowery), and Mesatis (the middle settlement), which were united by the common worship of Artemis Triclaria at her shrine on the river Melichus. The Achæans having strengthened and enlarged Aroe called it Patræ as the exclusive residence of the ruling families. In 419 B.C. the town was, by the advice of Alcibiades, connected with its harbour by long walls in imitation of those at Athens. The whole armed force of Patræ was destroyed by Metellus after the defeat of the Achæans at Scarpheia, and many of the remaining inhabitants forsook the city; but after the battle of Actium Augustus restored the ancient name Aroe, introduced a military colony of veterans from the 10th and 12th legions (not, as is usually said, the 22d), and bestowed the rights of coloni on the inhabitants of Rhyppæ and Dyme, and all the Locri Ozolæ except those of Amphissa. Colonia Augusta Aroe Patrensis became one of the most populous of all the towns of Greece; its colonial coinage extends from Augustus to Gordian III. That it was the scene of the martyrdom of St Andrew is purely apocryphal, but, like Corinth, it was an early and effective centre of Christianity; its archbishop is mentioned in the lists of the council of Sardica in 347. In 551 Patræ was laid in ruins by an earthquake. In 807 it was able without external assistance to defeat the Slavonians (Avars), though most of the credit of the victory was assigned to St Andrew, whose church was enriched by the imperial share of the spoils, and whose archbishop was made superior of the bishops of Methone, Lacedæmon, and Corone. Captured in 1205 by William of Champlitte and Villehardouin, the city became the capital and its archbishop the primate of the principality of Achæia. In 1387 De Heredia, grand-master of the order of the Hospital at Rhodes, endeavoured to make himself master of Achæia, and took Patras by storm. At the close of the 15th century the city was governed by the archbishop in name of the pope; but in 1423 Constantine, son of John VI., managed to get possession of it for a time. Taken by a Spanish fleet under Andrea Doria in 1532, sacked by another

Spanish fleet in 1595, and again sacked by the knights of Malta in 1603, Patras was at length in 1687 surrendered by the Turks to the Venetians, who made it the seat of one of the seven fiscal boards into which they divided the Morea. It was at Patras that the Greek revolution began in 1821; but the Turks, confined to the citadel, held out till 1828, when the French troops took possession of the Morea.

See C. I. L., vol. iii. 1; Bursian, *Geogr. von Griechenland* and Finlay's *Hist. of Greece*.

PATRIARCH (πατριάρχης, lit. the head or ruler of a πατριά, tribe, family, or clan) occurs four times in the New Testament, being applied to Abraham, the twelve sons of Jacob collectively, and David, and several times in the LXX., where the word is used to denote the officials called by the chronicler "princes of the tribes of Israel," "princes of hundreds," "chiefs of the fathers." Under the late Roman empire the title was officially applied down to the 5th century to the chief rabbi in Palestine (see *Cod. Theod.*, xvi. 8, 1; and comp. *ISRAEL*, vol. xiii. p. 428); the head of the synagogue at Babylon appears also to have been known as patriarch until 1038. The title at an early date passed over into the Christian church as an honorific though not official designation of all bishops; thus Gregory of Nyssa (*Or. Fun. in Mel.*) alludes to the fathers assembled in council at Constantinople as "these patriarchs." Afterwards the Easterns showed a tendency to limit the appellation to the occupants of the more important sees, just as in the West the so-called "metropolitans" began to receive more definite recognition. At the present day the heads of the various extant churches and sects in the East are very commonly called patriarchs (see vol. xi. p. 154 sq.), and in the West the Roman Church gives the honorary title to several dignitaries, such as the archbishops of Lisbon and Venice. In a strictly technical sense, however, that church recognizes only five patriarchates, those of Constantinople, Alexandria, Jerusalem, Antioch, and Rome. This peculiar restriction of the word, which may be said to date from the council of Chalcedon in 451, can be traced downwards from the time of Constantine, when the altered political circumstances and the civil division of the empire into four prefectures (*Orientis, Illyrici Orientalis, Italiæ, Galliarum*), each containing a number of "dioceses," gave a new importance to questions of ecclesiastical jurisdiction. Thus the council of Nice (can. 6) adjusted the jurisdiction of the "bishop" of Alexandria so as to include Libya and Pentapolis as well as Egypt, the ancient rights of Rome, Antioch, and the other "eparchies" being at the same time conserved. The third canon of the council of Constantinople assigned precedence to the "bishop" of Constantinople immediately after the "bishop" of Rome; and by the 28th of Chalcedon the "metropolitans" of Thrace, Pontus, and Asia were appointed to receive their consecration at his hands. The same council invested the bishop of Jerusalem, formerly under the jurisdiction of the metropolitan of Antioch, with supremacy over the whole of Palestine. Thenceforward a certain co-ordinate primacy was thus accorded to Rome, Constantinople, Antioch, Alexandria, and Jerusalem; but it is to be observed that in no official document belonging to this period is the title "patriarch" given to the bishop of any one of these sees, though the word "eparch" or "exarch" is occasionally employed. We find Theodosius, however, so designating the bishop of Rome, and not only is it given to the bishop of Constantinople in the *Novellæ* of Justinian, but we find Mennas in 536 claiming to be called ὁ οἰκουμηνικός πατριάρχης, not, of course, without violent protest in the West. After the fall of Jerusalem (637), Antioch (638), and Alexandria (640) into the hands of the Saracens, the importance of these sees became of course nominal merely, and it grew easier for Rome, at the head of the unbroken Western church, to give practical expression to its claims of superi-

ority over its sole surviving Eastern rival. Finding it difficult, however, to avoid the appearance of equality that was involved in the name of "patriarch," now conventionally bestowed on the occupants of other ancient and apostolic sees, the bishops of Rome rather avoided the title, preferring the more colourless designation of papa or pope (see Pope).

PATRICIAN. The history, in the Roman state, of the hereditary patrician order (*patricii*, *patres*, house-fathers, goodmen) who originally constituted the entire *populus Romanus* has been traced in the article **NOBILITY** (vol. xvii. pp. 525-6). With the transference of the imperial capital to Byzantium under Constantine, the title *patricius* became a personal and not an hereditary distinction; the name was held to denote a fatherly relation to the emperor, and those who bore it stood first among the *illustres*, receiving such appellations as "magnificentia," "celstudo," "eminentia," "magnitudo." High civil and military office was usually conferred on them, and they were frequently sent into the provinces as viceroys. After the overthrow of Romulus Augustulus in the West, Odoacer claimed and, practically at least, received from the emperor Zeno the title of "patricius," in virtue of which he governed Italy. It was similarly assumed by other barbarian conquerors. In 754 it was conferred by Pope Stephen on Pippin the Short, and it was afterwards borne by Charlemagne. It was as patrician of Rome that the emperor Henry IV. claimed the right to depose Pope Gregory VII. The title was abolished by Pope Eugenius III. in 1145.

PATRICK, St. In one of the incursions of the Scots and Picts upon the neighbouring Roman province south of the wall of Severus, probably that of 411 A.D., the year after Honorius had refused aid to the Britons, a youth of about fifteen was carried off with many others from the district in the neighbourhood of the wall at the head of the Solway, and sold as a slave on the opposite coast of Ireland in the territory of the Irish Picts called Dal Araide.¹ This youth was the future apostle of the Irish. As his name implies, he was of noble birth, and he tells us so himself. He was the son of the deacon Calpornius, who was the son of Potitus, a priest. His father was a decurio or magistrate, and, as Patrick according to tradition was born at Nemthur,² he must have exercised his functions of magistrate at that place, but on the withdrawal of the Roman garrisons from Britain probably

retired for safety south of the wall of Severus, where, as Patrick tells us, he had a small country place (*villula*) near the town (*vicus*) of Bannavem Taberniæ, whence Patrick was carried off. The country along the south of the wall, especially near the Solway, was a region of camps or military posts to which the designation Tabernia would be appropriate. Bannavem seems to be a Romanized form of a British name signifying "river foot," and most probably was the Banna of the *Chorography* of Ravenas, and of the inscription on an altar said to have been found at Birdoswald (the Romano-British Amboglanna), and now at Lanercost Priory. The name also occurs on the well-known bronze cup found about two hundred years ago at Rudge in Wiltshire, which dates from about 350. Banna must have been near Petriana, the former being probably the vicus or town, and the latter the military station proper. Towards the end of the 4th century, before the withdrawal of the Roman garrisons, there were along the wall 10,300 foot and 1500 horse according to the *Notitia Imperii*, so that Bannavem Taberniæ, or Bannavem of the military posts or encampments, was descriptive of the district, and the office of decurio in such a place one of considerable dignity.

The youth Succat or Patrick remained in hard slavery for six years, tending cattle, probably on Slemish Mountain in the county Antrim. He seems to have been of an enthusiastic temperament, and much given to prayer and meditation. Learning of a means of escape, it so filled his mind as to give rise to visions. The bays and creeks of the west and north-west of Ireland, especially Killala Bay, were much frequented in ancient times, for they afforded secure retreats to sea-rovers when they crept round the coast of Ireland and swooped down on that of Roman Britain. Ptolemy's town of Nagnata was probably on the bay just named; it is celebrated in the stories of Fomorians, Norsemen, and other sea-rovers. The kindred of the Ard Rí or paramount king of Ireland of the time, Dathi or rather Athi, one of the greatest leaders among the invading Scots, dwelt there; it was consequently a place which offered facilities for going to Britain, and from that place most probably Patrick succeeded in escaping. After his escape he appears to have conceived the noble idea of devoting himself to the conversion of the Irish, and to have gone somewhere for a few years to prepare himself for the priesthood. His biographers take him to Tours to St Martin, who was then dead several years, afterwards to the island of Lerins in the Mediterranean, and lastly to Rome, where he received a mission from Pope Celestine. For all this there is no evidence whatever, the whole story being the result of the confusion of Palladius with the real Patrick. The tradition of some connexion between the Irish apostle and St Martin of Tours, the monastic type of the earliest Irish Church, the doubts as to Patrick's fitness for the work which led to his writing his *Confession*, and indeed all the difficulties that beset the question of the origin of the Irish Church, receive a simple and satisfactory explanation upon the hypothesis of Patrick having prepared himself for the priesthood at *Candida Casa*, the monastic institution founded by St NINIAN (q.v.).

Patrick tells us that after a few years (i.e., after his escape) he was among the Britons with his kindred, who received him as a son. He was evidently bent upon his mission, for they besought him after such tribulations not to part from them again. Full of it, he dreams that a man whose name was Victorius came to him bearing innumerable epistles, one of which he received and read; the beginning of it contained the words, "The voice of the Irish"; whilst repeating these words he says, "I imagined that I heard in my mind (in mente) the voice of those who were near the wood of Fochlad, which is near

¹ The province of Valentia, reorganized by Theodosius I., was comprised between the wall of Antoninus, which extended from the Clyde to the Firth of Forth, and the wall of Severus, which extended from the Solway to Tynemouth. Although the destruction of the pagan temples was decreed in 381, and the pagan religion prohibited in 390, that is, a few years after the restoration of Roman power in Britain and the reorganization of this province by Theodosius, the greater part of the Romanized population of Britain seems to have been pagan at the end of the 4th century, and especially in Valentia, where Patrick was born about 396. Amidst the many evidences of Roman occupation that have been found there not a relic of Roman Christianity has, so far as we know, been yet discovered. In the south-west part of Valentia, along the north shore of the Solway Firth from the Nith to the Irish Channel, Ptolemy placed the tribe of the Novante, its principal dnn or oppidum being on the west side of Wigtown Bay, and called by him Lenkopibia, a name still preserved in Whithorn. During the great displacements of tribes consequent upon the Roman conquests and the inroads of the Scots and Picts, the British Novante disappear, and in their place we find at the end of the 4th century Goidelic Cruithni or Picts. Their position in the midst of a British population, and their contiguity to the part of Ulster occupied by the Irish Cruithni or Picts, clearly indicate that the Picts of Galloway were part of the Ulidian or Irish Picts pressed out of Ireland by the intrusion of the Scots. This settlement of the Irish Picts in Galloway afforded an excellent vantage-ground for such attacks as that spoken of in the text.

² There can be no doubt that Nemthur was situated at the Clyde end of the wall of Antoninus, where Dumbarton now is. It is called Nevthur in the Old Welsh MS. known as the "Black Book of Carmarthen."

the western sea, and thus they cried: We pray thee, holy youth, to come and henceforward walk amongst us." The wood here referred to, which was in the neighbourhood of Killala Bay, was most probably the place where he remained concealed when waiting for a boat to make his escape from slavery. This dream was followed by others, which shows how completely his mission occupied his mind. Patrick was about twenty-two years of age when he escaped from slavery, and, if we allow seven or eight years for the "few years" preparation, he probably was not more than thirty years of age when he entered on his mission about 425. There is a passage in his *Confession* which shows that he was still a young man when he commenced his work: "You know and God knows how I have lived among you from my youth up." Probus, the author of the fifth life published by Colgan, who has many claims upon our confidence, supports this view that Patrick began his mission while still a priest. We see in Patrick's own authentic acts that he must have sought among his friends in Britain to be made a bishop, for he complains in his *Confession* that a friend to whom he had communicated some fault he had committed when about fifteen years old had urged this thirty years after as a reason against his being consecrated to the higher office. This proves that he was only about forty-five years old when made bishop. If we assume that 411 was the year he was carried off as a slave, his consecration as bishop would fall in about 441, the fifteenth year of his mission, a date which corresponds with the results of Dr Todd's speculations based on a close analysis of all available chronological data. Compare in general on the conversion of Ireland what has been said in vol. xiii. p. 247 sq.

The date of St Patrick's death is as uncertain as that of every other event connected with him. The *Annals of the Four Masters* give 493, with which Ussher agrees; Tirechan's *Annotations*, on the other hand, state that Loegaire, son of Niall, king of Ireland, lived from two to five years after St Patrick. According to this account the death of St Patrick took place in 469, and that of Loegaire in 471 or 474, after a reign of thirty-six years, so that Loegaire's reign began either in 435 or 438. The *Annals of the Four Masters* record the death in 457 of Senn Patraicc, or Old Patrick, and of Loegaire in the following year, 458. The Patrick who died in 493 is a fiction due to the fusion of the acts of the two real Patricks, Palladius Patrick and Senn Patraicc, doubtless so called because he was the Patrick known as a priest before the arrival of the Roman bishop. Assuming Tirechan's statement as correct, and that St Patrick died in 469, his mission as priest and bishop lasted about forty-four years.

The materials for a life of the apostle of Ireland are very scanty; they consist indeed of only two Latin pieces—one the so-called *Confession* and the other an *Epistle* about a certain Coroticus. Some persons, apparently in Britain or Gaul, seem to have accused Patrick of presumption in having undertaken so great a work as the Christianizing of Ireland, and of incapacity for the task; the *Confession* is a defence of himself against these charges, and is a kind of autobiographical sketch. The *Epistle* is a denunciation of a British chief called Coroticus, supposed to be Caredig or Ceredig, son of Cynedda, conqueror of North Wales, who had ravaged the coast of Ireland, killed a number of Christian neophytes on the very day of their baptism while still clad in white garments, carried off others into slavery, and scoffed at a deputation of clergy Patrick had sent to ask their release. There is a copy of the *Confession* in the MS. called the "Book of Armagh," written about the year 807, and apparently made from Patrick's autograph, which the scribe several times complains of being then obscure. There are copies in other MSS. which contain nearly as much additional matter not in the "Book of Armagh" as would, if put together, be nearly equal to the text of the MS. just named. Are these additions part of the original work of Patrick omitted by the scribe because they were illegible, or for some other reason, or are they interpolations? Judging by many examples in other Irish MSS., the former appears to be the better interpretation, for they are written in the same

rude and archaic style, exhibit the same peculiarity of grammatical construction somewhat like Irish, and are not inconsistent with the rest. He modestly tells us himself that he is unlearned (*indoctus*) and very rustic (*rusticissimus*). The *Epistle* is not in the "Book of Armagh," but both pieces possess all the characteristics of the time and place, and may be regarded as genuine documents, and have been so regarded by nearly all scholars who have written on the subject.

There are also several old lives of the saint, seven of which have been published by Colgan in his *Trias Thaumaturga*, the last of which, known as the Tripartite life, is the most copious. These lives are based upon the two genuine documents above mentioned, and are a tissue of legends and miracles, and, though no doubt containing a few genuine traditions, are only of value for manners and customs, and even for this purpose require much care in their use.

The place, time, and circumstances of Patrick's labours have largely contributed to the obscurity which surrounds him. His very name has helped to increase it. Patricius, like Augustus, seems to have been commonly used, even down to the 7th century, in the sense of nobleman or gentleman; thus Dynamius, who lived in the beginning of the century just referred to, is described as "Vir illustris ac patricius Galliarum." Patrick's real name, according to tradition, was Succat, but in his own writings he calls himself Patrick. There was, however, another Patrick who under the name of Palladius was unquestionably sent as bishop to Ireland by Pope Celestine in the year 431, that is, the year before the other Patrick commenced his mission according to the generally received accounts. Irish writers also mention a third Patrick, Senn Patraicc, or Old Patrick, the head of St Patrick's community (*caput sapientum seniorum ejus*) according to one account, and his tutor according to another. The three Patricks have sorely puzzled hagiologists, and created so much confusion and conjecture in the history of the early church that some have doubted the existence of such a personage as St Patrick at all. The absence of any contemporary reference to him, or of any mention of him, by Columbanus, Bede, and indeed with very few exceptions by any writers outside of Ireland before the 9th century, adds very much to the uncertainty and obscurity of the subject. (W. K. S.)

PATRICK, ST, ORDER OF. See KNIGHTHOOD. vol. xiv. pp. 123-24.

PATRICK, SIMON (1626-1707), bishop of Chichester, and afterwards of Ely, author of a number of works in practical divinity, was born at Gainsborough, Lincolnshire, on 8th September 1626, entered Queens' College, Cambridge, in 1644, and, after taking orders in 1651, became successively chaplain to Sir Walter St John, and vicar of Battersea, Surrey. He was afterwards (1662) preferred to the rectory of St Paul's, Covent Garden, London, where he continued to labour during the year of the plague. Dean of Peterborough from 1678, he became bishop of Chichester in 1689, in which year he was employed, along with others of the new bishops, to settle the affairs of the church in Ireland. In 1691 he received the bishopric of Ely, which he held until his death, 31st May 1707.

His sermons and devotional writings, which are very numerous, were held in high estimation in last century, and his edifying *Commentary on the Historical and Poetical Books of the Old Testament*, in 10 vols., brought down as far as to the Song of Solomon, has been reprinted comparatively recently (1853). His *Friendly Debate between a Conformist and a Nonconformist* was a controversial tract which excited considerable feeling at the time of its publication in 1668, but he lived long enough to soothe by his moderation and candour the exasperation it had caused. The first collected edition of his works appeared at Oxford in 1859 (9 vols., 8vo); a small *Autobiography* was published also at Oxford in 1839.

PATRON AND CLIENT. Clientage appears to have been an institution of most of the Græco-Italian peoples in early stages of their history; but it is in Rome that we can most easily trace its origin, progress, and decay. Until the reforms of Servius Tullius, the only citizens proper were the members of the patrician or gentile houses; they alone could participate in the solemnities of the national religion, take part in the government and defence of the state, contract quiritarian marriage, hold property, and enjoy the protection of the laws. But alongside of them was a gradually increasing non-citizen population composed of slaves and clients. Some historians class amongst the latter, as clients of the state, those vanquished com-

munities which, having made an unconditional submission, were allowed to retain a quasi-corporate existence under the protection of Rome. But the name (derived from *cluere*, κλέειν, to obey) was common before Rome had made any conquests, and was usually applied to individuals who had attached themselves in a condition of dependence to the heads of patrician houses as their patrons, in order thereby to secure a *de facto* freedom. The relationship was ordinarily created by what, from the client's point of view, was called *adplicatio ad patronum*, from that of the patron, *susceptio clientis*,—the client being either a person who had come to Rome as an exile, who had passed through the asylum, or who had belonged to a state which Rome had overthrown. According to Dionysius and Plutarch, it was one of the early cares of Romulus to regulate the relationship, which, by their account of it, was esteemed a very intimate one, imposing upon the patron duties only less sacred than those he owed to his children and his ward, more urgent than any he could be called upon to perform towards his kinsmen, and whose neglect entailed the penalty of death (*Tellumoni sacer esto*). He was bound to provide his client with the necessities of life; and it was a common practice to make him a grant during pleasure of a small plot of land to cultivate on his own account. Further, he had to advise him in all his affairs; to represent him in any transactions with third parties in which, as a non-citizen, he could not act with effect; and, above all things, to stand by him, or rather be his substitute, in any litigation in which he might become involved. The client in return had not only generally to render his patron the respect and obedience due by a dependant, but, when he was in a position to do so and the circumstances of the patron required it, to render him pecuniary assistance. As time advanced and clients amassed wealth, we find this duty insisted upon in a great variety of forms, as in contributions towards the dowries of a patron's daughters, towards the ransom of a patron or any of his family who had been taken captive, towards the payment of penalties or fines imposed upon a patron, even towards his maintenance when he had become reduced to poverty. Neither might give evidence against the other,—a rule we find still in observance well on in the 7th century of the city, when C. Herennius declined to be a witness against C. Marius on the ground that the family of the latter had for generations been clients of the Herennii (Plut., *Mar.* 5). The client was regarded as a minor member (*gentilicius*) of his patron's *gens*; he was entitled to assist in its religious services, and bound to contribute to the cost of them; he had to follow his patron to battle on the order of the *gens*; he was subject to its jurisdiction and discipline, and was entitled to burial in its common sepulchre. And this was the condition, not only of the client who personally had attached himself to a patron, but that also of his descendants; the patronage and the clientage were alike hereditary. In much the same position as the clients, in the earlier centuries of Rome at least, were the freedmen; for, originally a slave did not on enfranchisement become a citizen; it was a *de facto* freedom merely that he enjoyed; his old owner was always called his patron, while he and his descendants were substantially in the position of clients, and often so designated. In the two hundred years that elapsed before the Servian constitutional reforms, the numerical strength of the clients, whether in that condition by *adplicatio*, enfranchisement, or descent, must have become considerable; and it was from time to time augmented by the retainers of distinguished immigrants admitted into the ranks of the patriciate. That all these, concurrently with the unattached plebeians, must have been admitted by Servius to nominal citizenship can hardly be doubted. They

probably were included in the four urban tribes; but, being incapable as yet of owning land, they could have no admission to the higher centuries, paid no census-tribute, were not qualified to serve in the legion, and most likely ranked no higher than *accensi*. With the institution of the assemblies of the plebeians of the tribes they must, thanks to their numbers, have gained in influence politically. But it was only with the enactment of the XII. Tables that their relations to their patrons were sensibly affected. For, while that code still denied them, in common with the plebeians generally, the right of intermarriage with the patrician families, it conferred upon them most of the other private rights of citizens; in particular, it entitled them to hold and acquire property, to enter into contracts on their own responsibility, and to litigate in person on their own behalf. The relation of patron and client, it is true, still remained; the patron could still exact from his client respect, obedience, and service, and he and his *gens* had still an eventual right of succession to a deceased client's estate. But the fiduciary duties of the patron were greatly relaxed, and practically little more was expected of him than that he should continue to give his client his advice, and prevent him falling into a condition of indigence; *sacer esto* ceased to be the penalty of protection denied or withheld, its application being limited to *fraus facta*, which, in the language of the Tables, meant positive injury inflicted or damage done. So matters remained during the 4th and 5th centuries. In the 6th a variety of events, social and political, contributed still further to modify the relationship. The rapacity of patrons was checked by the Cincian law, which prohibited their taking actual gifts of money from their clients; marriages between patron and client gradually ceased to be regarded as unlawful, or as ineffectual to secure to the issue the status of the patron father; political changes opened to the clients the rural tribes and the higher centuries, and qualified them for the legion, the magistracy, and the senate; hereditary clientage ceased when a client attained to a curule dignity; and, in the case of the descendants of freedmen enfranchised in solemn form, it came to be limited to the first generation. Gradually but steadily one feature after another of the old institution disappeared, till by the end of the 7th century it had resolved itself into the limited relationship between patron and freedman on the one hand, and the unlimited honorary relationship between the patron who gave gratuitous advice on questions of law and those who came to consult him on the other. To have a large following of clients of this class was a matter of ambition to every man of mark in the end of the republic; it increased his importance, and ensured him a band of zealous agents in his political schemes. But amid the rivalries of parties and with the venality of the lower orders, baser methods had to be resorted to in order to maintain a patron's influence; the favour and support of his clients had to be purchased with something more substantial than mere advice. And so arose that wretched and degrading clientage of the early empire, of which Martial, who was not ashamed to confess himself a first-rate specimen of the breed, has given us such graphic descriptions; gatherings of miserable idlers, sycophants, and spendthrifts, at the levees and public appearances of those whom, in their fawning servility, they addressed as lords and masters, but whom they abused behind their backs as close-fisted upstarts,—and all for the sake of the *sportula*, the daily dole of a dinner, or of a few pence wherewith to procure one. With the middle empire this disappeared; and, when a reference to patron and client occurs in later times, it is in the sense of counsel and client, the words patron and advocate being used almost synonymously. It was not so in the days of the great forensic orators. The word advocate, it is said

occurs only once in the singular in the pages of Cicero; and by *advocati* was generally understood at that time the body of friends who stood by a litigant in a great cause to give him in any shape their countenance and support. The orator who then appeared in the comitia or before a judge was almost invariably called patron, though the name of client was not so commonly given to the litigant he represented. But at a later period, when the bar had become a profession, and the qualifications, admission, numbers, and fees of counsel had become a matter of state regulation, *advocati* was the word usually employed to designate the pleaders as a class of professional men, each individual advocate, however, being still spoken of as patron in reference to the litigant with whose interest he was entrusted. It is in this limited connexion that patron and client come under our notice in the latest monuments of Roman law.

Literature.—On the clientage of early Rome, see Mommsen, "Die Römische Clientel," *Röm. Forschungen*, vol. i. p. 355 (Berlin, 1864); Voigt, "Ueber die Clientel und Libertinität," in *Ber. d. phil. histor. Classe d. Königl. Sächs. Gesellsch. d. Wissenschaften* (1878, pp. 147-219); Marquardt, *Privatleben d. Römer*, pp. 196-200 (Leipzig, 1879); Voigt, *Die XII. Tafeln*, vol. ii. pp. 667-679 (Leipzig, 1883). Earlier literature is noted in Willems, *Le Droit Public Romain*, 4th ed., p. 28 (Louvain, 1890). On the clientage of the early empire, see Becker, *Gallus*, vol. ii., Excursus 4; Friedländer, *Sitten-Geschichte Roms*, vol. i. pp. 207-219 (Leipzig, 1862); Marquardt, *op. cit.*, pp. 200-208. On the latest clientage, see Grellet-Dumazeau, *Le Barreau Romain* (Paris, 1851). (J. M*.)

PATTESON, JOHN COLERIDGE (1827-1871), bishop of Melanesia, was the eldest son of Justice Patteson and Frances Duke Coleridge, a near relation of Samuel Taylor Coleridge, and was born in Gower Street, Bedford Square, 2d April 1827. He was educated at Ottery St Mary, and at Eton, where he greatly distinguished himself on the cricket-field. He entered Balliol College, Oxford, in 1845, and graduated B.A. in 1848. After spending some time on the Continent in the capacity of tutor, he in 1852 became a fellow of Merton College. In 1853 he became curate of Alfrington, Devon, and in the following year he was ordained priest and joined the mission to the Melanesian islands in the South Pacific. There he laboured with great success, visiting the different islands of the group in the mission ship the "Southern Cross," and by his good sense and unselfish devotion winning the esteem and affection of the natives. In 1861 he was consecrated bishop of Melanesia, and in this capacity did much to promote the Christianization of the islands until his premature death by the hand of a native, 20th September 1871.

See *Life* by Charlotte M. Yonge, which first appeared in 1873 and has gone through several editions.

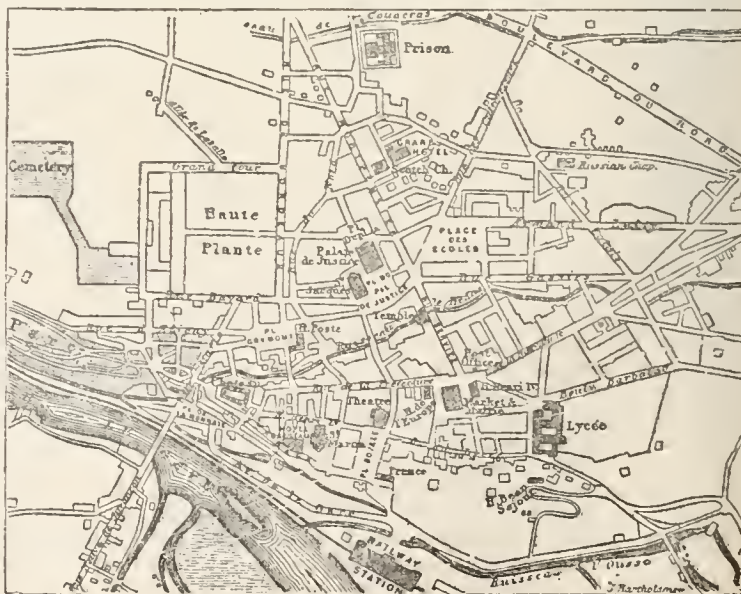

PAU, a city of France, formerly the capital of Béarn, and now the chief town of the department of Basses Pyrénées, and the seat of a court of appeal, is situated in 43° 17' N. lat. and 0° 23' W. long., on the edge of a plateau 130 feet above the right bank of the Gave de Pau (a left-hand affluent of the Adour), at a height of about 620 feet above the sea. It thus enjoys an admirable view of the Pyrenees, which rise about 25 miles to the south. A small stream, the Hédas, flowing in a deep ravine and crossed by several bridges, divides the city into two parts. The older and larger is enclosed between the Hédas, the Gave, and its other tributary the Ousse, and ends with the castle in the west,

while the new districts stretch northward in the direction of the *landes* of Pont-long. The modern importance of Pau

is due to its climate, which makes it a great winter health-resort. The most striking characteristic is the stillness of the air, resulting from the peculiarly sheltered situation. The town is built on a sandy soil, and the line of the streets running east and west is favourable to ventilation. The average rainfall is about 40 inches, and the mean winter temperature is 44°. the mean for the year being 62°.

Apart from an export flour-trade and some manufactures of chocolate and Béarn linen, the inhabitants of Pau depend entirely on their four thousand winter-visitors. Place Royale (in the centre of which, instead of the older statue of Louis XIV., now stands Raggi's statue of Henry IV., with bas-reliefs by Etex) is admired for the view which it affords over the valley of the Gave and the Pyrenees; it is connected by a fine boulevard with the castle gardens. Beyond the castle a park of thirty acres planted with beech trees stretches along the high bank of the Gave. The castle is bounded on the north and west by the Hédas, on the south by a canal drawn from the Gave, and on the east by a moat 30 feet deep; access is obtained by three bridges, that across the Hédas being of ancient construction. The castle is flanked by six square towers: south-east is that of Gaston Phœbus (113 feet high); north-east is the tower of Montauset or Montoiseau, so called because reached by removable ladders; east, the new tower; north-west, that of Billères; and on the west are those of Mazères. Another to the south is named after the mint in which Calvin used to preach.

In the gardens to the west of the castle stand a statue of Gaston Phœbus by Triquety and two porphyry vases presented by Bernadotte king of Sweden, who was born at Pau. In the castle court is a well 223 feet deep, with 100 feet of water; but it has been closed since 1855. On the ground-floor is the old hall of the estates of Béarn, 85 feet long and 36 feet wide, adorned with a white marble statue of Henry IV., and magnificent Flemish tapestries ordered by Francis I. Several of the upper chambers are adorned with Flemish, Brussels, or Gobelin tapestry, with tables in Swedish porphyry, Sèvres vases, fine coffers (notably a Gothic coffer from Jerusalem), arm-chairs of the 16th century, Venetian and St Gobain glass, &c.; but the

Plan of Pau.

most interesting room is that in which Henry IV. was born, still containing his mother's bed (from the castle of

Richelieu) and his own cradle made of a tortoise-shell. In the keep is a library of 6000 volumes, mainly of works relating to Henry IV. The two Gothic churches of St Jacques and St Martin are both modern; but the latter is of note for the height and elegance of its tower, its stained glass, and the fine Pyrenean marbles used in the high altar, the baldachin, and the sanctuary. Besides the state Protestant church (Église Française Réformée) there are Presbyterian, Anglican, and Russian places of worship. The population of Pau (about 6000 at the close of the 18th century) was 27,300 in 1871, and 29,971 in 1881.

Pau derives its name from the "pale" (in Langue d'Oc "pau") or palisade surrounding the old castle mentioned in the *fors* of Ossau in 1221. By the erection (1363) of the present castle Gaston Phœbus made the town a place of importance, but the viscounts

of Béarn continued to reside at Orthez till the reign of Gaston XI., when the states of Béarn were united at Pau. Gaston's grandson and successor Francis Phœbus, became king of Navarre in 1479. Margaret of Valois, who married Henry d'Albret, embellished the castle and gardens, and made her court one of the most brilliant of the time. In the religious disturbances under her daughter, Jeanne d'Albret, several Catholic nobles were put to death in the castle as rebels. In 1572, while a prisoner, Henry (afterwards IV. of France) restored the Catholic religion in Béarn, but the provincial estates met at Pau and rejected the decree, which Henry himself cancelled when he obtained his freedom. Pau continued to be the capital till 1620, though in 1614 the states of France demanded the union of Béarn and Basse Navarre with the French crown. When Louis XIII. entered the town in 1620 he restored the Catholic clergy to their privileges and possessions, disbanded the forces of Béarn, and caused the parliament of Pau to register the edict of union. The castle was occupied by Abd-el-Kader during part of his captivity.

P A U L

"SAUL, who is also (called) Paul," was a "Hebrew of the Hebrews," i.e., of pure Jewish descent unmixed with Gentile blood, of the tribe of Benjamin (Rom. xi. 1; 2 Cor. xi. 22; Phil. iii. 5). In the Acts of the Apostles it is stated that he was born at Tarsus in Cilicia (ix. 11, xxi. 39, xxii. 3); but in the 4th century there still lingered a tradition that his birthplace was Giscala, the last of the fortress-towns of Galilee which held out against Rome (Jerome, *De vir. illustr.* c. 5; *Ad Philem.* v. 23).¹ The fact that he was called by two names has been accounted for in various ways. Saul (the Aramaic form, used only as a vocative, and in the narratives of his conversion, Acts ix. 4, 17, xxii. 7, 13, xxvi. 14; elsewhere the Hellenized form, Σαῦλος) was a natural name for a Benjamite to give to his son, in memory of the first of Jewish kings; Paul is more difficult of explanation. It is first found in the narrative of the conversion of Sergius Paulus, the proconsul of Cyprus (Acts xiii. 9), and it has sometimes been supposed either that Paul himself adopted the name in compliment to his first Gentile convert of distinction (Jerome, Olshausen, Meyer, Ewald), or that the writer of the Acts intended to imply that it was so adopted (Baur, Zeller, Hausrath). Others have thought that it was assumed by Paul himself after the beginning of his ministry, and that it is derived from the Latin *paulus* in the sense either of "least among the apostles" (St Augustine) or "little of stature" (Mangold, with reference to 2 Cor. x. 10; Gal. iv. 13). But these and many similar conjectures may probably be set aside in favour of the supposition that he had a double name from the first, one Aramaic or Hebrew and the other Latin or Greek, like Simon Peter, John Mark, Simeon Niger, Joseph Justus; this supposition is confirmed by the fact that Paul was not an uncommon name in Syria and the eastern parts of Asia Minor (instances will be found in the *Index Nominum* to Boeckh's *Corp. Inscr. Græc.*). Whatever be its origin, Paul is the only name which he himself uses of himself, or which is used of him by others when once he had entered into the Roman world outside Palestine. The Acts speak of his having been a Roman citizen by birth (xxii. 28; cf. xvi. 17, xxiii. 27), a statement which also has given rise to several conjectures, because there is no clue to the ground upon which his claim to citizenship was based. Some modern writers question the fact, considering the statement to be part of the general colouring which the writer of the Acts is supposed to give to his narrative; and some also question the fact, which is generally considered to support it, of the appeal to the emperor. That he received part of his education at Tarsus, which was a

great seat of learning, is a possible inference from his use of some of the technical terms which were current in the Greek schools of rhetoric and philosophy; but, since the cultivation of a correct grammatical and rhetorical style was one of the chief studies of those schools, Paul's imperfect command of Greek syntax seems to show that this education did not go very far. That he received the main part of his education from Jewish sources is not only probable from the fact that his family were Pharisees, but certain from the whole tone and character of his writings. According to the Acts, his teacher was Gamaliel, who as the grandson of Hillel took a natural place as the head of the moderate school of Jewish theologians; nor, in spite of the objection that the fanaticism of the disciple was at variance with the moderation of the master, does the statement seem in itself improbable. A more important difficulty in the way of accepting the statement that Jerusalem was the place of his education is the fact that in that case his education must have been going on at the time of the preaching and death of Jesus Christ. That he had not seen Jesus Christ during His ministry seems to be clear, for a comparison of 1 Cor. ix. 1 with xv. 8 appears to limit his sight of Christ to that which he had at his conversion, and the "knowing Christ after the flesh" of 2 Cor. v. 16 is used not of personal acquaintance but of "carnal" as opposed to "spiritual" understanding; nor does the difficulty seem to be altogether adequately explained away by the hypothesis which some writers (e.g., Neander, Wieseler, Beysschlag) have adopted, that he was temporarily absent from Jerusalem at the times when Jesus Christ was there. Like all Jewish boys, he learnt a trade, that of tent-making; this was a natural employment for one of Cilician origin, since the hair of the Cilician goat was used to make a canvas (*cilicia*) which was specially adapted for the tents used by travellers on the great routes of commerce or by soldiers on their campaigns (cf. Philo, *De anim. sacrif. idon.*, i. vol. ii. p. 238, ed. Mang.). Whether he was married or not is a question which has been disputed from very early times; his expressions in 1 Cor. vii. 8, ix. 5, were taken by Tertullian to imply that he was not, and by Clement of Alexandria and Origen to imply that he had once been, but that he had become a widower.

The beginning of his active life was doubtless like its maturity; it was charged with emotion. He himself gives a graphic sketch of its inner history. His conversion to Christianity was not the first great change that he had undergone. "I was alive without the law once" (Rom. vii. 9). He had lived in his youth a pure and guileless life. He had felt that which is at once the charm and the force of such a life, the unconsciousness of wrong. But

¹ It was an Ebionite slander that he was not a Jew at all, but a Greek (Epiphanius, *Hær.*, xxx. 16).

while his fellow-disciples in the rabbinical schools had been content to dissect the text of the sacred code with a minute anatomy, the vision of a law of God which transcended both text and comment had loomed upon him like a new revelation. And with the sense of law had come the sense of sin. It was like the first dawn of conscience. He awoke as from a dream. "The commandment came." It was intended to be "unto life," but he found it to be "unto death"; for it opened up to him infinite possibilities of sinning: "I had not known lust except the law had said, Thou shalt not lust." And the possibilities of sinning became lures which drew him on to forbidden and hated ground. "sin, finding occasion through the commandment, beguiled me and through it slew me" (Rom. vii. 7-11). This was his inner life, and no man has ever analysed it with a more penetrating and graphic power. In his outward life this sense of the law of God became to him an overpowering stimulus. The stronger the consciousness of his personal failure the greater the impulse of his zeal. The vindication of the honour of God by persecuting heretics, which was an obligation upon all pious Jews, was for him a supreme duty. He became not only a persecutor but a leader among persecutors (Gal. i. 14). What he felt was a very frenzy of hate; he "breathed threatening and slaughter," like the snorting of a war-horse before a battle, against the renegade Jews who believed in a false Messiah (Acts ix. 1, xxvi. 11). His enthusiasm had been known before the popular outbreak which led to Stephen's death, for the witnesses to the martyr's stoning "laid down their clothes" at his feet (Acts vii. 58), and he took a prominent place in the persecution which followed. He himself speaks of having "made havoc" of the community at Jerusalem, spoiling it like a captured city (Gal. i. 13, 23); in the more detailed account of the Acts he went from house to house to search out and drag forth to punishment the adherents of the new heresy (viii. 3). When his victims came before the Jewish courts he tried, probably by scourging, to force them to apostatize (xxvi. 11); in some cases he voted for their death (xxii. 4, xxvi. 10). The persecution spread from Jerusalem to Judæa and Galilee (ix. 31); but Paul, with the same spirit of enterprise which afterwards showed itself in his missionary journeys, was not content with the limits of Palestine. He sought and obtained from the ecclesiastical authorities at Jerusalem letters similar to those which, in the 13th century, the popes gave to the "militia Jesu Christi contra hæreticos." The ordinary jurisdiction of the synagogues was for the time set aside; the special commissioner was empowered to take as prisoners to Jerusalem any whom he found to belong to the sect known as "The Way" (Acts ix. 2, xxii. 4, xxiv. 14; it is possible that the phrase was used of Christians by themselves, like the phrase "The Cause" among some of the nonconforming churches of England). Of the great cities which lay near Palestine Damascus was the most promising, if not the only field for such a commission. At Antioch and at Alexandria, though the Jews, who were very numerous, enjoyed a large amount of independence and had their own governor, the Roman authorities would probably have interfered to prevent the extreme measures which Paul demanded. At Damascus, where also the Jews were numerous and possibly had their own civil governor (2 Cor. xi. 32), the Arabian prince Aretas (Haritha), who then held the city, might naturally be disposed to let an influential section of the population deal as they pleased with their refractory members.

On Paul's way thither an event occurred which has proved to be of transcendent importance for the religious history of mankind. He became a Christian by what he believed to be the personal revelation of Jesus Christ.

His own accounts of the event are brief, but they are at the same time emphatic and uniform. "It pleased God . . . to reveal His Son in me" (Gal. i. 16); "have I not seen Jesus Christ our Lord" (1 Cor. ix. 1); "last of all He was seen of me also as of one born out of due time" (1 Cor. xv. 8, where *ὁφθῆναι* *καί μοι* must be read in the sense of the parallel expressions *ὁφθῆναι* *Κηφᾶ*, &c.; in other words, Paul puts the appearance to himself on a level with the appearances to the apostles after the resurrection). These accounts give no details of the circumstances. St Paul's estimate of the importance of such details was probably different from that which has been attached to them in later times. The accounts in the Acts of the Apostles are more elaborate; they are three in number, one in the continuous narrative, ix. 3-19, a second in the address on the temple stairs, xxii. 6-21, a third in the speech to Agrippa, xxvi. 12-18; they all differ from each other in details, they all agree in substance; the differences are fatal to the stricter theories of verbal inspiration, but they do not constitute a valid argument against the general truth of the narrative.¹

It is natural to find that the accounts of an event which lies so far outside the ordinary experience of men have been the object of much hostile criticism. The earliest denial of its reality is found in the Judæo-Christian writings known as the *Clementine Homilies*, where Simon Magus, who is made to be a caricature of Paul, is told that visions and dreams may come from demons as well as from God (*Clem. Hom.*, xvii. 13-19). The most important of later denials are those of the Tübingen school, which explain the narratives in the Acts either as a translation into the language of historical fact of the figurative expressions of the manifestation of Christ to the soul, and the consequent change from spiritual darkness to light (e.g., Baur, *Paul*, E.T., vol. i. p. 76; Zeller, *Acts*, E.T., vol. i. p. 289), or as an ecstatic vision (Holsten, *Das Evangelium des Paulus*, p. 65). But against all the difficulties and apparent incredibilities of the narratives there stand out the clear and indisputable facts that the persecutor was suddenly transformed into a believer, and that to his dying day he never ceased to believe and to preach that he had "seen Jesus Christ."

Nor was it only that he had seen Him; the gospel which He preached, as well as the call to preach it, was due to this revelation. It had "pleased God to reveal His Son in him" that he "might preach Him among the Gentiles" (Gal. i. 12, 16). He had received the special mark of God's favour, which consisted in his apostleship, that all nations might obey and believe the gospel (Rom. i. 5, cf. xii. 3, xv. 15, 16). He had been entrusted with a secret (*μυστήριον*) which had "been kept in silence through times eternal," but which it was now his special office to make known (Rom. xi. 25, xvi. 25, 26; and even more prominently in the later epistles, Eph. i. 9, iii. 2-9, vi. 19; Col. i. 26, 27, iv. 3). This secret was that "the Gentiles are fellow-heirs, and fellow-members of the body, and fellow-partakers of the promise in Christ Jesus through the gospel." This is the key to all his subsequent history. He was the "apostle of the Gentiles," and that "not from men, neither through man" (Gal. i. 1); and so thoroughly was the conviction of his special mission wrought into the fibres of his nature that it is difficult to give full credence to statements which appear to be at variance with it.

Of his life immediately after his conversion he himself

¹ For a clear and concise summary of the points of agreement and difference between the three accounts, reference may be made to an article by F. Zimmer, "Die drei Berichte der Apostelgeschichte über die Bekehrung des Paulus," in Hilgenfeld's *Zeitschr. f. wissenschaftl. Theol.*, 1882, p. 465 sq.

gives a clear account: "I conferred not with flesh and blood, neither went I up to Jerusalem to them which were apostles before me; but I went away into Arabia" (Gal. i. 16, 17). The reason of his retirement, whether it was to the Haurán (Renan) or to the Sinaitic peninsula (Holsten), is not far to seek. A great mental no less than a great bodily convulsion naturally calls for a period of rest; and the consequences of his new position had to be drawn out and realized before he could properly enter upon the mission-work which lay before him. From Arabia he returned to Damascus (Gal. i. 17), and there began not only his preaching of the gospel but also the long series of "perils from his own countrymen," which constitute so large a part of the circumstances of his subsequent history (Acts ix. 23-25; 2 Cor. xi. 32, 33).

It was not until "after three years," though it is uncertain whether the reckoning begins from his conversion or from his return to Damascus, that he went up to Jerusalem; his purpose in going was to become acquainted with Peter, and he stayed with him fifteen days (Gal. i. 18). Of his life at Jerusalem on this occasion there appear to have been erroneous accounts current even in his own lifetime, for he adds the emphatic attestation, as of a witness on his oath, that the account which he gives is true (Gal. i. 20). The point on which he seems to lay emphasis is that, in pursuance of his policy not to "confer with flesh and blood," he saw none of the apostles except Peter and James, and that even some years afterwards he was still unknown by face to the churches of Judæa which were in Christ.¹

From Jerusalem he went "into the regions of Syria and Cilicia," preaching the gospel (Gal. i. 21, 23). How much that brief expression covers is uncertain; it may refer only to the first few months after his departure from Jerusalem, or it may be a summary of many travels, of which that which is commonly known as his "first missionary journey" is a type. The form of expression in Gal. ii. 1 makes it probable that he purposely leaves an interval between the events which immediately succeeded his conversion and the conference at Jerusalem. For this interval, assuming it to exist, or in any case for the detail of its history, we have to depend on the accounts in Acts xi. 20-30, xii. 25 to xiv. 28. These accounts possibly cover only a small part of the whole period, and they are so limited to Paul's relations with Barnabas as to make it probable that they were derived from a lost "Acts of Barnabas." This supposition would probably account for the fact that in them the conversion of the Gentiles is to a great extent in the background.

The chief features of these accounts are the formation of a new centre of Christian life at Antioch, and a journey which Paul, Barnabas, and for part of the way John Mark took through Cyprus and Asia Minor.

The first of these facts has a significance which has sometimes been overlooked for the history not only of Paul himself but of Christianity in general. It is that the mingling together, in that splendid capital of the civilized East, of Jews and Syrians on the one hand with Greeks and Romans on the other furnished the conditions which made a Gentile Christianity possible. The religion of Jesus Christ emerged from its obscurity into the full glare of contemporary life. Its adherents attracted enough attention to receive in the common talk and intercourse of men a distinctive name. They were treated, not as a Jewish sect, but as a political party. To the Greek equivalent for the Hebrew "Messiah," which was probably considered to be not a title but a proper name, was added the

¹ A different account of this visit to Jerusalem is given in Acts ix. 26-30, xxvi. 20; the account of the trance in the temple, Acts xxii. 17-21, is in entire harmony with Paul's own words.

termination which had been employed for the followers of Sulla, of Pompey, and of Cæsar. It is improbable that this would have been the case unless the Christian community at Antioch had had a large Gentile element; and it is an even more certain and more important fact that in this first great mixed community the first and greatest of all the problems of early Christian communities had been solved, and that Jews and Gentiles lived a common life (Gal. ii. 12). What place Paul himself had in the formation of this community can only be conjectured. In the Acts he is less prominent than Barnabas; and, although it must be gathered from the Epistle to the Galatians that he took a leading part in the controversies which arose, still it is to be noted that he never elsewhere mentions Antioch in his epistles, and that he never visited it except casually in his travels. It may be supposed that from an early period he sought and found a wider field for his activity. The spirit of the Pharisees who "compassed sea and land to make one proselyte" was still strong within him. The zeal for God which had made him a persecutor had changed its direction but not its force. His conversion was but an overpowering call to a new sphere of work. It is consequently difficult to believe that he was content to take his place as merely one of a band of teachers elected by the community or appointed by the Twelve. The sense of a special mission never passed away from him. "Necessity was laid upon him" (1 Cor. ix. 16). Inferior to the Twelve in regard to the fact that he had once "persecuted the church of God," he was "not a whit behind the very chiefest apostles" (2 Cor. xi. 5) in regard both to the reality and the privileges of his commission, and to the truth of what he preached (1 Cor. ix. 3-6; 2 Cor. iii. 1-6; Gal. i. 12). It is also difficult to believe that he went out with Barnabas simply as the delegate of the Antiochian community; whatever significance the laying on of hands may have had for him (Acts xiii. 3), it would be contrary to the tenor of all his writings to suppose that he regarded it as giving him his commission to preach the gospel.

The narrative of the incidents of the single journey which is recorded in detail, and which possibly did not occupy more than one summer, has given rise to much controversy. Its general credibility is supported by the probability that in the first instance Paul would follow an ordinary commercial route, on which Jewish missionaries as well as Jewish merchants had been his pioneers. For his letters to his Gentile converts all presuppose their acquaintance with the elements of Judaism. They do not prove monotheism, but assume it.

According to the narrative, Paul and his companions went first to Cyprus, the native country of Barnabas, and travelled through the island from its eastern port, Salamis, to its capital, Paphos. At Paphos a Jewish sorcerer, Bar Jesus, was struck with blindness, and the proconsul, Sergius Paulus, was converted. From Cyprus, still following a common route of trade, they went into the south-east districts of Asia Minor, through Pamphylia to Antioch in Pisidia. At Antioch, on two successive Sabbaths, Paul spoke in the synagogue; the genuineness of the addresses which are recorded in the Acts has been disputed, chiefly because the second of them seems to imply that he "turned to the Gentiles," not as a primary and unconditional obligation, but owing to the rejection of the gospel by the Jews. Expelled from Antioch, they went on to Iconium (where the apocryphal "Acts of Paul and Thekla" place the scene of that improbable but not ungraceful romance), and thence to Lystra, where the healing of a cripple caused the simple and superstitious Lycæonians to take them for gods. Their farthest point was the neighbouring town of Derbe, from whence they returned by the route

by which they had come to the sea-coast, and thence to Antioch in Syria.

But, although the general features of the narrative may be accepted as true, especially if, as suggested above, its basis is a memoir or itinerary not of Paul but of Barnabas, yet it must be conceded that this portion of the Acts has large omissions. It is difficult to believe that the passionate zeal of an apostle who was urged by the stimulus of a special call of Jesus Christ was satisfied, for the long period of at least eleven years, with one short missionary journey, and that, with the exception of a brief visit to Jerusalem (Acts xi. 30), he remained quietly at Tarsus or at Antioch (xi. 25, xiii. 1, xiv. 28). In this period must fall at least a portion of the experiences which he records in 2 Cor. xi. 24-27, and for which no place can be found in the interval between the conference at Jerusalem and the writing of that epistle. The scourging in the synagogues, the beating with the lictor's rods in the Roman courts, the shipwrecks, the "night and day in the deep," the "perils of robbers," and "perils in the wilderness" belong no doubt to some of the unrecorded journeys of these first years of his apostolic life. A more important omission is that of some of the more distinctive features of his preaching. It is impossible to account for his attitude towards the original apostles in his interview with them at Jerusalem (Gal. ii. 1-10) except on the supposition that before that interview, no less than after it, he was that which he had been specially called to be, the "apostle of the Gentiles" and the preacher of the "gospel of the uncircumcision."

His relation to the Twelve.

At the end of fourteen years, either from his conversion or from his visit to Peter at Jerusalem, the question of the relation of the communities which he had formed, and of the gospel which he preached, to the original Christian communities, and to the gospel of the Twelve, came to a crisis. His position was unique. He owed neither his knowledge of the gospel nor his commission to preach it to any human authority (Gal. i. 1, 11, 12). As Jesus Christ had taught and sent forth the Twelve, so had He taught and sent forth Paul. He was on equal terms with the Twelve. Until a revelation came to him he was apparently at no pains to co-operate with them. But between their respective disciples there was evidently a sharp contention. The Jewish party, the original disciples and first converts, maintained the continued obligation of the Mosaic law and the limitation of the promises to those who observed it; the Pauline party asserted the abrogation of the law and the free justification of all who believed in Jesus Christ. The controversy narrowed itself to the one point of circumcision. If the Gentiles were without circumcision members of the kingdom of God, why was the law obligatory on the Jews? If, on the other hand, the Gentiles had to be circumcised, the gospel had but a secondary importance. It seemed for a time as though Christianity would be broken up into two sharply-divided sects, and that between the Jewish Christianity, which had its seat at Jerusalem, and which insisted on circumcision, and the Gentile Christianity, which had its seat at Antioch, and which rejected circumcision, there would be an irreconcilable antagonism. It was consequently "by revelation" (Gal. ii. 2) that Paul and Barnabas, with the Gentile convert Titus as their "minister" or secretary, went to confer with the leaders among the original disciples, the "pillars" or "them who were of repute," James, and Cephas, and John." He put the question to them: Was it possible that he was spending or had spent his labour in vain? (μὴ πῶς . . . ἔδραμον in Gal. ii. 2 form a direct question depending on ἀνεθέμην). He laid before them the "gospel of the uncircumcision." They made no addition to it (Paul says of himself ἀνεθέμην, and of "them who were of re-

pute" οὐδὲν προσανέθεντο, Gal. ii. 2, 6), but accepted it as Paul preached it, recognizing it as being a special work of God, and as being on the same level of authority with their own (Gal. ii. 7-9). The opposition was no doubt strong; there were "false brethren" who refused to emancipate the Gentile world from the bondage of the law; and there was also apparently a party of compromise which, admitting Paul's general contention, maintained the necessity of circumcision in certain cases, of which the case of Titus, for reasons which are no longer apparent, was typical. But Paul would have no compromise. From his point of view compromise was impossible. "Justification" was either "of faith" or "by the works of the law"; it was inconceivable that it could be partly by the one and partly by the other. And he succeeded in maintaining his position at all points. He received "the right hand of fellowship," and went back to Antioch the recognized head and preacher of the "gospel of the uncircumcision." Within his own sphere he had perfect freedom of action; the only tie between his converts and the original community at Jerusalem was the tie of benevolence. Jew and Gentile were so far "one body in Christ" that the wealthier Gentile communities should "remember the poor."¹

When Paul returned to Antioch Peter followed him, Peter and for a time the two apostles worked in harmony. Peter and Paul at Antioch "did eat with the Gentiles." He shared the common table

¹ Few passages of the New Testament have been more keenly debated of late years than the accounts of this conference at Jerusalem. In Acts xv. 4-29 and Gal. ii. 1-10. The only writers of eminence in recent times who think that the two accounts refer to separate events are Caspari, who identifies the visit to Jerusalem mentioned in Gal. ii. 1-10 with that of Acts xi. 30, xii. 25, and Wieseler, who identifies it with that of Acts xviii. 21, 22; both theories are chronologically impossible. Almost all writers agree in thinking that the two accounts refer to the same event, but no two writers precisely agree as to the extent to which they can be reconciled. (1) The differences between them were first insisted on by Schweigger, *Das nachapostolische Zeitalter*, 1845, vol. i. 116; then by Zeller, *Die Apostelgeschichte*, E.T., vol. ii. 8; Baur, *Paulus*, E.T., vol. i. 109; Hilgenfeld, *Der Galaterbrief*, 1852, p. 52, and in his *Einleitung in das Neue Testament*, 1875, p. 227, &c.; Krenkel, *Paulus*, 1869, p. 62; Lipsius, s.v. "Apostelkonvent," in Schenkel's *Bibel-Lexikon*, 1868, vol. i. 194; Overbeck, in his edition of De Wette's *Apostelgeschichte*, 1870, p. 216; Pfeiderer, *Paulinismus*, 1873, E.T., vol. ii. 5 and 234, and also in his "Paulinische Studien," in the *Jahrb. f. prot. Theol.*, 1883, No. 2; Weizsäcker, in the *Jahrb. f. deutsche Theol.*, 1873, p. 191; Hausrath, *Neutestamentliche Zeitgeschichte*, 2d ed., vol. iii. 151, vol. iv. 249; Holsten, *Zum Evangelium des Paulus und Petrus*, pp. 241, 292, *Das Evangelium des Paulus*, p. 143; Holtzmann, "Der Apostelkonvent," in Hilgenfeld's *Zeitschr. f. wissenschaftl. Theol.*, 1882 p. 436, 1883 p. 129 (to which articles the writer is indebted for several of the references here given). (2) The harmony of the two accounts is maintained, mostly in opposition to the above-named writers, by Neander, *Gesch. d. Pflanzung*, 5th ed., 1862, p. 153; Ewald, *Gesch. d. Volkes Israel*, 3d ed., 1863, vol. vi. 470; Ritschl, *Ent. d. altkath. Kirche*, 2d ed., 1857, p. 128; Lechler, *Das apostol. u. nachapostol. Zeitalter*, 2d ed., 1857, p. 397; Baumgarten, *Die Apostelgeschichte*, 2d ed., 1859, i. 461; Pressensé, *Hist. des trois premiers siècles*, 2d ed., 1868, vol. i. 457; Weiss, *Lehrb. d. bib. Theol.* (des N.T.), 2d ed., 1873, p. 141; Schenkel, *Das Christusbild der Apostel*, 1879, p. 38; K. Schmidt, s.v. "Apostel-Konvent," in Herzog's *Real-Encyclopädie*, 2d ed., vol. i. 575; Lightfoot, *Galatians*, p. 123; Wendt, in his edition of Meyer's *Apostelgesch.*, 1880, p. 311; Siefert, in Meyer's *Brief an die Galater*, 1880, p. 84, &c.; Zimmer, *Galaterbrief und Apostelgeschichte*, 1882; Nösgen, *Comm. über die Apostelgeschichte*, 1882, p. 287. (3) A compromise between the two accounts is attempted by Renan, *St Paul*, 1869, p. 81; Reuss, *Die Gesch. d. heil. Schr.*, N.T., 5th ed., 1874, p. 57; Keim, "Der Apostelkonvent," in his *Aus dem Urchristenthum*, 1873, p. 64; Grimm, "Der Apostelkonvent," in *Studien u. Kritiken* for 1880, p. 405.

The main points of difficulty in the two accounts are these. (1) The Acts say that Paul went up by appointment of the brethren at Antioch; Paul himself says that he went up "by revelation." (2) In the Acts Paul has a subordinate position; in his own account he treats with "the three" on equal terms. (3) In the Acts Peter and James are on Paul's side from the first; in Galatians they are so only at the end of the conference, and after a discussion. (4) The Acts make the conference result in a decree, in which certain observances are imposed upon the Gentiles; Paul himself expressly declares that the only injunction was that they "should remember the poor."

at which the Jewish distinctions of meats were disregarded. He thereby accepted Paul's position. But when "certain came from James" he drew back. The position of James was probably that, even if the law had ceased to be valid as a means of justification, it was still valid as a rule of life. For reasons which are not apparent, possibly the wish not to break with the community at Jerusalem, not only Peter but Barnabas and the whole of the Jewish party at Antioch accepted that position, with its consequent obligation of separation from the Gentile brethren, not only in social life, but probably also in the partaking of the Lord's Supper. Paul showed that the position of Peter was illogical, and that he was self-convicted (*κατεγνωσμένος ἦν*, Gal. ii. 11). His argument was that the freedom from the law was complete, and that to attach merit to obedience to the law was to make disobedience to the law a sin, and, by causing those who sought to be justified by faith only to be transgressors, to make Christ a "minister of sin." Obedience to any part of the law involved recognition of the whole of it as obligatory (Gal. v. 3), and consequently "made void the grace of God."

The schism in the community at Antioch was probably never healed. It is not probable that Paul's contention was there victorious; for, while Paul never again speaks of that city, Peter seems to have remained there, and he was looked upon in later times as the founder of its church.

But this failure at Antioch served to Paul as the occasion for carrying out a bolder conception. The horizon of his mission widened before him. The "fulness of the Gentiles" had to be brought in. His diocese was no longer Antioch, but the whole of the Roman empire. The years that followed were almost wholly spent among its great cities, "preaching among the Gentiles the unsearchable riches of Christ" (Eph. iii. 8). He became the spiritual father of many communities, and he watched over them with a father's constant care. He gathered round him a company of faithful disciples, who shared with him his missionary work, and whom he sent sometimes to break new ground, sometimes to arrange disputes, sometimes to gather contributions, sometimes to examine and report. Of his travels, whether with them or alone, no complete record has been preserved; some of them are minutely described in the Acts, others within the same period are known only or chiefly from his epistles. In giving an account of them it is necessary to change to some extent the historical perspective which is presented in the Acts; for, in working up fragments of itineraries of Paul's companions into a consecutive narrative, many things are made to come into the foreground which Paul himself would probably have disregarded, and many things are omitted or thrown into the shade to which, from his letters, he appears to have attached a primary importance.¹

The first scene of his new activity, it indeed it be allowable to consider the conference at Jerusalem and the subsequent dispute at Antioch as having given occasion for a new departure, was probably the eastern part of Asia Minor, and more particularly Galatia. Some of it he had visited before; and from the fact that the Galatians, though they had been heathens (Gal. iv. 8), were evidently acquainted with the law, it may be inferred that he still went on the track of Jewish missionaries, and that here, as elsewhere, Judaism had prepared the way for Christianity. Of his preaching he himself gives a brief summary; it was the vivid setting forth before their eyes of Jesus as the crucified

Messiah, and it was confirmed by evident signs of the working of the Spirit (Gal. iii. 1, 5). The new converts received it with enthusiasm; he felt for them as a father; and an illness (some have thought, from the form of expression in Gal. iv. 15, that it was an acute ophthalmia) which came upon him (assuming this to have been his first visit) intensified their mutual affection. What we learn specially of the Galatians is probably true also of the other Gentiles who received him; some of them were baptized (Gal. iii. 27), they were formed into communities (Gal. i. 2), and they were so far organized as to have a distinction between teachers and taught (Gal. vi. 6).

But an imperative call summoned him to Europe. The western part of Asia Minor, in which afterwards were formed the important churches of Ephesus, Colossæ, Hierapolis, and Laodicea, was for the present left alone. He passed on into Macedonia. The change was more than a passage from Asia to Europe. Hitherto, if Antioch be excepted, he had preached only in small provincial towns. Henceforward he preached chiefly, and at last exclusively, in the great centres of population. He began with Philippi, which was at once a great military post and the wealthy entrepôt of the gold and silver mines of the neighbouring Mount Pangeus. The testimony of the eye-witness whose account is incorporated in Acts xvi. 12-18 tells us that his first convert was a Jewish proselyte, named Lydia; and Paul himself mentions other women converts (Phil. iv. 2). There is the special interest about the community which soon grew up that it was organized after the manner of the guilds, of which there were many both at Philippi and in other towns of Macedonia, and that its administrative officers were entitled, probably from the analogy of those guilds, "bishops" and "deacons."

In Europe, as in Asia, persecution attended him. He was "shamefully entreated" at Philippi (1 Thess. ii. 2), and according to the Acts the ill-treatment came not from the Jews but from the Gentile employers of a frenzied prophetess, who saw in Paul's preaching an element of danger to their craft. Consequently he left that city, and passing over Amphipolis, the political capital of the province, but the seat rather of the official classes than of trade, he went on to the great seaport and commercial city of Thessalonica. His converts there seem to have been chiefly among the Gentile workmen (1 Thess. iv. 11; 2 Thess. iii. 10-12), and he himself became one of them. Knowing as he did the scanty wages of their toil, he "worked night and day that he might not burden any of them" (1 Thess. ii. 9; 2 Thess. iii. 8). But for all his working he does not seem to have earned enough to support his little company; he was constrained both once and again to accept help from Philippi (Phil. iv. 16). He was determined that, whatever he might have to endure, no sordid thought should enter into his relations with the Thessalonians; he would be to them only what a father is to his children, behaving himself "holily and righteously and unblameably," and exhorting them to walk worthily of God who had called them (1 Thess. ii. 10-12). But there, as elsewhere, his preaching was "in much conflict." The Jews were actively hostile. According to the account in the Acts (xvii. 5-9), they at last hounded on the lazzaroni of the city, who were doubtless moved as easily as a Moslem crowd in modern times by any cry of treason or infidelity, to attack the house of Jason (possibly one of Paul's kinsmen, Rom. xvi. 21), either because Paul himself was lodging there, or because it was the meeting-place of the community. Paul and Silas were not there, and so escaped; but it was thought prudent that they should go at once and secretly to the neighbouring small town of Berea. Thither, however, the fanatical Jews of Thessalonica pursued them; and Paul, leaving his companions Silas and Timothy at Berea, gave

¹ The most important instance of this is probably the almost entire omission of an account of his relations with the community at Corinth; one of his visits is entirely omitted, another is also omitted, though it may be inferred from the general expression "he came into Greece" (xx. 2); and of the disputes in the community, and Paul's relations to them, there is not a single word.

up his preaching in Macedonia for a time and went southwards to Athens.

The narrative which the Acts give of his stay at Athens is one of the most striking, and at the same time one of the most difficult, episodes in the book. What is the meaning of the inscription on the altar? What is the Areopagus? How far does the reported speech give Paul's actual words? What did the Athenians understand by the Resurrection? These are examples of questions on which it is easy to argue, but which, with our present knowledge, it is impossible to decide. One point seems to be clear, both from the absence of any further mention of the city in Paul's writings and from the absence of any permanent results of his visit, that his visit was a comparative failure. It was almost inevitable that it should be so. Athens was the educational centre of Greece. It was a great university city. For its students and professors the Christianity which Paul preached had only an intellectual interest. They were not conscious of the need, which Christianity presupposes, of a great moral reformation; nor indeed was it until many years afterwards, when Christianity had added to itself certain philosophical elements and become not only a religion but a theology, that the educated Greek mind, whether at Athens or elsewhere, took serious hold of it. Of Paul's own inner life at Athens we learn, not from the Acts, but from one of his epistles. His thoughts were not with the philosophers but with the communities of Macedonia and the converts among whom he had preached with such different success. He cared far less for the world of mocking critics and procrastinating idlers in the chief seat of culture than he did for the enthusiastic artisans of Thessalonica, to whom it was a burning question of dispute how soon the Second Advent would come, and what would be the relation of the living members of the church to those who had fallen asleep. He would fain have gone back to them, but "Satan hindered him" (1 Thess. ii. 17, 18); and he sent Timothy in his stead "to comfort them as concerning their faith," and to prevent their relapsing, as probably other converts did, under the pressure of persecution (1 Thess. iii. 2, 3).

A: From Athens he went to Corinth, the capital of the Roman province of Achaia, and the real centre of the busy life of Greece. It was not the ancient Greek city with Greek inhabitants, but a new city which had grown up in Roman times, with a vast population of mingled races, who had added to the traditional worship of Aphrodite the still more sensuous cults of the East. Never before had Paul had so vast or so promising a field for his preaching; for alike the filthy sensuality of its wealthy classes and the intense wretchedness of its half-million of paupers and slaves (τὴν βδελυρίαν τῶν ἐκείσε πλουσίων καὶ τῶν πενήτων ἀθλιότητα, Alciph. iii. 60) were prepared ground upon which his preaching could sow the seed, in the one case of moral reaction, and in the other of hope. At first the greatness of his task appalled him: "I was with you in weakness, and in fear, and in much trembling" (1 Cor. ii. 3). But he laid down for himself from the first the fixed principle that he would preach nothing but "Jesus Christ, and him crucified" (1 Cor. ii. 2), compromising with neither the Jews, to whom "the word of the cross," i.e., the doctrine of a crucified Messiah, was "a stumbling-block," nor with the Gentile philosophers, to whom it was "foolishness" (1 Cor. i. 18, 23). It is probable that there were other preachers of the gospel at Corinth, especially among the Jews, since soon afterwards there was a Judaizing party; Paul's own converts seem to have been chiefly among the Gentiles (1 Cor. xii. 2). Some of them apparently belonged to the luxurious classes (1 Cor. vi. 11), a few of them to the influential and literary classes (1 Cor. i. 26); but the majority were from the lowest classes, the "foolish,"

the "weak," the "base," and the "despised" (1 Cor. i. 27, 28). And among the poor he lived a poor man's life. It was his special "glorying" (1 Cor. ix. 15; 2 Cor. xi. 10) that he would not be burdensome to any of them (1 Cor. ix. 12; 2 Cor. xi. 9, xii. 13). He worked at his trade of tent-making; but it was a hard sad life. His trade was precarious, and did not suffice for even his scanty needs (2 Cor. xi. 9). Beneath the enthusiasm of the preacher was the physical distress of hunger and cold and ill-usage (1 Cor. iv. 11). But in "all his distress and affliction" he was comforted by the good news which Timothy brought him of the steadfastness of the Thessalonian converts; the sense of depression which preceded it is indicated by the graphic phrase, "Now we *live*, if ye stand fast in the Lord" (1 Thess. iii. 6-8). With Timothy came Silas, both of them bringing help for his material needs from the communities of Macedonia (2 Cor. xi. 9; Acts xviii. 5; perhaps only from Philippi, Phil. iv. 15), and it was apparently after their coming that the active preaching began (2 Cor. i. 19) which roused the Jews to a more open hostility.

Of that hostility an interesting incident is recorded in the Acts (xviii. 12-16); but a more important fact in Paul's life was the sending of a letter, the earliest of all his letters which have come down to us, to the community which he had founded at Thessalonica. Its genuineness, though perhaps not beyond dispute, is almost certain. Part of it is a renewed exhortation to steadfastness in face of persecutions, to purity of life, and to brotherly love; part of it is apparently an answer to a question which had arisen among the converts when some of their number had died before the Parousia; and part of it is a general summary of their duties as members of a Christian community. It was probably followed, some months afterwards, by a second letter; but the genuineness of the Second Epistle to the Thessalonians has been much disputed. It proceeds upon the same general lines as the first, but appears to correct the misapprehensions which the first had caused as to the nearness of the Parousia.

After having lived probably about two years at Corinth Paul resolved, for reasons to which he himself gives no clue, to change the centre of his activity from Corinth to Ephesus. Like Corinth, Ephesus was a great commercial ^{at Ephesus} city with a vast mixed population; it afforded a similar field for preaching, and it probably gave him increased facilities for communicating with the communities to which he was a spiritual father. It is clear from his epistles that his activity at Ephesus was on a much larger scale than the Acts of the Apostles indicate. Probably the author of the memoirs from which this part of the narrative in the Acts was compiled was not at this time with him; consequently there remain only fragmentary and for the most part unimportant anecdotes. His real life at this time is vividly pictured in the Epistles to the Corinthians. It was a life of hardship and danger and anxiety: "Even unto this present hour we both hunger and thirst, and are naked, and are buffeted, and have no certain dwelling-place; and we toil, working with our own hands; being reviled, we bless; being persecuted, we endure; being defamed, we intreat: we are made as the filth of the world, the offscouring of all things even until now" (1 Cor. iv. 11-13). It was almost more than he could bear: "We were weighed down exceedingly, beyond our power, inasmuch that we despaired even of life" (2 Cor. i. 8). He went about like one condemned to die, upon whom the sentence might at any moment be carried out (2 Cor. i. 9). Once, at least, it seemed as though the end had actually come, for he had to fight with beasts in the arena (1 Cor. xv. 32); and once, if not on the same occasion, he was only saved by Prisca and Aquila, "who for his life laid down their own necks" (Rom. xvi. 4). But that which

filled a larger place in his thoughts than the "perils" of either the past or the present was the "care of all the churches." He was the centre round which a system of communities revolved; and partly by letters, partly by sending his companions, and partly by personal visits, he kept himself informed of their varied concerns, and endeavoured to give a direction to their life.

His most important relations were those with the communities of Asia Minor and of Corinth.

(A) It is probable that from Ephesus he went to the churches of Galatia. Before writing to the Galatians he had paid them at least two visits (Gal. i. 9, iv. 13), and, although it is conceivable that both visits may belong to his earlier journeys, yet the tone of his letter implies that no great interval had elapsed since his last visit (Gal. i. 6). The Acts mention that soon after his arrival at Ephesus he went to Syria, and returned "through the region of Phrygia and Galatia in order, establishing all the disciples" (xviii. 23); and, although the motive which is assigned for that journey has been called in question, the journey itself is not inconsistent with the statements of his epistles.¹ He appears to have been followed by vigorous opponents, who denied his authority as a Christian teacher, and who taught "another gospel" (Gal. i. 6, 7). He consequently wrote a letter, the Epistle to the Galatians, which, from its marked antithetical character, throws greater light upon the essential points of his preaching than any other which has come down to us. It is mainly directed to three points: first, to assert that what he preached had its origin in a direct revelation to himself, and was consequently of divine authority; secondly, to show that the blessings of the gospel were not limited to the seed of Abraham, but were given to all that believe; thirdly, to maintain that submission to the requirements of the law was not merely unnecessary, but an abandonment of the gospel. To this he adds the practical exhortation that they should not "use their freedom for an occasion to the flesh," but "walk by the Spirit," from whom their new life came.

It is also probable that during his stay at Ephesus several communities were formed in the western corner of Phrygia, in the valley of the Lycus, at Laodicea, Colossæ, and Hierapolis. If the testimony of the Epistle to the Colossians be accepted, they were formed, not by Paul himself, but by Epaphroditus (Col. i. 7, ii. 1, iv. 12, 13).

(B) His relations at this time with the community at Corinth may for the most part be clearly inferred from his epistles, but, since they are ignored in the Acts and since the words of the epistles are in some cases ambiguous, there are some points of comparative uncertainty. The following is the most probable account of them. (1) Corinth, soon after Paul left it, was visited by Apollos, who is described in the Acts as an Alexandrian Jew, "a learned man" and "mighty in the Scriptures" (xviii. 24). Paul had "planted," and Apollos "watered" (1 Cor. iii. 6); to the unrhethorical and unphilosophical gospel of the one was added the rhetorical and philosophical preaching of the other; they both preached in effect the same gospel, but between their followers there soon came to be a rivalry; and it is probably in contrast to Apollos that Paul subsequently protests that his own preaching was "not in persuasive words of wisdom, but in demonstration of the Spirit and of power" (1 Cor. ii. 4). (2) It is probable that Paul then went to Corinth a second time; since his next visit was his third (2 Cor. xiii. 1, which, however, has sometimes been understood of an unfulfilled intention). (3) The Corinthians afterwards wrote to ask his advice on several points, viz., on marriage, on virgins, on things sacrificed to idols, on spiritual gifts, on the collection for the poor, and on his relations with Apollos (it is probable that the sections of Paul's letter which begin with the preposition *περὶ*, "concerning," are the direct answers to the letter of the Corinthians). He also received news of the state of affairs at Corinth from the slaves of Chloe, who told him of the divisions in the community (1 Cor. i. 11), and from Stephanas, Fortunatus, and Achaicus, who not only gave him better news, but probably also brought him material help (1 Cor. xvi. 17). He probably also learnt something from Apollos, who

had come to him (1 Cor. xvi. 12). (4) He then sent Timothy to them (1 Cor. iv. 17, xvi. 10, 11), possibly by way of Macedonia, and with Erastus (Acts xix. 22). It has been thought that Timothy never reached Corinth (Neander, De Wette, Hausrath, partly on the ground that he would have been mentioned in 2 Cor. xii. 17); but, on the other hand, since his intended visit was mentioned in the first letter, his non-arrival would probably have been expressly accounted for in the second (Heinrich, Holtzmann). (5) Before Timothy reached Corinth Paul addressed to the Corinthians the first of the two letters which have come down to us. (6) Afterwards, possibly in consequence of the news which Timothy brought to him at Ephesus, he sent a second letter, which has not been preserved; this is an inference from 2 Cor. ii. 3, 4, vii. 8-12, where the description of a letter written "with many tears," which made the Corinthians "sorry," does not seem applicable to the existing 1 Cor. (Hausrath thinks that this intermediate letter is to be recognized in 2 Cor. x-xiii.; but his hypothesis is rejected by Hilgenfeld, Beyschlag, Klopp, Weissäcker, Holtzmann, and others). (7) Then he sent Titus, probably with a view to the collection of alms for the poor Christians in Palestine (2 Cor. viii. 6, xii. 17, 18; 1 Cor. xvi. 1-3). (8) After this, without waiting for the return of Titus, he resolved to carry out the intention which he had for some time entertained, but which he had abandoned or postponed, of going again himself (1 Cor. xvi. 5, 6; 2 Cor. i. 15, 23; it may be noted that, while in the first epistle his intention was that which he actually carried out, viz., to go first to Macedonia and then to Corinth, in the second epistle the order of his intended route is altered).

An émeute which took place at Ephesus was, according to the Acts, the occasion if not the cause of his leaving that city; "a great door and effectual had been opened unto him" there (1 Cor. xvi. 9), and the growth of the new religion had caused an appreciable diminution in the trade of those who profited by the zeal of the worshippers at the temple (Acts xix. 23 to xx. 1). He went overland to Troas, where, as at Ephesus, "a door was opened unto him in the Lord" (2 Cor. ii. 12); but the thought of Corinth was stronger than the wish to make a new community. He was eager to meet Titus, and to hear of the effect of his now lost letter; and he went on into Macedonia. It is at this point of his life more than at any other that he reveals to us his inner history. At Ephesus he had been hunted almost to death; he had carried his life in his hand; and, "even when we were come into Macedonia, our flesh had no relief, but we were afflicted on every side; without were fightings, within were fears" (2 Cor. vii. 5). But, though the "outward man was decaying, yet the inward man was renewed day by day"; and the climax of splendid paradoxes which he wrote soon afterwards to the Corinthians (2 Cor. vi. 3-10) was not a rhetorical ideal, but the story of his actual life. But after a time Titus came with news which gladdened Paul's heart (2 Cor. vii. 7). He had been well received at Corinth. The letter had made a deep impression. The admonitions had been listened to. The Corinthians had repented of their conduct. They had rid themselves of "him that did the wrong," and Paul was "of good courage concerning them" (2 Cor. vii. 8-16). He then wrote the second of his extant letters to them, which was sent by Titus and the unknown "brother whose praise in the gospel is spread through all the churches," and who had been elected by the churches to travel with Paul and his company (2 Cor. viii. 18, 19). It was probably in the course of this journey that he went beyond the borders of Macedonia into the neighbouring province of Illyricum (Rom. xv. 19); but his real goal was Corinth. For the third time he went there, and, overcoming the scruples of his earlier visits, he was the guest of Gaius, in whose house the meetings of the community took place (Rom. xvi. 23).

Of the incidents of his visit no record remains; the Acts do not even mention it. But it was the culminating point of his intellectual activity; for in the course of it he wrote the greatest of all his letters, the Epistle to the Romans. And, as the body of that epistle throws an invaluable light upon the tenor of his preaching at this

¹ It has been customary to give this visit to Syria a factitious importance by representing it as constituting the point of division between the second and the third missionary journeys. But the arrangement of Paul's active life into "missionary journeys" is artificial and unsatisfactory. The so-called "first missionary journey" is, as has been pointed out above, only a single episode in at least eleven years of work; and, even if it be allowed that the conference at Jerusalem constitutes a sufficiently important epoch in his life to warrant a break in his biography, there is no solid reason whatever for fixing upon this particular visit to Syria as constituting such an epoch. If the latter part of his biography be broken up into chapters at all, it would be much more useful to divide it according to the centres at which he settled from time to time, and from which his activity radiated, Corinth, Ephesus, Caesarea (probably), and Rome.

time to the communities, among which that of Rome can hardly have been singular, so the salutations at the end, whether they be assumed to be an integral part of the whole or not, are a wonderful revelation of the breadth and intimacy of his relations with the individual members of those communities. But that which was as much in his mind as either the great question of the relation of faith to the law or the needs of individual converts in the Christian communities was the collection of alms "for the poor among the saints that were at Jerusalem" (Rom. xv. 26). The communities of Palestine had probably never ceased to be what the first disciples were, communities of paupers in a pauperized country, and consequently dependent upon external help. And all through his missionary journeys Paul had remembered the injunction which had sealed his compact with "the three" (Gal. ii. 10). In Galatia (1 Cor. xvi. 1), among the poor and persecuted churches of Macedonia (Rom. xv. 26; 2 Cor. viii. 1-4), at Corinth, and in Achaia (1 Cor. xvi. 1-3; 2 Cor. viii. and ix.), the Gentiles who had been made partakers with the Jews in spiritual things had been successfully told that "they owed to them also to minister unto them in carnal things" (Rom. xv. 27). The contributions were evidently on a large scale; and Paul, to prevent the charges of malversation which were sometimes made against him, associated with himself "in the matter of this grace" a person chosen by the churches themselves (2 Cor. viii. 19-21, xii. 17, 18); some have thought that all the persons whose names are mentioned in Acts xx. 4 were delegates of their respective churches for this purpose.

Sets out
for Jeru-
salem.

He resolved to go to Jerusalem himself with this material testimony of the brotherly feeling of the Gentile communities, and then, "having no more any place" in Greece, to go to the new mission fields of Rome and the still farther West (Rom. xv. 23-25). He was not certain that his peace-offering would be acceptable to the Jewish Christians, and he had reason to apprehend violence from the unbelieving Jews. His departure from Corinth, like that from Ephesus, was probably hastened by danger, to his life; and, instead of going direct to Jerusalem (an intention which seems to be implied in Rom. xv. 25), he and his companions took a circuitous route round the coasts of the Ægean Sea. His course lay through Philippi, Troas, Mitylene, Chios, and Miletus, where he took farewell of the elders of the community at Ephesus in an address of which some reminiscences are probably preserved in Acts xx. 18-34. Thence he went, by what was probably an ordinary route of commerce, to the Syrian coast, and at last he reached the Holy City.

The narrative which the Acts give of the incidents of his life there is full of grave difficulties. It leaves altogether in the background that which Paul himself mentions as his chief reason for making the visit; and it relates that he accepted the advice which was given him to avail himself of the custom of vicarious vows, in order to show, by his conformity to prevalent usages, that "there was no truth" in the reports that he had told the Gentiles "not to circumcise their children, neither to walk after the customs" (Acts xxi. 20-26). If this narrative be judged by the principles which Paul proclaims in the Epistle to the Galatians, it seems hardly credible. He had broken with Judaism, and his whole preaching was a preaching of the "righteousness which is of faith," as an antithesis to, and as superseding, the "righteousness which is of the law." But now he is represented as resting his defence on his conformity to the law, on his being "a Pharisee and the son of Pharisees," who was called in question for the one point only that he believed, as other Pharisees believed, in the resurrection of the dead.

What colouring of a later time, derived from later controversies, has been spread over the original outline of the history cannot now be told. While on the one hand the difficulties of the narrative as it stands cannot be overlooked, yet on the other hand no faithful historian will undertake, in the absence of all collateral evidence, the task of discriminating that which belongs to a contemporary testimony and that which belongs to a subsequent recension. From this uncertainty the general concurrence of even adverse critics excepts the "we" section (Acts xxvii. 1, xxviii. 16); whoever may have been the author of those "we" sections, and whatever may be the amount of revision to which they have been subjected, they seem to have for their basis the diary or itinerary of a companion of Paul, and the account of the voyage contains at least the indisputable fact that Paul went to Rome.

But his life at Rome and all the rest of his history are enveloped in mists from which no single gleam of certain light emerges. Almost every writer, whether apologetic or sceptical, has some new hypothesis respecting it; and the number and variety of the hypotheses which have been already framed is a warning, until new evidence appears, against adding to their number. The preliminary questions which have to be solved before any hypothesis can be said to have a foundation in fact are themselves extremely intricate; and their solution depends upon considerations to which, in the absence of positive and determining evidence, different minds tend inevitably to give different interpretations. The chief of these preliminary questions is the genuineness of the epistles bearing Paul's name, which, if they be his, must be assigned to the later period of his life, viz., those to the Philippians, Ephesians, and Colossians, to Philemon, to Timothy, and to Titus. As these epistles do not stand or fall together, but give rise in each case to separate discussion, the theories vary according as they are severally thought to be genuine or false. The least disputed is the Epistle to Philemon; but it is also the least fruitful in either doctrine or biographical details. Next to it in the order of general acceptance is the Epistle to the Philippians. The Epistles to the Ephesians and to the Colossians have given rise to disputes which cannot easily be settled in the absence of collateral evidence, since they mainly turn partly on the historical probability of the rapid growth in those communities of certain forms of theological speculation, and partly on the psychological probability of the almost sudden development in Paul's own mind of new methods of conceiving and presenting Christian doctrine. The pastoral epistles, viz., those to Timothy and to Titus, have given rise to still graver questions, and are probably even less defensible.

Genuine-
ness of
Pauline
epistles.

But, even if this preliminary question of the genuineness of the several epistles be decided in each instance in the affirmative, there remains the further question whether they or any of them belong to the period of Paul's imprisonment at Rome, and, if so, what they imply as to his history. It is held by many writers that they all belong to an earlier period of his life, especially to his stay at Cæsarea (Acts xxiv. 23, 27). It is held by other writers that they were all sent from Rome, and with some such writers it has become almost an article of faith that he was imprisoned there not once but twice. It is sometimes further supposed that in the interval between the first and second imprisonments he made his intended journey to Spain (Rom. xv. 24, which is apparently regarded as an accomplished fact by the author of the Muratorian fragment); and that either before or after his journey to Spain he visited again the communities of the Ægean seaboard which are mentioned in the pastoral epistles.

Difficul-
ties con-
nected
with

The place and manner and occasion of his death are not less uncertain than the facts of his later life. The

only fragment of approximately contemporary evidence is a vague and rhetorical passage in the letter of Clement of Rome (c. 5): "Paul . . . having taught the whole world righteousness, and having come to the goal of the West (*ἐπὶ τὸ τέμα της δύσεως*), and having borne witness (*μαρτυρήσας*) before the rulers, so was released from the world and went to the Holy Place, having become the greatest example of patience." The two material points in this passage, (1) "the limit of the West," (2) "having borne witness," are fruitful sources of controversy. The one may mean either Rome or Spain, the other may mean either "having testified" or "having suffered martyrdom." It is not until towards the end of the 2d century, after many causes had operated both to create and to crush traditions, that mention is made of Paul as having suffered about the same time as Peter at Rome; but the credibility of the assertion is weakened by its connexion in the same sentence with the erroneous statement that Peter and Paul went to Italy together after having founded the church at Corinth (Dionysius of Corinth, quoted by Eusebius, *H. E.*, ii. 25). A Roman presbyter named Gaius speaks, a few years later, of the martyr-tombs of the two apostles being visible at Rome (quoted by Eusebius, *l. c.*); but neither this testimony nor that of Tertullian (*De præscr.* 36, *Scorp.* 15, *Adv. Marc.* iv. 5) is sufficient to establish more than the general probability that Paul suffered martyrdom. But there is no warrant for going beyond this, as almost all Paul's biographers have done, and finding an actual date for his martyrdom in the so-called Neronian persecution of 64 A.D.¹

The chronology of the rest of his life is as uncertain as the date of his death. We have no means of knowing when he was born, or how long he lived, or at what dates the several events of his life took place. The nearest approach to a fixed point from which the dates of some events may be calculated is that of the death of Festus, which may probably, though by no means certainly, be placed in 62 A.D.; even if this date were certainly known, new evidence would be required to determine the length of time during which he held office; all that can or could be said is that Paul was sent to Rome some time before the death of Festus in 62 A.D. How widely opinions differ as to the rest of the chronology may be seen by a reference to the chronological table which is given by Meyer in the introduction to his *Commentary on the Acts*, and after him by Farrar, *St Paul*, vol. ii. p. 624.²

Of his personality he himself tells us as much as need be known when he quotes the adverse remarks of his opponents at Corinth: "his letters, they say, are weighty and strong; but his bodily presence is weak, and his speech of no account" (2 Cor. x. 10). The Christian romance-writer elaborated the picture, of which some traits may have come to him from tradition: "a man small in stature, bald-headed, bow-legged, stout, close-browed, with a slightly prominent nose, full of grace; for at one time he seemed like a man, at another time he had the face of an angel" (*Acta Pauli et Theclæ*, c. 3, ap. Tischendorf, *Acta Apostolorum Apocrypha*, p. 41); and the pagan caricaturist speaks of him in similar terms, as "bald in front, with a slightly prominent nose, who had taken an aerial journey

into the third heaven" (pseudo-Lucian, *Philopatris*, c. 12). Some early representations of him on gilded glasses and sarcophagi still remain; accounts of them will be found in Smith and Cheetham, *Dict. Chr. Ant.*, vol. ii. p. 1621; Schultze, *Die Katakomben*, Leipsic, 1882, p. 149. That he was sometimes stricken down by illness is clear from Gal. iv. 13 (some have thought also from 2 Cor. ii. 4); and at his moments of greatest exaltation "there was given to him a stake in the flesh . . . that he should not be exalted overmuch" (2 Cor. xii. 7). The nature of this special weakness has given rise to many conjectures; the most probable is that it was one of those obscure nervous disorders which are allied to epilepsy and sometimes mistaken for it.³

Of the writings which are ascribed to him in the current lists of the canonical books of the New Testament, and also of the Epistle to the Hebrews, accounts will be found in separate articles under their respective titles. The writings which are ascribed to him outside the canon, and which are all unquestionably pseudonymous, are the following.—(1) *The Epistle to the Laodiceans*. This is supposed to be the letter mentioned in Col. iv. 16; it has been recognized as apocryphal from early times (Jer., *Catal. script. eccl.*, c. 5; Theodoret on Coloss. iv. 16, &c.), but it is found in many Latin MSS. of the New Testament. The text, which is a cento from genuine Pauline epistles, will be found, e.g., in Anger, *Ueber den Laodiceenerbrief*, Leipsic, 1843; Lightfoot, *Colossians*, p. 274, who also gives a convenient summary of the views which have been held respecting the letter which is actually mentioned. (2) *A Third Epistle to the Corinthians*, i.e., the letter mentioned in 1 Cor. v. 9. This is found in an Armenian version, together with an equally apocryphal letter of the Corinthians to Paul; it has been several times printed, the best edition of it being that of Aucher, *Armenian and English Grammar*, Venice, 1819, p. 183. An English translation will be found in Stanley, *Epistles of St Paul to the Corinthians*, p. 593. (3) *Letters between Paul and Seneca*. These are first mentioned by Jerome, *Catal. script. eccl.*, c. 12, and Augustine, *Epist.* 64 (153), *ad Macedonium*, and have given rise to interesting discussions as to the possibility of personal relations having actually existed between the two men. The letters will be found in most editions of Seneca, e.g., ed. Hasse, vol. iii. 476; for the questions which have been raised concerning them reference may conveniently be made to Funk, "Der Briefwechsel des Paulus mit Seneca," in the *Theol. Quartalschr.*, Tübingen, 1867, p. 602, and Lightfoot, *Philippians*, p. 327. Besides these apocryphal letters there are several apocryphal works which profess to add to our information respecting his life; the most important of these are (1) *The Acts of Peter and Paul*, (2) *The Acts of Paul and Thecla*, (3) *The Apocalypse of Paul*; the first two are printed in Tischendorf's *Acta Apostolorum Apocrypha*, pp. 1, 40, the third in his *Apocalypses Mosis, Esæ, Pauli*, p. 34; all three will be found in an English version in *The Apocryphal Gospels, Acts, and Revelations*, translated by A. Walker, Edinburgh, 1870; an elaborate and trustworthy account of them will appear in the not yet completed work of R. A. Lipsius, *Die apokryphen Apostelgeschichten und Apostellegenden*.

Pauline Theology.

The consideration of Paul's theology is rendered difficult by several circumstances. Some of these circumstances attach to the history of the theology itself. (1) It has two elements, the logical and the mystical, which are seldom altogether separable from each other; it to his theology cannot be stated in a consecutive series of syllogisms, nor can any adequate view of it leave out of sight elements which belong to another order of thought than that within which the modern world ordinarily moves. (2) He belonged to an age in which abstract conceptions had a greater power over men's minds than they have now; the extreme tendency of that feature of his age is seen in Gnosticism, which not only gave abstract ideas an independent existence but endowed them with personality; and, although he was not a Gnostic, yet he lived at a time at which Gnosticism was conceivable, and some of his own expressions are not out of harmony with it. (3) Since he was in some instances attaching new meanings to words which were already in use, and since in such a case it is difficult for even the most rigidly logical writer to keep the new meaning entirely distinct from the old, it is natural to find that a writer of Paul's temperament, especially when writing as he did under different circumstances and to different classes of people, should sometimes use the same word in different senses. Other circumstances arise from the manner in which his theology

¹ The *Martyrium Pauli* in Zacagni, *Coll. mon. vet. eccl.*, Rome, 1698, p. 535, gives not only details but an exact date, viz., 29th June 66 A.D.; the day has been adopted by the Latin Church as the common anniversary of St Peter and St Paul. All the early evidence which bears upon the point has been collected by Kunze, *Præcipua patrum ecclesiasticorum testimonia rursus ad mortem Pauli apostoli spectant*, Göttingen, 1848.

² The literature of the subject is extensive; the most convenient summary of the discussions, for English readers, will be found in the introduction to Meyer's *Commentary*, which is mentioned above, and of which there is an English translation.

³ See Krenkel, "Das körperliche Leiden des Paulus," in the *Zeitschr. f. wissenschaftl. Theol.*, 1873, p. 238; and for various views, Lightfoot, *Galatians*, p. 188; Farrar, *St Paul*, vol. i., Ecclus. x. p. 652.

has been treated. (4) It has proved to be difficult for most writers to avoid attaching to some of the words which he uses, and which are also used by writers of other parts of the New Testament, ideas which may be true in themselves, and which were probably in the minds of those other writers, but which do not appear to have entered into Paul's own system of thought. (5) It has proved to be difficult for most writers to keep Paul's own ideas clear from their later accretions. Those ideas form the basis alike of Augustinianism, of Thomism, and of Lutheranism; and, since one or other of these systems of theology, or some modification of it, forms part of the education of most theological students, and is embodied in the catechism or confession with whose words, if not always with their meaning, every member of a Christian community is more or less familiar, it is not unnatural to find that almost all writers have approached the subject with a certain amount of prepossession in favour of some particular interpretation or combination of Paul's phrases. (6) Another kind of difficulty arises from the very limited extent to which it is possible to apply to his theology the method of comparison. If it were possible to recover a sufficient amount of current Palestinian theology for the purpose, any exposition of Paul's theology would begin by setting forth the main points of the system of ideas in which he was educated, and would proceed to show how far they were affected by the new elements which were introduced into that system by his conversion. Much light is thrown upon some points by the large knowledge of current Alexandrian theology which may be obtained from Philo; but, although Palestinian and Alexandrian theology had many elements in common, they seem to have differed most of all in those respects in which a knowledge of the former would have thrown light upon Paul. It becomes necessary, in the absence of most of the materials which would have been valuable for comparison, to content ourselves with putting together the predicates which he attaches to the several terms which he employs, with disentangling the winding threads of his arguments, and with endeavouring to ascertain what conceptions will best account for the several groups of his varying metaphors. The danger of stating the results of these processes in a systematic form is partly that, without the checks and side-lights which are afforded by a knowledge of their antecedents and surroundings, any such statement is liable to have a false perspective, by making prominent that which was subordinate and giving to unimportant phrases a disproportionate value; and partly that Paul's own variety and complexity of expression reflect the variety and complexity of the spiritual truths with which he deals, and for which any single form of statement is inadequate.

Sin, the fundamental conception.

The most fundamental conception, both historically in the development of Paul's own thought, and logically as the ground from which the rest of his theology may be deduced, is that of sin. The word is used sometimes to denote the actual doing of a wrong action, or the consciousness of having done it, and sometimes to denote the tendency to do such actions, or the quality of such actions in the abstract. This tendency or quality is conceived as a quasi-personal being, which dwells in men (Rom. vii. 20), which exercises dominion over them (Rom. v. 21, vi. 12, 14), to which they are slaves (Rom. vi. 13, 17 sq., vii. 14), which pays them wages (Rom. vi. 23), which imposes its law upon them (Rom. vii. 23, 25, viii. 2), which keeps them shut up in prison (Gal. iii. 22), or which, in less metaphorical language, causes evil desires (Rom. vii. 8). It is not precisely defined, but, since it is the opposite of obedience (Rom. vi. 16), its essence may be regarded as disobedience. No such definition was at the time necessary, for neither in his belief in the existence of sin nor in his conception of its nature did he differ from the great mass of his countrymen. His peculiarity was that he both believed in its universality and made that fact of its universality the basis of his teaching. In the early chapters of the Epistle to the Romans he rests the proof of the fact on an appeal to common experience. But the proof is rather of rhetorical than of logical validity. It was easy in addressing a congregation of Gentiles to point to the general and deep depravity of the society which surrounded them, and in addressing Jews not only to show that they fell short of their own standard, but also to clench the argument by an appeal to Scripture, which declared that "there is none righteous, no not one" (Ps. xiv. 1; Rom. iii. 10; cf. Gal. iii. 22). But the general prevalence of depravity did not show its universality, and the appeal to Scripture was not convincing to a Gentile. These arguments are not further insisted on, and a more cogent proof is found in the fact of the universality of death; for it was a fixed Jewish belief that "God created man to be immortal" (Wisd. ii. 23), and the fact that all men died showed that all men sinned (Rom. v. 12). Nor was even this proof sufficient. What had to be shown, for the purposes of his further arguments, was not merely that sin was universal but that it was so inevitably. This is done by showing that sin is inseparable from human nature on two grounds, the relation of which to each other is neither clear in itself nor clearly explained by Paul. (1) The one is that mankind as a race were involved in the sin of Adam (Rom. v. 12-19; 1 Cor. xv. 21, 22). "Through the one man's disobedience the many were made sinners" (Rom. v. 19) is

an alternative expression with "through the trespass of the one the many died" (Rom. v. 15). But as to the mode in which the "disobedience" or "trespass" of Adam affected the whole human race no information is given, and the question has been one of the chief puzzles of Christian theology in all ages. It is a point upon which, more than perhaps upon any other, light would be thrown by a fuller knowledge of contemporary Jewish theology (cf. Ecclesiasticus, xxv. 24, "of the woman came the beginning of sin and through her we all die"; the question is complicated by the mention of Adam in 1 Cor. xv. 47 as "of the earth, earthy," and apparently corruptible by virtue of his earthy nature, without reference to his transgression). (2) The second ground is at once more prominent and more intelligible to a modern mind. It is that human nature consists of two elements, and that one of them, as Paul gathered from his own experience, which he took to be identical in this respect with the universal experience of mankind, is constantly suggesting sinful actions. Whether it does so because it is in itself essentially sinful, or because sin has effected a permanent lodgment in it, is a question which has been vigorously debated, and which is the more difficult of solution because some of Paul's expressions appear to favour the former view and some the latter. To this element of human nature he gives the name "flesh," apparently including under it not only the material body but also, and more especially, the affections and desires which spring out of the body, such as love and hate, jealousy and anger; its tendency or "mind" (*φρόνημα*) is always in antagonism at once to the higher element or "spirit" (Gal. v. 17) and to the law of God, so that "they that are in the flesh cannot please God" (Rom. viii. 7, 8).

So far, in his conception of the dualism of human nature, of the inevitable tendency of the lower part to prevail over the higher, and of the consequent universality of wrongdoing, Paul did not differ from the majority of those who have at any time reflected either upon themselves or upon mankind. The idea of sin was common to him with the Stoics. But it was impossible for him to stop where the Stoics stopped, at the exhortation to men to live by the rule of what was highest in them, and so to "follow God." For he was not a philosopher but a theologian; he was not a "citizen of the world" but a "Hebrew of the Hebrews." God had stood to his race in an especially close relation; He had given it a code of laws, and that code of laws was to a Jewish theologian the measure not only of duty but of truth. How was the conception of the universality of sin consistent with the existence of "statutes" and "judgments, which if a man do he shall live in them" (Lev. xviii. 5, quoted in Rom. x. 5; Gal. iii. 12)? That statement of Scripture clearly implied, and most of his countrymen believed, that the perfect observance of the law was possible, and that so a man might be "righteous before God."

It was at this point that he broke off, not only from the majority of his countrymen, but from his own early beliefs. The thought came to him with the overwhelming power of a direct revelation, that the law not only had not been, but could not be, perfectly observed. In one sense he seems to have held even to the end of his life that there was "a righteousness that is in the law" (Phil. iii. 6). But in another and truer sense such a righteousness was impossible. "By the works of the law shall no flesh be justified" (Gal. ii. 16), and that not only in fact but of necessity. For the law went deeper than was commonly supposed.¹ It touched not only the outer but also the inner life, and in doing so it inevitably failed from the very constitution of human nature. The existence of that nature of the "fleshly" element was of itself a constant breach of the law. The "mind," the "inner man," might delight in the law of God, but the "flesh," even if it were not inherently sinful, was in perpetual "captivity to the law of sin." And for this state of things the law had no remedy. On the one hand; it was external to men; it could not give them the force of a new life (*ζωοποιῆσαι*, Gal. iii. 21). On the other hand, the flesh was too strong for it (Rom. viii. 3). Its failure had been foreseen and provided for. The blessing of which, before the law, God had spoken to Abraham was to come, not by observance of the law, but as the result of "promise" on the part of God, and of "faith" on the part of men (Rom. iv. 13-14; Gal. iii. 11-18). And when the question naturally presented itself, Why, if the law was an inevitable and predestined failure, it had been given at all? two answers suggested themselves; the one was that "it was added because of transgressions," i.e., probably to make men's sins and their failure to avoid them more apparent (Gal. iii. 19), since "through the law came the knowledge of sin" (Rom. iii. 20), the other was that the law came in "that the trespass might abound" (Rom. v. 20), and that so "through the commandment sin might

¹ It must be noted that there appears to be a constant interchange in his mind between the conception of the Mosaic law and the ideal conception of law in the abstract; but it is difficult to maintain that the two conceptions may always be distinguished by the presence or absence of the Greek article. 1 Cor. ix. 20, Phil. iii. 5, seem of themselves sufficient to make such a distinction untenable, but the contrary view is maintained in an excellent discussion of the point by Dr Gifford, "Introduction to the Epistle to the Romans," p. 41 sq., in the *Speaker's Commentary on the New Testament*.

become exceeding sinful" (Rom. vii. 13; so 1 Cor. xv. 56, "the strength of sin is the law"). It was consequently a jailer and "tutor," keeping men under restraint and discipline, until they were ready for that which God had purposed to give them in due time (Gal. iii. 23, 24).

For "in due season, when the fulness of the time was come, God sent forth His Son," "in the likeness of sinful flesh and for sin," to do that which "the law could not do" (Rom. vi. 6, viii. 3; Gal. iv. 4). This was a "free gift" of God (Rom. iii. 24, v. 15). The constant expression for it, and for the sum of the blessings which flow from it, is "grace" or "favour" (*χάρις*), a term which was already becoming specialized in an analogous sense in Hellenistic Greek (e.g., Wisd. iii. 9, iv. 15, "grace and mercy is to His saints"; Philo, vol. i. p. 102, ed. Mang., "the beginning of creation . . . is the goodness and grace of God"). Two corollaries followed from it; in the first place, the law, having failed, was superseded, and, so far from the performance of its requirements being necessary to ensure peace with God, "if ye receive circumcision, Christ will profit you nothing" (Gal. v. 2); in the second place, the distinction between Jew and Gentile was abolished, "for ye are all one in Christ Jesus" (Gal. iii. 28).

This was "the gospel of the grace of God" (Acts xx. 24), which it was His special mission to preach; he speaks of it sometimes as "my gospel" (Rom. ii. 16, xvi. 25), or the "gospel of the uncircumcision" (Gal. ii. 7), as well as in a special sense "the gospel of God" (Rom. i. 1, xv. 16; 2 Cor. xi. 7; 1 Thess. ii. 2, 8, 9), or "the gospel of Christ" (Rom. i. 9, xv. 19; 1 Cor. ix. 12, 18; 2 Cor. ii. 12, ix. 13, x. 14; Gal. i. 7; Phil. i. 27; 1 Thess. iii. 2; 2 Thess. i. 8), or "the gospel of the glory of Christ" (2 Cor. iv. 4); and elsewhere he speaks of it as his special "secret" or "mystery" (Rom. xvi. 25; 1 Cor. ii. 1 [Codd. A, C], and more emphatically in the later epistles, Eph. i. 9, iii. 3-9, vi. 19, Col. i. 26, 27; iv. 3).

Of this gospel Christ is the beginning and the end: theology and Christology are blended into one. Sometimes He is represented as having been "sent forth" (Rom. viii. 3), or "set forth" (Rom. iii. 25), or "given up" (Rom. viii. 32), by God; sometimes, on the other hand, it is said that He "gave Himself" (Gal. i. 4), or "gave Himself up" (Gal. ii. 20; Eph. v. 2), or "made Himself poor" (2 Cor. viii. 9), or "emptied Himself" (Phil. ii. 7-8). The act by which He accomplished what He designed or was designed to do was His death on the cross (Rom. v. 6, 8, vi. 10, viii. 34, xiv. 15; 1 Cor. viii. 11, xv. 3; 2 Cor. v. 14, 15; Gal. ii. 21; 1 Thess. v. 10). The "blood" of Christ (Rom. iii. 25, v. 9; 1 Cor. xi. 25; Eph. i. 7, ii. 13; Col. i. [14], 20), the "cross" of Christ (1 Cor. i. 17; Gal. v. 11, vi. 12, 14; Phil. ii. 8, iii. 18; Eph. ii. 16; Col. i. 20, ii. 14), "Christ crucified" (1 Cor. i. 23, ii. 2; Gal. iii. 1), are therefore used as concise symbolical expressions for His entire work.¹ The act by which the completion of that work was ratified and made manifest was His resurrection from the dead (Rom. i. 4; cf. Acts xiii. 33, 34, xvii. 31); hence "He was delivered up for our offences and raised again for our justification" (Rom. iv. 25). The resurrection is thus the guarantee of the truth of the gospel; without it there is no certainty that God has forgiven us; "if Christ be not risen then is our preaching vain, and your faith is also vain" (1 Cor. xv. 14). What quality there was in the death of Christ which gave it efficacy is probably indicated in Rom. v. 19, Phil. ii. 8, where it is spoken of as an act of "obedience." The precise force of the expressions, "being made a curse for us" (Gal. iii. 13), "He made Him to be sin for us" (2 Cor. v. 21), which probably also refer to the efficacious quality of the death of Christ, is less obvious.

The death of Christ was a death on our behalf (*ὕπὲρ ἡμῶν*, Rom. v. 6, 8, viii. 32, xiv. 15; 1 Cor. i. 13 [Codd. A, C], [v. 7], xi. 24; 2 Cor. v. 15; Gal. ii. 20, iii. 13; 1 Thess. v. 10 [Codd. A, B]; cf. Eph. v. 25), or on behalf of our sins (1 Cor. xv. 3; Gal. i. 4 [Codd. B]), or on our account (*περὶ ἡμῶν*, 1 Cor. i. 13 [Codd. B, D]; 1 Thess. v. 10 [Codd. A, D]), or on account of our sins (Gal. i. 4 [Codd. A, D]), or of sin in general (Rom. viii. 3), or because of us or our transgressions (*διὰ τὰ παραπτώματα, δι' αὐτὸν*, Rom. iv. 25; 1 Cor. viii. 11; cf. 2 Cor. viii. 9). These general expressions are expanded into more explicit statements in various ways; for the nature of the work which the death of Christ effected was capable of being regarded from several points of view, nor was any one metaphor or form of words adequate to express all its relations either to God or to mankind.

(1) The nature of Christ's work is sometimes expressed in language which is relative to the idea of sacrifice; and it is conceivable that, if the contemporary conception of sacrifice were better known to us, most of the other expressions would be found to be relative to the ideas which were connected by that of sacrifice (1 Cor. v. 7, "Christ our passover is sacrificed" [some MSS. add "for us"]; the uncertain expression *θυστήριον*, Rom. iii. 25, probably belongs to

the same group of ideas; the expressions with *ὑπὲρ* and *περὶ*, which have been quoted above, are sometimes regarded as being in all cases primarily sacrificial).

(2) It is sometimes expressed in language which is relative to the conception of sin as rebellion or enmity against God; what God effected through Christ was a reconciliation (*καταλλαγή*, Rom. v. 10, 11; 2 Cor. v. 18, 19), or peace (Rom. v. 1; Eph. ii. 14; hence the special force of the salutation "Grace to you and peace from God," which is prefixed to every epistle).

(3) It is sometimes expressed in language which is relative to the idea of deliverance or "salvation" (*σῶσθαι, σωτηρία*, Rom. i. 16, v. 9, and in all the epistles; *ἀπολύτρωσις*,² Rom. iii. 24; 1 Cor. i. 30; Eph. i. 7; Col. i. 14). The idea was originally Messianic, and referred to national deliverance from foreign oppression; but it had been raised into a higher sphere of thought, that from which men are saved being conceived to be the "wrath" of God, i.e., His punishment of sin (Rom. v. 9).

(4) It is sometimes expressed in language which is relative to the idea of purchasing a slave (1 Cor. vi. 20, vii. 23, and probably Rom. xiv. 8, 9). That to which men were in bondage was the law (Gal. iv. 5), which cursed those who did not fully obey it (Gal. iii. 10, 13), or the "elements of the universe" (Gal. iv. 3, 9), i.e., the sun and stars and other material things (cf. Wisd. xiii. 2), which are spoken of in a later epistle as "principalities and powers" over which Christ "triumphed" by rising from the dead (Col. ii. 15). Hence, probably, Paul's own description of himself as the "slave of Jesus Christ" (Rom. i. 1).

(5) It is sometimes expressed in language which is relative to the conception of God as the supreme lawgiver and judge. Sin is regarded as affording ground for a charge (*ἐγκλημα*, cf. Rom. viii. 33) against the sinner, and, sin being universal, all the world was liable to the judgment of God (Rom. iii. 19). But it was possible for the Judge, for certain reasons which He considered valid, i.e., on account of the sufficient exhibition or declaration of His righteousness in the death of Christ, not to take account of the offences charged, but to acquit (*δικαιοῦν*) instead of pronouncing sentence of condemnation; by this acquittal the person acquitted was placed in the position of one against whom no charge existed (*δίκαιοι κατασταθήσονται*, Rom. v. 19); and, since the acquittal might be regarded in its different relations as a consequence of either the favour of God, or the death of Christ, or the trust in God which made it valid for the individual, men are said in various passages to be acquitted by God's favour (Rom. iii. 24), or by the blood of Christ (Rom. v. 9; cf. Gal. ii. 17), or by faith (Rom. iii. 23, v. 1; Gal. iii. 8, 24).³

(6) It is sometimes expressed in language which is relative to the conception of a mystical union between Christ and the human race, or part of it, of such a kind that when He died men also died, and that when He rose again they also rose with Him (Rom. vi. 3-10; Gal. ii. 20; and also in the later epistles, Eph. ii. 5, 6; Col. ii. 12, iii. 3).

Some of these expressions are occasionally combined; for example, the ideas of acquittal and deliverance (Rom. v. 1, 2; 2 Cor. v. 19), those of acquittal and deliverance (Rom. v. 9), and those of sacrifice, in which Christ is conceived as dying on men's behalf, and of mystical union in which they die with Him (2 Cor. v. 14). The facts both of their variety and of their combination afford a strong argument against treating any one mode of expression as though it stood alone and gathered up into a single metaphor the whole of the new relations of God to men.

The effect of Christ's work upon mankind is also expressed in Christ's various ways. Sometimes it is expressed under the form of an work.

imparted attribute, sometimes under that of a new condition of life or a new relation to God. It is most frequently spoken of as (1) righteousness, or (2) life, or (3) sonship. (1) When spoken of as righteousness, it is sometimes said to have been given to men (Rom. v. 17); sometimes it is reckoned to them or placed to their account (Rom. iv. 6, 11; Gal. iii. 6); sometimes it is a power to which they have become, or ought to become, subject (Rom. vi. 18, x. 3); sometimes it is regarded as a quality which men already possess by virtue of Christ's death (Rom. v. 17); sometimes it is still to be attained (Rom. iv. 24, vi. 16; Gal. v. 5). (2) When spoken of as life, the conception also seems to vary between that of a life which men have already received, or into which they have already entered (Rom. vi. 4, viii. 10), and that of a life which is future (Rom. v. 17; Gal. vi. 8; cf. Col. iii. 3, 4, where it is conceived as being now

² This word seems to have lost its etymological sense of "ransoming," and to have connoted only "deliverance," e.g., in the LXX., Dan. iv. 29 (S1), Nebuchadnezzar speaks of *ὁ χρόνος τῆς ἀπολύτρωσός μου*, "the time of my deliverance"; in Irenaeus, l. 9, 5, it is used of the dismissal of the spectators in a theatre.

³ It is difficult to estimate the mischief which has been caused by the fact that *justicare* was adopted from early times as the translation of *δικαιοῦν*, and the consequent fact that a large part of Western theology has been based upon the etymological signification of *justificare* rather than upon the meaning of its Greek original. One of the clearest instances of the meaning of *δικαιοῦν* in Biblical Greek is LXX. Exod. xxiii. 7, *οὐ δικαιοῦσεις τὸν δούλον ἑκεν δούλον*, "thou shalt not acquit the wicked man for bribes."

¹ This view of the place of the death of Christ in the economy of redemption is so constant and integral a part of Paul's teaching as to outweigh and set aside the inference which some writers have drawn from Rom. viii. 3, that the "sending" of Christ—i.e., His incarnation—was itself sufficient for the end in view.

"hid with Christ in God," to be manifested at His coming); and similarly sometimes men are regarded as having already died with Christ (Rom. vi. 6-11), and sometimes the Christian's life is regarded as a prolonged act of dying in the "mortification" of the "deeds of the body" (Rom. viii. 13; cf. Col. iii. 5). (3) When spoken of as sonship, the conception also varies between that of a perfected and that of a still future "adoption"; on the one hand "we have received a spirit of adoption" (Rom. viii. 15), so that we are "all sons of God through faith in Christ Jesus" (Gal. iii. 26), and on the other hand we are still "waiting for the adoption, the deliverance of our body" (Rom. viii. 23).

For, although Christ died for all men (Rom. v. 18; 2 Cor. v. 14, 15; so in the pastoral epistles, 1 Tim. ii. 4, 6; Tit. ii. 11), it does not therefore follow that all men are at once in full possession of the benefits which His death made possible to them. Their righteousness or life or sonship is rather potential than actual. It becomes actual by the co-operation of their own mind and will, that is, by the continuous existence in them of the state of mind called trust or "faith."¹ For this view of the place of trust or "faith" St Paul finds support, and may perhaps have found the original suggestion, in the Old Testament. Abraham had believed that God both could and would perform His promises, and this belief "was counted to him as righteousness" (Gen. xv. 6; Rom. iv. 3; Gal. iii. 6); Habakkuk had proclaimed that "the just shall live as a consequence of his faith" (Hab. ii. 4; Rom. i. 17; Gal. iii. 11); and another prophet had said, "whosoever believeth in Him shall not be put to shame" (Rom. ix. 33, x. 11). The object of this trust or faith is variously stated to be "Him that raised Jesus our Lord from the dead" (Rom. iv. 24; x. 9), "Him that justifieth the ungodly" (Rom. iv. 5), or "Jesus Christ" (Rom. iii. 22; Gal. ii. 16, &c.), or His "blood" (Rom. iii. 25 probably). Hence the statement, that the gospel is "the power of God unto salvation," is limited by the condition "to every one that believeth" (Rom. i. 16). Hence, also, since this state of mind is that by which the death of Christ becomes of value to the individual, while he is said on the one hand to be acquitted or justified by Christ's blood (Rom. v. 9), he is said on the other hand to be acquitted or justified as a result of his faith (Rom. v. 1). Hence, also, the new relation of "righteousness" in which men stand to God,—while on the one hand it is "God's righteousness," as being a relation which is established by His favour and not by their merit (Rom. i. 17, iii. 21, 22, v. 17), it is on the other hand a "righteousness which results from faith" (*ἡ ἐκ πίστεως δικαιοσύνη*, Rom. x. 6). From another point of view it is an act of obedience or state of submission (Rom. i. 5, vi. 16, 17, x. 16, xvi. 19, 26; 2 Cor. x. 5, 6), being the acceptance by men of God's free gift as distinguished from "seeking to establish their own righteousness," i.e., to attain to a freedom from sin which their fleshly nature renders impossible (Rom. x. 3).

It is obvious that such a doctrine as that of acquittal from the guilt of wrongdoing by virtue of an act or state of mind, instead of by virtue of a course of conduct, is "antinomian," not merely in the sense that it supersedes the law of Moses, but also because it appears to supersede the natural law of morality. It was no wonder that some men should infer, and even attribute to Paul himself the inference, "Let us do evil that good may come" (Rom. iii. 8). The objection was no doubt felt to be real, inasmuch as it is more than once stated and receives more than one answer. (1) One of the answers which Paul gives to it (Rom. vi. 15 sq.) is due to his conception of both sin and righteousness as external forces. He had regarded sinful acts as the effects of the dominion of a real power residing within men and compelling them to do its will. He now points out that, to those who believe, this dominion is at an end. The believer is not only acquitted from the guilt of sin, but also emancipated from its slavery. He has become a slave to righteousness or to God (Rom. vi. 18, 22). This is stated partly as a fact and partly as a ground of obligation (Rom. vi. 18, 19); and the disregard of the obligation, or "building up again those things which I destroyed," brings a man again under the cognizance of God's law as a transgressor (Gal. ii. 18). (2) Another answer is due to the conception which has been mentioned above of the mystical union between Christ and mankind. This also is stated partly as a fact and partly as a ground of obligation. In one sense the believer has already died with Christ and risen with Him: "our old man was crucified with Him" (Rom. vi. 6), "they that are Christ's have crucified the flesh" (Gal. v. 24), "the life which I now live in the flesh I live in faith, the faith in the Son of God, who loved me and gave Himself for me" (Gal. ii. 20); so that on the one hand Christ is said to be in the believer (2 Cor. xiii. 5), and on the other hand the believer is said to be "in Christ." Whichever mode of conceiving the Christian life be adopted, a life of sin is impossible to it: "if any man be in Christ, he is a new creature" (2 Cor. v. 17), and the "new man" which thus comes

into being "is created after God in righteousness and true holiness" (Eph. iv. 24). In another sense this mystical dying with Christ and living with Him is rather an ideal towards which the believer must be continually striving; it affords a motive for his resisting the tendency to sin: "reckon ye also yourselves to be dead indeed unto sin, but alive unto God in Christ Jesus our Lord; let not sin therefore reign in your mortal body" (Rom. vi. 11, 12). (3) A third answer, which, though less directly given, is even more constantly implied, is that faith is followed by, if it be not coincident with, an immediate operation of God upon the soul which becomes for it a new moral power. For, although in the "natural man" there is an element, "the flesh," over which sin has such an especial dominion as to be said to dwell in it, there is also another element, the "mind" (*νοῦς*), or "spirit" (*πνεῦμα*), or "inner man" (*ὁ ἐσω ἄνθρωπος*), which is the slave, not of the "law of sin," but of the "law of God."² Against this the flesh wages a successful war and "brings it into captivity to the law of sin" (Rom. vi. 22-25). The result is that the mind may become "reprobate" (*ῥέδιμος*, Rom. i. 28; cf. Col. ii. 18, where the "mind" is so completely under the dominion of the flesh as to be called "the mind of the flesh"), or it may become defiled and ultimately lost (2 Cor. vii. 1; 1 Cor. v. 5). It is upon this part of man's nature that God works. By means of faith (Gal. iii. 14), or as a result of faith (Gal. iii. 2, v. 5), God gives and men receive His own Spirit (1 Thess. iv. 8) or the Spirit of Christ (Rom. viii. 10; Gal. iv. 6; Phil. i. 19). Sometimes the Spirit of God is said to "dwell in" them (Rom. viii. 9; 1 Cor. iii. 16), and once the closeness of the union is expressed by the still stronger metaphor of a marriage: "he that is joined to the Lord is one spirit" (1 Cor. vi. 17). This indwelling of, or union with, the Spirit is for the believer a new life; Christ has become for him "a life-giving spirit" (1 Cor. x. 45); this is a fact of his spiritual nature which will in due time be manifest even in the quickening of his mortal body (Rom. viii. 11), but in the meantime it becomes, like the facts of emancipation from sin and of union with Christ, a ground of moral obligation. "If we live by the Spirit, by the Spirit also let us walk" (Gal. v. 25); and the freedom from spiritual death is conditional on the "mortifying of the deeds of the body" (Rom. viii. 13).

It will be evident that, although Paul nowhere defines his conception of faith, he did not conceive it as a mere intellectual assent; it was a complete self-surrender to God (Gal. ii. 20), and on its human side it showed its activity in the great ethical principle of "love," which is the sum of a man's duties to his fellow-men (Gal. v. 6, 14).

But, as his conception of the effects of Christ's death, and of the Eschatological nature of faith by which these effects are appropriated by the individual, has, so far as the present life is concerned, chiefly a moral function aspect, and connects itself with practical duties, so, on the other of faith hand, it comprehends the whole physical and spiritual being of man, and connects itself with his eschatology. The resurrection of Christ is not merely the type of moral resurrection from sin to holiness, but at once the type and the cause and the pledge of the actual resurrection of the body. "If we believe that Jesus died and rose again, even so them also that are fallen asleep in Jesus will God bring with Him" (1 Thess. iv. 14); "He which raised up the Lord Jesus shall raise up us also with Jesus" (2 Cor. iv. 14); "if we died with Christ, we believe that we shall also live with Him" (Rom. vi. 8). Sometimes the new life of the body is viewed in relation to the mystical union of the believer with Christ: "we which live are always delivered unto death for Jesus' sake, that the life also of Jesus may be manifested in our mortal flesh" (2 Cor. iv. 11); and it follows from the conception of the "last Adam" as a "life-giving spirit" that, "as we have borne the image of the earthy, we shall also bear the image of the heavenly" (1 Cor. xv. 49; this will follow from the context, even if with most uncial MSS. we read "*let us also bear*"). Sometimes this new life is viewed as a result of the present indwelling of the Spirit: "if the Spirit of Him that raised up Jesus from the dead dwelleth in you, He that raised up Christ Jesus from the dead shall also quicken your mortal bodies through" (or "because of") "His Spirit that dwelleth in you" (Rom. viii. 11). This redemption or deliverance of the body from the "bondage of corruption" is the completion of the "adoption," "the liberty of the glory of the children of God" (Rom. viii. 21, 23); but the nature of the new body is not clearly explained. Sometimes the language seems to imply that this mortal body will be "quickened" or "transformed" (Rom. viii. 11; Phil. iii. 21), and the analogy afforded is that of a seed which after being buried reappears in a new form (1 Cor. xv. 36, 37); sometimes, on the

¹ "Faith" is not defined by Paul, but his use of the term so nearly resembles Philo's as to be explicable by it. With Philo it is the highest form of intellectual conviction, being more certain than either that which comes from the senses or that which comes from reasoning; cf., e.g., *De præmiis et poenis*, c. 5, vol. ii. p. 412, ed. Mang.

² The relation of *νοῦς* to *πνεῦμα* has been much discussed; among contemporary theologians Holsten and Weiss deny the existence of a *πνεῦμα* in the natural man, Lüdemann and Pfeiderer allow it. It is certain that the two words are used in the same sense by Philo; and it is most probable that they are also so used by Paul. One of many proofs is that in quoting Isa. xl. 13 in 1 Cor. ii. 13 he adopts *νοῦν* from the LXX. as the translation of *לֵב* (whereas *πνεῦμα* is the more usual translation), and proceeds to use the phrase *νοῦν Χριστοῦ* for *πνεῦμα Χριστοῦ*, which the argument requires, and with which it must be identical.

other hand, it seems to be implied that the earthly body will be dissolved, and that what awaits us is a new body, "a building of God, a house not made with hands, eternal in the heavens" (2 Cor. v. 1).

This change will come to all believers at the "advent" (*παρουσία*, 1 Cor. [i. 9, Cod. D.] xv. 23; 1 Thess. ii. 19, &c.), or "revelation" (*ἀποκάλυψις*, 1 Cor. i. 7; 2 Thess. i. 7), or "manifestation" (*ἐπιφάνεια*, 2 Thess. ii. 8, and afterwards in the pastoral epistles) of Jesus Christ. Some of them will have "fallen asleep in Christ," in which state he seems to conceive that they are "at home with the Lord" (2 Cor. v. 8); and others, among whom, in the language of confident hope, he includes himself, will be still alive (1 Thess. iv. 15-17). For "the day of our Lord Jesus Christ" (1 Cor. i. 8, v. 5; 2 Cor. i. 14, &c.) was conceived to be not far distant: "the night is far spent, the day is at hand" (Rom. xiii. 12), and "the mystery of lawlessness," which was to be revealed before that day could come, was already at work (2 Thess. ii. 3-7). But the "day" itself is variously conceived; sometimes the eternal life of believers in and with Christ appears to begin at the very moment of the Advent (1 Thess. iv. 17), and hence the day is spoken of as "the day of deliverance" (Eph. iv. 30); but more frequently "the day of the Lord" is also the day of judgment (Rom. ii. 5, 16), according to the eschatological ideas which had for some time been current among the Jews; in it all men, believers and unbelievers alike, are represented as standing before the judgment-seat of God (Rom. xiv. 10) or of Christ (2 Cor. v. 10) to give account of themselves to God, and to receive the reward of the things done in the body, whether good or evil. There is a similar variety of view in regard to what will happen after the Advent. The language which is used sometimes leads to the inference that the destruction of the enemies of the cross will be immediately effected (2 Thess. i. 9, ii. 8), and sometimes to the inference, which was also in accordance with current eschatological ideas, that there will be a Messianic reign, during which Christ will "put all enemies under His feet" (1 Cor. xv. 25). And, while in some passages unbelievers or evildoers are said to be punished with "eternal destruction from the face of the Lord" (2 Thess. i. 9; cf. Rom. ii. 8, 9), the view elsewhere seems to be that "in Christ shall all be made alive," the universality of the life in Christ being coextensive with the universality of the death in Adam (1 Cor. xv. 22).

It is difficult to reconcile these conceptions with one another, and still more so to reconcile some of them with other parts of Paul's doctrine of salvation, except perhaps on the hypothesis that even after his conversion many of the apocalyptic ideas which were current among his countrymen remained in his mind; this hypothesis is made the more probable by the fact that in the later and the probably post-Pauline epistles the apocalyptic elements are rare, and that the most definite eschatological statement which they contain is in full harmony with the conception of the believer's mystical union with Christ, "when Christ, who is our life, shall appear, then shall ye also appear with Him in glory" (Col. iii. 4).

Such are the main elements of Paul's soteriology. To most of the philosophical questions which have since been raised in connexion with it he neither gives nor implies an answer. It is possible that many of such questions did not even suggest themselves to him. The chief of all of them, that of the necessity of sacrifice, was probably axiomatic to a Jewish mind, and its place in Paul's system must be accepted with all the difficulties which such an acceptance involves. But there is one such philosophical question which even in Paul's time had begun to have a fascination for Oriental thinkers. What is the relation of free will to God? or in other words, is what men do the result of their own choice, or is it determined for them; and, if it be determined for them, how can God punish them as though they had been free (Rom. iii. 5, ix. 19)? The answer is given in the form of an antinomy, of which the thesis is the sovereignty of God and the antithesis the responsibility of men. The sovereignty of God is absolute. Instead of entertaining the objection which has since been raised, that God, having created rational and moral agents, has placed Himself under an obligation to deal with them as such, he makes the dependence of men upon God to be unconditional, and the alleged rights of men as against God to be as non-existent as those of an earthenware vessel against the potter who has given it shape (Rom. ix. 20-21). Some men are "vessels of wrath fitted unto destruction," some are "vessels of mercy . . . prepared unto glory" (Rom. ix. 22, 23); and God's dealings with them are as little conditioned by necessity as His original creation of them: "He hath mercy on whom He will, and whom He will He hardeneth" (Rom. ix. 18). But, over against this view of God's sovereignty, and without any endeavour to reconcile the difficulties which suggest themselves, he places the fact of human responsibility. The purpose of God worked itself out in history, but not without men's co-operation. He had first "called" the Jews; and though, on the one hand, "God gave them a spirit of stupor, eyes that they should not see, and ears that they should not hear" (Rom. xi. 8), yet, on the other hand, they were "a disobedient and gainsaying people" (Rom. x. 21), "seeking to establish their own righteousness," and not subjecting themselves

"to the righteousness of God" (Rom. x. 3). God had now carried out another part of His purpose. He had "called" the Gentiles. In the earlier epistles Paul spoke of this calling as having been not only part of God's purpose, but also expressly announced from time to time by the prophets (Rom. ix. 25, 26, x. 20); but in the doubtful later epistles it is spoken of as a "mystery which hath been hidden from all ages and generations" (Col. i. 26), but now had been "made known through the church" "unto the principalities and the powers in the heavenly places" (Eph. iii. 9, 10). But as with the Jews so with the Gentiles, the divine call was not only a fact but also a ground of obligation. While, on the one hand, "we are His workmanship, created in Christ Jesus for good works, which God afore prepared that we should walk in them" (Eph. ii. 10), yet, on the other hand, the Ephesians are entreated to "walk worthily of the calling wherewith ye were called" (Eph. iv. 1). In the Epistle to the Romans a still further part of God's purpose is indicated. The salvation which had come to the Gentiles by the fall of the Jews was "to provoke them to jealousy" (xi. 11); as in time past the Gentiles "were disobedient to God but now have obtained mercy" by the disobedience of the Jews, "even so have these also now been disobedient, that by the mercy shown to you they also may now obtain mercy" (xi. 30, 31). And so not only would "the fulness of the Gentiles come in," but also "all Israel shall be saved" (xi. 25, 26); "for God hath shut up all unto disobedience that He might have mercy upon all" (xi. 32).

But, just as the apparent fatalism of the theory of absolute pre-destination without reference to works stands side by side with the obligation of men to "work out their own salvation with fear and trembling" (Phil. ii. 12), so this apparent universalism stands side by side with the fact that all men do not receive the gospel. Out of the mass of men some, whether Jews or Gentiles, are "called." They constitute a separate class. As from one point of view they are the "called according to God's purpose" (Rom. viii. 28), or "called to be saints" (Rom. i. 7; 1 Cor. i. 2), or simply "called" (1 Cor. i. 24; it is to be noted that the expression does not occur in the later epistles), or "chosen" (Rom. viii. 33; Col. iii. 12), so, on the other hand, they are "they that believe" (Rom. iii. 22; 1 Cor. i. 21, xiv. 22; Gal. iii. 22; Eph. i. 19; 1 Thess. i. 7, ii. 10, 13; 2 Thess. i. 10); the call and the belief are complementary of each other, and therefore the terms are used as convertible (1 Cor. i. 21, 24). But the more frequent terms are those which came to Paul from his earlier associations. The Jews had known one another, and had spoken of themselves, in contrast to the rest of the world, as "brethren" (*e.g.*, Deut. xv. 12, xvii. 15; Philo, ii. 285, ed. Mang.) or "saints" (*e.g.*, Deut. xxxiii. 3; Dan. vii. 21). Paul applies these terms to the new "people of God"; they are "brethren" (*e.g.*, Rom. i. 13, most commonly as a term of address), and "the saints" (*e.g.*, Rom. xii. 13, xv. 25; 1 Cor. vi. 1). As such they are regarded as forming collectively a unity or society, which Paul, adopting a current Latinism, calls a "body" (*corpus* is frequently used in this sense; *σῶμα* is its Hellenistic translation in *e.g.*, the letter of Mark Antony in Joseph, *Ant. Jud.*, xiv. 12, 3, τὸ τῆς Ἀσίας σῶμα). A more important and permanent application of the view that those who believed in Jesus took the place of the Jews, and stood to God in the same special relation in which the Jews had stood, was the use of the term "congregation" or "assembly" (Heb. *qahal*, which the LXX. renders by both *συνάγωγη* and *ἐκκλησία*; in the Epistle of James (ii. 2) the former of these words is used of a particular Christian congregation; Paul uses the latter only, and the English translators render it invariably by "church") to designate the mass of believers regarded as a unity. The use of the word *ἐκκλησία* in this sense in the undisputed epistles is rare,—probably only in 1 Cor. xv. 9, Gal. i. 13, in each of which passages it is qualified, as in *e.g.*, Deut. xxiii. 1, Nehem. xii. 1, as "God's congregation." But either towards the end of his life, or, according to many modern critics, only among his followers after his death, this conception of Christians as forming a congregation was idealized. The common metaphor of a "body" by which that congregation had been designated, and which had already been elaborated as indicative of the diversity of parts and functions in the several Christian communities (1 Cor. xii. 12-30), is elaborated in the Epistles to the Ephesians and Colossians as indicative of the relation of the aggregate of believers to Christ. They are conceived, not as forming a society which bears Christ's name, but as bearing to Him partly the relation which the several members of an organized body bear to the head (Eph. i. 22, iv. 15, 16; Col. i. 18, 24), and partly the relation of a wife to a husband (Eph. v. 23-32). In a phrase of difficult and doubtful meaning the congregation of Christians, or "church," is spoken of as His "fulness" (*πληρωμα*, Eph. i. 23), and the progress in Christian virtues is represented partly as the growth of an organism to its full stature (Eph. iv. 14-16; Col. ii. 19), and partly as the filling out or realization of that which is empty or imperfect (Eph. iii. 19; Col. i. 9).

Side by side with this conception of the "called" or "saints" as collectively forming a "body" or "congregation," which was the Christian counterpart and fulfilment of the Jewish "congre-

gation," was the fact that wherever the gospel was preached, especially in the great cities of the empire, the converts tended to form communities. Such communities, whether for religious or non-religious purposes, were among the commonest phenomena of the age. How far Paul himself encouraged the formation of such communities among his converts is uncertain; but many considerations lead to the inference that where they were so formed they were formed rather upon the Gentile than upon the Jewish model. Out of several names which were in current use to designate them, that which Paul used was common to both Gentile and Jewish communities, and it was also that which he continued to use in another sense to designate the whole body of Christians. Hence has arisen the confusion which pervades almost all Christian literature between the use of the word *ἐκκλησία*, or "church," to denote the whole multitude of those who will be saved regarded as an ideal aggregate, and the use of the same word to denote a visible community of professing Christians in any one place or country.

The *raison d'être* of these communities was mutual help in the spiritual, the moral, and the outward life. Every member of a community had received the new life of the Spirit, and the diversities of character and opportunity which exist between man and man were conceived as diversities of manifestation (*φανέρωσις*) of the Spirit who lived within them, or, from another point of view, as diversities of gifts (*χαρίσματα*). "But to each one was given the manifestation of the Spirit to profit withal" (1 Cor. xii. 7). When the community met in assembly some of its members "prophesied," preaching as though with a divine inspiration; some spoke in such ecstasy that their words seemed to be those of an unknown tongue and needed an interpreter; some taught again the lessons which they had learned from Paul; some had "a psalm"; some had "a revelation" (1 Cor. xiv. 26 sq.). Sometimes the aim was rather moral than spiritual "edification." They exhorted one another, and "admonished" one another (Rom. xv. 14). Sometimes on points of practice they carried this "judging" of one another farther than Paul approved. The Christian liberty, which was no less a bond of union than the recognition of the new Christian law, was in danger of being overthrown; and more than once Paul thought it necessary to insist that they should not judge one another any more, but rather strive not to put a stumbling-block in each other's way (Rom. xiv. 10 sq.; 1 Cor. x. 25 sq.). If, however, the offence of any member were gross and open, the assembly became a court of discipline. To the community at Corinth, which had been slow to recognize the necessity of being thus "children of God without blemish in the midst of a crooked and perverse generation," Paul wrote peremptorily "not to keep company, if any man that is called a brother be a fornicator, or covetous, or an idolater, or a reviler, or a drunkard, or an extortioner" (1 Cor. v. 11). In one flagrant case they were bidden to "put away the wicked man from among themselves" (1 Cor. v. 13); but the right of the community to deal with such cases at their discretion was also recognized; for, when the guilty person had on his repentance been forgiven, or punished with a lesser punishment, instead of being expelled, Paul wrote again that the action of the majority was sufficient and had his approval (2 Cor. ii. 6, 10). But all such action was subordinated to the general rule, which is repeated in many forms, "let all that ye do be done in love" (1 Cor. xvi. 14). A not less prominent aim of these communities was mutual help in the material and outward life. Some of their members were necessitous or sick; and the duty of helping all such was discharged partly by giving contributions to the common fund and partly by distributing it. Sometimes also the members of other communities came as strangers, travelling as men did, "*quorum copinus fenumque supellec*" (Juvénal, iii. 14, of Jews). For such men, who probably brought, as in later times, letters of recommendation from one community to another (2 Cor. iii. 1), there was an ungrudging hospitality; and not long afterwards, if not in Paul's own time, it was a necessary qualification for a widow who wished to be placed as such on the roll of the community that she should not only have "used hospitality" but also herself have "washed the feet" of the tired travellers as they came in (1 Tim. v. 10). In Thessalonica, where the community was probably both poor and small, it seems probable that the members worked together at common trades, making contributions to a common fund and sharing a common table. It was natural that some should presume on the goodness of their brethren, and try to share the latter without making contributions to the former. Paul made a special rule that this should not be the case, and he himself, though he had the right to exemption, yet, for the sake of example, would not "eat bread for nought at any man's hand, but in labour and travail worked night and day" that he might not burden the slender resources of the brethren (2 Thess. iii. 8; 1 Thess. ii. 9).

In such communities, where the "gift" of each member was used for the common good, organization had not the importance which it had in an ordinary secular society. All work which the members of the community did for one another, including that which was done by the apostle himself, was a "ministry" (*διακονία*), and every one who did such work was, so far forth, a "minister" (*διάκονος*). The

names which ultimately came to be appropriated by special officers, appointed to do delegated work, were at first common to the whole body of members. As is natural in all communities, there were some who devoted themselves to the work with especial zeal; and the most rudimentary form of organization is found at Thessalonica, where certain persons are spoken of as devoting themselves to the special works of "labouring," i.e., probably attending to the material needs of the poorer brethren, "admonishing," i.e., probably bringing back erring brethren to the right way, and "presiding," or more probably (though the word is of uncertain meaning) "acting as protector," like a Roman "patronus," against oppression from without. The community are enjoined to recognize those persons, "and to esteem them very highly in love for their work's sake" (1 Thess. v. 12, 13). In a similar way at Corinth, where the democratical character of the community is even more apparent, Paul beseeches the brethren to "be in subjection" to those who had "set themselves to minister unto the saints" (1 Cor. xvi. 15, 16). But this recognition of the special zeal of certain members was very far from being a recognition or appointment of officers as such. The functions which came in time to be regarded as giving those who discharged them an exceptional status, were only regarded as "gifts," resembling in kind and not surpassing in excellence those of the other members of the community. In the Epistle to the Romans, "he that ruleth" (or "protecteth") is in the same rank as "he that giveth" and "he that exhorteth" (Rom. xii. 8); and in the First Epistle to the Corinthians "helps" and "governments" are not prominent above "miracles," "healings," and "divers kinds of tongues" (1 Cor. xii. 28). It is not until the later period, and probably also the different circumstances, of the Epistle to the Philippians that officers are found with definite titles, and probably also with a distinct status; Paul there writes "to all the saints . . . with the bishops and deacons" (Phil. i. 1). Still later, in the Epistle to the Ephesians, it seems probable that those who are spoken of as "apostles," "prophets," "evangelists," "pastors and teachers," are distinct from the great body of the community (Eph. iv. 11, 12). But it is to be noted that in no certainly authentic epistle does Paul make any mention of "presbyters." The view of Grotius and Vitringa that the "church" took the place of the "synagogue" seems, as far as the Pauline communities are concerned, to have little foundation. Those communities had a much closer resemblance to the Greek and Roman associations in the midst of which they grew, they stood side by side with the Jewish communities, but distinct from them, as "the churches of the Gentiles" (Rom. xvi. 4).

Admission to the community, or at least to full membership of Baptism in the community, seems to have been effected by the rite of baptism: "in one spirit were we all baptized into one body" (1 Cor. xii. 13). So important was this form of admission conceived to be that when a believer died before baptism another appears to have been baptized vicariously for him (1 Cor. xv. 29). It was a baptism "into Christ Jesus" (Rom. vi. 3; "into Christ," Gal. iii. 27),—a phrase which must probably be interpreted by the analogous expressions in 1 Cor. i. 13, 15, to mean that the name of Jesus Christ alone was used (that the name of the Trinity was not invariably used in early times is clear from St Ambrose, *De Spiritu Sancto*, i. 3). But in the teaching of the apostle baptism was more than an initiatory rite, and baptism "into Christ Jesus" had for him a special significance. The immersion of the body in water was a "being buried with Christ," and that not only symbolically but in a real, though mystical, sense; the rising out of the water was in a similar sense an actual rising with Christ into a new life, "that, like as Christ was raised from the dead through the glory of the Father, so we also might walk in newness of life" (Rom. vi. 4, where the word *ζωή*, "life," must be taken in its customary sense of actual or physical, not metaphorical or moral, life). It was otherwise expressed as the "putting on" of Christ, i.e., the being endowed with His nature (Gal. iii. 27, where the same word is used as in 1 Cor. xv. 53, "this mortal must put on immortality"). In the later form of Paul's doctrine an analogy was drawn between baptism and circumcision (Col. ii. 11, 12), the point of the analogy apparently being, not merely that each was an initiatory rite, but that, as in circumcision there was a "putting off" of a part of the body, so in baptism the whole "body of the flesh" was destroyed and the "new man" put on. There was the further significance in the rite that by baptism "into one body" the distinctions of race were obliterated. The baptized became "one man in Christ Jesus," so that there could no longer be either Jew or Greek, bond or free, male or female (Gal. iii. 28; cf. 1 Cor. xii. 13). The differences between the several members were merely the differences of functions which result from the diversity of parts in an organic whole; and thereby the foundations of a world-wide society were laid.

The most significant act of the community when it met together was the common meal. Like the members of most contemporary associations, the members of the Christian communities dined together. This common meal was a sacred meal; it was "the Lord's Supper"; it continued and commemorated the Paschal supper at which the Lord had bidden His disciples to eat the bread which was

His body, and to drink of the cup which was the "new covenant in His blood," in remembrance of Him; it thereby "proclaimed the Lord's death till He come" (1 Cor. xi. 24-26). Possibly owing to the double sense of the word *κοινωνία*, viz., "partaking," and "sharing in common," two views seem to be mingled together in the significance which Paul attached to the rite. The one is that, as in "Israel after the flesh" "they which eat the sacrifices" had "communion with the altar," and as those who partook of the heathen sacrifices had "communion with demons" (i.e., with the false gods to whom the sacrifices were offered), so to those who "partook of the table of the Lord" the "cup of blessing" was "a participation in the blood of Christ" and the "bread which we break" was "a participation in the body of Christ" (1 Cor. x. 16-21). The other view is that in thus partaking in common of the "body of Christ" the members of the community realized and consolidated their unity; "seeing that it is one bread, we who are many are one body" (1 Cor. x. 17). Both views must be regarded in relation to his conception of the mystical union of Christ with those who were baptized into His name, and of their consequent union with one another.

Literature.—The literature which bears upon St Paul is so extensive that a complete account of it would be as much beyond the compass of this article as it would be bewildering to its readers. The books which are here mentioned are the more important modern books which, without being in all cases conclusive or satisfactory, will enable a student to learn the nature of the main questions which have been raised. 1. *Life*:—Neander, *Geschichte der Pflanzung u. Leitung der christlichen Kirche durch die Apostel* (vol. i., 4th ed., Hamburg, 1847, Eng. tr. in Bohn's Standard Library); Baur, *Paulus der Apostel Jesu Christi* (Leipzig, 1845, Eng. tr. in Theological Translation Fund Library); Renan, *Les Apôtres* (Paris, 1866), and *Saint Paul* (1869); Krenkel, *Paulus der Apostel der Heiden* (Leipzig, 1869); Hausrath, *Der Apostel Paulus* (2d ed., Heidelberg, 1872), and art. "Paulus," in Schenkel's *Bibel-Lexicon*; Straatmann,

Paulus de Apostel van Jezus Christus (Amsterdam, 1874); Beyschlag, in *Riehm's Handwörterb. des bibl. Alterthums*; W. Schmidt, in *Herzog's Realencykl.* (2d ed.); and, in English, Conybeare and Howson, *The Life and Epistles of St Paul*; Farrar, *The Life and Work of St Paul*; Lewin, *The Life and Epistles of St Paul*. Detailed discussions of most of the important points will also be found in books upon the Acts of the Apostles; e.g., in Overbeck's edition of De Wette's *Kurzgefasstes exegetisches Handbuch* (Leipzig, 1870; the Introduction is translated and prefixed to the translation of Zeller's *Die Apostelgeschichte* in the Theological Translation Fund Library); Wendt's edition of Meyer's *Kritisch-exegetisches Handbuch* (Göttingen, 1880); and K. Schmidt, *Die Apostelgeschichte* (vol. i., Erlangen, 1882, the best modern book on the apologetic side). II. *Theology*:—The books which first opened up the study of St Paul's theology in distinction from that of other writers of the New Testament were Usteri's *Die Entwicklung des paulinischen Lehrbegriffs* (Zurich, 1824, 6th ed. 1851), and Dahne's book with the same title (Halle, 1835). The most important books on the subject which have since appeared (in addition to some of those which have been mentioned above) are Ritschl, *Die Entstehung der altkatholischen Kirche* (2d ed., Bonn, 1857); Reuss, *Histoire de la théologie chrétienne au siècle apostolique* (Strasbourg, 3d ed., 1864); Holsten, *Zum Evangelium des Paulus u. Petrus* (Rostock, 1865), and *Das Evangelium des Paulus dargestellt* (part I., Berlin, 1880); Pfleiderer, *Der Paulinismus* (Leipzig, 1873, Eng. tr. in the Theological Translation Fund Library); Sabatier, *L'apôtre Paul* (2d ed., Paris, 1881); Menegoz, *Le Péché et la Rédemption d'après S. Paul* (Paris, 1882); Ernesti, *Die Ethik des Apostels Paulus* (3d ed., Göttingen, 1882). English literature is singularly deficient in works on St Paul's theology, as distinguished from the philological and archeological questions which arise out of his life and epistles; almost the only important contributions to the subject are contained in the essays appended to Jowett's *Epistles of St Paul to the Thessalonians, Galatians, and Romans* (2d ed., 1859). Further information as to the literature of the subject, and especially as to the numerous monographs and magazine-articles on special points, will be found in the books which deal with New Testament literature in general; especially, for the older literature, Credner, *Einleitung in das N. T.* (Halle, 1836), and, for more recent literature, Reuss, *Die Geschichte der heiligen Schriften N. T.'s* (4th ed., Brunswick, 1874); Mangold's edition of Bleek's *Einleitung in das N. T.* (Berlin, 1875); Hilgenfeld, *Historisch-kritische Einleitung in das N. T.* (Leipzig, 1875); Weiss, *Lehrbuch der biblischen Theologie des N. T.'s* (3d ed., 1880, Eng. tr. in Clark's Foreign Theological Library). (E. H.A.)

PAUL THE DEACON. See PAULUS DIACONUS.

PAUL OF SAMOSATA, bishop of Antioch from about 260 A.D., is famous in church history as the author of the first attempt to replace the doctrine of the essential (physical) divinity of Christ by the old view of the human personality of the Redeemer. The effort was not successful even within his own community. At an Oriental general council, held at Antioch as early as the year 264, his teaching was investigated; but no conclusion was come to because it was alleged Paul had been cunning enough to disguise his real opinions. A second synod was equally abortive; but at a third (probably in the year 268), after a discussion between Paul and a presbyter named Malchion—a sophist of Antioch, and head of a scholastic institution—the metropolitan was excommunicated and his successor appointed. Under the protection of Zenobia, however, Paul continued in his office for four years longer; and the church of Antioch was split into two factions. In the year 272 the city was taken by the emperor Aurelian, who decided in person that the church-building belonged to the bishop who was in epistolary communication with the bishops of Rome and Italy. This decision of course proceeded on political considerations; and indeed it is probable that behind the theological controversy there had been all along a political disagreement, the opponents of Paul being enemies of Zenobia and adherents of the Roman party. About the life of Paul we know scarcely anything. His enemies, indeed, describe him as an unspiritual prelate, an empty preacher, an arrogant man of the world, and a crafty sophist; but this portrait must not be too readily accepted. We are told that he preferred the title of *Ducenarius* to that of bishop. This probably implies that he actually was a *procurator Ducenarius*, a civil post of considerable dignity, and we may well believe that he was very conscious of his position, maintained its formalities with some pride, and used it to give effect to his peculiar views. As an accomplished theologian he strenuously opposed the old expositors, i.e., the theologians of Alexandria, and prohibited the use in public worship of all those church hymns in which the essential divinity of Christ found expression.

His doctrine was no novelty, but merely a development of primitive Christian belief as represented, e.g., by Hermas, and at a later time by the so-called Alogi in Asia

Minor, and the Theodotians and Artemontes in Rome. Even in Syria it was not extinct at the end of the 3d century (see the *Acta Archelai*); but in the great churches of the empire—especially in the West and in Egypt—the Logos-Christology was already in the ascendant. And, since the previous state of things had passed from memory, it soon came to be regarded as "heresy" and "innovation" to think of Christ as most Christians had thought in the 2d century. It was chiefly Origen and his philosophical disciples, however, who had brought about the victory of the Logos-Christology, and discredited contrary opinions not only as unchurchly but also as unscientific. Thus the undertaking of Paul was no longer in harmony with the times. And yet his much-abused doctrine, as is now more and more clearly perceived, deserves the highest respect, inasmuch as it is an attempt to express the significance of Christ's person without the aid of cosmology or philosophical theories. The leading outlines of his Christology are as follows. God is to be conceived as one person; from Him, however, there proceeds eternally as *force* a Logos (*σοφία*), who may be called "Son." This Logos worked in the prophets, and at last, in the highest degree and in a unique manner, in Jesus. Jesus is in His own nature a man, originating in time; He is "from beneath." But, by means of inspiration and indwelling, the divine Logos worked upon Him "from above." A physical union is out of the question, because the Logos Himself is no "*φύσις*." To this divine endowment of Jesus corresponds His tried moral perfection. Through the unchangeableness of His mind and will He became like God; through love He became one with Him. For, said Paul, "the only kind of unity which can exist between two persons is that of disposition and direction of will, which comes to pass through love; only that which results from love has value, whatever is physical is worthless." Thus during all His life the Redeemer moved steadily onward, the Father enabling Him to perform mighty works, and finally He proved His indissoluble union in love with God by His death. As the reward of victory for His love and for His work among men He has received from God the name which is above every name; God has invested Him with divine honour, so that now we may call Him "the God born of the virgin." Since Jesus was eternally foreordained by God, we may even speak of a pre-existence of Christ; and Paul goes

so far as to use these words: "By the grace of God, and through progressive development under trial, Christ became God."

Although Paul was excommunicated, his teaching did not remain altogether without effect in the church. It had a marked influence on Lucian, and through him on Arianism. But it is in the Christological statements of Theodore of Mopsuestia, of Diodorus, and of Theodoret that we can most clearly recognize the influence of the teaching of Paul of Samosata.

PAUL, the name of five popes.

PAUL I., pope from 757 to 767, succeeded his brother Stephen III. on 29th May 757. His pontificate was chiefly remarkable for his close alliance with Pippin, king of France, to whom he made a present of books highly significant of the intellectual poverty of the times, and for his unsuccessful endeavours to effect a reconciliation with the iconoclastic emperor of the East, Constantine Copronymus. He died on 28th June 767, and received the honour of canonization, which he seems to have merited by his piety and virtues. His successor was Stephen IV.

PAUL II., Pietro Barbo, pope from 1464 to 1471, was born at Venice, 28th February 1418. He was on the mother's side the great-nephew of Gregory XII. and the nephew of Eugenius IV., to whose favour he owed his elevation to the cardinalate at the early age of twenty-two. He seems, however, to have made no especial figure at the papal court until the death of Calixtus III. in 1458, when we hear of his interfering actively to protect the late pope's nephew, Pietro Luigi Borgia, from the vengeance of the Roman nobility, and escorting him safely to Civita Vecchia. Upon the death of Pius II. he was unanimously and unexpectedly elected his successor, 31st August 1464. Vain of his personal appearance, he wished to take the name of Formosus, and afterwards that of Mark in honour of the patron saint of his native city, but, being dissuaded from both, called himself Paul. He abandoned his predecessor's projects for a crusade, which he saw to be impracticable, and made it his leading objects to preserve peace in Italy and to enhance the dignity of the papal see by a display of outward magnificence. He embellished the costume of the cardinals, collected jewels for his own adornment, entertained the Roman people with shows and banquets, and introduced the sports from which the Corso takes its name to this day. If the spirit of his pontificate was secular, its administration was in general prosperous, and no serious reproach would rest upon his memory but for his violent persecution of the humanists and scholars who adorned his court, the truth respecting which it is exceedingly difficult to discover. Whether actuated by a perception of the incompatibility between Renaissance culture and traditional Christianity, or by a panic fear of imaginary conspiracies against his own person, he appears to have acted with much arbitrary severity, and to have exhibited himself in the unamiable light of a comparatively illiterate man persecuting letters and learning. At the same time, his severities have been without doubt considerably exaggerated by the sufferers, from whom our knowledge of them is almost entirely derived, and his own official acts and documents give a much more favourable view of his character, confirmed by the tranquillity of Italy in his day. He was undoubtedly not a man of quick parts or enlarged

views, but he must have possessed considerable administrative ability, and his lavish ostentation, not in itself wholly impolitic, was frequently accompanied by displays of charity and munificence. He died very suddenly, probably of apoplexy, on 28th July 1471. The inventory of his personal effects, recently published by M. Eugène Müntz, is a valuable document for the history of art. He was succeeded by Sixtus IV.

PAUL III., Alessandro Farnese, pope from 1534 to 1549, was born 28th February 1468, of an ancient and noble Roman family. He received an excellent education, but his youth was dissolute and stormy, and he owed his promotion to the cardinalate (September 1493) to the admiration of Alexander VI. for his beautiful sister Giulia, whence he was derisively nicknamed Cardinal Petticoat. He soon showed himself, however, to be a man of ability and character, and his reputation and influence went on steadily increasing until, upon the death of Clement VII., being at the time senior cardinal of the sacred college, he was unanimously elected pope after a conclave of only two days, having been in a manner nominated by his predecessor (13th October 1534).

Succeeding the most unfortunate of the popes, at the most critical period in the history of the church, the part assigned to Paul III. was one of no common difficulty. But he also possessed no common qualifications,—prudence increased and vigour tempered by age, learning, moderation, and a prolonged experience of affairs. It was his misfortune to be not altogether a man of his own day: deeply penetrated with the ambitious, luxurious, and secular spirit of the Renaissance, he found it difficult to adapt himself personally to the changed circumstances of the times by entering into the Catholic Puritanism which, however disagreeable to a man of taste and refinement, was an indispensable necessity in combating the Reformation. The want was in a manner supplied by the men whom, conscious perhaps of his own deficiencies, he called around him. No pope has made so many distinguished cardinals, and his promotions included both men of evangelical piety inclined to the new doctrines like Contarini, and fanatical devotees of the old system like Caraffa. The latter group, though Paul had probably little personal inclination for them, triumphed in his councils. The bull instituting the order of the Jesuits (1540) marks the commencement of the Roman counter-reformation; two years afterwards the Roman Inquisition was established, Contarini died with strong suspicions of poison, Ochino was hunted from Italy, and a persecution broke out which soon exterminated Protestantism inside the Alps. Another memorable measure extorted from Paul by the necessities of his position was the convocation of the council of Trent in 1545; but he soon found means to suspend its sittings, which were not resumed for many years. His brief condemning slavery (1537) ranks among the most honourable actions of his reign. As a politician Paul continually strove to trim between Charles V. and Francis I., and to preserve the peace of Italy as far as compatible with his darling aim of procuring an establishment for his natural son. All these objects were accomplished. Paul's contemporaries respected and courted him, Italy in general enjoyed tranquillity, and the monster who brought such disgrace upon him acquired the principalities of Parma and Piacenza. After, however, the murder of this unworthy son, the ingratitude of his grandsons broke Paul's heart, and, overcome by a sudden fit of passion, he expired on 10th November 1549,—enjoying the rare distinction of being one of the very few popes who have died lamented by their subjects. His character was in many respects a very fine one, but in every respect the character of a prince and a scholar, not of an ecclesiastic. He was a munificent

patron of learning, was versed in science, and had an especial weakness for judicial astrology. The arts also owed much to him. Michelangelo's Last Judgment and other works of the first rank were completed under his auspices, and he greatly improved and beautified the city of Rome. Julius III. was his successor.

PAUL IV., Giovanni Pietro Caraffa, pope from 1555 to 1559, born 28th June 1476, was the nephew of Cardinal Oliviero Caraffa, by whose interest he became at an early age chamberlain to Pope Alexander VI., and subsequently, though contrary to his own inclination, archbishop of Chieti. He was afterwards nuncio in England and Spain, both of which missions he discharged with credit; but in 1524, under the influence of strong religious impressions, he resigned his archbishopric, distributed his goods among the poor, and retired from the world to direct the monastic order of Theatins, founded by himself. In 1536 the fame of his sanctity induced Paul III. to call him to his court and confer the dignity of cardinal upon him, notwithstanding his own reluctance. He now became the head of the reactionary party at Rome, bent on crushing all tendencies to religious innovation, while insisting on reforms in discipline and moral deportment. Such was unquestionably the policy required by the times from the exclusive point of view of the interests of the church, and it was thoroughly incarnate in Caraffa, in whom the spirit of the Dominican exterminators of the Albigenses seemed to revive. Having taken an important part in two conclaves, he was himself unexpectedly elected pope on 23d May 1555, after the death of Marcellus II., notwithstanding his personal unpopularity and the positive veto of Charles V. Raised to the pontifical throne, Paul showed himself a man of extreme counsels in every respect. He endeavoured to efface the prejudice against his former austerity by excessive magnificence. He rushed into politics, and evinced himself as rash in his partisanship as his predecessors had been dexterous and ambiguous. His open espousal of the cause of France brought upon him a Spanish invasion which would have destroyed his temporal sovereignty but for the superstition of Philip II. and his general Alva, who embraced the first opportunity of making peace. He called his nephews to court and trusted them with blind confidence, but unhesitatingly disgraced them when convinced of their unworthiness. He refused to acknowledge Ferdinand as emperor of Germany, maintaining that Charles had no right to abdicate or Ferdinand to succeed without his own permission. Amid all these agitations he never lost sight of the main purpose of his life: he struggled incessantly against heresy, and was the first pope to issue a full official *Index Librorum Prohibitorum* (see vol. xii. p. 730). He died, on 18th August 1559, recommending the Inquisition to the cardinals with his last breath, and leaving the character of a pope of rare energy of body and mind, upright in all his thoughts and actions, but intoxicated with fanaticism and the pride of office, and more perverse, obstinate, and impracticable than any occupant of the papal chair since Urban VI. His memory was so detested by the Roman people that the hawkers of glass and earthenware were compelled for a time to discontinue their usual cry of "carafo" and cry "ampolle." He was succeeded by Pius IV.

PAUL V., Camillo Borghese, pope from 1605 to 1621, was born in Rome, 17th September 1552, of a noble family. He followed the study of canon law, and after having filled various important offices was made a cardinal in 1596. He succeeded Leo XI. on 16th May 1605, after an unusually long and stormy conclave, the vicissitudes of which are dramatically narrated in Mr T. A. Trollope's *Paul the Pope and Paul the Friar*. No one, till the last moment, had thought of Borghese, who owed his election

to his supposed inoffensiveness and the inability of the leaders of the factions to agree upon any other man. Scarcely had he been elected ere he gave convincing proof that his character had been very much mistaken. He showed himself harsh, domineering, impatient of advice, fanatical in his devotion to the secular as well as the spiritual prerogatives of the church, and inflexible in his resolution to uphold them. He began by successfully repressing numerous encroachments of the civil power in various Roman Catholic countries, and thus became tempted to embark in a contention with the republic of Venice, which inflicted a deeper wound on Rome than anything that had taken place since the Reformation. The dispute was occasioned by the claim of the Venetians to try ecclesiastical culprits before the lay tribunals, and by the extension of old laws forbidding the unauthorized formation of religious corporations and the acquisition of property by ecclesiastics to the entire territory of the republic. Paul protested and menaced (October 1605), and, when the Venetians refused to yield, he launched (April 1606) a bull of excommunication against them, and placed the whole republic under an interdict. The Venetians set him at defiance, forbidding their clergy to pay the least attention to the papal censures, and banishing those who disobeyed from their dominions. A vehement literary controversy arose, in which the famous Father Sarpi, the chief counsellor of the Venetian senate, especially distinguished himself. Paul found himself impotent, and, disappointed in his expectations of material aid from Spain, was thankful to escape from the difficulty by the mediation of France, whose representative, Cardinal Joyeuse, negotiated a compromise in April 1607. The Venetians made some nominal concessions, but gained every substantial point at issue; the main result of the contention, however, was to demonstrate the inefficacy of the spiritual weapons on which Rome had so long relied, and the disrepute into which papal pretensions had fallen even among Catholic nations. Throughout the remainder of his long pontificate Paul acted with comparative moderation, maintaining, nevertheless, the character of a zealous pontiff intent on combating heresy, and especially active in his encouragement of foreign missions. He ranks among the popes who have contributed most to the embellishment of Rome; the nave, façade, and portico of St Peter's were completed by him; he also erected the sumptuous Borghese chapel in Santa Maria Maggiore, and greatly benefited the city by improving streets and constructing public fountains. He died on 28th January 1621, and was succeeded by Gregory XV.

(R. G.)

PAUL (1754-1801), emperor of Russia, son of Peter III. and of Catherine, was born on the 2d of October 1754. During the early part of his life he was treated with great harshness by his mother, who had usurped the throne and did not allow him to take any part in the government. There is little doubt that she did not intend him to succeed, but her will was burnt by one of Paul's adherents. His days were spent in retirement, with the exception of a tour which he made in the west of Europe in the year 1780. He was twice married, first, in 1773, to Augusta, princess of Hesse Darmstadt, who died three years afterwards, leaving no issue; secondly, in 1776, to Dorothea Sophia, princess of Württemberg, who was received into the Greek Church as Maria Feodorovna. Paul Petrovich ascended the throne on the death of his mother Catherine, 17th November 1796. One of his first acts was to cause the body of his father to be exhumed from the Nevski monastery and buried with the empress his wife in the Petropavlovski church among the rest of the czars. Orloff and the other persons implicated in Peter's assassination were compelled to follow the coffins,

and afterwards banished the empire for ever. The chief ministers of the new emperor were Rostopchin and Arakchëeff. Paul now gave signs of a benevolent disposition; among other acts of generosity he set at liberty Kosciusko, who had been detained a prisoner at St Petersburg. He, however, revived many obsolete imperial privileges which were offensive to the nobility, and became unpopular by introducing German regulations into the army. He altered the *oukas* (*ukase*) of Peter the Great which made the succession to the throne dependent upon the will of the reigning sovereign, and declared it inherent in the eldest son. In 1798 he was appointed grand-master of the order of the Knights of Malta. Alarmed at the progress of the French Republic, he joined Turkey, England, Austria, and Naples in a coalition against Bonaparte. To command the Russians, the veteran Suwaroff was summoned from his rural retreat, to which he had been banished in consequence of making some satirical verses on the new regulations which had been introduced by Paul. For the campaigns of the Russian general, the article *RUSSIA* may be consulted. It may suffice to say here that he, triumphant at first, was eventually compelled to retreat, and was recalled by Paul. He died in disgrace in the year 1800. Soon afterwards the capricious emperor completely changed his plans. Having been flattered by Bonaparte, he secretly made overtures to him and quarrelled with England, seizing English vessels and goods which happened to be in the Russian ports. Bonaparte now entered into an agreement with Paul, whereby they should simultaneously invade the English possessions in India. But the coalition was broken up by the assassination of the Russian emperor in the night of 23d to 24th March 1801, which Bonaparte had the meanness to declare in the *Moniteur* had been planned by the English. The story of his death is well known: he was strangled in the Mikhailovski Palace by Zouboff, Pahlen, and other conspirators. Their original object appears to have been only to make him abdicate. An interesting account of the events immediately preceding the emperor's death has been given by General Sabloulkoff, who was on duty that evening at the palace. The empress Maria survived till 1828.

The solution of the incongruities of the character of Paul seems to lie in the fact that he was more or less insane. Hence his outbursts of cruelty in such cases as those of the pastor Seidler and Kotzebue, alternating with generosity, as in his treatment of Kosciusko and other Poles. Englishmen are familiar with some of his mad pranks from the highly interesting travels of Edward Clarke, who suffered from the despot's caprice. Among other whimsicalities, Kotzebue tells us that he seriously proposed that the sovereigns of Europe should settle their differences by single combat. He had so imperilled the position of the country by his extravagance and eccentric policy that his death, however unjustifiable the means, seemed almost a necessity. All Russia breathed afresh when Alexander II. ascended the throne.

The only event of the reign of Paul of permanent importance to Russia was the annexation of Georgia in 1799.

PAUL, ST VINCENT OF. See VINCENT OF PAUL, ST.

PAULDING, JAMES KIRKE (1778-1860), in his day a successful politician, and a writer of some distinction, was born in Dutchess county, New York, United States, on 22d August 1778, and, after a brief course of education at the village school, removed to New York city in 1800, to reside with his brother-in-law, William Irving, a brother of Washington Irving. In connexion with the latter Paulding began in 1807 a series of brief lightly humorous articles, which, under the title of "The Salmagundi Papers," soon became popular, and continued

to appear until 25th June 1808, when they terminated with the twentieth number. Six years later he published a political pamphlet, *The United States and England*, which attracted the notice of President Madison, who in 1814 appointed the author secretary to the Board of Navy Commissioners. Subsequently Paulding was for twelve years navy agent in New York city, and from 1837 to 1841 secretary of the navy, under President Van Buren. Although much of his literary work consisted of political contributions to the press, he yet found time to write a large number of essays, poems, and tales. His marriage in 1818, the death of his wife, and his own withdrawal from public life in 1841, with his death on 5th April 1860, comprise the chief remaining facts of his useful, honourable, and uneventful career.

From his father, who was an active revolutionary patriot, Paulding inherited strong anti-British sentiments, which colour much of his satire, but otherwise he was a just and genial critic, and a delicate and kindly humorist. Of a reserved disposition and hasty temper, with many prejudices, and of extreme political views, he was yet an eminently upright man; of an affectionate nature and a forgiving disposition; a hater of debt, lies, and shams; and an absolutely incorruptible official, who, in every relation of life, was inspired by a lofty, if sometimes mistaken, sense of honesty and honour. In literature he merits notice chiefly as a pioneer, and, though his place was never high, and will certainly not be permanent, he was among the first distinctively American as opposed to English writers, and protested more vigorously than any of his contemporaries against intellectual thralldom to the mother-country. As a prose writer he is chaste and elegant, with a fine negligence, which is sometimes the result of art, more frequently of haste; and, while not so elaborate as Irving, so diffuse as Cooper, or so frank as Neal, he is generally just, neat, fanciful, and realistically descriptive. Among his short stories perhaps the best are *Dyspepsy* and *The Politician*, among the long *The Dutchman's Fireside*. As a poet he is gracefully commonplace,—a weak reflexion of Thomson, with a dash of the prairie and the backwoods. His longest and most ambitious poem is—or was, for it is now forgotten—*The Backwoodsman*, which is ill-constructed and tedious, and the only lines of Paulding's which survive in popular memory are the familiar—

"Peter Piper picked a peck of pickled peppers;

Where is the peck of pickled peppers Peter Piper picked?"

which may be found in *Koningsmarke*.

The following is a list of his writings:—*The Diverting History of John Bull and Brother Jonathan* (1812); *The Lay of the Scottish Fiddle: a Tale of Havre de Grace, supposed to be written by Walter Scott Esq.* (1813), a good-natured parody on *The Lay of the Last Minstrel* written with the special intention of ridiculing certain American follies and exposing the excesses of the British in the Chesapeake; *The United States and England* (1814); *Letters from the South* (1817); *The Backwoodsman*; a *Poem* (1818); *Salmagundi*, second series (1819-20); *A Sketch of Old England*, by a *New England Man* (1822); *Koningsmarke, the Long Finne* (1823), a quiz on the romantic school of Scott; *John Bull in America: or the New Manxhausen* (1824), a broad caricature of the early type of British traveller in America; *The Merry Tales of the Three Wise Men of Gotham* (1826); *The New Mirror for Travellers* (1828); *The Tales of the Good Woman*, by a *Doubtful Gentleman*,—otherwise James K. Paulding (1829); *Chronicles of the City of Gotham*, from the papers of a retired Common Councilman (1830); *The Lion of the West*; a *Comedy* (1831); *The Dutchman's Fireside* (1831); *Westward Ho!* (1832); *A Life of Washington* (1835), ably and gracefully written; *Slavery in the United States* (1836); *The Book of Saint Nicholas*, a series of stories of the old Dutch settlers (1837); *A Gift from Fairyland* (1838); *The Old Continental*; or *The Price of Liberty* (1846); *American Comedies*, the joint production of himself and his son William J. Paulding (1847); and *The Puritan and his Daughter* (1849). The same son also published a posthumous volume by his father, entitled *A Book of Yagaries*, which is included in an edition of Paulding's *Select Works* (4 vols., 1867-68), and a most unsatisfactory biography, mostly made up of long extracts from Paulding's writings, called *Literary Life of James K. Paulding* (1867).

PAULI, REINHOLD (1823-1882), historian, was born at Berlin on 25th May 1823. From his mother, who was of Huguenot descent, he derived a vivacious temperament; from his father, a minister of the Reformed Church, sprung of a family of clergymen and theological professors, he inherited strong religious convictions. He spent his boyhood in Bremen, from whose republican citizens he early imbibed a hearty admiration of liberal self-government, moral discipline, and extensive sea-trade. With the exception of two semesters when he heard Dahlmann at Bonn, he studied at the university of Berlin (1842-46), where he acquired a lifelong predilection for the Hohenzollerns and for the civil service and army of Prussia. Ranke was young Pauli's model historian, but he had far too much individuality to bind himself slavishly to any school. After having taken his degree and passed the public schoolmaster's examination, he became in 1847 private tutor in the family

of Mr Bannatyne, a solicitor in Glasgow, and stayed seven years in Great Britain. During 1849-52 he served as private secretary to the Prussian ambassador Bunsen in London, and made the acquaintance of many eminent politicians of the day and of distinguished antiquaries, such as Kemble, Thorpe, and Hardy. Never a mere book-scholar, he saw various parts of England with an observant eye, and followed public questions with warm interest. He now conceived the plan of investigating the history of England in its original sources. In this way he was the first faithfully to copy some of the Anglo-Saxon annals; but, as soon as he learned that Thorpe was going to edit them for the Master of the Rolls, he liberally committed his transcripts to him. The roots of Great and Greater Britain appeared to him to lie in Anglo-Saxon, not in Celtic, institutions, and therefore his first book was *König Aelfred* (Berlin, 1851). Though critically destroying many long-cherished legends, he described his hero's character and times in warm colours. The book was twice translated into English, and Lappenberg, the best judge then living, declared its author worthy to continue his own *Geschichte von England*. Not without material privations Pauli continued his stay in England, and between 1853 and 1858 published three large volumes, comprising the period from Henry II. to Henry VII. In 1855 he became privat-docent at Bonn, and he obtained a professorship at Rostock in 1857. Thence he removed in 1859 to Tübingen, where, however, in 1866 he offended the Württemberg Government by vehemently denouncing its Austrian policy in an essay which appeared during the Prussian war in the *Preussische Jahrbücher*. Exiled to a remote country seminary, he preferred to resign. He now returned to his native country and obtained in 1867 a post in the university of Marburg, which he once represented in the Prussian Upper House. In 1870 he found an honourable position at Göttingen, where the former dynastic union of Hanover with Great Britain had left a splendid English library, and where Waitz had brought together a flourishing historical school.

Pauli's later life was chiefly devoted to modern history, and the *Geschichte Englands 1814-52*, in 3 vols. (Leipsic, 1864-75) made his name widely known. He fulfilled his duties as a teacher and examiner and as a fellow of different learned societies with punctual accuracy; he became member of the academics of Göttingen, Munich, and Berlin, and honorary doctor of Oxford and Cambridge. He helped friends and pupils with untiring kindness; in his happy and social home he was often visited by distinguished English scholars. And he was for a whole generation a living link between the historical literature of England and Germany, "those two columns of the Teutonic world, which, for the benefit of human progress he firmly believed in, he fondly hoped would never be torn asunder." When suddenly called away by a stroke of apoplexy on 3d June 1882, he was deeply lamented on both sides of the Channel.

Pauli's *History of England* was remarkable for its research. Never before had the records, then piled up in the Tower without calendars or indexes, been used in so full a way; never before had the chronicles and memoirs been so thoroughly criticized. The short review of these original sources, given in the appendices, formed a guide to the mediæval historiography of England, and was later on, when better editions appeared, supplemented by Pauli's critiques contributed to German periodicals. The main narrative follows the king, but at the end of each reign the literary, religious, social, economical, and especially the commercial features of the period are cleverly grouped together. Though Pauli was no regular jurist, even the development of the constitutional side of his subject was then superior to the general standard. Indeed these parts, and these only, Pauli lived to see without jealousy superseded by Gneist and Stubbs, while in every other respect his work, then an immense advance upon Lingard, still remains the most solid of its kind. It has never been translated, perhaps on account of its almost annalistic form, and its contempt for the popular attractions of moralizing remarks, philosophical speculation, or picturesque style. To gain

new facts, to show the way for further investigation, seemed to Pauli a worthier task than to amuse the public with a brilliant story. The history is remarkable for the completeness with which the author has used all reports, letters, and memoirs he could lay his hands upon. He was also allowed to inspect private papers of Cobden and of the Prussian ambassadors Bülow and Bunsen; and he knew something by personal recollection. Still he openly confessed that this contemporary history could be only preliminary, on account of the wide gaps in our knowledge of the secret policy; and because "he felt, in dealing with the flowing formless mass of living characters, as if he were touching hot lava that could not yet be shaped into constructive material." Nevertheless the carefully-weighed judgment and the profound understanding of the manifold and tangled tendencies of modern strife are simply astonishing, if we consider that the author was a foreigner. Abroad no guide through the English history of the 19th century can rival this work, while the English reader will find at least the chapters on foreign policy to contain much that is new, and will be sure to admire the impartial views of a distant but lofty and noble observer. Pauli had learned to love the organic growth of the English constitution, and could not look without misgivings on the radical destruction of its aristocratic basis.

Besides a great many essays on the Middle Ages, of which only the popular ones have been collected in *Bilder aus Alt-England* (Gotha, 1860; 2d ed. 1876, translated 1861), and in *Aufsätze zur Englischen Geschichte* (Leipsic, 1869; *Neue Folge*, edited by Hartwig, Leipsic, 1883), Pauli published two monographs: "Grosseteste und Marsh," in the *Tübingen Program* for 1864, and *Simon von Montfort* (Tübingen, 1867). From a literary point of view these biographies are the best things Pauli wrote, and in them he was successful in creating figures of impressive character; but his general histories also usually centre round a hero, e.g., Canning and Peel in his history of England in our own times. Well versed in paleography, Pauli discovered several important memorials, and never despised the humbler task of an editor; he edited Gower's *Confessio Amantis* (1857), *The Libell of Englyshe Policye* of 1436 (1878), and three tracts on political economy of the time of Henry VIII., *Transactions of the Göttingen Society*, 1878. For the *Monumenta Germaniae Historica* he furnished a quantity of MS. collations, and extracted conjointly with Liebermann pieces of interest for Germany out of English historians before 1300 A.D., which appeared in part in vol. xiii. (1881), and in part will fill vol. xxvii. For the Berlin Academy he selected and copied a mass of records relating to Germany, mainly of the 14th century, which did excellent service for the Hanseatic publications. For the Camden Society he had prepared the account book of the Prussian crusade of Henry Earl of Derby in 1392, which, it is hoped, will be edited by an eminent English historian. He contributed numberless reviews and detailed, often exhaustive, essays on minor subjects of English history to Sybel's *Historische Zeitschrift*, *Preussische Jahrbücher*, *Grenzboten*, *Rundschau*, *Im Neuen Reich*, *Forschungen zur Deutschen Geschichte*, *Archiv für ältere deutsche Geschichtskunde*, *Hansische Geschichtsblätter*, *Zeitschrift für Kirchenrecht*, *Deutsche Literaturzeitung*, *Göttingische Nachrichten*, *Göttingische Anzeigen*. These articles possess in some respects a very high value as material for future scholars. Pauli's last studies on Henry VIII. and the Hanoverian succession, based on the discovery of the papers of Robethon, the elector's agent, are printed in the *Aufsätze, Neue Folge*.

Hartwig prefixed a sketch of Pauli's life to the *Aufsätze, Neue Folge*, and Pfendorn delivered a lecture upon him, printed in the *Transactions of the Göttingen Society* (1882). (F. L.)

PAULICIANS (Παυλικιανοί), the name of a religious sect which sprang up in Armenia in the latter half of the 7th century. Their founder was Constantine, belonging to a village near Samosata called Mananalis, where a dualistic, perhaps Marcionite, community had long subsisted. About 660 A.D. his attention had been drawn to the New Testament, and especially to the epistles of Paul, whence he derived a set of opinions which, in their combination at least, were quite peculiar to himself, and under their inspiration he forthwith came forward as a reforming preacher. The scene of his first efforts was Cibossa, in the district of Colonia in Armenia Prima, where, in token of his Pauline discipleship, he called himself Sylvanus and his flock Macedonians. He died about the year 684, but had a succession of like-minded followers—Simoon (called Titus), Paul, Gegnæsius (Timothy), Joseph (Epaphroditus)—under whom the sect continued to spread into Asia Minor, ultimately taking up its headquarters in Phanæra in Helenopontus. According to Petrus Siculus, whose *Historia Manichæorum* was written about 870, they held the ordinary dualistic doctrine common to all the

Manichæans, expressly distinguishing the Being to whom the present world owes its creation and government from the maker and ruler of that which is to come; further, besides being quite out of sympathy with the Catholic doctrine as to the Theotokos, they rejected the Old Testament, the sacraments, the symbol of the cross, and the ordained ministry of the church. The morals of the followers of Constantine seem to have been for the most part unexceptionable, tending to severity, but one of his remoter successors, Baanes by name, gave way to such excesses as to earn for himself the surname of *ὁ βυρραπός*; and Sergius (Tychicus), about the beginning of the 9th century, found so great scope for a moral reformation and was so successful in his efforts for this end that he is sometimes spoken of, not extravagantly, as the second founder of the sect. Their aversion to images made them specially obnoxious to persecution by both parties during the iconoclastic controversy,—the iconoclasts specially finding it necessary to give practical demonstration of their antipathy to the Paulician heretics. The violence of Leo the Armenian in particular compelled many of their number, and Sergius among them, to seek refuge in the Saracen part of Armenia, where the emir of Melitene assigned them a seat in the little town of Argaum; from this settlement, notwithstanding the remonstrances of their head, they made frequent and damaging inroads on the Byzantine territory. After the death of Sergius in 835 their government became more political and republican, until the violence of Theodora drove new reinforcements to their camp, including an able military leader named Carbeas, who presently placed himself at their head. The sect continued to grow and to found new settlements, among which Tephrica is specially mentioned by the Byzantine historians as a cause of embarrassment. At the head of an army composed of Paulicians and Moslems, Carbeas more than once invaded the territory of the empire and inflicted defeat on the opposing forces. Chrysocheir, his stepson and successor, was still more successful; sweeping all opposition before him, he overran the whole of Asia Minor, pillaging Nice and Nicomedia, Ancyra and Ephesus,—Basil the Macedonian vainly appealing now to arms and now to negotiation. At last, however (871), he was surprised and slain, and his followers were driven back to their mountain fastnesses. In 970 John Zimisce succeeded in removing a large colony of them, as guardians of the frontier, to the region about Philippopolis in Thrace, where full religious liberty was guaranteed them. Here they continued to flourish in virtual independence for more than a century, until Alexius Comnenus inflicted chastisement on them for having deserted his standard in the course of the Norman war. In 1115 that emperor fixed his winter quarters in Philippopolis to use for their conversion the various powers of persuasion at his command, and the orthodox city of Alexiopolis was founded in the immediate neighbourhood. The sect, however, called "Popelicans" by Villehardouin, continued to subsist in Thrace until at least the beginning of the 13th century, as did also the Euchites, afterwards Bogomili, who had been attracted to the locality by the toleration of Zimisce. Meanwhile, branch societies of Paulicians had established themselves in Italy and France, and reappear in history there under various names, such as Bulgari, Patareni, Cathari, and Albigenes.

The Paulicians are the subject of a monograph by F. Schmidt (*Historia Paulicianorum Orientalium*, Copenhagen, 1826); and the *Historia* of Petrus Siculus, already referred to, has been edited (Göttingen, 1846) by Gieseler, whose "Untersuchungen über die Geschichte der Paulicianer," in *Stud. u. Krit.* (1829), as well as the relative sections of his *Church History*, deserves special mention. See also vol. iii. of Neander's *Kirchengeschichte*.

PAULINUS, ST. OF NOLA. Pontius Meropius Anicius Paulinus, who was successively a consul, a monk, and a

bishop, was born at Bordeaux in 353 A.D. His father, præfectus prætorio in Gaul, was a man of great wealth, so that Augustine could speak of Paulinus, who inherited it, as "opulentissimus dives," and Ausonius, himself a man of property, could speak of his estates as "regna." The literary education of the future saint was entrusted to his elder contemporary and townsman Ausonius, and how considerable was the degree of culture to which he attained as a writer both in prose and verse can yet be seen from his extant works, though it is of course impossible for any one in cold blood to concur in all the friendly praises of Ausonius and Jerome, the latter of whom compares him as a letter-writer to Cicero. In 378 he was raised to the rank of consul suffectus, and in the following year he appears to have been sent as consularis into Campania. Here, whether in an official capacity or not, he certainly remained for some time; and, according to his own account, it was at this period, while present at a festival of St Felix of Nola, that he first entered upon his lifelong devotion to the cultus of that saint. Probably before this time he had married a wealthy Spanish lady named Therasia; the union appears to have been a sympathetic and happy one, though not unclouded by domestic sorrows, among which may be mentioned the death in infancy of their only child,—a bereavement which, combined with the many disasters by which the empire was being visited, did much to foster in them that world-weariness to which they afterwards gave such emphatic expression. From Campania Paulinus returned to his native place and came into correspondence or personal intimacy with men like Martin of Tours and Ambrose of Milan, whose example could not fail to keep before him the claims of Christianity as conceived by them; and ultimately (about 389) he was formally received into the church by Bishop Delphinus of Bordeaux, whence shortly afterwards he withdrew with his wife beyond the Pyrenees. This withdrawal from the pursuits and pleasures of the world called forth the playful banter and serious remonstrances with which alternately he was plied by Ausonius; all appeals, however, to the common memories of an old friendship and to the claims of patriotism and of ambition were made in vain. It is impossible, of course, to say what precise amount of truth may underlie the poet's hint at an undue feminine ascendancy over his friend, which is implied in the expression "Tanaquil tua." Therasia was certainly at least not behind her husband in eagerness to have done with the fast-failing friendship and help of "the world"; but Paulinus is unflinching in his reply to every reproach and entreaty: "Negant Camœnis, nec patent Apollini dicata Christo pectora. . . . Nunc alia mentem vis agit, major deus. . . . O beata injuria, displicere cum Christo." The personal asceticism of Paulinus and his liberality towards the poor soon brought him into great repute among all the devout of the region in which he had settled; and while he was spending Christmas at Barcelona the enthusiasm of the people rose to such a pitch that they insisted on his being forthwith ordained to the priesthood. The irregularity of this step, however, was resented by many of the clergy, and the occurrence is still passed lightly over by his Roman Catholic panegyrists. In the following year he went into Italy, and after visiting Ambrose at Milan and Siricius at Rome—the latter of whom, however, jealous probably of the growing monkish spirit and mindful also of the irregular ordination, received him somewhat coldly—he proceeded into Campania, where, in the neighbourhood of Nola, he settled among the rude structures which on his former visit he had caused to be built around the tomb and relics of his "dominædinus" (lord of the edifice) and patron saint. Along with Therasia (now a sister, not a wife), while leading a life of rigid asceticism, he devoted the whole of his vast wealth to the

entertainment of needy pilgrims, to payment of the debts of the insolvent, and to public works of utility or ornament; besides building basilicas at Fondi and Nola, he provided the latter place with a much-needed aqueduct. At the next vacancy, not later than 409, he succeeded to the bishopric of Nola, and this office he held with ever-increasing honour until his death, which occurred shortly after that of Augustine in 431. He is commemorated by the Church of Rome on 22d June.

The extant writings of Paulinus consist of some fifty *Epistolæ*, addressed to Sulpicius Severus, Delphinus, Augustine, Jerome, and others; thirty-two *Carmina* in a great variety of metre, including a series of hexameter "natales," begun about 393 and continued annually in honour of the festival of St Felix, metrical epistles to Ausonius and Gestidius, and paraphrases of three psalms; and a *Passio S. Genesii*. They reveal to us a kindly and cheerful soul, well versed in the literary accomplishments of the period, but without any strength of intellectual grasp and peculiarly prone to superstition. The somewhat conspicuous place in church history occupied by Paulinus is chiefly due to the effect his great influence had in promoting the practice of pilgrimage, relic-hunting, and picture-worship, as well as the uncritical acceptance of every alleged miracle; to the intellectual development of Christianity he contributed nothing and it may well be questioned whether the manner in which he discharged the stewardship of his wealth was as judicious and beneficial as it certainly was generous.

His works were edited by Rosweyde and Fronton le Duc in 1622 (Antwerp, 8vo), and their text was reprinted in the *Bibl. max. patr.* (1677). The next editor was Le Brun des Marettes (Paris, 1685, 2 vols. 4to), whose text was reproduced in substance by Muratori (Verona, 1736), and reprinted by Migne.

PAULUS, HEINRICH EBERHARD GOTTLÖB (1761-1851), the distinguished representative of the rationalistic school of German theologians of the beginning of this century, was born at Leonberg, near Stuttgart, 1st September 1761. His father, the Lutheran clergyman at Leonberg, was convinced of the immortality of the soul by spiritualism, and was deprived of his living in consequence of his belief in the intercourse of departed spirits with men. He likewise required of his children unconditional obedience, and commanded them to believe the doctrines of religion without asking wherefore. The father's spiritualism and dogmatism drove the son by natural reaction to the rationalism which prevailed at the time; and of which, in its application to Biblical history, Paulus became the most famous representative. He was educated at Tübingen, was three years master in a German school, and then spent two years in travelling through England and the principal countries of the Continent. He subsequently published interesting passages from the journal of his tour. In 1789 he was chosen ordinary professor of Oriental languages at Jena. In addition to the studies of his own department he prosecuted especially mathematics, as the best preparation for clear thinking. At Jena he lived in close intercourse with Schiller, Goethe, Herder, and the most distinguished literary men of the time. In 1793 he succeeded Doederlein as professor of theology. His special work was the exposition of the Old and New Testaments in the light of his great Oriental learning and according to his characteristic principle of "natural explanation." He held that miracles in the strict sense were impossible, that the events recorded in the Bible took place naturally, and that the narratives of the Gospels are the true reports of men who either were eyewitnesses or had obtained information from such as were. From a purely apologetic motive he sought to remove what other interpreters regarded as miracles from the Bible by distinguishing between the *fact* related and the author's *opinion* of it, by seeking a naturalistic exegesis of a narrative, e.g., that ἐν τῇ θάλασσῃ (Matt. xiv. 25) means *by the shore and not on the sea*, by supplying circumstances omitted by the author, by remembering that the author produces as miracles occurrences which can now be explained otherwise, e.g., exorcisms. The chief exegetical works of Paulus are his *Philologisch-kritischer und histor-*

ischer Commentar über das Neue Testament (4 vols., 1800-1804), *Clavis über die Psalmen* (1791), and *Clavis über Jesaias* (1793), and particularly his *Exegetisches Handbuch über die drei ersten Evangelien* (3 vols., 1830-33; 2d ed., 1841-42). His *Life of Jesus* (2 vols., 1828) is a synoptical translation of the Gospels, prefaced by an account of the preparation for the Christ and a brief summary of His history, and accompanied by very short explanations interwoven in the translation. The form of the work was fatal to its success, and the subsequent *Exegetisches Handbuch* rendered it quite superfluous. In the latter work Paulus really contributed much to a true interpretation of the Gospel narratives, notwithstanding his entire failure to explain the miracles away. The historical and geographical excursions and dissertations interwoven in his commentaries are of considerable value. He was particularly well acquainted with the conditions of Oriental life. In the year 1803 Paulus left Jena on account of his health, and filled various posts in south Germany until 1811, when he became professor of exegesis and ecclesiastical history at Heidelberg. It was there that he found the freest scope for his great learning and tutorial abilities. He filled this chair until 1844, when he retired on account of his great age. He died, faithful to his first rationalistic position, a staunch friend of intellectual and political freedom and light, 10th August 1851, in his ninetieth year.

The literary labours of Paulus were not confined to exegesis. He edited a collected small edition of Spinoza's works (1802-1803), a collection of the most noted Eastern travels (1792-1803), Schelling's *Vorlesungen über die Offenbarung* (1843), &c. He was also the author of *Skizzen aus meiner Bildungs- und Lebensgeschichte* (1839), and he left behind him the materials for a biography, which was published by Professor Reichlin-Meldegg, under the title *H. E. G. Paulus und seine Zeit* (1853).

PAULUS, JULIUS. See ROMAN LAW.

PAULUS (or PAULLUS), LUCIUS ÆMILIUS, a distinguished Roman general, of the patrician family of the Æmili, was born about 229 B.C. He was the son of the consul of the same name who fell at Cannæ. As curule ædile in 192 he gave a proof of his integrity by prosecuting the persons who made an illegal use of the public pastures. His first laurels were won in Further Spain, whither he was sent as prætor in 191. Though at first defeated with loss, he finally overthrew the enemy in a bloody battle (189) and tranquillized Spain. In 182 he was consul, and in the following year subdued the Ingauni, a piratical tribe of Liguria, dismantling their towns and carrying off their ships. For this service he was granted a triumph. After a period of retirement from public life he was elected consul a second time, for 168, and entrusted with the command in the Macedonian war, which the incapacity of previous Roman generals had allowed to drag on without success for three years. Paulus brought the war to a speedy termination by the battle of Pydna, fought on 22d June (Julian calendar) 168. The battle decided the fate of Macedonia, which was henceforward a Roman province. The Macedonian king Perseus surrendered shortly afterwards and met with a courteous reception from the Roman general. Paulus now availed himself of his position to make the tour of Greece, visiting with an intelligent interest the places immortalized in Greek history and legend. Afterwards, assisted by ten Roman commissioners, he arranged the affairs of Macedonia. In obedience to the orders of the senate, on his return through Epirus to Italy he gave up seventy towns to pillage and carried off 150,000 of the inhabitants as slaves. A magnificent triumph, graced by the presence of the captive king Persous and his three children, rewarded the conqueror of Macedonia (167). But his public glory was closely attended by private misfortune; of the two sons borne him by his second wife one died a few days before,

the other a few days after, his triumph. The veteran was thus left without a son to bear his name; for of his two sons by his first wife Papiria, the elder had been adopted by Quintus Fabius Maximus, Hannibal's great opponent, and the younger by the son of Scipio Africanus. The latter, known as P. Cornelius Scipio Æmilianus, was the conqueror of Carthage and Numantia. Paulus was censor in 164, and died in 160. At the funeral games exhibited in his honour the *Hecyra* of Terence was acted for the second and the *Adelphi* for the first time.

Paulus was a fine specimen of a Roman noble. An aristocrat to the backbone, he was yet beloved by the people, whose favour he never deigned to court by unworthy means. His integrity was perfect; of the vast sums brought by him into the Roman treasury from Spain and Macedonia he kept not a penny to himself. At his death his property with difficulty sufficed to pay his wife's dowry. As a general he was a strict disciplinarian; as an augur he discharged the religious duties of his office with conscientious care and exactness. His piety passed into superstition, as when before the battle of Pydna he sacrificed to the moon, then under eclipse. His sympathy with Greek learning and art is attested by the Greek masters whom he procured for his sons, as well as by his travels in Greece, the works of art he brought home, and his friendship for the historian Polybius. His nobility of nature won him the affection and esteem of all who knew him, of his enemies no less than of his countrymen. An affecting proof is the fact recorded by Plutarch that his body was carried to the grave by volunteers from all the nations he had conquered, while old men from Spain, Liguria, and Macedonia followed, lamenting the man who (according to them) was at once their conqueror and their saviour.

There is a life of him by Plutarch, but his campaigns in Liguria and Macedonia are more fully described by Livy (xl. 25-28; xlv. 17-xlv. 41).

PAULUS ÆGINETA. See ÆGINETA, vol. i. p. 181, and MEDICINE, vol. xv. p. 804.

PAULUS DIACONUS, the historian of the Lombard dominion in Italy, flourished in the 8th century (see LOMBARDS, vol. xiv. p. 813). An ancestor of his named Leupichis entered Italy in the train of Alboin and received an allotment of lands at or near Forum Julii (Friuli). By an invasion of Avars all the five sons of this warrior were swept off into Illyria, but one, his namesake, returned through many perils and restored the ruined fortunes of his house. His grandson was Warnefrid, who, by his wife Theodelinda, became the father of Paulus. The future historian (born about 720 or 725) received an education unusually good for his times, possibly in part conducted at the court of King Ratchis in Pavia. From a teacher named Flavian he received at least the rudiments of Greek. In middle life, probably, he retired into the great Benedictine monastery of Monte Cassino, which his patron King Ratchis had entered in 749. The ruin which befell the Lombard monarchy in 774 at the hands of Charles the Great may have caused him to take this step. In this ruin was involved his brother Arichis, whose estates were confiscated, himself confined in prison for seven years, and his wife and children reduced to beggary. About 781 Paulus left his monastery and travelled to France, probably in order to intercede for this brother, and after considerable delay his request was granted. Meanwhile, his literary gifts had come to be highly appreciated by the Frankish king. The letters and the verses which passed between Charles (employing the pen of a secretary) and Paulus give a pleasant idea of the relation between the two parties, and remind us of the intercourse between the Italian princes and the scholars of the Renaissance. After some years' residence in France Paulus returned to Italy and to his convent, and died, probably between 790 and 800, at his beloved Monte Cassino. His surname, Diaconus (or Levita), shows that he took orders as a deacon, no doubt during his residence in the monastery.

The chief works of Paulus are his *Continuation of Eutropius* and his *Lombard History*. The former (one of his earliest works) was written at the request of Adelperga, wife of the duke of Benevento. Paulus recommended her to read the Roman history of Eutropius, but, as she complained that this heathen writer said nothing of

church affairs, and stopped short at the death of Jovian, Paulus interwove some extracts from the ecclesiastical historians, and added six books (xl.-xvi.), bringing down the history to 553 A.D. At this point his *Lombard History*, in six books, written in the later years of his life and cut short by his death, takes up the tale, which is told henceforward from the point of view of a Lombard patriot. The sagas of the Langobardic warriors, plentifully interspersed, give to the narrative a wild barbaric interest. The document called the *Origo Gentis Langobardicæ* and the lost history of Secundus of Trient furnished some of his materials. He also makes free use of Gregory of Tours, Bede, Isidore, and others. In some aspects Paulus naturally suggests a comparison with Jordanes, that other historian of a barbarian nation falling into ruin, but in learning and literary honesty the Lombard is greatly the superior of the Goth. His style is, for his age, wonderfully good, though his grammar shows the breaking down of the old Latin inflexions into the *lingua volgare*.

Paulus wrote also a history of the bishops of Metz, some homilies, and several small poems, some rhythmical, some metrical. His works were frequently copied in the Middle Ages. Of the *Lombard History* there are more than a hundred MSS. extant, those of Assisi, Cividale, and St Gall being the most important. The edition of his histories published as part of the *Monumenta Germanicæ Historica* (1878-79) supersedes all others. For further information, the student may consult G. Waitz's preface to the *Lombard History* in that edition, and F. Dahn's *Langobardische Studien*, an able monograph, but perhaps too negative in its conclusions. The English reader will find an excellent sketch of Paulus's life and writings in Ugo Balzani's *Early Chroniclers of Italy* (London, 1883).

PAUPERISM. See POOR LAWS.

PAUSANIAS, the general who led the Greeks to victory at Plataea, was a Spartan and a member of the Agid branch of the royal house. In 479 B.C. he succeeded his father Cleombrotus as regent and guardian of his cousin the youthful king Plistarchus, and in the same year he was appointed, by virtue of his rank, to lead the army despatched by the Spartans to help the Athenians against the Persians under Mardonius. He commanded the united Greek army at the memorable battle of Plataea (479), which for ever secured the freedom of Greece against the Persians. The credit of that great victory belongs to the soldiers rather than to their general, for Pausanias seems to have acted without any settled plan, and to have given battle only when he was forced to do so by the enemy. Indeed, his attempt to withdraw the Spartan contingent from the post of honour on the right, in order to avoid encountering the native Persian troops under Mardonius, savours of positive cowardice. But, if he feared the living, he respected the dead; a proposal made by a Greek after the battle to avenge the death of Leonidas by mutilating the corpse of the gallant Mardonius received from Pausanias a stern rebuke. - After the expulsion of the Persians from Greece Pausanias led a Greek fleet (478 or 477) to Cyprus and thence to Byzantium, which he captured from the Persians. But the successes he had hitherto enjoyed only fed without satisfying his ambition. He conceived the design of making himself master of all Greece, and with this view he opened a correspondence with Xerxes, offering to marry his daughter and reduce Greece to a Persian province. The proposal was hailed with delight by the Persian monarch. Puffed up with these hopes, Pausanias now assumed by anticipation the airs and state of a tyrant, and by his overbearing manners offended the Greeks so deeply that in disgust they transferred the leadership of the allied forces from Sparta to Athens,—a momentous step, from which sprang the maritime empire of Athens. Pausanias was recalled to Sparta and tried, but, though convicted and punished for minor offences, the evidence was insufficient to substantiate the charge of treason, and he was acquitted. Having afterwards the folly to return to Byzantium in a private capacity and reopen communications with Persia, he was again recalled and put on his trial. There was strong suspicion of his treason, but no positive evidence. It was known, too, that he had incited the Helots to revolt.

promising them freedom and citizenship if they would join him; but, with characteristic caution, the authorities declined to accept the evidence of a Helot against a Spartan, and Pausanias might, after all, have been acquitted if it had not been that a messenger to whom he entrusted a letter for Artabazus, the Persian satrap, opened it, and, finding in it a direction to put the bearer to death, carried it to the ephors. But not until they had contrived to overhear a conversation between Pausanias and his messenger were the ephors satisfied of his guilt; and then they proceeded to arrest him. Foreseeing their intention, Pausanias took refuge in the temple of Athens of the Brazen House. The ephors took off the roof, blocked up the doors, and starved him. When on the point of death he was dragged out, that his corpse might not defile the sanctuary. This happened about 467.

The principal authorities for the life of Pausanias are Herodotus (ix. 10 sq.) and Thucydides (i. 94, 95, 128-134). There is a biography of him by Cornelius Nepos. See also Diodorus, xi. 29-34, 44-46; Pausanias, iii. 4, 7 and *ib.* 17, 7; Plutarch, *Themistocles*, 23; *Id.*, *Aristides*, 11, 14-20, 23; Aristodemus, ii. iv. vi-viii. (in Müller's *Fragm. Hist. Græc.*, vol. v.); Justin, 2, 14.

PAUSANIAS, a prose-writer (λογογράφος) of Greek traditions, mythical and historical, and a critic of Greek art. His important work, in ten books, called 'Ελλάδος Περιήγησις, usually known as *Pausanias Descriptio Græciæ*, has come down to us entire. It is strictly an itinerary through the Peloponnesus, including Attica, Bœotia, and Phocis, with a rather slight mention of the adjacent islands and some of the principal towns on the Asiatic coast. It was evidently compiled by one whose interest was mainly centred in making notes of art-collections as they existed in the Greek temples and public places in the time of the Antonines. In connexion with these he expatiates on the myths and legends locally preserved, and thus he has handed down to us much valuable mythological material which would otherwise have been lost. A large portion of his work, however, is devoted to Greek history, properly so called, though, after the manner of Herodotus and the early logographers, he draws no distinction between legend and history. In a general sense he may be styled an antiquary rather than an art-critic, a man of industry rather than of genius, and one who deserves praise more from the matter of his work than for the manner of it. Of the personal history of Pausanias nothing is recorded. He lived during the prosperous times of the Roman empire under Hadrian, whom he often mentions by name, and his successors Antoninus Pius and Marcus Aurelius, the latter of whom became emperor in 161 A.D. His wars against the German Marcomanni are alluded to,¹ and Antoninus Pius² is also named in reference to his successful contest with the Moors. Mention is also made of the "wall" raised between the Forth and the Clyde by the elder Antonine to keep off the assaults of the Brigantes. About himself and his birthplace the author is singularly reticent. Nor has his work any formal introduction or conclusion. He commences abruptly with a description of Attica: "The mainland of Hellas off the Cyclades and opposite the Ægean Sea is called Attica, the jutting headland of which is Sunium. There is a harbour when you have sailed past this foreland, and a temple of Athena the Sunian goddess on the height." He goes on to describe Athens at considerable length, and gives a valuable though too brief account of the Parthenon and the great bronze statue of the goddess on the Acropolis, the work of Phidias,³ the

spear and helm of which were visible to those sailing into the harbour from Sunium. On the ivory and gold statue of the goddess in the Parthenon (c. 24) he writes very briefly; on the Erechtheum and its antiquities he expatiates more largely. The great temple of Ephesus, the very site of which was lost till Mr Wood's explorations between 1863 and 1874, appears to have been perfect in his time, but he does not describe it; he merely says⁴ that "Ionia contains temples such as are not elsewhere to be seen, and first of all that of the Ephesian goddess, remarkable for its size and its wealth in general."

Like Herodotus and Strabo, Pausanias was a traveller and an inquirer. In some respects it is probable that he imitates the manner of Herodotus, as in his credulity⁵ and the affectation of reserve in sacred matters. But, while geography and ethnology chiefly engaged the attention of Strabo, art and antiquities generally form the staple of Pausanias's work. The passion of the Romans for securing specimens of Greek art had long been fed by the plunder of temples and the removal of statues from the towns of the Greek provinces, so graphically described in the orations against Verres. Pausanias comments on the great antiquity of this kind of sacrilege. "It is clear," he remarks,⁶ "that Augustus was not the first who established the custom of carrying away offerings from the temples of conquered nations, but that he merely followed a very old precedent." And he quotes many examples of statues removed by right of conquest, as from Troy, from Brauron and Branchidæ by Xerxes, from Tiryns by the Argives, &c.

In the age of the Antonines special attention was directed to the works of art still remaining in the Greek cities. The work known as Antonine's *Itinerary*, which is a kind of handbook of the whole Roman empire and its complex system of roads and colonies, may have suggested to Pausanias a "Description of Greece," on the lines laid down by Herodotus and Strabo; but we have no exact date of the composition of either work. Leland compiled his *Itinerary* or tour through Britain on much the same principles, and his record of churches and castles as they remained in the later years of Henry VIII. is a survey of mediæval art which resembles the notes of Pausanias formed from his own inquiry and observation.

The vast wealth of the Greek cities in statuary and sculpture, which had been accumulating from the 5th century B.C. till the capture of Corinth by Mummius, may be judged of by the records of the plunderings of Verres and the costly purchases of Cicero⁷ and his successors to the time of Nero, and even of Hadrian, which are matters of history. Nevertheless, after the drain of more than three centuries, "Pausanias," says Mr Westropp,⁸ "was able to describe 2827 statues."

Whether Pausanias had any real taste or enthusiasm for or judgment of fine art does not appear from his somewhat matter-of-fact accounts. He reminds us of a catalogue of goods made with the view of a sale, minus the auctioneer's "puffing." Nor is his motive much more apparent; he may have written to let connoisseurs know what was yet to be had, or to put on record existing works, with the names of the artists, as a protest against further spoliation, or he may have been commissioned by imperial authority to make a list of the art-treasures still exhibited to travellers in the Roman provinces. In the century from Augustus to Trajan Greek education in art, literature, and philosophy was much affected by the rich and well-born Romans, and collections of Greek bronzes and real or spurious articles of antiquity were keenly competed for, as we know from many of the epigrams of Martial.⁹

Pausanias does not usually say that an object is beautiful; he tells us what it is, where it is, and who executed it; that is generally all. Occasionally he remarks that a statue is "worth

¹ vii. (Achaica), 5, 2.

² As when he says, as if seriously (viii. 2, 4), that it seems to him quite credible that Lycæon was changed into a wolf and Niobe into a stone in the good old times when the gods conversed with men on earth.

³ viii. 46, 2.

⁴ Often referred to in his letters to Atticus.

⁵ The *Cycle of Development of the Art of Sculpture in Greece and Rome*, lect. v. p. 166.

⁶ Propertius has a curious critique on the relative merits of the Greek sculptors and painters (iv. 8, 9-16). In elegy 4 of the same book, ver. 6, he disclaims the character of a wealthy collector, "ne miser ara parca clade, Corinthe, tua."

¹ *Descr. Gr.*, viii. (Areadica), 43, 6.

² viii. 43, 5, τοῦτον Εὐσεβῆ τὸν βασιλέα ἐκάλεσαν οἱ Ῥωμαῖοι, διότι τῇ ἐς τὸ θεῖον τιμῇ μάλιστα ἐφαίνετο χρώμενος. The epithet is usually attributed to the affection shown to the memory of Hadrian, by whom he had been adopted.

³ i. 28, 2. This statue is referred to by Aristophanes (*Eg.*, 1172) and Euripides (*Herc. Fur.*, 1003).

looking at," *θέας ἄξιον*, but criticism, in the true sense of the word, is hardly ever attempted. In ii. 27, 5 he speaks highly of Polyclitus as an architect, and says that none can rival him for beauty or proportion. In vii. 5, 2 he says the temples of Hera in Samos and of Athena at Phocæa "were objects of admiration," though they had been burned and greatly injured by the Persians. Occasionally (as vii. 5, 4; 26, 6) he guesses the name of an unknown artist from the style of a sculpture; in vii. 25, 4 he describes some marble statues of women as showing a good style of art, *ἐχούσαι τέχνης εὖ*. His descriptions of a series of designs, like those painted by Polygnotus in the Lesche at Delphi,¹ are dry and without a glimpse of discrimination,—mere lists of names and subjects, like modern "guides" to a gallery or museum of art. At the same time the minuteness of observation and the careful record of all the inscribed names are most commendable, and the value of the account to us from a literary point of view, as showing what subjects were regarded as "Homeric" in the time of Polygnotus, a contemporary of Pericles, cannot be overrated. The same remarks apply to the account of the famous "chest of Cypselus," preserved at Olympia, and claiming a great antiquity from the inscriptions being written *βοιωτρώδῳ*, alternately from left to right and right to left.² He ends his description of scenes chiefly taken from the *Troica* with these words:³ "Who the maker of this chest was we had no means of forming any conjecture. The inscriptions upon it may perhaps be by another hand; but our general impression was that the designer was Eumelus of Coriath, mainly on account of the processional hymn which he composed for Delos." This Eumelus is believed to have flourished about 750 B.C. The suspicion of Pausanias that the inscriptions were later made it probable that the whole design and workmanship were imitative on an archaic model.

Recent explorations, especially those at Olympia, are largely indebted to the careful and detailed accounts of Pausanias.⁴ The temples at Ephesus, Branchidæ, Claros, Samos, and Phocæa he merely mentions, his researches being limited to the cities of western Greece.⁵ His notes on the topography of Athens, though he passes over several of the more important buildings, as the great theatre and the Odeum, with little more than a mere reference, are still the principal authority confirming the allusions in early writers. He seems, indeed, to have admired objects more for their antiquity than for their beauty. He often diverges into long details of history, largely mixed with legend, as in his long account of the Messenian wars in book iv.; indeed, mythology and history proper stand with Pausanias in precisely the same category. He does not show any great advance in this respect from the times of Hecateus or Pherecydes of Syros.

The style of Pausanias is simple and easy, but it is wanting in the quaintness and vivacity of Herodotus, and it has not the florid eloquence of Plato or Lucian. The simple and genuine credulity of Herodotus seems foolish or affected in a writer who lived in a much more advanced period of human knowledge. Thus he gravely tells us⁶ that the water of the Styx will break crystal and precious stones and vessels of clay, and cause metals, even gold, to decay, and can only be kept in a horse's hoof.

The titles of the several books are taken from the divisions of the Peloponnesus, together with the three lying immediately north of the isthmus; the first book being devoted to Attica, the ninth to Boeotia, and the tenth to Phocis. The remainder are (ii.) Corinthiaca, (iii.) Laconica, (iv.) Messeniaca, (v. and vi.) Eliaca, (vii.) Achaica, (viii.) Arcadica. In adopting this nomenclature he probably followed the *Troica*, *Persica*, &c., of Hellanicus. A vast mass of information is contained in these several books, which may be closely compared in their treatment and in the great variety of subjects with English "county histories."

Without the sustained interest and the genial humour which characterize the work of Herodotus, composed as it evidently was for recital and not for private reading, Pausanias is an accurate and diligent recorder of what he saw and knew. He copied inscriptions, and, like Herodotus, he often quotes oracles; in ascertaining the names of artists he is particularly careful. That he had made great research into the history and topography of Greece is abundantly shown; but he is rather chary in his reference to previous authors. Of Herodotus he makes mention in eight or nine places, of Plutarch in one (i. 36, 4), of Plato in four. Thucydides is referred to once (vi. 19, 5), Acusilaus once (ii. 16, 4), Hellanicus

twice, Hecateus four times, Strabo nowhere. Of the poets, epic, lyric, and dramatic, he displays a good knowledge, as well as of Pindar, whom he frequently quotes. It is clear, therefore, that Pausanias was a literary man, and perhaps it is more an idiosyncrasy than a fault that he is cold and prosaic in his descriptions. Of the author's birth, family, or country there are no indications. The name is Doric, but the style is the Attic of Plutarch, Strabo, and Lucian.

The best editions of Pausanias are those of Siebela (5 vols. 8vo, Leipzig, 1822-28), and of Schubart and Wals (5 vols. 8vo, Leipzig, 1838-40). Schubart's text was reprinted in the Trübner series (2 vols. 12mo, Leipzig, 1862), with brief introductory critical notes and a very careful and complete index. This is an excellent and accurate edition, and one which leaves nothing to be desired. (P. A. P.)

PAUSILIPO, or POSILLIPO. See NAPLES, vol. xvii. p. 127.

PAVIA, a city of Italy, the chief town of a province, and a bishop's see, is situated at a height of 270 feet above the sea-level, 22½ miles by rail south of Milan, on the left bank of the Ticino, about 2 miles above its junction with the Po. The railway from Milan to Genoa, which is there joined by lines from Cremona, &c., crosses the river on a fine bridge constructed in 1865; and, farther down, the city is connected with the suburban village of Ticino by a remarkable brick-built covered bridge dating from the 14th century. Though it has lost its importance as a fortified town, and no longer deserves the designation of "City of the Hundred Towers," Pavia is still for the most part surrounded by its ramparts, which in a circuit of about 3½ miles enclose an area of 400 acres. Several of its buildings are of great architectural interest. The basilica of San Michele is one of the finest specimens extant of the Lombard style (cf. ARCHITECTURE, vol. ii. p. 435), and as it was within its walls that the crown was placed on the head of the "kings of Italy," from whom the house of Savoy claims to be descended, it has received the legal title of Basilica Reale (royal decree of 1863). A careful restoration has since been effected. The cathedral of San Stefano, of which the first stone was laid by Bishop Ascanio Sforza in 1488, is still unfinished, the original design by Cristoforo Rocchi, a pupil of Bramante, consisting of a central octagon from which four arms projected so as to form a cross. In the interior is the tomb of St. Augustine, a remarkable specimen of 14th-century sculpture, which presents the saint life-size in pontifical robes, and is surrounded by a profusion of bas-reliefs and minor figures representing saints of his order, liberal arts, and cardinal virtues—in all, 420 heads. The relics which it enshrines are said to have been brought from Hippo to Sardinia by African refugees, purchased in 724 by Liutprand, and deposited in the now ruined church of San Pietro in Ciel d'Oro, and thence transferred to the cathedral subsequent to their rediscovery in 1695. Beneath the high altar is the tomb of Boetius, whose remains were also brought from San Pietro; and from the roof of the building is suspended the lance of Roland (Orlando).⁷ Of

⁷ The famous Certosa of Pavia, one of the most magnificent monasteries in the world, is not situated within the city, but at a distance of about 5 miles towards the north. Its founder, Gian Galeazzo Visconti (to whom we also owe the Milan cathedral), laid the first stone on 27th August 1396, and the building was nominally finished in 1542. A parallelogram, about 140 yards long by 110 broad, is surrounded on all sides by a lofty cloister formed of 123 arches. The church, whose marble façade is more richly decorated than any other in north Italy, is in the form of a Latin cross, 253 feet long by 177 feet wide, with three naves and a vast octagonal dome. In the south transept stands the mausoleum, in Carrara marble, of Gian Galeazzo Visconti, designed by Galeazzo Pellegrini in 1490; and in the north transept are the marble statues of Lodovico Sforza il Moro and his consort Beatrice by Cristoforo Solari. The Carthusian monks, to whom the monastery was entrusted from the first by its founder, were bound to employ a certain proportion of their annual revenue in prosecuting the work till its completion; and even after 1542 they voluntarily continued to expend large sums on further decoration. The Certosa of Pavia is thus a practical text-book of Italian art for well-nigh three centuries (see Durelli, *La Certosa di Pavia*, Milan, 1823; and Gruner's *Fresco Decorations*, 1854, and *Terra Cotta Architecture in North Italy*, 1867).

¹ x. (Phocica), 25-31. ² v. (Eliaca), 17-19. ³ 19, 2, p. 427.

⁴ Eliaca (II.), book vi., the later chapters of which give a very full description of Olympia and its buildings and statues.

⁵ vii. 5, 4. Here occurs one of the few faint expressions of pleasure or praise that the writer indulges in. "You would be pleased," he says, "also with the temple of Hercules at Erythrae, and that of Athena at Priene, the latter on account of the statue, the Heracleum for its antiquity." These remarks show that he had visited and knew something of the temples in Ionia. The tomb of Mausolus at Halicarnassus he mentions in terms approaching to praise, viii. 16, 4.

⁶ viii. (Arcadica), 18, 5.

secular edifices in Pavia the most noteworthy is the palace or castle of the Visconti, begun in 1360 for Galeazzo II. It is a vast quadrangle, presenting to the outside heavy fronts of massive masonry, but in the 15th and 16th centuries it was as remarkable for sumptuousness as for strength. Originally there was a square tower at each corner; two were destroyed by the French artillery in 1527.¹ The university of Pavia (formally constituted in 1361 by the emperor Charles IV., but claiming to have its first origin in a school founded by Charlemagne) has faculties of law, medicine, and science. The professors number between forty and fifty, but the students have decreased from 1475 in 1860 to 604 in 1881-82. Among its subsidiary establishments are two colleges—the Borromeo and the Ghislieri—founded respectively by Archbishop Borromeo (1563) and Pope Pius V. (1569) for the gratuitous maintenance of a certain number of poor students; a museum of natural history, instituted in 1772 under Spallanzani; a botanical garden, commenced in 1774; an agricultural garden, bestowed on the university by Napoleon in 1806; and the oldest anatomical cabinet in Italy. The university library was founded by Maria Theresa in 1754; the famous collection of books which Gian Galeazzo brought together by the aid of Petrarch was carried off to Blois by the French in 1500. The civil hospital of San Matteo is a large and flourishing institution, dating from 1449; like the Borromeo and Ghislieri colleges, it has large landed estates in the circondario. Comparatively few manufactures are prosecuted in Pavia, but there is considerable trade by water as well as by rail, barges being able to pass down the Po to the Adriatic and along the canal to Milan. The population of the city was 27,885 in 1871 and 27,792 in 1881, or, including the suburbs Ticino, Calvenzano, and Borgorato, 29,836; that of the commune was 29,618 in 1871 and 29,941 in 1881.

History.—Ticinum—it was not till the close of the 7th century that the city was called Papia or Pavia—was a place of some importance under the Roman empire, having, according to Pliny, been founded by two Gallic tribes at the time of the first Gallic immigration into Italy. It was at Ticinum that Augustus met the funeral procession of Drusus; and Claudius II. was first saluted emperor by the garrison in the city. Ravaged by Attila in 452 and by Odoacer in 476, Ticinum was, after 489, raised to much more than its former position by Theodoric the Goth, who restored its fortifications and made it the seat of a royal palace. From Theodoric's successors it was recovered for the Eastern empire by Narses; but the imperial garrison, after a siege of more than three years, was obliged by famine to surrender to the Lombards in 573, and Ticinum-Pavia became, as the capital of the Lombard kingdom, one of the leading cities of Italy. By the conquest of Pavia and the capture of Desiderius in 774 Charlemagne completely destroyed the Lombard supremacy; but the city continued to be the centre of the Carolingian power in Italy, and a royal residence was built in the neighbourhood (Corteolona on the Olona). It was in San Michele Maggiore in Pavia that Berengar of Friuli and his quasi-regal successors down to Berengar II. and Adalbert II. were crowned "kings of Italy." Under the reign of the first the city was sacked and burned by the Hungarians, and the bishop was among those who perished in the flames. At Pavia was celebrated in 951 the marriage of Otto I. and Adelheid (Adelaide), which exercised so important an influence on the relations of the empire and Italy; but, when the succession to the crown of Italy came to be disputed between the emperor Henry II. and Harduin of Ivrea, the city sided strongly with the latter. Laid in ruins by Henry, who was attacked by the citizens on the night after his coronation in 1004, it was none the less ready to close its gates on Conrad the Salic in 1026. The jealousy which had meanwhile been growing up between Pavia and Milan having in 1056 broken out into open war, Pavia in the long run had recourse to the hated emperors to aid her against her now more hated rival; and for the most part The Carthusians were expelled in 1782, and, after being held for a time by Cistercians (1784) and Carmelites (1798), the monastery was closed in 1810; but it was restored to the Carthusians in 1843, and was exempted from confiscation in 1866. The lead was all stripped from the roof in 1797 by order of the French Directory; but the building as a whole is still in excellent preservation.

¹ See Professor Magenta's monograph, *I Visconti e gli Sforza nel Castello di Pavia*, Milan, 1884, 2 vols., folio.

she remained, through all the broils and revolutions of the time, attached to the Ghibelline party till the latter part of the 14th century. From 1380, when Galeazzo was appointed imperial vicar by Charles IV., Pavia became practically a possession of the Visconti family, and in due course formed part of the duchy of Milan. For the success which attended its insurrection against the French garrison in 1499 it paid a terrible penalty in 1500, being both given over to pillage and forced to furnish a contribution of 50,000 gold crowns. Having been strongly fortified by Charles V., the city was in 1525 able to bid defiance to Francis I., who was so disastrously beaten in the vicinity; but two years later the French under Lautrec subjected it to a sack of seven days. In 1655 Prince Thomas of Savoy invested Pavia with an army of 20,000 Frenchmen, but had to withdraw after fifty-two days' siege. During the 18th century the city had its full share of the wars. The Austrians under Prince Eugene occupied it in 1706, the French in 1733, and the French and Spaniards in 1745; and the Austrians were again in possession from 1746 till 1796. In May of that year it was seized for the French republic by Napoleon, who, to punish it for an insurrection, condemned it to three hours' pillage. The revolutionary movement of February 1848 was crushed by the Austrians and the university was closed; and, though the Sardinian forces obtained possession in March, the Austrians soon recovered their ground. It was not till 1859 that Pavia passed with the rest of Lombardy to the Sardinian crown.

At several periods Pavia has been the centre of great intellectual activity. It was in a tower which, previous to 1584, stood near the church of Doll' Annunziata that Boetius wrote his *De Consolatione Philosophiæ*; the legal school of Pavia was rendered celebrated in the 11th century by Lanfranc (afterwards archbishop of Canterbury); Christopher Columbus studied at the university about 1447; and printing was introduced in 1471. Two of the bishops of Pavia have been raised to the papal throne as John XIV. and John III. Lanfranc, Pope John XIV., Porta the anatomist, and Cremona the mathematician were born in the city.

See Breventano, *Istoria di Pavia*, 1570; Marroni, *De ecclesia et episcopis papiensibus commentarius*, 1757; Capponi, *Mem. stor. di Pavia*, 1782; Carpanelli, *Compendio istorico delle cose pavesi*, 1817; and various monographs by the local antiquarians Magenta and Dell' Aequa.

PAVLOGRAD, a town of European Russia, at the head of a district in the government of Ekaterinoslaff, on the river Voltch'ya, 13 miles from its junction with the Samara (a tributary of the Dnieper), and a short distance to the left of the railway from Kharkoff to Sebastopol. It dates from the latter half of the 18th century, and was originally known as Luganskoe Selo. It was made a district town of Ekaterinoslaff in 1784. Its population increased from 8653 in 1865 to 11,400 in 1870; and it is the seat of three annual fairs, and has a large trade in cattle.

PAWNBROKING. See PLEDGE; also USURY AND USURY LAWS.

PAWTUCKET, a town of the United States, in Providence county, Rhode Island, 4 miles north-east of Providence by the Providence and Worcester Railroad, is situated on both sides of the navigable Pawtucket river (Blackstone river above the falls), which falls about 50 feet at this point, affording abundant water-power. At Pawtucket in 1790 Samuel Slater erected the first water-power cotton-factory in America. In the early part of the present century Pawtucket was the seat of shipbuilding and of considerable commerce. It is now a place with nearly 100 different industries, including the Conart Thread Works (employing over 2000 hands), large manufactories of cotton and woollen cloths, steam-engines, fire-engines, &c. The exports and imports amount to several million dollars annually. In 1862 Pawtucket, originally belonging to Massachusetts, became part of Rhode Island. The population in 1880 was 19,030, and in 1884 (estimated) about 23,000.

PAXO, or **PAXOS**, one of the IONIAN ISLANDS (*q.v.*), about 8 miles south of the southern extremity of Corfu, is a hilly mass of limestone 5 miles long by 2 broad, and not more than 600 feet high. Though it has only a single stream and a few springs, and the inhabitants were often obliged, before the Russians and English provided them with cisterns, to bring water from the mainland, Paxo is well clothed with olives, which produce oil of the very highest quality. Gaion (or, less correctly, Gaia), the principal village, lies on the east coast, and has a small har-

bour. Towards the centre, on an eminence, stands Papandi, the residence of the bishop of Paxo, and throughout the island are scattered a large number of churches, whose belfries add greatly to the picturesqueness of the views. On the west and south-west coasts are some extensive and remarkable caverns, of which an account will be found in Davy's *Ionian Islands*, vol. i. pp. 66-71. Ancient writers—Polybius, Pliny, &c.—do not mention Paxos by itself, but apply the plural form Paxi (Παξοί) to Paxos and the smaller island which is now known as Antipaxo (the Propaxos of the *Antonine Itinerary*). Compare PAN, p. 208 above.

PAXTON, SIR JOSEPH (1803-1865), architect and ornamental gardener, was born of humble parents at Milton Bryant, near Woburn, Bedfordshire, and was educated at the grammar-school of that town. Having served his apprenticeship as gardener, he obtained employment at Chiswick, the seat of the duke of Devonshire, and eventually became superintendent of the duke's gardens and grounds at Chatsworth, and manager of his Derbyshire estates. The design according to which he remodelled the gardens and grounds has awakened the general admiration of landscape gardeners; and he also built a grand conservatory, in which he introduced various improvements of great value in construction and arrangements. To this edifice there attaches a peculiar interest from the fact that it formed the model for the Great Exhibition building of 1851. The happy suggestion of Paxton solved a difficulty which threatened to render it impossible to hold the exhibition, and in recognition of his great services he received the honour of knighthood. On the formation of the Crystal Palace Company he was invited to prepare the design for the building at Sydenham, and was also appointed director of the gardens and grounds. Subsequently he received several commissions as an architect, his most important design being that for the mansion of Baron James de Rothschild at Ferrières in France. His versatility of invention was also shown by his organization of the Army Work Corps which served in the Crimea. In 1854 he was chosen M.P. for Coventry, which he continued to represent till his death, which occurred at his residence near the Crystal Palace, 8th June 1865. Paxton was elected in 1826 a Fellow of the Horticultural Society, in 1833 a Fellow of the Linnean Society, and in 1844 he was made a knight of the order of St Vladimir by the emperor of Russia. He is the author of several contributions to the literature of horticulture, including a *Practical Treatise on the Culture of the Dahlia* (1838) and a *Pocket Botanical Dictionary* (1st ed., 1840). He also edited the *Cottage Calendar*, the *Horticultural Register*, and the *Botanical Magazine*.

PAYMENT, in English law, is one of the modes of performance of an obligation, and consists in the discharge of a sum due in money or the equivalent of money. In order that payment may extinguish the obligation it is necessary that it should be made at a proper time and place, in a proper manner, and by and to a proper person. If the sum due be not paid at the appointed time, the creditor is entitled to sue the debtor at once, in spite of the readiness of the latter to pay at a later date, subject, in the case of bills and notes, to the allowance of days of grace. In the common case of sale of goods for ready money, a right to the goods vests at once upon sale in the purchaser, a right to the price in the seller; but the seller need not part with the goods till payment of the price.

Payment may be made at any time of the day upon which it falls due, except in the case of mercantile contracts, where the creditor is not bound to wait for payment beyond the usual hours of mercantile business. If no place be fixed for payment, the debtor is bound to find, or to use reasonable means to find, the creditor, unless the latter be

abroad. Payment must be made in money which is a legal tender (see below), unless the creditor waive his right to payment in money by accepting some other mode of payment, as a negotiable instrument or a transfer of credit. If the payment be by negotiable instrument, the instrument may operate either as an absolute or as a conditional discharge. In the ordinary case of payment by cheque the creditor accepts the cheque conditionally upon its being honoured; if it be dishonoured, he is remitted to his original rights. The creditor has a right to payment in full, and is not bound to accept part payment unless by special agreement. Part payment is sufficient to take the debt out of the Statute of Limitations. It is a technical rule of English law that payment of a smaller sum, even though accepted by the creditor in full satisfaction, is no defence to a subsequent action for the debt. The reason of this rule seems to be that there is no consideration for the creditor foregoing his right to full payment. In order that payment of a smaller sum may satisfy the debt, it must be made by a person other than the person originally liable, or at an earlier date, or at another place, or in another manner than the date, place, or manner contracted for. Thus a bill or note may be satisfied by money to a less amount, or a money debt by a bill or note to a less amount; a debt of £100 cannot be discharged by payment of £90 (unless the creditor execute a release under seal), though it may be discharged by payment of £10 before the day appointed, or by a bill for £10. Payment must in general be made by the debtor or his agent, or by a stranger to the contract with the assent of the debtor. If payment be made by a stranger without the assent of the debtor, it seems uncertain how far English law regards such payment as a satisfaction of the debt. If the debtor ratify the payment, it then undoubtedly becomes a satisfaction. Payment must be made to the creditor or his agent. A *bona fide* payment to an apparent agent may be good, though he has in fact no authority to receive it. Such payment will usually be good where the authority of the agent has been countermanded without notice to the debtor. The fact of payment may be presumed, as from lapse of time. Thus payment of a testator's debts is generally presumed after twenty years. A written receipt is only presumptive and not conclusive evidence of payment. If payment be made under a mistake of fact, it may be recovered, but it is otherwise if it be made under a mistake of law, for it is a maxim of law that *ignorantia legis neminem excusat*. Money paid under compulsion of law, even though not due, cannot generally be recovered where there has been no fraud or extortion.

Appropriation of Payments.—Where the creditor has two debts due to him from the same debtor on distinct accounts, the general law as to the appropriation of payments made by the debtor is that the debtor is entitled to apply the payments to such account as he thinks fit. *Solvitur in modum solventis*. In default of appropriation by the debtor the creditor is entitled to determine the application of the sums paid, and may appropriate them even to the discharge of debts barred by the Statute of Limitations. In default of appropriation by either debtor or creditor, the law implies an appropriation of the earlier payments to the earlier debts.

Payment into and out of Court.—Money is generally paid into court to abide the result of pending litigation, as in interpleader proceedings, or where litigation has already begun, as security for costs or as a defence or partial defence to a claim. Payment into court does not necessarily (except in actions for libel and slander) operate as an admission of liability. Money may sometimes be paid into court where no litigation is pending, as under the Trustee Relief Act, 1847. Payment of money out of court is obtained by the order of the court upon petition or summons or otherwise, or simply on the request or the written authority of the person entitled to it.

Payment of Wages.—By the "Truck Act," 1 and 2 Will. IV. c. 37 (which applies to Great Britain), the payment of wages to most kinds of labourers and workmen otherwise than in coin is prohibited. This Act does not apply to domestic or agricultural servants. The provisions of the Act are extended to the hosiery trade by 37

and 38 Vict. c. 48. Payment of wages in public-houses (except in the case of domestic servants) is illegal by the combined effect of 35 and 36 Vict. cc. 76 and 77, and 46 and 47 Vict. c. 31.

Tender.—This is payment duly proffered to a creditor, but rendered abortive by the act of the creditor. In order that a tender may be good in law it must as a rule be made under circumstances which would make it a good payment if accepted. The money tendered must be a legal tender, unless the creditor waive his right to a legal tender, as where he objects to the amount and not the mode of tender. Bank of England notes are legal tender for any sum above £5, except by the bank itself, 3 and 4 Will. IV. c. 98, s. 6. Gold is legal tender to any amount, silver up to 40s., bronze up to 1s., 33 and 34 Vict. c. 10. By 29 and 30 Vict. c. 65 the gold coinage of colonial mints may be made legal tender by proclamation. Under the powers of this Act the gold coinage of the Sydney mint has been declared to be legal tender. The effect of tender is not to discharge the debt, but to enable the debtor, when sued for the debt, to pay the money into court and to get judgment for the costs of his defence.

Scotland.—The law of Scotland as to payment agrees in most points with that of England. Where a debt is constituted by writ payment cannot be proved by witnesses; where it is not constituted by writ, payment to the amount of £100 Scots may be proved by witnesses; beyond that amount it can only be proved by writ or oath of party. The term tender seems to be strictly applied only to a judicial offer of a sum for damages and expenses made by the defender during litigation, not to an offer made by the debtor before litigation. Bank of England notes are not a legal tender in Scotland, 8 and 9 Vict. c. 38, s. 15, or in Ireland, 8 and 9 Vict. c. 37, s. 6.

United States.—In the United States the law as a rule does not materially differ from English law. In some States, however, money may be recovered, even when it has been paid under a mistake of law. The question of legal tender has been an important one. In 1862 Congress passed an Act making treasury notes legal tender. After much litigation, the Supreme Court of the United States finally decided in 1870 in favour of the constitutionality of this Act, both as to contracts made before and after it was passed (see 1 *Kent's Comm.*, p. 252). These notes are legal tender for all purposes except duties on imports and interest on the public debt. All gold coins, silver dollars, and silver coins below the value of a dollar coined before 1854 are legal tender to any amount. Silver coins below the value of a dollar of 1854 and subsequent years are legal tender for sums not exceeding five dollars. Silver three-cent pieces of the dates 1851 to 1853 are legal tender for sums not exceeding thirty cents, those of subsequent years for sums not exceeding five dollars. Cents and foreign coins are not legal tender. Postage currency is not legal tender for private debts (*Bouvier's Law Dict.*, "Legal Tender"). It falls exclusively within the jurisdiction of Congress to declare paper or copper money a legal tender. By the constitution of the United States, "no State . . . shall make anything but gold and silver coin a tender in payment of debts" (art. i. s. 10).

PAYSANDU, formerly **SAN BENITO**, a port and departmental town of Uruguay, is situated on the left bank of the river Uruguay in 32° 20' S. lat. and 58° 1' W. long., 270 miles by river from Montevideo, and 120 miles by road from Durazno, the present terminus of the railway. The long streets run east and west at right angles to the river, and the slope of the ground makes drainage easy. Paysandu has been a great battle-ground: in 1846, for instance, it was held by Oribe and bombarded by Rivera, and in 1865 it was captured by the Brazilians after a twenty-eight days' siege. But the name is best known in Europe for the ox-tongues, &c., preserved in its extensive *saladeros*. In 1868 the population was about 9000, and it has since considerably increased. Taking Paysandu to mean Father Sandú or Alexander, the inhabitants call themselves Sanduséros.

PAYTA, or **PAITA**, a town of Peru, in the province of Piura, with only 2390 inhabitants in 1876, but of importance as the northmost harbour of the Peruvian coast, the port of the city of Piura (San Miguel de), with which it is connected by rail, a regular calling-place for steamers, and a great rendezvous for whaling vessels. It consists of a single narrow street of reed and wattle houses, but there are a good harbour and an iron custom-house. The great drawback of the place used to be want of water, previous to the construction by the Government of an aqueduct from the Chira river. Straw hats, cattle, hides, and cotton are exported. Formerly a rich and flourishing place, Payta has never recovered from the effects of Lord Anson's

attack in 1741, when only two of its churches were spared. There is a raised beach at Payta 300 feet high; the slate and sandstone are covered by conglomerate sand and a gypsum formation containing shells of living species.

PAZ DE AYACUCHO, LA. See **LA PAZ**.

PEA (*Pisum*), a genus of *Leguminosæ*, consisting of herbs with compound pinnate leaves ending in tendrils, by means of which the weak stems are enabled to support themselves, and with large leafy stipules at the base. The flowers are typically "papilionaceous," with a "standard" or large petal above, two side petals or wings, and two front petals below forming the keel. The stamens are ten,—nine united, the tenth usually free or only slightly joined to the others. The ovary is prolonged into a long, thick, bent style, compressed from side to side at the tip and fringed with hairs. The fruit is a characteristic "legume" or pod, bursting when ripe into two valves, which bear the large globular seeds (peas) on their edges. These seeds are on short stalks, the upper extremity of which is dilated into a shallow cup or aril; the two cotyledons are thick and fleshy, with a radicle bent along their edges on one side. The genus is exceedingly close to *Lathyrus*, being only distinguished technically by the style, which in the latter genus is compressed from above downwards and not thick. It is not surprising, therefore, that under the general name "pea" species both of *Pisum* and of *Lathyrus* are included. The common field or grey pea with compressed mottled seeds and two to four leaflets is *Pisum arvense*, which is cultivated in all temperate parts of the globe, but which, according to the Italian botanists, is truly a native of central and southern Italy. The garden pea, *P. sativum*, is more tender than the preceding, and its origin is not known. It has not been found in a wild state anywhere, and it is considered that it may be a form of *P. arvense*, having, however, from four to six leaflets to each leaf and globular seeds of uniform colour.

P. sativum was known to Theophrastus; and De Candolle points out that the word "pison" or its equivalent occurs in the Albanian tongue as well as in Latin, whence he concludes that the pea was known to the Aryans, and was perhaps brought by them into Greece and Italy. Peas have been found in the Swiss lake-dwellings of the bronze period. The garden peas differ considerably in size, shape of pod, degree of productiveness, form and colour of seed, &c. The sugar peas are those in which the inner lining of the pod is very thin instead of being somewhat horny, so that the whole pod can be eaten. Unlike most papilionaceous plants, pea-flowers are perfectly fertile without the aid of insects, and thus do not intercross so freely as most similar plants do. On the other hand, a case is known wherein the pollen from a purple-podded pea applied to the stigma of one of the green-podded sugar peas produced a purple pod, showing that not only the ovule but even the ovary was affected by the cross. The numerous varieties of peas in cultivation have been obtained by cross-fertilization, but chiefly by selection. Peas constitute a highly nutritious article of diet from the large quantity of nitrogenous materials they contain in addition to starchy and saccharine matters.

The *Sweet Pea*, cultivated for the beauty and fragrance of its flowers, is not a true *Pisum*, but a species of *Lathyrus* (*L. odoratus*), a native of southern Europe. The *Chick Pea* (*Cicer arietinum*), not cultivated in England, is still farther removed from the true peas. The *Everlasting Pea* of gardens is a species of *Lathyrus*, with very deep fleshy roots, bold foliage, and beautiful but scentless flowers. *L. latifolius*, a British wild plant, is the source of most of the garden varieties.

PEABODY, a town of the United States, in Essex county, Massachusetts, 2 miles north-west of Salem. Incorporated as South Danvers in 1855, it adopted its present name in 1868 in honour of the philanthropist George Peabody, who was born in the township, and in 1852 erected there the Peabody Institute, which now contains various memorials of its founder, the portrait of herself presented by Queen Victoria, the Congress medal, &c. Peabody contains a large number of leather and morocco factories, and several glue-works, print-works, &c. Its inhabitants numbered 7343 in 1870 and 9028 in 1880.

PEABODY, GEORGE (1795-1869), philanthropist, was descended from an old yeoman family of Hertfordshire, England, named Pabody or Pebody, who, six generations before his birth, had emigrated to New England. He was born at Danvers (now Peabody), Massachusetts, 18th February 1795. The only regular education he received was at the district school, and when only eleven years of age he became apprentice at a grocery store. At the end of four years he became assistant to his brother, who kept a dry goods shop, and a year afterwards, on the shop being burned, to his uncle, who had a business in George Town, District of Columbia. After serving as a volunteer at Fort Warburton in the short war between Great Britain and the United States in 1812, he became partner with Elisha Riggs in a dry goods store, Riggs furnishing the capital, while Peabody had the practical management. As bagman he travelled through the western wilds of New York and Pennsylvania and the plantations of Maryland and Virginia. Through his energy and skill the business increased with astounding rapidity, and on the retirement of Riggs about 1830 Peabody found himself at the head of one of the largest mercantile concerns in the world. About 1837 he established himself in London as merchant and money-broker at Wanford Court, City, and in 1843 he withdrew from the concern in America. It is, however, as a sagacious and generous philanthropist that Peabody has made his name a household word. While holding aloof from the strife of politics in the United States, he was ready to give his native country the benefit of his business skill and the aid of his wealth in its financial difficulties. The number of his great benefactions to public objects is too great for bare mention here. It must suffice to name among the more important a gift of £25,000 for educational purposes at Danvers; of £100,000 to found and endow an institution for science in Baltimore, a sum afterwards increased by a second donation of £100,000; of various sums to Harvard University; and of £350,000 for the erection of dwelling-houses for the working-classes in London, which sum was increased by his will to half a million. If this last benefaction has failed to produce the good results anticipated, this has been due to causes for which Peabody was not responsible, and which do not at all detract from the wise beneficence of the gift. He received from the Queen the offer of a baronetcy, but declined it. In 1867 the United States Congress awarded him a special vote of thanks for his many large gifts to public institutions in America. He died at Eaton Square, London, 14th November 1869.

PEACH. By Bentham and Hooker the peach is included under the genus *Prunus* (*Prunus persica*), and its resemblance to the plum is indeed obvious; others have classed it with the almond, *Amygdalus*; while others again have considered it sufficiently distinct to constitute a genus of its own under the name *Persica*.

In general terms the peach may be said to be a medium-sized tree, with lanceolate, stipulate leaves, borne on long, slender, relatively unbranched shoots, and with the flowers arranged singly, or in groups of two or more, at intervals along the shoots. The flowers have a hollow tube at the base bearing at its free edge five sepals, an equal number of petals, usually concave or spoon-shaped, pink or white, and a great number of stamens. The pistil consists of a single carpel with its ovary, style, stigma, and solitary ovule or twin ovules. This carpel is, in the first instance, free within the flower-tube, but, as growth goes on, the flower-tube and the carpel become fused together into one mass, the flesh of the peach, the inner layers of the carpel becoming woody to form the stone, while the ovule ripens into the kernel or seed. This is exactly the structure of the plum or apricot, and differs from that of the almond,

which is identical in the first instance, only in the circumstance that the fleshy part of the latter eventually becomes dry and leathery and cracks open along a line called the suture.

The nectarine is a variation from the peach, mainly characterized by the circumstance that, while the skin of the ripe fruit is downy in the peach, it is shining and destitute of hairs in the nectarine. That there is no essential difference between the two is, however, shown by the facts that the seeds of the peach will produce nectarines, and *vice versa*, and that it is not very uncommon, though still exceptional, to see peaches and nectarines on the same branch, and fruits which combine in themselves the characteristics of both nectarines and peaches. The blossoms of the peach are formed the autumn previous to their expansion, and this fact, together with the peculiarities of their form and position, requires to be borne in mind by the gardener in his pruning and training operations, as mentioned in HORTICULTURE (vol. xii. pp. 272, 273). The only point of practical interest requiring mention here is the very singular fact attested by all peach-growers, that, while certain peaches are liable to the attacks of a parasitic fungus known as mildew, others are not, showing a difference in constitution analogous to that observed in the case of human beings, some of whom will readily succumb to particular diseases, while others seem proof against their attacks. In the case of the peach this peculiarity is in some way connected with the presence of small glandular outgrowths on the stalk, or at the base of the leaf. Some peaches have globular, others reniform glands, others none at all, and these latter trees are much more subject to mildew than are those provided with glands.

The history of the peach, almond, and nectarine is interesting and important as regards the question of the origin of species and the production and perpetuation of varieties. As to the origin of the peach two views are held, that of Alphonse de Candolle, who attributes all cultivated varieties to a distinct species, probably of Chinese origin, and that adopted by many naturalists, but more especially by Darwin, who looks upon the peach as a modification of the almond. The importance of the subject demands that a summary of the principal facts and inferences bearing on this question should be given. In the first place, the peach as we now know it has been nowhere recognized in the wild state. In the few instances where it is said to have been found wild the probabilities are that the tree was an escape from cultivation. Aitchison, however, gathered in the Házardarakht ravine in Afghanistan a form with different-shaped fruit from that of the almond, being larger and flatter. "The surface of the fruit," he observes, "resembles that of the peach in texture and colour; and the nut is quite distinct from that of 419 [the wild almond]. The whole shrub resembles more what one might consider a wild form of the peach than that of the almond." It is admitted, however, by all competent botanists that the almond is wild in the hotter and drier parts of the Mediterranean and Levantine regions. Aitchison also mentions the almond as wild in some parts of Afghanistan, where it is known to the natives as "bédám," the same word that they apply to the cultivated almond. The branches of the tree are carried by the priests in religious ceremonies. It is not known as a wild plant in China or Japan.

As to the nectarine, of its origin as a variation from the peach there is abundant evidence, as has already been mentioned; it is only requisite to add the very important fact that the seeds of the nectarine, even when that nectarine has been produced by bud-variation from a peach, will generally produce nectarines, or, as gardeners say, "come true."

Darwin brings together the records of several cases, not only of gradations between peaches and nectarines, but also of intermediate forms between the peach and the almond. So far as we know, however, no case has yet been recorded of a peach or a nectarine producing an almond, or *vice versa*, although if all have had a common origin such an event might be expected. Thus the botanical evidence seems to indicate that the wild almond is the source of cultivated almonds, peaches, and nectarines, and consequently that the peach was introduced from Asia Minor or Persia, whence the name *Persica* given to the peach; and Aitchison's discovery in Afghanistan of a form which reminded him of a wild peach lends additional force to this view.

On the other hand, Alphonse de Candolle, from philological and other considerations, considers the peach to be of Chinese origin.

The peach has not, it is true, been found wild in China, but it has been cultivated there from time immemorial; it has entered into the literature and folk-lore of the people; and it is designated by a distinct name, "to" or "tao," a word found in the writings of Confucius five centuries before Christ, and even in other writings dating from the 10th century before the Christian era. Though now cultivated in India, and almost wild in some parts of the north-west, and, as we have seen, probably also in Afghanistan, it has no Sanskrit name; it is not mentioned in the Hebrew text of the Scriptures, nor in the earliest Greek times. Xenophon makes no mention of the peach, though the Ten Thousand must have traversed the country where, according to some, the peach is native, but Theophrastus, a hundred years later, does speak of it as a Persian fruit, and De Candolle suggests that it might have been introduced into Greece by Alexander. According to his view, the seeds of the peach, cultivated for ages in China, might have been carried by the Chinese into Kashmir, Bokhara, and Persia between the period of the Sanskrit emigration and the Græco-Persian period. Once established, its cultivation would readily extend westward, or, on the other hand, by Cabul to north-western India, where its cultivation is not ancient. While the peach has been cultivated in China for thousands of years, the almond does not grow wild in that country, and its introduction is supposed not to go back farther than the Christian era.

On the whole, we should be inclined to attribute greater weight to the evidence from botanical sources than to that derived from philology, particularly since the discovery both of the wild almond and of a form like a wild peach in Afghanistan. It may, however, well be that both peach and almond are derived from some pre-existing and now extinct form whose descendants have spread over the whole geographic area mentioned; but of course this is a mere speculation, though indirect evidence in its support might be obtained from the nectarine, of which no mention is made in ancient literature, and which, as we have seen, originates from the peach and reproduces itself by seed, thus offering the characteristics of a species in the act of developing itself. (M. T. M.)

PEACOCK (the first syllable from the Latin *Pavo*, in Anglo-Saxon *Paue*, Dutch *Pauw*, German *Pfau*, French *Paon*), the bird so well known from the splendid plumage of the male, and as the proverbial personification of pride. A native of the Indian peninsula and Ceylon, in some parts of which it is very abundant, its domestication dates from times so remote that nothing can be positively stated on that score. Setting aside its importation to Palestine by Solomon (1 Kings x. 22; 2 Chron. ix. 21), its assignment in classical mythology as the favourite bird of Hera or Juno testifies to the early acquaintance the Greeks must have had with it; but, though it is mentioned by Aristophanes and other older writers, their knowledge of it was probably very slight until after the conquests of Alexander. Throughout all succeeding time, however, it has never very freely rendered itself to domestication, and, retaining much of its wild character, can hardly be accounted an inhabitant of the poultry-yard, but rather an ornamental denizen of the pleasure-ground or shrubbery; while, even in this condition, it is seldom kept in large numbers, for it has a bad reputation for doing mischief in gardens, it is not very prolific, and, though in earlier days highly esteemed for the table,¹ it is no longer considered the delicacy it was once thought.

As in most cases of domestic animals, pied or white varieties of the ordinary Peacock, *Pavo cristatus*, are not unfrequently to be seen; and, though lacking in proportion the gorgeous resplendence for which the common bird stands unsurpassed, they are valued as curiosities. Greater interest, however, attends what is known as the "japanned" Peacock, often erroneously named the Japanese or Japan Peacock, a form which has received the name of *P. nigripennis*, as though it were a distinct species. In this form the cock, besides other less conspicuous differences, has all the upper wing-coverts of a deep lustrous blue instead of being mottled with brown and white, while the hen is of a more or less greyish-white, deeply tinged

with dull yellowish-brown near the base of the neck and shoulders. It "breeds true"; but occasionally a presumably pure stock of birds of the usual coloration throws out one or more having the "japanned" plumage, leading to the conclusion that the latter may be due to "reversion to a primordial and otherwise extinct condition of the species"; and it is to be observed that the "japanned" male has in the coloration of the parts mentioned no little resemblance to that of the second indubitably good species, the *P. muticus* (or *P. spicifer* of some writers) of Burma and Java, though the character of the latter's crest—the feathers of which are barbed along their whole length instead of at the tip only—and its golden-green neck and breast furnish a ready means of distinction. The late Sir R. Heron was confident that the "japanned" breed had arisen in England within his memory,² and Darwin (*Anim. and Plants under Domestication*, i. pp. 290-292) was inclined to believe it only a variety; but its abrupt appearance, which rests on indisputable evidence, is most suggestive in the light that it may one day throw on the question

"Japanned" or "black-shouldered" Peafowls.

of evolution as exhibited in the origin of "species". It should be stated that the "japanned" bird is not known to exist anywhere as a wild race. The accompanying woodcut is copied from a plate drawn by Mr Wolf, given in Mr Elliot's *Monograph of the Phasianidae*.

The Peafowls belong to the group *Gallinae*, from the normal members of which they do not materially differ in structure; and, though by some systematists they are raised to the rank of a Family, *Pavonidae*, most are content to regard them as a Subfamily of *Phasianidae* (PHEASANT, *q.v.*). Akin to the genus *Pavo* is *Polyplectron*, of which the males are armed with two or more spurs on each leg, and near them is generally placed the genus *Argusianus*, containing the Argus-Pheasants, remarkable for their wonderfully ocellated plumage, and the extraordinary length of the secondary quills of their wings, as well as of the tail-feathers. It must always be remembered that the so-called "tail" of the Peacock is formed not by the rectrices or true tail-feathers, but by the singular development of the tail-coverts, a fact of which any one may be satisfied by looking at the bird when these magnificent plumes are erected and expanded in disk-like form as is his habit when displaying his beauty to his mates. (A. N.)

PEACOCK, GEORGE (1791-1858), mathematician, was born at Thornlon Hall, Denton, near Darlington, 9th April

² This is probably not the case. The present writer has a distinct recollection of having seen a bird of this form represented in an old Dutch picture, though when or where he cannot state.

¹ Classical authors contain many allusions to its high appreciation at the most sumptuous banquets; and mediæval bills of fare on state occasions nearly always include it. In the days of chivalry one of the most solemn oaths was taken "on the Peacock", which seems to have been served up garnished with its gaudy plumage.

1791. He was educated at Richmond, Yorkshire, and entered Trinity College, Cambridge, in 1809. He was second wrangler in the mathematical tripos of 1812 (Sir J. F. W. Herschel being senior), was elected fellow of his college in 1814, and became assistant tutor and lecturer in 1815, full tutor in 1823, and sole tutor of "his side" in 1835. Peacock distinguished himself by his business capacity, and by his broad views of the duties and functions of the educational institution in whose management he had so large a share.

Peacock was all his life an ardent educational reformer. While still an undergraduate he formed a league with Herschel, Babbage, and Maule to conduct the famous struggle of "d-ism *versus* dot-age," which ended in the introduction into Cambridge of the Continental notation ($\frac{dy}{dx}$) in the infinitesimal calculus to the exclusion of the fluxional notation (\dot{y}) of Newton. This was an important reform, not so much on account of the mere change of notation (for nowadays mathematicians follow Lagrange in using both these notations), but because it signified the opening to the mathematicians of Cambridge of the vast storehouse of Continental discoveries. Up to that time Cambridge mathematicians had been resting supinely under the shadow of Newton, despising the Continental methods, but doing nothing to demonstrate the power of their own. The analytical society thus formed in 1813 published various memoirs, and translated Lacroix's *Differential Calculus* in 1816. Peacock powerfully aided the movement by publishing in 1820 *A Collection of Examples of the Application of the Differential and Integral Calculus*, which remains a valuable text-book to this day. He also took a great interest in the general question of university education. In 1841 he published a pamphlet on the university statutes, in which he indicated the necessity for reform; and in 1850 and 1855 he was a member of the commission of inquiry relative to the university of Cambridge.

In 1837 he was appointed Lowndean professor of astronomy. In 1839 he took the degree of D.D., and the same year was appointed by Lord Melbourne to the deanery of Ely. Without in any way neglecting his university duties, Peacock threw himself with characteristic ardour into the duties of this new position. He improved the sanitation of Ely, published in 1840 *Observations on Plans for Cathedral Reform*, and carried out extensive works of restoration in his own cathedral. He was twice prolocutor of the lower house of convocation for the province of Canterbury.

This list by no means exhausts the sphere of Peacock's activity. He was a prime mover in the establishment of the Cambridge Astronomical Observatory, and in the founding of the Cambridge Philosophical Society. He was a fellow of the Royal, Royal Astronomical, Geological, and other scientific societies. In 1838, and again in 1843, he was one of the commissioners for standards of weights and measures; and he also furnished valuable information to the commissioners on decimal coinage, a matter in which he took great interest. He died on the 8th November 1858, before the university commission, in whose work he took so great an interest, had finished its labours.

It will excite little surprise that a man of so many occupations should have left more mark upon the men of his own day than upon the science of the succeeding generation. Although Peacock was most distinguished and will be longest remembered as a mathematician, it would be difficult to point to much work of his which is of importance at the present day. His original contributions to mathematical science were concerned chiefly with the philosophy of its first principles. He did good service in systematizing the operational laws of algebra, and in throwing light upon the nature and use of imaginaries. His work in this field was, however, thrown into the shade by the later and farther-reaching discoveries of Hamilton and Grassmann. Two great services he did for mathema-

tical education which deserve especial mention. He published, first in 1830, and then in an enlarged form in 1842, a *Treatise on Algebra*, in which he applied his philosophical ideas concerning algebraical analysis to the elucidation of its elements. This text-book was probably too far ahead of his age, for it does not seem to have come into very general use; at all events, it might with great advantage be studied by the teachers of elementary mathematics at the present day, and is very much superior in method and arrangement to any of the English text-books at present in vogue. The second great service was the publication in the *British Association Reports* for 1833 of his "Report on the Recent Progress and Present State of certain branches of Analysis." English mathematicians of this generation will doubtless find on reading this brilliant summary a good many dicta which they will call in question, and they will see a good deal of evidence that Peacock did not always fully appreciate, or perhaps always quite understand, the work of the foremost Continental mathematicians of his time; but they will be ready to condone these shortcomings when they remember that they were carried on the shoulders of Peacock and his "d-istic league" out of the mire into which English mathematics had fallen, and that it is but natural that they should catch a better view of the surrounding scenery than did their bearer. Whatever its defects may be, Peacock's report remains a work of permanent value, one of the first and one of the best of those valuable summaries of scientific progress which have enriched the annual volumes of the British Association, and which would have justified its existence had it done nothing else for the advancement of science.

PEACOCK, THOMAS LOVE (1785-1866), novelist and poet, was born at Weymouth, 18th October 1785. His father, a glass merchant in London, died soon after his son's birth, and young Peacock received his education at a private school at Englefield Green, where he distinguished himself by unusual precocity. After a brief experience of business he elected to devote himself to study and the pursuit of literature, living with his mother on their private means. His first books were poetical, *The Monks of St Mark* (1804), *Palmyra* (1806), *The Genius of the Thames* (1810), *The Philosophy of Melancholy* (1812),—works of no great merit. He also made several dramatic attempts, which did not find their way to the stage. He served for a short time as secretary to Sir Home Popham at Flushing, and paid several visits to Wales. In 1812 he became acquainted with Shelley, who made him his executor together with Lord Byron. In 1815 he evinced his peculiar power by writing *Headlong Hall*, the prototype of all his subsequent novels. It was published in 1816, and *Melincourt* followed in the ensuing year. During 1817 he lived at Great Marlow, enjoying the almost daily society of Shelley, and writing *Nightmare Abbey* and *Rhododaphne*, by far the best of his long poems. In 1819 he received the appointment of assistant examiner at the India House, at the same time as Mill and Strachey. Peacock's nomination appears to have been due to the influence of his old schoolfellow Peter Auber, secretary to the East India Company, and the papers he prepared as tests of his ability were returned to him with the high encomium, "Nothing superfluous and nothing wanting." This was characteristic of the whole of his intellectual work; and equally characteristic of the man was his marriage about this time to a Welsh lady, to whom he proposed by letter, not having seen her for eight years. His official duties greatly interfered with independent composition. *Maid Marian* nevertheless appeared in 1822, *The Misfortunes of Elphin* in 1829, and *Crotchet Castle* in 1831; and he would probably have written more but for the death in 1833 of his mother, to whom he was deeply attached. He also contributed to the *Westminster Review* and the *Examiner*. His services to the East India Company, outside the usual official routine, were considerable. He defended it successfully against the attacks of Mr J. S. Buckingham and the Liverpool salt interest, and made the subject of steam navigation to India peculiarly his own. He represented the company before the various parliamentary committees on this question; and in 1839 and 1840 superintended the construction of iron steamers,

which not only made the voyage round the Cape successfully, but proved very useful in the Chinese war. He also framed instructions for the Euphrates expedition, pronounced by General Chesney to be models of sagacity. In 1836 he succeeded Mill as chief examiner, and in 1856 he retired upon a pension. During his later years he contributed several papers to *Fraser's Magazine*, including reminiscences of Shelley. He also wrote in the same magazine his last novel, *Gryll Grange* (1860), inferior to his earlier writings in humour and vigour, but still a surprising effort for a man of his age. He died 23d January 1866 at Lower Halliford, near Chertsey, where, so far as his London occupations would allow him, he had resided for more than forty years.

Peacock's position in English literature is unique. There was nothing like his type of novel before his time; though there might have been if it had occurred to Swift to invent a story as a vehicle for the dialogue of his *Polite Conversation*. But, while Swift's interlocutors represent ordinary types, Peacock's are highly exceptional; while the humour of the former consists in their stereotyped conventionality or unconscious folly, the talk in Peacock's novels is brilliant; and, while Swift's characters utter proverbs, Peacock's are equipped from the author's own stores of humorous observation or reflexion. He speaks as well in his own person as through his puppets; and perhaps no writer since Pope has enriched English literature with such an abundance of quotable things. This pithy wit and sense, combined with remarkable grace and accuracy of natural description, atone for the primitive simplicity of plot and character. There is just enough of both to keep the story going, and the author's plan required no more. Of his seven fictions, *Nightmare Abbey* and *Crotchet Castle* are perhaps on the whole the best, the former displaying the most *vis comica* of situation, the latter the fullest maturity of intellectual power, and the most skilful grouping of the motley crowd of "perfectibilians, deteriorationists, statu-quo-ites, phrenologists, transcendentalists, political economists, theorists in all sciences, projectors in all arts, morbid visionaries, romantic enthusiasts, lovers of music, lovers of the picturesque, and lovers of good dinners," who constitute the *dramatis personæ* of that comedy in narrative, the Peacockian novel. *Maid Marian* and *The Misfortunes of Elphin* are hardly less entertaining, but are somewhat cramped by the absence of portraiture from the life and the necessity for historical colouring. Both contain descriptive passages of extraordinary beauty. *Melincourt* is a comparative failure, the excellent idea of an orang-outang mimicking humanity being insufficient as the sole groundwork of a novel. *Headlong Hall*, though more than foreshadowing the author's subsequent excellence, is marred by a certain bookish awkwardness characteristic of the recluse student, which reappears in *Gryll Grange* as the pedantry of an old-fashioned scholar, whose likes and dislikes have become inveterate and whose sceptical liberalism, always rather inspired by hatred of cant than enthusiasm for progress, has petrified into only too earnest conservatism. Pianos and perspective equally with competitive examinations and "panto-pragmatism" are the objects of the writer's distaste, and for the first time in his career we feel inclined to laugh at him, being no longer able to laugh with him. The book's quaint resolute paganism, however, is very refreshing in an age eaten up with introspection; it is the kindest of Peacock's writings, and contains the most beautiful of his poems, "Years Ago," the reminiscence of an early attachment. In general the ballads and songs interspersed through his tales are models of exact and melodious diction, and instinct with true feeling. His more ambitious poems are worth little, except *Rhododaphne*, attractive as a story and perfect as a

composition, but destitute of genuine poetical inspiration. His critical and miscellaneous writings are always interesting, especially the restorations of lost classical plays in the *Horæ Dramaticæ*, but the only one of great mark is the witty and crushing exposure in the *Westminster Review* of Moore's ignorance of the manners and belief he has ventured to portray in his *Epicurean*. Peacock resented the misrepresentation of his favourite sect, the good and ill of whose tenets were fairly represented in his own person. Somewhat sluggish and self-indulgent, incapable of enthusiasm or self-sacrifice, he yet possessed a deep undemonstrative kindness of nature; he could not bear to see any one near him unhappy or uncomfortable; and his sympathy, no less than his genial humour, gained him the attachment of children, dependants, and friends. His feelings were steady rather than acute; he retained throughout life with touching fidelity the memory of an early affection. In official life he was upright and conscientious; his judgment was shrewd and robust, and the quaint crotchets and prejudices which contrasted so curiously with his usual sagacity were in general the exaggeration of sound ideas held with undue exclusiveness. As a candidate for literary immortality he should be safe. The same causes which restrict his popularity ensure his permanence. His novels depend but slightly on temporary phases of manners, but are vitally associated with standard literature, and with general tendencies innate in the human mind. Neither his intellectual liberalism nor his constitutional conservatism will ever be out of date; and what Shelley justly termed "the lightness, strength, and chastity" of his diction secures him an honourable rank among those English writers whose claims to remembrance depend not only upon matter but upon style.

Peacock's works were collected, though not completely, and published in three volumes in 1875, at the expense of his friend and former protégé, Sir Henry Cole, with an excellent memoir by his grand-daughter Mrs Clarke, and a critical essay by Lord Houghton. Other criticisms have been written, by Mr Spedding in the *Edinburgh Review* and by James Hannay in the *North British Review*. For an interesting personal notice, see *A Poet's Sketch Book*, by R. W. Buchanan, 1884. (R. G.)

PEAR (*Pyrus communis*). The pear has essentially the same floral structure as the apple. In both cases the so-called fruit is composed of the flower-tube or upper end of the flower-stalk greatly dilated, and enclosing within its cellular flesh the five cartilaginous carpels which constitute the "core" and are really the true fruit. From the upper rim of the flower-tube or receptacle are given off the five sepals, the five petals, and the very numerous stamens. The form of the pear and of the apple respectively, although usually characteristic enough, is not by itself sufficient to distinguish them, for there are pears which cannot by form alone be distinguished from apples, and apples which cannot by superficial appearance be recognized from pears. The main distinction is the occurrence in the tissue of the fruit, or beneath the rind, of clusters of cells, filled with hard woody deposit in the case of the pear, constituting the "grit," while in the apple no such formation of woody cells takes place. The appearance of the tree—the bark, the foliage, the flowers—is, however, usually quite characteristic in the two species. Cultivated pears, whose number is enormous, are without doubt derived from one or two wild species widely distributed throughout Europe and western Asia, and sometimes forming part of the natural vegetation of the forests. In England, where the pear is sometimes considered wild, there is always the doubt that it may not really be so, but the produce of some seed of a cultivated tree deposited by birds or otherwise, which has degenerated into the wild spine-bearing tree known as *Pyrus communis*.

The cultivation of the pear extends to the remotest

antiquity. Traces of it have been found in the Swiss lake-dwellings; it is mentioned in the oldest Greek writings, and was cultivated by the Romans. The word "pear" or its equivalent occurs in all the Celtic languages, while in Slavonic and other dialects different appellations, but still referring to the same thing, are found,—a diversity and multiplicity of nomenclature which leads De Candolle to infer a very ancient cultivation of the tree from the shores of the Caspian to those of the Atlantic. A certain race of pears, with white down on the under surface of their leaves, is supposed to have originated from *P. nivalis*, and their fruit is chiefly used in France in the manufacture of PERRY (*q.v.*). Other small-fruited pears, distinguished by their precocity and apple-like fruit, may be referred to *P. cordata*, a species found wild in western France, and in Devonshire and Cornwall.

The late Professor Karl Koch considered that cultivated pears were the descendants of three species—*P. persica* (from which the bergamots have descended), *P. clæagrifolia*, and *P. sinensis*. DeCaisne, who made the subject one of critical study for a number of years, and not only investigated the wild forms, but carefully studied the peculiarities of the numerous varieties cultivated in the Jardin des Plantes, refers all cultivated pears to one species, the individuals of which have in course of time diverged in various directions, so as to form now six races:—(1) the Celtic, including *P. cordata*; (2) the Germanic, including *P. communis*, *P. Achras*, and *P. piraster*; (3) the Hellenic, including *P. parviflora*, *P. sinica*, and others; (4) the Pontic, including *P. clæagrifolia*; (5) the Indian, comprising *P. Paschæ*; and (6) the Mongolic, represented by *P. sinensis*. With reference to the Celtic race, *P. cordata*, it is interesting to note its connexion with Arthurian legend, and the Isle of Avalon or Isle of Apples. An island in Loch Awe has a Celtic legend containing the principal features of Arthurian story; but in this case the word is "berries" instead of "apples." Dr Phené visited Armorica (Brittany) with a view of investigating these matters, and brought thence fruits of a small berry-like pear, which were identified by the writer with the *Pyrus cordata* of western France, as well as with a tree which had then been recently discovered in some parts of Devonshire and Cornwall by Mr Briggs. (For cultivation of pears see HORTICULTURE, vol. xii. p. 274.)

PEARL. Pearls are calcareous concretions of peculiar lustre, produced by certain molluscs, and valued as objects of personal ornament. It is believed that most pearls are formed by the intrusion of some foreign substance between the mantle of the mollusc and its shell, which, becoming a source of irritation, determines the deposition of nacreous matter in concentric layers until the substance is completely encysted. The popular notion that the disturbing object is commonly a grain of sand seems untenable; according to Dr Gwyn Jeffreys and some other conchologists, it is in most cases a minute parasite; while Dr Kelaart has suggested that it may be the frustule of a diatom, or even one of the ova of the pearl-producing mollusc itself. The experience of pearl-fishers shows that those shells which are irregular in shape and stunted in growth, or which bear excrescences, or are honeycombed by boring parasites, are those most likely to yield pearls.

The substance of a pearl is essentially the same as that which lines the interior of many shells, and is known as "mother-of-pearl." Sir D. Brewster first showed that the iridescence of this substance was an optical phenomenon due to the interference of rays of light reflected from microscopic corrugations of the surface—an effect which may be imitated by artificial striations on a suitable medium. When the inner laminated portion of a nacreous shell is digested in acid the calcareous layers are dissolved away, leaving a very delicate membranous pellicle, which, as shown by Dr Carpenter, may retain the iridescence as long as it is undisturbed, but which loses it when pressed or stretched.

Although a large number of molluscs secrete MOTHER-OF-PEARL (*q.v.*), only a few of them yield true pearls. The finest, are obtained from the so-called "pearl oyster," the *Avicula* (*Meleagrina*) *margaritifera*, Linnaeus, while fresh-

water pearls are procured chiefly from the "pearl mussel," *Unio* (*Margaritana*) *margaritifera*, L.¹ These river-pearls are generally of dull leaden hue, and inferior in beauty to those of marine origin.

It is obvious that if a pearl presents a perfectly spherical form it must have remained loose in the substance of the muscles or other soft tissues of the mollusc. Frequently, however, the pearl becomes cemented to the interior of the shell, the point of attachment thus interfering with its symmetry. In this position it may receive successive nacreous deposits, which ultimately form a pearl of hemispherical shape, so that when cut from the shell it may be flat on one side and convex on the other, forming what jewellers know as a "perle bouton." In the course of growth the pearl may become involved in the general deposit of mother-of-pearl, and be ultimately buried in the substance of the shell. It has thus happened that fine pearls have occasionally been unexpectedly brought to light in cutting up mother-of-pearl in the workshop.

When a pearl oyster is attacked by a boring parasite the mollusc protects itself by depositing nacreous matter at the point of invasion, thus forming a hollow body of irregular shape known as a "blister pearl." Hollow warty pearl is sometimes termed in trade "coq de perle." Solid pearls of irregular form are often produced by deposition on rough objects, such as small fragments of wood, and these, and in fact all irregular-shaped pearls, are termed "perles baroques," or "barrok pearls." It appears that the Romans in the period of the Decline restricted the name *unio* to the globular pearl, and termed the baroque *margaritum*. It was fashionable in the 16th and 17th centuries to mount curiously-shaped baroques in gold and enamel so as to form ornamental objects of grotesque character. A valuable collection of such mounted pearls by Dinglinger is preserved in the Green vaults at Dresden.

A pearl of the first water should possess, in jewellers' language, a perfect "skin" and a fine "orient"; that is to say, it must be of delicate texture, free from speck or flaw, and of clear almost translucent white colour, with a subdued iridescent sheen. It should also be perfectly spherical, or, if not, of a symmetrical pear-shape. On removing the outer layer of a pearl the subjacent surface is generally dull, like a dead fish-eye, but it occasionally happens that a poor pearl encloses a "lively kernel," and may therefore be improved by careful peeling. The most perfect pearl in existence is said to be one, known as "La Pellegrina," in the museum of Zosima in Moscow; it is a perfectly globular Indian pearl of singular beauty, weighing 28 carats. The largest known pearl is one of irregular shape in Mr Beresford Hope's collection at the South Kensington museum. This magnificent pearl weighs 3 oz., has a circumference of 4½ inches, and is surmounted by an enamelled and jewelled gold crown, forming a pendant of great value.

Pearl Fisheries.—The ancients obtained their pearls chiefly from India and the Persian Gulf, but at the present time they are also procured from the Sulu seas, the coast of Australia, the shores of Central America, and some of the South Pacific islands. The ancient fisheries of Ceylon (Taprobane) are situated in the Gulf of Manaar, the fishing-

¹ *Meleagrina margaritifera*, L., belongs to the family *Aviculidae* of most zoologists, to the family *Aviculaceæ*, order *Monomya*, of article MOLLUSCA. *Meleagrina* is merely a sub-genus of *Avicula*. The animal which produces fresh-water pearls in Britain and other parts of Europe was named *Unio margaritifera* by Retzius in *Nova Gen. Test.*, and this is the name adopted by most modern zoologists; the animal was placed in a separate genus, *Margaritana*, by Schumacher for insufficient reasons. It belongs to the order *Isomya*, family *Unionaceæ*. The molluscs from which river-pearls are obtained in the United States and other parts of the world are mostly species of *Unio* or *Anodonta*. The above are all *Lamellibranchia*.

banks lying from 6 to 8 miles off the western shore, a little to the south of the isle of Manaar. The Tinnevely fishery is on the Madras side of the strait, near Tuticorin. These Indian fishing-grounds are under the control of Government inspectors, who regulate the fisheries, and permit fishing only when they consider the banks to be in a satisfactory condition. The oysters yield the best pearls at about four years of age. Fishing, when permitted, generally commences in the second week in March, and lasts for from four to six weeks, according to the season. The boats are grouped in fleets of from sixty to seventy, and start usually at midnight so as to reach the oyster-banks at sunrise. Each boat generally carries ten divers. On reaching the bank a signal-gun is fired, and diving commences. To facilitate the descent of the diver, a stone of granite weighing about 40 lb is attached to the cord by which he is let down. The divers work in pairs, one man diving while the other watches the signal-cord, drawing up the sink-stone first, then hauling up the baskets of oysters, and finally raising the diver himself. On an average the divers remain under water from fifty to eighty seconds, though some can endure a much longer submergence, and exceptional instances are cited of men remaining below for as long as six minutes. After resting for a minute or two at the surface, the diver descends again; and so on, until exhausted, when he comes on board and watches the rope, while his comrade relieves him as diver. Using neither diving dress nor bell, the native descends naked, carrying only a girdle for the support of the basket in which he places the pearl-oysters. In his submarine work the diver makes skilful use of his toes for prehensile purposes. To arm himself against the attacks of the sharks and other fishes which infest the Indian waters, he carries spikes of ironwood; and the genuine Indian diver never descends without the incantations of shark-charmers, one of whom accompanies the boat while others remain on shore. Not only is the diver exposed to the danger of attack by sharks, but his exciting calling, in a tropical climate, is necessarily exhausting, and as a rule he is a short-lived man.

The diving continues from sunrise to about noon, when a gun is fired, and the work stopped. On the arrival of the fleet at shore, the divers carry their oysters to a shed, where they are made up into four heaps, one of which is taken by the diver as his remuneration. The oysters are then sold by auction in lots of 1000 each. The pearls, after removal from the dead oysters, are "classed" by passing through a number of small brass cullenders, known as "baskets," the holes in the successive vessels being smaller and smaller. Having been sized in this way, they are sorted as to colour, weighed, and valued. (For the history and production of the Ceylon fishery, see CEYLON, vol. v. p. 364.)

Since the days of the Macedonians pearl-fishing has been carried on in the Persian Gulf. It is said that the oyster-beds extend along the entire Arabian coast of the gulf, but the most important are on sandbanks off the islands of Bahrein. According to Colonel Pelly's report in 1863, there were 1500 boats belonging to Bahrein alone, and the annual profit from the pearl-fishery was about £400,000. The chief centre of the trade is the port of Lingah. Most of the products of this fishery are known as "Bombay pearls," from the fact that many of the best are sold there. The shells usually present a dark colour about the edges, like that of "smoked pearl." The yellow-tinted pearls are sent chiefly to Bombay, while the whitest go to Baghdad. Very small pearls, much below a pea in size, are generally known as "seed-pearls," and these are valued in India and China as constituents of certain electuaries, while occasionally they are calcined for *chunam*, or

lime, used with betel as a masticatory. There is a small pearl-fishery near Kurrachee on the coast of Bombay.

From the time of the Ptolemies pearl-fishing has been prosecuted along the coast of the Red Sea, especially in the neighbourhood of Jiddah and Koseir. This fishery is now insignificant, but the Arabs still obtain from this district a quantity of mother-of-pearl shells, which are shipped from Alexandria, and come into the market as "Egyptians."

Very fine pearls are obtained from the Sulu Archipelago, on the north-east of Borneo. The mother-of-pearl shells from the Sulu seas are characterized by a yellow colour on the border and back, which unfits them for many ornamental purposes. Pearl-oysters are also abundant in the seas around the Aru Islands to the south-west of New Guinea. From Labuan a good many pearl-shells are occasionally sent to Singapore. They are also obtained from the neighbourhood of Timor, and from New Caledonia. The pearl-oyster occurs throughout the Pacific, mostly in the clear water of the lagoons within the atolls, though fine shells are also found in deep water outside the coral reefs. The Polynesian divers do not employ sink-stones, and the women are said to be more skilful than the men. They anoint their bodies with oil before diving. Fine pearl-shells are obtained from Navigators' Islands, the Society Islands, the Low Archipelago or Paumotu Isles, and the Gambier Islands. Many of the Gambier pearls present a bronzy tint.

Pearl-fishing is actively prosecuted along the western coast of Central America, especially in the Gulf of California, and to a less extent around the Pearl Islands in the Bay of Panama. These pearls are obtained from the *Meleagrina californica*, Cpr., and the mother-of-pearl shell is known in commerce as "Panama" or "bullock" shell. The fishing-grounds are in water about 40 feet deep, and the season lasts for four months. An ordinary fishing-party expects to obtain about three tons of shells per day, and it is estimated that one shell in a thousand contains a pearl. The pearls are shipped in barrels from San Francisco and Panama. Some pearls of rare beauty have been obtained from the Bay of Mulege, near Los Coyetes, in the Gulf of California; and in 1882 a pearl of 75 carats, the largest on record from this district, was found near La Paz in California. The coast of Guayaquil also yields pearls. Columbus found that pearl-fishing was carried on in his time in the Gulf of Mexico, and pearls are still obtained from the Caribbean Sea. These are produced chiefly by *Meleagrina squamulosa*, Lam.; and the mother-of-pearl shells are known as "blue-edged" or "black-lipped," these being less valuable than the "silver-lipped" shells of India. In the West Indies the best pearls are obtained from St Thomas and from the island of Margarita, off the coast of Venezuela. From Margarita Philip II. of Spain is said to have obtained in 1579 a famous pearl of 250 carats.

Of late years pearl-fishing has been started with considerable success in the Australian seas. Good pearls are found in Shark's Bay, on the coast of West Australia, especially in an inlet termed Useless Harbour. Mother-of-pearl shells are also fished at many other points along the western coast, between the 15th and 25th parallels of south latitude. An important pearl-fishery is also established in Torres Strait and on the coast of Queensland. The shells occur in water from four to six fathoms deep, and the divers are generally Malays and Papuans, though sometimes native Australians. On the western coast of Australia the pearl-shells are obtained by dredging rather than by diving. Quite recently (1884) pearl-shells have been found at Port Darwin. Pearls have also been found in Oakley Creek, New Zealand.

River-pearls are produced by the fresh-water mussels inhabiting

the mountain-streams of temperate climates in the northern hemisphere,—especially in Scotland, Wales, Ireland, Saxony, Bohemia, Bavaria, Lapland, and Canada. The pearls of Britain are mentioned by Tacitus and by Pliny, and a breastplate studded with British pearls was dedicated by Julius Cæsar to Venus Genetrix. As early as 1355 Scotch pearls are referred to in a statute of the goldsmiths of Paris; and in the reign of Charles II. the Scotch pearl trade was sufficiently important to attract the attention of parliament. Writing in 1705, John Spruel says, "I have dealt in pearls these forty years and more, and yet to this day I could never sell a necklace of fine Scots pearl in Scotland, nor yet fine pendants, the generality seeking for Oriental pearls, because farther fetched. At this very day I can show some of our own Scots pearl as fine, more hard and transparent, than any Oriental" (*An Account Current betwixt Scotland and England*, Edinburgh, 1705). The Scotch pearl-fishery, after having declined for years, was revived in 1860 by a German named Moritz Unger, who visited Scotland and bought up all the pearls he could find in the hands of the peasantry, thus leading to an eager search for more pearls the following season. It is estimated that in 1865 the produce of the season's fishing in the Scotch rivers was worth at least £12,000. This yield, however, was not maintained; the rivers were over-fished, and the industry was discouraged inasmuch as it tended to interfere with the salmon-fishery, and in some cases injured the banks of the streams. At the present time only a few pearls are obtained at irregular intervals by an occasional fisherman.

The principal rivers in Scotland which have yielded pearls are the Spey, the Tay, and the South Esk; and to a less extent the Doon, the Dee, the Don, the Ythan, the Teith, the Forth, and many other streams. In North Wales the Conway was at one time celebrated for its pearls; and it is related that Sir Richard Wynn, chamberlain to the queen of Charles II., presented her with a Conway pearl which is believed to occupy a place in the British crown. In Ireland the rivers of Donegal, Tyrone, and Wexford have yielded pearls. It is said that Sir John Hawkins the circumnavigator had a patent for pearl-fishing in the Irt in Cumberland. Although the pearl-fisheries of Britain are now neglected, it is otherwise with those of Germany. The most important of these are in the forest-streams of Bavaria, between Ratisbon and Passau. The Saxon fisheries are chiefly confined to the basin of the White Elster, and those of Bohemia to the Horazdowitz district of Wotawa. For more than two centuries the Saxon fisheries have been carefully regulated by inspectors, who examine the streams every spring, and determine where fishing is to be permitted. After a tract has been fished over, it is left to rest for ten or fifteen years. The fisher folk open the valves of the mussels with an iron instrument, and if they find no pearl restore the mussel to the water.

River-pearls are found in many parts of the United States, and have been systematically worked in the Little Miami river, Warren county, Ohio. The season extends from June to October. Japan produces freshwater pearls, found especially in the *Anodonta japonica*. But it is in China that the culture of the pearl-mussel is carried to the greatest perfection. The Chinese also obtain marine pearls, and use a large quantity of mother-of-pearl for decorative purposes. More than twenty-two centuries before our era pearls are enumerated as a tribute or tax in China; and they are mentioned as products of the western part of the empire in the *Rh'ya*, a dictionary compiled earlier than 1000 A.C. A process for promoting the artificial formation of pearls in the Chinese river-mussels was discovered by Ye-jin-yang, a native of Hoochow, in the 13th century; and this process is still extensively carried on near the city of Teh-ting, where it forms the staple industry of several villages, and is said to give employment to about 5000 people. Large numbers of the mussels are collected in May and June, and the valves of each are gently opened with a spatula to allow of the introduction of various foreign bodies, which are inserted by means of a forked bamboo stick. These "matrices" are generally pellets of prepared mud, but may be small bosses of bone, brass, or wood. After a number of these objects have been placed in convenient positions on one valve, the unfortunate mollusc is turned over and the operation is repeated on the other valve. The mussels are then placed in shallow ponds connected with the canals, and are nourished by tubs of night-soil being thrown in from time to time. After several months, in some cases two or three years, the mussels are removed, and the pearls which have formed over the matrices are cut from the shells, while the molluscs themselves serve as food. The matrix is generally extracted from the pearl and the cavity filled with white wax, the aperture being neatly sealed up so as to render the appearance of the pearl as perfect as possible. Millions of such pearls are annually sold at Soo-chow. The most curious of these Chinese pearls are those which present the form of small seated images of Buddha. The figures are cast in very thin lead, or stamped in tin, and are inserted as previously described. As many as twenty may sometimes be seen, ranged in parallel rows, in the valves of a single individual. Covered with nacreous matter, closely adherent to the shell, they have all the appearance of natural objects, and, exciting the wonder

of the ignorant, are prized as amulets. Specimens of these Buddha pearls in the British Museum are referred to the species *Dipsas plicata*. It should be mentioned that Linnæus, probably ignorant of what had long been practised in China, demonstrated the possibility of producing artificial pearls in the freshwater mussels of Sweden.

Pink pearls are occasionally found in the great conch or fountain shell of the West Indies, *Strombus gigas*, L.; but these, though much prized, are not nacreous, and their tint is apt to fade. They are also produced by the chank shell, *Turbinella scolumus*, L.¹ Yellowish-brown pearls, of little or no value, are yielded by the *Pinna squamosa*, and bad-coloured concretions are formed by the *Placuna placenta*.² Black pearls, which are very highly valued, are obtained chiefly from the pearl-oyster of the Gulf of Mexico.

Artificial pearls were first made in western Europe in 1680 by Jacquin, a rosary-maker in Paris, and the trade is now largely carried on in France, Germany, and Italy. Spheres of thin glass are filled with a preparation known as "essence d'orient," made from the silvery scales of the bleak or "ablette," which is caused to adhere to the inner wall of the globe, and the cavity is then filled with white wax. The scales are in some cases incorporated with celluloid. Many imitation pearls are now formed of an opaline glass of nacreous lustre, and the soft appearance of the pearl obtained by the judicious use of hydrofluoric acid. An excellent substitute for black pearl is found in the so-called "ironstone jewellery," and consists of close-grained hæmatite, not too highly polished; but the great density of the hæmatite immediately destroys the illusion. Pink pearls are imitated by turning small spheres out of the rosy part of the conch shell, or even out of pink coral.

Le Beck, "Pearl Fishery in the Gulf of Manar," in *Asiatic Researches*, v., 1798, p. 393; T. Von Hessler, *Die Perlmuschel und ihre Perlen* (Leipsic, 1859); K. Möbius, *Die echten Perlen* (Hamburg, 1857). (F. W. R.)

PEARSON, JOHN (1612-1686), a learned English bishop, was born at Great Snoring in the county of Norfolk, on the 28th of February 1612. After attending Eton, he entered Queens' College, Cambridge, 10th June 1631, and was elected a scholar of King's in April following and a fellow in 1634. Entering holy orders in 1639, he was collated to the prebend of Nether-Avon, in the church of Sarum. In 1640 he was appointed chaplain to the lord-keeper Finch, by whom he was presented to the living of Thorington in Suffolk during the same year. In 1650 he was made preacher of St Clement's, Eastcheap, in London. Seven years later he and Peter Gunning had a dispute with two Roman Catholics upon the subject of schism, a one-sided account of which was printed at Paris by one of the Roman Catholic disputants, under the title *Schism Unmasked*, 1658. In 1659 Pearson published at London his celebrated *Exposition of the Creed*,¹ dedicated to his parishioners of St Clement's, Eastcheap, to whom the substance of that now standard work had been preached several years before, and by whom he had been desired to make it public. The same year he likewise published the *Golden Remains of the ever-memorable Mr John Hales of Eton*, to which he prefixed a preface containing a character of that eminent man, with whom he had been acquainted for many years, drawn up with great elegance and force. Pearson had also a principal share in the editing of the *Critici Sacri*, first published in 1660. Soon after the Restoration he was presented by Juxon, then bishop of London, to the rectory of St Christopher's in that city; and he was also in 1660 created doctor of divinity at Cambridge, in pursuance of the king's letters mandatory, installed prebendary of Ely, archdeacon of Surrey, and made master of Jesus College, Cambridge. In 1661 he was appointed Lady Margaret professor of divinity

¹ *Strombus gigas*, L., is a Gastropod belonging to the family *Strombidae*, of the order *Azygobranchia*. *Turbinella scolumus*, Lam., is a Gastropod belonging to the family *Muricidae*, of the same order.

² *Placuna placenta*, L., belongs to the family *Ostreidae* of the mollusks (family *Ostracea* of article MOLLUSCA); it is found on the shores of North Australia. *Pinna squamosa*, Gmelin, belongs to the *Mytilidae* (the *Mytilaceæ* of article MOLLUSCA); it occurs in the Mediterranean. Both are Lamellibranchs.

in that university; and on the first day of the ensuing year he was nominated one of the commissioners for the review of the liturgy in the conference held at the Savoy. On the 14th of April 1662 he was elected master of Trinity College, Cambridge, and in August resigned his rectory of St Christopher's and his prebend of Ely. In 1667 he was admitted a Fellow of the Royal Society. In 1672 he published at Cambridge *Vindiciæ Epistolæ S. Ignatii, in 4to*, in answer to Daillé, to which is subjoined *Isaacii Vossii Epistolæ duæ adversus Davidem Blondellum*. Upon the death of Dr. Wilkins in 1672, Pearson was appointed his successor in the see of Chester. In 1682 his *Annales Cyprianici* were published at Oxford, with Fell's edition of that father's works. Pearson was disabled from all public service by ill health a considerable time before his death at Chester on the 16th of July 1686. His last work, the *Two Dissertations on the Succession and Times of the First Bishops of Rome*, formed the principal part of his *Opera Posthuma*, edited by Henry Dodwell in 1688.

See the memoir in *Biographia Britannica*, and another by Edward Churton prefixed to the edition of Pearson's *Minor Theological Works*, 2 vols., Oxford, 1844.

PECCARY. Under this name are included two species of small pig-like animals forming the genus *Dicotyles* of Cuvier, belonging to the section *Suina* of the Artiodactyle Ungulates (see MAMMALIA, vol. xv. p. 430). They are peculiar to the New World, and in it are the only surviving members of the large group now represented in the Old World by the various species of swine, babirussas, wart-hogs, and hippopotami.

The teeth of the peccaries differ from those of the true pigs (genus *Sus*) numerically, in wanting the upper outer incisor and the anterior premolar on each side of each jaw, the dental formula being $i \frac{2}{3}, c \frac{1}{1}, p \frac{3}{3}, m \frac{3}{3}$, total 38. The upper canines have their points directed downwards, not outwards or upwards as in the boars, and they are very sharp, with cutting hinder edges; and completely covered with enamel until worn. The lower canines are large and directed upwards and outwards, and slightly curved backwards. The premolar and molar teeth form a continuous series, gradually increasing in size from the first to the last. The true molars have square quadricuspidate crowns. The stomach is much more complex than in the true pigs, almost approaching that of a ruminant. In the feet the two middle (third and fourth) metapodial bones, which are completely separate in the pigs, are united at their upper ends, as in the ruminants. On the fore foot the two (second and fifth) outer toes are equally developed as in pigs, but on the hind foot, although the inner (or second) is present, the outer or fifth toe is entirely wanting, giving an unsymmetrical appearance of the member, very unusual in Artiodactyles. As in all other existing Ungulates, there is no trace of a first digit (pollex or hallux) on either foot. As in the pigs, the snout is truncated, and the nostrils are situated in its flat, expanded, disk-like termination. The ears are rather small, ovate, and erect; and there is no external appearance of a tail. The surface is well covered with thick bristly hair, and rather behind the middle of the back is a large and peculiar gland, which secretes an oleaginous substance with a powerful musky odour. This was mistaken by the old travellers for a second navel, a popular error which suggested to Cuvier the name of *Dicotyles*. When the animal is killed for food, it is necessary speedily to remove this gland, otherwise it will taint the whole flesh so as to render it uneatable.

There are two species, so nearly allied that they will breed together freely in captivity. Unlike the true pigs, they never appear to produce more than two young ones at a birth.

The collared peccary (*D. tajacu*, Linn., *torquatus*, Cuvier) ranges from the Red river of Arkansas through the forest

Peccary.

districts of Central and South America as far as the Rio Negro of Patagonia. Generally it is found singly or in pairs, or at most in small herds of from eight to ten, and is a comparatively harmless creature, not being inclined to attack other animals or human beings. Its colour is dark grey, with a white or whitish band passing across the chest from shoulder to shoulder. The length of the head and body is about 36 inches. The white-lipped peccary or warree (*D. labiatus*, Cuvier) is rather larger, being about 40 inches in length, of a blackish colour, with the lips and lower jaw white. Its range is less extensive, it is not found farther north than British Honduras or south of Paraguay. It is generally met with in large droves of from fifty to a hundred or more individuals, and is of a more pugnacious disposition than the former species, and capable of inflicting severe wounds with its sharp tusks. A hunter who encounters a herd of them in a forest has often to climb a tree as his only chance of safety. Both species are omnivorous, living on roots, fallen fruits, worms, and carrion; and when they approach the neighbourhood of villages and cultivated lands they often inflict great devastation upon the crops of the inhabitants.

Fossil remains of extinct species of peccaries of the Pleistocene period have been found in the caves of Brazil, and also as far north as Virginia and South Carolina. They have also been traced backwards in time, with apparently little modification of structure, to the Upper Miocene formations of Oregon.

PECS. See FUNFKIRCHEN, vol. ix. p. 827.

PEDOMETER is an apparatus in the form of a watch, which, carried on the person of a traveller, indicates the number of paces made, and thereby approximately the distance travelled. The ordinary form has a dial-plate with chapters for yards and miles respectively, but in some, miles and their fractions only are indicated, while others are divided for kilometres, &c. The registration is effected by the fall of a heavy pendulum, caused by the percussion of each step. The pendulum is forced back to a horizontal position by a delicate spring, and with each stroke a fine-toothed ratchet-wheel attached to it is moved round a certain length. The ratchet communicates with a train of wheels which govern the dial-hands. In using the apparatus a measured mile or other known distance is walked, and the indication thereby made on the dial-plate observed. According as it is too great or too small, the stroke of the pendulum is shortened or lengthened by a screw which correspondingly affects the ratchet motion

and thereby regulates the indication to the average pace. Obviously the pedometer is little better than an ingenious toy, depending even for rough measurements on the uniformity of pace maintained throughout the journey measured.

PEDRO (PETER), the name borne by several sovereigns of Aragon, Castile, and Portugal. Three of them were contemporaries, and, to add to the confusion to which this has given rise, each of them was the son and successor of an Alphonso.

Aragon.—**PEDRO IV.** (1317-1387), surnamed "the Ceremonious," succeeded his father Alfonso IV. in 1336, placing the crown upon his own head at Saragossa to make it quite plain that he did not hold of the pope. In 1344 he deposed his brother-in-law Jayme from the throne of Majorca, and again made the Balearic Isles, Cerdagne, and Roussillon directly subject to the crown of Aragon. In 1346 jealousy of his brother Jayme led him to alter the succession in favour of his daughters, but two powerful unions or leagues in Aragon and Valencia compelled him in the following year anew to recognize the legitimate heir-presumptive. The victory of Epila, however, in 1348 enabled him to triumph over his factious nobles and to cancel the privileges they had extorted from him. In 1351 Pedro, desiring to strengthen his precarious hold upon the island of Sardinia, entered into an alliance with Venice, and began hostilities against Genoa, which, carried on at intervals for many years, were definitively terminated only by his successor. In 1356 a breach of neutrality by some Catalan ships at San Lucar led to a war with the king of Castile, which was carried on with occasional suspensions until 1375, when the infanta Leonora of Aragon was married to Don Juan (afterwards John I.) of Castile. In 1377 Pedro succeeded in reconquering Sicily after the death of Frederick III., but, to avoid the threatened interdict of Urban VI., he ceded the island to Martin, his grandson, retaining the suzerainty only. In 1382 he sent troops to Greece to seize, on his behalf, the duchy of Athens. Pedro died at Barcelona on 5th January 1387, and was succeeded by his son John I. He left a curious history of his reign, written in Catalan, which has been printed by Carbonell in his *Chroniques de Espanya* (1547).

Three other kings of Aragon bore this name. **PEDRO I.** succeeded his father Sancho Ramirez on the throne of Aragon and Navarre in 1094, and died in 1104. The leading event of his reign was the conquest of Huesca (1096). **PEDRO II.** (1174-1213) succeeded his father Alphonso II. in 1196. In November 1204 he was crowned in St Peter's, Rome, by Innocent III., in return for which honour he declared his kingdom feudatory of the Roman see and promised an annual tribute, not, however, without a strong protest on the part of his subjects, whose hostile demonstrations in the following year he had difficulty in repressing. In 1209 he purchased peace with Sancho VII. of Navarre, and in 1212 he, along with that sovereign, gave valuable help to Alphonso of Castile in securing the splendid victory over the Arabs at Navas de Tolosa. In the following year, having taken up arms on behalf of his brother-in-law, Count Raymond of Toulouse, he was slain in the disastrous battle of Muret (12th September 1213). He was succeeded by his only son, Jayme I., "el Conquistador." **PEDRO III.** (1236-1285), son of Jayme I. and grandson of Pedro II., succeeded to the crowns of Aragon, Catalonia, and Valencia in 1276. In 1262 he had married Constance, daughter of Manfred, king of the Sicilies, and on the strength of this alliance he took advantage of the Sicilian Vespers to lay claim to the kingdom of Sicily. This involved him in a ruinous war, in the course of which his dissatisfied subjects united to assert their ancient "fueros" or privileges, exacting from him at Saragossa in 1283 the "Privilegio General," which in spirit and import may be compared to the English Great Charter. Charles of Valois, invested by the pope with the crown of Aragon, sought to invade the kingdom, but was repulsed both by land and sea. Charles's death in 1285, which terminated the war, was followed by that of Pedro in the same year.

Castile and Leon.—**PEDRO I.** (1333-1369), commonly surnamed "the Cruel," but sometimes referred to as "the Justiciary," was the only legitimate son of Alphonso XI., and was born at Burgos on 30th August 1333. When

raised to the throne at Seville by his father's premature death before Gibraltar (29th March 1350), Pedro was a mere lad, with exceptionally small experience of courts and camps, having lived in comparative retirement along with his mother, Doña Maria of Portugal, in the Andalusian capital, while his illegitimate brothers, the children of Leonora de Guzman, the eldest of whom were Don Enrique (Henry), count of Trastamara, and Don Fadrique (Frederick), grandmaster of Santiago, had remained beside Alphonso, and had accompanied him on his warlike expeditions. At the beginning of his reign he was thus, almost of necessity, compelled to abandon the conduct of affairs to more experienced hands; by the skilful policy, accordingly, of the powerful and ambitious Juan Alonso de Alburquerque, who had been his father's chancellor and prime minister, his many enemies and rivals were, for a time at least, successfully kept at bay. The king, however, soon began to assert his independence; whereupon the minister, remembering how helpful a royal mistress had been for the furtherance of his own ends during the preceding reign, did not scruple to encourage Pedro's passion for the young, well-born, and beautiful Maria de Padilla, even after his marriage with Blanche de Bourbon had been arranged. His experiment proved a disastrous one, and not least so to himself. The influence of Maria and of her relations, which rapidly became great, was soon turned against the too politic Alburquerque; and, as a first step towards his dismissal from power, they succeeded in making him seem less indispensable by effecting a superficial reconciliation between the king and his brothers. Then, on the minister's remonstrating against the conduct of Pedro in deserting Blanche for his mistress almost immediately after his marriage at Valladolid in June 1354, a complete change of administration took place, and Alburquerque retired to his estates. Shortly afterwards he was joined by the king's brothers Enrique and Fadrique in raising the standard of revolt in Castile; in this formidable movement they were speedily joined by Pedro's cousins, the infantes of Aragon, as well as by increasing numbers of the ricos hombres and caballeros of the kingdom, and by several of the towns, their grievances being his repudiation of Blanche, his deposition of Alburquerque, and the murder of Juan Nuñez de Prado, the master of Calatrava for which he was believed to be responsible. The cortes of Toro accordingly asked him to take back his queen and dismiss the Padillas, and so general was the national feeling in this matter that even his own mother deserted his cause, and on his giving evasive replies he found himself before the end of the year practically stripped of all his real authority, surrounded by officials of his enemies' choosing, and virtually a prisoner in their hands. He succeeded, however, in making his escape from Toro to Segovia with a handful of followers in the following year, and the divergence of interest that soon arose to separate the Aragonese princes from the bastard sons of Alphonso XI. so wrought in his favour that he was soon able (1356) to recover all the authority he had ever had, and to secure at least a transitory peace by the policy of reckless assassination which years previously he had inaugurated while Alburquerque was still his minister, and which he brought to a climax in the cold-blooded murder of his brother Don Fadrique at Seville in 1358, the tragedy to which he is said to have been specially incited for his unenviable surname. In 1356 he already found himself strong enough to enter upon a war with his namesake Pedro IV. of Aragon, and, with inconsiderable intervals of truce brought about through the intervention of the papal legate, he continued to carry it on for several years. In 1365 he was still campaigning beyond the borders of his kingdom when Castile was invaded by the "free companies" of French and English troops under Du Guesclin and

Calverley on behalf of Don Enrique, whose cause had now been espoused by France. He returned only to find himself practically unthroned, and towards the close of 1366 he sailed from Coruña for Guienne almost unaccompanied, save by his three daughters, but taking with him a considerable quantity of money and jewels. He was befriended in his exile by the Black Prince, and by liberal promises obtained his alliance and assurances of material help; the English troops accordingly crossed the Pyrenees in the following spring, and, by the bloody victory of Najera or Navarrete near Logroño (13th April 1367), once more restored him to his kingdom. Pedro, however, was unwilling or unable to implement the bargain he had made, and by his arrogant demeanour soon alienated his chivalrous ally; before the close of the year Don Enrique had again begun to collect his forces, while the Black Prince, injured and indignant, turned his face homewards. A final battle between Pedro and his brother took place at Montiel (13th March 1369), with the result that the former was driven for shelter into the fortress. Ten days afterwards he was induced to visit the camp of Enrique by illusory hopes of a favourable treaty through Du Guesclin; the brothers, who had not seen each other for fifteen years, met for the last time; angry words passed between them, soon they came to blows, and in the desperate struggle that ensued Don Pedro met his death. Pedro was in no way remarkable either as a soldier or as a ruler of men, and his character, so odious in the one feature expressed by his only too well deserved surname, presents singularly few redeeming traits; it is not even picturesque. The best that can be alleged by way of apology for him and excuse for his barren reign is the untowardness of the circumstances of his birth, education, and accession. To a narrow and uncultivated mind like his "the tyrant's plea" could hardly ever have appealed with greater plausibility. It is significant, however, that in Spain itself there are two nearly opposite points of view from which Pedro appears not as "el Cruel" but as "el Justiciero." On the one hand, the common people of Andalusia among whom he lived, the Jews whose commerce he encouraged, the Moors whom his very want of religion enabled him to tolerate, have helped to keep alive the tradition of the substantial if occasionally capricious and whimsical justice he often delighted personally to administer. The other point of view is that of such monarchs as Isabella "la Católica" and Philip II., who could not but be grateful to him for all he had done to weaken the power of the nobles of Castile.

The chief source for the incidents of the reign of Don Pedro is the *Chronicles of Castile*, by Pero Lopez de Ayala, of which there are two redactions known as the *Vulgar* and the *Abreviada*. These form the basis of Prosper Mérimée's *Histoire de Don Pedro, Premier Roi de Castille* (1848; 2d ed. 1865; Eng. trans., anon., 1849).

Portugal.—PEDRO I. (1320-1367) was the son of Alfonso IV. and Beatrice of Castile, and in 1339 married Constance, daughter of the duke of Peñafiel and marquis of Villena. The story of his passion for Inez de Castro, of his supposed marriage with her, of her cruel murder in 1355, and of the exhumation and coronation of her dead body has been told elsewhere (see vol. v. p. 202). He succeeded to the throne in 1357 and died in 1367, after a peaceful and comparatively uneventful reign of ten years.

For other sovereigns bearing this name see BRAZIL and PORTUGAL.

PEEBLES, a midland county of Scotland, is bounded N. and N.E. by Midlothian, E. and S.E. by Selkirk, S. by Dumfries, and W. by Lanark. Its outline is somewhat irregular, the greatest length from north to south being about 30 miles, the greatest breadth about 20, and the smallest about 10. The area is 226,899 acres, or about 355 square miles.

From the fact that the county lies within the upper valley of the Tweed, it is sometimes known as Tweeddale. The surface consists of a succession of hills broken by the vale of the Tweed, which in some parts attains considerable breadth, but by the narrow valleys forming the courses of numerous "waters" and smaller streams. The lowest point above sea-level is about 450 feet, but the hills generally vary in height from 900 to 1500 feet, while several attain an altitude considerably over 2000 feet. The highest summits are Broad Law (2754 feet), Cramalt Craig (2723 feet), and Dollar Law (2680 feet). The hills for the most part are rounded in form. The scenery is thus generally devoid of very striking or picturesque features, and its quiet pastoral character has a pleasing effect, while the exuberant plantations which clothe the sides and summits of the hills in the neighbourhood of the Tweed, with the well-cultivated fields adjoining its banks, lend to this district an aspect of rich luxuriance.

The Tweed has its source in a small fountain named Tweed's Well at the base of a hill on the south-western border called Tweed's Cross, from the farther side of which flow the Annan and the Clyde. It rises about 1300 feet above sea-level, and, with waters of sparkling clearness and purity, justly entitling it to the name of the "silver Tweed," flows with rapid course north-eastwards to the town of Peebles, receiving continual accessions from mountain streamlets, the principal being the Biggar Water from the west at Drumelzier, the Lyne from the north-west at Lyne, the Manor Water from the south near Edderston, and the Eddlestone Water from the north at Peebles. After passing Peebles the river bends in a more easterly direction, receiving, before it leaves the county, the Quair Water from the south and the Leithen from the north: The Megget Water flows eastwards into St Mary's Loch, which forms, for a very short distance, the south-eastern boundary of the county with Selkirkshire. The Medwin Water separates a portion of the south-western boundary of Linton parish from Lanarkshire. Peebles is, perhaps, more resorted to by anglers than any other county in Scotland, and it would be difficult to find anywhere else in the kingdom, within an equal area, so many streams and rivers affording such good sport and so unhampered by restrictions. Apart from St Mary's Loch, on the borders of the county, there are no sheets of water of much extent.

Geology.—Peeblesshire is included in the Silurian tableland of southern Scotland, and consists chiefly of Upper Silurian rocks, having generally a north-western dip. The strata have been thrown into great flexures by volcanic action, and are frequently mingled with igneous rocks, such as trap, felspar, and porphyry. In the valley of the Tweed, where there is a great anticlinal flexure, slates with thin beds of anthracite are found, and also limestone. In a slate-quarry near Traquair graptolites, trilobites, and shells are met with, but nowhere else in the county have fossils been discovered. There are evidences of glacial action in the rounded forms of the hills, the frequent groovings along their flanks, and the large number of striated boulders. In the northern part of the county, in the parishes of Linton and Newlands, the Silurian rocks dip beneath the Carboniferous strata of the West of Scotland coal-field. In Peeblesshire the strata consist of sandstone and coal-beds. Ironstone is also found, and lead-ore occurs in thin beds near the Leithen. Limestone and marl are abundant, and at Stobo there is a quarry of excellent blue slate.

Climate, Soil, and Agriculture.—In the uplands the climate, though colder than that of the Lothians, is generally pure and dry, and remarkably healthy. The average rainfall is about 29 inches. On the summits and slopes of

the hills frequent showers occur when it is quite fair in the valleys. The reflexion of the "slanters" on the hillsides sometimes greatly increases the heat in the valleys and assists the early ripening of the crops. The character of the soil varies considerably, moss, gravel, and clay being all represented. The flat lands consist generally of rich loam, composed of sand and clay.

As may be supposed from its hilly character, the county is pastoral rather than agricultural. The old system of small farms is nearly completely broken up, the average size of the holdings being now about 200 acres of arable land, with pasturage for 600 to 800 sheep attached. According to the agricultural returns of 1883, of the total area only 42,433 acres, or a little less than a fifth, were under cultivation, corn crops occupying 9832 acres, green crops 5716, rotation grasses 12,078, and permanent pasture 14,763. There were 10,177 acres under woods, 11 acres of market-gardens, and 6 of nursery-grounds. The most common rotation of crops is a six-course shift of (1) turnips, (2) barley or oats, (3), (4), and (5) grass or pasture, and (6) oats. The principal crops are oats, which in 1883 occupied 8797 acres, or about nine-tenths of the total area under corn crops, and turnips, for which the soil is specially well adapted, and which occupied 4679 acres, or about four-fifths of the total area under green crops. Horses in 1883 numbered 1142, cattle 5664, and sheep 192,122. The horses are frequently Clydesdales, and many are bred in the county. The most common breed of cattle in the county is a cross between Ayrshire and shorthorns, the cows being principally Ayrshire. Yorkshire calves and stirks are occasionally bought for feeding. The pasture, on account of the hilly character of the land, is better adapted for sheep than for cattle. On the green grassy pasture Cheviots and half-breds are the sheep most commonly preferred, and the heathery ranges are stocked with blackfaced. Crosses of blackfaced, Cheviot, and half-bred ewes with Leicestershire rams are common.

According to the latest return, the land was divided among 708 proprietors, possessing 232,410 acres, with an annual valuation of £142,614, the annual average value per acre being about 12s. 3d. Of the owners, 532, or about 75 per cent., possessed less than one acre each. The following possessed over 5000 acres each:—earl of Wemyss and March, 41,247; Sir G. G. Montgomerie, 18,172; Sir J. Murray Nasmyth, 15,485; John Miller, 13,000; James Tweedie, 11,151; trustees of the late earl of Traquair, 10,778; Colonel James McKenzie, 9403; Sir Robert Hay, 9155; Sir W. H. G. Carmichael, 8756; John White, 6366; George Graham Bell, 6600; James Wolfe Murray, 5108.

Manufactures.—Although the county has the advantage of convenient railway communication both by the North British and Caledonian systems, and possesses also abundant water-power, the only textile industries are the weaving of tweeds and shawls at Peebles and Innerleithen. The other manufactures are connected with the immediate wants of an agricultural population.

Administration and Population.—The county includes sixteen parishes, and one royal burgh, the county town. Along with the neighbouring county of Selkirk it forms a parliamentary county, which returns one member to parliament. Within the last fifty years the population of Peebles has increased about one-third, and, while in the first decade, between 1831 and 1841, there was a decrease from 10,578 to 10,499, the rate of increase has since then augmented in every succeeding decade. In 1861 the population amounted to 11,408, in 1871 to 12,330, and in 1881 to 13,822, of whom 6626 were males and 7196 females. In 1831 females were in a minority, being only 5236 to 5342 males. The county includes two towns, Peebles (3495) and Innerleithen (2813), and two villages, Walkerburn (1026) and West Linton (434). The town population in 1831 numbered 5808, the village 1460, and the rural 6554.

History and Antiquities.—There are a great number of British remains, including five circular British camps and numerous sepulchral tombs, where many cists and stone coffins have been discovered, sometimes containing armillæ of gold, and stone axes and hammers. The standing-stones of Tweedsmuir and the remarkable earthen terraces on the hillsides, especially at Purvis Hill near Innerleithen and at Romanno, also deserve notice. The only important Roman remains are traces of a camp on the Lyne, which some suppose to be the Coria of Ptolemy. The district was included in the old kingdom of Northumbria, and passed to the kingdom of Scotland in the 11th century. By David I. it was made a deanery in the archdeaconry of Peebles, and it was subsequently included in the diocese of Glasgow. About the middle of the 12th century it was placed under the jurisdiction of two sheriffs, one of whom was settled at Traquair and the other at Peebles. There are a considerable number of old castles, some of special interest, as Neidpath Castle on the Tweed, about a mile west from Peebles, originally a Norman keep, built about the time of David I., and enlarged for a baronial residence by the Hays, who came into possession of it in the 15th century; Horsburgh Castle, a picturesque

ruin near Innerleithen, once the seat of the Horsburghs, hereditary sheriffs-depute of Peebles; and the mansion-house or palace of Traquair, frequently resided in by the Scottish kings when they came to hunt in Ettrick Forest.

See Pennecuik, *Description of Tweeddale*, 1715; W. Chambers, *History of Peeblesshire*, 1864.

PEEBLES, the county town of Peeblesshire, is finely situated at the junction of the Eddlestone Water and the Tweed, and on the North British and Caledonian Railways, 22 miles south of Edinburgh. The new town, consisting of a main street (High Street) with several streets diverging, is situated on the south side of the Eddlestone Water; and the old town, consisting now of only a small number of houses, is on the north side; while a number of villas cover the elevated ground on the south of the Tweed. The Tweed is crossed by a bridge of five arches, lately widened and improved, and the Eddlestone Water by two bridges. Among the modern public buildings are the town-hall, the corn exchange, and the hydropathic establishment. At the beginning of the present century Peebles possessed manufactures of fine cottons, but the industry is now discontinued. The town possesses woollen mills and meal and flour mills; it is also a centre of agriculture and has attractions as a summer residence. The population in 1801 was 2088, which had increased in 1831 to 2750, and, although in 1871 it had diminished to 2631, by 1881 it had increased to 3495. The population of the royal burgh in 1881 was 2609.

The castle of Peebles had disappeared about the beginning of the 18th century, and its site is now occupied by the parish church. There are still, however, numerous antique architectural relics, including some portions of the old town wall; the ruins of the church of the Holy Cross, founded in 1261, and of St Andrew's parish church, founded in 1195, both in the old town; vaulted cellars of the 16th and 17th centuries, situated in a close behind Mungo Park's laboratory, and built for security against Border freebooters. Queensberry Lodge, formerly the town residence of the duke of Queensberry, a building in the old style of Scottish domestic architecture, was purchased by the late William Chambers of Edinburgh, and, after being fitted up as a public reading-room, museum, and gallery of art, was presented by him to his native town under the name of the Chambers' Institution (opened in 1859). The ancient cross of Peebles now occupies the centre of the courtyard of the institution.

Peebles was at a very early period a favourite residence of Scottish kings, who came to hunt in the neighbouring Ettrick Forest. It received its original charter in all probability from Alexander III., who built and endowed the church of the Holy Cross, and also founded a monastery for red friars. It was created a royal burgh in 1367. In 1545 the town and the ancient churches were destroyed by Protector Somerset, and in 1604 it suffered severely from accidental fire. Its charter was extended by James VI., but after the union of the English and the Scottish crowns it lost its early importance.

PEEKSKILL, a manufacturing village of the United States in Cortlandt township, Westchester county, New York, lies on the east bank of the Hudson, 43 miles above New York city, with which it has communication by rail and (in summer) by river. Besides iron-smelting, it carries on the manufacture of railings, stoves, and fire-bricks. A church, dating from 1767, and the Van Cortlandt mansion are among its principal buildings. Incorporated in 1816, Peekskill had 6560 inhabitants in 1870 and 6893 in 1880.

PEEL, SIR ROBERT (1788-1850), twice prime minister and for many years the leading statesman of England, was born 5th February 1788 in a cottage near Chamber Hall, the seat of his family, in the neighbourhood of Bury (Lancashire),—Chamber Hall itself being at the time under repair. He was a scion of that new aristocracy of wealth which sprang from the rapid progress of mechanical discovery and manufactures in the latter part of the 18th century. His ancestors were Yorkshire yeomen in the district of Craven, whence they migrated to Blackburn in Lancashire. His grandfather, Robert Peel, first of Peelfold, and afterwards of Brookside, near Blackburn, was a calico-

printer, who, appreciating the discovery of his townsman Hargreaves, took to cotton-spinning with the spinning-jenny and grew a wealthy man. His father, Robert Peel, third son of the last-named, carried on the same business at Bury with still greater success, in partnership with Mr Yates, whose daughter Ellen he married. He made a princely fortune, became the owner of Drayton Manor and member of parliament for the neighbouring borough of Tamworth, was a trusted and honoured, as well as ardent, supporter of Pitt, contributed magnificently towards the support of that leader's war policy, was rewarded with a baronetcy, and founded a rich and powerful house, on whose arms he emblazoned, and in whose motto he commemorated, the prosperous industry from which it sprang. The example and precepts of the father took early effect upon his eldest son, whom from the first he destined and prepared to serve his country in public life. At Harrow, according to the accounts of his contemporaries, Peel was a steady industrious boy, the best scholar in the school, fonder of solitary walks than of the games of his companions, but ready to help those who were duller than himself, and not unpopular among his fellows. At Christ Church, where he entered as a gentleman commoner, he studied hard, and was the first who, under the new examination statutes, took a first class both in classics and in mathematics. His examination for his B.A. degree in 1808 was an academical ovation in presence of a numerous audience, who came to hear the first man of the day; and a relation who was at Oxford at the time has recorded that the triumph, like both the triumphs and reverses of after life, was calmly borne. From his classical studies Robert Peel derived not only the classical, though somewhat pompous, character of his speeches and the Latin quotations with which they were often happily interspersed, but something of his lofty ideal of political ambition. Nor did he ever cease to love these pursuits of his youth; and in 1837, when elected lord rector of Glasgow university, in his inaugural speech he passed a glowing eulogy on classical education. To his mathematical training, which was then not common among public men, he no doubt owed in part his method, his clearness, his great power of grasping steadily and working out difficult and complicated questions. His speeches show that, in addition to his academical knowledge, he was well versed in English literature, in history, and in the principles of law. While reading hard he did not neglect to develop his tall and vigorous frame, and fortify his strong constitution, by manly exercises; and, though he lost his life partly through his bad riding, he was always a good shot and an untiring walker after game. Sprung from the most religious class of English society, he grew up and remained through life a religious man, and from that source drew deep conscientiousness and tranquillity under all difficulties and in all fortunes. His Oxford education confirmed his attachment to the Protestant Church of England. His practical mind remained satisfied with the doctrines of his youth; and he never showed that he had studied the great religious controversies, or that he understood the great religious movements of his day.

In 1809, being then in his twenty-second year, he was brought into parliament for the close borough of Cashel, which he afterwards exchanged for Chippenham, and commenced his parliamentary career under the eye of his father, then member for Tamworth, who fondly saw in him the future leader of the Tory party. Pitt, Fox, and Burke were gone. Sheridan shone with an expiring ray. But in that House of Commons sat Wilberforce, Windham, Tierney, Grattan, Perceval, Castlereagh, Plunkett, Romilly, Mackintosh, Burdett, Whitbread, Horner, Brougham, Parrell, Huskisson, and, above all, George Canning. Lord

Palmerston entered the house at the same time, and Lord John Russell a few years afterwards. Among these men young Peel had to rise. And he rose, not by splendid eloquence, by profound political philosophy, or by great originality of thought, but by the closest attention to all his parliamentary duties, by a study of all the business of parliament, which made him at length familiar with the whole range of public questions and public interests, and by a style of speaking which, owing its force not to high flights of oratory, but to knowledge of the subject in hand, clearness of exposition, close reasoning, and tact in dealing with a parliamentary audience, backed by the character and position of the speaker, improved with his information, practice, station, and experience till it gave him an unrivalled command over the House of Commons. The Tory party was then all-powerful at home; while abroad Europe was at the feet of Napoleon. But Napoleon's fortune was about to turn; and, with the close of the struggle against revolutionary France, political progress in England was soon to resume the march which that struggle had arrested. Young Peel's lot, however, was cast, through his father, with the Tory party. In his maiden speech in 1810, seconding the address, he defended the Walcheren expedition, which he again vindicated soon afterwards against the report of Lord Porchester's committee. It is said that even then Lord Liverpool discerned in him a dangerous tendency to think for himself, and told his father that he must be put at once into the harness of office. At all events he began official life as Lord Liverpool's private secretary, and shortly afterwards, in 1811, was made under-secretary for the colonies by Perceval. In 1812 he was transferred by Lord Liverpool to the more important but unhappy post of secretary for Ireland. There he was engaged till 1817 in maintaining, by insurrection Acts and other repressive measures, English and Protestant ascendancy over a country heaving with discontent, teeming with conspiracy, and ever ready to burst into rebellion. A middle course between Irish parties was impossible. Peel became, by the necessity of his situation, "Orange Peel," and plied the established engines of coercion and patronage with a vigorous hand. At the same time, it was his frequent duty to combat Grattan, Plunkett, Canning, and the other movers and advocates of Catholic emancipation in the House of Commons. He, however, always spoke on this question with a command of temper wonderful in hot youth, with the utmost courtesy towards his opponents, and with warm expressions of sympathy and even of admiration for the Irish people. Nor was the ground he took against the Catholics that of religious principle never to be abandoned, but that of political expediency, which political necessity might overcome. He also, thus early, did his best to advocate and promote secular education in Ireland as a means of reconciling sects and raising the character of the people. He materially improved the conduct of ordinary business in his office, and gave great satisfaction to merchants and others with whom he had to deal. But his greatest service to Ireland as secretary was the institution of the regular Irish constabulary, nicknamed after him "Peelers," for the protection of life and property in a country where both were insecure. His moderation of tone did not save him from the violent abuse of O'Connell, whom he, young, hot-tempered (though his temper was generally under control), and sensitive on the point of honour, was ill advised enough to challenge,—an affair which covered them both with ridicule. In 1817 he obtained the highest parliamentary distinction of the Tory party by being elected member for the university of Oxford,—an honour for which he was chosen in preference to Canning on account of his hostility to Catholic emancipation, Lord Eldon lending

him his best support. In the following year he resigned the Irish secretaryship, of the odious work of which he had long been very weary, and remained out of office till 1822. But he still supported the ministers with official zeal, even in the question of the "Peterloo massacre." In the affair of Queen Caroline, however, he stood somewhat aloof, disapproving some steps taken by the Government, and sensitive to popular opinion; and when Canning retired on account of this affair Peel declined Lord Liverpool's invitation to take the vacant place in the cabinet. During this break in his tenure of office he had some time for reflexion, which there was enough in the aspect of the political world to move. But early office had done its work. It had given him excellent habits of business, great knowledge, and a high position; but it had left him somewhat stiff, somewhat punctilious, somewhat too cold and reserved to win the hearts of those whose confidence he might command, and somewhat over anxious for formal justifications when he might well have left the essential patriotism and probity of his conduct to the judgment of men of honour and the heart of the people. At the same time he was no pedant in business; in corresponding on political subjects he loved to throw off official forms and communicate his views with the freedom of private correspondence; and, where his confidence was given, it was given without reserve.

At this period he was made chairman of the bullion committee on the death of Horner. He was chosen for this important office by Huskisson, Ricardo, and their fellow-economists, who saw in him a mind open to conviction; though he owed hereditary allegiance to Pitt's financial policy, and had actually voted with his Pittite father for a resolution of Lord Liverpool's Government denying the existence of any depreciation in the paper currency. The choice proved judicious. Peel was converted to the currency doctrines of the economists, and proclaimed his conversion in a great speech on the 24th of May 1819, in which he moved and carried four resolutions embodying the recommendations of the bullion committee in favour of a return to cash payments. This laid the foundation of his financial reputation, and his co-operation with the economists tended to give a liberal turn to his commercial principles. In the course he took he somewhat diverged from his party, and particularly from his father, who remained faithful to Pitt's depreciated paper, and between whom and his schismatic son a solemn and touching passage occurred in the debate. The author of the Cash Payments Act had often to defend his policy, and he did so with vigour. The Act is sometimes said to have been hard on debtors, including the nation as debtor, because it required debts to be paid in cash which had been contracted in depreciated paper; and Peel, as heir to a great fundholder, was even charged with being biassed by his personal interests. But it is answered that the Bank Restriction Acts, under which the depreciated paper had circulated, themselves contained a provision for a return to cash payments six months after peace.

In 1820 Peel married Julia, daughter of General Sir John Floyd, who bore him five sons and two daughters. Three of his sons, Robert, Frederick, and Arthur, have followed him in holding parliamentary office, the youngest being now (1884) speaker of the House of Commons; while another, William, the sailor, has run a bright course in another sphere, and found a glorious grave. The writers who have most severely censured Sir Robert Peel as a public man have suspended their censures to dwell on the virtues and happiness of his private and domestic life. He was not only a most loving husband and father but a true and warm-hearted friend. In Whitehall Gardens or at

Drayton Manor he gladly opened his mind, wearied with the cares of state, to the enjoyments of a circle in which it was his pleasure and his pride to gather some of the most distinguished intellects of the day. He indulged in free and cheerful talk, in which he showed a keen sense of the ridiculous, and a dry sarcastic humour, which often broke out also in his speeches in the House of Commons. He sought the conversation of men of science, he took delight in art, and was a great collector of pictures. He was fond of farming and agricultural improvements; he actively promoted useful works and the advancement of knowledge; he loved making his friends, dependants, tenants, and neighbours happy. And, cold as he was in public, even to those whom he desired to win, yet in his gay and social hour few men whose minds were so laden could be more bright and genial than Sir Robert Peel.

In 1822 Peel consented to strengthen the enfeebled ministry of Lord Liverpool by becoming home secretary; and in that capacity he had again to undertake the office of coercing the growing discontent in Ireland, of which he remained the real administrator, and had again to lead in the House of Commons the opposition to the rising cause of Catholic emancipation. In 1825, being defeated on the Catholic question in the House of Commons, he wished to resign office, but Lord Liverpool pleaded that his resignation would break up the Government. He found a happier and more congenial task in reforming and humanizing the criminal law, especially those parts of it which relate to offences against property and offences punishable by death. The five Acts in which Peel accomplished this great work, the first step towards a complete and civilized code, as well as the great speech of 9th March 1826, in which he opened the subject to the House, will form one of the most solid and enduring monuments of his fame. Criminal law reform was the reform of Romilly and Mackintosh, from the hands of the latter of whom Peel received it. But the masterly bills in which it was embodied were the bills of Peel,—not himself a creative genius, but, like the founder of his house, a profound appreciator of other men's creations, and unrivalled in the power of giving them practical and complete effect. This great measure, beyond the sphere of party, was probably also another step in the emancipation of Peel's mind.

In 1827 the Liverpool ministry was broken up by the fatal illness of its chief, and under the new premier, George Canning, Peel, like the duke of Wellington and other high Tory members of Lord Liverpool's cabinet, refused to serve. Canning and Peel were rivals; but we need not interpret as mere personal rivalry that which was certainly, in part at least, a real difference of connexion and opinion. Canning took a Liberal line, and was supported by many of the Whigs; the seceders were Tories, and it is difficult to see how their position in Canning's cabinet could have been otherwise than a false one. Separation led to public coolness and occasional approaches to bitterness on both sides in debate. But there seems no ground for exaggerated complaints against Peel's conduct. Canning himself said to a friend that "Peel was the only man who had behaved decently towards him." Their private intercourse remained uninterrupted to the end; and Canning's son afterwards entered public life under the auspices of Peel. The charge of having urged Catholic emancipation on Lord Liverpool in 1825, and opposed Canning for being a friend to it in 1827, made against Sir Robert Peel in the fierce corn-law debates of 1846, has been withdrawn by those who made it.

In January 1828, after Canning's death, the duke of Wellington formed a Tory Government, in which Peel was home secretary and leader of the House of Commons. This cabinet, Tory as it was, did not include the impractic-

cable Lord Eldon, and did include Huskisson and three more friends of Canning. Its policy was to endeavour to stave off the growing demand for organic change by administrative reform, and by lightening the burdens of the people. The civil list was retrenched with an unsparing hand, the public expenditure was reduced lower than it had been since the Revolutionary war, and the import of corn was permitted under a sliding scale of duties. Peel also introduced into London the improved system of police which he had previously established with so much success in Ireland. But the tide ran too strong to be thus headed. First the Government were compelled, after a defeat in the House of Commons, to acquiesce in the repeal of the Test and Corporation Acts, Peel bringing over their High Church supporters, as far as he could; through Dr Lloyd, bishop of Oxford, his tutor at Christ Church, and now his beloved friend and the partner of his counsels in political matters affecting the interests of the church. Immediately afterwards the question of Catholic emancipation was brought to a crisis by the menacing power of the Catholic Association and the election of O'Connell for the county of Clare. Peel expressed to the duke of Wellington his conviction that the Catholic question must be settled. The duke consented. The consent of the king, which could scarcely have been obtained except by the duke and Peel, was extorted, withdrawn (the ministers being out for a few hours), and again extorted; and on the 5th of March 1829 Peel proposed Catholic emancipation in a speech of more than four hours, which was listened to with unflinching attention, and concluded amidst cheers which were heard in Westminster Hall. The apostate was overwhelmed with obloquy. Having been elected for the university of Oxford as a leading opponent of the Catholics, he had thought it right to resign his seat on being converted to emancipation. His friends put him again in nomination, but he was defeated by Sir R. H. Inglis, though the great majority of distinction and intellect was on his side. He took refuge in the close borough of Westbury, whence he afterwards removed to Tamworth, for which he sat till his death. Catholic emancipation was forced on Peel by circumstances; but it was mainly owing to him that the measure was complete, and based upon equality of civil rights. This great concession, however, did not save the Tory Government. The French Revolution of July 1830 gave fresh strength to the movement against them, though, schooled by the past, they promptly recognized King Louis Philippe. The parliamentary reform movement was joined by some of their offended Protestant supporters. The duke of Wellington committed them fatally against all reform, first by cashiering Huskisson for voting in favour of giving the forfeited franchise of East Retford to Birmingham, and then by a violent anti-reform declaration in the House of Lords. The elections went against them on the demise of the crown; they were compelled, by popular feeling, to put off the king's visit to the city; they were beaten on Sir H. Parnell's motion for a committee on the civil list, and resigned.

While in office, Peel succeeded to the baronetcy, Drayton Manor, and a great estate by the death of his father 3d May 1830. The old man had lived to see his fondest hopes fulfilled in the greatness of his son; but he had also lived to see that a father must not expect to fix his son's opinions,—above all, the opinions of such a son as Sir Robert Peel, and in such an age as that which followed the French Revolution.

The ability and obstinacy of Sir Robert Peel's resistance to the Reform Bill won back for him the allegiance of his party. His opposition was resolute, but it was temperate, and not such as to inflame the fierce passions of the time,

delay the return of civil peace, or put an insurmountable barrier between his friends and the more moderate among their opponents. Once only he betrayed the suppressed fire of his temper, in the historical debate of the 22d April 1831, when his speech was broken off by the arrival of the king to dissolve the parliament which had thrown out reform. He refused to join the duke of Wellington in the desperate enterprise of forming a Tory Government at the height of the storm, when the Grey ministry had gone out on the refusal of the king to promise them an unlimited creation of peers. By this conduct he secured for his party the full benefit of the reaction which he no doubt knew was sure to ensue. The general election of 1832, after the passing of the Reform Bill, left him with barely 150 followers in the House of Commons; but this handful rapidly swelled under his management into the great Conservative party. He frankly accepted the Reform Act, stamped it as final, taught his party to register instead of despairing, appealed to the intelligence of the middle classes, whose new-born power he appreciated, steadily supported the Whig ministers against the Radicals and O'Connell, and gained every moral advantage which the most dignified and constitutional tactics could afford. The changes which the Reform Act necessarily drew with it, such as municipal reform, he rather watched in the Conservative interest than strongly opposed. To this policy, and to the great parliamentary powers of its author, it was mainly due that, in the course of a few years, the Conservatives were as strong in the reformed parliament as the Tories had been in the unreformed. It is vain to deny the praise of genius to such a leader, though his genius may have been of a practical, not of a speculative or imaginative kind. The skill of a pilot who steered for many years over such waters may sometimes have resembled craft. But the duke of Wellington's emphatic eulogy on him was, "Of all the men I ever knew, he had the greatest regard for truth." The duke might have added that his own question, "How is the king's Government to be carried on in a reformed parliament?" was mainly solved by the temperate and constitutional policy of Sir Robert Peel, and by his personal influence on the debates and proceedings of the House of Commons during the years which followed the Reform Act.

In 1834, on the dismissal of the Melbourne ministry, power came to Sir Robert Peel before he expected or desired it. He hurried from Rome at the call of the duke of Wellington, whose sagacious modesty knew his superior in politics and yielded him the first place, and became prime minister, holding the two offices of first lord of the treasury and chancellor of the exchequer. He vainly sought to include in his cabinet the two recent seceders from the Whigs, Lord Stanley and Sir James Graham. A dissolution gave him a great increase of strength in the House, but not enough. He was outvoted on the election of the speaker at the opening of the session of 1835, and, after struggling on for six weeks longer, was finally beaten, and resigned on the question of appropriating the surplus revenues of the church in Ireland to national education. His time had not yet come; but the capacity, energy, and resource he displayed in this short tenure of office raised him immensely in the estimation of the House, his party, and the country. Of the great budget of practical reforms which he brought forward, the plan for the commutation of tithes, the ecclesiastical commission, and the plan for settling the question of dissenters' marriages bore fruit, then or afterwards. His scheme for settling the question of dissenters' marriages, framed in the amplest spirit of liberality, was a striking instance of his habit of doing thoroughly and without reserve that which he had once made up his mind to do

From 1835 to 1840 he pursued the same course of patient and far-sighted opposition, the end of which, sure though distant, was not only office but power. In 1837 the Conservative members of the House of Commons, with victory now in sight, gave their leader a grand banquet at Merchant Taylors' Hall, where he proclaimed in a great speech the creed and objects of his party. In 1839, the Whigs having resigned on the Jamaica Bill, he was called on to form a Government, but failed, through the refusal of the queen, by advice of Lords John Russell and Palmerston, to part with the ladies of her bedchamber, whom he deemed it necessary to replace by ladies not connected with his political opponents. His time was not even yet fully come. In 1840 he was hurried, it is believed by the ardour of his followers, into a premature motion of want of confidence, which was brought forward by Sir John Yarde Buller and failed. But in the following year a similar motion was carried by a majority of one, and the Whigs were compelled to appeal to the country. The result was a majority of ninety-one against them on a motion of want of confidence in the autumn of 1841, upon which they resigned, and Sir Robert Peel, becoming first lord of the treasury, with a commanding majority in both Houses of Parliament, the country in his favour, and many colleagues of the highest ability and distinction, grasped with no doubtful hold the reins of power.

The crisis called for a master-hand. The finances were in disorder. For some years there had been a growing deficit, which for 1841 was upwards of two millions, and attempts to supply this deficit by additions to assessed taxes and customs duties had failed. Distress and discontent reigned in the country, especially among the trading and manufacturing classes. The great financier took till the spring of 1842 to mature his plans. He then boldly supplied the deficit by imposing an income-tax on all incomes above a certain amount. He accompanied this tax with a reform of the tariff, by which prohibitory duties were removed and other duties abated on a vast number of articles of import, especially the raw materials of manufactures and prime articles of food. The increased consumption, as the reformer expected, counterbalanced the reduction of duty. The income-tax was renewed and the reform of the tariff carried still further on the same principle in 1845. The result was, in place of a deficit of upwards of two millions, a surplus of five millions in 1845, and the removal of seven millions and a half of taxes up to 1847, not only without loss, but with gain to the ordinary revenue of the country. The prosperous state of the finances and of public affairs also permitted a reduction of the interest on a portion of the national debt, giving a yearly saving at once of £625,000, and ultimately of a million and a quarter to the public. In 1844 another great financial measure, the Bank Charter Act, was passed and, though severely controverted and thrice suspended at a desperate crisis, has ever since regulated the currency of the country. In Ireland O'Connell's agitation for the repeal of the Union had now assumed threatening proportions, and verged upon rebellion. The great agitator was prosecuted, with his chief adherents, for conspiracy and sedition; and, though the conviction was quashed for informality, repeal was quelled in its chief. At the same time a healing hand was extended to Ireland. The Charitable Bequests Act gave Roman Catholics a share in the administration of charities and legal power to endow their own religion. The allowance to Maynooth was largely increased, notwithstanding violent Protestant opposition. Three queen's colleges, for the higher education of all the youth of Ireland, without distinction of religion, were founded, notwithstanding violent opposition, both Protestant and Roman Catholic. The principle of toleration, once

accepted, was thoroughly carried out. The last remnants of the penal laws were swept from the statute-book, and justice was extended to the Roman Catholic Church in Canada and Malta. In the same spirit Acts were passed for clearing from doubt Irish Presbyterian marriages, for settling the titles of a large number of dissenters' chapels in England, and removing the municipal disabilities of the Jews. The grant for national education was trebled, and an attempt was made, though in vain, to introduce effective education clauses into the factory bills. To the alienation of any part of the revenues of the Established Church Sir Robert Peel never would consent; but he had issued the ecclesiastical commission, and he now made better provision for a number of populous parishes by a redistribution of part of the revenues of the church. The weakest part of the conduct of this great Government, perhaps, was its failure to control the railway mania by promptly laying down the lines on a Government plan. It passed an Act in 1844 which gave the Government a right of purchase, and it had prepared a palliative measure in 1846, but was compelled to sacrifice this, like all other secondary measures, to the repeal of the corn laws. It failed also, though not without an effort, to avert the great schism in the Church of Scotland. Abroad it was as prosperous as at home. It had found disaster and disgrace in Afghanistan. It speedily ended the war there with honour. By the hand of its governor-general of India the invading Sikhs were destroyed upon the Sutlej. Guizot has said that the objects—not only the ostensible but the real objects—of Sir Robert Peel's foreign policy were peace and justice among nations. The angry and dangerous questions with France, touching the right of search, the war in Morocco, and the Tahiti affair, and with the United States touching the Maine boundary and the Oregon territory, were happily settled by frank and patient negotiation. In this and in other parts of his administration Sir Robert Peel was well seconded by the ability of his colleagues, but the premier himself was the soul of all.

Yet there was a canker in all this greatness. There were malcontents in Sir Robert Peel's party whose presence often caused embarrassment and twice collision and scandal. The Young Englanders disliked him because he had hoisted the flag of Conservatism instead of Toryism on the morrow of the Reform Bill. The strong philanthropists and Tory Chartists disliked him because he was a strict economist and an upholder of the new poor law. But the fatal question was protection. That question was being fast brought to a crisis by public opinion and the Anti-Corn-Law League. Sir Robert Peel had become in principle a free-trader. Since his accession to power a new responsibility had fallen on him, which compelled him to think less of a class and more of the people. He had expressed to Guizot a deep, nay, a passionate conviction that something must be done to relieve the suffering and precarious condition of the labouring classes. He had lowered the duties of the sliding scale, and thereby caused the secession from the cabinet of the duke of Buckingham. He had alarmed the farmers by admitting foreign cattle and meat under his new tariff, and by admitting Canadian corn. He had done his best in his speeches to put the maintenance of the corn laws on low ground, and to wean the landed interest from their reliance on protection. But to protection the landed interest fondly clung; and it is hard to say how far Sir Robert Peel himself dreaded the consequences of repeal to the steadiness of prices and to mortgaged estates. The approach of the Irish famine in 1845 decisively turned the wavering balance. The ports must be opened, and, being opened, they could not again be closed upon the same conditions. The Clare election and Catholic emancipation were played over again. Sir

Robert proposed to his cabinet the repeal of the corn laws. Lord Stanley and the duke of Buccleuch dissented, and Sir Robert resigned. But Lord John Russell failed to form a new Government. Sir Robert again came into office; and now, with the consent of all the cabinet but Lord Stanley, who retired, he, in a great speech on 27th January 1846, brought the repeal of the corn laws before the House of Commons. In the long and fierce debate that ensued he was overwhelmed, both by political and personal enemies, with the most virulent invective, which he bore with his wonted calmness, and to which he made no retorts. His measure was carried; but immediately afterwards the offended protectionists, goaded by Lord George Bentinck and Disraeli, coalesced with the Whigs, and threw him out on the Irish Coercion Bill. He went home from his defeat, escorted by a great crowd, who uncovered as he passed, and he immediately resigned. So fell a Conservative Government which would otherwise have probably ended only with the life of its chief. Those who overthrew Sir Robert Peel have dwelt on what they naturally believe to have been the bitterness of his fall. It is certain that he was deeply pained by the rupture with his party, but it is doubtful whether otherwise his fall was so bitter. For evening had begun to steal over his long day of toil; he had the memory of immense labours gone through, and of great things achieved in the service of the state; he had a kingly position in the country, great wealth, fine tastes, and a happy home.

Though out of office he was not out of power. He had "lost a party, but won a nation." The Whig ministry which succeeded him leant much on his support, with which he never taxed them. He joined them in carrying forward free-trade principles by the repeal of the navigation laws. He joined them in carrying forward the principle of religious liberty by the bill for the emancipation of the Jews. One important measure was his own. While in office he had probed, by the Devon commission of inquiry, the sores of Ireland connected with the ownership and occupation of land. In 1849, in a speech on the Irish Poor Laws, he first suggested, and in the next year he aided in establishing, a commission to facilitate the sale of estates in a hopeless state of encumbrance. The Encumbered Estates Act made no attempt, like later legislation, to secure by law the uncertain customary rights of Irish tenants, but it transferred the land from ruined landlords to solvent owners capable of performing the duties of property towards the people. On the 28th of June 1850, Sir Robert Peel made a great speech on the Greek question against Lord Palmerston's foreign policy of interference. This speech, being against the Government, was thought to show that he was ready to return to office. It was his last. On the following day he was thrown from his horse on Constitution Hill, and mortally injured by the fall. Three days he lingered in all the pain which the quick nerves of genius can endure. On the fourth (2d July 1850) he took the sacrament, bade a calm farewell to his family and friends, and died; and a great sorrow fell on the whole land. All the tributes which respect and gratitude could pay were paid to him by the sovereign, by parliament, by public men of all parties, by the country, by the press, and, above all, by the great towns and the masses of the people to whom he had given "bread unleavened with injustice." He would have been buried among the great men of England in Westminster Abbey, but his will desired that he might be laid in Drayton church. It also renounced a peerage for his family, as he had before declined the garter for himself when it was offered him by the queen through Lord Aberdeen.

Those who judge Sir Robert Peel will remember that he

was bred a Tory in days when party was a religion; that he entered parliament a youth, was in office at twenty-four and secretary for Ireland at twenty-five; that his public life extended over a long period rife with change; and that his own changes were all forwards and with the advancing intellect of the time. They will enumerate the great practical improvements and the great acts of legislative justice of those days—Catholic emancipation, freedom for dissenters, free trade, the great reforms in police, criminal law, currency, finance, the Irish Encumbered Estates Act; even the encouragement of agricultural improvement by loans of public money—and note how large a share Sir Robert Peel had, if not in originating, in giving thorough practical effect to all. They will observe that of what he did nothing has been undone. They will reflect that as a parliamentary statesman he could not govern without a party, and that it is difficult to govern at once for a party and for the whole people. They will compare his administration with those that preceded and those that followed, and the state and fortunes of his party when he was at its head with its state and fortunes after his fall. They will consider the peace and goodwill which his foreign policy diffused over Europe. They will think of his ardent love of his country, of his abstinence from intrigue, violence, and faction, of his boundless labour through a long life devoted to the public service. Whether he was a model of statesmanship may be doubted. Models of statesmanship are rare, if by a model of statesmanship is meant a great administrator and party leader, a great political philosopher, and a great independent orator, all in one. But if the question is, whether he was a ruler loved and trusted by the English people, there is no arguing against the tears of a nation.

Those who wish to know more of him will consult his own posthumous memoirs, edited by his literary executors Earl Stanhope and Viscount Cardwell; the four volumes of his speeches; a sketch of his life and character by Sir Lawrence Peel; an historical sketch by Lord Dalling; Guizot's *Sir Robert Peel* (1857); Künzel's *Leben und Reden Sir Robert Peel's* (1851); Disraeli's *Life of Lord George Bentinck* (1853); Morley's *Life of Cobden*; and the general histories of the time. (G. S.—C. S. P.)

PEELE, GEORGE (1558-1598), was one of the group of university poets with whom Shakespeare entered into competition at the beginning of his career. His exact age has been ascertained and the facts of his life diligently searched out by Mr Dyce, the editor of his works. It appears from a deposition made by him at Oxford that he was twenty-five years old in 1583. He took his bachelor's degree at Oxford in 1577, and his master's degree two years afterwards. Before he reached middle age, Peele was "driven to extreme shifts" for a living, and he became so notorious for disreputable practical jokes that a body of "merrie conceited jests" was fathered upon him; but he began life brilliantly. He was "a noted poet at the university." He married a woman of property. When a distinguished foreigner was entertained at Christ Church with elaborately-mounted plays and pageants, Peele was entrusted with the superintendence of the show. He was complimented in Latin pentameters on his translation of one of the plays of Euripides. He wrote *The Arraignment of Paris*, a bright little comedy with pretty songs, for representation before Queen Elizabeth. This was published in 1584; and in 1587 his friend Nash declared him to be "the chief supporter of plesance now living, the atlas of poetry, and *primus verborum artifex*." From this brilliant height the reckless poet quickly slid down to a much less respectable position, and acquired renown of a different kind by his clever tricks on creditors, tavern-keepers, and "croshebells." He began to write for the common players, whose ingratitude to gentlemen of education was bitterly deplored by his friend Greene. Of

these productions the following have been preserved and edited by Mr Dyce:—*The Chronicle History of Edward I.* (published in 1593); *The Battle of Alcazar* (1594); *The Old Wives' Tale* (1595); *David and Bethsabe* (1599); *Sir Clyomon and Sir Clamydes* (1599). These plays, which are very different in kind, testify to Peele's versatility and adroitness, but do not entitle him to much consideration either as a poet or as a dramatist. Quickness of wit

and fancy and a certain neatness of versification are their highest qualities. As Peele lived through the transition from the first tentative essays to the full maturity of the great Elizabethan drama, his works have an historical interest as showing what an ingenious man of culture could do with the common stock of theatrical characters, situations, and imagery. His comedies are often pretty, but his tragedies are inflated and preposterous.

P E E R A G E

Special
character
of the
British
peerage.

IT was remarked in the article NOBILITY (vol. xvii. pp. 529, 530) that the existence of the peerage, as that word is understood in the three British kingdoms, is something altogether peculiar to those kingdoms, and that it has actually hindered them from possessing a nobility of the Continental type. Before we try to trace out the history of the British peerage, it will be well to show more fully than was done in that article in what the institution consists, and in what it differs from those institutions in other countries which are most like it. And to this end we must define what we understand by the word peerage in the British sense. In its historical use it takes in all the members or possible members of the House of Lords and no other persons. But modern usage and modern decisions seem to limit the use of the name on one side, and to extend it on another. There is no kind of doubt that, according to the earliest precedents—precedents reaching up to the earliest official use of the word *peer*—the spiritual lords are equally peers with the temporal. But it has been held, at least from the 17th century, that the spiritual lords, though lords of parliament equally with the temporal lords, are not, like them, peers. Again, in earlier times no peers were heard of except members of the House of Lords, but membership of that House, even as a temporal lord, was not necessarily hereditary. But a decision of the present reign has ruled that a life-peerage is possible, but that the holder of such a peerage has no right to a seat as a lord of parliament. And an Act of the present reign of later date has actually called into being a class of lords who, it would seem, may possibly be either lords of parliament without being peers, or peers without being lords of parliament. These doctrines, some of which trample all the facts of history under foot, but which must be supposed to declare the modern law, establish the possibility of peers who are not lords of parliament, as well as of lords of parliament who are not peers. The question whether all lords of parliament were peers has been debated for several centuries; that all peers were *in esse* or *in posse* lords of parliament, that the right to a seat in parliament was the essence of peerage round which all other rights have grown, was surely never doubted till the year 1856.

Still these later doctrines, though founded on altogether wrong historical grounds, give us a definition of peerage which is intelligible and convenient. Setting aside the possible peers who are not lords of parliament, the two decisions between them rule that the parliamentary peerage is confined to the temporal lords, and that, except in the case of the very modern official lords, their peerage is necessarily hereditary. This definition is convenient in practice, because it is the hereditary temporal peerage whose growth and constitution is of that unique kind which distinguishes it from all other bodies which bear the same name or which present any likeness to it in other ways. It will save trouble in this inquiry if we use the word *peerage* in what—with the possible exception of the last-created official lords—seems now to be its legal sense, as meaning the hereditary temporal peerage only.

In this sense then the peerage of England—continued after the union between England and Scotland in the peerage of Great Britain, and after the union between Great Britain and Ireland in the peerage of the United Kingdom—is a body of men possessing privileges which are not merely personal but hereditary, privileges which descend in all cases according to some rule of hereditary succession, but which pass only to one member of a family at a time. In this the peerage differs from nobility strictly so called, in which the hereditary privileges, whatever they may consist in, pass on to all the descendants of the person first created or otherwise acknowledged as noble. The essential and distinguishing privilege of the peer, as defined above, is that he is an hereditary lord of parliament, that he has, by virtue of his birth, a right to a summons from the crown to attend personally in every parliament and to take his seat in the House of Lords. He is thus, by right of birth, a member of the great council of the nation, an hereditary legislator, and an hereditary judge. Whatever other privileges, substantial or honorary, the peer may possess, they have all gathered round this central privilege, which is that which distinguishes the peer from all other men. The peer of parliament thus holds a different position from the lords spiritual, equally lords of parliament with himself, but holding their seats by a different tenure from that of an hereditary peerage. He holds a different position from the possible non-parliamentary peers implied in the decision of 1856. He holds a different position from the official lords of parliament created by the last Act. The number of the peerage is unlimited; the crown may raise whom it will to any of its ranks; but it is now understood that, in order to make the persons so raised peers in the full sense, to make them lords of parliament, the creation must extend to their heirs of some kind as well as to themselves.

The special character of the British peerage, as distinguished from privileged orders in any other time or place, springs directly from the fact that the essence of the peerage is the hereditary right of a personal summons to parliament. To determine the origin of the peerage is thus to determine how a certain body of men came to possess this hereditary right of summons. But, before we enter on this inquiry, one or two remarks will be needful which are naturally suggested by the definition of peerage which has just been given.

It has been said above that the holder of a peerage as defined is a lord of parliament *in esse* or *in posse*. It has become necessary during the present and last centuries to add these last words to the definition. For it is plain that, since the successive unions of England and Scotland and of Great Britain and Ireland, an hereditary peerage has not always in practice carried with it a seat in the House of Lords (cf. the *Lords' Report on the Dignity of a Peer*, ii. 16). For since those unions certain persons, namely those peers of Scotland and Ireland who are not representative peers and who do not hold peerages of England, of Great Britain, or of the United Kingdom, have been undoubted peers, they have enjoyed some or all of the per-

its distinction
from
nobility.

sonal privileges of peerage, but they have had no seats in the House of Lords. But this is a modern accident and anomaly. The persons spoken of hold peerages which entitled their holders to seats in the parliaments of Scotland and Ireland as long as those parliaments were distinct bodies. And their present holders, if not members of the House of Lords *in esse*, are such *in posse*. They have a capacity for being chosen to seats in that House which is not shared by other persons. Their membership of the House is rather suspended than altogether taken away. Their rather anomalous case hardly affects the general principle that, as far as the hereditary peerage is concerned, peerage and membership of the House of Lords are the same thing.

A few words are also needed as to the effect of the earlier doctrine which rules that peerage is an attribute of the lords temporal only and not of the lords spiritual (see *Lords' Report*, i. 323, 393; ii. 75). This is doubtless meant to imply a certain inferiority on the part of the spiritual lords, as not sharing in that nobility of blood which is looked on as the special attribute of the hereditary peerage. But the inferiority thus implied, as it has nothing to do with parliamentary powers, has also nothing to do with precedence. The lords spiritual as a body are always mentioned first; one class of them, namely the archbishops, take precedence of all temporal peers who are not of the royal family, as the other bishops take precedence of the temporal barons. What the distinction is concerned with is simply certain personal privileges, such as the right of being tried by the court of our lord the king in parliament, that is by the House of Lords or some part of it, instead of in the ordinary way by a jury. The doctrine which denies "peerage" to the spiritual lords is altogether contrary to earlier precedents; but the way in which it came about is one of the most curious parts of our inquiry. It was the natural result of the ideas under whose influence the temporal peerage grew up and put on its distinguishing character.

The use of the word peers (*pares*) to denote the members of the House of Lords first appears in the 14th century, and it was fully established before the end of that century. The name seems to be rather a direct importation from France than anything of natural English or even Norman growth. In the 12th and 13th centuries the great men of the realm appear under various names, English, Latin, and French, *witan*, *sapientes*, *magnates*, *proceres*, *grants*, and the like; they are *pares* only incidentally, as other men might be. In the Great Charter the word *pares*, in the phrase *judicium parium*, has simply the general meaning which it still keeps in the rule that every man shall be tried by his *peers*, the peer (in the later sense) by his peers and the commoner by his. In the 13th century this seems to have still been the only meaning of the word in England. This is illustrated by the story of Peter des Roches, bishop of Winchester (see R. Wendover, iv. 277; M. Paris, ed. Luard, iii. 252; Stubbs, *Const. Hist.*, ii. 48, 183), when in 1233 the right of being tried by their peers was asserted on behalf of Richard earl Marshall, and others. The bishops and other lords exhort the king to make peace with certain of his nobles and other subjects, "quos absque iudicio parium exaulaverat," &c. The Poitevin bishop, either through ignorance or of set purpose, misunderstood the phrase, and answered that in England there were no peers (*pares*) as there were in France, and that therefore the king might deal with all his subjects as he chose by means of his own justices only.¹ The word *pares* is here clearly used in one sense and understood in another. The English lords used

the word in its older general sense: Peter des Roches used it in the special sense which it bore in France. Neither used it in the sense which it took in the next century. It was perfectly true that there was in England no body of men answering to the peers of France, of whom we shall speak presently. But there is every likelihood that the name, as describing a particular body of men in England, was borrowed from the peers of France.

But the thing is more important than the name. Whatever view may be taken of the constitution of the ancient Witenagemót, we may safely assume that that assembly, with whatever change in its constitution, is personally continued in the House of Lords. That house consists of two classes of men who have never lost their right to a personal summons, together with certain other classes who have acquired that right in later times. Two classes of men, namely earls and bishops, have, with a certain interval in the 17th century, sat continuously in the councils of the nation from the earliest times. These two classes are those whose presence connects the earliest and the latest English assemblies. From the time when the House of Lords began to take anything like its present shape, other classes of men, spiritual and temporal, were summoned as well as the bishops and earls, but not with the same regularity as they were. Some abbots were always summoned from the beginning, and a few other churchmen afterwards obtained the same right. But, while every bishop—except in a few cases of personal enmity on the part of the king—was summoned as a matter of course, there was great irregularity in summoning of abbots. So some barons were always summoned as well as the earls; but, while every earl was—with a few such exceptions as in the case of the bishops—summoned as a matter of course, there was great irregularity in summoning the barons. The bishops and earls in short were personages too great to be left out; so were a few of the greatest abbots. Lesser men, spiritual or temporal, might be summoned or not according to a hundred reasons of convenience, caprice, or accident. But it is only the common tendency of things that the occasional summons should grow into the perpetual summons, and that the perpetual summons should, wherever it was possible, that is, in the case of the temporal lords, grow into the hereditary summons. In other words, the doctrine was gradually established that, when a man was once summoned, a right of summons was created for him and his heirs for ever. The establishment of this doctrine called into being a new order of men, of lower rank than the bishops and earls but of equal parliamentary power, namely the class of barons having an hereditary right to seats in parliament. Presently, in the course of the 14th and 15th centuries, the ranks of the temporal peerage were increased by the invention of new orders, those of duke, marquess, and viscount, the two former classes taking precedence of the ancient earls.

It is easy to see how the growth of these several classes of hereditary lords of parliament tended to strengthen the notion of the temporal peerage as a body by itself, apart from all other men, even from those lords of parliament whose seats were not hereditary. There were five classes of men who were not peers in the sense of strict equality among themselves, for they were divided by rigid rules of precedence, but who were peers in the sense of having each of them an equal right to something peculiar to themselves, something which was so far from being shared with any who were not lords of parliament that it was not shared by all who were. The archbishop took precedence of the duke, the bishop took precedence of the baron; but duke and baron alike shared in something which archbishop and bishop had not, the hereditary right to a summons to

¹ "Quod non sunt pares in Anglia, sicut in regno Francorum, unde licet regi Anglorum per justitios quos constituerit quolibet de regno suo exulare et mediante iudicio condemnare."

parliament. The peerage of the temporal lord came to be looked on as something inherent in the blood, something which could not, like the official seat of the churchman, be resigned or lost by any means except by such legal processes as involved "corruption of blood." The parliamentary powers, the formal precedence, of the spiritual lords were not touched, but the idea silently grew that they were not the peers of the hereditary members of the House. In short, the doctrine grew that the temporal lords alone were peers, as alone having their blood "ennobled," which is the herald's way of saying that they held their seats by hereditary right. The extinction of so many temporal peerages in the Wars of the Roses, the creation of so many new peerages under the Tudors, while in one way they lowered the strength and dignity of the order, in another way helped more and more to mark it out as a separate order, distinct from all others.

But the spiritual lords were not the only class that lost by the growth of the doctrine of hereditary peerage. No doctrine about blood or peerage could get rid of the fact that the parliamentary position of the bishops and the greater abbots was as old as that of the earls, far older than that of the barons, to say nothing of the ranks more lately devised. But there was another body of men whom the growth of the hereditary doctrine hindered from becoming peers, and from becoming lords of parliament in any full sense. These were the judges. As the judges grew to be a distinct and recognized class, they came to be summoned to parliament like the barons. The same reason which made it expedient to summon bishops, earls, and barons, made it expedient to summon judges also. It would not have been unreasonable if, in the many shiftings and experiments which took place before the constitution of the two Houses finally settled itself, the judges had come to hold official seats in the House of Lords in the same way as the bishops. But the growth and strengthening of the hereditary doctrine hindered the judges as a body from ever winning the same position in parliament as the bishops and abbots. They had not the same antiquity; they had not the same territorial position; their tenure was less secure; the spiritual lord might lose his office by resignation or by a legal process; the judge might lose his by the mere arbitrary will of the sovereign. The bishops then could be denied the right of personal peerage; they could not be denied their full parliamentary position, their seats and votes. But the same feeling which deprived the bishop of his personal peerage hindered the judge from ever obtaining the personal peerage, and even from obtaining a full seat and vote in parliament. Owing to these influences, the judges have ever held an anomalous position in parliament; they came to be in a manner in the House of Lords but not of it, to be its counsellors and assessors, but not its members.

The growth of the hereditary doctrine pressed hardly, we must allow, on both bishops and judges. But its working on either of those classes has been of small moment indeed compared with the effect on the nation at large. There is no institution for which England has greater reason to be thankful than for her hereditary peerage; for, as we began by saying, it has saved her from the curse of a nobility. Or rather, to speak more accurately, the growth of the peerage with its comparatively harmless privileges hindered the real nobility from keeping or winning privileges which would have been anything but harmless. If the word *nobility* has any real meaning, it must, according to the analogy of lands where there is a real nobility, take in all who bear coat-armour by good right (see *NOBILITY*). It is a remark which has been made a thousand times, and no remark can be truer, that countless families which would be reckoned as noble any-

where else are not reckoned as noble in England. That is to say, though they may be rich and ancient, though they may claim an illustrious pedigree and may be able to prove their claim, yet they have nothing to do with the peerage. In England no family is looked upon as noble unless its head is a peer. In other words, the idea of peerage has altogether displaced the older idea of nobility. The growth of the order of peers has hindered the growth of any nobility apart from the peerage. The hereditary dignity of the peer, the great political position which it carries with it, stands so immeasurably above any hereditary dignity which attaches to the simple gentleman by coat-armour, that the gentleman by coat-armour—the noble of other lands—ceased in England to be looked on, or rather perhaps never came to be looked on, as noble at all. In other words, the growth of the peerage saved the country from the curse of a nobility after the fashion of the nobility of France or of Germany. The difference in this respect between England and other lands is plain at first sight, and there really seems no other way to explain the difference except that every notion of hereditary dignity and privilege gathered so exclusively round the hereditary peerage as to leave nothing of any account to gather round any smaller hereditary position.

But, while the growth of the peerage thus hindered the growth of a nobility of which every gentleman should be a member, it was still possible that a real nobility might have grown up out of the peerage itself. That is to say, it might have come about that, while none but the descendants of peers were privileged, all the descendants of peers should be privileged. A nobility might thus have been formed, much smaller than a nobility taking in all lawful bearers of coat-armour, but still a nobility by no means small. But in England no such nobility has ever grown up. No one has any substantial privilege except the peer himself. No one in short is noble but the peer himself. Even in common speech, though we speak of a noble family, we do not personally apply the word *noble* to any other member of that family, unless, in the case of the higher ranks of the peerage, to a few immediate descendants of the peer. In short, while the blood of the peer is said to be ennobled, it is ennobled with a nobility so high and rare that it cannot pass to more than one at a time even of his own descendants (see the plain speaking of Dr Stubbs. *Const. Hist.*, iii. 443). The eldest son of a duke is legally a commoner; the children of his younger sons are not only legally but socially undistinguishable from other commoners. That is to say, the hereditary possession of the peer is not nobility at all in the sense which that word bears in other lands. It is a fiction to say that the peer's blood is ennobled, when the inheritors of his blood are not inheritors of his nobility. In short, as there is no nobility outside the families whose heads are peers, neither is there any real nobility within those families. As the growth of the hereditary peerage made nobility impossible outside the families of peers, so the particular form of its growth made true nobility impossible even within those families. For, after all, the essence of peerage is simply that the peer becomes by birth what other men become either by royal nomination or by popular election. The official origin of the peer still cleaves to him. The best description of his position is that he holds a great hereditary office. His place as legislator and judge is in itself as strictly official as the dignity of the bishop or the sheriff; but, as, unlike the dignity of the bishop and the sheriff, it has become hereditary, something of the magic sentiment of hereditary descent has spread itself over its actual holder and over a few of his immediate descendants. But, as the dignity is in itself official, the hereditary sentiment has not been able to go further than

this; it has not prevailed so far as to establish any nobility or any privilege of any kind for all the descendants of the hereditary legislator and hereditary judge.

This result was further strengthened by the peculiar nature of the office which became hereditary in the peers of England; it is an office which can be discharged only in concert with others; the very essence of the peerage is the summons to take part in the proceedings of an assembly. In itself nothing is more natural than the growth of nobility out of office; it is as one of the chief ways in which nobility has come into being. And, to take a position higher than that of mere nobility, men in other lands whose dignity was in its beginning yet more purely official than that of the peers of England, say the dukes and counts of Germany, contrived, not only to make their offices hereditary but to make at least their honorary privileges extend to all their descendants for ever and ever. That is to say, they grew into a nobility—a nobility to be sure within a wider nobility—in the strictest sense. Why did not the English peerage do the same? For two reasons, which are in truth different forms of the same reason, different results of the fact that the royal power was so much stronger in England than it was in Germany. One is because the growth of the dukes and counts of Germany belongs to a much earlier state of things than the growth of the English peerage, to a state of things when national unity and the royal authority, though much stronger than they were afterwards, were much less firmly established than they were in England in the age when the hereditary peerage grew up. But partly also, and chiefly, because the dignity and authority of the German duke or count was mainly a local and personal dignity and authority, a dignity and authority which he held in himself and exercised apart from his fellows, while the dignity and authority of the English peer was one which he could hold and exercise only in partnership with his fellows. To the German duke or count his position in the national assembly was the least important part of his powers; to the English peer it was the essence of his whole position. After the purely official character of the earldoms had died out, the English peer was nothing apart from his brother peers. His greatness was the greatness of the member of a powerful assembly. He might be hereditary legislator and hereditary judge; but he could not act as either except in concert with all the other hereditary legislators and hereditary judges. The earls and bishops of England, each by himself, might, if the royal authority had been weaker, have grown into princes, like the dukes and bishops of Germany. The earls, after the change in their character, and the other ranks of peerage from their beginning, were shown to be simple subjects by the very nature of their dignity and power. The position of the German duke or count doubtless came from a royal grant; but it was from a royal grant of some distant age. The position of the English peer rested altogether on a writ from the crown, and that not a writ of past ages, but a writ which, though it could not be refused, needed to be renewed in each successive parliament. In other lands the assembly of the nobles was great and powerful because it was an assembly of great and powerful men; in England the peer was great and powerful because he was a member of a great and powerful assembly. A parliamentary dignity of this kind, even when it became strictly hereditary, was very different from the *quasi* princely position of the great nobles of other lands. And, though the peer commonly had a great local position, sometimes an almost princely position, it was not as peer that he held it. Whatever might be his local dignity and local rights, they had nothing to do with his peerage; they were shared in his degree by the smallest lord of a manor. In short, the hereditary dignity

of the peer, hereditary membership of the great council of the nation, was on the one hand so transcendent as to extinguish all other hereditary dignities; on the other hand, as resting on membership of an assembly, it could not well grow into nobility in the strictest sense. The peerage therefore, the office of hereditary legislator and hereditary judge, passed, and such nobility as it conferred passed with it, to one member only of the family at a time. The other members had no share in the office, and therefore had no share in the nobility which it conferred.

It was then in this way that the peerage, growing out of the hereditary summons to parliament, hindered the growth of any nobility outside the families of peers and by the same means hindered the growth of any real nobility within their families. To the existence of the peerage then, more than to any other cause, England owes its happy freedom from the curse of a really privileged class, the happy equality in the eye of the law of all men who are not actually peers,—an equality which reaches so high that the children of the sovereign himself, whatever may be their personal honours and precedence, are, unless they are formally created peers, in the eye of the law commoners like other men. The privileges of the actual peerage have been a small price pay for such a blessing as this. But we must remember that this happy peculiarity, like all other features in the English constitution, came about by accident, or more truly by the silent working of historical circumstances. As no English lawgiver ever decreed in so many words that there should be two Houses of Parliament and not one, three, or four—as no lawgiver ever decreed in so many words that one of these Houses should be elective and the other hereditary or official—so no lawgiver ever decreed in so many words that the children of the hereditary lord of parliament should be in no way partaker of his privileges. All these things came of themselves; we cannot point to any particular enactment which established any of them, or to any particular moment when they were established. Like everything else, they grew by usage, not by enactment; later enactments confirmed them or took them for granted (see *Lords' Report*, i. 47, 483; ii. 25). But we can see that the rule which has established but one form of real distinction among Englishmen, that which parts the actual peer and the commoner, grew out of the way in which the elements of the parliament finally settled themselves. The parliamentary line was in the end drawn between the baron and the knight. One is rather surprised that it was drawn at that point. The gap between the earl and the baron, and again the gap between the knight and the citizen, might either of them seem wider than the gap between the baron and the knight. Yet in the end the barons were lifted up to the fellowship of bishops and earls, while the knights were thrust down to the fellowship of citizens and burgesses. This must have done much to hinder the knightly families, families which in any other land would have ranked as noble, from keeping or claiming any strictly hereditary privilege. On the other hand, as we have already seen, the nature of that privilege of peerage which the barons were admitted to share hindered the baronial families from claiming any fresh hereditary privilege beyond the hereditary transmission of the peerage itself.

Such is a general view of the nature and origin of peerage in England, following at greater length the lines already traced out in the article ENGLAND. This view may now be confirmed by a few of the special facts and dates which stand out most conspicuously in that course of events which led to the received doctrine of peerage. We assume the House of Lords as the personal continuation of the ancient *Witenagemōt*, *Mycel Gemōt*, *Magnum Concilium*, by whatever name we choose to call that im-

Silent growth of the peerage.

Constitution of the two Houses gradually fixed

memorial body which, whatever was its constitution, was certainly not representative in the sense of being elective. Alongside of this older body grew up that newer representative and elective body which became the House of Commons. We may best place the beginnings of the peerage at the point when we can distinctly see that barons are personally summoned to the one House, while knights find their way into the other only by election. It hardly needs to be explained that the word *baron*, originally meaning simply *man*, has in itself nothing to do with peerage or with seats in parliament. Survivals of its earlier and wider meaning may still be traced in the titles of the Barons of the Exchequer and the Barons of the Cinque Ports, and in other uses of the word, more common perhaps in Scotland and Ireland than in England. *Baro* often translates the older English *thegn*, and perhaps neither of these names is very easy to define. By the 13th century the name *baron* had come specially to mean the highest class among the king's lay tenants-in-chief under the rank of earl; the baron was the holder of several knight's fees. In a wider and vaguer sense, the word often takes in both the earls and the spiritual lords. In its narrower sense it means those who were barons and not more than barons. As the practice of personal summons to parliament came in, the barons formed a class of men who might reasonably hope or fear, as the case might be, that the personal summons might come to them; and to many of them it did come. And its coming or not coming established a distinction between two classes of barons. A distinction between greater and lesser barons is implied in the Great Charter (c. xiv.), which asserts the right of the "*majores barones*" to a personal summons along with the archbishops, bishops, abbots, and earls, while the other tenants-in-chief—among them by implication such barons as did not come under the head of *majores*—were to be summoned generally by the sheriff. And this ordinance must be taken in connexion with the earlier writ of 1215 (Selden, *Titles of Honour*, 587; Stubbs, *Select Charters*, 278, and *Const. Hist.*, i. 568), in which the sheriff is bidden to summon the knights in arms, and the barons without arms, and also four discreet men from each shire, "*ad loquendum nobiscum de negotiis regni nostri*," that is, in other words, to a parliament. The Charter thus secures to the greater barons, as a separate class, the right of being personally summoned by the king, and not by the sheriff along with other men. It parts them off from other tenants-in-chief and puts them alongside of the prelates and earls. These two documents between them may be taken as giving us at once the first distinct approach to the notion of peerage and the first distinct approach to the notion of representation. The "*majores barones*" are not defined; but the summons supplied the means of defining them, or rather it became a means of making them the only barons. As the summons became hereditary, barons came more and more to be looked on simply as a class of men who had seats in the House of Lords. The word came to mean a rank in the peerage, and it was gradually forgotten that there ever had been territorial barons who had no claim to seats in parliament.

But it was only by slow degrees that the hereditary summons, or even the necessary summons of every man who had once been summoned, became the established rule. Throughout the 13th century the language in which the national assembly is spoken of is wonderfully shifting. Sometimes its constitution seems more popular, sometimes less so. Sometimes its more dignified members are spoken of vaguely under such names as *magnates*, without distinction into particular classes. But, when particular classes are reckoned up, the barons always form one class among them; but the number of barons summoned varies greatly.

The Charter gives the *majores barones* the right of personal summons; but the *majores barones* are not as yet a defined and undoubted class of men like the bishops and earls. None but the holder of a barony in the territorial sense was likely to be summoned; but the king still had a wide choice as to whom among the holders of such baronies he would acknowledge as *majores barones*; and we find that dissatisfaction was caused by the way in which the king exercised this power. In 1255 there is a remarkable notice in Matthew Paris (v. 520, ed. Luard; cf. Hallam, *Middle Ages*, ii. 153) where the "*magnates*" complain that all of their number had not been summoned according to the Charter, and they therefore decline to grant an aid in the absence of their peers.¹ It is possible that some bishops or earls may, for some personal reason, have been left unsummoned, but the complaint is far more likely to have come from the barons specially so called. Here the word *pares* is still used in its more general sense, but it is used in a way that might easily lead to its special use. On the other hand, it has been alleged that, by a statute of the later years of Henry III., it was formally ordained that no barons, or even earls, should come to parliament, except those whom the king should specially summon (see Selden, *Titles of Honour*, 589; Hallam, *Middle Ages*, ii. 142; Stubbs, *Const. Hist.*, ii. 203). The existence of such a statute may be doubted; but, as far as the barons are concerned, the story fairly expresses the facts of the case. Under Edward I. an approach, to say the least, is made to the creation of a definite class of parliamentary barons. Dr Stubbs marks the year 1295 as "the point of time from which the regularity of the baronial summons is held to involve the creation of an hereditary dignity, and so to distinguish the ancient qualification of barony by tenure from that of barony by writ" (*Const. Hist.*, iii. 437). In another passage (ii. 183) he thus marks the general result of Edward's reign—

"The hereditary summoning of a large proportion of great vassals was a middle course between the very limited peerage which in France coexisted with an enormous mass of privileged nobility, and the unmanageable, ever-varying assembly of the whole mass of feudal tenants as prescribed in Magna Carta."

It may be thought that the hereditary nature of the barony is here put a little too strongly for the days of Edward I. One may certainly doubt whether Edward, when he summoned a baron to parliament, meant positively to pledge himself to summon that baron's heirs for ever and ever, or even necessarily to summon the baron himself to every future parliament. The facts are the other way; the summons still for a while remains irregular (see Nicolas, *Historic Peerage*, xxiv., xxv., ed. Courthope; *Lords' Report*, ii. 29, 290). But the perpetual summons, the hereditary summons, gradually became the rule, and that rule may in a certain sense be said to date from 1295. That is, from that time the tendency is to the perpetual summons, to the hereditary summons; from that time anything else gradually becomes exceptional (cf. *Const. Hist.*, ii. 203 with iii. 439); things had reached a point when the lawyers were sure before long to lay down the rule that a single summons implied a perpetual and an hereditary summons. It is not too much to fix the reign of Edward I. as the time when the hereditary parliamentary baronage began, without rigidly ruling that the king could not after 1295 lawfully refuse a summons to a man who had been summoned already.

From this time then we may look on the class of parliamentary barons with succession as beginning and steadily growing. And the admission of the barons had a great

¹ "Responsum fuit, quod omnes tunc temporis non fuerunt juxta tenorem magnæ cartæ suæ, et ideo sine paribus suis tunc absentibus nullum responsum dare vocati auxilium concedere aut prestare."

Greater and lesser barons.

The greater barons summoned personally.

First signs of the hereditary summons.

effect on the position of the older members of the House, the prelates and earls. It was in fact their admission which gave the English peerage its distinctive character. A house of earls, bishops, and great abbots would have remained an official house. The earldom might pass from father to son; but it would pass as an hereditary office, entitling its holder to a seat by virtue of his office, just like those lords who held their seats by virtue of offices which did not pass from father to son. Indeed we must not forget the meaning of the word *hereditary* in early times. It is applied to whatever goes by succession, whether that succession is ruled by natural generation, by election or nomination, or by any other way. The office and estate of the bishop or abbot is hereditary in this sense; it must pass to some successor, and it is therefore often spoken of as hereditary. Indeed, as long as the earl was appointed, his office was hereditary only in the same sense as that of the bishop. The only difference was that the office of the bishop could not possibly become hereditary in the modern sense, while the office of the earl easily might, and therefore did. But, if the earls had continued to have no fellows in the Upper House except the prelates, the earldom could hardly have sunk into a mere rank. It was the addition of a class which had no official position—save that which their seats in parliament conferred upon them—a class whose seats were first purely personal and then purely hereditary in the modern sense, which helped more than anything else to do away with the official character of the earls. And in so doing it helped to widen the gap between the spiritual and temporal lords. The earl and the baron alike came to be looked on as sitting by some hereditary virtue of descent; their blood was said to be ennobled, while the bishop and the abbot still sat only by what might seem to be in some sort the lower claim of holding an elective office.

It is then to the days of Edward I. that we are to look, not strictly for the creation of peerage in the modern sense, but for the beginning of a system out of which peerage in that sense very naturally grew. In the words of the great constitutional historian, Edward I. must,

"in the selection of a smaller number to be the constant recipients of a summons, have introduced a constitutional change scarcely inferior to that by which he incorporated the representatives of the commons in the national council; in other words, he created the House of Lords as much as he created the House of Commons."

That is to say, he did not create the first elements of either, which existed long before, nor did he give either its final shape, which neither took till afterwards; but he established both in such a shape that all later changes may be fairly looked on as merely changes in detail.

The succession of regular parliaments in the established sense of the word thus begins in 1295, and from that time we have a House of Lords consisting of prelates, earls, and barons, of whom the barons are fast becoming hereditary as well as the earls. But the body so formed is still spoken of by various names (see *Lords' Report*, i. 273, 277, 279, 302, 316—where we find the word *nobles*—et al.). The earliest use of the word *peer* in anything like its present sense is found in the Act against the Despencers, 1322 (*Lords' Report*, i. 281), where, as Bishop Stubbs says (*Const. Hist.*, ii. 183), "it is used so clumsily as to show that it was in this sense a novelty." The words are "prelatz, countes, baronnes, et les autres *piers* de la terre," and again "nous *piers* de la terre, countes et barouns." It comes again in the act of deposition of Richard II. (*Lords' Report*, i. 349) in the form "*pares* et proceres regni Anglia, spirituals et temporales." Nothing therefore can be plainer than that the spiritual lords were looked on as peers no less than the temporal. The point indeed was formally settled at an intermediate time, namely by the Act of 1341

(*Lords' Report*, i. 313; Stubbs, *Const. Hist.*, ii. 389), when Archbishop Stratford secured the right of the peers ("*piers de la terre*") of both orders to be tried only by their peers in parliament ("*en pleyn parlement et devant les piers ou le roi se fait partie*"). It is worth noticing that at this point the *Lords' Report* stops to comment at some length on the special position of the peerage now established. As the committee puts it,

"The distinction of the peers of the realm as a separate class, by privileges confined to themselves personally as peers, and not extending to any others, but throwing at the same time all the rest of the free population into one class, having all equal rights, is a singularity which marks the constitution of the English government, and was first apparently clearly established by this statute to which all the other subjects of the realm gave their assent."

And again they remark (p. 314) that

"the confinement of the privilege of peerage to those called the peers of the realm, as a personal privilege, giving no privilege or even legal rank to their families, and moulding all who had not that privilege, however high their birth, into the mass of the commons, has been considered an important feature in the constitution of the government of England. It may have prevailed, and probably did in some degree prevail, before; but by this statute it was clearly and distinctly recognized."

This is true; yet the object of the statute is not to shut out the peers' children from privilege, but to assert the disputed privilege of the peers themselves. The exclusion of the peers' children from privilege is a mere inference, though a necessary one. No legislator ever decreed in so many words the exclusion of the children of peers from privilege, because no legislator ever decreed in so many words the privileges of the peers themselves.

By this time we may look on the position of the peerage as fully established. It is now fully received, as at least the ordinary rule, that the baron who was once summoned should be always summoned, and that his right to the summons should pass to his representative after him (*Lords' Report*, ii. 28). In short the parliamentary position of baron has become successive, a word answering pretty well to hereditary in the older sense. A question might now arise as to the nature of the succession, a question which could not arise as long as the person summoned had no certainty that he would be summoned again. In other words, was it necessarily hereditary in the later sense of that word?

That is to say, the question of peerage by tenure, or rather the question whether the succession to a peerage might be by tenure, now sprang up. Did the right to the summons, and hereby the right to the peerage, go with the territorial barony itself, or did it go according to the line of natural descent from the first baron? There was a good deal to be said for the first view. We cannot doubt that barony by writ arose out of barony by tenure, that is, that the writ of summons was originally sent only to persons who held by barony, and, as the phrase "*maiores barones*" implies, not to all of them. If then the barony and the natural line of descent of the first baron should be parted from each other, it was by no means unreasonable to argue that the writ, a consequence of the tenure, should go with the actual barony rather than follow the line of natural descent. And the same notion seems implied in the ancient practice of sending writs to the husbands of heiresses, even, by the courtesy of England, after the death of their wives (see Stubbs, *Const. Hist.*, iii. 438; *Hist. Peerage*, xxxviii.). On the other hand the natural feeling in favour of direct hereditary succession would tell the other way, especially as soon as the doctrine of the ennobling of the blood had fully come in. It is that doctrine more than anything else which has got rid alike of peerages by tenure, of peerages for life, and of peerages held by the husbands of heiresses. If the peerage could pass by marriage or purchase, the doctrine of nobility of blood was set aside. Till that doctrine was fully established, there was nothing unreasonable in

either practice. Again, as the hereditary right to the summons became the rule, writs, held to be no less hereditary than those issued to the barons by tenure, began, even under Edward I., to be issued to persons who had no baronial tenure at all (see Stubbs, *Const. Hist.*, ii. 204; *Historic Peerage*, xxvi.). This practice would of course tell in favour of strict hereditary succession and against succession by tenure. The result has been that hereditary succession became the rule, but that the claim of succession by tenure was brought forward in some particular cases, as the earldom of Arundel and the baronies of Abergavenny, Berkeley, and others. The case of the earldom of Arundel (more truly of Sussex) is discussed at length in the *Lords' Report* (i. 405 sq.), and it is held (ii. 320) to be the only case in which peerage by tenure has been allowed. Yet nothing can be more contrary to all ancient notions of an earldom than that it should follow the possession of certain lands and buildings, as the castle and honour of Arundel. What is chiefly proved is that by the eleventh year of Henry VI. the ancient notion of an earldom had passed away, and that the earldom had sunk to be a mere rank. The succession to the earldom of Arundel was settled by Act of Parliament in 1627 (*Lords' Report*, ii. 242), an Act whose preamble seems to acknowledge the fact of the earldom by tenure. But succession by tenure seems as distinctly agreeable to the oldest notion of a barony as it is contrary to the oldest notion of an earldom. The tendency of later times has been against it, because it contradicts the fancy about "ennobling" of blood; yet those who have at different times claimed a place in the peerage by virtue of baronies by tenure have not been without strong arguments in the way of precedent. The latest claim of the kind, that to the barony of Berkeley, was not formally decided. The facts and arguments will be found at great length in Appendix III. to Sir Harris Nicolas's *Report on the Barony of Lisle*. His conclusion is against the claim by tenure; yet it certainly seems that, when the castle of Berkeley, the tenure of which was said to carry with it the barony and peerage, was separated from the direct line of succession, as specially when the castle was held by the crown in the 16th century (see pp. 321-327), the heirs were not summoned to parliament, or were summoned as a new creation (see on the other hand *Lords' Report*, ii. 143). There is no strictly legal decision of the general question; but an order in council in 1669 (*Lords' Report*, ii. 242) declares against barony by tenure, rather on grounds of expediency than of law. It was declared in the case of the barony of Fitzwalter that "barony by tenure had been discontinued for many ages, and was not then in being, and so not fit to be revived or to admit any pretence of right to succession thereon." And the Lords' Committee (p. 241) give their own opinion that "the right of any person to claim to be a lord of parliament, by reason of tenure, either as an earl or as a baron, supposing such a right to have existed at the time of the charter of John, may be considered as abrogated by the change of circumstances, without any distinct law for the purpose." That is to say, the claim was as legal as any other claim of peerage, resting equally on usage; but it was inconvenient according to the new doctrine about blood being "ennobled."

Order in
council
of 1669.

The same age which saw the earls and barons put on the shape of an hereditary peerage was also that which saw the order enlarged by the creation of new classes of peers. The ancient earls of England now saw men placed over their heads bearing the French titles of *duke* and *marquess*. Neither title was absolutely new in England; but both were now used in a new sense. *Duke* and *earl* were in truth the same thing; *dux*, afterwards supplanted by *comes*, was the older Latin translation of the English

ealdorman or *eorl*, and *eorl* was the English word commonly used to express the *dukes* as well as the *counts* of other lands. So the *marchio*, *markgraf*, *marquis*, was known in England in his official character as the *lord marcher*. But now, first dukes and then marquesses come in as distinct ranks of peerage higher than earl. That the earls of England put up with such an assumption was most likely owing to the fact that the earliest dukes were the king's own sons and near kinsmen, the first of all being the eldest son of Edward III. He was created duke of Cornwall in 1337, a dukedom to which the eldest son of the reigning sovereign is born. Marquesses began under Richard II. in 1386, when Robert Vere, earl of Oxford, was created marquess of Dublin and directly afterwards duke of Ireland (*Lords' Fifth Report*, 78, 79). Lastly, in the next century, the tale of the ranks of the temporal peerage was made up by the insertion of another French title; that of *viscount*, between the earl and the baron. John Beaumont was in 1440 created Viscount Beaumont (*Lords' Fifth Report*, 235). The choice of a title, as concerned England, was a strange one, since, at least from the Norman Conquest onwards, *viscount*, *vicecomes*, had been the everyday French and Latin description of the ancient English sheriff (see Stubbs, *Const. Hist.*, iii. 436, and the patent of creation in *Lords' Report*, v. 235, where the new viscount is placed "super cunctis barones regni"). Since that time no title conveying the rights of peerage has been devised. The Lords' Committee (i. 470) look on it as doubtful whether such a power abides in the crown, and a decision in the spirit of the Wensleydale decision would most likely rule that such a creation would at least give no right to a seat in the House of Lords. Yet, if the crown be, as lawyers tell us it is, the fountain of honour, it is hard to see why its streams should not flow as readily in one age as in another. If Henry VI. could give his new invention of viscounts seats in parliament with precedence over barons, it is hard to see why James I. might not, if he had chosen, have given his new invention of baronets seats in parliament with precedence over dukes.

The five ranks of the temporal peerage were thus established in the order of duke, marquess, earl, viscount, baron. But it must be noticed that duke, marquess, and viscount, are strictly speaking titles in a sense in which baron is not. Baron in truth is very seldom used as a personal description (Stubbs, *Const. Hist.*, iii. 440), except in two or three special cases which are hard to account for, those chiefly of the baronies of Stafford and Greystock (see *Lords' Report* i. 261, 394; ii. 185). The baron is commonly described by some of the endless forms of *senior*, or as *chivaler*, or sometimes—doubtless if he held that particular dignity—as *banneret*. To this day, though in familiar speech all ranks of peerage under duke are often confounded under the common description of *lord*, yet the names marquess, earl, and viscount are all far more commonly heard than the name baron, which is hardly ever used except in the most formal language. As for bannerets, though they seem sometimes to be mentioned along with various ranks of peerage (*Lords' Report*, i. 328), it does not appear (see Stubbs, *Const. Hist.*, iii. 446) that banneret ever really was a rank of peerage, like the others from baron up to duke.

The invention of these new ranks of peerage undoubtedly helped to strengthen the notion of the temporal peerage as an order distinct both from all who are not lords of parliament and from the spiritual lords also. Another novelty also came in along with the dukes and marquesses. The right of the earls was immemorial; the right of the barons had grown up by usage. Edward III. began to create earls and, when dukes were invented, dukes also, by patent. They were commonly created in parliament and with becoming ceremonies. Earls were thus first created

Use
the word
baron.

In 1328. This bestowal of an earldom as an hereditary rank is another process from granting an earldom, conceived as an office or even as an estate. Later in the century, in 1387, Richard II. began to create barons also by patent (*Historic Peerage*, p. xlii.), and this form of creation gradually supplanted the ancient peerage by writ. The object of this change seems to have been (see *Historic Peerage*, p. xxviii.) the better to mark the dignity as hereditary (for the hereditary nature of the barony by writ was after all only a matter of usage or inference), and at the same time to define the line of succession. This, in the baronies by writ, is said to be in the heirs-general of the grantee—words to be understood, as it would seem, of the heirs-general of his body only; in a barony or other peerage conferred by patent the line of succession may take any shape that the crown chooses, the most common limitation being to the heirs-male of the body of the grantee. Very singular lines of succession have sometimes been chosen (*Historic Peerage*, xlv.), as specially in the case of the dukedom of Somerset in 1547, in which the line of the eldest son was placed after that of the second. And the manifest right of the crown to name no line of succession at all, that is, to create a life-peerage only, was often exercised in the first days of dukes and marquesses. A duke of Exeter was created for life as late as 1416. Perhaps the strangest case of all is the patent of the barony of Lisle in 1444, which may be called the creation by patent of a barony by tenure. The whole story of the Lisle barony has been dealt with by Sir Harris Nicolas in a separate volume (see also *Lords' Report*, ii. 199 sq.; Stubbs, *Const. Hist.*, iii. 437); but it is only this patent that concerns us. It seems to grant a barony with a seat in parliament to the grantee John Talbot and his heirs and assigns, being lords of the manor of Kingston Lisle (see the document, the language of which varies in different parts, in the *Lords' Report*, ii. 199; v. 243). This is certainly strange; but, if we once grant the royal power to create peerages and to limit their succession at pleasure, it seems necessarily to follow that the crown may exercise that power in any way that it chooses, whether by limiting it to the grantee personally or giving any kind of remainder that it is thought good.

The temporal peerage being thus fully established on its present ground in the course of the 15th century, we come in the course of the next two centuries to see the effect of the theories under which it had grown up. A series of deductions are gradually made, naturally enough as deductions from the premises; but then the premises can be admitted only by trampling ancient precedents under foot. First of all, we have the denial already spoken of of some of the personal privileges of peerage to the spiritual lords. This was silently brought about in the Tudor times, when Bishop Fisher and Archbishop Cranmer—one might perhaps add Abbot Whiting—were tried by juries in defiance of the principle laid down by Archbishop Stratford under Edward III. Against this course no remonstrance seems to have been made; indeed the times were not favourable for remonstrances, least of all for remonstrances made by spiritual persons. The doctrine that the spiritual lords were lords of parliament but not peers was established by a standing order of the House of Lords older than 1625, as it is referred to in the journals of the House in that year. It was then referred to a committee of privileges for further consideration, but no report is recorded (cf. Coke's *Institutes*, ii. 30).

Presently all the powers both of the spiritual and the temporal lords were for a while extinguished, and those of the spiritual lords by an undoubted legislative act. The Act of 1642, by which the bishops lost their seats in parliament, stands distinguished, as a real and lawful act of

the legislature, from the process by which so much of the so-called law on the subject grew up through a series of resolutions, dictated mostly, we may venture to say, neither by precedent nor by written law, but by the prejudices and assumptions of a particular class of men. The exclusion of the bishops by the regular Act of 1642 was followed in 1649 by the less regular exclusion of the temporal lords also. The House of Lords was abolished by a vote of the House of Commons only. The essence of peerage was thus taken away, but the peers kept their titles and precedence, and they were allowed to be chosen to seats in the House of Commons. When the old parliamentary constitution revived in 1660, the Act of 1649 was naturally treated as null, while the Act of 1642 was of course treated as valid. In 1660 therefore a House of Lords again sat which consisted of temporal lords only. But the bishops were restored to their seats by an Act of the next parliament in 1661, and the lords again ordered a committee "to consider of an order in the standing orders of this House which mentions the lords the bishops to be only lords of parliament and not peers, whereas several Acts of Parliament mentions them to be peers." Nothing came of the labours of this second committee, and the doctrine which it was to consider has since been held for law. Both the doctrine and the reason for it have raised the indignation, not only of the two great constitutional historians, one of them himself a churchman, but of at least one great legal authority (see Blackstone, book i. c. 12, vol. i. p. 401, ed. Christian; and contrast Stephen, *New Commentaries*, ii. 590, and Kerr's Blackstone, i. 407; cf. Hallam, *Middle Ages*, ii. 138; *Lords' Report*, ii. 323, 339). The attack on the rights of the spiritual lords was carried yet further by the Commons in the case of the earl of Derby in 1679, when they objected to their voting on an impeachment even in its preliminary stages. Their right to take a part in all such proceedings up to the question which might involve life or death (a share in which on the part of churchmen would be contrary to canon law) is asserted by the eleventh article of the Constitutions of Clarendon (Stubbs, *Select Charters*, 133). The question now raised, which was decided in favour of the bishops, according to the terms of the Constitutions, did not directly touch the question of the peerage of the bishops, but it had an indirect connexion with it. The denial of the bishops' peerage implied that they had no right to be tried as peers in the court of the king in parliament, as not being, as the phrase goes, "of trial by nobility." It might therefore be plausibly argued that they had no right to be judges in that court. The right of the bishops to vote on a bill of attainder, which, on any canonical ground, would seem quite as objectionable as their voting on an impeachment, was never denied, because a bill of attainder is a legislative act, and does not touch the question of peerage. Indeed, we may say that the law is still far from clear on the whole matter. The statute of 1696 (7 and 8 Will. III.) for "regulating of Trials in cases of Treason and Misprision of Treason" speaks of "trials of peers" and of "all the peers who have a right to sit and vote in parliament," without distinctly defining whether the word *peer* is meant to apply to the lords temporal only.

In the same century another step in the development of the theory of peerage was taken by the resolutions of the lords in 1640 and 1678 that a peer could not relinquish his peerage. This inference also, whatever may be thought of it, though distinctly against earlier precedents, follows (see *Lords' Report*, ii. 25, 26, 48) directly from the doctrine of "ennobling of blood."

The next point in the history of the peerage is one which, like the exclusion of the bishops in 1642, was a matter of real legislation, as distinguished from mere

decisions and resolutions. This was the change in the theory of peerage which followed on the union of England and Scotland in 1707. By the treaty of union the peerage of Scotland was to be represented by sixteen of its number chosen for each parliament by the Scottish peers themselves. This amounted, as has been already set forth, to the creation of a class of men who are peers as concerns their personal privileges, but who are lords of parliament only *in posse* and not *in esse*. The Scottish peers were made incapable of sitting in the House of Commons, and the Scottish peerage was doomed to gradual extinction, as no new peers of Scotland were to be created. And further, by a resolution of the lords in 1711, it was held during the greater part of the last century that a patent of peerage of the United Kingdom granted to a Scottish peer did not give him a seat in parliament. Presently an attempt at legislation with regard to the peerage was made which, if carried, would have altogether changed its character. This was the Peerage Bill of 1719. That bill was not carried, but its proposals are worth notice, not only because they would, if they had become law, have altogether changed the nature of the peerage as a political institution, but also because they illustrate the way in which, like everything else in English constitutional history, the peerage and everything belonging to it had grown up gradually by force of precedent. The right of the crown to create peers at pleasure, and to entail their peerages on any line of succession that it thought good, had never been disputed, but neither had it ever been the subject of any legislative enactment. The proposed bill, in limiting both powers, would have given them their first being by formal legislation. The proposal was that the peerage of the United Kingdom should, after a creation of six peers, be confined to its existing number, with an exception in favour of members of the royal family. For the future, with that exception, no peerage could be created, except when one had become extinct. Instead of the sixteen elective peers of Scotland, the king was to bestow hereditary seats on twenty-five members of the Scottish peerage, and the number was to be kept up by a new promotion whenever any of the twenty-five peerages became extinct. It was forcibly remarked at the time that this would place the remainder of the Scottish peerage in a condition politically inferior to that of all other British subjects, as they would have been incapable both of sitting in either house of parliament and of choosing those who should sit in either. But the general effect of the bill on the constitution of the country would have been far more important. The crown would have lost one of its chief powers, and the relations between the peers and the rest of the nation would have been altogether changed. They would not have come any nearer to the strict notion of a nobility, for it was not proposed to confer direct privilege on any but the peers themselves. But the bill would have placed both the peers and their families in a wholly new position. They would have become a body into which no one could be raised, except in the occasional case of a peerage becoming extinct. It would have been impossible to move a statesman from the Commons to the Lords at any moment when it might be for the public good that he should be moved. Even the lord chancellor, the speaker of the House of Lords, could not have received a peerage unless one chanced to be extinct at the needful time. It is plain that the peers, if they did not become a nobility, would have become an oligarchy, a close body, cut off both from the crown and from the mass of the people in a way in which they had never been cut off before.

The next change in the peerage was that which followed the union with Ireland in 1800. The terms of that union, as regarded the peerage, differed a good deal from those of

the union with Scotland. The twenty-eight representative peers of Ireland are chosen for life, and the other Irish peers are capable of sitting in the House of Commons for constituencies in Great Britain; only by so doing they lose the privileges of peerage (other than mere titles and precedence) so long as they are members of that body. The Irish peerage is not doomed to extinction as well as the Scottish; one Irish peerage may always be created whenever three have become extinct, and the Irish peerage is always to be kept up to the number of one hundred, not counting those who hold peerages of the United Kingdom.

The changes with regard to the lords spiritual introduced by the union with Ireland, by the disestablishment of the Irish Church, and by the increase in the number of English bishoprics have affected the character of the House of Lords, but not that of the hereditary temporal peerage. By the Act of Union one Irish archbishop and four bishops—afterwards only three—were entitled to seats in rotation, changing, not from parliament to parliament, but from session to session. This arrangement was probably practically more convenient; but it seems contrary to the nature of a summons, which must surely be a summons for the whole life of a parliament. Each Irish bishop was thus an *in posse* lord of parliament, like the Scottish and Irish temporal peers, only with the certainty of a seat some time, if he lived long enough. By the Act of Disestablishment in 1869 the Irish bishops lost their seats altogether. And by two Acts of the present reign the English prelates, except the holders of the two archiepiscopal sees and those of London, Durham, and Winchester, have their position completely changed. The number of bishops has been increased, but not the number of spiritual lords. The bishop therefore who holds any see but one of those five waits for his summons to parliament till he reaches it by seniority. Till then he too is a lord of parliament *in posse*.

In our own day too we come, in 1856, to the case of the Wensleydale peerage, which has been already referred to (see May, *Constitutional History*, i. 291-298). Sir James Parke was by letters-patent created a peer for life only, and a summons to parliament was issued to him accordingly. This was a return to the ancient practice of the 14th and 15th centuries; but the power does not appear to have been exercised in later times except in the case of peeresses (see Nicolas, *Historic Peerage*, xlv. ; May, i. 292). One hardly knows what to make of such creations as those of Lord Hay in 1606 and Lord Reede in 1644, the accounts of which in the *Historic Peerage* (xlv. 243, 394) seem somewhat contradictory. But, if the creation of Lord Hay was a real creation of a peer for life, but without the right to a seat in parliament, it was so defined by a clause in the patent itself, which would seem to imply that, without such a clause, the creation would have given a right to a seat in parliament. The right of the crown to create life-peers, though not exercised, was constantly asserted by the best lawyers, and it is admitted even in the *Lords' Report* (ii. 37; see May, i. 294). Yet in 1856 the House of Lords took upon itself, in defiance of the whole history of their order, to refuse admission to a baron lawfully created, lawfully summoned, merely because the crown had not bound itself, in the 19th century any more than in the 13th or 14th, to summon the representatives of the baron so created for ever and ever. This decision seems to be now accepted as law; yet it is hard to see how, except when they have been taken away by Act of Parliament, any powers which were exercised by Edward I. can be refused to Queen Victoria. In short, the rights of the crown, the reason and expediency of the case, were all sacrificed to the superstition about "cnnobling of blood." And Sir T. E. May, recording the resolution with admiration (i. 296), tells us that "by constitutional usage, having the force of law, the House

of Lords had been for centuries a chamber consisting of hereditary councillors of the crown," and that "the crown could not change its constitution by admitting a life-peer to a seat in parliament." Three pages further on he found out that the House of Lords contained other members whose seats were not "hereditary" in the modern sense, and we can hardly think that he used that word in its ancient meaning. The crown yielded to the pretensions of the lords; Lord Wensleydale received a fresh creation by a patent extending to his imaginary heirs, and it is to be presumed that he was thereby "ennobled in blood" to the satisfaction of those with whom he had to sit. While the question of life-peerage was left in abeyance, the official peerages referred to at the beginning of this article were created by an act of 1876. These are the Lords of Appeal in Ordinary, paid officers who hold their office, like other judges, during good behaviour, who are lords of parliament, with a right to a writ of summons to sit and vote so long as they hold office, and who rank for life as barons with such titles as the crown may appoint. In the case therefore of the resignation or removal from office of a lord of appeal we should have the non-parliamentary baron revived. Whether in such a case he would be entitled to be tried in the king's court in parliament does not appear. Nor does the Act rule whether the lord so created is a peer, either while he is a lord of parliament or after he ceases to be such. The doctrine of "ennobling of blood" would seem to imply that, as his title is not hereditary, he is not a peer. It would follow then that a lord of appeal who has resigned or has been removed, though "entitled to rank as a baron for life," is a baron who is neither a peer nor a lord of parliament.

A peerage, by the decisions of 1640 and 1678 (*Lords' Report*, ii. 25, 49) cannot be either surrendered to the crown or alienated to any other person. It can be forfeited only by attainder or by Act of Parliament. Of this last process there seems to be only one case, that of George Neville, duke of Bedford, degraded by parliament in the reign of Edward IV., as not being wealthy enough to support his dignity. This of course, like attainder by Act of Parliament, comes under the general principle that parliament may do anything. It is further held (*Historic Peerage*, lxxviii.) that, while an attainder for high treason extinguishes a peerage of any kind, an attainder for felony only extinguishes a peerage by writ, but not a peerage by patent. A peeress in her own right by descent or creation has all the privileges of a peer, except that of sitting in parliament, which is suspended while the peerage is held by a female, but revives when it passes to a male heir. The wife or widow of a peer, not being a peeress in her own right, has also the same privileges; but she loses them if she marries a commoner. By social usage she keeps her title, but, if charged with treason or felony, she is tried by a jury and not by the lords. If a peerage which passes to heirs-general, like the ancient baronies by writ, is held by a man who leaves no son, but more than one daughter, the peerage goes into abeyance; that is it is held by no one till the abeyance is terminated. If there comes to be only one person representing the claims of all the sisters, he can claim the termination of the abeyance as a matter of right. The crown also can terminate it at any moment in favour of any of the persons between whom it is in abeyance, that is, in favour of the representative of any of the sisters. It is by this transmission through females that the ancient baronies have mainly lived on, often overshadowed by higher but more modern titles. Those peers who can show a direct succession in the male line from 1295 are few indeed. By female succession also the titles of these and other ancient baronies have in most cases got parted from the original surnames of the holders. This seems to

have led to the practice, which of late has been rather the rule than the exception, of creating peers with fancy titles, often very strange ones, sometimes neither their own surnames nor the name of any place with which they have anything to do. Yet, by a survival of the ancient notion of barony, the baron is always created Lord A of B (perhaps more strictly Lord A, Baron of B), though the place named is by no means always his own manor. The earl of course could originally be only the earl of a shire—the name of the shire and of the shire-town being often used indifferently. But, as the order of earls became more numerous, and as the official character of the earldom was quite forgotten, men were made earls of places of all kinds, and in modern times a surname has often been the title of both earls and marquesses. It is needless to say that the titles of marquesses, when territorial, have had no necessary reference to the original meaning of the title, as keeper of a march. The titles of dukedoms seem always to have been territorial, unless in the singular case of "Duchess Dudley" in the reign of Charles I. Dudley was the lady's surname; she does not seem to have been in any sense duchess of the town of Dudley. Clarendon always talks of "Duke Hamilton"; but here the surname is taken from a place. Viscounts take their titles both from names and places; but the viscount who has a territorial title is never spoken of as viscount of A, as the duke is always, and the marquess and the earl in language which is at all formal.

Children of peers have a definite precedence and an elaborate system of courtesy titles and epithets which perplexes foreigners and sometimes natives. The eldest son of a peer ranks immediately after peers of the rank next below that of his father; the younger sons rank after peers of the next degree below that. Thus a duke's eldest son ranks next after marquesses; a marquess's eldest son ranks next after earls, and a duke's younger son next after eldest sons of marquesses. The precedence of daughters follows the general principle, the principle implied in the doctrine of abeyance, that all daughters rank with the eldest son. Then again the eldest sons of dukes, marquesses, and earls bear by courtesy the second title of their fathers, and the eldest sons of the eldest sons of dukes and marquesses bear what may be called the grand-father's third title. All these, though called by a title of peerage, are, as we have already had need to insist, legally commoners; but the eldest sons of peers have been not uncommonly summoned to the House of Lords by the title of some barony held by their fathers. Their precedence is in no way affected by the title which they may happen to bear. The eldest son of a duke always ranks next after marquesses, whether his courtesy title, that is the second title of his father, is marquess or baron. The younger sons of dukes and marquesses bear the courtesy title of Lord with the Christian and surname, and, on the principle which regulates the precedence of daughters, the title of Lady extends to the daughters of earls as well as to those of dukes and marquesses. The daughter of a peer married to a commoner keeps her rank; but, if she marries a peer, she takes the rank of her husband, whether that be higher or lower than the rank which she has by birth. In all these matters the substantial privileges of the peerage and its mere honorary titles and precedence are often at curious cross purposes with one another. All sons of peers are esquires of right. By courtesy all children of peers who do not bear any higher title are entitled to the conventional epithet of "honourable"; "noble" they are not in any, even conventional, sense. The style formerly was, with perfect correctness, "Hon. A B, Esq." The "Esq." is now left out; it is not easy to see why.

It is curious to compare the peerage of England, and the peerages of Scotland and Ireland formed after its model, with the famous body of the twelve peers of France, from which we cannot doubt that the name *pares* was transferred to the English assembly of *witan*, *magnates*, or *proceres*. The twelve were the archbishop and duke of Rheims, the bishops and dukes of Langres and Laon, the bishops and counts of Beauvais, Noyon, and Châlons, the dukes of Burgundy, Normandy, and Aquitaine, the counts of Flanders, Toulouse, and Champagne. The list of the spiritual peers, a little startling at first, is easily understood when we take in the circumstances of the French kingdom in the 12th century. The six prelates are those who held of the king of the French as king; the other great churchmen of the Western Kingdom held either of one of the vassal princes (as the archbishop of Rouen did of the duke of the Normans) or of the king as duke, as did among others the bishop of Paris, whom at first sight we might have looked for on the list. The institution of this body is commonly attributed to the age of Philip Augustus, and indeed to that king personally; and it can hardly be doubted that it had its origin in the romances of Charlemagne. The twelve peers are said to have appeared at Philip's coronation, and also to have formed the court by which John, duke of the Normans and king of the English, was deprived of the lands that he held in fief of the French crown. But it is certainly hard to see them all in the character of twelve peers on either occasion, though it is certain that some of them were present at Philip's coronation in 1179, and among them the then duke of the Normans and husband of the duchess of Aquitaine, Henry king of the English.¹ Nor does the exact name of *pares* seem to be given by any contemporary writer to the body by which John is said to have been condemned, though it is so used in the next century (see *Præclara Francorum Facinora*, ap. Duchèsne, *Rev. Franc. Script.*, v. 764). But

that there was an acknowledged body of peers of France in the 13th century is shown, if by nothing else, by the speech of Peter bishop of Winchester quoted above. Gradually all the temporal peerages became united with the crown, save only Flanders, which was released from vassalage when the emperor Charles V. was its count. It therefore became needful on ceremonial occasions that, while the spiritual peers appeared in person, the temporal peers should be represented by persons who were created peers for the occasion. The later peerage of France, those dukes, counts, and barons who were distinguished as *peers*, dates from the 14th century. The duchies so distinguished were at first confined to the royal family, and in some sort represented the ancient peerage; but the title of *duke and peer* was afterwards extended to others, among them in 1674 to at least one prelate, that of Paris, then become an archbishopric. The counties and baronies distinguished as peerages were but few, and most of them were reunited to the crown; they are therefore much less known than the duchies. In the more modern use of the word, the Chamber of Peers dates from the charter of Louis XVIII. in 1814. It was a body of hereditary members created by the crown after the model of the temporal peerage of England. After the revolution of 1830 this was changed into a Chamber of Peers for life, which "ceased to exist" at the revolution of 1848.

The fullest account of the origin and growth of the English peerage will be found in the five volumes of the *Reports of the Lords' Committees touching the Dignity of a Peer of the Realm* (1820-1829). The mass of information brought together is wonderful, and, though the prejudices of the order sometimes peep through, the general treatment of the subject is on the whole fair and highly creditable, especially when we remember that the inquiry was begun before any light had been thrown on the subject by modern research. Besides this, the works of Selden, Hallam, Nicolas, and Stubbs have been, as will have been remarked, constantly referred to throughout the article. But it is sometimes curious to compare the point of view of a professional antiquary like Sir Harris Nicolas with that of the two great constitutional historians. (E. A. F.)

PEGASUS, a famous horse of Greek fable, was said to have sprung from the trunk of the Gorgon Medusa when her head was cut off by Perseus. Bellerophon caught him as he drank of the spring Peirene on the Acrocorinthus at Corinth, or (according to another version) received him tamed and bridled at the hands of Athene. Mounted on Pegasus, Bellerophon slew the Chimæra and overcame the Solymi and the Amazons, but when he tried to fly to heaven on his back the horse threw him and continued his heavenward course. Arrived in heaven, Pegasus served Zeus, fetching for him his thunder and lightning. Hence some have thought that Pegasus is a symbol of the thundercloud. In later legend he is the horse of Eos, the Morning. Pindar and later poets represent him as winged. The name is from *πηγός*, "compact," "stout." The erroneous derivation from *πηγή*, "a spring of water," may have given birth to the legends which connect Pegasus with water, as that his father was Poseidon, that he was born at the springs of Ocean (like the fabulous Indian horse Uçaihsravas, prototype of horses, produced at the churning of Ocean), and that he had the power of making springs gush from the ground by a blow of his hoof. This was said to have been the origin of Hippocrene (Horse-spring), the fountain of the Muses on Mount Helicon, as well as of another spring of the same name at Trœzen. But there are facts that speak for an independent mythological connexion between horses and water, e.g., the sacredness of the horse to Poseidon, the epithets Hippios and Equester

applied to Poseidon and Neptune, the Greek fable of the origin of the first horse (produced by Poseidon striking the ground with his trident), and the custom in Argolis of sacrificing horses to Poseidon by drowning them in a well. (The Illyrians similarly sacrificed horses by drowning.) From his connexion with Hippocrene Pegasus has come to be regarded as the horse of the Muses and hence as a symbol of poetry. But this is a modern attribute of Pegasus, not known to the ancients, and dating only from the *Orlando Innamorato* of the Italian poet Boiardo.

PEGU, a division of British Burmah, comprising the districts of Rangoon, Hanthawaddy, Tharawadi, and Prome, has an area of 9159 square miles, with a population (in 1881) of 1,162,393. The province of Pegu was annexed by the British after the second Burmese war in 1852-53.

PEGU, an ancient town in the Rangoon district of British Burmah, is situated on the Pegu river, 20 miles west of the Tsit-toung, in 17° 20' N. lat. and 96° 30' E. long. It was founded in 573 A.D., and was for a long time the capital of the Talaing kingdom, overthrown by Aloung-bhura in the middle of the 18th century. Early European travellers describe the city as of great size, strength, and magnificence. Modern Pegu lies close to the river-side, and had a population in 1881 of 5891.

PEHLEVI. See PAHLAVI.

PEIRCE, BENJAMIN (1809-1880), mathematician and astronomer, was born at Salem, Massachusetts, 4th April 1809. Graduating at Harvard College in 1829, he became mathematical tutor there in 1831 and professor in 1833. He had already assisted Bowditch in his translation of the *Mécanique Céleste*, and now produced a series of mathematical text-books characterized by the brevity

¹ See Rigordus, *De Gestis Philippi Augusti*, ap. Duchèsne, *Hist. Franc. Script.*, v.; Will. Arn., *ib.* 101; Ben. Petrib. 242, ed. Stubbs; Matthew Paris, *ib.* 658, ed. Luard; cf. Sismondi, *Histoire des Français*, i., 363, 489-492.

and terseness which marks all his work and made his teaching unattractive to inapt pupils. To young men of real talent, on the contrary, his teaching and warm personal interest in their work were of the greatest advantage, and he holds a most honourable place in the development of American mathematics. After Bowditch's death in 1838 Peirce stood at the head of American mathematicians; but the first work that gave him a wider fame was his computation of the general perturbations of Uranus and Neptune (*Proc. Amer. Acad.*, 1848). In 1849 he became consulting astronomer to the American Nautical Almanac, and for this work he prepared new tables of the moon (1852). Another piece of important astronomical work was his discussion of the equilibrium of Saturn's ring, in which he showed that a fluid ring was necessarily unstable as well as a solid one. From 1867 to 1874 he was superintendent of the coast survey; in 1857 he published his largest and most characteristic work, the *System of Analytical Mechanics*. He himself, however, seems to have thought most of his *Linear Associative Algebra* (lithographed privately in a few copies, 1870; reprinted in the *American Journ. of Math.*, 1882). His death took place at Cambridge, United States, on 6th October 1880.

PEKING or PEKIN, the capital of the Chinese empire, is situated in $39^{\circ} 54' 36''$ N. lat. and $116^{\circ} 27'$ E. long., and stands on the northern extremity of the great alluvial delta which extends southwards from its walls for 700 miles. For the last nine centuries Peking, under various names and under the dominion of successive dynasties, has, with some short intervals, remained an imperial city. Its situation near the northern frontier recommended it to the Tatar invaders as a convenient centre for their power, and its peculiarly fortunate position as regards the supernatural terrestrial influences pertaining to it has inclined succeeding Chinese monarchs to accept it as the seat of their courts. In 986 it was taken by an invading force of Khitan Tatars, who adopted it as their headquarters and named it Nanking, or the "southern capital." During the early part of the 12th century the Chinese recaptured it and reduced it from the rank of a metropolis to that of a provincial city of the first grade, and called it Yen-shan Foo. In 1151 it fell into the hands of the Kin Tatars, who made it a royal residence under the name of Chung-tu, or "central capital." Less than a century later it became the prize of Jenghiz Khan, who, having his main interests centred on the Mongolian steppes, declined to move his court southwards. To his great successor Kublai Khan (1280-1294), however, the establishment of a capital within the frontiers of China became a necessity, and, following the example set him by preceding sovereigns, he made choice of Yenking, as he rechristened the city. With his usual magnificence, he rebuilt the town, which became known in Chinese as Ta-tu, or "great capital," and in Mongolian as Khanbalik, or "city of the khan." During the reign of the first emperor of the dynasty (1368-1399) which succeeded that founded by Jenghiz Khan the court resided at the modern Nanking, but in the eyes of the succeeding sovereign Yung-lo (1403-1425) the political advantages of a northern residence appeared so obvious that he transferred his court to Peking (i.e., the northern capital), which has ever since been the seat of government.

During the periods above mentioned the extent and boundaries of the city varied considerably. Under the Kin dynasty the walls extended to the south-west of the Tatar portion of the present city, and the foundations of the northern ramparts of the Khan-balik of Kublai Khan are still to be traced at a distance of about 2 miles in a northerly direction beyond the existing walls. The modern city consists of two parts, the *nui ch'ing*, or inner city, commonly known to foreigners as the "Tatar city," and the *wai ch'ing*, or outer city, known in the same way as the "Chinese city." These names are somewhat misleading, as the inner city is not enclosed within the outer city, but adjoins its northern wall, which, being longer than the *nui ch'ing* is wide, outflanks it considerably at both ends, as may be seen in the accompanying plan. The outer walls of the double city contain an area of about 25 square miles, and measure 30 miles in circumference. Unlike the walls of most Chinese cities, those of Peking are kept in perfect order. Those of the Tatar portion, which is the oldest part of the city, are 50 feet high, with a width of 60 feet at the base and 40 feet at the top, while those of the Chinese city, which were built by the emperor Kea-tsing in 1543, measure 30 feet in height, and have a width of 25 feet at the base and 15 feet at the top. The terre-plein is well and smoothly paved, and is defended by a crenellated parapet. The outer faces of the walls are strengthened by square buttresses built out at intervals of 60 yards, and on

Plan of Peking. (Scale, one mile and a half to an inch.)

the summits of these stand the guard-houses for the troops on duty. Each of the sixteen gates of the city

is protected by a semicircular enceinte, and is surmounted with a high tower built in galleries and provided with countless loopholes.

The population of Peking is reckoned to be about 1,000,000, a number which is out of all proportion to the immense area enclosed within its walls. This disparity is partly accounted for by the facts that large spaces, notably in the Chinese city, are not built over, and that the grounds surrounding the imperial palace, private residences, and temples are very extensive. Viewed from the walls Peking looks like a city of gardens. Few crowded neighbourhoods are visible, and the characteristic features of the scene which meets the eye are the upturned roofs of temples, palaces, and mansions, gay with blue, green, and yellow glazed tiles, glittering among the groves of trees with which the city abounds. Enclosed within the Tatar city is the *Hwang ch'ing*, or "Imperial city," which in its turn encloses the *Tsze-kin ch'ing*, or "Purple Forbidden city," in which stands the emperor's palace. On the north of the *Tsze-kin ch'ing*, and separated from it by a moat, is an artificial mound known as the *King shan*, or "Prospect Hill." This mound, which forms a prominent object in the view over the city, is about 150 feet high, and is topped with five summits, on each of which stands a temple. It is encircled by a wall measuring upwards of a mile in circumference, and is prettily planted with trees, on one of which the last emperor of the Ming dynasty (1644), finding escape from the Manchu invaders impossible, hanged himself. On the west of Prospect Hill is the *Se yuen*, or "Western Park," which forms part of the palace grounds. This park is tastefully laid out, and is traversed by a lake, which is mainly noticeable from the remarkably handsome marble bridge which crosses it from east to west. Directly northwards from Prospect Hill stand the residence of the Titu, or "governor of the city," and the Bell and the Drum Towers, both of which have attained celebrity from the nature of their contents,—the first from the huge bell which hangs in it, and the second from the appliances it contains for marking the time. The bell is one of five which the emperor Yung-lo ordered to be cast. In common with the others, it weighs 120,000 lb, is 14 feet high, 34 feet in circumference at the rim, and is 9 inches thick. It is struck by a wooden beam swung on the outside, and only at the changes of the night-watches, when its deep tone may be heard in all parts of the city. In the Drum Tower incense-sticks, specially prepared by the Astronomical Board, are kept burning to mark the passage of time, in which important duty their accuracy is checked by a clepsydra. Another of Yung-lo's bells is hung in a Buddhist temple outside the north-west angle of the city wall, and is covered both on the inside and outside with the Chinese texts of the *Lankavatāra Sūtra*, and the *Saddharma pundarika Sūtra*.

Turning southwards we again come to the Purple Forbidden city, the central portion of which forms the imperial palace, where, in halls which for the magnificence of their proportions and barbaric splendour are probably not to be surpassed anywhere, the Son of Heaven holds his court, gives audience to ambassadors from tributary states, and receives the congratulations of his ministers at the annual seasons of rejoicing. In the eastern and western portions of this city are situated the residences of the highest dignitaries of the empire; while beyond its confines on the south stand the offices of the six official boards which direct the affairs of the eighteen provinces. It was in the "yamun" of one of these boards—the *Le Pu* or board of rites—that Lord Elgin signed the treaty at the conclusion of the war in 1860,—an event which derives especial interest from the fact of its having been the first occasion on which a European plenipoten-

tiary ever entered Peking accompanied by all the pomp and circumstance of his rank.

Outside the Purple Forbidden city the most noteworthy building is the Temple of Heaven, which stands in the outer or Chinese city. Here at early morn on the 22d of December the emperor offers sacrifice on an open altar to Shang-ti, and at periods of drought or famine presents prayers for relief to the same supreme deity. The altar at which these solemn rites are performed "consists of a triple circular marble terrace, 210 feet wide at the base, 150 in the middle, and 90 at the top." The uppermost surface is paved with blocks of the same material forming nine concentric circles, the innermost consisting of nine blocks, and that on the outside of eighty-one blocks. On the central stone, which is a perfect circle, the emperor kneels, "surrounded first by the circles of the terraces and their enclosing walls, and then by the circle of the horizon." In the same temple stands the altar of prayer for good harvests, which is surmounted by a triple-roofed circular structure 99 feet in height. The tiles of these roofs are of glazed porcelain of the most exquisite deep-blue colour, and add a conspicuous element of splendour to the shrine, which even without their aid would inspire admiration by the grace of the design and the rare beauty of the materials employed in its construction.

The other powers of nature have shrines dedicated to them at the altar to Earth on the north of the city, the altars to the Sun and Moon outside the north-eastern and north-western angles respectively of the Chinese city, and the altar of Agriculture inside the south gate of the Chinese city. Next to these in religious importance comes the Confucian temple, known as the *Kwo-tze-keen*. Here there is no splendour; everything is quite plain; and one hall contains all that is sacred in the building. There the tablets of "the soul of the most holy ancestral teacher, Confucius," and of his ten principal disciples stand as objects of worship for their countless followers. In one courtyard of this temple are deposited the celebrated ten stone drums which bear poetical inscriptions commemorative of the hunting expeditions of King Suen (827-781 B.C.), in whose reign they are believed, though erroneously, to have been cut; and in another stands a series of stone tablets on which are inscribed the names of all those who have obtained the highest literary degree of *Tsin-sze* for the last five centuries.

In the south-eastern portion of the Tatar city is the observatory, which was built by order of Kublai Khan in 1296. During the period of the Jesuit ascendancy in the reign of K'ang-he (1661-1721), the superintendence of this institution was confided to Roman Catholic missionaries, under whose guidance the bronze instruments now existing were constructed. Unlike the thoroughfares in the cities of central and southern China, the streets of Peking are wide and open, but, being unpaved and the soil being light and alluvial, they easily become almost impassable from mud in wet weather and ankle-deep in dust in dry weather. The inhabitants of Peking being consumers only, and in no way producers, the trade of the city is very small, and the article of the European treaties which prohibits foreign merchants from trading within the walls is, therefore, to be regretted only as an instance of the narrow-mindedness of the Chinese Government.

E. Bretschneider, *Archæological and Historical Researches on Peking and its Environs* (1876); S. Wells Williams, *The Middle Kingdom* (1884); Edkins, *Peking* (1870).

PELAGIA, Sr. An Antiochene saint of this name, a virgin of fifteen years, who chose death by a leap from the housetop rather than dishonour, is mentioned by Ambrose (*De Virg.*, iii. 7, 33 sq., *Ep.* xxxvii. ad *Simpl.*), and is the subject of two sermons by Chrysostom. More famous is

the story of another Pelagia of Antioch, a famous ballet-girl of the town, who, in the full flower of her beauty and guilty sovereignty over the youth of the city, was suddenly converted by the influence of the holy bishop Nonnus, whom she had seen and heard for a moment as he preached in front of a church which she happened to pass with her gay train of attendants and admirers. She sought out Nonnus, and her tears of genuine penitence overcame his canonical scruples; she was baptized, and, disguising herself in male attire and in the dress of a penitent, she retired to the grotto on the Mount of Olives which still bears her name, and there died after three years of strict penance. This story, which seems to combine with the name of the older Pelagia some traits from an actual history referred to by Chrysostom (*Hom. lxvii. in Mat. § 3*), is preserved in a narrative bearing the fictitious name of John, a deacon of the equally fictitious Nonnus, which by internal evidence is assigned by Usener to the second quarter of the 5th century. Usener, however, has shown that the very popular legend has a much older basis, and that, in common with a number of other female saints, including Marina or MARGARITA (*q.v.*), and Pelagia of Tarsus, whose story is closely akin to the Marina legend, Pelagia is only a Christianized travesty of an old local form of Aphrodite. The name of Marina or Pelagia is an epithet of Aphrodite; the parallel figure of Anthusa in Seleucia of Cilicia bears a name to be explained by the Anthera of Cnossus; the corresponding saint at Tyre is Porphyria, corresponding to Venus Purpurissa. The contradictory attributes of a pure virgin and a penitent are explicable in legends proper to the Syrian coast, where Astarte-Aphrodite had correspondingly opposite forms and character; the masculine garb of the converted Pelagia is to be explained from the hermaphrodite Aphroditus-Aphrodite of western Asia, the Cyprian Anathusa.

See Usener, *Legenden der heiligen Pelagia*, Bonn, 1879, and Gildemeister's edition of the Syriac version of the legend of Pelagia of Antioch, *Bonn Univ. Progr.* of 22d March 1879.

PELAGIUS. Of the origin of Pelagius almost nothing is known. The name is supposed to be a Græcized form of the Cymric *Morgan* (*muir*, sea; *gin*, begotten). His contemporaries understood that he was of British birth, and gave him the distinctive appellation *Brito*. He was a large ponderous person, heavy both in body and mind, if we are to believe Jerome ("stolidissimus et Scotorum pultibus prægravatus"). Born during the second half of the 4th century, he was influenced by the monastic enthusiasm which had been kindled in Gaul by Athanasius (336), and which, through the energy of Martin of Tours (361), rapidly communicated itself to the Britons and Scots. For, though Pelagius remained a layman throughout his life, and though he never appears in any strict connexion with a cœnobitical fraternity, he yet adhered to monastic discipline ("veluti monachus"), and distinguished himself by his purity of life and exceptional sanctity ("egregie Christianus"). He seems to have been one of the earliest, if not the very earliest, of that remarkable series of men who issued from the monasteries of Scotland and Ireland and carried back to the Continent in a purified form the religion they had received from it. Coming to Rome in the beginning of the 5th century (his earliest known writing is of date 405), he found a scandalously low tone of morality prevalent. From his extant *Commentaries on the Epistles of St Paul* it may be gathered that men were encouraged to rely on a profession of the Christian creed, and on the magical efficacy of the sacraments, while they entirely neglected to cultivate a Christian character. This state of things Pelagius denounced. But his remonstrances were met by the plea of human weakness ("durum est, arduum est, non possumus, homines sumus, fragili carne circum-

dati"). To remove this plea by exhibiting the actual power of human nature became his first object. It seemed to him that the Augustinian doctrine of total depravity and of the consequent bondage of the will both cut the sinew of all human effort and threw upon God the blame which really belonged to man. Unless men had the power to do God's will, it was vain for Him to declare it. And, if men believed they were incapable of virtue, they would make no effort to reach it. His favourite maxim was, "If I ought, I can." Accordingly, he expressed unmeasured disapproval when he heard a bishop at Rome quoting with approbation the characteristic words of Augustine: "Give what Thou commandest, and command what Thou wilt."

The views of Pelagius did not originate in a conscious reaction against the influence of the Augustinian theology, although each of these systems was developed into its ultimate form by the opposition of the other. Neither must too much weight be allowed to the circumstance that Pelagius was a monk, for he was unquestionably alive to the delusive character of much that passed for monkish sanctity. Yet possibly his monastic training may have led him to look more at conduct than at character, and to believe that holiness could be arrived at by rigour of discipline. This view of things suited his natural temperament, which was essentially matter-of-fact and somewhat shallow. Judging from the general style of his writings, his religious development had been equable and peaceful, not marked by the prolonged mental conflict, the spiritual turmoil, the hand-to-hand wrestling with God, the abrupt transitions, which characterized the experience of his great opponent. With no great depth of mind, he saw very clearly the thing before him, and many of his practical counsels are marked by sagacity, and are expressed with the succinctness of a proverb ("corpus non frangendum, sed regendum est"). His interests were primarily ethical; hence his insistence on the freedom of the will and his limitation of the action of divine grace.

The peculiar tenets of Pelagius, though indicated in the commentaries which he published at Rome previous to 409, might not so speedily have attracted attention had they not been adopted by Cœlestius, a much younger and bolder man than his teacher. Cœlestius had been trained as a lawyer, but abandoned his profession for an ascetic life. When Rome was sacked by the Goths (410) the two friends crossed to Africa. There Pelagius once or twice met with Augustine, but very shortly sailed for Palestine, where he justly expected his opinions would be more cordially received. Cœlestius remained in Carthage with the view of receiving ordination. But Aurelius, bishop of Carthage, being warned against him, summoned a synod, at which Paulinus, a deacon of Milan, charged Cœlestius with holding the following six errors:—(1) that Adam would have died even if he had not sinned; (2) that the sin of Adam injured himself alone, not the human race; (3) that new-born children are in the same condition in which Adam was before the fall; (4) that the whole human race does not die because of Adam's death or sin, nor will the race rise again because of the resurrection of Christ; (5) that the law gives entrance to heaven as well as the gospel; (6) that even before the coming of Christ there were men who were entirely without sin. To these propositions a 7th is sometimes added, "that infants, though unbaptized, have eternal life," a corollary from the third. Cœlestius did not deny that he held these opinions, but he maintained that they were open questions, on which the church had never pronounced. The synod, notwithstanding, condemned and excommunicated him. Cœlestius, after a futile appeal to Rome, repaired to Ephesus, and there received ordination.

In Palestine Pelagius lived unmolested and revered,

until in 415 Orosius, a Spanish priest, came from Augustine to warn Jerome against him. The result was that in June of that year Pelagius was cited before John, bishop of Jerusalem, and charged with holding that man may be without sin, if only he desires it. This prosecution broke down, and in December of the same year Pelagius was summoned before a synod of fourteen bishops at Diospolis (Lydda). The prosecutors on this occasion were two Gallican bishops, Heros of Arles and Lazarus of Aix, but on account of the illness of one of them neither could appear. The proceedings, being conducted in various languages and by means of interpreters, lacked certainty, and justified Jerome's application to the synod of the epithet "miserable." But there is no doubt that Pelagius repudiated the assertion of Coelestius, that "the divine grace and help is not granted to individual acts, but consists in free will, and in the giving of the law and instruction." At the same time he affirmed that a man is able, if he likes, to live without sin and keep the commandments of God, inasmuch as God gives him this ability. The synod was satisfied with these statements, and pronounced Pelagius to be in agreement with Catholic teaching. Pelagius naturally plumed himself on his acquittal, and provoked Augustine to give a detailed account of the synod, in which he shows that the language used by Pelagius was ambiguous, but that, being interpreted by his previous written statements, it involved a denial of what the church understood by *grace* and by man's dependence on it. The North-African church as a whole resented the decisions of Diospolis, and sent up from their synods of Carthage and Mileve (416) an appeal to Innocent, bishop of Rome, who decided the question in favour of the African synods on "the broad, popular, and unanswerable ground that all Christian devotion implies the assistance of divine grace, that it is admitted in every response of the service, in every act of worship." And, though his successor Zosimus wavered for a time, influenced partly by his Greek training, which led him to consider the points in dispute as idle, and partly by the *Confession of Faith* which Pelagius had addressed to the see of Rome, he at length fell in with what he saw to be the general mind of both the ecclesiastical and the civil powers. For, simultaneously with the largely attended African synod which finally condemned Pelagianism in the West, an imperial edict was issued at Ravenna on 30th April 418, peremptorily determining the theological question and enacting that not only Pelagius and Coelestius but all who accept their opinions shall suffer confiscation of goods and irrevocable banishment. Thus prompted, Zosimus drew up a circular inviting all the bishops of Christendom to subscribe a condemnation of Pelagian opinions. To this document signature was refused by nineteen Italian bishops, among whom was Julian of Eclanum (Apulia), a man of good birth, approved sanctity, and great capacity, who now became the recognized leader of the movement. But not even his acuteness and zeal could redeem a cause which was rendered hopeless when the Eastern Church (Ephesus, 431) confirmed the decision of the West.

Pelagianism.

The system of Pelagius is a consistent whole, each part involving the existence of every other. Starting from the idea that "ability limits obligation," and resolved that men should feel their responsibility, he insisted that man is able to do all that God commands, and that there is, and can be, no sin where the will is not absolutely free,—able to choose good or evil. The favourite Pelagian formula, "*Si necessitatis est, peccatum non est; si voluntatis, vitari potest*," has an appearance of finality which imposed on superficial minds. The theory of the will involved in this fundamental axiom of Pelagianism is that which is commonly known as the "liberty of indifference," or "power of contrary choice,"—a theory which affirms the freedom of the will, not in the sense that the individual is self-determined, but in the sense that in each volition and at each
