moment of life, no matter what the previous career of the individual has been, the will is in equipoise, able to choose good or evil. We are born characterless (*non pleni*), and with no bias towards good or evil (*ut sine virtute, ita et sine vitio*). It follows that we are uninjured by the sin of Adam, save in so far as the evil example of our predecessors misleads and influences us (*non propagine sed exemplo*). There is, in fact, no such thing as original sin, sin being a thing of will and not of nature; for if it could be of nature our sin would be chargeable on God the creator. This will, capable of good as of evil, being the natural endowment of man, is found in the heathen as well as in the Christian, and the heathen may therefore perfectly keep such law as they know. But, if all men have this natural ability to do and to be all that is required for perfect righteousness, what becomes of grace, of the aid of the Holy Spirit, and, in a word, of Christianity? Pelagius vacillates considerably in his use of the word "*grace*." Sometimes he makes it equivalent to natural endowment. Indeed one of his most careful statements is to this effect: "We distinguish three things—the ability, the will, the act (*posse, velle, esse*). The ability is in nature, and must be referred to God, who has bestowed this on His creature; the other two, the will and the act, must be referred to man, because they flow from the fountain of free will" (*Aug., De Gr. Christi, c. 4*). But at other times he admits a much wider range to grace, so as to make Augustine doubt whether his meaning is not, after all, orthodox. But, when he speaks of grace "*sanctifying*," "*assisting*," and so forth, it is only that man may "*more easily*" accomplish what he could with more difficulty accomplish without grace. A decisive passage occurs in the letter he sent to the see of Rome along with his *Confessio Fidei*: "We maintain that free will exists generally in all mankind, in Christians, Jews, and Gentiles; they have all equally received it by nature, but in Christians only it is assisted by grace. In others this good of their original creation is naked and unarmed. They shall be judged and condemned because, though possessed of free will, by which they might come to the faith and merit the grace of God, they make an ill use of their freedom; while Christians shall be rewarded because, by using their free will aright, they merit the grace of the Lord and keep His commandments" (*ib.*, c. 33, 34). Pelagius allowed to grace everything but the initial determining movement towards salvation. He ascribed to the unassisted human will power to accept and use the proffered salvation of Christ. It was at this point his departure from the Catholic creed could be made apparent: Pelagius maintains, expressly and by implication, that it is the human will which takes the initiative, and is the determining factor in the salvation of the individual; while the church maintains that it is the divine will that takes the initiative by renewing and enabling the human will to accept and use the aid or grace offered.

Semipelagianism.

It was easy for Augustine to show that this was an "impia opinio"; it was easy for him to expose the defective character of a theory of the will which implied that God was not holy because He is necessarily holy; it was easy for him to show that the positions of Pelagius were anti-Scriptural (see AUGUSTINE); but, though his arguments prevailed, they did not wholly convince, and the rise of Semipelagianism—an attempt to hold a middle course between the harshness of Augustinianism and the obvious errors of Pelagianism—is full of significance. This earnest and conciliatory movement discovered itself simultaneously in North Africa and in southern Gaul. In the former church, which naturally desired to adhere to the views of its own great theologian, the monks of Adrumetum found themselves either sunk to the verge of despair or provoked to licentiousness by his predestinarian teaching. When this was reported to Augustine he wrote two elaborate treatises to show that when God ordains the end He also ordains the means, and if any man is ordained to life eternal he is thereby ordained to holiness and zealous effort. But meanwhile some of the monks themselves had struck out a *via media* which ascribed to God sovereign grace and yet left intact man's responsibility. A similar scheme was adopted by Cassian of Marseilles (hence Semipelagians are often spoken of as *Massilians*), and was afterwards ably advocated by Vincent of Lerins and Faustus of Rhegium. These writers, in opposition to Pelagius, maintained that man was damaged by the fall, and seemed indeed disposed to purchase a certificate of orthodoxy by the abusive epithets they heaped upon Pelagians (*raae, muscae moriturae*, &c.). The differentia of Semipelagianism is the tenet that in regeneration, and all that results from it, the divine and the human will are co-operating (*synergistic*) coefficient factors. After finding considerable acceptance, this theory was ultimately condemned, because it retained the root-principle of Pelagianism,—that man has some ability to will good and that the beginning of salvation may be with man. The councils of Orange and Valence (529), however, which condemned Semipelagianism, did so with the significant restriction that predestination to evil was not to be taught,—a restriction so agreeable to the general feeling of the church that, three centuries after, Gottschalk was sentenced to be

degraded from the priesthood, scourged, and imprisoned for teaching reprobation. The questions raised by Pelagius continually recur, but, without tracing the strife as sustained by Thomists and Jansenists on the one side and the Jesuits and Arminians on the other, this article can only indicate the general bearing of the controversy on society and the church.

The anthropology of Pelagius was essentially naturalistic. It threatened to supersede grace by nature, to deny all immediate divine influence, and so to make Christianity practically useless. Pelagius himself did not carry his rationalism through to its issues; but the logical consequence of his system was, as Augustine perceived, the denial of the atonement and other central truths of revealed religion. And, while the Pelagians never existed as a sect separate from the church catholic, yet wherever rationalism has infected any part of the church there Pelagianism has sooner or later appeared; and the term "Pelagian" has been continued to denote views which minimize the effects of the fall and unduly magnify man's natural ability. These views and tendencies have appeared in theologies which are not in other respects rationalistic, as, e.g., in Arminianism; and their presence in such theologies is explained by the desire to remove everything which might seem to discourage human effort.

It is not easy to determine how far the vices which ate so deeply into the life of the church of the Middle Ages were due to the sharpness with which some of the severer features of the Augustinian theology were defined during the Pelagian controversy. The pernicious belief in the magical efficacy of the sacraments and the consequent defective ethical power of religion, the superstitious eagerness to accept the church's creed without examining or really believing it, the falsity and cruelty engendered and propagated by the idea that in the church's cause all weapons were justifiable, these vices were undoubtedly due to the belief that the visible church was the sole divinely-appointed repository of grace. And the sharply-accentuated tone in which Augustinianism affirmed man's inability quickened the craving for that grace or direct agency of God upon the soul which the church declared to be needful and administered through her divinely-appointed persons and sacraments, and thus brought a decided impulse to the development of the sacerdotal system.

Again, although it may fairly be doubted whether, as Baur supposes, Augustine was permanently tainted with the Manichaean notion of the inherent evil of matter, it can scarcely be questioned that his views on marriage as elicited by the Pelagian controversy gave a considerable impulse to the already prevalent idea of the superiority of virginity. When the Pelagians declared that Augustine's theory of original sin discredited marriage by the implication that even the children of the regenerate were born in sin, he could only reply (*De Nuptiis et Concupiscentia*) that marriage now cannot partake of the spotless purity of the marriage of unfallen man, and that, though what is evil in concupiscence is made a good use of in marriage, it is still a thing to be ashamed of,—not only with the shame of natural modesty (which he does not take into account) but with the shame of guilt. So that, even although he is careful to point out the advantages of marriage, an indelible stigma is still left even on the lawful procreation of children.

The remark of Milman, that "all established religions subside into Pelagianism, or at least semi-Pelagianism," is unexpected, but the converse remark, that "no Pelagian ever has or ever will work a religious revolution," may be easily substantiated. It has indeed become a commonplace of historical science that in order to do or to endure great things men must believe in one form or other of predestination. They must feel confident that they are made use of by God to accomplish things that to Him seem worthy, and that until these be accomplished no earthly power can defeat or harm them. They must feel that their will is embraced in the divine and empowered by it. And it is the consciousness of their own impotence that leads men to yield themselves as instruments of the divine power. Pelagianism is the creed of quiet times and commonplace people; Augustinianism is the inevitable faith of periods that are dangerous and eventful, and in which men must exhibit some heroism.

Of the writings of Pelagius there have been preserved to us in the works of Jerome (5th vol. of Martianay's ed., and 11th vol. of Vallarsi's ed.);—(1) *Commentarii in Epistolam Pauli*; (2) *Epistola ad Demetriadem* (also published separately by Semler, Halle, 1775); (3) *Libellus Fidei*. But in Augustine's various writings against Pelagianism (in the 10th vol., Bened. ed.) many passages are cited from the writings of Pelagius; and in the appendix of the same volume a valuable collection of documents connected with the controversy will be found. In the ordinary histories of the church other authorities are mentioned, and reference need here be made only to Wiggers, *Versuch . . . des Augustinismus und Pelag.* (Hamburg, 1833; translated by Emerson, Andover, 1840); Worter, *Der Pelagianismus* (2d ed., Freiburg, 1874); Guizot, *Histoire de la Civilisation en France*, 5 leçon; M. Izley, *Augustin's Doctrine of Predestination* (London, 1855); and Cunningham, *Historical Theology* (Edin., 1865). (M. D.)

PELAGIUS I., pope from 555 to 560, was a Roman by birth, and first appears in history at Constantinople in the rank of deacon, and as apocrisiarius of Pope Silverius, whose overthrow in favour of Vigilius his intrigues pro-

moted. Vigilius continued him in his diplomatic appointment, and he was sent by the emperor Justinian in 542 to Antioch on ecclesiastical business; he afterwards took part in the synod at Gaza which deposed Paul of Alexandria. In his official position he had amassed some wealth, which on his return to Rome he so employed among the poor as to secure for himself great popularity; and, when Vigilius was summoned to Byzantium in 544, Pelagius, now archdeacon, was left behind as his vicar, and by his tact in dealing with Totila, the Gothic invader, succeeded in saving the citizens from murder and outrage. He appears subsequently to have followed his master to Constantinople, and there to have taken part in the Three Chapters controversy; in 553, at all events, he signed the "constitutum" of Vigilius in favour of these, and for refusing, along with him, to accept the decrees of the fifth general council (the 2d of Constantinople, 553) shared his sentence of exile. Like Vigilius, he afterwards, however, condemned the chapters, and accordingly, when the citizens of Rome, through the mediation of Narses, begged for the restoration of the pope and his clergy, both were recalled from banishment. The emperor now asked the Roman representatives whom they should prefer—Vigilius or Pelagius—and it may safely be presumed that their reply, to the effect that they would not choose the latter as long as the former was alive, was hardly such as Justinian had expected or wished. Both set out for Rome, but Vigilius died mysteriously on the way at Syracuse. Pelagius, as the nominee of Justinian, at once succeeded on his arrival in Rome, but most of the clergy, suspecting his orthodoxy, and believing him to have had some share in the unlooked-for removal of his predecessor, shunned his fellowship, and only two bishops and one presbyter could be got to take part in his ordination to the pontificate. He enjoyed, however, the support of Narses, and, after he had publicly purged himself of the charge of complicity in Vigilius's death by solemn oath in the church of St Peter, he met with toleration, at least so far as his own immediate diocese was concerned, the populace remembering his former charities and his success in dealing with Totila. The rest of the Western bishops, however, still held aloof from the man who, by condemning the Three Chapters, had put a slight, as they thought, upon the council of Chalcedon; and the episcopate of Tuscany caused his name to be removed from the diptychs. This elicited from him a circular, in which he asserted his loyalty to the four general councils, and declared that in their action against the holy see the hostile bishops had been guilty of schism. The bishops of Liguria and Æmilia, headed by the archbishop of Milan, and those of Istria and Venice, headed by Paulinus of Aquileia, also withheld their fellowship from one who had taken part in the council of Constantinople; but Narses resisted the appeals of Pelagius, who would fain have invoked the secular arm. Childebert, king of the Franks, also, even after the pope had sent a confession of his faith, refused to interfere. Pelagius died on 3d March 560, and was succeeded by John III.

PELAGIUS II., a native of Rome, but of Gothic descent, was pope from 578 to 590, having been consecrated successor of Benedict I., without awaiting the sanction of the emperor, on 27th November of the former year. To make his apologies for this irregularity he sent deacon Gregory, who afterwards became Pope Gregory the Great, as his apocrisiarius to Constantinople. In 585 he sought to heal the schism which had subsisted since the time of Pelagius I. in connexion with the Three Chapters controversy by writing to the bishops of Istria with the exhortation to "avoid foolish and unlearned questions," but his efforts as a peacemaker were without success. In 588 John, patriarch of Constantinople, by reviving the

old and disputed claim to the title of œcumenic patriarch, elicited a vigorous protest from Pelagius, but the decretal which professes to convey the exact words of the document is now known to be false. He died in January 590, and was succeeded by Gregory I.

PELASGI. See **GREECE**, vol. xi. p. 90, and **ITALY**, vol. xiii. p. 444.

PELEW (PELLEW, PALAU, or PALAO) ISLANDS, a group in the western Pacific at the intersection of 134° 30' E. long. by 7°, 8°, and 9° N. lat., which, as it is often considered part of the Caroline Archipelago, has been described in the article **CAROLINE ISLANDS**, vol. v pp. 125, 126. The name *Islas Palaos*, by which the islands are first designated, is of doubtful but certainly not of native origin, and was originally applied by the Spaniards in an indefinite way to all the islands east of Mindanao (Philippines). The English form "Pelew" may be a corruption either of Palao or of Peleliu (Pellelew), the proper name of one of the southern islands. According to Miklukho-Maklay (*Izvestiya of the Imp. Russian Geogr. Soc.*, 1878, pp. 257-297; cf. *Zeitschr. f. Ethnol.*, Berlin, 1878) the ordinary nomenclature on our maps is often erroneous, the correct forms being Babeltop, Kayangel (not Yanguel or Kiangle), N'yaur (not Angaur or Angour), Arkledeu (not Korph), Namalakal (not Amanakal), &c. The men vary in height from 5 feet to 5 feet 7 inches, the women from 4 feet 9 to 5 feet 2. The character of the hair differs greatly in different individuals; both sexes wear it wound up in a back-knot. Tattooing (but not of a very elaborate type) is in vogue, especially among the women, by whom the operation is always performed. The skull shows a strong tendency to brachycephalism. Adults of both sexes have their teeth carefully blackened by *teldalek* (a kind of earth). Sir John Lubbock (*The Origin of Civilisation*) places the Pelew Islanders among the peoples destitute of religion; but Miklukho-Maklay found among them a well-developed Shamanism, every village having a *kalit*, or shaman, and the group containing five high kalits with an extensive jurisdiction. The ornithology of the Pelew Islands has been investigated by Dr Otto Finsch (*Journal des Muséum Godeffroy*, 1875), who enumerates fifty-six species, of which twelve are peculiar to the group. The occurrence of *Gallus bankiva* and the Nicobar pigeon and the absence of parrots and finches are points of interest.

PELHAM, HENRY (1696-1754), prime minister of England, was the younger brother of Thomas Hollis Pelham, duke of Newcastle, and was born in 1696. He was educated by a private tutor and at Christ Church, Oxford, which he entered in July 1710. As a volunteer he served in Dormer's regiment at the battle of Preston in 1715; subsequently he spent some time on the Continent, and in 1718 entered parliament for Seaford, Sussex. Through strong family influence and the recommendation of Walpole he was chosen in 1721 a lord of the treasury. The following year he was returned for Sussex county. In 1724 he entered the cabinet as secretary of war, but this office he exchanged in 1730 for the more lucrative one of paymaster of the forces. He made himself conspicuous by his support of Walpole on the question of the excise, and during the subsequent attacks, which ultimately led to his resignation in 1742. In the following year a union of parties resulted in the formation of the administration of which Pelham was prime minister, with the additional office of chancellor of the exchequer. Being strongly in favour of peace, he carried on the war with languor and indifferent success, but the country, wearied of the interminable struggle, was disposed to acquiesce in his foreign policy almost without a murmur. The king, thwarted in his favourite schemes,

made overtures in 1746 to Lord Bath, but his purpose was upset by the sudden resignation of the Pelhams, who, however, at the king's request, immediately resumed office. His very defects were, in the peculiar condition of parties, among the chief elements of Pelham's success, for one with a strong personality, moderate self-respect, or high conceptions of statesmanship could not have restrained the discordant elements of the cabinet for any length of time. Moreover, he undoubtedly possessed the important requisites of considerable practical tact and a thorough acquaintance with the details of business and the forms of the House. Whatever quarrels or insubordination might exist within the cabinet, they never broke out into open revolt, and during his administration there was seemingly a complete lull in the strife of parties. Nor can a high degree of praise be denied to his financial policy, especially his plans for the reduction of the national debt and the simplification and consolidation of its different branches. He died 6th March 1754.

See Cox, *Memoirs of the Pelham Administration*, 2 vols., 1829.

PELIAS, PELIADES. Pelias, a celebrated character in Greek fable, was the son of Poseidon and Tyro, daughter of Salmoneus. Because Tyro afterwards married her father's brother Cretheus, king of Iolcus in Thessaly, to whom she bore Æson, Pheres, and Amythaon, Pelias was by some thought to be the son of Cretheus. He and his twin-brother Neleus were exposed by their mother, but were found and nurtured by a herdsman, who called one of them Pelias, because his face was discoloured by a blow from the hoof of a mare, and the other Neleus, because a bitch had out of pity suckled him. When grown to manhood they discovered their mother, and Pelias slew Sidero, Tyro's stepmother, on the altar of Hera, whither she had fled, because she had ill-used their mother. On the death of Cretheus Pelias made himself master of the kingdom of Iolcus. (According to others, after the death of his half-brother Æson, he ruled as regent for Æson's son Jason.) He had previously quarrelled with his brother Neleus, who went to Messenia, where he founded Pylus. Pelias married Anaxibœa, daughter of Bias, or, according to others, Philomache, daughter of Amphion, and became the father of a son, Acastus, and of daughters, Pisidice, Pelopea, Hippothoe, and Alcestis; to these daughters (called Peliades after their father) others add Amphinome, Evadne, Asteropœa, and Antinoe. In order to rid himself of Jason Pelias sent him to Colchis in quest of the golden fleece, and he availed himself of the absence of the son in order to put to death his father Æson together with his mother and brother. When Jason returned with the golden fleece he cast about how he should avenge the death of his parents. In this he was helped by Medea, who persuaded the Peliades to cut in pieces and boil their father Pelias, assuring them that he would thus be restored to youth. Acastus drove out Medea and celebrated far-famed funeral games in honour of his father. The Peliades fled to Mantinea in Arcadia, where their graves were shown in the time of Pausanias.

The tragic death of Pelias was the subject of Sophocles's drama *Rhizotomoi* (Root-cutters), and in the *Tyro* he treated another portion of the legend. *Peliades* was the name of Euripides's first play.

PELICAN (Fr. *Pélican*, Lat. *Pelecanus* or *Pelicanus*), a large fish-eating water-fowl, remarkable for the enormous pouch formed by the extensible skin between the lower jaws of its long, and apparently formidable but in reality very weak, bill. The ordinary Pelican, the *Onocrotalus* of the ancients, to whom it was well known, and the *Pelecanus onocrotalus* of ornithologists, is a very abundant bird in some districts of South-eastern Europe, South-western Asia, and North-eastern Africa occasionally straying. It is

believed, into the northern parts of Germany and France; but the possibility of such wanderers having escaped from confinement is always to be regarded,¹ since few zoological gardens are without examples which are often in the finest condition. Its usual haunts are the shallow margins of the larger lakes and rivers, where fishes are plentiful, since it requires for its sustenance a vast supply of them, pursuing them under water, and rising to the surface to swallow those that it has captured in its capacious pouch. The nest is formed among the reeds that border the waters it frequents, placed on the ground and lined with grass. Therein two eggs, with white, chalky shells, are commonly laid. The young during the first twelvemonth are of a grayish-brown, but this dress is slowly superseded by the growth of white feathers, until when mature almost the whole plumage, except the black primaries, is white, deeply suffused by a rich blush of rose or salmon-colour, passing into yellow on the crest and lower part of the neck in front. A second and somewhat larger species, *Pelecanus crispus*, also inhabits Europe, but in smaller numbers. This, when adult, is readily distinguishable from the ordinary bird by the absence of the blush from its plumage, and by the curled feathers that project from and overhang each side of the head, which with some differences of coloration of the bill, pouch, bare skin round the eyes, and irides give it a wholly distinct expression.² Two specimens of the humerus of as many Pelicans have been found in the English fens (*Ibis*, 1868, p. 363; *Proc. Zool. Society*, 1871, p. 702), thus proving the former existence of the bird in England at no very distant period, and one of them being that of a young example points to its having been bred in this country. It is possible from their large size that they belonged to *P. crispus*. Ornithologists have been much divided in opinion as to the number of living species of the genus *Pelecanus* (cf. *op. cit.*, 1868, p. 264; 1869, p. 571; 1871, p. 631)—the estimate varying from six to ten or eleven; but the former is the number recognized by the latest author on the subject, M. Dubois (*Bull. Mus. de Belgique*, 1883). North America has one, *P. erythrorhynchus*, very similar to *P. onocrotalus* both in appearance and habits, but remarkable for a triangular, compressed, horny excrescence which is developed on the ridge of the male's bill in the breeding season, and, as ascertained by Mr Ridgway (*Ibis*, 1869, p. 350), falls off without leaving trace of its existence when that is over. Australia has *P. conspicillatus*, easily distinguished by its black tail and wing-coverts. Of more marine habit are *P. philippensis* and *P. fuscus*, the former having a wide range in Southern Asia, and, it is said, reaching Madagascar, and the latter common on the coasts of the warmer parts of both North and South America.

The genus *Pelecanus* as instituted by Linnæus included the CORMORANT (vol. vi. p. 407) and GANNET (vol. x. p. 70) as well as the true Pelicans, and for a long while these and some other distinct groups, as the SNAKE-BIRDS (*q.v.*), FRIGATE-BIRDS (vol. ix. p. 786), and TROPIC-BIRDS (*q.v.*), which have all the four toes of the foot connected by a web, were regarded as forming a single family, *Pelecanidae*; but this name has now been restricted to the Pelicans only, though all are still usually associated under the name *Steganopodes* (ORNITHOLOGY, p. 46). It may be necessary to state that there is no foundation for the venerable legend of the Pelican feeding her young with blood from

her own breast, which has given it an important place in ecclesiastical heraldry, except that, as Mr Bartlett has suggested (*Proc. Zool. Society*, 1869, p. 146), the curious bloody secretion ejected from the mouth of the Flamingo may have given rise to the belief, through that bird having been mistaken for the "Pelican of the wilderness." (A. N.)

PELIGNI. See ITALY, vol. xiii. p. 444.

PÉLISSIER, JEAN JACQUES AMABLE (1794-1864), duke of Malakhoff, marshal of France, was born 6th November 1794 at Maïommo (Seine Inférieure), where his father was employed in a powder-magazine. After attending the military college of La Flèche and the special school of St Cyr, he in 1815 entered the army as sub-lieutenant in an artillery regiment. A brilliant examination in 1819 secured his promotion to the staff. He served as aide-de-camp in the Spanish campaign of 1823, and in the expedition to the Morea in 1828-29, at the conclusion of which he received the grand cross. In 1830 he took part in an expedition to Algeria, and on his return was promoted to the rank of major. Nine years later he was again sent to Algeria as chief of the staff with the rank of lieutenant-colonel, and remained there in active service till the Crimean war, taking a prominent part in many important operations, and, by gradual promotion, advancing to the rank of general of division. The merciless severity of his conduct in suffocating a whole Arab tribe in a cavern, where they had taken refuge and refused to surrender, awakened in 1846 such a strong feeling of indignation in Europe that Marshal Soult, the French minister of war, expressed in the chambers his regret at its occurrence; but Marshal Bugeaud, the governor-general of Algeria, not only gave it his approval but shortly afterwards secured for Pélissier further promotion. On the declaration of war with Russia Pélissier was sent to the Crimea, where on 16th May 1855 he succeeded Marshal Canrobert as commander-in-chief of the French forces before Sebastopol. After the capture of the fortress he was, on the 12th September, promoted to be marshal. On his return to Paris he was named senator, created duke of Malakhoff (22d July 1856), and rewarded with a grant of 100,000 francs per annum. From March 1858 to May 1859 he acted as French ambassador in London, whence he was recalled to take command of the army of observation on the Rhine. In 1860 he was appointed governor-general of Algeria; and he died there 22d May 1864.

See ALGERIA (vol. i. pp. 568, 569); Marbaud, *Le Maréchal Pélissier*, 1863; Castille, *Portraits Historiques*, 2d series, 1859.

PELL, JOHN (1610-1685), mathematician, was born on 1st March 1610 at Southwick in Sussex, where his father was minister. He was educated at the free school of Steyning, and entered Trinity College, Cambridge, at the age of thirteen. During his university career he made himself an accomplished linguist, and even before he took his M.A. degree (in 1630) he was engaged in learned correspondence with Briggs and other mathematicians. His great reputation and the influence of Sir William Boswell, the English resident, with the States-General procured his election in 1643 to the chair of mathematics in Amsterdam, whence he removed in 1646, on the invitation of the prince of Orange, to Breda, where he remained till 1652.

From 1654 to 1658 Pell acted as Cromwell's political agent to the Protestant cantons of Switzerland. On his return to England he took orders and was appointed by Charles II. to the rectory of Fobbing in Essex, and in 1673 he was presented by Bishop Sheldon to the rectory of Laindon in the same county. His devotion to mathematical science seems to have interfered alike with his advancement in the church and with the proper management of his private affairs. Cheated, it is said, by his tenants and relations, he was reduced to the utmost

¹ This caution was not neglected by the prudent, even so long ago as Sir Thomas Browne's days; for he, recording the occurrence of a Pelican in Norfolk, was careful to notice that about the same time one of the Pelicans kept by the king (Charles II.) in St James's Park had been lost.

² It is also said to have twenty-two rectrices, while the ordinary species has only eighteen.

poverty. For a time he was confined as a debtor in the King's Bench prison. He lived, on the invitation of Dr Whistler, for a short time in 1682 at the College of Physicians, but died 12th December 1685 at the house of Mr Cothorne, reader of the church of St Giles in the Fields. He was buried at the expense of the rector of this church and of Dr Busby, the master of Westminster School. Many of Pell's manuscripts fell into the hands of Dr Busby, and afterwards came into the possession of the Royal Society; they are still preserved in something like forty folio volumes, which contain, not only Pell's own memoirs, but much of his correspondence with the mathematicians of his time.

The Diophantine analysis was a favourite subject with Pell; he lectured on it at Amsterdam; and he is now best remembered for his solution of the indeterminate equation, $ax^2 - y^2 = 1$, which is now known by his name, and which had been proposed by Fermat as a challenge to the English mathematicians. His chief works are *Astronomical History of Observations of Heavenly Motions and Appearances*, 1634; *Ecliptica Prognostica*, 1634; *Controversy with Longomontanus concerning the Quadrature of the Circle*, 1646 (?); *An Idea of the Mathematics*, 12mo, 1650; *Branker's Translation of Rhonius's Algebra, much altered and augmented*, 4to, 1668; *A Table of Ten Thousand Square Numbers*, fol., 1672.

PELLA. See MACEDONIA, vol. xv. p. 137.

PELLAGRA (Ital. *pelle agra*, smarting skin) is the name given, from one of its early symptoms, to a peculiar disease, of comparatively modern origin, occurring among the peasantry in Lombardy and other provinces of northern Italy, and in the Asturias (*mal de la rosa*), Gascony, Roumania, and Corfu. It is a progressive disease of nutrition tending towards profound paralytic and mental disorders, and is associated to a very significant extent, if not even invariably, with a staple diet of damaged maize along with other peculiarly wretched and hopeless conditions of living. Although Lombardy is the garden of Italy, its peasantry are over-worked, under-paid, and under-fed; instead of a diet suited to their severe labour, their sustenance consists largely of the more worthless kinds of Indian corn of their own growing, the produce of poorly-cultivated ground, sown late, harvested before maturity, and stored carelessly in its wet state; even if they grow a certain proportion of good maize-corn the millers, to whom they are often in debt, are more likely to grind the worst samples for the peasants' own use. The flour is either made into a kind of porridge—the "polenta" of Italy, the "cruchade" of Gascony, or the "mamaliga" of Roumania—or it is made into loaves, without yeast, baked hastily on the surface only or on one side, and raw and wet within, large enough to last a week, and apt to turn sour and mouldy before the week is out.¹

That pellagra is not a *morbus miseræ* pure and simple, wanting some more specific cause, will be at once apparent when we consider that the misery of living is as old as the human race, whereas pellagra is a disease of the last hundred years or so, and that in Ireland, Russia, Upper Silesia, Galicia, or other headquarters of the *morbi miseræ*,

¹ Of the peasantry of the Asturias, Townsend, a traveller of the last century, says:

"They eat little flesh, they drink little wine; their usual diet is Indian corn, with beans, peas, chestnuts, apples, pears, melons, and cucumbers; and even their bread, made of Indian corn, has neither barn nor leaven, but is unfermented, and in the state of dough; their drink is water" (li. 14).

The following is the most recent account (by Dr Petit) of the condition of the peasantry in the pellagrous district of the Gironde:

"The cultivation of this district consists of millet, rye, a small quantity of maize, and a few rare vineyards. The soil does not suffice for the nourishment of the miserable population who cultivate it. They are slovenly, and sleep in their clothes; their labour is in general of the severest kind, and they are very ill fed. Their food is mostly a porridge of millet; maize is rarely part of their diet [elsewhere he says, "in all these provinces the flour of maize enters largely into the food of the people"], which includes a little rye-bread, sour most of the time, a few sardines, and rancid lard. Meat is almost excluded from their food; sometimes on *feita-days* one may see a quarter of mutton or veal at the repast. Their usual drink is water, and mostly bad water; wine is not drunk except in well-to-do families. Their dwellings are deplorable; they are low-roofed and damp, built of wattle, and constantly enveloped in reek. It often happens that man and beast live together. Pellagra rages as an endemic among these populations."

pellagra is unknown. The special factor is undoubtedly maize as an article of diet or as the staple diet; but it is, on the other hand, perfectly clear that there is nothing in a maize diet itself to induce pellagra. Compared with the enormous extent of the maize-zone both in the western and eastern hemispheres, the pellagra-area is a mere spot on the map; excluding Corfu, it lies between the parallels of 46° and 42° N.; and the exception of Corfu is a significant one. It is only since 1856 that pellagra has become endemic in that island. Maize has always thriven well there; but wine-growing has displaced it to a great extent, and the maize, which is still largely in request with the peasantry, is now mostly imported; it is in fact chiefly Roumanian maize of an inferior kind, and all the more deteriorated owing to its long water-transit by way of the Danube and Black Sea. Again, in the Danubian provinces themselves the peasantry of Transylvania, who are by no means well off, are free from pellagra, notwithstanding their addiction to polenta, having long ago learned the art of husbandry from the Saxon part of the population; they allow the maize to ripen to the utmost, and then let it dry on the ground and afterwards in barns, whereas the Wallack peasantry of Roumania, who are subject to pellagra, gather the corn before it is ripe, and shoot it into pits where it becomes musty. In other countries where the conditions of climate and soil are somewhat trying for maize, as in Burgundy, Franche Comté, and the Bresse in France, and in Mexico, the greatest care is taken to dry the Indian corn before it is stored; and it may be said that wherever these precautions are taken pellagra does not follow. It has happened on several occasions, after a particularly bad maize-harvest, that pellagra has risen almost to an epidemic. Again, its prevalence within its actual endemic area varies much from province to province or from commune to commune, being always last where the maize-diet is supplemented by wheaten flour, rice, beans, chestnuts, potatoes, or fish.

Characters of the Disease.—The indications of pellagra usually begin in the spring of the year, declining towards autumn, and recurring with increasing intensity and permanence in the spring seasons following. A peasant who is acquiring the malady feels unfit for work, suffers from headaches, giddiness, singing in the ears, a burning of the skin, especially in the hands and feet, and diarrhœa. At the same time a red rash appears on the skin, of the nature of erysipelas, the red or livid spots being tense and painful, especially where they are directly exposed to the sun. About July or August of the first season these symptoms disappear, the spots on the skin remaining rough and dry. The spring attack of the year following will probably be more severe and more likely to leave traces behind it; with each successive year the patient becomes more like a mummy, his skin shrivelled and fallow, or even black at certain spots, as in Addison's disease, his angles protruding, his muscles wasted, his movements slow and languid, and his sensibility diminished. Meanwhile there are more special symptoms relating to the nervous system, including drooping of the eyelid, dilatation of the pupil, and other disorders of vision, together with symptoms relating to the digestive system, such as a red and dry tongue, a burning feeling in the mouth, pain on swallowing, and diarrhœa. Peasants with this progressive malady upon them come to the towns spring after spring seeking relief at the various hospitals, and under a good regimen and a permanently improved diet the malady is often checked. But after a certain stage the disease is confirmed in a profound disorganization of the nervous system; spasms of the limbs begin to occur, and contractures of the joints from partial paralysis of the extensor muscles and preponderant action of the flexors; melancholy, imbecility,

and a strong suicidal tendency are common accompaniments. A large number of pellagrous peasants end their days in lunatic asylums in a state of drivelling wretchedness or raving madness; many more drag out a miserable existence in the communes where their working years had been spent, sometimes receiving the communal relief to which the law entitles them; while the cases that are reckoned curable are in Italy received into the various endowed hospitals, of which there are a large number. Cases that are rapidly fatal end in delirium or a state of typhoid stupor; the more protracted cases are cut off at last by rapid wasting, colliquative and ill-smelling sweats, profuse diarrhoea, and dropsy. After death a variety of textural changes are found, which may be referred in general to trophic disorders, or disorders of tissue-nutrition; in a considerable number the kidneys are in the contracted state corresponding to the clinical condition of Bright's disease without albuminuria; another condition often remarked is thinning of the muscular coats of the intestine; deposits of pigment in the internal organs are also characteristic, just as the discoloration of the skin is during life.

Treatment.—There is hardly any doubt as to the remedy for pellagra, just as there is hardly any doubt as to its cause. The question is mainly one of the social condition of the peasantry, of their food and wages; it is partly, also, a question of growing Indian corn on a soil or in a climate where it will not mature unless with high farming. There is nothing in the resources of medicine proper to cure this disease; as the cause is, so must the remedy be.

Affinities of Pellagra.—The disease has the general characters of a tropho-neurosis. The early involvement of certain areas of the skin, especially in exposed places such as the hands and feet, suggests leprosy; as in that disease, there is first hyperæsthesia and then loss of sensibility, sometimes a thickening of the surface and discolorations; and, although in pellagra the onset each successive spring and the subsidence towards autumn are distinctive, yet in leprosy also the cutaneous disorder is apt to come and go at first, reappearing at the same spots and gradually becoming fixed. The grand difference in leprosy, at least in the nodular variety of it, is that a new growth of a granulomatous kind arises at these spots in the skin and around the nerves. The occasional deep discoloration of the pellagrous skin in certain spots has suggested a resemblance to Addison's disease of the suprarenals, and has even made the diagnosis difficult. But after the cutaneous disorders the course of pellagra is something *sui generis*; the melancholy, imbecility, or mania, as well as the mutilated state of the body, are peculiar to it. With ergotism the points of resemblance are more perhaps in the causation than in the nosological characters; both diseases are specifically due to damaged grain, ergotism being caused by the presence of an actual bulky parasitic mould on rye, whereas pellagra is more probably caused by fermentation and decomposition within the proper substance of the maize-corn. As regards heredity, it is much less marked in pellagra than in leprosy, but there are good grounds for believing that the disease is in fact inherited sometimes by the offspring; infants at the breast may show the symptoms of it, but that fact is not in itself conclusive for heredity, for the reason that infants at the breast are partly fed on the household polenta. As regards contagiousness, there is no more proof of it in pellagra than there is in leprosy.

Geographical Distribution and History.—Pellagra is peculiarly a disease of the peasantry, being hardly ever seen in residents of the towns. In Italy the number of peasants affected by it was estimated in 1879 at 100,000, the distribution being as follows:—Lombardy, 40,833; Venetia, 29,386; Piedmont, 1692; Liguria, 143; Emilia, 13,728; Tuscany, 4382; the Marches and Umbria, 2155; Rome, 76. In Lombardy the worst centres are in the provinces of Brescia, Pavia, Piacenza, and Ferrara. In Italy the disease has increased very considerably within the last thirty years; thus, in the province of Vicenza the number of persons known to be pellagrous in 1853-55 was 1380, in 1860 it was 2974, and in 1879 it had risen to 3400. There are no accurate returns from the Asturias and other affected provinces of Spain, but the malady there is said to have declined very materially of late. In Gascony, where it did not begin until about fifty years ago, it is somewhat common, more in the Landes than in the Gironde; in one district of the latter *Petit* estimates that there are 200 cases in a population of 6000. In Roumania the total number is given at 4500, Moldavia having a larger share than Wallachia. In Corfu it exists in 27 out of the

117 communes, the proportion of cases for the whole island being 3·2 per 1000 inhabitants.

Maize was grown in Europe for many years before pellagra showed itself (see MAIZE); but the outbreak of the disease corresponds on the whole closely in time (particularly in Gascony and Roumania) with the introduction of an inferior kind of maize as the staple food of the peasantry. The first accounts of pellagra come from Spain. Casal in 1762 described the disease in the Asturias under the name of *mal de la rosa*; it is said to have been noticed first in 1735 around Oviedo, being then confined within very narrow limits. The Asturias are still its headquarters in Spain, but it is prevalent also in Burgos, Navarra, Zaragoza, Lower Aragon, Guadalupe, and Cuenca, and it is met with in other provinces as well. In Italy it was first reported from the vicinity of Lago Maggiore, and a few years later (in 1750) it broke out simultaneously in the districts of Milan, Brescia, Bergamo, and Lodi, extending afterwards to Como, Cremona, Mantua, and Pavia, and to the whole of Lombardy before the end of the century. It became endemic also in Venetia on the one side and in Piedmont on the other, almost contemporaneously with this. Within the present century it has extended its area southwards into Emilia and into Tuscany, while it has become more prevalent in its earlier seats at the same time. There is very little of it in central Italy, while southern Italy with Sicily, is absolutely exempt, notwithstanding the common use of Indian corn in the form of bread and macaroni. The first authentic information of its existence in Gascony came from near Arcachon in 1818, after which it spread along the coast of the Gironde and the Landes. It has extended subsequently along the left bank of the Garonne and towards the Pyrenees; but around Dax it is said to have decreased considerably of late. In Roumania, where the medical profession is unanimous in tracing it to the use of damaged maize, it dates from about 1833-46. It is only since 1856 that it has become endemic in Corfu, under the circumstances already mentioned.

Literature.—*La Pellagra in Italia*, Rome, 1880 (official report, with appendices relating to France, Spain, and Roumania, and a copious bibliography extending to fifteen pages). An article on "The Pellagra in Italy," in the *Edin. Rev.* for April 1881, is based on this report. The authority for Corfu is Tympalos. The best inquiries on the toxic properties of damaged maize are those of Lombroso. See also Hirsch, *Historisch-geographische Pathologie*, vol. ii., 2d ed., Stuttgart, 1883 (Engl. trans.). (C. C.)

PELLICANUS, CONRAD (1478-1556), one of the most interesting minor figures in German theology and scholarship in the great age of the Reformation, was born at Ruffach in Alsace in the winter of 1478. His paternal name was Kürsner, his father's father having been a currier of Wyl in the Black Forest. The Latin name of Pellicanus was chosen for him by his mother's brother Jodocus Gallus, an ecclesiastic connected with the university of Heidelberg, who gave his nephew sixteen months at the university at the cost of some fourteen florins in 1491-92. Pellicanus's parents were worthy people, but very poor; the boy was eager for learning, but had no books; at school at Ruffach, where he had learned well, "with much fear and many a scourging," it was only the richer boys who had a copy of the *Ulm Donatus* of 1485. So when his uncle tired of him and he came back to Ruffach, with some knowledge of the great Latin classics as well as of the usual bachelor's course, he was glad to teach gratis in the Minorite convent school that he might borrow books from the library, and in his sixteenth year he resolved to become a friar. This step helped his studies, for he was sent to Tübingen in 1496 and became a favourite pupil of the guardian of the Minorite convent there, Paulus Scriptoris, a man of considerable general learning and of much boldness and honesty, who anticipated Luther in his open preaching on such topics as vows, indulgences, and the sacraments. There seems to have been at that time in south-west Germany a considerable amount of sturdy independent thought among the Franciscans, and more genuine conformity to the original ideas of the order than is often supposed; Pellicanus himself became a Protestant very gradually, and without any such revulsion of feeling as marked Luther's conversion; at the moment when he went to Zurich and threw off the cowl he was pleased to think that the good St Francis would not abhor him for his change of dress, and for learning for the first time at the age of forty-eight the difference between crowns, florins, and batzen. At Tübingen the future "apostate in three

languages" was able to begin the study of Hebrew. He had no teacher and no grammar; but Paulus Scriptoris carried him a huge codex of the prophets on his own shoulders all the way from Mainz. He learned the letters from the transcription of a few verses in the *Star of the Messiah* of Petrus Niger, and, with a subsequent hint or two from Reuchlin, who also lent him the grammar of Moses Kimhi, made his way through the Bible for himself with the help of Jerome's Latin. He got on so well that he was not only a useful helper to Reuchlin but anticipated the manuals of the great Hebraist by composing in 1501 the first Hebrew grammar in a European tongue. It was printed in 1503, and afterwards included in Reysch's *Margarita Philosophica*. Hebrew remained a favourite study to the last. Pellican's autobiography is full of interesting details as to the gradual multiplication of accessible books on the subject, which he hunted up in every journey; and ultimately he not only studied but translated a vast mass of rabbinical and Talmudic texts. With a cooler judgment than Reuchlin, however, he was not deceived as to the true value of the later Hebrew wisdom, and his interest in Jewish literature was mainly philological. In linguistic knowledge he reached a high standard for that time,—certainly higher than that of his better-known pupil, S. Münster. The chief fruit of these studies is the vast Biblical commentary published at Zurich in his later years (1532-39, 7 vols.), which shows a remarkably sound judgment on questions of the text, and a sense for historical as opposed to typological exegesis, such as soon disappeared from the Protestant Church and was hardly equalled by any in his own day. Pellicanus became priest in 1501 and continued to serve his order at Ruffach, Pforzheim, and Basel till 1526. At Basel he did much laborious work for Froben's editions, and acquired a thorough knowledge of the early fathers, through which his dissatisfaction with current dogma gradually ripened into conviction that the church taught many doctrines of which the early doctors of Christendom knew nothing. He spoke his views frankly, but he disliked polemic, and was happy in his convent or in long journeys in the service of his order, which carried him over all south Germany and through Italy as far as Rome; he found also more toleration than might have been expected, even after he became active in circulating Luther's books. Thus, supported by the civic authorities, he remained guardian of the convent of his order at Basel from 1519 till 1524, and, even when he had to give up this post, remained in the monastery for two years, professing theology in the university and always toiling with indefatigable zeal. At length, when the position was becoming quite untenable, he received through Zwingli a call to Zurich as professor of Hebrew, and, formally throwing off his monk's habit, entered on a new life. Here he remained till his death in 1556, falling into his new surroundings with the ease of a simple affectionate nature, happy in the friendship of Zwingli and Bullinger, hospitably entertaining the many learned strangers who visited Zurich or the poor students who crowded to its school, avoiding religious controversy, and always deep in his books. The step in life which cost him most thought was his marriage, but this also proved so happy an experiment that he lived to be married a second time. In his later years he was afflicted with the stone, the torture of so many of the older scholars, but he continued active till the last.

Pellican's scholarship, though not brilliant, was really extensive, his sound sense and his singularly pure and devoted character gave him a great influence, as is apparent even in the too modest autobiography which he wrote for his son. He was curiously free from the pedantry of the time for a man who had lived so much among books; his views about the use of the German vernacular as a vehicle of culture (*Chron.*, 135, 36) are a striking proof of this.

As a theologian his natural affinities were with Zwingli, with whom in his smaller sphere he shared the advantage of having grown up to the views of the Reformation, without any sudden and violent mental struggle, by the natural progress of his studies and religious life. Thus he never lost his sympathy with humanism and with its great German representative, Erasmus. The Reformed Church might have had a happier course if it had longer kept to the lines of the first Zurich doctors. Pellican's Latin autobiography (*Chronicon C. P. R.*) is one of the most interesting documents of the period. It was first published by Riggenbach in 1877, and in this volume the other sources for his life are registered.

PELLICO, SILVIO (1788-1854), Italian dramatist, was born at Saluzzo in Piedmont on 24th June 1788, the earlier portion of his life being passed at Pinerolo and Turin under the tuition of a priest named Manavella. A taste for the drama, fostered by private theatrical recitals, showed itself at the age of ten in the composition of a tragedy under the inspiration of Cæsarotti's translation of the Ossianic poems. On the marriage of his twin sister Rosina with a maternal cousin at Lyons he went to reside in that city, devoting himself during four years to the study of French literature. His patriotism having been re-awakened by the reading of Foscolo's *Dei Sepolcri*, he returned in 1810 to Milan, where he became professor of French in the Collegio degli Orfani Militari. The appearance of Carlotta Marchionni on the Milan stage induced him to compose for her the tragedy *Francesca da Rimini*, which, despite the adverse criticism of Foscolo, was brought out with success on the return of the actress to the city a few years later. Its publication was followed by that of the tragedy *Eufemio da Messina*, but the representation of the latter was forbidden. Pellico had in the meantime continued his work as tutor, first to the unfortunate son of Count Briche, and then to the two sons of Count Porro Lambertenghi. In this capacity he was brought into contact with many of the foremost men of the day and threw himself heartily into an attempt to weaken the hold of the Austrian despotism by indirect educational means. Of the powerful literary executive which gathered about Counts Porro and Confalonieri, Pellico was the able secretary,—the management of the *Conciliatore*, which appeared in 1818 as the organ of the association, resting largely upon him. But the paper, under the relentless censorship of the Austrian officials, ran for a single year only, and the society itself was broken up by the more vigorous action of the Government consequent upon the formation of the constitution of Naples. In October 1820 Pellico was arrested on the charge of carbonarism and conveyed to the Santa Margherita prison. Occupied at first in preparing his defence and in religious meditation, he found means, after his removal to the Piombi at Venice in February 1821, to resume literary work, composing there several *Cantiche* and the tragedies *Ester d'Engaddi* and *Iginia d'Asti*. The sentence of death pronounced on him in February 1822 was finally commuted to fifteen years *carcere duro*, and in the following April he was placed in the Spielberg at Brünn. His chief work during this part of his imprisonment was the tragedy *Leoniero da Dertona*, for the preservation of which he was compelled to rely on his memory. After his release in 1830 he commenced the publication of his prison compositions, of which the *Ester* was played at Turin in 1831, but immediately suppressed. In 1832 appeared his *Gismonda da Mendrisio*, *Erodiade*, and the *Leoniero*, under the title of *Tre nuovi Tragedie*, and in the same year the work which gave him his European fame, *Le Mie Prigioni*. The last gained him the friendship of the Marchesa di Barolo, the reformer of the Turin prisons, and in 1834 he accepted from her a yearly pension of 1200 francs. His tragedy *Tommaso Moro* had been published in 1833, his most important subsequent publication being the *Opere Inedite* in 1837. On the decease of his parents in 1838 he was received into the Casa Barolo, where he

remained till his death, assisting the marchesa in her charities, and writing chiefly upon religious themes. Of these works the best known is the *Dei Doveri degli Uomini*, a series of trite maxims which do honour to his piety rather than to his critical judgment. A fragmentary biography of the marchesa by Pellico was published in Italian and English after her death. He died 31st January 1854, and was buried in the Campo Santo at Turin. His writings, whether in prose or verse, are chaste and graceful, but defective in virility and breadth of thought, and his tragedies display neither the insight into character nor the constructive power of a great dramatist. It is in the simple narrative and naive egotism of *Le Mie Prigioni* that he has established his strongest claim to remembrance, winning fame by his misfortunes rather than by his genius.

Cf. Piero Maroncelli, *Addizioni alle Mie Prigioni*, Paris, 1834; the biographies by Latour; Gabriele Rosselli; Didier, *Revue des Deux Mondes*, September, 1842; De Loménie, *Galerie des Contemp. Illustr.*, iv., 1842; Chiala, Turin, 1852; Nollet-Fabert, 1854; Giorgio Briano, 1854; Bourdon, 1868; and the life of the Marchesa di Barolo.

PELOPIDAS, a distinguished Greek general, who, in conjunction with Epaminondas, raised his native city Thebes to a pitch of power such as she never attained to before or afterwards. He was the son of Hippocles and member of an illustrious Theban family. The large property to which he succeeded in his youth, and which he seems to have increased by a brilliant marriage, was liberally employed by him in the relief of the destitute. When he could not persuade his friend Epaminondas to share his wealth, he imitated that great man in the stern simplicity and frugality of his life and in his cheerful endurance of hardships. Though his taste for hunting and gymnastics, and his fiery temper, contrasted with the studious habits and the "gentle and majestic patience" of his friend, no one appreciated better than Pelopidas the greatness of Epaminondas, to whom, if inferior as a general and a statesman, he was equal in romantic courage and unselfish devotion to his fatherland. Their friendship continued unbroken till death. It was cemented by a battle in which Epaminondas saved the life of Pelopidas. When the Spartans under Phœbidas seized the Cadmea or citadel of Thebes (summer of 383 or 382 B.C.), Pelopidas, as a member of the democratic club which was opposed to the Spartans, was forced to flee. Along with other exiles he found a refuge at Athens. Epaminondas, protected from suspicion by his poverty and his studies, was suffered to remain in Thebes. Though a very young man, Pelopidas took a leading part in persuading his fellow-exiles to strike a blow for the liberation of Thebes. Having concerted a plan with their friends in Thebes, Pelopidas, with a few companions, entered the city in disguise, surprised and slew the magistrates favourable to Sparta, and roused the people to attack the Spartan garrison in the citadel. But the Spartans capitulated and marched out. This happened in the early winter of 379. Pelopidas and two others of the liberators were elected "bœotarchs," or chief magistrates of Bœotia, an office which had been in abeyance for some years. Henceforward to the end of his life Pelopidas was annually elected to one of the chief offices of the state. The treacherous attempt made soon afterwards by the Spartan Sphodrias to seize the Piræus was said, with little probability, to have been instigated by Pelopidas in order to embroil Sparta with Athens. The liberation of Thebes was followed by some years of desultory warfare with Sparta. At Tanagra, however, Pelopidas defeated the enemy and slew the Spartan governor. Still more brilliant was the victory gained by him at Tegyra over a numerically superior force of two Spartan divisions. His success was due chiefly to the disciplined valour of the

Sacred Band, a picked regiment of 300 men, whom Pelopidas led to glory on many a bloody field. The battle of Tegyra, as the first occasion on which the Spartans had ever been worsted by an inferior force, made a deep impression on Greece. At the great battle of Leuctra (July 371), which permanently crippled the power of Sparta, Pelopidas and the Sacred Band were again conspicuous. Pelopidas was one of the generals in command of the Theban army which invaded the Peloponnesus in 370-369, and he joined with Epaminondas in persuading their colleagues to prosecute the campaign even after the expiry of their year of office. For this the two friends were tried for their life, but acquitted. Soon afterwards (apparently in 369), in response to a petition of the Thessalians, Pelopidas was despatched with an army to Thessaly against Alexander, tyrant of Phæræ. After occupying Larissa and freeing the Thessalians from the oppression of the tyrant, Pelopidas marched into Macedonia, where, at the request of the belligerents, he acted as arbitrator between Alexander king of Macedonia and the pretender Ptolemæus. Having concluded an alliance with the Macedonian king, he brought back to Thebes, amongst other hostages, the youthful Philip, brother of the king and afterwards father of Alexander the Great. In the following year (368), Pelopidas returned to Thessaly as ambassador and without an army. Learning that Ptolemæus had killed Alexander of Macedonia and seized the throne, he collected a body of mercenaries and marched against him. Ptolemæus induced the troops of Pelopidas to desert their leader, but he was too prudent to press his advantage, and agreed to act as regent for the brothers of the late king and to be an ally of Thebes. On his return from Macedonia Pelopidas was seized and detained by Alexander of Phæræ. From this captivity, in which his scornful bearing excited the wonder of his captor, he was released by a Theban force under Epaminondas. By the exertions of Epaminondas and Pelopidas, Thebes had by this time become the most powerful state in Greece; and that she might be formally recognized as such Pelopidas was sent as ambassador (367) to the Persian court. Favourably impressed by the renown and still more by the personal character of the envoy, the Persian king, Artaxerxes, loaded him with marks of honour and ratified all his proposals. These were, that Messene should be independent, that Athens should lay up her warships, and that any city which declined to follow the leadership of Thebes should be treated as an enemy by Persia. The purpose of the treaty, to strengthen Thebes by weakening Athens and Sparta, was obvious. It found no favour with the Greek states and remained a dead letter. In 364 the Thessalian towns once more appealed to Pelopidas for help against their old enemy Alexander of Phæræ. Disregarding an ominous eclipse of the sun, Pelopidas pushed on with a handful of troops, leaving the main body to follow. At the heights of Cynoscephalæ, near Pharsalus, he came up with the tyrant Alexander at the head of a much superior force. The valour of Pelopidas secured another victory, but it was his last,—catching sight of his hated foe, he rushed on him single-handed and fell covered with wounds. The Thessalians, in whose cause he died, requested and received the honour of carrying the hero to his last home, and the crowns, trophies, and golden arms by which the coffin was surrounded bore witness to the love and sorrow of a whole people. His friend did not long survive him. He too was to die fighting his country's battles in a foreign land. The pre-eminence of Thebes was the work of these two men alone, and with them it passed away.

Our chief authority is Plutarch's *Life of Pelopidas*. Xenophon was a contemporary, and his history covers the whole period of the life of Pelopidas, but, with his usual malignity to the enemies of

Sparta, he only mentions Pelopidas in connexion with his fruitless embassy to Persia. There is a meagre life by Cornelius Nepos. See also Diod. Sic., xv. 62, 67, 71, 75, 80, 81.

PELOPONNESUS. See GREECE.

PELOPS, a hero of Greek mythology, was the grandson of Zeus, son of Tantalus and Dione, and brother of Niobe. His father's home was on Mount Sipylus in Asia Minor, whence Pelops is spoken of as a Lydian or a Phrygian, or even as a Paphlagonian. Tantalus was a friend and companion of the gods, and one day he served up to them his own son boiled and cut in pieces. The gods detected the crime, and none of them would partake except Demeter (according to others Thetis), who, distracted by the loss of her daughter Persephone, ate of the shoulder. The gods restored Pelops to life, and the shoulder consumed by Demeter was replaced by one of ivory. Wherefore the descendants of Pelops had a white mark on their shoulder ever after. This tale is perhaps a reminiscence of human sacrifice, of which numerous traces remain in Greek legend and history. Poseidon admired Pelops, the beautiful boy, and carried him off to Olympus, where he dwelt with the gods, till, for his father's sins, he was cast out from heaven. Then, taking much wealth with him, he crossed over from Asia to Greece. He went to Pisa in Elis as suitor of Hippodamia, daughter of King CEnomaus, who had already vanquished in the chariot-race and slain many suitors for his daughter's hand. But by the help of Poseidon, who lent him winged steeds, or of CEnomaus's charioteer Myrtilus, whom he or Hippodamia bribed, Pelops was victorious in the race, wedded Hippodamia, and became king of Pisa. Pelops's race for his wife was a favourite subject of Greek poetry and art. It may be a confused recollection of the custom of wife-snatching prevalent in early times. When Myrtilus claimed his promised reward, Pelops flung him into the sea near Geræstus in Eubœa, and from his dying curse sprang those crimes and sorrows of the house of Pelops which supplied the Greek tragedians with such fruitful themes. Among the sons of Pelops by Hippodamia were Atreus, Thyestes, and Chrysippus. According to others Chrysippus was his son by a different mother. Atreus and Thyestes were jealous of Chrysippus and murdered him, wherefore Pelops drove them out. According to another story it was Hippodamia who murdered him and fled, but afterwards her bones were brought back to Olympia, where she had a temple, in which the women offered her a yearly sacrifice. From Pisa Pelops extended his sway over the neighbouring Olympia, where he celebrated the Olympian games with a splendour unknown before. He warred against and treacherously slew Stympbalus, king of Arcadia. His power and fame were so great that henceforward the whole peninsula was known to the ancients as Peloponnesus (Isle of Pelops). In after times Pelops was honoured at Olympia above all other heroes; a temple was built for him by Heracles, his descendant in the fourth generation, in which the annual magistrates sacrificed to him a black ram. During the Trojan war the Greeks were told that Troy could not be taken until they fetched a bone of Pelops. So a shoulder-blade of Pelops was brought from Pisa. When it was being brought back again the ship carrying it was wrecked off Eubœa. Many years afterwards the bone was taken up by Damarmenus, a fisherman, in his net. Astonished at its size, he went to inquire of the Delphic oracle. There he met envoys from Elis come to discover a remedy for a pestilence. The oracle bade them recover the bone of Pelops, and commanded Damarmenus to restore it to them. He did so, and he and his descendants were appointed custodians of the bone. Some thought that the Palladium was made of the bones of Pelops. This belief in the miraculous efficacy of

the bones of heroes was common in Greece (witness, e.g., the story of the bones of Orestes in Herodotus). From the great size of the bones they may sometimes have been those of large extinct animals.

From the reference to Asia in the tales of Tantalus, Niobe, and Pelops it has been conjectured with some probability that Asia was the original seat of these legends, and that it was only after emigration to Greece that the people amongst whom they were current localized a part of the tale of Pelops in their new home. In the time of Pausanias the throne of Pelops was still shown on the top of Mount Sipylus. The story of Pelops is told in the beautiful first Olympian ode of Pindar. The prosaic version of the story found in Nicolaus Damascenus (17) differs in several points from the usual legend.

PELOUZE, THÉOPHILE JULES (1807-1867), French chemist, was born on 26th February 1807 at Valognes in Normandy, where his father was manager of a porcelain manufactory. The elder Pelouze was a man of great ability and energy, but of a peculiarly susceptible temperament, which made it impossible for him to remain long in any position. He gave up his post at Valognes, and found employment successively at the glass-works of St Gobain, the iron-works at Charenton, and in gas-works. This moving life was unfavourable for the family finances, but doubtless gave young Pelouze opportunities of seeing and becoming familiar with a great variety of chemical operations on a large scale. He studied pharmaceutical chemistry first at La Fère, and afterwards, under Chevalier, at the École de Pharmacie in Paris. He then became a clinical clerk under Magendie in the Salpêtrière hospital. One day, when returning from a visit to his father at Charenton, he was surprised by a heavy shower, and seeing what he took to be a public carriage—the omnibus of the period—he hailed it. It contained only one passenger, but the driver, instead of stopping for another fare, drove on without taking the least notice. Pelouze rushed up and stopped the horse. On this the solitary passenger, who was Gay-Lussac, explained that he had hired the vehicle for his own use, but that he would be glad of the company of the new-comer. The result of this accidental introduction was that Pelouze abandoned medicine and continued the study of chemistry in Gay-Lussac's laboratory. From 1827 to 1829 he acted as assistant to Gay-Lussac and Lassaigne, and in 1830, on the recommendation of Gay-Lussac, he was appointed professor of chemistry at Lille. Returning to Paris, he was appointed in 1831 professor of chemistry at the École Polytechnique and at the Collège de France, in 1833 assayer to the mint, and in 1848 president of the Mint Commission. In 1850 he succeeded Gay-Lussac as chemical adviser to the glass-works of St Gobain. He was elected a member of the Institute of France in 1837. He died, after a short illness, on the 31st of May 1867.

Along with Frémy, Pelouze published a *Treatise on Chemistry* (1849-50; 2d ed. 1854-56). His numerous chemical papers were published in the *Annales de Chimie et de Physique* and in the *Comptes rendus*. Among these the most important are:—"On Beetroot Sugar" (1831), "On Salicine" (1830 and 1831), "On the Transformation of Hydrocyanic Acid and Water into Formiate of Ammonia" (1831), "On Lactic acid" (with Gay-Lussac, 1833), "On Tannin, Gallic Acid, Pyrogallid Acid, &c." (1833), "On the Product of the Distillation of Organic Acids" (1834), "On Nitrosulphates" (1835), "On Butyric Acid" (with Gélis, 1844), "On Gun-cotton" (1846 and 1847), "On the Effect of Light on the Colour of Glass" (1865 and 1867).

PELTIER, JEAN CHARLES ATHANASE, was originally a watchmaker, but retired from business about the age of thirty and devoted himself to experimental and observational science. He was born at Ham (Somme) in February 1785; his death took place at Paris in October 1845.

His great experimental discovery was the heating or

cooling of the junctions in a heterogeneous circuit of metals according to the direction in which an electric current is made to pass round the circuit (1834). This reversible effect is proportional directly to the strength of the current, not to its square, as is the irreversible generation of heat due to resistance in all parts of the circuit. It is found that, if a current pass from an external source through a circuit of two metals, it *cools* one junction and heats the other. It cools the junction if it be in the same direction as the thermo-electric current which would be caused by directly heating that junction. In other words, the passage of a current from an external source produces in the junctions of the circuit a distribution of temperature which leads to the weakening of the current by the superposition of a thermo-electric current running in the opposite direction. The true importance of this so-called "Peltier effect" in the explanation of thermo-electric currents was first clearly pointed out by Joule; and Sir W. Thomson (see vol. viii. p. 97) further extended the subject by showing, both theoretically and experimentally, that there is something closely analogous to the Peltier effect when the heterogeneity is due, not to difference of quality of matter, but to difference of temperature in contiguous portions of the same material. Shortly after Peltier's discovery was published, Lenz effected by means of it the freezing of small quantities of water by the cold developed in a bismuth-antimony junction when a voltaic current was passed through the metals in the order named.

Peltier's other papers, which are numerous, are devoted in great part to atmospheric electricity, waterspouts, cyanometry and polarization of sky-light, the temperature of water in the spheroidal state, and the boiling-point at great elevations. There are also a few devoted to curious points of natural history. But his name will always be associated with the thermal effects at junctions in a voltaic circuit, a discovery of importance quite comparable with those of Seebeck and Cumming.

PELUSIUM, an ancient city of Egypt, at the mouth of the most easterly (Pelusiæ) branch of the Nile, was the key of the land towards Syria and a strong fortress, which, from the Persian invasion at least, played a great part in all wars between Egypt and the East. It has not, however, been satisfactorily identified with any place mentioned in the hieroglyphic monuments, and the conjecture of Jerome, who supposes it to be the Sin of Ezekiel xxx. 15, 16, though admirably suited to the context and certainly preferable to the Sais of the LXX., cannot be positively established. Pelusium is the Faramâ of the Arabs; the neighbouring place still called Tīna is hardly to be identified etymologically with Sin. The country about Pelusium was noted for the production of flax; the fame of the Pelusian linen is, perhaps, still preserved in the word "blouse." The whole district has now relapsed into sand and marsh, and the site has not yielded any important remains.

PEMBERTON, an urban sanitary district of Lancashire, England, situated on the Lancashire and Yorkshire Railway, 2½ miles west from Wigan. Near the town are stone quarries and collieries, and the town itself possesses cotton-mills, chemical works, and iron-foundries. At a short distance is Hawkley Hall, an ancient timber house. At Ancliff in the township of Pemberton there was, according to ancient records, a burning well of considerable fame, but the name Ancliff has now disappeared, and the site cannot be verified. The population of the urban sanitary district (area 2894 acres) in 1871 was 10,374, and in 1881 it was 13,762.

PEMBROKE, the most westerly county of South Wales, lies to the west of the counties of Cardigan and Carmarthen, and is bounded on three sides by the ocean—on the S. by the Bristol Channel, on the W. by St George's

Channel, and on the N. by Cardigan Bay. Its length from Strumble Head to St Gowan's Head is about 30 miles, and its average breadth a little over 20. The area is 393,682 acres, or about 615 square miles.

The coast-line is extremely irregular and extends to over 100 miles, the principal inlets being Newport Bay; Fishguard Bay, 3 miles in breadth, with an average depth of from 30 to 70 feet, and possessing a good anchorage-ground of mud and sand; St Bride's Bay, 8 miles long by 8 broad; and Milford Haven, a splendid landlocked natural harbour, having a length of about 20 miles, and including numerous small bays and creeks. A considerable number of islands adjoin the coast, the largest being Ramsey, which (excepting some small rocks) includes the most westerly land in Wales; Skomer and Stockham, between St Bride's Bay and Milford Haven; and Caldy, south of Tenby. The southern coast, consisting of bare, broken, and beetling limestone cliffs, in many cases 200 feet in height, is exposed to the full force of the Atlantic, which in several places has hollowed out long funnel-shaped cavities into which the sea has entrance, the most remarkable being Boshoston Mere, near St Gowan's Head. Owing to the ocean storms the county is almost bare of trees, and the bareness is not relieved or atoned for by mountains, although in many parts of the coast the scenery is wildly picturesque. For the most part the surface is gently undulating, the small rounded hills rising in height towards the north, until they merge in the Presley range, which runs from east to west and divides the county into two parts, the highest summits being Cwm-Cerwyn, 1754 feet, in the centre of the chain, the lesser eminences of Moel Trigarn and Carn-meyn in the east, and Bwlch-gwnt and Foel Eryr in the west. The principal rivers are the Teifi, which forms for a short distance the north-eastern boundary of the county with Cardiganshire; the Cledly or Cleddou, of which there are two branches, an eastern and a western, both flowing south and mingling their waters in Milford Haven; the Nevern, which flows north into Newport Bay; and the Gwaen, which flows through a narrow and beautifully-wooded glen to Fishguard Bay.

Geology and Minerals.—Three-fourths of the county, including the northern portion stretching westwards to the western Cleddou river, and, with certain exceptions, to the Channel, is formed of Llandeilo flags. The Carboniferous strata from the South-Wales coal-field extend across the centre of the county from east to west, their area narrowing towards the west. The Pembrokeshire coal-field differs entirely from the South-Wales coal-field both in the lie of the strata and in the character of its beds, due to the occurrence of volcanic action. It is separated also from the main field by an interpolation of Old Red Sandstone. North, east, and north-west it is bounded by beds of mountain limestone and millstone grit, and on the south by Cambrian beds and by the ocean, below which the Coal-measures extend. The strata are composed of Coal-measures, Carboniferous Limestone, and Old Red Sandstone, and are frequently extremely contorted. Igneous stratified rocks also occur in the Presley range, and in the neighbourhood of St David's Head. The coal is anthracite, and when put on the fire in a wet state emits a blue flame without smoke. About 80,000 tons are now dug annually, the coal being used for furnaces and for smelting and brewing purposes. There is a lead mine at Llanfyrnach, from which a considerable yield of silver is obtained, the annual value of the ore raised being about £15,000. In caves explored near Tenby and on Caldy Island there have been found remains of various species of extinct mammals.

Climate, Soil, and Agriculture.—Although Pembrokeshire is exposed to frequent violent gales from the south-west, the climate in the south is very mild and warm; and

flowers, fruits, and vegetables are earlier than in most other districts of the United Kingdom. Towards the north, especially on the higher ground, it is much colder, and damp fogs and rain are frequent. The most common soil is a dark-grey loam, which is much improved by admixture with lime and sand. The sandstone and limestone formation in the south produces an excellent quick soil, admirably adapted for horticulture, which is generally pursued in this district. In the more northerly and higher regions more attention is given to cattle-rearing and dairy-farming than to the raising of crops or sheep-farming. The farm-houses and buildings, which formerly were rude and primitive in construction, with low mud-walls, are now generally built of stone on improved methods. The cottages of the peasants are, however, still for the most part uncomfortable huts built of a clay and straw compound called "clom." Great improvements have lately taken place in farming, owing in great part to the enlightened encouragement of the landlords.

From 5935 in 1875 the number of holdings had increased to 5999 in 1880 (the latest return). Nearly four-fifths, 4222, were not above 50 acres each in extent, 837 were between 50 and 100 acres, 353 between 100 and 300, and only 87 above 300 acres. In 1883 there were 305,644 acres, or about 77 per cent. of the total area, under tillage, corn crops occupying 55,011 acres, green crops 13,266, rotation grasses 28,409, permanent pasture 206,052, and fallow 2906. The principal cereals are barley occupying 24,799 acres and oats (of which the black species occupy a large area) 25,494 acres, wheat occupying only 4604 acres. Potatoes were grown on 3042 acres, turnips and swedes on 8038, and mangolds on 1322. Horses in 1883 numbered 14,383 (of which 8665 were used solely for purposes of agriculture), cattle 83,436 (of which 31,779 were cows and heifers in milk or in calf), sheep 91,901, and pigs 27,623. The principal breed of cattle are the native Castlemartins, black in colour, and well suited to the climate and the system of farming, as they both fatten readily and yield large supplies of milk. Herefords and Alderneys have lately been introduced on many farms, but the old breeds is still the favourite.

According to the latest return the land was divided among 3121 owners, possessing 356,699 acres, at an annual valuation of £389,701, or about 41 ls. 10d. per acre. The estimated amount of common or waste land was 11,260 acres. Of the owners, 1492, or about 44 per cent., possessed less than one acre each. The following owned over 5000 acres each, viz., C. E. G. Phillips, 18,729 acres; earl of Cawdor, 17,736; Sir Owen Scourfield, Bart., 11,243; Lord Kensington, 6537; bishop of St David's, 5651; George Harries, 5173; and M. A. Sawin, 5163.

Manufactures.—Flannels are woven in various towns, and are the principal textile manufacture of the county; there are also rope and sail works, and hat-making is practised. Many of the inhabitants are engaged in coal-mining and in fishing. At Pater there is a very extensive dockyard, and shipbuilding is carried on at several other ports. Since the opening up of railway communication the shipping trade, and the mining and other industries, have made extensive progress, but the railway connexion is still somewhat imperfect.

Administration and Population.—The county includes seven hundreds; the municipal boroughs of Haverfordwest (6398), Pembroke (14,156), and Tenby (4750), and part (2058) of the municipal borough of Cardigan, the remainder of which is in Cardiganshire. In addition to Haverfordwest, Pembroke, and Tenby, there are four other market towns,—Fishguard (2009), Milford (3812), Narberth (2334), and Newport (1504). The county is divided into three poor-law unions—Haverfordwest, Pembroke, and Narberth. It is included in the south-western circuit. It has one court of quarter-sessions, and is divided into seven petty and special sessional divisions. One member is returned to parliament for the county, one for the Haverfordwest district of boroughs, consisting of Fishguard, Haverfordwest, and Narberth, and one for the Pembroke district of boroughs, consisting of Milford, Pembroke, Tenby, and Wiston. Pembroke has 153 civil parishes, with part of one other. It constitutes the archdeaconry of St David's in the diocese of the same name, and forms part of the province of Canterbury. From 56,280 in 1801 the population had increased in 1821 to 74,009, in 1851 to 94,140, but in 1871 it had diminished to 91,998, and in 1881 to 91,824, of whom 43,449 were males and 48,375 females. The number of inhabited houses in 1881 was 19,462, the average number of persons to an acre 0.23, and of acres to a person 4.26.

History, &c.—Although the limestone caves of Pembroke are abundant with relics of the Pleistocene fauna, no traces have as yet been discovered of Palæolithic man. Neolithic remains are plentiful.

In caves, cliff-castles, bogs, kitchen-middens, &c., implements of the polished stone age are frequently found, but, strange to say, the long barrows typical of this period are wanting; dolmens or cromlechs, however, are very common: the Ordnance map gives eighteen, but this is by no means an exhaustive list. Llech-y-Drybedd near Nevern, Pentre Evan near Newport, another one in the same town, Longhouse near Mathry, Tre Llys on Pencair, are magnificent specimens of Megalithic work. Stone circles, cairns, monoliths, and earthworks abound in the county; what proportion of these are attributable to the dolichocephalic non-Aryan Silures who used stone implements it is impossible to say.

The Goidel or Gaelic branch of the Celtic family has the credit of having introduced bronze and round tumuli with cremated bodies; of these latter there are a great number in Pembrokeshire, and considerable quantities of bronze implements have been discovered. A mixture of Silures and Goidels seem to have held the country until they were conquered by the Romans about the year 70 A.D. Roman remains are but scantily represented in Pembrokeshire. Via Julia terminated at St David's, but no traces of the peculiar Roman roadmaking exist. Fenton, the county historian, fancied he discovered the station *Ad Vigesium* of the spurious *Itinerary* of Antonine at Ambleston, and there can be no doubt that a large Roman building of some sort did exist at that place. The late Professor Rolleston and Mr E. Laws discovered Samian ware in the cave of Longbury near Tenby, and Roman coins, ranging from Vespasian, 78 A.D., to Constantine II., 340 A.D., have been found very plentifully in the county.

When the Saxons pressed the Cymric tribe of Brythonic Celts in Cumbria, the latter appear to have migrated into Wales, and to have conquered the inhabitants; the Pembrokeshire Goidels seem to have held out for some time. During this troubled period there was a great incursion of missionaries, both Goidel and Cymric: to these we owe the nomenclature of many villages. To this period must be attributed the sepulchral inscriptions in that strange character which has been called Ogam. Of these so many are to be found in Pembrokeshire that it has been considered probable they were invented in the district. They are usually in base Latin; good specimens are to be seen on Caldy Island, St Dogmel's, Cwmgloyne near Nevern, and Trefgarne near Haverfordwest. Most of the crosses must be attributed to this period, though probably the inscribed ones at Carew and Nevern are of later date.

After Wales had been completely conquered by the Cymry, Rhodri Mawr divided it among his sons, and Pembrokeshire fell to Cadell in 877. From that period until its complete incorporation with England it suffered terribly from the family feuds of the Welsh princes. The Scandinavians also proved a fearful scourge. Their first incursion, according to the Brut-y-Tywyssogion, took place in 795. The creeks of Pembrokeshire were peculiarly adapted to the wants of the vikings, and they seem to have formed a strong colony in the county, of which such names as Asgard, Fishguard, Grafsholm, Freystrop, Goodwich, Milford Haven (Midfjord Havn), Haverfordwest (Havards Fjord), &c., are an abiding evidence.

During the reign of William Rufus, Arnulph de Montgomery, son of Roger de Belesme, invaded the southern portion of the county with the king's sanction; he gained a district and built Pembroke Castle; Manorbier was most likely erected at the same time. In 1107 a colony of Flemings was sent into Pembrokeshire by the king (Henry I.); they settled at Haverford and Tenby. A second party of Flemings and other adventurers was despatched to Pembroke by Henry II.; these were mercenaries who had served in the civil war between Stephen and Mand. In April 1170 a party of Pembrokeshire men invaded and overran the eastern shores of Ireland.

In 1405 Owen Glendower harried the country; he occupied Tenby with 10,000 Welshmen, and was joined by a French force of 12,000 men who had landed in Milford Haven. In 1456 Henry VII. was born in Pembroke Castle, the residence of his uncle Jasper Tudor, earl of Pembroke. After a long exile he landed at Brunt near Dale with French troops; here he was joined by Sir Rhys ap Thomas at the head of a large number of Welshmen, with whom he marched to Bosworth field. When the church property was disposed of under Henry VIII., Lamphey Court, once a bishop's seat, fell to the Devereux family, and it was the residence of the three Devereux earls of Essex. These noblemen were extremely popular, and it was most likely in consequence of the political views held by Robert the third earl that when the civil war broke out Pembrokeshire was found to be "the most seditious county in all Wales, or rather of England, for the inhabitants were like English corporations, unlike loyal Welshmen" (*Mercurius Aulicus*, 29th week, 20th July 1644). Pembroke and Tenby held out until 1648, when the Presbyterians rebelled against the Independents; then under Mayor and Colonel Poyer the royal standard was hoisted on Pembroke keep. Cromwell himself besieged Pembroke, which yielded to him on 17th July 1648.

Besides the ruins of the fine castle of Pembroke, many others are to be found in the county,—Manorbier, Carew, Lamphey, Narberth

Llawhaddon, Haverford, Roch, Newport; but Newport has been turned into a modern dwelling-house. Most of these are Edwardian erections on Norman work, some of them having Tudor additions.

The most important ecclesiastical building is the cathedral of St David's. Some sort of church existed on the site from the 6th century, but the earliest work now remaining is that of Bishop Peter de Leia (1180). This was seriously injured by the fall of the tower in 1220; the damage had scarcely been repaired when the church was wrecked by an earthquake in 1248. In 1328 Henry Gower succeeded to the bishopric, the most munificent benefactor the church of St David's ever saw; he transformed the cathedral, introducing the Decorated style throughout the edifice. After the Reformation the building was permitted to fall gradually into decay, until it had become little better than a ruin. But in 1863 the edifice, more especially the tower, was thoroughly restored under the late Sir Gilbert Scott.

PEMBROKE, a municipal and parliamentary borough of South Wales, is picturesquely situated on an elevated ridge at the head of Pennar Mouth Creek, on the south side of Milford Haven, 30 miles south-west of Carmarthen. The ruins of the ancient castle, originally founded by Arnulph de Montgomery in 1094, occupy the summit of the ridge. The castle was one of the strongest of the ancient fortresses of Wales. Beneath it is an enormous natural cavern, called "The Wogan," 70 feet long and 50 feet wide. At the beginning of the Civil War the castle was held for the Parliament, but, the commandants having gone over to the Royal cause, it was taken by Cromwell after six weeks' siege. Near the castle are the ruins of Monkton Priory church, in the Norman style, containing a long vaulted nave in good preservation. The church of St Mary, in the Early Pointed style, possesses a massive steeple. At Pater, 2 miles west of Pembroke, is Pembroke dock, an important Government dockyard, surrounded with very strong fortifications. The dock is 70 acres in extent, and the yard affords employment to about 2400 artisans. There are also artillery and infantry barracks. Pembroke possesses a town-hall, assembly rooms, a mechanics' institute, an infirmary, and several charities. The town was incorporated by Strongbow, earl of Pembroke, in the reign of Stephen, but the earliest charter preserved is one granted by John, which was confirmed by successive sovereigns. The population of the municipal borough (area, 5626 acres), which includes the two wards of Pater and Pembroke, in 1871 was 13,704, and in 1881 it was 14,156. The population of the parliamentary borough (area, 6298 acres) in the latter year was 16,339.

PEMPHIGUS. See SKIN, DISEASES OF.

PEN, an instrument for writing or for forming lines with an ink or other coloured fluid. The English word, as well as its equivalents in French (*plume*) and in German (*Feder*), originally means a wing-feather, but in ancient times the implements used for producing written characters were not quills. The earliest writing implement was probably the stylus (Gr. *στῦλος*), a pointed bodkin of metal, bone, or ivory, which, however, was only used for producing incised or engraved letters. The calamus (Gr. *κάλαμος*) or arundo, the hollow tubular stalk of grasses growing in marshy lands, was the true ancient representative of the modern pen; hollow joints of bamboo were similarly employed. The use of such pens can be traced to a remote antiquity among the civilized nations of the East, where reeds and canes are to this day in common use as writing instruments. The earliest specific allusion to the quill pen occurs in the writings of St Isidore of Seville (early part of the 7th century).¹ But there is no reason to assume that the quill pen was not in use at an earlier period, and, indeed, remains have been found which prove that even metal pens were not altogether unknown to the ancient Romans.

The quills, formerly in exclusive use, and still largely employed among Western communities as writing instruments, are obtained principally from the wings of the goose. Swan-quills are also highly prized, and for special purposes crow-quills and the wing-feathers of certain other birds are adopted. For the method of preparing quills, &c., see FEATHERS, vol. ix. p. 60. In 1809 Joseph Bramah, the famous inventor, devised and patented a machine for cutting up the quill into separate nibs by dividing the barrel into three or even four parts, and cutting these transversely into "two, three, four, and some into five lengths." Bramah's invention first familiarized the public with the appearance and use of the nib and holder in place of the complete quill or barrel, and in that sense he anticipated the form of pen now most commonly used. In 1818 Charles Watt obtained a patent for gilding and preparing quills and pens by manual labour and chemical means, which may be regarded as the precursor of the gold pen. But a more distinct advance in this direction was effected in 1822, when Hawkins and Mordan patented the application of horn and tortoise-shell to the formation of pen-nibs, the points of which were rendered durable by impressing into them small pieces of diamond, ruby, or other very hard substance, or by lapping a small piece of thin sheet gold over the end of the tortoise-shell, and by various other ways securing a hard unalterable point to the pen.

Metallic pens, though perhaps not altogether unknown even in classical times, did not come into use till the present century, and indeed did not become common till near the middle of the century. At the meeting of the British Association in Birmingham in 1839 steel pens were scarcely known; ten years later the manufacture had become an important local industry. In 1803 a steel pen was made and sold in London by a Mr Wise, which was in the form of a tube or barrel pen, the edges meeting to form the slit with sides cut away as in the case of an ordinary quill. These sold at about five shillings each, and as they were hard, stiff, and unsatisfactory instruments they were not in great demand. In 1808 a metallic pen was patented by Bryan Donkin, made of two separate parts, flat or nearly so, with the flat sides opposite each other forming the slit of the pen, or, as an alternative, of one piece, flat and not cylindrical as in the usual form, bent to the proper angle before being inserted into the tube which forms its holder. In Birmingham a steel pen was made by a splitting manufacturer, Harrison, for Dr Priestley towards the end of the 18th century. Harrison in after years became associated in the split-ring business with Josiah Mason, who was one of the great pioneers of the steel-pen trade. Mason developed the manufacture on the basis of an invention by James Perry, who in 1830 obtained a patent for improvements which must be regarded as the foundation of the steel-pen industry. Perry's improvements consisted in producing pens from hard, thin, and elastic metal, the most suitable material being described as the very best steel brought to a spring temper. The necessary flexibility was given to the pen by a central hole formed in the pen between the nib and the shoulder in connexion with a central slit, and by making between the nib and the shoulder one or more lateral slits on each side of the central slit. Joseph Gillott, who divides with Mason and Perry the credit of perfecting the metallic pen, does not appear as a patentee till 1831, when he patented an improvement which consisted in forming elongated points on the nibs of pens. These early pens lacked softness, flexibility, and smoothness of action, and subsequent inventions of Perry, Gillott, Mordan, and others were largely devoted to overcoming such defects. Metals other than steel were also frequently suggested by inventors, those most commonly

¹ "Instrumenta scribæ calamus et penna; ex his enim verba paginis hifunguntur; sed calamus a-boris est, penna avis, cujus acumen dividitur in duo."

proposed being silver, zinc, German silver, aluminium, and aluminium bronze, the last-named having at one time come into extensive use. The development of the gold pen cannot be traced through the patent records in the same way as some others. Dr Wollaston, it is recorded, used a gold pen composed of two thin slips of gold tipped with rhodium, made apparently on the principle patented by Donkin in 1808. Messrs Mordan of London have the credit of being the earliest regular makers of gold pens with tips of osmium-iridium alloy, and that manufacture was subsequently developed by Messrs Wileys of Birmingham. The gold pens now made are provided with iridium tips, and their manufacture is a special industry, requiring processes and machines different from those used in the steel-pen industry.

Fountain pens and penholders in which considerable reservoirs of ink could be carried ready for use were introduced by a patented invention of the ingenious Joseph Bramah. Of his several plans for a fountain pen one proposal was a hollow tube of silver or other metal, the tube being made so thin that it could readily be compressed out of shape and so cause an escape of ink to the nib, and another plan was to fit the tube with a piston which might slide down the interior and so force out ink. John Scheffer in 1819 patented a device consisting of a reservoir in the holder operated on by a stud, which, when pressed by the thumb, yielded a flow of ink to the nib. Many forms of attachment and modifications of the shape of the pen have also been introduced with the view of enabling the pen itself to carry a considerable supply of ink, and to discharge it in writing in a safe and equal manner. A highly original and comparatively successful form of fountain pen of recent introduction is known as the stylograph, in which the ordinary form of nib is dispensed with, and connected with the barrel or reservoir is a finely-tapered point tipped with iridium pierced with a fine aperture. Into the aperture is fitted an iridium needle or plug attached internally to a delicate gold spring, and the act of writing sufficiently pushes back the needle to allow the escape of the requisite flow of ink by the aperture. The two principal forms of stylograph are that of MacKinnon, patented first in the United States in March 1879, and that of Cross, the United States patent for which was secured in January 1878.

The finish which the common steel pen now shows, and the low price at which it can be sold, are triumphs of manufacturing skill, the credit of which is largely due to Birmingham. For the fraction of a farthing there can now be purchased an article incomparably superior to that which in the early years of the century cost five shillings. The metal used consists of rolled sheets of cast steel of the finest quality, made from Swedish charcoal iron. These sheets are cut into strips of suitable width, annealed in a muffle furnace, and pickled in a bath of dilute sulphuric acid to remove the oxidized scale from the surface. The strips so cleaned are next rolled between steel rollers till they are reduced to ribbons the thickness of the pens to be made. At this stage the raw material is ready for the series of manufacturing operations, most of which are performed with the aid of hand fly-presses, moving suitable cutting, stamping, and embossing attachments. The pen blanks are first cut out of the ribbon so as to leave as little scrap as possible. These blanks are next pierced, that is, the central perforation and the side or shoulder slits by which flexibility is secured are made at one operation. After again annealing, they are marked and embossed with maker's name, trade-mark, or any of the endless variety of marks by which pens are distinguished from each other. Up to this point the blanks are flat; they are now raised or rounded into the semi-cylindrical form in which pens are used. At this stage the pens are tempered by heating in iron boxes in a muffle, plunging in oil, and heating over a fire in a rotating cylindrical vessel till their surfaces attain the dull blue colour characteristic of spring steel elasticity. They are then scoured and polished by being revolved in large tin cylinders, in which they are mixed with sand, pounded crucibles, or such substances. The grinding of the points next follows, an operation performed by small rapidly-revolving emery-wheels, on which the points are first ground lengthwise and then across the nib, the object of the process being to increase the elasticity of the point. The slitting process which

follows—that is, the cutting of the pen-slit from the perforation to the point—is effected with a chisel-cutter worked by a hand screw-press. On the precision with which the slit divides the point depends the perfection of the pen, to finish which it now only remains to colour the surface in a revolving cylinder over a charcoal fire, and to varnish it in a solution of shellac.

Birmingham, which was the first home of the steel-pen industry, continues to be its principal centre, but steel pens are also made in the United States and in France and Germany. (J. P.A.)

PENANCE. The word "penance" (*pœnitentia*) has a double signification,—its strict legal meaning of a penalty inflicted by the formal sentence of a spiritual authority in punishment of an offence, and with the primary object of amending and so benefiting the offender; and its wider and more popular sense of any ascetic practice adopted, whether voluntarily or under compulsion, for the expiation of sin or for advance in spiritual attainment. Broadly speaking, no trace of such a theory is visible in classical paganism, from which the idea of sin as a moral defilement is almost absent. There are faint marks discernible in the Greek heroic legends of something analogous to penance, when we read of a hero being driven into exile for some crime (most usually unpremeditated homicide), and not permitted to return till he had found some one able and willing to purify him with certain lustral sacrifices. In the historical period these lustral sacrifices continue, but the accompanying penalty disappears. Punishments for religious offences, and of a very severe kind, extending to death itself, as in the case of Socrates, are frequent, but they are not of the nature of penance, not having the amendment of the offender in view, but only the safety of the state, to be secured by an act of vengeance designed to avert the anger of the gods and to prevent the repetition of the crime believed likely to invoke it. The Oriental religions, contrariwise, teem with the ascetic principle, and personal austerities form a large part of the Zoroastrian, Buddhist, and Brahman systems. Yet, with the exception of the pilgrimages, which enter so deeply and widely into the religious habits of the peoples professing these creeds, and involve much toil and suffering in the case of the poorer pilgrims, these austerities are not of general incidence, but are confined to a comparatively small, and, so to say, professional body of devotees, such as the Indian Jogis, who are entirely distinct from the main body of their co-religionists. Islam had originally nothing even remotely like the practices in question, save in so far as the annual fast of Ramadan and the hajj to Mecca and other sacred places necessitated self-denial; and it is even on record that Mohammed himself directly discouraged an ascetic spirit which displayed itself in some of his trustiest companions and disciples, such as 'Omar, 'Alī, Abū-Dharr, and Abū-Horeirah. But the reaction of conquered Persia, long the home of Zoroastrian asceticism, on the Arab victors was marked and early, and an inner body of austere devotees arose in the midst of Mohammedanism within a century and a half of the Flight, though having no justification in the Koran or in the body of early tradition for their tenets and usages. They were in almost every instance of Persian origin, and the most famous of them all, the converted robber Fodheil Abū 'Alī Zalikhanī, the Benedict of Islam, who first organized the scattered ascetics into the brotherhood of dervishes, was himself a Khorāsānī of pure descent. But, like the Indian Jogis, the Mohammedan dervishes and fakirs have continued as an isolated class, and have never exerted the kind of influence which Christian monachism, especially in the West, has done. Nor has the principle of penance ever formed an important integer of the Jewish religion. The Levitical code enjoins the performance of various lustral sacrifices in expiation of certain sins; but the cost of the victims is the only element of penalty, being virtually a money fine

on the offender. The prophets, while dwelling much on the necessity of repentance, of a moral change in the sinner, are almost entirely silent as to any accompanying acts and observances of an ascetic nature: and, though occasional references to prolonged fastings and to the wearing of sackcloth as penitential exercises are found, yet they appear as exceptional and spontaneous, and not as part of an accredited system, nor as enjoined by any authority external to the devotee or penitent himself. Even under the Talmudic code there is no organized system of penance. The three degrees of excommunication, *niddui*, *cherem*, and *shammata*, ascending from mere exclusion from the congregation for a month, through the stage of anathema, to that of public and ignominious expulsion from fellowship in Israel (and that at first irrevocably, though the penalty was afterwards relaxed), practically exhaust the code, since there are no formal provisions for inflicting other penalties, whatever voluntary observances may at any time have been superadded.

The Christian theory of penance ultimately rests on the view that the Christian church is the precise analogue of the Jewish people under the elder dispensation. As the Jews were the one family on earth in direct covenant with God, so that it became necessary for all Gentiles who desired to be brought into the like relation to abandon their own proper nationality and to become Jews by adoption, forsaking their former habits and associations together with their creed; and as various offences against the law of Moses were punished with temporary or final exclusion from fellowship in the Hebrew polity; so was it from a very early period in the Christian church. One marked difference between the Rabbinical and the Christian discipline is indeed visible from the first, that the former involved the suspension or deprivation of civil rights, whereas the latter, in all the earlier centuries at any rate, was a purely spiritual penalty. But they are agreed in combining two ideas, one wholly foreign (as already observed) to paganism, and the other but vaguely shadowed therein,—the aim of healing the offender himself and the need of his making public satisfaction to the society whose rules he had broken, and which might suffer in reputation and influence by reason of his misconduct. It is this notion of satisfaction which has led to the extension of the word “penance” itself from its more restricted and legal meaning to its wider use as covering the whole range of ascetic practices. And, as it soon came to be accepted that the inward sorrow for sin would be attended with an outward token of that sorrow, involving pain or humiliation in some form or other, there are four distinct stages in the ecclesiastical use of the word “penitencia,”—first, as denoting the change of mind due to sorrow for sin; next, the external penalty attached to each offence; thirdly, the discipline of the church in dealing with all spiritual offences; and lastly, any piece of austerity practised with a religious motive; and the fact of the Latin language having no doublets like the English “penitence” and “penance” to express the distinct though allied ideas of the mental attitude and the outward action has powerfully conditioned Latin theology and practice.¹

There is naturally but little to be found in the New Testament on the subject of discipline; but the whole principle is provided for and anticipated in one saying of

Christ—that which directs that he who neglects to hear the church as arbiter in a dispute shall be regarded as a heathen man and a publican, and which goes on to confer upon the apostles the power of binding and loosing (Matt. xviii. 17, 18),—words which they, with their Jewish experience and associations, must needs have interpreted as authorizing, and even enjoining, the infliction of penalties, and notably that of excommunication, upon members of the new society. Accordingly, the leading example of such discipline, the case of the incestuous Corinthian, attests plainly some form of trial, a sentence of excommunication, some proof of repentance, and the consequent reconciliation and restoration of the offender (1 Cor. v.; 2 Cor. ii. 6-10): and it is most probable that some such method was pursued in the sub-apostolic church, each case being dealt with locally, and on its separate merits, long before any formal system or code came into existence. The penalties seem at first to have been very simple and lenient, leaving out of account the difficult problem of the phrase “delivering to Satan,” twice found in this connexion (1 Cor. v. 5: 1 Tim. i. 20), which may mean merely relegating to heathen fellowship by exclusion from the society of Christians, but also may cover much more ground. Exclusion from the eucharist itself, exclusion from non-communicating attendance at the eucharist, and exclusion from all religious assemblies for even the minor offences of worship are the only censures discoverable in the earlier period, though it is not long before certain additional penalties accompanying these grades of separation begin to appear. The following broad rules govern all cases of penitential discipline in the ancient church. (1) Penance related only to baptized and communicant Christians. Even catechumens were not held capable of it, to say nothing of Jews or Pagans. (2) It was exclusively spiritual, and in no way touched the civil condition of the penitent, even after the conversion of the empire. (3) It was not compulsory, but spontaneous; nay, so far was it from being imposed, that it had to be sought as a favour. Of course, where it was not so sought the excommunication of the offender remained in force, but this excommunication was not regarded as in itself a penance in the later use of that term. (4) The most usual rule allowed of penance but once. The relapsing offender had no second opportunity granted him. (5) It was always preceded by confession (*ἐξομολόγησις*), a term which, however, even as early as Tertullian's time, was already extended to include, over and above the oral acknowledgment of guilt, the external acts of mortification accompanying it (*De Pen.*, c. 9). (6) There was a careful classification of the offences involving penance, and after a time a corresponding classification of penitents into certain fixed grades, through which it was in many cases necessary to pass, from the lowest to the highest, before receiving absolution and being restored to full communion.

The case dealt with by St Paul establishes one point, that of the comparative brevity of the time of penance, even for very grave offences, since three years is the longest period which can have elapsed between the two epistles to the Corinthians; whereas under the later system periods of fifteen and twenty years are not rarely to be found, and in some cases penance was for life, however protracted. The earlier method can be shown to have come into wide acceptance far within the 2d century, because it forms the subject of a charge made against the church by Tertullian in one of his Montanist treatises (*De Pudicitia*); and the more stringent discipline of the succeeding era appears to be due to the nearly simultaneous action of two causes,—the great success which attended the persecution set on foot by the emperor Decius in 249, resulting as it did in a far larger propor-

¹ The Greek word *μετάνοια*, which stands both for repentance and for the sacrament or mystery of penance, has undergone a singular degeneration of meaning in ecclesiastical language, being often used to denote an obeisance of head and body, because that gesture is one which was enjoined upon penitents as part of the outward expression of sorrow for sin. But this ambiguity has had no theological results; because the penalty imposed in the confessional is not called *μετάνοια*, but *ἐνστίλβα*, and thus no confusion can arise, especially as the context always shows clearly when *μετάνοια* stands for a mere gesture.

tion of apostasies and compromises than any of the others, and the rise of Novatianism within two years, in protest against the leniency exercised towards the lapsed. Although the church rejected the extreme theories of rigid discipline which Novatian formulated, yet it was tacitly admitted that he did but exaggerate a truth, and the reins began to be drawn tighter from that time forward. Much information regarding the practical working of the system in the third century can be gathered from the epistles of Cyprian, and from his treatise *On the Lapsed*; but the fact that he had to struggle against a lax party in Africa, at the very time when laxity was preponderant in the Italian Church, proves that no uniform system had yet been evolved. The 4th century is the period when broad general rules, intended to apply to all cases, begin to be laid down, and when the distribution of penitents into fixed classes or grades is clearly evident. The Eastern Church took the lead in this development, and canons of Ancyra and Neo-Cæsarea in 314 refer to the grades of penance in terms which imply their general recognition as already established. They are first defined in an epistle ascribed to Gregory Thaumaturgus about the year 258, and are as under: (1) Weepers, forbidden to enter a church, and permitted merely to assemble at the doors to ask the prayers of those entering; (2) Hearers, suffered to come in for the Scripture lessons and the minor offices, but obliged to depart before the eucharistic office began; (3) Kneelers, allowed to attend the earlier part of the eucharistic office, as far as the close of the introductory portion, but obliged to withdraw then along with the catechumens; (4) Standers, who might remain throughout the entire rite, but were not suffered to communicate. This minute subdivision does not seem to have made good a footing in Western Christendom, where the first of these degrees is not found on record (Morinus, *De Penitent.*, vi. 8), nor did it hold its ground very long in the East itself, disappearing as it does during the 5th century. The penitential observances usually imposed on those who were admitted to these grades were public confession of their offence in presence of the congregation, and that, in the case of the lowest grade, several times over; the disuse of all ornaments, and the assumption of a sackcloth garb, with the strewing of ashes on the head (Euseb., *H. E.*, v. 28); men had to cut off their hair and shave their beards; women to wear their hair dishevelled and to adopt a special veil; all had to abstain from baths, festivals, and, generally speaking, all physical enjoyments, and fasting on bread and water was often enjoined; they were bound to much more frequent and regular attendance at all religious assemblies than the faithful or the catechumens (Conc. Carthag. IV., c. 81); if possessed of means, they were required to give largely in alms, or to assist actively in works of charity; and they were, for the first ten centuries, incapable of being admitted to ordination. One result of the crowds of penitents which had to be dealt with after the lull that followed the Decian persecution was that the bishops were no longer sufficient in numbers to deal with each case separately, though under the earlier system the bishop alone (even when the presbyters acted as his assessors) could put to penance, as he continued for a long time to be the only officer who could reconcile and readmit those who had performed their appointed penance. A practice arose, therefore, of appointing certain presbyters to confer with all persons applying for admission to penance, and to receive their confessions privately, in order to prepare them for the public confession which made an integral part of penance, and indeed to decide whether they could be admitted thereto at all. These officers, known as "penitentiaries," were abolished in the church of Constantinople by the patriarch Nectarius about 390 (Socrat., *H. E.*, v. 19; Sozom., *H. E.*,

vii. 16), and his example was followed throughout nearly the whole East; but the office continued in the West, with various modifications necessitated by the gradual change of discipline.

The main difference between the earlier and later systems lies in the fact that penance was for some centuries restricted to certain very grave sins, to wit, idolatry, adultery, and murder, with such lesser offences as were closely allied (as, for instance, the delivery of the sacred books to pagan inquisitors, that *traditio* which has given the words "treason" and "traitor" to modern diction); nor does it appear that any distinction was made between the treatment of those penitents whose guilt was notorious and those whose own voluntary confession alone made it manifest. Minor offences were punished with suspension of communion and with refusal of oblations at the hands of the offender, and many were left wholly to the individual conscience. But the catalogue of canonical offences was much enlarged at the time when the penitential system was developed and codified,—theft, usury, false witness, polygamy, habitual drunkenness, and some others being included amongst those which had to be publicly expiated. Yet it was this increased severity which led to the almost total abrogation of public penance, because of the scandal given by the publication of the numerous offences on the new list, whereas the cases under the older rule were necessarily few, however serious. It is clearly stated by both Socrates and Sozomen that the motive of Nectarius in abolishing the office of penitentiary was to avoid the recurrence of an uproar occasioned by the public confession of a lady of high rank, implicating others in a disgraceful fashion, so that he judged it better to leave the question of communion to be settled in private by penitents with their religious advisers, and not to be made matter of general publicity. This became the rule at once in the East, but public penance held its place in the West for many centuries longer, and in fact has never become entirely obsolete. There was, however, a considerable innovation introduced after the 7th century, in that offences privately committed were put in a different category from public sins, and were no longer made liable to public penance, but might be, and soon were, dealt with by private confession and penance only. Not only so, but, whereas the accusation of any person to the bishop as an offender was the usual mode of bringing his case under ecclesiastical cognizance in the earlier Christian centuries, on the other hand the discipline introduced in the Middle Ages was to exact public penance from such alone as had been convicted on trial before secular judges. The first beginnings of this innovation on Western usage are attributed by Morinus with much probability to Theodore of Tarsus, the Greek archbishop of Canterbury, who sat from 668 to 690, and whose *Penitential* (or code of ecclesiastical discipline), though not the earliest even now extant in the British Isles, soon achieved wide acceptance throughout the West, notwithstanding that it followed the then long-established Eastern usage in favour of private as opposed to public confession. A more serious innovation, fraught with dangerous consequences, made its appearance somewhat later, that of buying off a penance by a money payment to be expended in alms, a system in full force in the 9th century, as attested by the capitularies of Hincmar of Rheims and Hérard of Tours. Another custom which tended to break down the efficiency of the earlier discipline was that of resorting to Rome to have the more serious cases adjudicated on by the pope. At first this was an exceptional mode of dealing with difficult matters, regarded as too serious or too intricate for local decision, but by the 11th century it had become a fashion, so that offenders of any rank or wealth refused habitually to submit to

penance at the hands of the local authorities, and betook themselves to Rome, where they stated their case in their own way, with no evidence to check them, so that they were enabled either to evade the canonical penances altogether or to get them much lightened. This abuse was combated by various councils, notably that of Seligenstadt in 1022, which decreed in its eighteenth canon "that no indulgences obtained from the Roman pontiff should avail for penitents, unless they had first fulfilled the penances set them by their own priests according to the degree of their offence; and, if they chose to go then to Rome, they must procure a permit from their own bishop, and letters on the matter in question to be carried to the pope." But this attempt to check the practice was unsuccessful, and it became established that, just as certain cases of conscience were reserved to the bishop, and could not be dealt with by ordinary parish priests, so certain other cases were withdrawn from the cognizance of the bishops themselves, and reserved for the hearing and decision of the pope alone. Many alterations in the nature and incidence of penances were made in the course of the later Middle Ages, but the details are unimportant except for specialists; it will suffice to mention such examples as imprisonment in monasteries, penitential pilgrimages, and flagellations, the last having been introduced by the hermit Dominic the Cuirassier (died 1060).

It is time to speak of the position occupied by penance in the theological systems of the Latin and Greek Churches. Both of them account penance, taken in its widest sense of the method of dealing spiritually with sins by confession, discipline, and absolution, as a sacrament, but there are various differences in their theories and methods. The Greek and Armenian Churches are in full agreement with the Latin Church in regarding confession as an integral and essential part of penance, of which they consider it the outward and visible sign, while the spiritual part of the sacrament consists in the form of absolution, whether precatory or declaratory, pronounced by the priest. And they lay down that the external acts of asceticism performed by the penitent are not strictly part of the sacrament itself, but merely the fulfilment of the church's injunctions, and tokens of that repentance which should attend the confession of sins. And confession, though recommended as a religious observance, is not a matter of formal ecclesiastical precept in the Eastern Church, but is left to the individual conscience, though it is usual to practise it at least once a year, prior to the Easter communion. There are also certain public penances sometimes enjoined in the East for sins of exceptional gravity, publicly or legally proved, but they do not form part of the normal system, one part of which, in strict agreement with ancient usage, consists in suspending heinous offenders from communion for some years, during which they can receive only the *ἀντίδοτον* or blessed bread. And in all cases the Easterns deny that penances are in any sense satisfactions or expiations of sins made to appease divine justice.

In the Latin Church the first noticeable divergence from Oriental usage is that the old public form of penance, technically known as "*solennis*," still survives in a documentary fashion in the *Pontifical*, though it has dropped into virtual abeyance. It consists of two distinct and correlative parts,—the public expulsion of penitents from church on Ash Wednesday and their reconciliation and readmission on Maundy Thursday following. As these rites preserve in essentials the traditions of very early Western usage, it is well to give some account of them here.

On Ash Wednesday, then, those penitents whose names are written down on a list for the purpose assemble, in coarse raiment and barefoot, at the cathedral of their diocese at nine o'clock A.M.

Their penances are then assigned them severally by the penitentiary or some other officer deputed for the purpose, after which they are sent out of the church, and bidden to wait at the doors. The bishop, attended by the clergy and choir, takes his seat in the middle of the nave, facing the doors, having previously blessed ashes for the coming rite. The penitents are next admitted, and, kneeling before the bishop, have ashes sprinkled on their heads by him or by some other dignitary present, and sackcloth is also laid upon them in similar fashion. The penitential psalms and the litanies are then said, all kneeling; after this the penitents stand up to hear a sermon from the bishop, at the close of which he takes one of them by the right hand, and leads him towards the doors, followed by all the other penitents, each grasping another's hand, and also holding lighted tapers, when they are ejected in a body. They kneel outside, and are again addressed by the bishop, enjoining them to spend the time of penance in prayers, fastings, almsdeeds, and pilgrimages, and to return on Maundy Thursday for reconciliation. The church-doors are then shut in their faces, and the bishop proceeds to celebrate mass.

The office on Maundy Thursday begins with the penitential psalms and the litanies, said by the bishop and clergy in church, while the penitents wait, barefoot and with unlighted tapers, outside the doors. After some preliminary ceremonies, a deacon goes to the penitents with a lighted candle, and kindles their tapers. The bishop then seats himself, as in the former rite, and the penitents are presented to him collectively by the archdeacon with a formal address. The bishop then rises, and with his immediate attendants advances to the doors, where he delivers a short address to the penitents, which ended, he returns into the church, still keeping near the doors, and, while a psalm is sung, the penitents enter and kneel before him; then the archdeacon or archpriest petitions for their reconciliation, and, having replied to the bishop's question as to their fitness, recites certain verses and responses alternately with the choir, while the bishop takes hold of the hand of one of the penitents, who in his turn takes that of another, till all form a chain, and thus they are led by the bishop to the middle of the church, where he recites a form of absolution over them. Psalms and prayers, closing with another absolutory form and a benediction, end the office, after which the penitents resume their ordinary dress, laying aside that which they had worn during Lent.

A further difference between the Eastern and Latin Churches is that the latter has made confession a formal precept ever since the canon of the Lateran council under Innocent III. in 1215, *Omnis utriusque sexus*, which enjoins all those arrived at years of discretion to confess at least once a year to their own parish priest, or to another priest with consent of the parish priest, the act being no longer left optional. And the choice of a confessor is limited also by the rule that absolution is not accounted valid unless pronounced by a priest having local jurisdiction and faculties. The chief divergence, however, between East and West on the sacrament of penance is due to the remarkable developments both in the doctrinal and the disciplinary aspects of the rite which took place in Latin Christendom during the Middle Ages. The former of these is mainly concerned with the new application, in the 12th century, of the system of indulgences, from its original character of a relaxation of the duration or severity of the temporal penalties annexed to offences by the canons to the remission of purgatorial chastisement of departed souls in the intermediate state—a tenet which seems to have been first developed by Hugh and Richard of St Victor—which gave rise to the practice of penitential observances by persons not lying under any censure, with the aim of acquiring the advantages thus held out to them for themselves or others, living or departed, to whom they are at liberty to transfer them. The latter is due to the legal, methodizing, and codifying temper which forms such a marked peculiarity of the Latin mind, in contrast with the more speculative Greek. Hence has arisen a copious literature, beginning with those *Penitentials*, or codes of disciplinary canons, already mentioned, but amplified at a later time into a vast system of moral theology and casuistry, mainly elaborated in the 16th and 17th centuries (see LIGUORI), whereby the whole modern administration of penance in the Latin Church is regulated. The Oriental churches have no corresponding system or text-books, and continue to observe the les-

methodized and determinate order in use during the 6th and immediately succeeding centuries. There is no theological difference between them, however, in respect of their view of absolution, although in the one case a declaratory, and in the other a precatory, form is employed. But a distinction in practice is maintained hereupon, for even the United Greeks are obliged, in virtue of an instruction issued by Clement VIII. in 1595, to use only the declaratory form when pronouncing absolution. In Latin theology the matter of the sacrament of penance is distinguished as "remote" and "proximate," as "exterior" and "interior," as "necessary" and "sufficient." The remote and exterior matter of penance is all post-baptismal sin, with the remission and correction of which penance has to do. The class of mortal sins are the necessary exterior matter, because confession is the only recognized mode of obtaining their remission. Venial sins are sufficient or voluntary matter of penance, because confession of them is not compulsory, and remission may be otherwise had. The contrition, confession, and satisfaction of the penitent are the proximate and interior matter of penance, with this further distinction, that the two former are "essential" and inseparable parts of it, while satisfaction, though an "integral" part, is not essential, being capable of dispensation. The form of the sacrament is the absolution pronounced by the priest. And, as before stated, the acts of bodily or spiritual mortification enjoined on the penitent as parts of his satisfaction, are called penances.

In the Church of England, penance, governed by pre-Reformation canons and statutes, has continued to be inflicted by sentence of the ecclesiastical courts down to very recent times,—one of its commonest forms being that of standing at the church-door clad in a white sheet. Precautions were taken by constitutions of Cardinal Othobon and Archbishop Stratford against the abuse of money commutations of penance; and the right of the spiritual courts to deal with cases involving penance, whether corporal or pecuniary, was protected against writs of prohibition by the statutes *Circumspecte agatis*, 13 Edward I. st. 4, and *Articuli Cleri*, 9 Edward II. st. 1, c. 2. The *Reformatio Legum* provided that ecclesiastical penances should not be commuted for money, save for some grave and necessary cause, and that such money should be applied to the relief of the poor, while a repeated offence should admit of no commutation. This same question came up frequently, having been dealt with under Queen Elizabeth, Charles I., William III., and Queen Anne, on the last occasion by Convocation, which laid down rules that no commutation-money should be allowed by any ecclesiastical judge without the consent of the ordinary in writing, nor disposed of without the like consent. The commutation office in the Book of Common Prayer makes reference to the solemn Lenten penance described above, as a thing desirable to be restored; but no action has ever been taken for the purpose.

In the Lutheran communion, penance, though at first amongst the usages intended to be maintained, and acknowledged in the *Articles* of Schmalkald, and also in the *Apology* for the Confession of Augsburg, has never held an effective place, being in truth incompatible with the doctrines and polity elaborated by Luther himself; so that, although confession and absolution continue as survivals in the Lutheran system, they are not associated with any regular discipline. Far otherwise is it with Calvinism. The twelfth chapter of the fourth book of Calvin's *Institutes* is mainly taken up with the question of ecclesiastical discipline, whose necessity is broadly stated, and alleged to extend to the whole body, clerical and lay alike, and to be derived from the power of the Keys. No precise rules are laid down, beyond saying that censures may begin with private monition, but should ascend in

severity in proportion to the gravity and notoriety of offences; but, in point of fact, the system raised on this basis by most of the Calvinist societies was a stringent and searching one. In particular, the *First* and *Second Books of Discipline*, put forth by John Knox and by the second generation of Scottish Reformers, lay down the principles for dealing with offenders against religion and morals with much clearness and precision, and the *Form of Process in the Judicatories of the Kirk*, as approved by the General Assembly in 1707, prescribes the manner of proceeding to inflict the several penalties enacted against a variety of offences and scandals. These at one time covered a wide area, but in later times only certain forms of immorality have continued to be brought under ecclesiastical cognizance for public censure and penalties. All the other more important Protestant sects have their own systems of discipline, more or less stringent, but they are virtually restricted in operation to suspension of communion with the body, or to expulsion from membership, no other penalties being provided.

PENANG. See PRINCE OF WALES ISLAND.

PENARTH, a seaport of Glamorganshire, Wales, is picturesquely situated on rising ground on the south side of the mouth of the Taff opposite Cardiff, from which it is four miles distant by rail and two by steamer. It was a small and unimportant village until an Act was passed in 1856 for making a tidal harbour. The docks (1865-84) are on a very extensive and complete scale, and the town is now an important shipping port for the minerals of South Wales, especially alabaster, coal, and iron. In 1883 there entered 1130 steamers and 567 sailing-vessels with an aggregate registered tonnage of 1,316,265 tons. The total quantity of coal and coke shipped in the same year was 2,274,003 tons. A line of rails 4 miles in length connects the docks with the Taff Vale Railway. The town is frequented in summer as a bathing-place, and the Rhætic beds at the head are of special interest to geologists. The principal buildings are the custom-house and dock-offices, and the church of St Augustine, in the Early English style, erected by the Baroness Windsor, who also built national schools. The population of the urban sanitary district (area, 2202 acres) in 1871 was 3104, and in 1881 it was 6228.

PENATES, Roman gods of the store-room and kitchen, derived their name from *penus*, "eatables, food." The store-room over which they presided was, in old times, beside the *atrium*, the room which served as kitchen, parlour, and bedroom in one; but in later times the store-room was in the back part of the house. It was sanctified by the presence of the Penates, and none but pure and chaste persons might enter it, just as with the Hindus the kitchen is sacred and inviolable. The family hearth, which anciently stood in the *atrium*, was their altar; on it were placed their images, two in number, for the Penates were always in pairs—the name does not occur in the singular.

They had no individual names, but were always known under the general designation, Penates. Closely associated with the Penates were the Lares, another species of domestic deity, who seem to have been the deified spirits of deceased ancestors (see *LARES*). But while each family had two Penates it had but one Lar. In the household shrine the image of the Lar (dressed in a toga) was placed between the two images of the Penates, which were represented as dancing and elevating a drinking-horn in token of joy and plenty. The three images together were sometimes called Penates, sometimes Lares, and either name was used metaphorically for "home." The shrine stood originally in the *atrium*, but when the hearth and the kitchen were separated from the *atrium* and removed to the back of the house, and meals were taken in an upper story, the position of the shrine was also shifted. In the houses at Pompeii it is sometimes in the kitchen, sometimes in the rooms. In the later empire it was placed behind the house-door, and a taper or lamp was kept burning before it. But the worship in the interior of the house was also kept up even into Christian times; it was forbidden by an ordinance of Theodosius (392 A.D.). The old Roman used, in company with his children and slaves, to offer a morning sacrifice and prayer to his household gods. Before meals the blessing of the gods was asked, and after the meal, but before dessert, there was a short silence, and a portion of food was placed on the hearth and burned. If the hearth and the images were not in the eating-room, either the images were brought and put on the table, or before the shrine was placed a table on which were set a salt-cellar, food, and a burning lamp. Three days in the month, viz., the Calends, Nones, and Ides (i.e., the first, the fifth or seventh, and the thirteenth or fifteenth), were set apart for special family worship, as were also the *Caristia* (22d February) and the *Saturnalia* in December. On these days as well as on such occasions as birthdays, marriages, and safe returns from journeys, the images were crowned and offerings made to them of cakes, honey, wine, incense, and sometimes a pig. As each family had its own Penates, so the state, as a collection of families, had its public Penates. Intermediate between the worship of the public and private Penates were probably the rites (*sacra*) observed by each clan (*gens*) or collection of families supposed to be descended from a common ancestor. The other towns of Latium had their public Penates as well as Rome. The sanctuary of the whole Latin league was at Lavinium. To these Penates at Lavinium the Roman priests brought yearly offerings, and the Roman consuls, praetors, and dictators sacrificed both when they entered on and when they laid down their office. To them, too, the generals sacrificed before departing for their provinces. Alba Longa, the real mother-city of Latium, had also its ancient Penates, and the Romans maintained the worship on the Alban Mount long after the destruction of Alba Longa. The Penates had a temple of their own at Rome. It was on the Velia near the Forum, and has by some been identified with the round vestibule of the church of SS. Cosma e Damiano. In this and many other temples the Penates were represented by two images of youths seated holding spears. The Penates were also worshipped in the neighbouring temple of Vesta. To distinguish the two worships, it has been supposed that the Penates in the former temple were those of Latium, while those in the temple of Vesta were the Penates proper of Rome. Certainly the worship of the Penates, whose altar was the hearth and to whom the kitchen was sacred, was closely connected with that of Vesta, goddess of the domestic hearth.

The origin and nature of the Penates was a subject of much discussion to the Romans themselves. They were traced to the mysterious worship of Samothrace; Dar-

danus, it was said, took the Penates from Samothrace to Troy, and after the destruction of Troy Æneas brought them to Italy and established them at Lavinium. From Lavinium Ascanius carried the worship to Alba Longa, and from Alba Longa it was brought to Rome. Equally unsatisfactory with this attempt to connect Roman religion with Greek legend are the vague and mystic speculations in which the later Romans indulged respecting the nature of the Penates. Some said they were the great gods to whom we owe breath, body, and reason, viz., Jupiter representing the middle ether, Juno the lowest air and the earth, and Minerva the highest ether, to whom some added Mercury as the god of speech (Servius, on *Æn.*, ii. 296; Macrobius, *Sat.*, iii. 4, 8; Arnobius, *Adv. Nat.*, iii. 40). Others identified them with Apollo and Neptune (Macrobius, iii. 4, 6; Arnob., *l.c.*; Serv., on *Æn.*, iii. 119). The Etruscans held the Penates to be Ceres, Pales, and Fortuna, to whom others added Genius Jovialis (Serv., on *Æn.*, ii. 325; Arnob., *l.c.*). The late writer Martianus Capella records the view that heaven was divided into sixteen regions, in the first of which were placed the Penates along with Jupiter, the Lares, &c. More fruitful than these misty speculations is the suggestion, made by the ancients themselves, that the worship of these family gods sprang from the ancient Roman custom (common to many savage tribes) of burying the dead in the house. But this would account for the worship of the Lares rather than of the Penates. A comparison with other primitive religious beliefs suggests the conjecture that the Penates may be a remnant of that fetishism or animism (i.e., the attribution of life, thought, and feeling to all objects animate and inanimate) in which many savage tribes exist to this day, and through which the higher races have probably passed at some period of their history, whether we suppose animism to be the primitive state of the human mind, or to be itself a development from the worship of ancestors, as Mr Herbert Spencer believes, or from some lower form of belief. The Roman *genti* seem certainly to have been fetiches, and the Penates were perhaps originally a species of *genti*. Thus the Penates, as simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo, and Minerva, whose wide and varied attributes represent a power of abstraction and generalization in the minds of their worshippers such as is not possessed by very primitive men. With the Penates we may compare the kindly household gods of old Germany; they too had their home on the kitchen hearth and received offerings of food and clothing. In the castle of Hudemühlen (Hanover) there was a kobold for whom a cover was always set on the table. In Lapland each house had one or more spirits. The souls of the dead are regarded as house-spirits by the Russians; they are represented as dwarfs, and are served with food and drink. Each house in Servia has its patron-saint. In the mountains of Mysore every house has its bhuta or guardian deity, to whom prayer and sacrifices are offered. The Chinese god of the kitchen presents some curious analogies to the Penates: incense and candles are burnt before him on the first and fifteenth of the month; some families burn incense and candles before him daily; and on great festivals, one of which is at the winter solstice (nearly corresponding to the Saturnalia), he is served with cakes, pork, wine, incense, &c., which are placed on a table before him.

PENCIL (Lat. *penicillus*, a small tail), a name originally applied to a small fine-pointed brush used in painting, and still employed to denote the finer camel's-hair and sable

brushes used by artists, has, in English, come commonly to signify solid cones or rods of various materials used for writing and drawing. Some method of producing black or coloured markings with rods of solid material on parchment, paper, wood, and other like smooth surfaces must have been known from time immemorial, but the ordinary so-called black-lead pencil does not possess a very high antiquity. It has been asserted that a manuscript of Theophilus, attributed to the 13th century, shows signs of having been ruled with a black-lead pencil; but the first distinct allusion to the common form of the instrument occurs in the treatise on fossils by Conrad Gesner of Zurich (1565), who describes an article for writing formed of wood and a piece of lead, or, as he believed, an artificial composition called by some *stimmi anglicanum* (English antimony). The famous Borrowdale mine in Cumberland having been discovered about that time, it is probable that we have here the first allusion to that great find of graphite which for so long supplied the world with its best lead pencils. While the supply of the Cumberland mine lasted, the material for the highly-esteemed English pencils consisted simply of the native graphite as taken from the mine. The pieces were sawn into thin veneers, which again were cut into the slender square rods forming the "lead" of the pencil. These leads were either cased in pencil cedar (the wood of the Virginian cedar, *Juniperus virginiana*), forming ordinary pencils, or they were, by an ingenious and delicate process of turning, in which ruby-cutters were used, rendered circular to supply the "ever-pointed pencils," which, however, are of comparatively modern origin.

Strenuous efforts were made on the Continent and in England to enable manufacturers to become independent of the product of the Cumberland mine. In Nuremberg, where the great pencil factory of the Faber family was established in 1761, pencils were made from pulverized graphite cemented into solid blocks by means of gums, resins, glue, sulphur, and other such substances, but none of these preparations yielded useful pencils. About the year 1795 Conté of Paris devised the process by which now all black-lead pencils, and indeed pencils of all sorts, are manufactured. In 1843 Mr Brockedon patented a process for compressing pure black-lead powder into solid compact blocks by which he was enabled to use the dust, fragments, and cuttings of fine Cumberland lead. He submitted the powdered substance to enormous pressure, and, by concurrently exhausting the air from the dies and the block of graphite in process of compression, he succeeded in forming a dense compact and uniform cake which could be treated in the same way as natural massive graphite from the mine. Brockedon's process would have proved successful and important had the supply of fine English black lead continued, but the exhaustion of the Borrowdale supplies and the excellence of Conté's process have rendered it more of scientific interest than of commercial value.

The pencil leads prepared by the Conté process consist of a most intimate mixture of graphite and clay, both first brought to a condition of the finest subdivision. The graphite is reduced to fine powder in a mortar; it is sifted and sometimes treated with mineral acid, to free it from iron, &c., then washed, and thereafter calcined at a bright-red heat. To get it in the condition of fine division, it is mixed with water and poured into a vat, where the heavier particles sink. From this vat the water bearing the lighter particles passes into another at a lower level, and so into one or two more, in each of which the comparatively heavy particles sink, and only the still finer particles are carried over. That which sinks in the last of the series is in a condition of extremely fine division, and is used for pencils of the highest quality. The clay, which must be free of sand and iron, is treated in the same manner, and brought to a state of great uniformity and smoothness. Clay and graphite so prepared are mixed in varying proportions from about equal parts to two of clay for one of graphite according as the pencils are to be hard or soft. They are thoroughly incorporated and ground together, then placed in bags and squeezed in a hydraulic press till

they have the consistency of stiff dough, in which condition they are ready for forming pencil rods. For this purpose the plastic mass is placed in a strong upright cylinder of brass, into which a plunger or piston works, moved by a powerful screw-press. The bottom of the cylinder consists of a thick bronze plate having in it a number of small apertures the section and size of the leads to be made. By the application of pressure to the plunger the graphite mixture is squeezed in continuous threads through the holes, and these threads are received and arranged in straight continuous lengths on a board, on which they are left to dry for some hours. For further drying by gentle heat they are placed in straight grooves in a grooved board, covered with another board, in which position they harden to stiff rods. These are afterwards cut into lengths for pencils, which are packed with charcoal in a covered crucible and submitted to a high furnace-heat. The two elements which regulate the comparative hardness and blackness of pencils are the proportions of graphite and clay in the leads and the heat to which they are raised in the crucible. According as the proportion of graphite is greater and the heat lower the pencil is softer and of deeper black streak.

The cedar in which pencils are cased is cut into two sets of rectangular slips of unequal thickness; but so that a thick and a thin slip put together form in section a square. In the thick or body piece is formed the groove or depression to receive the lead, which perfectly fits and fills it. The thinner covering piece is glued on and the pencil rounded between revolving cutters working at great speed. The cutters leave the rounded surface perfectly smooth, and it only remains to stamp the finished pencil with name and grade, &c. Very many pencils—but not usually good English qualities—are lacquered or varnished, and have the names, &c., stamped in gold letters.

Black pencils of an inferior quality are made from the dust of graphite melted up with sulphur and run into moulds. Such, with a little tallow added to give them softness, are the pencils commonly used by carpenters. Coloured pencils consist of a mixture of clay, with appropriate mineral colouring matter, wax, and tallow, treated by the Conté method as in making lead pencils. In the indelible and copying pencils which have come into use in recent years, the colouring matter is an aniline preparation mixed with clay and gum. The mixture not only makes a streak which adheres to the paper, but, when the writing is moistened with water, it dissolves and assumes the appearance and properties of an ink.

Nuremberg is the great centre of the pencil trade, possessing twenty-six factories which give employment to 5500 persons, the annual output of pencils numbering not less than 250 millions, of a value of upwards of £400,000. (J. PA.)

PENDULUM. See CLOCKS, vol. vi. p. 14, and MECHANICS, vol. xv. pp. 705, 718, 768.

PENELOPE, the faithful wife of the Greek hero Odysseus (Ulysses), immortalized by Homer in the *Odyssey*. She was the daughter of the Spartan Icarus and Periboea. Shortly before Odysseus left his native island of Ithaca to war against Troy, Penelope bore him a son, Telemachus. When her husband tarried long many chieftains of Ithaca and the islands round about wooed her to wife; they behaved wantonly, wasting the substance of Odysseus, insulting his son, and corrupting the maidservants. The heart of Penelope yearned for Odysseus, and, to rid herself of the importunities of the wooers, she bade them wait till she had woven a winding-sheet for old Laertes, the father of Odysseus. But every night she undid the piece which she had woven by day, so that the web was always unfinished. This she did for three years, till her maids revealed the secret to the wooers. Robbed of her pretext for delay she was in sore straits, till she was relieved by the arrival of Odysseus after an absence of twenty years. He slew the wooers, and the long-parted husband and wife were united once more.

Such is the story of Penelope in Homer. Later writers add other particulars about her. She was won by Odysseus in a race proposed by Icarus to his daughter's suitors. When Icarus would fain that Odysseus should bide with him in Sparta, or at least leave him his daughter, and Odysseus let Penelope choose whether she would go with him to Ithaca or stay with her father in Sparta, she silently drew her veil over her face. Her father understood her and let her go (Pausan., iii. 12, 20). Some said that she bore a son, Ptoliporthes, to Odysseus after his return from Troy. Others (marrying Homer's picture of her as a true and loving wife) said that in her husband's absence she bore Pan to Hermes or the suitors. Another story was that on his return Odysseus repudiated her as

unfaithful, that she went to Sparta and thence to Mantinea, where she died and where her tomb was shown (Pausan., viii. 12). According to others, after the death of Odysseus she married Telegonus (son of Odysseus and Circe) in *Ææa*, or in the islands of the Blest. The name is connected with *πῆνες*, *πήνη*, "wool," and hence means "weaver." The Homeric form is Penelopeia.

PENGUIN, the name (of very uncertain origin) of a flightless sea-bird,¹ but, so far as is known, first given to one inhabiting the seas of Newfoundland, as in Hore's "Voyage to Cape Breton," 1536 (Hackluyt, *Researches*, iii. pp. 168-170), which subsequently became known as the Great Auk or GARE-FOWL (vol. x. p. 78); and, though the French equivalent *Pingouin*² preserves its old application, at the present day, the word Penguin is by English ornithologists always used in a general sense for certain Birds inhabiting the Southern Ocean, called by the French *Manchots*, the *Spheniscidae* of ornithologists, which in some respects form perhaps the most singular group of the whole Class, or at least we may say of the Carinate Subclass. For a long while their position was very much misunderstood, some of the best of recent or even living systematists having placed them in close company with the *Alcidae* or Auks, to which they bear only a relationship of analogy, as indeed had been perceived by a few ornithologists, who recognized in the Penguins a very distinct Order, *Impennes*. The view of the latter is hardly likely to be disputed in future, now that the anatomical researches of MM. Paul Gervais and Alix (*Journ. de Zoologie*, 1877, pp. 424-470), M. Filhol (*Bull. Soc. Philomathique*, ser. 7, vi. pp. 226-248), and above all of Prof. Watson (*Zoology, Voy. Challenger*, part xviii.) have put the independent position of the *Spheniscidae* in the clearest light.³ The most conspicuous outward character presented by the Penguins is the total want of quills in their wings, which are as incapable of flexure as the flippers of a Cetacean, though they move freely at the shoulder-joint, and some at least of the species occasionally make use of them for progressing on land. In the water they are most efficient paddles, and are usually, if not always, worked alternately with a rotatory action. The plumage which clothes the whole body, leaving no bare spaces, generally consists of small scale-like feathers, many

of them consisting only of a simple shaft without the development of barbs; but several of the species have the head decorated with long cirrhus tufts, and in some the tail-quills, which are very numerous, are also long.⁴ In standing these birds preserve an upright position, generally resting on the "tarsus"⁵ alone, but in walking or running on land this is kept nearly vertical, and their weight is supported by the toes alone.

The most northerly limit of the Penguins' range in the Atlantic is Tristan d'Acunha, and in the Indian Ocean Amsterdam Island, but they also occur off the Cape of Good Hope and along the south coast of Australia, as well as on the south and east of New Zealand, while in the Pacific one species at least extends along the west coast of South America and to the Galapagos; but north of the equator none are found. In the breeding season they resort to the most desolate lands in higher southern latitudes, and indeed have been met with as far to the southward as navigators have penetrated. Possibly the Falkland Islands may be regarded as the locality richest in species,⁶ though, whatever may have been the case once, their abundance there

King-Penguin (*Aptenodytes pennanti*).

as individuals does not now nearly approach what it was in many other places, owing doubtless to the ravages of man, whose advent is always accompanied by massacre and devastation on an enormous scale—the habit of the helpless birds, when breeding, to congregate by hundreds and thousands in what are called "Penguin-rookeries" contributing to the ease with which their slaughter can be effected. Incapable of escape by flight, they are yet able to make enough resistance or retaliation (for they bite powerfully

¹ Of the three derivations assigned to this name, the first is by Drayton in 1613 (*Polybion*, Song 9), where it is said to be the Welsh *pen gwyn*, or "white head"; the second, which seems to meet with Littré's approval, deduces it from the Latin *pinguis* (fat); the third supposes it to be a corruption of "pin-wing" (*Ann. Nat. History*, ser. 4, iv. p. 133), meaning a bird that has undergone the operation of pinioning or, as in one part at least of England it is commonly called, "pin-winging." In opposition to the first of these hypotheses it has been urged (1) that there is no real evidence of any Welsh discovery of the bird, (2) that it is very unlikely for the Welsh, if they did discover it, to have been able to pass on their name to English navigators, and (3) that it had not a white head, but only a patch of white thereon. To the second hypothesis Prof. Skeat (*Dictionary*, p. 433) objects that it "will not account for the suffix -in, and is therefore wrong; besides which the 'Dutchmen' [who were asserted to be the authors of the name] turn out to be Sir Francis Drake" and his men. In support of the third hypothesis Mr. Reeks wrote (*Zoologist*, ser. 2, p. 1854) that the people in Newfoundland who used to meet with this bird always pronounced its name "Pin wing." Prof. Skeat's inquiry (*loc. cit.*), whether the name may not after all be South-American, is to be answered in the negative, since, so far as evidence goes, it was given to the North-American bird before the South-American was known in Europe.

² *Gorsou* has also been used by some French writers, being a corruption of *Geirfugl* or Gare-fowl.

³ Though the present writer cannot wholly agree with the conclusions of the last of these investigators, his remarks (pp. 230-232) on the "Origin of the Penguins" are worthy of all attention. He considers that they are the surviving members of a group that branched off early from the primitive "avian" stem, but that at the time of their separation the stem had diverged so far from Reptiles as to possess true wings, though the metatarsal bones had lost their distinctness and become fused into the single bone so characteristic of existing Birds. The ancestral Penguin, Prof. Watson argues, must have had functional wings, the muscles of which, through atrophy, have been converted into non-contractile tendinous bands.

⁴ The pterylographical characters of the Penguins are well described by Mr. Huxley (*Proc. Boston Soc. Nat. History*, 1871). Mr. Bartlett has observed (*Proc. Zool. Society*, 1879, pp. 6-9) that, instead of moulting in the way that birds ordinarily do, Penguins, at least in passing from the immature to the adult dress, cast off the short scale-like feathers from their wings in a manner that he compares to "the shedding of the skin in a serpent."

⁵ The three metatarsals in the Penguins are not, as in other birds, united for the whole of their length, but only at the extremities, thus preserving a portion of their originally distinct existence, a fact probably attributable to arrest of development, since the researches of Prof. Gegenbaur shew that the embryos of all birds, so far as is known, possess these bones in an independent condition. More recently Prof. Marsh has found that in the Dinosaurian genus *Ceratopsaurus* the metatarsals acquire a condition very similar to that which they present in the Penguins (*Am. Journ. Science*, Aug. 1884).

⁶ An interesting account of the Penguins of these islands is given by Capt. Abbott (*Ibis*, 1860, p. 336).

when they get the chance) to excite the wrath of their murderers, and this only brings upon them greater destruction, so that the interest of nearly all the numerous accounts of these "rookeries" is spoilt by the disgusting details of the brutal havoc perpetrated upon them.

The *Spheniscidae* have been divided into at least eight genera, but three, or at most four, seem to be all that are needed, and three can be well distinguished, as pointed out by Dr Coues in the Philadelphia *Proceedings* for 1872 (pp. 170-212), by anatomical as well as by external characters. They are (1) *Aptenodytes*, easily recognized by its long and thin bill, slightly decurved, from which *Pygoscelis*, as Prof. Watson has shewn, is hardly distinguishable; (2) *Eudyptes*, in which the bill is much shorter and somewhat broader; and (3) *Spheniscus*, in which the shortish bill is compressed and the maxilla ends in a conspicuous hook. *Aptenodytes* contains the largest species, among them those known as the "Emperor" and "King" Penguins, *A. patagonica* and *A. longirostris*.¹ Three others belong also to this genus, if *Pygoscelis* be not recognized, but they seem not to require any particular remark. *Eudyptes*, containing the crested Penguins, known to sailors as "Rock-hoppers" or "Macaronis," would appear to have five species, and *Spheniscus* four, among which *S. mendiculus*, which occurs in the Galapagos, and therefore has the most northerly range of the whole group, alone needs notice here. The generic and specific distribution of the Penguins is the subject of an excellent essay by Prof. Alphonse Milne-Edwards in the *Annales des Sciences Naturelles* for 1880 (vol. ix. art. 9, pp. 23-81), of which there is a German translation in the *Mittheilungen* of the Ornithological Union of Vienna for 1883 (pp. 179-186, 210-222, 238-241). (A. N.)

PENN, WILLIAM (1644-1718), the Quaker, was the son of Admiral William Penn and Margaret Jasper, a Dutch lady, and was born at Tower Hill, London, on 14th October 1644. During his father's absence at sea he lived at Wanstead in Essex, and went to school at Chigwell close by, in which places he was brought under strong Puritan influences. Like many children of sensitive temperament, he had times of spiritual excitement; when about twelve he was "suddenly surprised with an inward comfort, and, as he thought, an external glory in the room, which gave rise to religious emotions, during which he had the strongest conviction of the being of a God, and that the soul of man was capable of enjoying communication with Him. He believed also that the seal of divinity had been put upon him at this moment, or that he had been awakened or called upon to a holy life." It would indeed have been unnatural if a mind so disposed had not, when the time came, seized with avidity upon the distinctive doctrine of the Friends, that of the "inward light."

Upon the death of Cromwell, Penn's father, who, like Monk, was purely an adventurer, and had served the Protector because there was no other career open, and who, according to Clarendon, had previously offered to bring over the fleet to Charles, remained with his family on the Irish estates which Cromwell had given him, of the value of £300 a year. On the deposition of Richard Cromwell he at once declared for the king and went to the court at Holland, where he was received into favour and knighted; and at the elections for the Convention Parliament he was returned for Weymouth. During these events young Penn studied under a private tutor on Tower Hill until, in October 1660, he was entered as a gentleman commoner at Christ Church. He appears in the same year to have contributed to the *Threnodia*, a collection of elegies on the death of the young duke of Gloucester.

¹ An example, presumably of the former species, weighing 78 lb, was, according to Dr McCormick (*Voyages of Discovery*, i. p. 259), obtained by the "Terror" in January 1842.

The rigour with which the Anglican statutes were revived, and the Puritan heads of colleges supplanted, roused the spirit of resistance at Oxford to the uttermost. With this spirit Penn, who was on familiar terms with John Owen, and who had already fallen under the influence of Thomas Loe the Quaker, then at Oxford, actively sympathized. He and others refused to attend chapel and church service, and were fined in consequence. So far did the young enthusiasts proceed in the expression of their hatred to the Anglican regulations that it is said they fell upon the students who were clothed in surplices and violently tore the hated vestments from them. How far his leaving the university resulted from this cannot be clearly ascertained. Anthony Wood has nothing regarding the cause of his leaving, but says that he stayed at Oxford for two years, and that he was noted for proficiency in many sports. There is no doubt that in January 1662 his father was anxious to remove him to Cambridge, and consulted Pepys on the subject; and in later years he speaks of being "banished" the college, and of being whipped, beaten, and turned out of doors on his return to his father, in the anger of the latter at his avowed Quakerism. A reconciliation, however, was effected; and Penn was sent to France to forget this folly. The plan was for a time successful. Penn appears to have entered more or less into the gaieties of the court of Louis XIV., and while there to have become acquainted with Robert Spencer, afterwards earl of Sunderland, and with Dorothy, sister to Algernon Sidney. What, however, is more certain is that he somewhat later placed himself under the tuition of Moses Amyraut, the celebrated president of the Protestant college of Saumur, and at that time the exponent of liberal Calvinism, from whom he gained the patristic knowledge which is so prominent in his controversial writings, and whose example, doubtless, stimulated the tolerant views he already entertained. He afterwards travelled in Italy, returning to England in August 1664, with "a great deal, if not too much, of the vanity of the French garb and affected manner of speech and gait."²

Until the outbreak of the plague Penn was a student of Lincoln's Inn. For a few days also he served on the staff of his father—now great captain commander—and was by him sent back in April 1665 to Charles with despatches. It will be observed that his letters to his father even at this time are couched in quaintly devout phraseology. Returning after the naval victory off Lowestoft in June, Admiral Penn found that, probably from the effect upon his mind of the awful visitation of the plague, his son had again become settled in seriousness and Quakerism. To bring him once more to views of life not inconsistent with court preferment, the admiral sent him in February 1666 with introductions to Ormonde's pure but brilliant court in Ireland, and to manage his estate in Cork round Shannagarry Castle, his title to which was disputed. Penn appears also later in the year to have been "clerk of the cheque" at Kinsale, of the castle and fort of which his father had the command. When the mutiny broke out in Carrickfergus Penn volunteered for service, and acted under Arran so as to gain considerable reputation. The result was that in May 1666 Ormonde offered him his father's company of foot, but, for some unexplained reason, the admiral demurred to this arrangement. It was at this time that the well-known portrait was painted of the great Quaker in a suit of armour; and, strangely enough, it was at this time, too, that the conversion, begun when he was a boy, according to Penn's own account, by Thomas Loe in Ireland, was completed at the same place by the same agency.³

On 3d September 1667 Penn attended a meeting of

² Pepys, 30th August 1664.

³ Webb, *The Penns and Penningtons*, 1867. p. 17

Quakers in Cork, at which he assisted to expel a soldier who had disturbed the meeting. He was in consequence, with others present, sent to prison, by the magistrates. From prison he wrote to Lord Orrery, the president of Munster, a letter, in which he first publicly makes a claim for perfect freedom of conscience. He was immediately released, and at once returned to his father in London, with the distinctive marks of Quakerism strong upon him—the use of the “thee” and “thou,” and the refusal to remove his hat. So staunch on the hat question was he that he could not accept even the compromise suggested by his father, viz., that he should uncover before the king, the duke of York, and himself.

Penn now became a minister of the denomination, and at once entered upon controversy and authorship. His first book, *Truth Exalted*, in which he summons to trial princes, priests, and people, was “a short but sure testimony against all those religions, faiths, and worship that have been formed and followed in the darkness of apostasy,” and declared Quakerism to be “the alone good way of life and salvation.” Its tone and language were violent and aggressive in the extreme. The same offensive personality is shown in *The Guide Mistaken*, a tract written in answer to John Clapham’s *Guide to the True Religion*. It was at this time, too, that he appealed, not unsuccessfully, to Buckingham, who on Clarendon’s fall was posing as the protector of the Dissenters, to use his efforts to procure parliamentary toleration.

Penn’s first public discussion was with Thomas Vincent, a London Presbyterian minister, who had reflected on the “damnable” doctrines of the Quakers. In this he appears to have acted as second to George Whitehead.¹ The discussion, which had turned chiefly upon the doctrine of the Trinity, ended uselessly, and Penn at once published *The Sandy Foundation Shaken*, a tract of ability sufficient to excite Pepys’s astonishment, in which orthodox views on the Trinity, plenary satisfaction, imputed righteousness, and other doctrinal points were so offensively attacked that, at the instance of the bishop of London, Penn was placed in the Tower, where he remained for nearly nine months. The imputations upon his opinions and good citizenship, made as well by Dissenters as by the church, he repelled in *Innocency with her Open Face*, in which he asserts his full belief in the divinity of Christ, the atonement, and justification through faith, though insisting on the necessity of good works. It was now, too, that he published the most important of his books, *No Cross, no Crown*, which, besides the lessons of constancy and resignation indicated by the title, contained an able defence of the Quaker doctrines and practices, and a scathing attack on the evils of the age, especially the loose and unchristian lives of the clergy.

While completely refusing to recant or to yield to the persuasions of Stillingfleet, who, it is stated on doubtful authority, was sent to argue with him, Penn addressed a letter to Arlington in July 1669, in which, on grounds of religious freedom, he asked him to interfere. It is noteworthy, as showing the views then predominant, that he was almost at once set at liberty.

An infernal reconciliation now took place with his father, who had been impeached through the jealousy of Rupert and Monk (in April 1668), and whose conduct in the operations of 1665 he had publicly vindicated; and Penn was again sent on family business to Ireland. There is good reason for thinking that the extent of the differences between him and his father have been much exaggerated.² While there he regularly attended Quaker meetings, and was active in intercession for imprisoned Friends. At the desire of his father, whose health was fast failing, Penn

returned to London in 1670, and was immediately involved in fresh trouble. Having found the usual place of meeting in Gracechurch Street closed by soldiers, Penn, as a protest, preached to the people in the open street. With William Mead he was at once arrested and indicted at the Old Bailey on 1st September for preaching to an unlawful, seditious, and riotous assembly, which had met together with force and arms. The Conventicle Act not touching their case, the trial which followed, and which may be read at length in Penn’s *People’s Ancient and Just Liberties Asserted*, was a notable one in the history of trial by jury. The prisoners and the jury were alike brow-beaten and threatened by the bench, and particularly by the recorder. With extreme courage and skill Penn exposed the illegality of the prosecution, while the jury, for the first time, asserted the right of juries to decide in opposition to the ruling of the court. They brought in a verdict declaring Penn and Mead “guilty of speaking in Gracechurch Street,” but refused to add “to an unlawful assembly”; then, as the pressure upon them increased, and as they were sent back time after time without food, light, fire, or tobacco, they first acquitted Mead, while returning their original verdict upon Penn, and then, when that verdict was not admitted, returned their final answer “not guilty” for both. The court fined the jurymen 40 marks each for their contumacy, and, in default of payment, imprisoned them, whereupon they vindicated and established for ever the right they had claimed in an action before the Court of Common Pleas, when all twelve judges unanimously declared their imprisonment illegal.

Penn himself had been fined for not removing his hat in court, had been imprisoned on his refusal to pay, and had earnestly requested his family not to pay for him. The fine, however, was settled anonymously, and he was released in time to be present at his father’s death on 16th September 1670, at the early age of forty-nine. Penn now found himself in possession of a fortune of £1500 a year, and a claim on the crown for £15,000, lent to Charles II. by his father. The admiral appears, from a later statement of Penn, to have asked the king and James to become his son’s protectors, and James accepted and acted up to the engagement in a special manner. Upon his release Penn at once plunged into controversy, challenging a Baptist minister named Ives, at High Wycombe, to a public dispute and, according to the Quaker account, easily defeating him. No account is forthcoming from the other side. Hearing at Oxford that students who attended Friends’ meetings were rigorously used, he wrote a vehement and abusive remonstrance to the vice-chancellor in defence of religious freedom. This found still more remarkable expression in the *Seasonable Caveat against Popery* (January 1671), in which, while refuting the arguments of Roman Catholics, he urges, far in advance of his age and of all other sects, entire and unlimited toleration of faith and worship,—not, be it observed, on the grounds of expediency or of Scripture, but upon the distinctively Quaker doctrine of the “inward light.”

In the beginning of 1671 Penn was again arrested for preaching in Wheeler Street meeting-house by Sir J. Robinson, the lieutenant of the Tower, formerly lord mayor, and known as a brutal and bigoted churchman. Legal proof being wanting of any breach of the Conventicle Act, and the Oxford or Five Mile Act also proving inapplicable, Robinson, who had some special cause of enmity against Penn, urged upon him the oath of allegiance. This, of course, the Quaker would not take, and consequently was imprisoned for six months. A saying is recorded of Penn on this occasion worthy of remembrance. Robinson had ordered a corporal and some soldiers to take him to prison. “No, no,” said Penn, “send thy lacquey. I know the way

¹ Sewel’s *Hist. of Friends*, p. 172.

² Granville’s *Memorials of Sir W. Penn*, vol. ii. p. 571.

to Newgate." During this imprisonment Penn wrote several works, the most important being *The Great Case of Liberty of Conscience* (February 1671), a noble defence of complete toleration. Upon his release he started upon a missionary journey through Holland and Germany; at Emden he founded a Quaker Society, and established an intimate friendship with the princess palatine Elizabeth. In his letters written during this journey will be found a full exposition of the doctrine of the "inward light."

Upon his return home in the spring of 1672 Penn married Gulielma Springett, daughter of Mary Pennington by her first husband, Sir William Springett; she appears to have been equally remarkable for beauty, devotion to her husband, and firmness to the religious principles which she had adopted when little more than a child.¹ He now settled at Rickmansworth in Hertfordshire, and gave himself up to controversial writing. To this year, 1672, belong the *Treatise on Oaths and England's Present Interest Considered*, in the latter of which, written immediately after the withdrawal of the Declaration of Indulgence, is contained an able statement of the arguments against comprehension and for toleration. It should not be omitted by any one who desires to understand the state of feeling on the subject. In the year 1673 Penn was still more active. He secured the release of George Fox, addressed the Quakers in Holland and Germany, carried on public controversies with Hicks, a Baptist, and Faldo, an Independent, and published his treatise on the *Christian Quaker and his Divine Testimony Vindicated*, the *Discourse of the General Rule of Faith and Practice*,² *Reasons against Railing* (in answer to Hicks), *Counterfeit Christianity Detected*, and a *Just Rebuke to One-and-twenty Learned Divines* (an answer to Faldo and to *Quakerism no Christianity*). His last public controversy was in 1675 with Richard Baxter, in which, of course, each party claimed the victory. During this year his active sympathies were enlisted on behalf of imprisoned Quakers at Aberdeen. At this point Penn's connexion with America begins.

The province of New Jersey, comprising the country between the Hudson and Delaware rivers on the east and west, had been granted in March 1663-64 by Charles II. to his brother; James in turn had in June of the same year leased it to Lord Berkeley and Sir G. Carteret in equal shares. By a deed, dated 18th March 1673/74, John Fenwick, a Quaker, bought one of the shares, that of Lord Berkeley (Stoughton erroneously says Carteret's) in trust for Edward Byllinge, also a Friend, for £1000. This sale was confirmed by James, after the second Dutch war, on 6th August 1680. Disputes having arisen between Fenwick and Byllinge, Penn acted as arbitrator; and then, Byllinge being in money difficulties, and being compelled to sell his interest in order to satisfy his creditors, Penn was added, at their request, to two of themselves, as trustee. The disputes were settled by Fenwick receiving ten out of the hundred parts into which the province was divided,³ with a considerable sum of money, the remaining ninety parts being afterwards put up for sale. Fenwick sold his ten parts to two other Friends, Eldridge and Warner, who thus, with Penn and the other two, became masters of West Jersey, West New Jersey, or New West Jersey, as it was indifferently called.⁴ The five proprietors appointed three commissioners, with instructions dated from London 6th August 1676, to settle disputes with Fenwick (who

had bought fresh land from the Indians, upon which Salem was built, Penn being himself one of the settlers there) and to purchase new territories, to survey and divide them, and to build a town,—New Beverley, or Burlington, being the result. For the new colony Penn drew up a constitution, under the title of "Concessions," which he himself thus describes: "There we lay a foundation for after ages to understand their liberty as men and Christians, that they may not be brought in bondage but by their own consent; for we put the power in the people." The greatest care is taken to make this constitution "as near as may be conveniently to the primitive, ancient, and fundamental laws of the nation of England." But a democratic element is introduced, and the new principle of perfect religious freedom—"that no men, nor numbers of men upon earth, hath power or authority to rule over men's consciences in religious matters"—stands in the first place (chap. xvi.). With regard to the liberty of the subject, no one might be condemned in life, liberty, or estate, except by a jury of twelve, and the right of challenging was granted to the uttermost (chap. xvii.). Imprisonment for debt was not abolished (as Dixon states), but was reduced to a minimum (chap. xviii.), while theft was punished by twofold restitution either in value or in labour to that amount (chap. xxviii.). The provisions of chap. xix., taking their rise doubtless in Penn's own trial at the Old Bailey in 1670, deserve special notice. All causes were to go before three justices, with a jury. "They, the said justices, shall pronounce such judgment as they shall receive from, and be directed by the said twelve men, in whom only the judgment resides, and not otherwise. And in case of their neglect and refusal, that then one of the twelve, by consent of the rest, pronounce their own judgment as the justices should have done." The justices and constables, moreover, were elected by the people, the former for two years only (chap. xli.). Suitors might plead in person, and the courts were public (chap. xxii.). Questions between Indians and settlers were to be arranged by a mixed jury (chap. xxv.).

An assembly was to meet yearly, consisting of a hundred persons, chosen by the inhabitants, freeholders, and proprietors, one for each division of the province. The election was to be by ballot, and each member was to receive a shilling a day from his division, "that thereby he may be known to be the servant of the people." The executive power was to be in the hands of ten commissioners⁵ chosen by the assembly. Such a constitution, which is in marked contrast with Locke's aristocratic one for Carolina, settled eight years previously, soon attracted large numbers of Quakers to West Jersey.

It was shortly before these occurrences that Penn inherited through his wife the estate of Worminghurst in Sussex, whither he removed from Rickmansworth. He now (25th July 1677) undertook a second missionary journey to the Continent along with George Fox, Robert Barclay, and George Keith. Of this journey a full account, published seventeen years later, will be found in his selected works. He visited particularly Rotterdam and all the Holland towns, renewed his intimacy with the princess Elizabeth at Herwerden, and, under considerable privations, travelled through Hanover, Germany, the lower Rhine, and the electorate of Brandenburg, returning by Bremen and the Hague. It is worthy of recollection that the American settlers from Kirchheim, one of the places which responded in an especial degree to Penn's teaching, are noted as the first who declared it unlawful for Christians to hold slaves. Penn reached England again on 24th October.

¹ For a very charming account of her, and the whole Pennington connexion, see Maria Webb's *The Penns and Penningtons*.

² See on this Stoughton's *Penn*, p. 113.

³ The deed by which Fenwick and Byllinge conveyed New West Jersey to Penn, Gawry, and Nicholas is dated 10th February 1674/75.

⁴ The line of partition was "from the east side of Little Egg Harbour, straight north, through the country, to the utmost branch of Delaware river."

⁵ Penn's letter of 26th August 1676 says twelve, and Clarkson has followed this; but the Concessions, which were not assented to by the inhabitants until 3d March 1676/77, say ten.

His attention was at once taken up both with the disputes which had arisen within the Quaker body itself on questions of discipline, and still more with an endeavour to secure some decent measure of toleration for the Friends. He tried to gain the insertion in the Bill for the relief of Protestant Dissenters of a clause enabling Friends to affirm instead of taking the oath, and twice addressed the House of Commons' committee with considerable eloquence and effect. The Bill, however, fell to the ground at the sudden prorogation.

In 1678 the Popish Terror came to a head, and to calm and guide Friends in the prevailing excitement Penn wrote his *Epistle to the Children of Light in this Generation*. A far more important publication was *An Address to Protestants of all Persuasions*, by William Penn, Protestant, in 1679. In the first part of this work he inveighs against the five crying evils of the time so far as they are "under the correction of the civil magistrates," with an address to the magistrates for redress of those evils; the second part deals similarly with "the five capital evils that relate to the ecclesiastical state of these kingdoms"; the whole work is a powerful exposition of the doctrine of pure toleration and a protest against the enforcement of opinions as articles of faith. This was succeeded, at the general election which followed the dissolution of the pensionary parliament, by an important political manifesto, *England's Great Interest in the Choice of this New Parliament*, in which he insisted on the following points:—the discovery and punishment of the plot, the impeachment of corrupt ministers and councillors, the punishment of "pensioners," the enactment of frequent parliaments, security from Popery and slavery, and ease for Protestant Dissenters. Next came *One Project for the Good of England*, perhaps the most pungent of all his political writings. A single sentence will show the homely style of illustration which Penn usually adopted. "But since the industry, rents, and taxes of the Dissenters are as current as their neighbours', who loses by such narrowness more than England, than the Government, and the magistracy? . . . Till it be the interest of the former to destroy his flock, to starve the horse he rides and the cow that gives him milk, it cannot be the interest of England to let a great part of her sober and useful inhabitants be destroyed for things that concern another world." But he was not merely active with his pen. He was at this time in close intimacy with Algernon Sidney, who stood successively for Guildford and Bamber. In each case, owing in a great degree to Penn's eager advocacy, Sidney was elected, only to have his elections annulled by court influence. Toleration for Dissenters seemed as far off as ever. The future of English politics must have appeared to Penn well-nigh hopeless. Encouraged by his success in the New Jersey provinces, he again turned his thoughts to America. In repayment of the debt mentioned above Penn now asked from the crown, at a council held on 24th June 1680, for "a tract of land in America north of Maryland, bounded on the east by the Delaware, on the west limited as Maryland [i.e., by New Jersey], northward as far as plantable"; this latter limit Penn explained to be "three degrees northwards." This formed a tract 300 miles by 160, of extreme fertility, mineral wealth, and richness of all kinds. Disputes with James, and with Lord Baltimore, who had rights over Maryland, delayed the matter until 24th March 1681, when the grant received the royal signature, and Penn was made master of the province of Pennsylvania. His own account of the name is that he suggested "Sylvania," that the king added the "Penn" in honour of his father, and that, although he strenuously objected and even tried to bribe the secretaries, he could not get the name altered. It should be added that early in 1682 Carteret, grandson of the original pro-

prietor, transferred his rights in East Jersey to Penn and eleven associates, who soon afterwards conveyed one-half of their interest to the earl of Perth and eleven others. It is uncertain to what extent Penn retained his interest in West and East Jersey, and when it ceased. The two provinces were united under one government in 1699, and Penn was a proprietor in 1700. In 1702 the government of New Jersey was surrendered to the crown.

By the charter for Pennsylvania Penn was made proprietary of the province. He was supreme governor; he had the power of making laws with the advice, assent, and approbation of the freemen, of appointing officers, and of granting pardons. The laws were to contain nothing contrary to English law with a saving to the crown and the English council in the case of appeals. Parliament was to be supreme in all questions of trade and commerce; the right to levy taxes and customs was reserved to England; an agent to represent Penn was to reside in London; neglect on the part of Penn was to lead to the passing of the government to the crown (which event actually took place in 1692); no correspondence might be carried on with countries at war with Great Britain. A clause added at the last moment illustrates curiously both the strength and the jealousy of the Anglican Church at the time. The importunity of the bishop of London extorted the right to appoint Anglican ministers, should twenty members of the colony desire it, thus securing the very thing which Penn was anxious to avoid,—the recognition of the principle of an establishment.

Having appointed Colonel Markham, his cousin, as deputy, and having in October sent out three commissioners to manage affairs until his arrival, Penn proceeded to draw up proposals to adventurers, with an account of the resources of the colony. He negotiated, too, with James and Lord Baltimore with the view, ultimately successful, of freeing the mouth of the Delaware, wrote to the Indians in conciliatory terms, and encouraged the formation of companies to work the infant colony both in England and Germany, especially the "Free Society of Traders in Pennsylvania," to whom he sold 20,000 acres, absolutely refusing, however, to grant any monopolies. In July he drew up a body of "conditions and concessions." This constitution, savouring strongly of Harrington's *Oceana*, was framed in consultation with Sidney, though to what extent is doubtful. The inferences drawn by Hepworth Dixon from a single letter of Penn to Sidney, given at length by Stoughton, are quite unjustifiable. This sketch of a constitution was democratic in the purest sense. Until the council of seventy-two (chosen by universal suffrage every three years, twenty-four retiring each year) and the assembly (chosen annually) were duly elected, a body of provisional laws was added.

It was in the midst of this extreme activity that Penn was made a Fellow of the Royal Society. Leaving his family behind him, Penn sailed with a hundred comrades from Deal in the "Welcome" on 1st September 1682. His *Last Farewell to England* and his letter to his wife and children contain a beautiful expression of his pious and manly nature. He landed at Newcastle on the Delaware on 27th October, his company having lost one-third of their number by smallpox during the voyage. After receiving formal possession, and having visited New York, Penn ascended the Delaware to the Swedish settlement of Upland, to which he gave the name of Chester. The assembly at once met, and on the 7th December passed the "Great Law of Pennsylvania." The idea which informs this law is that Pennsylvania was to be a Christian state on a Quaker model. Only one condition is made necessary for office or citizenship, viz., Christianity. The constitution is purely democratic; all offices, for example, are elective. In many other provisions Penn showed him-

self far in advance of his time, but in none so much as where the penalty of death was abolished for all offences except murder. Lawsuits were to be superseded by arbitration, always a favourite idea with Penn. Philadelphia was now founded, and within two years contained 300 houses and a population of 2500. At the same time an Act was passed, uniting under the same government the territories which had been granted by feoffment by James in 1682. Realistic and entirely imaginative accounts (*cf.* Dixon, p. 270), inspired chiefly by Benjamin West's picture, have been given of the treaty which there seems no doubt Penn actually made in November 1682 with the Indians. His connexion with them was one of the most successful parts of his management, and he gained at once and retained through life their intense affection. At his death they sent to his widow a message of sorrow for the loss of their "brother Onas," with some choice skins to form a cloak which might protect her "while passing through the thorny wilderness without her guide."

Penn now wrote an account of Pennsylvania from his own observation for the "Free Society of Traders," in which he shows considerable power of artistic description.

Tales of violent persecution of the Quakers, and the necessity of settling disputes which had arisen with Lord Baltimore, his neighbour in Maryland, brought Penn back to England (2d October 1684) after an absence of two years. In the spring of 1683 he had modified the original charter at the desire of the assembly, but without at all altering its democratic character.¹ He was, in reference to this alteration, charged with selfish and deceitful dealing by the assembly. Within five months after his arrival in England Charles II. died, and Penn found himself at once in a position of great influence. His close connexion with James, dating from the death of his father, was rendered doubly strong by the fact that, from different causes, each was sincerely anxious to establish complete liberty of conscience. Even before his coronation James had told Penn that "he desired not that peaceable men should be disturbed for their religion." Penn now took up his abode at Kensington in Holland House, so as to be near the court. His influence there was great enough to secure the pardon of John Locke, who had been dismissed from Oxford by Charles, and of 1200 Quakers who were in prison. At this time, too, he was busy with his pen once more, writing a further account of Pennsylvania, a pamphlet in defence of Buckingham's essay in favour of toleration, in which he is supposed to have had some share, and his *Persuasive to Moderation to Dissenting Christians*, very similar in tone to the *One Project for the Good of England*. When Monmouth's rebellion was suppressed he appears to have done his best to mitigate the horrors of the western commission, opposing Jeffreys to the uttermost;² and he stood by Cornish and Elizabeth Gaunt at their executions. He says himself in a letter dated 2d October 1685, "About 300 hanged in divers towns in the West, about 1000 to be transported. I begged twenty of the king."

Macaulay, the grotesqueness of whose blunders on this matter is equalled only by the animus that inspired them, and by the disingenuousness with which he defended them, has accused Penn of being concerned in some of the worst actions of the court at this time. His complete refutation by Forster, Paget, Dixon, and others renders it unnecessary to do more than allude to the cases of the Maids of Taunton, Alderman Kiffin, and Magdalen College (Oxford).

In 1686, when making a third missionary journey to Holland and Germany, Penn was charged by James with an informal mission to the prince of Orange to endeavour to gain his assent to the removal of religious tests. Here

he met Burnet, from whom, as from the prince, he gained no satisfaction, and who greatly disliked him. On his return he went on a preaching mission through England. His position with James was undoubtedly a compromising one, and it is not strange that, wishing to tolerate Papists, he should, in the prevailing temper of England, be once more accused of being a Jesuit, while he was in constant antagonism to their body. Even Tillotson took up this view strongly, though he at once accepted Penn's vehement disavowal. It was in reference to this that Penn wrote one of his pithy sentences: "I abhor two principles in religion, and pity them that own them; the first is obedience upon authority without conviction; and the other, destroying them that differ from me for God's sake. Such a religion is without judgment, though not without teeth."

In 1687 James published the Declaration of Indulgence, and Penn probably drew up the address of thanks on the part of the Quakers. It fully reflects his views, which are further ably put in the pamphlet *Good Advice to the Church of England, Roman Catholics, and Protestant Dissenters*, in which he showed the wisdom and duty of repealing the Test Acts and Penal Laws.

At the Revolution he behaved with courage. He was one of the few friends of the king who remained in London, and, when twice summoned before the council, spoke boldly in his behalf. He admitted that James had asked him to come to him in France; but at the same time he asserted his perfect loyalty. During the absence of William in 1690 he was proclaimed by Mary as a dangerous person, but no evidence of treason was forthcoming. It was now that he lost by death two of his dearest friends, Robert Barclay and George Fox. It was at the funeral of the latter that, upon the information of the notorious informer Fuller, an attempt was made to arrest him, but he had just left the ground; the fact that no further steps were then taken shows how little the Government believed in his guilt. He now lived in retirement in London, though his address was perfectly well known to his friends in the council. In 1691, again on Fuller's evidence, a proclamation was issued for the arrest of Penn and two others as being concerned in Preston's plot. He might, on the intercession of Locke, have obtained a pardon, but refused to do so. He appears to have especially felt the suspicions that fell upon him from the members of his own body. In 1692 he began to write again, both on questions of Quaker discipline and in defence of the sect. *Just Measures in an Epistle of Peace and Love, The New Athenians* (in reply to the attacks of the *Athenian Mercury*), and *A Key opening the Way to every Capacity* are the principal publications of this year.

Meantime matters had been going badly in Pennsylvania. Penn had, in 1687, been obliged to make changes in the composition of the executive body, though in 1689 it reverted to the original constitution; the legislative bodies had quarrelled; and Penn could not gain his rents. He was closely concerned also in this year with a dispute between East and West Jersey regarding the dividing line, in which he espoused the cause of the former (and richer) province. The chief difficulty, however, in Pennsylvania was the dispute between the province—*i.e.*, the country given to Penn by the charter—and the "territories," or the lands granted to him by the duke of York by feoffment in August 1682, which were under the same Government but had differing interests. No sooner had Penn by a skilful compromise settled this matter than the colony was torn by the religious schism caused by George Keith. The difficulties which Quaker principles placed in the way of arming the colony—a matter of grave importance in the existing European complications—fought most hardly against Penn's power. On 21st October 1692 an order of

¹ Dixon, p. 276.

² Burnet, iii. 66; Dalrymple, i. 282.

council was issued depriving Penn of the governorship of Pennsylvania, and giving it to Colonel Fletcher, the governor of New York.¹ To this blow were added the illness of his wife and a fresh accusation of treasonable correspondence with James. In his enforced retirement he wrote the most devotional and the most charming of his works,—the collection of maxims of conduct and religion entitled *The Fruits of Solitude*. In December, thanks to the efforts of his friends at court, among whom were Buckingham, Somers, Rochester, and Henry Sidney, he received an intimation that no further steps would be taken against him. The accusation, however, had been public, and he insisted on the withdrawal being as public. He was therefore heard in full council before the king, and honourably acquitted of all charge of treason. It was now that he wrote an *Essay towards the Present and Future Peace of Europe*, in which he puts forth the idea of a great court of arbitration, a principle which he had already carried out in Pennsylvania.

In 1694 (23d February) his wife Gulielma died, leaving two sons, Springett and William, and a daughter Letitia, afterwards married to William Aubrey. Two other daughters, Mary and Hannah, died in infancy. He consoled himself by writing his *Account of the Rise and Progress of the People called Quakers*. The coldness and suspicion with which he had been regarded by his own denomination had now ceased, and he was once more regarded by the Quaker body as their leader. About the same time (20th August) he was restored to the governorship of Pennsylvania; and he promised to supply money and men for the defence of the frontiers. In 1695 he went on another preaching mission in the west, and sent a petition to parliament praying that affirmations might be substituted for oaths. This year and the next were busily occupied with preaching and writing, one of his auditors being no less a person than Peter the Great. In March 1696 he formed a second marriage, with Hannah Callowhill, his son Springett dying five weeks later. In this year he wrote his work *On Primitive Christianity*, in which he argues that the faith and practice of the Friends were those of the early church. In 1697 Penn removed to Bristol, and during the greater part of 1698 was preaching with great success against oppression in Ireland, whither he had gone to look after the property at Shannangarry.

In 1699 he was back in Pennsylvania, landing near Chester on 30th November, where the success of Colonel Quarry, judge of the admiralty in Pennsylvania, who was in the interests of those who wished to make the province an imperial colony, and the high-handed action of the deputy Markham in opposition to the crown, were causing great difficulties. Penn carried with him particular instructions to put down piracy, which the objections of the Quakers to the use of force had rendered audacious, and concerning which Quarry had made strong representations to the home Government, while Markham and the inhabitants apparently encouraged it. Penn and Quarry, however, came at once to a satisfactory understanding on this matter, and the illegal traffic was vigorously and successfully attacked. The next question he took up was slavery, and his attitude towards it is curious. In 1696 the Philadelphia yearly meeting had passed a resolution declaring it contrary to the first principles of the gospel. Penn, however, did not venture upon emancipation; but he insisted on the instruction of negroes, permission for them to marry,

repression of polygamy and adultery, and proposed regulations for their trial and punishment. The assembly, however, a very mixed body of all nations, now refused to accept any of these proposals except the last-named.

His great success was with the Indians; by their treaty with him in 1700 they promised not to help any enemy of England, to traffic only with those approved by the governor, and to sell furs or skins to none but inhabitants of the province. At the same time he showed his capacity for legislation by the share he took with Lord Bellemont at New York in the consolidation of the laws in use in the various parts of America.

Affairs now again demanded his presence in England. The king had in 1701 written to urge upon the Pennsylvania Government a union with other private colonies for defence, and had asked for money for fortifications. The difficulty felt by the crown in this matter was a natural one. A Bill was brought into the Lords to convert private into crown colonies. Penn's son appeared before the committee of the House and managed to delay the matter until his father's return. On 15th September Penn called the assembly together, in which the differences between the province and the territories again broke out. He succeeded, however, in calming them, appointed a council of ten to manage the province in his absence, and gave municipal institutions to Philadelphia. In May 1700, experience having shown that alterations in the charter were advisable, the assembly had, almost unanimously, requested Penn to revise it. On 28th October 1701 he handed it back to them in the form in which it afterwards remained. An assembly was to be chosen yearly, of four persons from each county, with all the self-governing privileges of the English House of Commons. Two-thirds were to form a quorum. The nomination of sheriffs, coroners, and magistrates for each county was given to the governor, who was to select from names handed in by the freemen. Moreover, the council was no longer elected by the people, but nominated by the governor, who was thus practically left single in the executive. The assembly, however, who, by the first charter, had not the right to propound laws; but might only amend or reject them, now acquired that privilege. In other respects the original charter remained, and the inviolability of conscience was again emphatically asserted. Penn reached England in December 1701. The accession of Anne appears to have put an end to the Bill in the Lords, and to his troubles on this score. He once more assumed the position of leader of the Dissenters and himself read the address of thanks for the promise from the throne to maintain the Act of Toleration. He now too took up his abode again at Kensington, and published while here his *More Fruits of Solitude*.

In 1703 he went to Knightsbridge, where he remained until 1706, when he removed to Brentford, his final residence being taken up in 1710 at Field Ruscombe, near Twyford. In 1704 he wrote his *Life of Bulstrode Whitelocke*. He had now much trouble from America. The territorialists were openly rejecting his authority, and doing their best to obstruct all business in the assembly; and matters were further embarrassed by the injudicious conduct of Governor Evans in 1706. Moreover, pecuniary troubles came heavily upon him, while the conduct of his son William, who became the ringleader of all the dissolute characters in Philadelphia, was another and still more severe trial. This son was married, and had a son and daughter, but appears to have been left entirely out of account in the settlement of Penn's proprietary rights on his death.

Whatever were Penn's great qualities, he was deficient in judgment of character. This was especially shown in the choice of his steward Ford, from whom he had borrowed money, and who, by dexterous swindling, had managed, at the time of his death, to establish a claim for £14,000

¹ Colonel Fletcher's commission recites "that by reason of great neglect and miscarriage in the government of Pennsylvania Her Majesty found it necessary to take the government into her hands and under her immediate protection." The attorney-general and the solicitor-general were of opinion (on 12th July 1694) that, when the aforesaid reasons failed or ceased, the right of government belonged to the petitioner.

against Penn. Penn, however, refused to pay, and spent nine months in the Fleet rather than give way. He was released at length by his friends, who paid £7500 in composition of all claims. Difficulties with his government of Pennsylvania continued to harass him. Fresh disputes took place with Lord Baltimore, the owner of Maryland, and Penn also felt deeply what seemed to him the ungrateful treatment which he met with at the hands of the assembly. He therefore in 1710 wrote, in earnest and affectionate language, an address to his "old friends," setting forth his wrongs. So great was the effect which this produced that the assembly which met in October of that year was entirely in his interests; revenues were properly paid; the disaffected were silenced and complaints were hushed; while an advance in moral sense was shown by the fact that a Bill was passed prohibiting the importation of negroes. This, however, when submitted to the British parliament, was cancelled. Penn now, in February 1712, being in failing health, proposed to surrender his powers to the crown. He appears, from Dixon's work (p. 413), to have offered previously, just before he was arrested by the Ferds, to give up his government for £20,000, but with stipulations which rendered the crown unwilling to take it. On the present occasion the commission of plantations recommended that Penn should receive £12,000 in four years from the time of surrender, Penn stipulating only that the queen should take the Quakers under her protection; and £1000 was given him in part payment. Before, however, the matter could go further he was seized with apoplectic fits, which shattered his understanding and memory. A second attack occurred in 1713, and from that time until his death his powers gradually failed, although at times his intellect was clear and vigorous. He died on 30th May 1718, leaving three sons by his second wife, John, Thomas, and Richard, and was buried along with his first and second wives at Jourdan's meeting-house, near Chalfont St Giles in Buckinghamshire. It has finally to be mentioned that in 1790 the proprietary rights of Penn's descendants were bought up for a pension of £4000 a year to the eldest male descendant by his second wife, and that this pension was commuted in 1884 for the sum of £67,000. (O. A.)

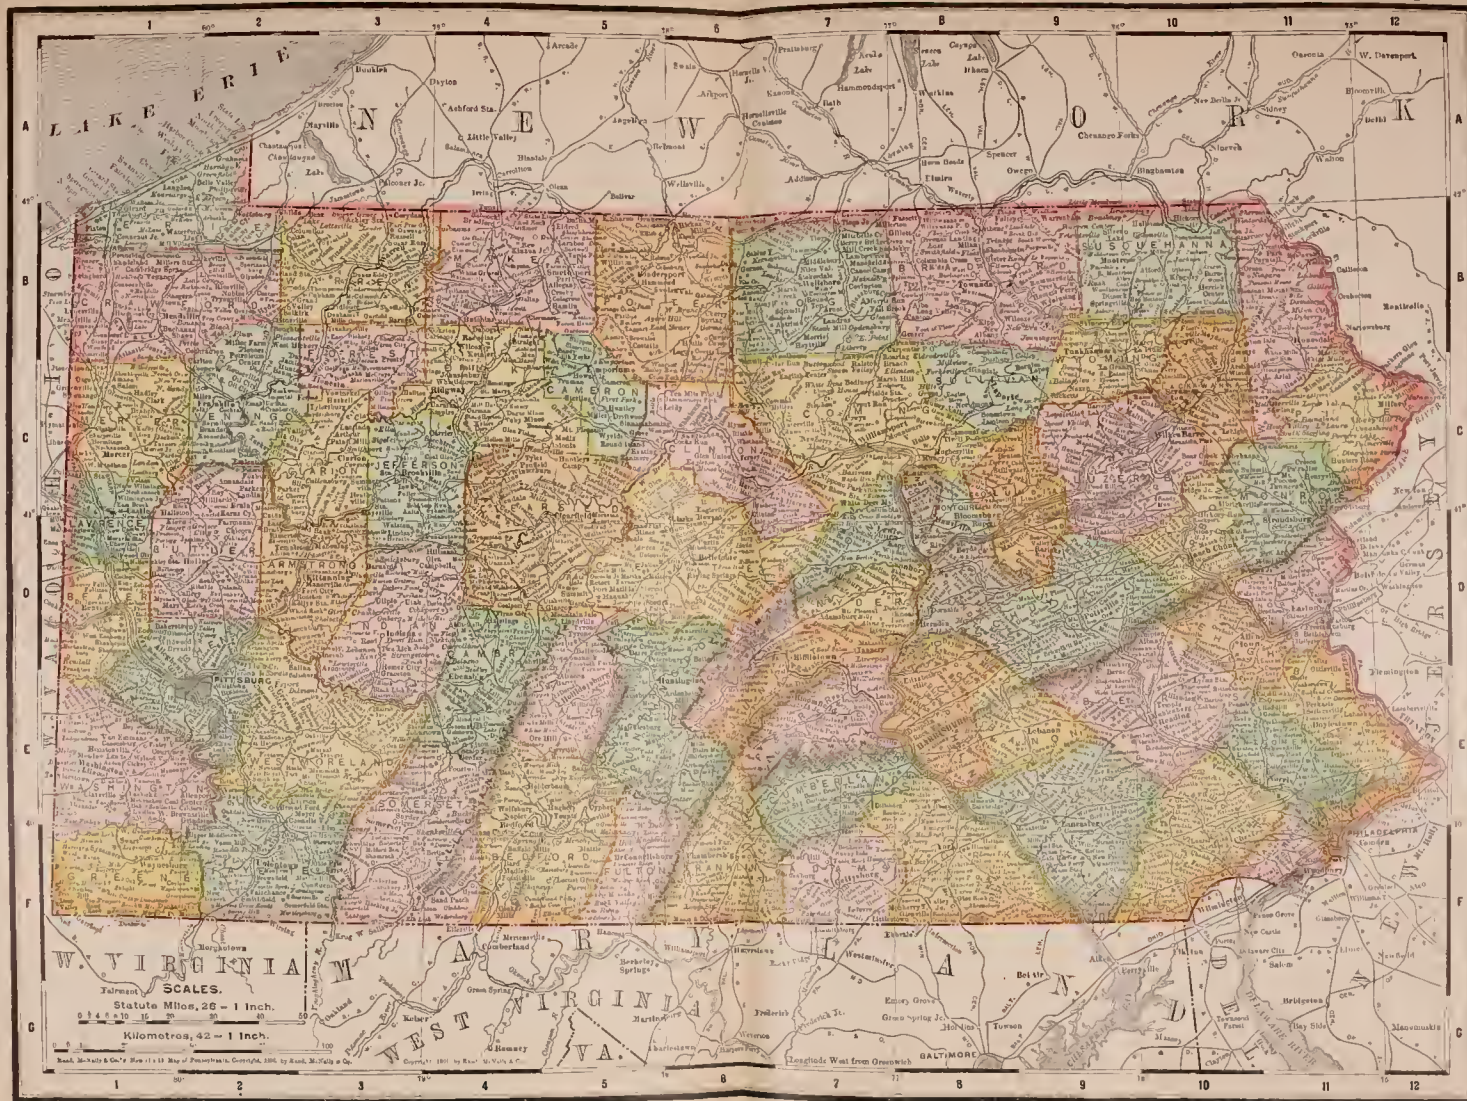

PENNANT, THOMAS (1726-1798), naturalist and antiquary, was descended from an old Welsh family, who for many generations had resided at Downing, Flintshire, where he was born 14th June 1726. He received his early education at Wrexham and Fulham, and afterwards attended Queen's and Oriel Colleges, Oxford, but did not take a degree. At twelve years of age he was inspired with a passion for natural history through obtaining a present of Willughby's *Ornithology*; and a tour in Cornwall in 1746-47 after leaving Oxford awakened his strong interest in minerals and fossils. In 1750 his account of an earthquake which he felt at Downing was inserted in the *Philosophical Transactions*, where there also appeared in 1756 a paper on several coralloid bodies he had collected at Coalbrook Dale, Shropshire. In the following year, at the instance of Linnæus, he was elected a member of the Royal Society of Upsala. In 1766 he published a folio volume entitled *British Zoology*. The work is meritorious rather as a laborious compilation than as an original contribution to science, but that it served a good purpose is evidenced by the number of editions (see ORNITHOLOGY, p. 9 above) through which it passed. During its progress he visited the Continent and made the acquaintance of Buffon, Voltaire, Haller, and Pallas. In 1771 was published his *Synopsis of Quadrupeds*, afterwards extended into a *History of Quadrupeds*. At the end of the same year he published *A Tour in Scotland in 1769*, which proving remarkably popular was followed in 1774 by an

account of another journey in Scotland published in two volumes, afterwards distinguished as the second and third *Tour*. In these works he manifested the rare faculty of investing with interest details of antiquarian lore, while they have also proved invaluable as preserving the record of important antiquarian relics which have now perished. In 1778 he brought out a similar *Tour in Wales*, which was followed by a *Journey to Snowdon* (part i. 1781, part ii. 1783), afterwards forming the second volume of the *Tour*. In 1782 he published a *Journey from Chester to London*. He brought out *Arctic Zoology* in 1785-87. In 1790 appeared his *Account of London*, which has gone through a large number of editions, and has justly been termed "the most popular book ever written on the subject." Three years later he published the *Literary Life of the late T. Pennant, written by himself*. In his later years he was engaged on a work entitled *Outlines of the Globe*, vols. i. and ii. of which appeared in 1798, and vols. iii. and iv., edited by his son David Pennant, in 1800. He was also the author of a number of minor works, some of which were published posthumously. He died at Downing 16th December 1798. Pennant was in 1767 elected a member of the Royal Society, and he was a member of many other learned societies, both home and foreign. In 1771 he received the degree of D.C.L. from the university of Oxford.

PENNI, GIANFRANCESCO (1488-1528), Italian painter, surnamed "Il Fattore," from the relation in which he stood to Raphael, whose favourite disciple he was after Giulio Romano, was a native of Florence, but spent the latter years of his life in Naples. He painted in oil as well as in fresco, but is chiefly known for his work in the Loggia of the Vatican.

PENNSYLVANIA, one of the original thirteen States of the North American Union, lying between 39° 43' and 42° 15' N. lat., and between 74° 40' and 80° 36' W. long., is 160 miles wide, and more than 300 miles long from east to west. Its northern, southern, and western border-lines were meant to be straight; the eastern follows the course of the Delaware river. It is bounded by the States of New York and New Jersey on the N. and E., by Ohio on the W., and by Delaware, Maryland, and West Virginia on the S. At its north-west corner a small triangular addition gives it a shore-line of 40 miles, with one good harbour, on Lake Erie. At its south-eastern corner, a circle of 10 miles radius (struck from the court-house at Newcastle) throws a small area into the State of Delaware. Its surface, subdivided into sixty-seven counties, measures nearly 28,800,000 acres or 45,000 square miles; less than one-half of its acreage is in cultivated farms, and only 1,000,000 of the people live in separate farm-houses. Out of a population of 4,283,000, nearly 2,000,000 lived in towns and cities in 1880, and more than 2,000,000 in country hamlets or factory villages, at iron mines and furnaces, at coal-mines and coke-ovens, at lumber-camps and oil-wells, or along the many lines of canal and railroad which traverse the State in all directions.

Physical Features.—Pennsylvania is topographically divisible into three parts: a south-east district, the open country between the South Mountains and the sea; a middle belt of parallel valleys separated by low parallel mountain-ridges; and a northern and western upland, behind the escarpment of the Alleghany Mountain. One and a half millions of its people inhabit the fertile and highly-cultivated south-eastern triangle, which is nowhere more than 600 or 700 feet above the level of the sea. One million inhabit the middle belt of higher-lying valleys, rich in iron ore and anthracite coal. One and a half millions occupy the great bituminous coal and oil regions of the northern and western counties, elevated from 1000 to 2500 feet above the sea,

which constitute at least one-half of the State, and drain, not eastward into the Atlantic, but northward into the St Lawrence and westward into the Mississippi.

The valleys of the middle belt are of two characters, distinguished by the farming population of the Atlantic States as "rich valleys" and "poor valleys." The former, whether large or small, are completely enclosed and comparatively level arenas of limestone land, surrounded by rocky and wooded barriers, less than 1000 feet high, through narrow gaps in which streams enter or issue. A curiously sculptured slate-terrace, half the height of the encircling mountain, overlooks each of these secluded valleys. Their entire limestone floor has been under cultivation for a century, and the best iron-ore deposits of the State and its oldest mines are situated in them. They are gardens of fertility, yielding heavy crops of wheat, rye, and maize to the frugal, thrifty, and laborious descendants of their early settlers. Innumerable caverns ramify beneath the surface; sink-holes receive the drainage of the fields; many of the water-courses appear and disappear beneath sunken arches of limestone; and wells are the chief source of supply. Old orchards and great planted trees abound, and more picturesque landscapes cannot be found. Nittany, the largest of these isolated valleys, occupies the centre of the State. It is 60 miles long, but its greatest width is only 10 miles; and it is subdivided at its north-eastern end by long projecting mountain-spurs into narrow parallel coves, each of which is known by a special name, Brush valley, Penn's valley, &c. Sinking Spring valley is at its south-western end, and here it is traversed by the Little Juniata river, along the banks of which runs the Pennsylvania Railroad. A narrow valley, called Canoe valley, leads southward into Morrison's cove, which is half as large as Nittany valley. The next largest limestone valley is Kishicoquilis, 40 miles long by 5 miles wide, ending southward in a point, and split at its north-east end into three. German Amish (Mennonite sect) and Scotch-Irish Presbyterian settlers, separated by an ideal cross line, have made this valley famous for its loveliness and wealth. Farther south is M'Connell's cove, west of this Friend's cove, and still farther west Millikin's cove. Two little oval holes in the mountains north-east of Nittany valley, Nippenose valley and Oval valley, and two long slit-like depressions in Tuscarora and Black Log Mountains conclude the short list of these remarkable limestone threshing-floors of Pennsylvania.

Across the whole State, however, stretches the Great Valley in a wide and gentle curve from east to south, one-half its surface covered with the soil of the terrace-slate, the other half with the same limestone soil which causes the exceptional fertility of the isolated valleys above enumerated. This very remarkable feature of the Atlantic side of the continent extends in an unbroken line for nearly 1000 miles, from eastern Canada to the lowlands of the Gulf of Mexico, only 150 miles of its length being in Pennsylvania, where its average width may be called 15 miles. Everywhere on its north-west side rises a sharp and regularly level-crested ridge, about 1000 feet high, heavily timbered. On its other or southern side a range of irregular mountain-land completely secludes the Great Valley from the seaboard, except for about 50 miles in Pennsylvania. This mountain-range is known in Vermont as the Green Mountains, in Massachusetts as the Taconic Mountains, in New York and New Jersey as the Highlands, in Pennsylvania and Maryland as the South Mountains, in Virginia as the Blue Ridge, in North Carolina as the Unaka or Smoky Mountains. In their northern extension they rise to heights of 3000 and 4000 feet; in the southern States they have summits from 4000 to 7000 feet above the sea. In Pennsylvania few parts of the range exceed 1500 feet; and at the broken

gap of 50 miles already mentioned the Great Valley limestone land protrudes southward through the interrupted range, to make of Lancaster the richest agricultural county in the State. Before the era of railways Lancaster county made the markets of Philadelphia the cheapest and most luxurious in the world. It was on this exceptional outspread of the Great Valley limestone that the Germans of the first immigration settled. The limestone plain of Lancaster spreads west across the Susquehanna river into York county, and east into Berks and Chester counties to within 20 miles of Philadelphia. The whole plain swarms with life; the houses are small, but the stone barns are of colossal size, 100 and even 150 feet long and from 30 to 50 feet high, the barnyard-wall supported on ranges of heavy columns, while on the other side of the building an earthen slope ascends to the great barn door.

The eight counties which lie along the face of the South Mountains, in the south-eastern region of the State, are in the highest state of cultivation, and resemble the most picturesque rural districts of England,—a country of rolling hills and gently sloping vales, with occasional rocky dells of no great depth, and low cascades utilized for grist-mills, factories, and machine shops; a country of wheat, rye, maize, potatoes, tobacco, turnip-fields, orchards, meadows, and patches of woodland; a country of flowing water, salubrious, fertile, and wealthy; dotted with hamlets, villages, and towns, and with the country-seats of affluent citizens. But the region as a whole is 'divisible' into at least four districts, differing as much in population as in soil and situation. The counties of York and Adams, lying west of the Susquehanna river along the Maryland line, are inhabited by Germans, who for the most part still use the patois of their fatherland, mixed with English words and phrases. The counties of Montgomery and Bucks, lying between the Schuylkill and Delaware rivers, have a mingled population of the descendants of Germans, Quakers, and French-Huguenots. The hilly district of northern Chester is also partly German. Southern Lancaster, southern Chester, and Delaware counties support the most intelligent and virtuous population in the State, largely composed of the descendants of Penn's colonists, who have mostly escaped the narrowing and enervating influences of the city, and enjoy the mental and physical activity, the simplicity of manners, and the loyalty to truth, justice, and charity which characterized the Quakers at the origin of the sect in England. The district which they inhabit is a veritable fairyland, and its principal town, Westchester, has been for a long time one of the notable centres of scientific life in the State.

Climate.—The climate of so great a State is necessarily various, and is made more variable by its situation on the eastern side of the continent facing the Gulf Stream. The north-west wind is dry and cold in winter, the south-west wind always mild and rainy, and the south-east ocean wind wet and sultry in summer; but the dreaded north-easters of New England lose much of their rigour by the time they reach the Delaware. The northern highlands of the State are buried under 4 or 5 feet of snow four months of the year. The southern middle counties enjoy genial weather the whole year round, interrupted only by a few short intervals of intense heat or cold, never lasting more than three consecutive days. The midland valleys are very hot in midsummer and very cold in mid-winter, the thermometer ranging between 0° and 100°, with a not unfrequent sudden fall after a sultry week of 30° or 40° in a few hours, ending with thunderstorms, and followed by dry, clear, cool weather, with winds from the north-west. The climate of the south-western counties is comparatively dry and equable, but with a sufficient annual rainfall, and plenty of snow in winter, productive of great river-floods

in spring. The average annual rainfall ranges from 36 inches in the western counties to 42 inches at Philadelphia. Destructive "freshets" descend the eastern rivers when the ice breaks up; for the Delaware and Susquehanna rivers are almost every year frozen over from tide-water to their sources; thunderstorms happen in the midst of winter; the January thaw is always to be apprehended; and when heavy rains break up the ice and it accumulates in the gaps of the mountains, the main river-channels become scenes of inevitable disaster. In 1837 the valley of the Lehigh was swept clean for 60 miles, the dams and locks of the canal were all destroyed, and every bridge and mill disappeared. Along the lower Susquehanna the floating ice has often been piled upon the railroad embankment to the height of several yards. Even in midsummer a heavier downpour than usual in 1836 carried destruction through the valley of the Juniata. But the affluents of the Ohio river in the western part of the State are subject every year to this danger.

Geology.—For unknown geological reasons Pennsylvania is peculiar for exhibiting the Palæozoic system in its

maximum development, that is, from the Permian formation down to the base of Murchison's Lower Silurian, with a total thickness of more than 40,000 feet at the eastern outcrops, diminishing to half that amount in the western counties. As all the formations are thrown into great anticlinal and synclinal folds, and cut through transversely by the rivers, they can be measured along numerous continuous and conformable section lines. Near Harrisburg, at Pottsville, and at Mauch Chunk the Carboniferous, Devonian, and Upper Silurian rocks, standing vertical, show a cross section 5 miles thick. At the Delaware and Lehigh water-gaps the Lower Silurian slates are 6000 feet thick. In Canoe valley the underlying Lower Silurian limestones have been measured 6500 feet thick. In the south-western corner of the State about 1000 feet of Permian rocks overlie the Coal-measures proper. Thus the following Palæozoic column can be studied with peculiar advantages in Pennsylvania, many of its more important stages either becoming greatly attenuated or wholly disappearing when followed into the neighbouring States of New York, Ohio, and Virginia.

Geological Map of Pennsylvania.

The geology of south-eastern Pennsylvania is not understood. There can be no doubt that the copper-bearing porphyritic Huronian system is well represented in the South Mountains, south of the Chambersburg fault, on the borders of Maryland; but the systematic age of the gneisses, mica schists, garnetiferous schists, serpentine and chrome iron rocks, of the Philadelphia belt, commencing at Trenton,

crossing the Schuylkill river on a section line 15 miles wide, and extending through Delaware and Chester counties into Maryland, is still under discussion, some geologists considering them of pre-Cambrian age and others regarding them as metamorphosed Silurian rocks. They contain minute quantities of gold and are evidently a prolongation of the great gold-bearing belt of Virginia and the Carolinas.

Minerals.—The mineral resources of Pennsylvania have never been exaggerated except by those who compare its iron-mines with those of other States. It possesses a virtual monopoly of anthracite. The output of rock-oil is still amazing. The bituminous, coking, and block coal district is only one large part of an enormous area which includes eastern Ohio, West Virginia, middle Tennessee, and northern Alabama; and the ranges of iron-ores extend through New Jersey and New York into New England and Canada, and through Maryland, Virginia, North Carolina, and eastern Tennessee into Alabama, with no sensible difference of quantity or quality in either direction. But Pennsylvania has the advantage over other States of a first plant, both in iron-works and coal-mines, and in a consequent multiplication and concentration of capital for these industries, which must keep her *facile princeps* in this respect for a long time to come. Sooner or later she must take a second rank in iron, but never in coal and coke. It is possible that the oil-fields of the three States to the south and west of her may become as productive as her own, although no signs of such an event are visible yet to geologists; but no contingency of events can affect her absolute control of the anthracite market.

Three anthracite coal-regions in eastern Pennsylvania are recognized by railroad men, coal-dealers, and statisticians; but they do not exactly correspond to the three anthracite coal-fields of the geological survey reports. (1) By the Schuylkill region is meant all the surface of coal-land which is drained by that river, with all the small additions from the upper water-basins of the Shamokin and Swatara rivers, affluents of the Susquehanna. In 1822 it supplied the Philadelphia market with 1480 tons of coal; in 1880 it distributed, in all directions along the lines of the Reading Railroad, 9,500,000 tons. (2) By the Lehigh region is meant all the coal-lands on that river, furnishing in 1821 1073 tons, and in 1882 5,700,000, chiefly to the city of New York. (3) By the Wyoming region is meant the isolated valley of the Susquehanna (north branch) and Lackawanna rivers, commencing its shipments in 1829 with 7000, and sending in 1882 14,000,000 tons of coal eastward, northward, and westward, to Boston, Montreal, and Chicago. In 1883 these three regions shipped a total of 31,800,000 tons.

The three anthracite coal-fields into which the region divides itself geologically—the southern, the middle, and the northern—are three groups of narrow parallel basins filled with crumpled Coal-measures. Each field has a characteristic grouping of its basins different from the other two: the southern in perfectly straight lines, except at its western end, which has a long fork or fish-tail; the middle in échelon; the northern in a long sweeping curve from west by east to north. The southern field has for its southern border a sharp low mountain-ridge, 62 miles long, bearing about N. by 60° E., and ending abruptly westward near the Susquehanna river and eastward at the Lehigh river. It is gapped in four places, by the Swatara, by the Schuylkill, and by its two principal branches, giving passage to three railways and two canals, one of which has been abandoned and the other is little used. In this mountain the lower Coal-measures descend vertically to a depth of 3000 feet below tide-level, and then rise again in a series of waves to the top of a much higher mountain which borders the field upon the north. From the top of this broad mountain the Coal-measures have been swept away. They are next seen descending steeply northward into the middle field, where they sink to various depths of 1000 or 2000 feet below sea-level, rolling six times so as to make that number of mining basins, and then rise into the air, along a bounding mountain at the northern edge of the field, not to descend again to the present surface of the earth for 40 miles. Only the lowest beds, however, appear there in narrow strips upon the highest plateau of the State, and not as anthracite, but as bituminous coal. This description, however, only applies to the western division of the middle field. Its eastern division has a very different character. On the broad rolling top of the Beaver Meadow Mountains, west of the Lehigh river, lie a group of closely-folded parallel troughs, in which the coal-beds descend steeply to depths of 1000 or 2000 feet, and rapidly rise again to the surface, each trough being pointed at both ends and disappearing on the summits of mountain-spurs, which look down upon deeply-indented red-shale valleys. The collieries of this eastern division of the middle field are all on very high land, from 1600 to 1800 feet above the sea; and branch railroads descend from them by steep gradients to the two rival main lines, which follow the banks of the Lehigh and Delaware rivers to the Atlantic coast.

The northern field corresponds exactly to the Wyoming region. It is a moon-shaped trough, 50 miles long by 6 miles wide, tapering to a point both ways. Its eastern half is drained by the Lackawanna river westward into the Susquehanna river, where the latter breaks through the northern mountain-wall and begins to meander westward through the Kingston flats in the centre of the coal-field made famous by the incidents of Indian warfare. A few miles farther on the river breaks half through the northern wall, splitting it lengthwise, and then cuts off the western point of the basin, leaving a little patch of it capping the isolated spur. This magnificent coal-field is traversed diagonally by anticlinal and synclinal folds in the Coal-measures in such a manner as to subdivide it into more than thirty small coal-basins, all connected underground, the deepest of which hold more than 3000 feet of Coal-measures; so that in a hiltop near Wilkesbarre fossil-shells of the Permian formation, the uppermost division of the Carboniferous system, have been collected.

Until the maps of the anthracite section of the State Geological Survey have been completed, the area of anthracite coal-land in all three fields cannot be accurately stated. The total number of coal-beds cannot be stated, because some are hardly noticeable; others are composed of several layers separated elsewhere by 50 or 100 feet of intervening rock. The identification of the beds across the intervals which separate the fields, and even from colliery to colliery, is not in all cases satisfactory. It may, however, be said generally that the whole column of Coal-measures contains more than a hundred coal-beds. Less than one-fourth of these have hitherto been considered of desirable size and quality for mining. Most of the output in past years and at present comes from five or six of them, from the Lykens valley bed, from the Buck Mountain bed especially from the Mammoth bed—all of

them white ash—and from two or three red ash beds next higher in the series. The first quantities of coal which were sent to the market came from an open quarry on the summit of the mountain at Mauch Chunk, where the Mammoth bed is 60 feet thick. In subsequent years a long range of extensive collieries were created on the Mine Hill slope of the bed behind Pottsville. Later still the Mahanoy and Shenandoah collieries were established behind the Broad Mountain. From early years the great bed was worked in the Wyoming region by the Baltimore Company. Other corporations have extensively exploited it throughout the valley. Old mines in this bed are worked on a great scale also at Hazleton and Beaver Meadow, and later plants were made at Jeanesville, Clifton, and elsewhere. A choice though smaller bed, called the Buck Mountain vein, extends through all three fields, and is largely mined in many places, sometimes in tunnel-connexion with the Mammoth and sometimes alone. The Lykens valley bed, holding 10 and 12 feet of exceedingly choice coal, lies near the bottom of the Millstone grit (the base of the Coal-measures), but is scarcely workable anywhere except at the western end of the southern field.

The waste in mining anthracite coal is enormous, although it has been somewhat diminished by the concentration of most of the coal-properties under the control of a few railway companies, who employ competent engineers and superintendents. But the markets demand the delivery of the coal in sizes. Iron furnaces alone accept the run of the mine. The "breaker," an anthracite invention, and a monster of destruction, is an edifice of wood and iron 100 feet high, furnished with slopes and lifts to take the mine-cars to the top, with rollers set with teeth to crush the larger lumps, with bolting screens to separate the sizes, with picking banks and boys to throw out slate descending the shoots, and with bays or pockets from which the coal is drawn at will to fill railway trains passing underneath. The waste is carted off to a neighbouring hillside. Hills of this "dust," 100 feet high and hundreds of feet long, enumber the country, and awaken the anxiety of proprietors respecting its future disposal. All plans for utilizing it cheaply on a large scale have as yet failed, and no serious change in the situation can take place until the supply in the earth begins to fail. The time for that is distant. The annual output can reach 50,000,000 tons, and, in spite of the waste, can continue at that figure for three centuries. An exact calculation of solid contents in the ground, of waste in mining and breaking, and of quantity sent to market has been made for only one division of one field.

At the eastern end of the southern field, for instance, six beds, as yet locally worked by only thirteen collieries (four of them now abandoned), contained originally 1,033,000,000 tons, of which only 54,000,000 have been extracted (between 1820 and 1882), leaving 979,000,000 tons still untouched. The output in 1820 was less than 400 tons, that of 1849 nearly 400,000 tons, that of 1882 838,000. In a few years it will reach 2,000,000, and might continue at that rate five centuries.

The number of working collieries in the anthracite region is constantly changing. The list for 1881-82, reported by the official mine inspectors, numbers 141 in the northern field, 51 in the eastern middle, 91 in the western middle, and 79 in the southern field, 353 collieries in all. The fuel they send to market is both white coal from the lower and red-ash coal from the higher beds of the series, the market sizes being designated egg, stove, chestnut, pea, and buckwheat. By sampling carefully the contents of five cars from one colliery carrying each a different size of coal, and analysing the samples, it was found that, while there was little difference in the percentage of water (say 1·7), of sulphur (say 0·7), and of volatile matter (say 4·0), the percentage of ash regularly increased as the size diminished (egg 5·662, stove 10·174, chestnut 12·666, pea 14·664, buckwheat 16·620), showing the finer breakage of the slaty layers, and the mixture of slate-dust with the smaller sizes of coal. The percentage of solid carbon, of course, diminished directly with the size, from 88·5 in egg-coal to 76·9 in buckwheat. The coal dust of the heaps about the mines, before alluded to, is therefore, no doubt, still lower in solid carbon; yet Captain Wootten's dust-burning locomotives on the Reading Railroad have been a success; and the dust or "braize" of the Philadelphia coal-yards is sold for use in fire-boxes of suitable construction.

The bituminous coal-region of Pennsylvania covers the western third of the State, the greatest thickness of Coal-measures being in the south-western corner. Six wide parallel basins sweep round from the boundary-line with New York State south-westward into Ohio and West Virginia. The summit of the Alleghany Mountain, containing the lowest coals, limits the region towards the south-east; an irregular line parallel with and 30 miles distant from the shore of Lake Erie limits it on the north-west. The basins all gradually deepen going south-west, and are all subdivided into smaller local basins by gentle rolls. In one or two neighbourhoods the coal-beds dip as much as 30°; but over almost the entire area they are so nearly horizontal that a dip of 2° or 3° is exceptionally great. Over thousands of square miles they lie as flat as geological formations can ever lie, considering the accidents of original deposi-

tion in the quiet Carboniferous sea. There is a striking uniformity in the composition of the whole formation, which is naturally divisible into: (1) upper (Permian) barren-measures; (2) upper (Pittsburgh) productive Coal-measures; (3) lower barren-measures; (4) lower productive Coal-measures; (5) Millstone grit (Pottsville conglomerate); (6) Mauch Chunk shale and mountain limestone; (7) Pocono sandstone and lowest (worthless) coal-beds. These rest on more than 10,000 feet of Devonian rocks.

The area of the State actually covered by one or more workable bituminous coal-beds is about 9000 square miles. Dr H. M. Chance's calculation of area, thickness, content, &c. (in a paper read before the Am. Inst. Min. Eng., October 1881), is the most trustworthy yet made. He assumes sixteen important coal-beds, none workable over the whole area of thirty-one counties,—only the lowest beds being preserved in ten, and the principal upper beds only in seven of these counties. Beds less than 2 feet thick are ignored. Beds from 2 to 3 feet thick are estimated only from outcrop down to water-level; beds from 3 to 5, to 150 feet below water-level; beds over 5, to 400 feet below water-level. Allowing 1650 gross tons per foot to the acre (less 11 per cent. for slate, bone, and sulphur partings, say 1500 gross tons) the mass of beds over 6 feet is 11,000,000,000 tons; of beds between 6 and 3 feet, 19,500,000,000; and of beds under 3 feet, 3,000,000,000,—making a total of 33,500,000,000 gross tons, 75 per cent. of which can be mined, *i. e.*, 25,000,000,000 tons; of this 10,500,000,000 are in the Pittsburgh bed. An exaggerated statement was current thirty years ago that the Pittsburgh coal-bed within the limits of the State of Pennsylvania would equal the whole annual British coal-trade (then 100,000,000 tons) for 2000 years. According to our present knowledge such an output would exhaust it in a single century.

The upper productive Coal-measures, about 300 feet thick, contain four workable beds, of which the lowest (Pittsburgh) is the mainstay of the coke and iron interests of the seven south-western counties, furnishing to 77 collieries in Allegheny county 4,000,000 tons, to 50 in Fayette county 1,566,000, to 46 in Westmoreland county 2,335,000, to 31 in Washington county 798,000, to 14 in Somerset county 200,000,—total nearly 9,000,000 tons mined out of 217 collieries, most of them mere adits into the hillsides, at various levels (from 30 to 300 feet) above the water-level of the Ohio river, or its main branch, the Monongahela river, and its branch the Youghiogheny river. Along these streams railroad stations and slack water pools receive the coal let down by trestle-work slopes from the adits. A few shafts are sunk to the bed where, for short distances, it sinks a few yards beneath water-level.

The iron-ores of Pennsylvania formerly sufficed for stocking the furnaces of the State; but for more than twenty years past large outside supplies have been in demand,—the red hæmatites of Michigan, the magnetic ores of Canada, northern New York, and especially of northern New Jersey, and the limonites of Virginia, not to speak of numerous cargoes of Algerian ore. To understand the native ores it will be necessary to refer to the schedule of the geological formations of the State (see p. 500 above). The more recent formations—the Tertiary and the Cretaceous—poor in iron ores, are not found in Pennsylvania, being confined to the Atlantic seaboard. The next older formation—the Trias—also poor in iron ore, makes an independent belt across the State through Bucks, Montgomery, Chester, Lancaster, York, and Adams counties. Hence we have only to consider five sources of supply,—(a) the carbonate ores of the Coal-measures, with brown hæmatite outcrops; (b) the lower Devonian brown hæmatites; (c) the Upper Silurian red fossil-ore; (d) the Lower Silurian brown hæmatites; and (e) the Azoic magnetites, some of them apparently in Cambrian rocks, overlaid by Trias, and the rest of them interbedded with the oldest (Laurentian?) gneisses.

The ordinary ironstone of the Coal-measures occurs in ball or plate layers throughout the bituminous coal-region, but is almost wanting in the anthracite region. Brown hæmatite deposits, always connected with the limestone beds in the Coal-measures, were formerly extensively mined, but the supplies of Carboniferous ore of both kinds are far from meeting the present demand, and the make of charcoal iron from them has been virtually abandoned. At the base of the Devonian series the Marcellus still yields considerable quantities of brown hæmatite from the outcrop of a ferruginous clay-bed, but only in two or three noteworthy localities. The Clinton beds of red fossil-ore (soft and rich at the outcrop, hard and lean lower down) at Danville and Bloomsbury, at Frankstown and Hollidaysburg, at Bloody Run and Bedford, kept furnaces going for a good many years, and are still used as mixtures at Johnstown and elsewhere. The Lower Silurian brown hæmatite mines, however, have been the chief dependence of the industry. They are very numerous in the isolated limestone valleys and along the whole course of the Great Valley. Some of these open quarries are of vast size, and between 100 and 200 feet deep; furnishing shot and ball and pipe ore of the finest quality, both cold-short and red-short; and the high reputation of American or Juniata iron is based upon the history first of the charcoal and then of the anthracite make of pig-metal from these special ores. Railroads now

carry them long distances to the present centres of the iron manufacture, in the heart of the bituminous coal-region, or in front of the anthracite region, on the Lehigh, Schuylkill, and Susquehanna rivers, where they can be mixed with the subcrystalline iron ores of the South Mountains or of the Highlands of New Jersey. The South Mountains of Pennsylvania, however, cannot be said to be rich in these last-mentioned deposits, a few of which are indeed mined to a considerable extent; but no thorough exploration of the range has yet been undertaken to see if the deep-lying strata contain the Canadian and New York magnetites which are to be expected. Some of the oldest and largest mines are situated at the edge of the Trias belt, and were formerly supposed to be of Trias age; but it seems now probable that they belong to a Cambrian slate formation covered by the Trias; and in all cases they are touched or surrounded by trap-dykes, which cut the Trias or trap-beds that interlie the Trias. The most remarkable of these mines is the "Cornwall" near Lebanon, where great quantities of cupriferous magnetite are obtained by stoping the walls of a vast open quarry.

The iron industry of Pennsylvania has always competed with the cotton growth of the southern States and the cotton industry of the eastern States for political power in Congress, to save itself against a foreign importation of rolled iron. The iron-masters of Pennsylvania have led in every debate upon a protective tariff. Pennsylvania has always furnished one-half of the total amount of pig-iron cast in the United States. In 1883 it made 2,688,891 tons out of a total of 5,146,972 tons made in twenty-four States and one Territory. Of these 1,416,468 tons were anthracite pig, 1,184,108 coke and raw coal pig, and only 38,349 were charcoal pig; and the number of furnaces at the end of 1883 was 142 in blast and 129 out of blast. In like manner Pennsylvania has always rolled more than one-half of the iron and steel rails of American manufacture,—in 1883, for instance, 857,818 tons out of a total of 1,360,694, and of these 319,544 were Bessemer. So of crucible-steel ingots Pennsylvania in 1883 made 68,687 out of a total of 80,455; open-hearth steel ingots, 72,333 of a total of 133,679; in a word, of all kinds of rolled iron, 1,081,163 tons out of a total of 2,348,874. The petroleum statistics for 1882, partly mixed with those of an adjoining district in New York, show a product of 30,541,740 barrels (of 42 gallons).

Vegetation.—The vegetation of the State corresponds in variety with the variety of elevation and distance from the seaboard. The mountains are clad with forests of pine, hemlock, oak, beech, maple, walnut, wild cherry, cucumber, dogwood, and laurel, and cultivated apple, cherry, pear, and peach trees grow in the clearings. Wild grapes grow in sheltered places; wild huckleberries, strawberries, and blackberries flourish. Oats, barley, and timothy grass yield heavy crops. The original forest remains only here and there in secluded spots. All its white-pine timber has been cut, and none grows to replace it. The spruce-pine, hemlock, and oak woods have been girdled by settlers, or barked by tanners and left to die. Extensive iron-furnace tracts have been systematically cut several times; the deserted charcoal grounds in the anthracite and coke districts have become covered with a dense low growth of oak, maple, birch, dogwood, and other deciduous vegetation. Two other motives have co-operated for the destruction of the original forest,—the demand for railway sleepers and the still greater demand for timber and slabs in mines. The annual forest fires, sometimes of enormous magnitude, help to keep the size of forest-wood small, and to cover the uncultivated part of the State with brushwood. The early settlers of the low country also cut without mercy and without fear; no shadow was allowed to fall on a field. The traditional practice lasted long; but the scarcity of wood at length made itself felt. The last generation began to plant; the present cherishes and multiplies trees, in and around fields, along roads, and on rough ground. The old settled parts of the State are becoming again well wooded. The mountain-ridges will always remain so, for outcrops of sandstone make them rocky, and the terracing of their steep slopes is not yet to be thought of. In the north-western counties the discovery of petroleum in 1859 produced a great demand for derrick lumber, and the ephemeral wooden cities which sprang up during the succeeding twenty-five years caused a rapid bringing under cultivation of at least 5000 square miles, lying between 1000 and 2000 feet above the level of the sea.

Two hundred and eighty-four genera and 544 species of plants are enumerated as growing on the plateau of Wayne county, in the north-east corner of the State, a typical portion of the whole upland region, covered with glacial drift-sand and gravel, with innumerable lakes, ponds, and small swamps, lying at various elevations from 1100 to 2000 feet above the sea.

Fauna.—The zoology of Pennsylvania exhibits that transition stage of its history in which we live. The elk has disappeared; but the panther (puma) and the small wolf are occasionally met with. The black bear is not by any means extinct, and can always find its way anew into the State from West Virginia. The wild cat is common in the least settled counties. Hedgehogs, ground-hogs, weasels, polecats, squirrels of three species, mice of several

species, and musk-rats abound; but the beaver, which has given name to so many mountains, rivers, creeks, and swamps all over the State, no longer exists. The wild turkey is practically exterminated, but is occasionally shot on the mountains. Owls, wood-doves, thrushes, and other birds are abundant. Harmless snakes of various species are innumerable, especially a constrictor, the black snake, which grows to a length of 5 or 6 feet. Two venomous snakes are still numerous, the copper-head in the half-cultivated districts and the rattlesnake in the mountains. The latter, in spite of all efforts to exterminate it, breeds with incredible rapidity. In summer it descends into the valleys. But, while the more dreaded copper-head is active and malicious and bites without warning, the rattlesnake is always sluggish and timid, and takes so much time to get into coil, and is so noisy about it, that it is an object more of contempt than of apprehension. The black snake is its worst enemy and is always victorious; the deer also bounds around it, leaps upon it, and scatters it in pieces; the hog feeds upon it; and yet half the State is infested with it. Poisonous insects are almost unknown; but infinite swarms of gnats torment cattle and men in the forest counties. During a short season in summer mosquitoes abound along the tidal rivers, when the south wind blows. Fleas have only recently been imported; but ticks are common in the lowland woods, and the native bed-bug, which breeds under the bark of the hemlock, has become domiciled throughout the State, and is the curse not only of the traveller but of a large part of the resident population.

Government.—The constitution of 1874 gives the right to vote to every male citizen over twenty-one years of age who has been a citizen of the United States one month, resident in Pennsylvania one year, and in his election district two months; but, if over twenty-two years old, he must have paid a tax at least two months before the day of election. The legislative power is vested in a general assembly of two houses,—fifty senators elected by the people for four years and two hundred representatives for two years. There are strong constitutional guards against special legislation. The executive department consists of a governor, lieutenant-governor, and secretary of internal affairs, elected each for four years, an auditor for three, and a treasurer for two, together with a secretary of state, an attorney-general, and a superintendent of public instruction, each appointed for four years by the governor with consent of the senate. The judiciary consists of a supreme court of seven judges elected for twenty-one years; forty-three district courts of common pleas each with one or more judges elected for ten years, and exercising probate jurisdiction except in cities where there are orphans' courts; and local magistrates of minor jurisdiction. The State sends twenty-seven representatives to the national Congress; and federal courts for the eastern districts are held at Philadelphia, and for the western district at Pittsburgh, Williamsport, and Erie.

Population.—The population was estimated in 1755 at 200,000. The results of subsequent censuses are shown in the following table—

| Census. | Males. | Females. | Total. | Density per square mile. |
|---------|-----------|-----------|-----------|--------------------------|
| 1700 | 222,810 | 211,563 | 434,373 | 9.0 |
| 1800 | 309,507 | 292,858 | 602,365 | 19.4 |
| 1810 | 413,575 | 396,516 | 810,091 | 18.0 |
| 1820 | 532,432 | 517,026 | 1,049,458 | 23.8 |
| 1830 | 634,378 | 604,455 | 1,238,833 | 30.0 |
| 1840 | 867,556 | 856,477 | 1,724,033 | 38.3 |
| 1850 | 1,108,103 | 1,143,983 | 2,252,086 | 51.4 |
| 1860 | 1,454,419 | 1,451,796 | 2,906,215 | 64.6 |
| 1870 | 1,758,499 | 1,765,452 | 3,523,951 | 78.2 |
| 1880 | 2,136,655 | 2,146,236 | 4,282,891 | 95.2 |

Of the last total 85,535 were coloured; 587,829 were of foreign birth, including 80,102 English, 236,505 Irish, 20,735 Scotch, 29,447 Welsh, and 168,426 Germans.

Education.—In 1880 but 4.6 per cent. of the population over ten years old were unable to read, and 7.1 per cent. unable to write. The State is divided into 2215 districts, which hold school property valued at \$23,341,560, and maintain 19,183 schools, of which 7812 are graded. Directing boards elected by the people appoint county superintendents. The State superintendent has two deputies. The teachers number 21,289, of whom 12,778 are women, the average monthly wages for men being \$35.12, and for women \$28.80. There are fourteen normal schools, ten being under State patronage. The total school expenditure for 1882 was \$8,262,244, including \$1,000,000 of State aid, given every year. The schools are free to all persons from six to twenty-one years of age; and this "school population" in 1880 numbered 1,422,377. In 1883 there were 945,345 on the registers; the average attendance was 611,317. There are twenty-eight colleges giving four-year courses, but only five confine themselves strictly to college work, viz., university of Pennsylvania at Philadelphia, Lehigh university at South Bethlehem, Lafayette college at Easton, Haverford college at Haverford, and Dickinson college at Carlisle. The grounds, buildings, and apparatus of twenty institutions are valued at \$2,188,000, and they hold \$3,951,000 in productive funds. Swarthmore college and eight others admit both sexes to equal privileges. The

textile industries of the State have led to extensive provisions for technical and scientific instruction. There are seventeen theological schools, a law department in the university of Pennsylvania, five medical colleges, all in Philadelphia, an academy of fine arts, and about two hundred academies of various grades.

Prisons, &c.—There are two penitentiaries, the Eastern, at Philadelphia, on the separate-cell system, with about 1000 convicts, and the Western, at Allegheny, on the congregate system, with about 650 convicts. The reform school at Morgantown (cottage system); and the house of refuge at Philadelphia receive youthful offenders, who in both institutions average over 1000. An industrial reformatory at Huntingdon, with room for 500 youthful criminals sentenced for first offences, is near completion (1884). There are 69 county jails, costing annually \$750,000; the commitments for the year ending 30th September 1883 were 2323, and the inmates 1127.

Pauperism, Insanity, &c.—On 30th September 1883 there were 38 county almshouses, containing 8313 inmates, costing for the year \$1,296,945, to which add \$203,830 for township poor and \$226,000 for outdoor relief. A law of 1883 forbids the retention of children over two and under sixteen in almshouses with adult paupers for more than sixty days. Charitable institutions and societies are numerous. Since 1879 a society for organizing charity has been operating in Philadelphia to prevent indiscriminate and duplicate giving, and mendicancy. There are five State hospitals for insane,—at Harrisburg, Danville, Warren, Duxbury, and Norristown. These with three other prominent establishments had 3575 inmates on 1st October 1882, of whom 2220 were indigent. In one year 5107 cases were treated, 1552 newly admitted, 968 persons discharged, 368 died. In 1880 there were 3884 blind persons in the State; in January 1884 there were 373 in institutions assisted by the State. Of those discharged about two-thirds have a fair prospect of self-support. In institutions for deaf and dumb there were 321. Of 404 children in the institute for feeble-minded at Media only 100 were deemed incapable of improvement.

Agriculture.—By the census of 1880 there were 301,112 persons engaged in agriculture, and 1,154,955 in all other occupations. The number of farms was 213,542, averaging 93 acres each. There were under improvement 13,423,007 acres, an increase of 1,907,042 since 1870; the value of products was \$129,760,476. The principal crops are wheat, maize, hay, and tobacco, the cultivation of the last having greatly increased of late, so that Pennsylvania ranks third among the tobacco-raising States of the Union, its product in 1880 being 36,943,272 lb. It is most largely grown in Lancaster county. There is a large yield of honey and maple sugar, and the butter product of 1880 was 79,836,012 lb.

Manufactures.—The manufacturing industry has more than trebled since 1860. In 1880 the capital invested in 31,232 establishments was \$474,510,993, the cost of material used in a year \$465,020,563, the total sum paid in wages \$134,055,904,—the number of persons employed being 387,072, and the value of product \$744,818,445, or nearly one-seventh of the total product of manufactures in the United States (\$5,369,579,191). Iron and steel take the lead; textile fabrics, including carpets, cottons, woollens, silks, yarns, hosiery, and hats make a large item; 333 tanneries yield in leather \$23,735,814; flour and grist mills do a large business; the lumber interest centres at Williamsport and glass-making at Pittsburgh, and there are salt-wells at Allegheny.

Communications.—Connexions between the navigable rivers were effected in former years at a cost of over \$50,000,000, by a system of canals now chiefly used for the carriage of coal, subordinate to the mining and railway corporations, which are closely related. There are about 5500 miles of railroad in the State belonging to numerous companies, but the Pennsylvania Railroad system and the Philadelphia and Reading system are by far the most important. The Pennsylvania has not only consolidated under its management many lines within the State but has gained control by purchase or lease of trunk lines and branches leading through other States, east, west, north, and south, including in all over 6000 miles of road. Of these 2555 belong to the Pennsylvania division, of which the gross earnings in 1883 were \$32,017,818, and the net earnings \$13,696,399. The Philadelphia and Reading owns or controls 1533 miles of road, and along with a heavy passenger business (18,195,264 carried in 1883) is largely occupied with transportation of coal from the mines to Philadelphia and New York. Its gross earnings in 1883 were \$29,797,927, its net earnings \$14,464,070, exclusive of rentals of leased lines and interest. In conjunction with the Reading Coal and Iron Company, a separate corporation, it controls seventy-four collieries, covering 163,317 acres of anthracite coal lands. The gross earnings of the Coal and Iron Company for 1883 were \$17,038,858, and the net earnings \$921,771. Other companies control lines leading from the coal and iron regions to New York city. The railroad interest gives employment to over 76,000 men, besides the 3000 employed by the Baldwin Locomotive Works in Philadelphia.

Finance.—For the year ending 30th November 1882 the State revenue, exclusive of a loan of \$9,360,120, was \$7,068,529, of which over \$4,000,000 came from taxes on corporations, and nearly all the

rest from various business licences. The State imposes no tax on real estate, but collects \$437,776 from taxes on money at interest, watches, and carriages. The expenditure, exclusive of payment on debt, was \$5,024,766. The debt was \$20,225,033, with \$7,992,983 of assets in the sinking fund. Thirty-eight counties report debts aggregating \$76,301,876, and there are heavy municipal debts. The value of real estate reported in 1882 was \$1,593,430,041, of which \$110,000,126 were legally exempt from taxation.

Militia.—Distributed over the State and organized into regiments and brigades are 137 volunteer companies, containing 8220 men and officers, and called collectively the "national guard." They include three batteries of artillery, three companies of cavalry, and 131 of infantry, and are armed, equipped, and supplied by the State at an annual expense of about \$242,000.

History.—The grant of the extensive territory called Pennsylvania, made by Charles II. in 1681 to William PENN (*q.v.*), carried with it full proprietorship and dominion, saving only the king's sovereignty. Penn at once created a quick market for lands by publishing in England and on the Continent his liberal scheme of government and his intention to try the "holy experiment" of "a free colony for all mankind." In 1682, when he crossed the sea to take possession, he found the western bank of the Delaware already occupied by nearly 6000 Swedes, Dutch, and English, the Swedes having begun a settlement in 1638. To these, as to settlers from all nations, he conceded equal liberties. The desire to escape from spiritual and temporal despotisms, and the chance of acquiring rich lands in a salubrious climate on easy terms, drew thousands of immigrants: English Quakers, Scottish and Irish Presbyterians, German Mennonites, French Huguenots, men of all religions, were alike welcome; the population increased for a few years at the rate of one thousand a year; then more rapidly, so that at the end of seventy-five years it exceeded 200,000. Penn twice visited Pennsylvania, staying each time two years. In December 1682 he summoned delegates to meet him at Upland (now Chester) to confer about government; the land was divided into counties, and in March following representatives chosen by the people of these districts agreed on a constitution, based upon popular suffrage, and guaranteeing liberty of conscience. All magistrates and officers were to be chosen by the people, Penn surrendering all claim for revenue by taxation, and retaining for himself and his deputies only the governorship. For his further connexion with Pennsylvania, see PENN. In 1682 PHILADELPHIA (*q.v.*) was founded. The failure to settle the boundary-line between Pennsylvania and Maryland, in dispute between Lord Baltimore and Penn, long caused great irritation among the settlers, who were liable to double taxation; but in 1750 Lord Hardwick's decree in Chancery confirmed the original claims of Penn, and in 1763-67 Mason and Dixon definitely fixed and marked 246 miles of the line, since made famous as the separation between free and slave States.

For over sixty years the predominance of the Quakers in the assembly had prevented any legislation for public defence,—of which, indeed, there was little need so long as Indians and whites kept their covenant. But in 1744 the Indians became allies of the French, then at war with Great Britain. French military posts established in western Pennsylvania not only violated the integrity of the province but threatened to confine the English to the east of the Alleghenies, and perhaps to crowd them off the continent. The party of non-resistance was overborne by a sense of public danger, which found strong expression in a pamphlet by Franklin; and in 1747 the assembly permitted volunteer organization. One hundred and twenty companies were soon enrolled, ten of them, of a hundred men each, in Philadelphia. But there was no efficient management nor hearty co-operation with adjacent colonies. Braddock's defeat in 1754 intensified the alarm; Fort Duquesne (site of Pittsburgh), which he aimed to reduce, was held by the French till 1758. The peace of Paris in 1763 did not quiet the Red Men. Pontiac, a famous sachem, united the western tribes in a war of extermination, only ended when the whites had proved their mastery. The royal council, displeased with self-governing tendencies, annulled the militia law of Pennsylvania; but the pressure of common danger and the dread of tomahawk and torch not only led to the offer of a bounty of \$130 for Indian scalps, but taught the lessons of comradeship and co-operation; and nourished the self-reliant courage of the generation which was to strike for independence. Though stout against the Stamp Act of 1765 and other parliamentary encroachments, Pennsylvania was not swift to move; the assembly sought to mediate between the parliament and the colonies, but the course of events soon made neutrality impossible. A long adjournment was construed as abdication; a committee of safety seized the reins till the people could speak through a representative convention. The convention espoused the revolution; in September 1776 a State constitution was promulgated; in 1778 the old charter was formally annulled and the Penn claims silenced by payment of £130,000. During the war Pennsylvania was the scene of important events,—the deliberations of the Congress and the Declaration of Independence in 1776; the battles of Brandywine and Germantown in 1777; the British occupation of Phil-

adelphia, and the encampment of Washington at Valley Forge, in 1777-78. A brief but violent mutiny of the unpaid soldiery of Pennsylvania in 1781 led Congress to adopt a better system of finance, under the wise guidance of Robert Morris of Philadelphia. In 1812, at the outbreak of war with Great Britain, Pennsylvania promptly furnished its quota of troops. At the opening of the war with the southern States in 1861, in response to the president's call for 14,000 men as the State's quota, Pennsylvania sent 25,975, and during the war furnished a total of 387,284. No other northern State was invaded. At Gettysburg, near the State border, a three days' battle was fought, 30th June to 3d July 1863, resulting in a decisive victory of the Federal forces. In 1864 Chambersburg was burned by the Confederates. For more than two centuries Penn's commonwealth has been advancing in population and prosperity, and the great body of the people have dwelt in peace. There have been five serious local disturbances. Between 1791 and 1794 there was organized resistance to the collection of a federal tax on distilled spirits, but a strong display of force quelled the insurrection without bloodshed. In 1844 there were riots in Kensington, a suburb of Philadelphia, between "native Americans" and Catholic Irish, resulting in the destruction of thirty dwellings, three churches, one convent, and many lives. Between 1835 and 1861 anti-slavery meetings in Philadelphia were often roughly interrupted, and in 1838 Pennsylvania Hall was burned by a pro-slavery mob. A criminal combination in the anthracite mining region, known as the "Molly Maguires," was broken up in 1876 by due course of law, twenty men being hanged for murder. In 1877 the "railroad riots," an outbreak of dissatisfied railway employés, caused a vast destruction of property at Pittsburgh and vicinity, but were quelled by the military. The constitution has been four times revised,—in 1838, 1850, 1857, 1874. (J. P. L.—C. G. A.)

PENRITH, a market-town of Cumberland, England, is situated near the river Eamont, and on the Lancaster and Carlisle section of the London and North-Western Railway, 18 miles south of Carlisle, and 5 north-east of Ulswater. The town consists chiefly of one long and wide street. To the west once stood an ancient castle, erected as a protection against the Scots, on the site of an old Roman encampment. But it was dismantled by Charles I.; the ruins still remain. The principal public buildings are the grammar-school, founded by Queen Elizabeth in 1566, the agricultural hall, the mechanics' institute, and the working-men's literary institute. There are breweries, tanneries, and saw-mills, but the town depends chiefly on agriculture. The population of the urban sanitary district in 1871 was 8317, and in 1881 it was 9268.

Old Penrith, the *Bremetenracum* of the Romans, was about 5 miles north by west of the present town. At the Conquest the honour of Penrith was a royal franchise; but it was alternately in the possession of the English and Scottish kings until given to Anthony Beck, bishop of Durham, by Edward I. The town more than once lapsed to the crown. In 1696 it was granted to William Bentinck, earl of Portland, and in 1783 it was sold by the duke of Portland to the duke of Devonshire.

PENSACOLA, a city of the United States, capital of Escambia county, Florida, on the north-west coast of Pensacola Bay. The harbour has recently been improved so as to secure a uniform depth of 24 feet. Pensacola is the terminus of three railway lines which connect it with Mobile, Montgomery, Jacksonville, and Millview, the starting-place of steamers plying to Cedar Keys, &c., and the seat of a large trade in lumber (mainly pitch pine), early vegetables, and winter fruits. About 7 miles west of Pensacola lies a United States navy-yard. The value of the exports to Great Britain and the British colonies in 1882 was \$1,481,702, to other foreign countries \$1,091,113, and to the United States \$535,225. The total imports were only \$169,082. In 1850 the population was 2164, in 1870 3347, and in 1880 6845; and it has since increased to upwards of 8000.

Pensacola Bay is said to have been discovered by Narvaez in 1523. French, and afterwards Spanish, colonists settled on the site of the town in the close of the 17th century. In 1719 it was captured by Bienville, in 1723 restored to the Spaniards, in 1763 occupied by the British, in 1781 captured by General Galvez, in 1814 taken from the British by the United States general Jackson, and again in 1818 taken by the same general from the Spaniards. In 1821, according to the treaty of 1819, it became, with the rest of Florida, part of the United States territory.

PENTATEUCH AND JOSHUA. The name Pentateuch, already found in Tertullian and Origen, corresponds to the Jewish חמשה חומשי התורה (the five-fifths of the Torah, or Law); the several books were named by the Jews from their initial words, though at least Leviticus, Numbers, and Deuteronomy had also titles corresponding to those we use, viz., חמשה חומשי התורה (Αμμοσφρακωδευμ, Origen, in *Ens.*, *H. E.*, vi. 25), and משנה תורה. The Pentateuch, together with Joshua, Judges, and Ruth, with which it is usually united in Greek MSS., makes up the Octateuch; the Pentateuch and Joshua together have recently been named the Hexateuch. The date of the division of the Torah into five books cannot be made out; it is probably older than the Septuagint translation.

Moses is already taken for the author of the Pentateuch in 2 Chronicles xxv. 4, xxxv. 12 *sq.*; only the last eight verses of Deuteronomy are, according to the rabbins, not from his pen. From the synagogue belief in the Mosaic authorship passed to the church, and is still widely prevalent among Christians. At an early date, indeed, doubts suggested themselves as to the correctness of this view, but it was not till the 17th century that these became so strong that they could not be suppressed.¹ It was observed that Moses does not speak of himself in the first person, but that some other writer speaks of him in the third,—a writer, too, who lived long after. The expression of Gen. xii. 6, “the Canaanite was then in the land,” is spoken to readers who had long forgotten that a different nation from Israel had once occupied the Holy Land; the words of Gen. xxxvi. 31, “these are the kings that reigned in Edom, before there reigned any king over the children of Israel,” have no prophetic aspect; they point to an author who wrote under the Hebrew monarchy. Again, the “book of the wars of Jehovah” (Num. xxi. 14) cannot possibly be cited by Moses himself, as it contains a record of his own deeds; and, when Deut. xxxiv. 10 (comp. Num. xii.) says that “there arose not a prophet since in Israel like unto Moses,” the writer is necessarily one who looked back to Moses through a long series of later prophets.

At the same time attention was drawn to a variety of contradictions, inequalities, transpositions, and repetitions of events in the Pentateuch, such as excluded the idea that the whole came from a single pen. Thus Peyrerius remarked that Gen. xx. and xxvi. stand in an impossible chronological context; and on the incongruity of Gen. i. and ii., which he pressed very strongly, he rested his hypothesis of the Preadamites. Such observations could not but grievously shake the persuasion that Moses was the author of the Pentateuch, while at the same time they directed criticism to a less negative task—viz., the analysis of the Pentateuch. For this, indeed, the 17th century did not effect anything considerable, but at least two conclusions came out with sufficient clearness. The first of these was the self-contained character of Deuteronomy, which in these days there was a disposition to regard as the oldest book of the Pentateuch, and that with the best claims to authenticity. And in the second place the Pentateuchal laws and the Pentateuchal history were sharply distinguished; the chief difficulties were felt to lie in the narrative, and there seemed to be less reason for questioning the Mosaic authorship of the laws.

Spinoza's bold conjecture that in their present form not only the Pentateuch but also the other historical books of the Old Testament were composed by Ezra ran far ahead of the laborious investigation of details necessary to solve

the previous question of the composition of the Pentateuch. Jean Astruc has the merit of opening the true path of this investigation. He recognized in Genesis two main sources, between which he divided the whole materials of the book, with some few exceptions, and these sources he distinguished by the mark that the one used for God the name Elohim (Gen. i., v.; comp. Exod. vi. 3) and the other the name Jehovah (Gen. ii.-iv.).² Astruc's hypothesis, fortified by the observation of other linguistic differences which regularly corresponded with the variation in the names of God, was introduced into Germany by Eichhorn's *Einleitung in d. A. T.*, and proved there the fruitful and just point of departure for all further inquiry. At first, indeed, it was with but uncertain steps that critics advanced from the analysis of Genesis to that of the other books, where the simple criterion of the alternation of the divine names was no longer available. In the hands of the Scotsman Geddes and the German Vater the Pentateuch resolved itself into an agglomeration of longer and shorter fragments, between which no threads of continuous connexion could be traced³ (“Fragmentary Hypothesis”). The fragmentary hypothesis was mainly supported by arguments drawn from the middle books of the Pentateuch, and as limited to these it long found wide support. Even De Wette started from it in his investigations; but this was really an inconsistency, for his fundamental idea was to show throughout all parts of the Pentateuch traces of certain common tendencies, and even of one deliberate plan; nor was he far from recognizing the close relation between the Elohist of Genesis and the legislation of the middle books.

De Wette's chief concern, however, was not with the literary but with the historical criticism of the Pentateuch, and in the latter he made an epoch. In his *Diss. Critica* of 1805 (*Opusc. Theol.*, pp. 149-168) he placed the composition of Deuteronomy in the time of King Josiah (arguing from a comparison of 2 Kings xxii., xxiii., with Deut. xii.), and pronounced it to be the most recent stratum of the Pentateuch, not, as had previously been supposed, the oldest. In his *Critical Enquiry into the Credibility of the Books of Chronicles* (Halle, 1806) he showed that the laws of Moses are unknown to the post-Mosaic history; this he did by instituting a close comparison of Samuel and Kings with the Chronicles, from which it appeared that the variations of the latter are not to be explained by the use of other sources, but solely by the desire of the Jewish scribes to shape the history in conformity with the law, and to give the law that place in history which, to their surprise, had not been conceded to it by the older historical books. Finally, in his *Criticism of the Mosaic History* (Halle, 1807) De Wette attacked the method then prevalent in Germany of eliminating all miracles and prophecies from the Bible by explaining them away, and then rationalizing what remained into a dry prosaic pragmatism. De Wette refuses to find any history in the Pentateuch; all is legend and poetry. The Pentateuch is not an authority for the history of the time it deals with, but only for the time in which it was written; it is, he says, the conditions of this much later time which the author idealizes and throws back into the past, whether in the form of narrative or of law.

De Wette's brilliant *début*, which made his reputation for the rest of his life, exercised a powerful influence on his contemporaries. For several *decennia* all who were open to critical ideas at all stood under his influence. Gramberg, Leo, and Von Bohlen wrote under this influence; Gesenius in Halle, the greatest Hebraist then living, taught under it; nay, Vatke and George were guided by De

Wette's ideas and started from the ground that he had conquered, although they advanced beyond him to a much more definite and better established position, and were also diametrically opposed to him in one most important point, of which we shall have more to say presently.¹

But meantime a reaction was rising which sought to direct criticism towards positive rather than negative results. The chief representatives of this positive criticism, which now took up a distinct attitude of opposition to the negative criticism of De Wette, were Bleek, Ewald, and Movers. By giving up certain parts of the Pentateuch, especially Deuteronomy, they thought themselves able to vindicate certain other parts as beyond doubt genuinely Mosaic, just in the same way as they threw over the Davidic authorship of certain psalms in order to strengthen the claim of others to bear his name. The procedure by which particular ancient hymns or laws were sifted out from the Psalter or the Pentateuch had some resemblance to the *decretum absolutum* of theology; but up to a certain point the reaction was in the right. The youthful De Wette and his followers had really gone too far in applying the same measure to all parts of the Pentateuch, and had been satisfied with a very inadequate insight into its composition and the relation of its parts. Historical criticism had hurried on too fast, and literary criticism had now to overtake it. De Wette himself felt the necessity for this, and from the year 1817 onwards—the year of the first edition of his *Einleitung*—he took an active and useful part in the solution of the problems of Pentateuchal analysis. The fragmentary hypothesis was now superseded; the connexion of the Elohist of Genesis with the legislation of the middle books was clearly recognized; and the book of Joshua was included as the conclusion of the Pentateuch. The closely-knit connexion and regular structure of the narrative of the Elohist impressed the critics; it seemed to supply the skeleton which had been clothed with flesh and blood by the Jehovist, in whose contributions there was no such obvious conformity to a plan. From all this it was naturally concluded that the Elohist had written the *Grundschrift* or primary narrative, which lay before the Jehovist and was supplemented by him ("Supplementary Hypothesis").²

This view remained dominant till Hupfeld in 1853 published his investigations on *The Sources of Genesis and the Method of their Composition*. Hupfeld denied that the Jehovist followed the context of the Elohist narrative, merely supplementing it by additions of his own. He pointed out that such Elohist passages in Genesis as clearly have undergone a Jehovistic redaction (e.g., chaps. xx., xxi., xxii.) belong to a different Elohist from the author of Gen. i. Thus he distinguished three independent sources in Genesis, and he assumed further, somewhat inconsequently, that no one of them had anything to do with the others till a fourth and later writer wove them all together into a single whole. This assumption was corrected by Nöldeke, who showed that the second Elohist is preserved only in extracts embodied in the Jehovistic book, that the Jehovist and second Elohist form one whole and the *Grundschrift* another, and that thus, in spite of Hupfeld's discovery, the Pentateuch (Deuteronomy being excluded) was still to be regarded as made up of two great layers. Nöldeke had also the honour of having been the first to

trace in detail how the Elohist *Grundschrift* runs through the whole Hexateuch, and of having described with masterly hand the peculiar and inflexible type of its ideas and language. In this task he was aided by the commentary of Knobel, whose industry furnished very valuable materials for men of judgment to work upon.³

Thus the investigation into the composition of the Pentateuch had reached a point of rest and a provisional conclusion. The results may be thus summarized. The five books of Moses with Joshua form one whole; and it is not the death of Moses but the conquest of the promised land which forms the true close of the history of the patriarchal age, the exodus, and the wanderings in the wilderness; it is therefore more correct to speak of the Hexateuch than of the Pentateuch. From this whole it is most easy to detach the book of Deuteronomy, and accordingly its independence was very early recognized. Of the other elements, that which has the most marked individuality is the work of the Elohist, which we shall in the sequel call the Priestly Code. This too, like Deuteronomy, is a law-book, but it has an historical setting. Its main stock is Leviticus, with the cognate parts of the adjacent books, Exod. xxv.-xl. (except chaps. xxxii.-xxxiv.) and Num. i.-x., xv.-xix., xxv.-xxxvi. (with some inconsiderable exceptions). This law-book does not, like Deuteronomy, embrace precepts for civil life, but is confined to affairs of worship, and mainly to the esoteric aspect of public worship, that is, to such points as belonged to the function of the priests as distinguished from the worshipping people. The legal contents of the Code are supported on a scaffolding of history, which, however, belongs to the literary form rather than to the substance of the work. It is only where some point of legal interest is involved that the narrative acquires any fulness, as it does in the book of Genesis in connexion with the three preparatory stages of the Mosaic covenant attached to the names of Adam, Noah, and Abraham. Generally speaking, the historical thread is very thin, and often (Gen. v., xi.) it becomes a mere genealogical line, on which is hung a continuous chronology carried on from the creation to the exodus. The Priestly Code is characterized by a marked predilection for numbers and measures, for arrangement (titles to sections) and formality of scheme, by the poverty and inflexibility of its language, by standing repetitions of certain expressions and phrases such as are not elsewhere found in old Hebrew. Thus its distinguishing marks are very pronounced, and can always be recognized without difficulty. If now Deuteronomy and the Priestly Code are successively subtracted from our present Pentateuch the Jehovistic history-book remains, distinguished from both the others by the fact that it is essentially narrative and not law, and by the pleasure it takes in bringing out details of the historical tradition, so that individual points of the story receive full justice and are not sacrificed to the interests of the general plan. The patriarchal history belongs almost entirely to this document, and forms the most characteristic part of it; here that history forms no mere epitomized introduction to more important matter, as in the Priestly Code, but is treated in all fulness as a subject of first-rate importance. Legislative elements are incorporated in the Jehovistic narrative only at one point, where they naturally fall into the historical context, viz., in connexion with the law-giving on Sinai (Exod. xx.-xxiii., xxxiv.).

These, then, are the three main component parts of the Hexateuch—Deuteronomy, the Priestly Code, and the Jehovist. But the Jehovist has woven together in his history-book two sources, one of which uses the name

Elohim (Hupfeld's younger Elohist), while the other says Iahwè, as does the Jehovist himself. So, too, the Priestly Code is not a perfectly incomposite structure; it has one main stock marked by a very definite historical arrangement and preserved with little admixture in the book of Genesis; but on the one hand some older elements have been incorporated in this stock, while on the other hand there have been engrafted on it quite a number of later *novellæ*, which in point of form are not absolutely homogeneous with the main body of the Code, but in point of substance are quite similar to it, reflecting the same tendencies and ideas and using the same expressions and mannerisms, so that the whole may be regarded as an historical unity though not strictly as a literary one.

The very name of Deuteronomy shows that from the earliest times it has been regarded as at least possessing a relative independence; the only difficulty is to determine where this section of the Pentateuch begins and ends. In recent times opinion has inclined more and more to the judgment of Hobbes and Vater, that the original Deuteronomy must be limited to the laws in chaps. xii.-xxvi.

The reasons that compel us to distinguish the Priestly Code from the Jehovist, and the relation that subsists between these two elements, may be exemplified and illustrated by the first nine chapters of Genesis. We begin by comparing Gen. i. 1 to ii. 4a with Gen. ii. 4b to iii. 24. The history of the first man in paradise has nothing to do with the preceding record of the creation of the world in six days, which is neither referred to nor presupposed. "In the day that Jehovah made the earth there was as yet no plant of the field upon the earth, and no herb grew in the field; for Jehovah had not caused it to rain upon the earth, and there was not a man to till the ground. But a mist went up from the earth, and watered the whole face of the ground. And Jehovah formed man of the dust of the ground and breathed into his nostrils the breath of life." It might be supposed that the picture drawn in chap. i. is here briefly referred to in order to add a particular feature which had not been fully brought out there. But there is no situation in chap. i. which this scene fits. There man is made last of all, but here first of all, before vegetation, and according to ii. 19 *sq.* also before the beasts. There man and woman are created together, here at first the man is alone. There vegetation and wet stand opposed, the plants spring up as soon as there is dry land; here the condition of vegetation is the moistening of the dry land—it must first rain; the earth, therefore, was originally not water but a parched desert;—the same conception as in the book of Job, where the sea bursts forth from the womb of the hard earth. The conceptions of the two narratives are different all through, as appears equally in what follows. "Jehovah planted a garden eastwards in Eden, at the place where the four chief rivers of the world are parted from a common source. Here among other goodly trees grew the tree of life and the tree of knowledge. In this garden Jehovah set the man, to dress it and to keep it, to eat of all the fruits save only that of the tree of knowledge." In chap. i. man receives from the first as his portion the whole great earth as he now occupies it, and his task is a purely natural one; "be fruitful and multiply, and fill the earth and subdue it." But in chap. ii. the first man is placed in a mysterious garden of God, with a very limited sphere, where all is supernatural and marvellous. To speak generally, the ideas of God and man in chap. i. are rational and enlightened, but bare and prosaic; in chaps. ii.-iii. they are childlike and primitive, but full of meaning. The point of the contrast is mainly this: in Gen. ii., iii., man is in fact forbidden to lift the veil of things and know the world, represented by the tree of knowledge; in Gen. i. this is his primary task, to rule over all the earth, for sovereignty and knowledge come to the same thing. There nature is to man altogether a marvel; here it is a mere thing, an object for him. There it is robbery for man to seek to be as God; here God from the first created man in His own image, after His likeness, and appointed him His vicegerent on earth. With these incongruities in the substance and spirit of the two sections we must take also the differences of form and language observable alike in the whole manner of the narrative—which in Gen. i. is confined by a precise and formal scheme, while in Gen. ii., iii., it has a free poetic movement—and in individual expressions. Thus Gen. i. has Elohim, Gen. ii., iii., Jehovah;¹ Gen. i. has the technical word בָּרָא, "create," while the other narrative uses the ordinary words עָשָׂה, "make," יָצַר, "form;" and so forth.

The contrast between the two records appears in a somewhat different way when we go on to compare Gen. v. with Gen. ix. 17 *sq.* The elements of the genealogy of ten members in the Priestly Code

and that of seven members in the Jehovist correspond, save that the former adds Noah after Lamech, and that at the beginning Adam-Cain is doubled and becomes Adam-Seth-Enosh-Cainan. Adam and Enosh both mean "man," so that the latter series is equivalent to Adam-Seth-Adam-Cainan; in other words Enosh-Cainan is the beginning of a series corresponding to that in chap. iv., and Adam-Seth is a parallel and variation. Linguistically chap. v. is distinguished from chap. iv. by the use of הוֹלִיד in place of יָלַד.

In Gen. i.-v. we find the two narratives lying side by side in continuous pieces and without intermixture; in Gen. vi.-ix., on the other hand, we have a kind of mosaic, in which elements taken from each are interwoven to form a single narrative. The narrative of the Priestly Code is preserved entire in vi. 9-22, vii. 11, 13-16 (except the last clause of ver. 16), 19-22, 24, viii. 1-5 (with one small exception), 13, 14, ix. 1-17. The Jehovistic narrative, on the other hand, is curtailed to prevent repetition; it would not have done to relate twice over the building of the ark and the divine command to do so, or to give the ordinance of the rainbow once after viii. 22, and then again in ix. 9 *sq.* The hand that fused the two sources together into one continuous account is very plainly recognized in vii. 8, 9, as compared on the one side with vi. 19, 20, and on the other with vii. 2.

The justice of Hupfeld's observation, that besides the first Elohist (our Priestly Code) there is a second author who uses the same name of God, can be best proved from Gen. xx.-xxii., where this second Elohist appears for the first time. According to the Priestly Code Ishmael was fourteen years old at the birth of Isaac, and thus would be seventeen when some three years later Isaac was weaned. But how does this accord with xxi. 9 *sq.*, where Ishmael appears not as a lad of seventeen but as a child at play (קָטָן, ver. 9), who is laid on his mother's shoulder (ver. 14), and when thrown down by her in her despair (ver. 15) is quite unable to help himself? Similar inconsistencies appear if we attempt to place chap. xx. in the context of the Priestly Code; it was already observed by Peyrierius that it is "non vero simile, regem Gerere voluisse Saram vetulam cui desierant fieri muliebria." We come, then, to ask what is the relation between this second Elohist writing, from which the greater part of Gen. xx.-xxii. is derived, and the Jehovistic history. In their matter, their points of view, and also in language—apart from the names of God—the two are on the whole similar, as may be seen by comparing chap. xx. with chap. xxvi., or chap. xxi. with chap. xvi. Moreover, the Elohist history is preserved to us in a Jehovistic setting, as can be plainly discerned, partly by certain slight changes (xxi. 33, xxii. 11-14), partly by larger additions (xx. 18, xxi. 1, 32b, xxii. 15-18). But we cannot suppose that it was the principal narrator of the Jehovistic history—the author of the main mass of chaps. xii., xiii., xvi., xviii., xix., xxiv., xxvi.—who incorporated chaps. xx.-xxii. in his own book. For how can we imagine anything so absurd as that, before or after, he should have chosen to tell again in his own words and with full detail and important variations almost all the stories which he borrowed from another work? Rather must we conclude that the union of the Elohist work (E) with the main Jehovistic narrative (J) was accomplished by a third hand. This third author is most conveniently designated as the Jehovist, and his work is compendiously cited as JE; the authors of its two component parts are frequently called for distinction the Jahvist and the Elohist. The editorial hand of the Jehovist can be traced not only in E but in his main source J (the source which uses the name Iahwè); compare, for example, Gen. xvi. 8-10 with Gen. xxv. 15, 18.

Still more complicated than the work of the Jehovist is the Priestly Code, at least in its main section, the ritual legislation of the middle books. It is conceded on all hands that the collection of laws in Lev. xvii.-xxvi. was originally a small independent code, though it has now been worked into the Priestly Code by the aid of very considerable editorial treatment. It is equally undeniable, though not as universally admitted, that—to take one example—Exod. xxx. and xxxi. cannot be placed in the same line with Exod. xxv.-xxix., but form a supplement to the last-named section. No reason can be assigned why the author of Exod. xxv.-xxix., if he intended to mention the golden altar of incense at all, should have failed to include it in the passage where he describes all the other furniture within the tabernacle,—the ark, mercy-seat, golden table, and candlestick; that the altar of incense is first mentioned in Exod. xxx. 1-10 is only to be understood on the assumption that chaps. xxx. and xxxi. were added by a later author.

Such are the main lines of the view now most prevalent as to the composition of the Hexateuch. We come next to consider the date and mutual relations of the several sources. As regards Deuteronomy and the Jehovist there is tolerably complete agreement among critics. Some, indeed, attempt to date Deuteronomy before the time of Josiah, in the age of Hezekiah (2 Kings xviii. 4, 22), or even still earlier; but on the whole the date originally

¹ The addition of Elohim, which produces the un-Hebrew form Jehovah Elohim, in Gen. ii., iii., is due to an editor who desired to soften the abrupt transition from the Elohim of the one narrator to the Jehovah of the other.

assigned by De Wette has held its ground. That the author of Deuteronomy had the Jehovistic work before him is also admitted; and it is pretty well agreed that the latter is referred, alike by the character of its language and the circle of its ideas and by express references (Gen. xii. 6, xxxvi. 31, xxxiv. 10; Num. xxii. sq.; Deut. xxxiv. 10), to the golden age of Hebrew literature, the same which has given us the finest parts of the books of Judges, Samuel, and Kings, and the oldest extant prophetic writings,—the age of the kings and prophets, before the dissolution of the sister states of Israel and Judah.

On the other hand, the date of the Priestly Code is disputed. Till pretty recently it was commonly regarded as the oldest part of the Hexateuch. The fact that it is mainly legal seemed to give it the priority over the history of the Jehovist; for Moses was a lawgiver, not a narrator. Again, the priestly legislation has reference to worship, and regulates all points of ritual with great exactness; and by the rule that the earliest forms of religion lay most weight on ceremonies of worship and all matters of form, this fact seemed to mark the Priestly Code as older than Deuteronomy, where affairs of ritual worship are less prominent than precepts of ethical conduct. Once more, the demands made by Deuteronomy for the maintenance of the priesthood and ritual service are much less heavy than the corresponding demands of the Priestly Code; and here again it was natural enough to argue that practical difficulties had led to the abolition or modification of the heavier burdens. And these conclusions were confirmed by the prevalent impression that the final redaction of the Pentateuch, and still more of the book of Joshua, was Deuteronomic, and that the same Deuteronomic redaction could be traced also in the other historical books. But even more weight than was laid on these really plausible arguments was held to attach to another point which seemed not merely to prove the priority of the Priestly Code but to indicate that it was at least partly of Mosaic origin. Alike in the Jehovistic Book of the Covenant and in Deuteronomy the legislation is expressly constructed on the supposition of a nation no longer nomadic but settled in the land of Canaan. The Priestly Code, on the contrary, is throughout directed to Israel as it lived encamped during the wilderness wanderings, and never makes anticipatory reference to later conditions. So also in Genesis the Priestly Code strictly observes the difference between the patriarchal age and later times, and is careful not to transfer Mosaic institutions to the times of the Hebrew forefathers. This air of antiquity, combined with a corresponding severe simplicity in the style and form, and a cast of language which differs profoundly from classical Hebrew, and was conjectured to be of an older mould, was the principal feature relied on as evidence that the Priestly Code deserved the title of the *Grundschrift*, the original and fundamental part of the Hexateuch.

But, in point of fact, it was none of these arguments which really gave rise to the doctrine of the priority of the Priestly Code; that doctrine had its veritable source in the supplementary hypothesis described above. After the supplementary hypothesis was given up, the inferences originally drawn from it continued to hold their ground; though it was made out that the Jehovist did not presuppose the existence of the Priestly Code, critics still assumed without question that the latter was the older work of the two. Critical analysis made steady progress, but the work of synthesis did not hold even pace with it; this part of the problem was treated rather slightly, and merely by the way. Indeed, the true scope of the problem was not realized; it was not seen that most important historical questions were involved as well as questions merely literary, and that to assign the true order of

the different strata of the Pentateuch was equivalent to a reconstruction of the history of Israel. As regards the narrative matter it was forgotten that, after the Jehovistic, Deuteronomic, and priestly versions of the history had been felicitously disentangled from one another, it was necessary to examine the mutual relations of the three, to consider them as marking so many stages of an historical tradition, which had passed through its successive phases under the action of living causes, and the growth of which could and must be traced and historically explained. Still greater faults of omission characterized the critical treatment of the legal parts of the Pentateuch. Bleek, the oracle in all such matters of the German school of "Vermittelungstheologen" (the theologians who tried to mediate between orthodoxy and criticism alike in doctrine and in history), never looked beyond the historical framework of the priestly laws, altogether shutting his eyes to their substance. He never thought of instituting an exact comparison between them and the Deuteronomic law, still less of examining their relation to the historical and prophetic books, with which, in truth, as appears from his *Introduction*, he had only a superficial acquaintance. Ewald, on the other hand, whose views as to the Priestly Code were cognate to those of Bleek, undoubtedly had an intimate acquaintance with Hebrew antiquity, and understood the prophets as no one else did. But he too neglected the task of a careful comparison between the different strata of the Pentateuchal legislation and the equally necessary task of determining how the several laws agreed with or differed from such definite data for the history of religion as could be collected from the historical and prophetic books. He had therefore no fixed measure to apply to the criticism of the laws, though his conception of the history suffered little, and his conception of prophecy still less, from the fact that in shaping them he left the law practically out of sight, or only called it in from time to time in an irregular and rather unnatural way.

Meanwhile, two Hegelian writers, starting from the original position of De Wette, and moving on lines apart from the beaten track of criticism, had actually effected the solution of the most important problem in the whole sphere of Old Testament study. Vatke and George have the honour of being the first by whom the question of the historical sequence of the several stages of the law was attacked on a sound method, with full mastery over the available evidence, and with a clear insight into the far-reaching scope of the problem. But their works made no permanent impression, and were neglected even by Reuss, although this scholar had fallen at the same time upon quite similar ideas, which he did not venture to publish.¹

¹ The following propositions were formulated by Reuss in 1833 (or, as he elsewhere gives the date, in 1834), though they were not published till 1879. 1. L'élément historique du Pentateuque peut et doit être examiné à part et ne pas être confondu avec l'élément légal. 2. L'un et l'autre ont pu exister sans rédaction écrite. La mention, chez d'anciens écrivains, de certaines traditions patriarcales ou mosaïques, ne prouve pas l'existence du Pentateuque, et une nation peut avoir un droit coutumier sans code écrit. Les traditions nationales des Israélites remontent plus haut que les lois du Pentateuque et la rédaction des premières est antérieure à celle des secondes. 4. L'intérêt principal de l'historien doit porter sur la date des lois, parce que sur ce terrain il a plus de chance d'arriver à des résultats certains. Il faut en conséquence procéder à l'interrogatoire des témoins. 5. L'histoire racontée dans les livres des Juges et de Samuel, et même en partie celle comprise dans les livres des Rois, est en contradiction avec des lois dites mosaïques; donc celles-ci étaient inconnues à l'époque de la rédaction de ces livres, à plus forte raison elles n'ont pas existé dans les temps qui y sont décrits. 6. Les prophètes du 8^e et du 7^e siècle ne savent rien du code mosaïque. 7. Jérémie est le premier prophète qui connaisse une loi écrite et ses citations rapportent au Deutéronome. 8. Le Deutéronome (iv. 45-xxviii. 68) est le livre que les prêtres prétendaient avoir trouvé dans le temple, du temps du roi Josias. Ce code est la partie la plus ancienne de la législation (rédigée) comprise dans le Pentateuque. 9. L'histoire des Israélites,

The new ideas lay dormant for thirty years, when they were revived through a pupil of Reuss, K. H. Graf. He too was deemed at first to offer an easy victory to the weapons of "critical analysis," which found many vulnerable points in the original statement of his views. For, while Graf placed the legislation of the middle books very late, holding it to have been framed after the great captivity, he at first still held fast to the doctrine of the great antiquity of the so-called Elohist of Genesis (in the sense which that term bore before Hupfeld's discovery), thus violently rending the Priestly Code in twain, and separating its members by an interval of half a millennium. This he was compelled to do, because, for Genesis at least, he still adhered to the supplementary hypothesis, according to which the Jehovist worked on the basis laid by the (priestly) Elohist. Here, however, he was tying himself by bonds which had been already loosed by Hupfeld; and, as literary criticism actually stood, it could show no reason for holding that the Jehovist was necessarily later than the Elohist. In the end, therefore, literary criticism offered itself as Graf's auxiliary. Following a hint of Kuenen's, he embraced the proffered alliance, gave up the violent attempt to divide the Priestly Code, and proceeded without further obstacle to extend to the historical part of that code as found in Genesis those conclusions which he had already established for its main or legislative part. Graf himself did not live to see the victory of his cause. His *Goel*, to speak with the ancient Hebrews, was Professor A. Kuenen of Leyden, who has had the chief share in the task of developing and enforcing the hypothesis of Graf.¹

The characteristic feature in the hypothesis of Graf is that the Priestly Code is placed later than Deuteronomy, so that the order is no longer Priestly Code, Jehovist, Deuteronomy, but Jehovist, Deuteronomy, Priestly Code. The method of inquiry has been already indicated; the three strata of the Pentateuch are compared with one another, and at the same time the investigator seeks to place them in their proper relation to the successive phases of Hebrew history as these are known to us from other and undisputed evidence. The process may be shortened if it be taken as agreed that the date of Deuteronomy is known from 2 Kings xxii.; for this gives us at starting a fixed point, to which the less certain points can be referred. The method can be applied alike to the historical and legal parts of the three strata of the Hexateuch. For the Jehovist has legislative matter in Exod. xx.-xxiii., xxxiv., and Deuteronomy and the Priestly Code embrace historical matters; moreover, we always find that the legal standpoint of each author influences his presentation of the history, and *vice versa*. The most important point, however, is the comparison of the laws, especially of the laws about worship, with corresponding statements in the historical and prophetic books.

The turning-point in the history of worship in Israel is the centralization of the cultus in Jerusalem by Josiah (2 Kings xxii., xxiii.). Till then there were in Judah, as there had been before in Samaria, a multitude of local

sanctuaries, the legitimacy of which no one dreamt of disputing. If Hezekiah made an attempt to abolish these local shrines, as we are told in 2 Kings xviii. 4, 22, it is yet plain that this attempt was not very serious, as it had been quite forgotten less than a hundred years later. Josiah's reforms were the first that went deep enough to leave a mark on history. Not, indeed, that the high places fell at one blow; they rose again after the king's death, and the attachment to them finally disappeared only when the Babylonian exile tore the nation from its ancestral soil and forcibly interrupted its traditional customs. The returning exiles were thoroughly imbued with the ideas of Josiah's reform, and had no thought of worshipping except in Jerusalem; it cost them no sacrifice of their feelings to leave the ruined high places unbuilt. From this date all Jews understood as a matter of course that the one God had only one sanctuary. Thus we have three distinct historical periods,—(1) the period before Josiah, (2) the transition period introduced by Josiah's reforms, and (3) the period after the exile. Can we trace a correspondence between these three historical phases and the laws as to worship?

1. The principal law-book embodied by the Jehovist, the First so-called Book of the Covenant, takes it for granted in Exod. period xx. 24-26 that altars are many, not one. Here there is no idea of attaching value to the retention of a single place for the altar; earth and rough stones are to be found everywhere, and an altar of these materials falls into ruins as easily as it is built. Again, a choice of materials is given, presumably for the construction of different altars, and Jehovah proposes to come to His worshippers and bless them, not in the place where he causes His name to be celebrated, but at every such place. The Jehovistic law therefore agrees with the customary usage of the earlier period of Hebrew history; and so too does the Jehovistic story, according to which the patriarchs wherever they reside erect altars, set up cippi (*maçceboth*), plant trees, and dig wells. The places of which these acts of the patriarchs are related are not fortuitous, they are the same places as were afterwards famous shrines. This is why the narrator speaks of them; his interest in the sites is not antiquarian, but corresponds to the practical importance they held in the worship of his own day. The altar which Abraham built at Shechem is the same on which sacrifices still continued to be offered; Jacob's anointed stone at Bethel was still anointed, and tithes were still offered at it in fulfilment of vows, in the writer's own generation. The things which a later generation deemed offensive and heathenish—high places, *maçceboth*, sacred trees, and wells—all appear here as consecrated by patriarchal precedent, and the narrative can only be understood as a picture of what daily took place in the first century or thereabout after the division of the kingdoms, thrown back into the past and clothed with ancient authority.

2. The Deuteronomic legislation begins (Deut. xii.), just like the Book of the Covenant, with a law for the place of worship. But now there is a complete change; Jehovah is to be worshipped only in Jerusalem and nowhere else. The new law-book is never weary of repeating this command and developing its consequences in every direction. All this is directed against current usage, against "what we are accustomed to do at this day"; the law is polemical and aims at reformation. This law therefore belongs to the second period of the history, the time when the party of reform in Jerusalem was attacking the high places. When we read, then, that King Josiah was moved to destroy the local sanctuaries by the discovery of a law-book, this book, assuming it to be preserved in the Pentateuch, can be none other than the legislative part of Deuteronomy, which must once have had a separate exist-

en tant qu'il s'agit du développement national déterminé par des lois écrites, se divisera en deux périodes, avant et après Josias. 10. Ezéchiel est antérieur à la rédaction du code rituel et des lois qui ont définitivement organisé la hiérarchie. 11. Le livre de Josué n'est pas, tant s'en faut, la partie la plus récente de l'ouvrage entier. 12. Le rédacteur du Pentateuque se distingue clairement de l'ancien prophète Moïse. (*L'histoire sainte et la loi*, Paris, 1879, pp. 23, 24.)

Kuenen, "De priesterlijke Bestanddeelen van Pentateuch en Jozua," in *Theol. Tijdschrift*, 1870, p. 391 sq., and *De Godsdienst van Israël*, 2 vols., Haarlem, 1869-70. See also J. Wellhausen, *Prolegomena zur Geschichte Israels*, 2d ed., Berlin, 1883 (Eng. tr., Edinburgh, A. & C. Black, 1885); the first edition appeared in 1878 as *Geschichte Israels*, vol. i.

ence in a shorter form than the present book of Deuteronomy; this, too, is the inference to which we are led by the citations and references in Kings and Jeremiah.

3. In the Priestly Code all worship depends on the tabernacle, and would fall to nothing apart from it. The tabernacle is simply a means of putting the law of unity of worship in an historical form; it is the only legitimate sanctuary; there is no other spot where God dwells and shows Himself, no other where man can approach God and seek His face with sacrifice and gifts. But, while Deuteronomy demands, the Priestly Code presupposes, the limitation of worship to one sanctuary. This principle is tacitly assumed as the basis of everything else, but is never asserted in so many words; the principle, it appears, is now no novelty, but can be taken for granted. Hence we conclude that the Priestly Code builds on the realization of the object aimed at in Deuteronomy, and therefore belongs to the time after the exile, when this object had been fully secured. An institution which in its origin must necessarily have had a negative significance as an instrument in the hands of polemical reformers is here taken to have been from the first the only intelligible and legitimate form of worship. It is so taken because established customs always appear to be natural and to need no reason for their existence.

Priest-
hood.

The abolition of the local shrines in favour of Jerusalem necessarily involved the deposition of the provincial priesthood in favour of the sons of Zadok in the temple of Solomon. The law of Deuteronomy tries to avoid this consequence by conceding the privilege of offering sacrifices at Jerusalem to the Levites from other places; Levites in Deuteronomy is the general name for priests whose right to officiate is hereditary. But this privilege was never realized, no doubt because the sons of Zadok opposed it. The latter, therefore, were now the only real priests, and the priests of the high places lost their office with the destruction of their altars; for the loss of their sacrificial dues they received a sort of eleemosynary compensation from their aristocratic brethren (2 Kings xxiii. 9). The displacing of the provincial priests, though practically almost inevitable, went against the law of Deuteronomy; but an argument to justify it was supplied by Ezekiel (Ezek. xlv.). The other Levites, he says, forfeited their priesthood by abusing it in the service of the high places; and for this they shall be degraded to be mere servants of the Levites of Jerusalem, who have not been guilty of the offence of doing sacrifice in provincial shrines, and thus alone deserve to remain priests. If we start from Deuteronomy, where all Levites have equal priestly rights, this argument and ordinance are plain enough, but it is utterly impossible to understand them if the Priestly Code is taken as already existing. Ezekiel views the priesthood as originally the right of all Levites, while by the Priestly Code a Levite who claims this right is guilty of baseless and wicked presumption, such as once cost the lives of all the company of Korah. And the position of the Levites which Ezekiel qualifies as a punishment and a degradation appears to the Code as the natural position, which their ancestors from father to son had held from the first. The distinction between priest and Levite, which Ezekiel introduces expressly as an innovation, and which elsewhere in the Old Testament is known only to the author of Chronicles, is, according to the Code, a Mosaic institution fixed and settled from the beginning. Ezekiel's ideas and aims are entirely in the same direction as the Priestly Code, and yet he plainly does not know the Code itself. This can only mean that in his day it did not exist, and that his ordinances formed one of the steps that prepared the way for it.

The Priestly Code gives us an hierarchy fully developed, such as existed after the exile. Aaron stands above

his sons as the sons of Aaron stand above the Levites. He has not only the highest place, but a place quite unique, like that of the Roman pontiff; his sons minister under his superintendence (Num. iii. 4); he himself is the only priest with full rights; as such he wears the Urim and Thummim, and the golden ephod; and none but he can enter the holy of holies and offer incense there. Before the exile there were, of course, differences of rank among the priests, but the chief priest was only *primus inter pares*; even Ezekiel knows no high priest in the sense of the Priestly Code. The Urim and Thummim were the insignia of the Levites in general (Deut. xxxiii. 8), and the linen ephod was worn by them all, while the golden ephod was not a garment but a gold-plated image such as the greater sanctuaries used to possess (Judges viii. 27; Isa. xxx. 22). Moreover, up to the exile the temple at Jerusalem was the king's chapel, and the priests were his servants; even Ezekiel, who in most points aims at securing the independence of the priests, gives the prince a weighty part in matters of worship, for it is he who receives the dues of the people, and in return defrays the sacrificial service. In the Priestly Code, on the other hand, the dues are paid direct to the sanctuary, the ritual service has full autonomy, and it has its own head, who holds his place by divine right. Nay, the high priest represents more than the church's independence of the state; he exercises sovereignty over Israel. Though sceptre and sword are lacking to him, his spiritual dignity as high priest makes him the head of the theocracy. He alone is the responsible representative of the commonwealth; the names of the twelve tribes are written on his shoulders and his breast. Offence of his inculpates the whole people and demands the same expiation as a national sin, while the sin-offerings prescribed for the princes mark them out as mere private persons compared with him. His death makes an epoch; the fugitive manslayer is amnestied, not on the death of the king, but on the death of the high priest. On his investiture he receives a kingly unction (whence his name, "the anointed priest"); he wears the diadem and tiara of a monarch, and is clad in royal purple, the most unpriestly dress possible. When now we find that the head of the national worship is as such, and merely as such—for no political powers accompany the high priesthood—also the head of the nation, this can only mean that the nation is one which has been deprived of its civil autonomy, that it no longer enjoys political existence, but survives merely as a church. In truth the Priestly Code never contemplates Israel as a nation, but only as a religious community, the whole life of which is summed up in the service of the sanctuary. The community is that of the second temple, the Jewish hierarchy under that foreign dominion which alone made such an hierarchy possible. The pattern of the so-called Mosaic theocracy, which does not suit the conditions of any earlier age, and of which Hebrew prophecy knows nothing, even in its ideal descriptions of the commonwealth of Israel as it ought to be, fits post-exilic Judaism to a nicety, and was never an actual thing till then. After the exile the Jews were deprived by their foreign rulers of all the functions of public political life; they were thus able, and thus indeed compelled, to devote their whole energies to sacred things, in which full freedom was left them. So the temple became the one centre of national life, and the prince of the temple head of the spiritual commonwealth, while, at the same time, the administration of the few political affairs which were still left to the Jews themselves fell into his hands as a matter of course, because the nation had no other chief.

The material basis of the hierarchy was supplied by the sacred dues. In the Priestly Code the priests receive all

sin-offerings and guilt-offerings, the greater part of the cereal accompaniments of sacrifices, the skin of the burnt-offering, the breast and shoulder of thank-offerings. Further, they receive the male firstlings and the tithe of cattle, as also the firstfruits and tithes of the fruits of the land. Yet with all this they are not even obliged to support at their own cost the stated services and offerings of the temple, which are provided for by a poll-tax. The poll-tax is not ordained in the main body of the Code, but such a tax, of the amount of one-third of a shekel, began to be paid in the time of Nehemiah (Neh. x. 32), and in a novel of the law (Exod. xxx. 15) it is demanded at the higher rate of half a shekel per head. That these exorbitant taxes were paid to or claimed by the priests in the wilderness, or during the anarchy of the period of the judges, is inconceivable. Nor in the period of the kingship is it conceivable that the priests laid claim to contributions much in excess of what the king himself received from his subjects; certainly no such claim would have been supported by the royal authority. In 1 Sam. viii. 15 the tithes appear as paid to the king, and are viewed as an oppressive exaction, yet they form but a single element in the multiplicity of dues which the priests claim under the Priestly Code. But, above all, the fundamental principles of the system of priestly dues in the Code are absolutely irreconcilable with the fact that as long as Solomon's temple stood the king had the power to dispose of its revenues as he pleased. The sacred taxes are the financial expression of the hierocratic system; they accord with the condition of the Jews after the exile, and under the second temple they were actually paid according to the Code, or with only minor departures from its provisions.

Before the exile the sacred gifts were not paid to the priests at all but to Jehovah; they had no resemblance to taxes, and their religious meaning, which in the later system is hardly recognizable, was quite plainly marked. They were in fact identical with the great public festal offerings which the offerers consumed in solemn sacrificial meals before Jehovah, that is, at the sanctuary. The change of these offerings into a kind of tax was connected with an entire transformation of the old character of Israel's worship, which resulted from its centralization at Jerusalem. In the old days the public worship of the nation consisted essentially in the celebration of the yearly feasts; that this was so can be plainly seen from the prophets,—from Amos, but especially from Hosea. And accordingly the laws of worship are confined to this one point in the Jehovist, and even in Deuteronomy. After the exile the festal observances became much less important than the *tamid*, the regular daily and weekly offerings and services; and so we find it in the Priestly Code. But, apart from this, the feasts underwent a qualitative change, a sort of degeneration, which claims our special attention. Originally they were thanksgiving feasts in acknowledgment of Jehovah's goodness in the seasons of the year. The expression of thanks lay in the presentation of the firstlings and firstfruits, and these constituted the festal offerings. The chief feast, at the close of the old Hebrew year, was the autumn feast of ingathering (Feast of Tabernacles),—a thanksgiving for the whole produce of the vinepress and the corn-flour, but especially for the vintage and the olive harvest. Then, at the beginning of the summer half-year, came the feast of unleavened bread (*Maççôth*, Easter), which in turn was followed by the harvest feast (Pentecost). Between the two last there was a definite interval of seven weeks; hence the name "Feast of Weeks" (Exod. xxxiv.). In Deut. xvi. 9 the seven weeks are explained as "seven weeks from such time as thou beginnest to put the sickle to the corn." The Easter feast, therefore, is the commencement of the corn harvest, and this throws light

on its fixed relation to Pentecost. The one is the end of the harvest, the other its commencement in Abib (the month of "corn-ears"); between them lie the "determined weeks of harvest" (Jer. v. 24). The whole of this *tempus clausum* is one great time of gladness (Isa. ix. 3), bounded by the two feasts. According to Lev. xxiii. 9-22 the distinguishing ceremony at Easter is the presentation of a sheaf of barley, before which no one is allowed to taste the new corn; the corresponding rule at Pentecost is the presentation of leavened wheaten bread. The barley of course is the first and the wheat the last grain ripe; at the beginning of harvest the firstfruits are presented in the sheaf, and men also partake of the new growth in the shape of parched ears of corn (Lev. xxiii. 14; Josh. v. 11); at the end of harvest the firstfruits take the form of ordinary bread. We now see the meaning of the "unleavened bread." Unleavened cakes are quickly prepared, and were used when bread had to be furnished suddenly (1 Sam. xxviii. 24); here it is the new meal of the year which is hastily baked into a sort of bannock without waiting for the tedious process of leavening. The unleavened bread contrasts with the Pentecostal cake in the same way as the barley sheaf and the parched ears do, and so, as we see from Josh. v. 11, parched corn may be eaten instead of unleavened bread,—a point worthy of notice.

Thus the three feasts are all originally thanksgivings for the fruits of the ground, and in all of them the offering of firstfruits is the characteristic feature. Quite similarly the Passover, which was celebrated at the same season as the Easter feast of unleavened bread, is also a thanksgiving feast; but here the offerings are not taken from the fruits of the ground but from the male firstlings of the cattle (sheep and oxen). The Jehovistic tradition in Exodus still exhibits this original character of the Passover with perfect clearness. Jehovah demands that His people shall go forth and celebrate His feast in the wilderness with sacrifices of sheep and oxen; and, because Pharaoh refuses to allow the Hebrews to serve their God by offering the firstlings of cattle that are His due, He takes from the king the firstborn of his subjects. The feast, therefore, is older than the exodus, and the former is the occasion of the latter, not *vice versa*. In the Priestly Code the true significance of the feasts appears only dimly in particular details of ritual; their general character is entirely changed. They no longer rest on the seasons and the fruits of the season, and indeed have no basis in the nature of things. They are simply statutory ordinances resting on a positive divine command, which at most was issued in commemoration of some historical event. Their relation to the firstfruits and firstlings is quite gone; indeed these offerings have no longer any place in acts of worship, being transformed into a mere tax, which is holy only in name. This degeneration of the old feasts is carried furthest in the case of the Passover. An historical reason is assigned to the Passover as early as Deuteronomy and the Deuteronomic redaction of the Jehovist, but in these writings the real character of the feast remains so far unchanged that it is still celebrated by the sacrifice of the firstlings of oxen and of sheep. But in the Priestly Code the paschal sacrifice has quite lost its old character, and consists of a yearling sheep or goat, while the firstlings have no more connexion with the Passover, but are a mere due to the priests without any properly religious character. The other feasts have also lost their individuality by being divorced from the firstfruits and celebrated instead by stated sacrifices, which are merely the *tamid* on a larger scale, and have no individuality of meaning. All this is a consequence of the centralizing process which took the observances of worship away from their natural soil, spiritualized them, and gave them a stereotyped reference to

Jehovah's relation with Israel as a whole, and to the sacred history. This centralization, indeed, was not the work of the Priestly Code but of the prophets; but in the Code we find all its consequences fully developed, while even in Deuteronomy the process is still quite in an early stage. Jewish practice after the exile is guided by the Priestly Code, not in every detail, but quite unquestionably in its main features. In the time of Christ no one thought of any other kind of Passover than that prescribed in the Code; the paschal lamb had obliterated all recollection of the sacrifice of the firstlings.

The conclusions which we have reached by comparing the successive strata of the laws are confirmed by a comparison of the several stages of the historical tradition embodied in the Pentateuch. The several threads of narrative which run side by side in the Pentateuch are so distinct in point of form that critics were long disposed to assume that in point of substance also they are independent narratives, without mutual relation. This, however, is highly improbable on general considerations, and is seen to be quite impossible when regard is paid to the close correspondence of the several sources in regard to the arrangement of the historical matter they contain. It is because the arrangement is so similar in all the narratives that it was possible to weave them together into one book; and besides this we find a close agreement in many notable points of detail. Here too analysis does not exhaust the task of the critic; a subsequent synthesis is required. When he has separated out the individual documents the critic has still to examine their mutual relations, to comprehend them as phases in a living process, and in this way to trace the gradual development of the Hebrew historical tradition. In the present article, however, we cannot say anything of the way in which the Deuteronomist views the Hebrew history, nor shall we attempt to characterize the differences between the two sources of the Jehovist, but limit ourselves to a general comparison between the Jehovistic narrative and that of the Priestly Code.

Bleek and his school viewed it as a great merit of the latter narrative that it strictly observes the difference between various ages, mixes nothing Mosaic with the patriarchal period, and in the Mosaic history never forgets that the scene lies in the wilderness of wandering. They also took it as a mark of fidelity to authentic sources that the Code contains so many dry lists, such a mass of unimportant numbers and names, such exact technical descriptions of details which could have no interest for posterity. Against this view Colenso, in the first part of his *Pentateuch and Book of Joshua critically examined* (Lond., 1862), proved that just those parts of the Hexateuch which contain the most precise details, and so have the air of authentic documents, are least consistent with the laws of possibility. Colenso, when he wrote, had no thought of the several sources of the Hexateuch, but this only makes it the more remarkable that his criticisms mainly affect the Priestly Code. Nöldeke followed Colenso with clearer insight, and determined the character and value of the priestly narrative by tracing all through it an artificial construction and a fictitious character. In fact the supposed marks of historical accuracy and dependence on authentic records are quite out of place in such a narrative as that of the Pentateuch, the substance of which is not historical but legendary. This legendary character is always manifest both in the form and in the substance of the narrative of the Jehovist; his stories of the patriarchs and of Moses are just such as might have been gathered from popular tradition. With him the general plan of the history is still quite loose; the individual stories are the important thing, and they have a truly living

individuality. They have always a local connexion, and we can still often see what motives lie at the root of them; but even when we do not understand these legends they lose none of their charm; for they breathe a sweet poetic fragrance, and in them heaven and earth are magically blended into one. The Priestly Code, on the other hand, dwells as little as possible on the details of the several stories, the pearls are stripped off in order that the thread on which they were strung may be properly seen. Love and hate and all the passions, angels, miracles, and theophanies, local and historical allusions, disappear; the old narrative shrivels into a sort of genealogical scheme,—a bare scaffolding to support a pragmatic construction of the connexion and progress of the sacred history. But in legendary narrative connexion is a very secondary matter; indeed it is only brought in when the several legends are collected and written down. When, therefore, the Priestly Code makes the connexion the chief thing, it is clear that it has lost all touch of the original sources and starting-points of the legends. It does not, therefore, draw from oral tradition but from books; its dry excerpts can have no other source than a tradition already fixed in writing. In point of fact it simply draws on the Jehovistic narrative. The order in which that narrative disposed the popular legends is here made the essential thing; the arrangement, which in the Jehovist was still quite subordinate to the details, is here brought into the foreground; the old order of events is strictly adhered to, but is so emphasized as to become the one important thing in the history. It obviously was the intention of the priestly narrator to give by this treatment the historical quaintness of his materials, freed of all superfluous additions. At the same time, he has used all means to dress up the old naïve traditions into a learned history. Sorely against its real character, he forces it into a chronological system, which he carries through without a break from Adam to Joshua. Whenever he can he patches the story with things that have the air of authoritative documents, great lists of subjects without predicates, of numbers and names which could never have been handed down orally without being put in writing, and introduces a spurious air of learned research in the most unsuitable places. Finally, he rationalizes the history after the standard of his own religious ideas and general culture; above all, he shapes it so that it forms a framework, and at the same time a gradual preparation for the Mosaic law. With the spirit of the legend, in which the Jehovist still lives, he has nothing in common, and so he forces it into conformity with a point of view entirely different from its own.

The greater part of the narratives of the Pentateuch cannot be measured by an historical standard; but within certain limits that standard can be applied to the epical age of Moses and Joshua. Thus we can apply historical criticism to the several versions of the way in which the tribes of Israel got possession of the land of Canaan. The priestly narrator represents all Canaan as reduced to a *tabula rasa*, and then makes the masterless and unpeopled land be divided by lot. The first lot falls to Judah, then come Manasseh and Ephraim, then Benjamin and Simeon, and lastly the five northerly tribes, Zebulun, Issachar, Asher, Naphtali, Dan. "These are the inheritances which Eleazar the priest and Joshua the son of Nun and the heads of the tribes of Israel apportioned by lot at Shiloh before Jehovah at the door of the tabernacle." According to the Jehovist (Josh. xiv. 6) Judah and Joseph seem to have had their portions assigned to them while the Israelite headquarters were still at Gilgal—but not by lot—and to have gone forth from Gilgal to take possession of them. A good deal later the rest of the land was divided by lot to the remaining tribes at Shiloh, or perhaps, in the original form of the narrative, at Shechem (Josh. xviii. 2-10); Joshua casts the lots and makes the assignments alone, Eleazar is not associated with him. The absolute uniformity in the method of the division of the land to all the tribes is in some degree given up in this account; it is still more strongly contradicted by the important chapter, Judges i. Fragments of this chapter are found also in the book of Joshua, and there is no doubt that it belongs to the Jehovistic group of narra-

ties, in common with which it speaks of the Angel of Jehovah. It is in truth not a continuation of but a parallel to the book of Joshua, presupposing the conquest of the lands east of the Jordan, but not of western Canaan. The latter conquest is what it relates, and in a way quite different from the book of Joshua. From Gilgal, where the Angel of Jehovah first set up his camp, the tribes go forth singly each to conquer a land for itself, Judah going first and Joseph following. It is only of the movements of these two tribes that we have a regular narrative, and for Joseph this is limited to the first beginnings of his conquests. There is no mention of Joshua; a commander-in-chief of all Israel would indeed be out of place in this record of the conquest, but Joshua might have appeared in it as commander of his own tribe. The incompleteness of the conquest is frankly admitted; the Canaanites continued to hold undisturbed the cities of the plain, and it was only in the time of the kingship, when Israel was waxen strong, that they became subject and tributary. From all that we know of the subsequent history there can be no doubt that this account of the conquest is vastly nearer to the facts than that which prevails in the book of Joshua, where everything is done with systematic completeness, and the whole land dispeopled and then divided by lot. This latter and less historical view is most consistently carried through in the priestly narrative, which accordingly must be the narrative most remote from the origin of the Hebrew tradition. The same conclusion may be drawn from the fact that the priestly writer never names the tribe of Joseph, but always the two tribes of Ephraim and Manasseh, which, moreover, do not receive nearly so much notice as Judah, although Joshua, the leader of Ephraim, is retained in the character of leader of all Israel from an old and originally Ephraïtic tradition.

The middle position which the legal part of Deuteronomy holds between the Jehovist and the Priestly Code is also characteristic of the Deuteronomic narrative, which is founded throughout on the narrative of the Jehovist, but from time to time shows a certain leaning to the points of view characteristic of the priestly narrator. The order of the several parts of the Hexateuch to which we have been led by all these arguments is confirmed by an examination of the other historical books and the books of Chronicles. The original sources of the books of Judges, Samuel, and Kings stand on the same platform with the Jehovist; the editing they received in the exile presupposes Deuteronomy; and the latest construction of the history as contained in Chronicles rests on the Priestly Code. This is admitted and need not be proved in detail; the conclusion to be drawn is obvious.

We have now indicated the chief lines on which criticism must proceed in determining the order of the sources of the Hexateuch, and the age of the Priestly Code in particular,—though, of course, it has not been possible at all to exhaust the argument. The objections that have been taken to Graf's hypothesis partly rest on misunderstanding. It is asked, for example, what is left for Moses if he was not the author of the Torah. But Moses may have been the founder of the Torah though the Pentateuchal legislation was codified almost a thousand years later; for the Torah was originally not a written law but the oral decisions of the priests at the sanctuary—case-law, in short, by which they decided all manner of questions and controversies that were brought before their tribunal; their Torah was the instruction to others that came from their lips, not at all a written document in their hands guaranteeing their own status, and instructing themselves how to proceed in the sacrificial ritual. Questions of clean and unclean belonged to the Torah, because these were matters on which the laity required to be directed; but, speaking generally, the ritual, so far as it consisted in ceremonies performed by the priests themselves, was no part of the Torah. But, while it was only at a late date that the ritual appeared as Torah as it does in the Priestly Code, its usages and traditions are exceedingly ancient, going back, in fact, to pre-Mosaic and heathenish times. It is absurd to speak as if Graf's hypothesis meant that the whole ritual is the invention of the Priestly Code, first put into practice after the exile; all that is affirmed by

the advocates of that hypothesis is that in earlier times the ritual was not the substructure of an hierocracy, that there was in fact no hierocracy before the exile, but that Jehovah's sovereignty was an ideal thing and not visibly embodied in an organization of the commonwealth under the forms of a specifically spiritual power. The theocracy was the state; the old Israelites regarded their civil constitution as a divine miracle. The later Jews assumed the existence of the state as a natural thing that required no explanation, and built the theocracy over it as a special divine institution.

There are, however, some more serious objections taken to the Grafian hypothesis. It is, indeed, simply a misstatement of facts to say that the language of the Priestly Code forbids us to date it so late as post-exilic times. On the other hand, a real difficulty lies in the fact that, while the priestly redaction extends to Deuteronomy (Dent. i. 3), it is also true that the Deuteronomic redaction extends to the Priestly Code (Josh. xx.). The way out of this dilemma is to be found by recognizing that the so-called Deuteronomic redaction was not a single and final act, that the characteristic phrases of Deuteronomy became household words to subsequent generations, and were still current and found application centuries after the time of Josiah. Thus, for example, the traces of Deuteronomic redaction in Josh. xx. are still lacking in the Septuagint; the canonical text, we see, was retouched at a very late date indeed. Of the other objections taken to the Grafian hypothesis only one need be mentioned here, viz., that the Persians are not named in the list of nations in Gen. x. This is certainly hard to understand if the passage was written in the Persian period. But the difficulty is not insuperable; the Persians, for example, may have been held to be included in the mention of the Medians, and this also would give the list the archaic air which the priestly writer affects. At any rate, a residue of minute difficulties not yet thoroughly explained cannot outweigh the decisive arguments that support the view that the Priestly Code originated in and after the exile. Kuenen observes with justice that "it is absolutely necessary to start with the plain and unambiguous facts, and to allow them to guide our judgment on questionable points. The study of details is not superfluous in laying down the main lines of the critical construction, but, as soon as our studies have supplied us with some really fixed points, further progress must proceed from them, and we must first gain a general view of the whole field instead of always working away at details, and then coming out with a rounded theory which lacks nothing but a foundation."

Finally, it is a pure *petitio principii*, and nothing more, to say that the post-exilic age was not equal to the task of producing a work like the Priestly Code. The position of the Jews after the exile made it imperative on them to reorganize themselves in conformity with the entire change in their situation, and the Priestly Code corresponds to all that we should expect to find in a constitution for the Jews after the exile as completely as it fails to correspond with the conditions which a law-book older than the exile would have had to satisfy. After the final destruction of the kingdom by Nebuchadnezzar, they found in the ritual and *personnel* of the temple at Jerusalem the elements out of which a new commonwealth could be built, in conformity with the circumstances and needs of the time. The community of Judea raised itself from the dust by holding on to its ruined sanctuary. The old usages and ordinances were reshaped in detail, but as a whole they were not replaced by new creations; the novelty lay in their being worked into a system and applied as a means to organize the "remnant" of Israel. This was the origin of the sacred constitution of Judaism. Religion

in old Israel had been a faith which gave its support to the natural ordinances of human society; it was now set forth in external and visible form as a special institution, within an artificial sphere peculiar to itself, which rose far above the level of common life. The necessary presupposition of this kind of theocracy is service to a foreign empire, and so the theocracy is essentially the same thing as hierocracy. Its finished picture is drawn in the Priestly Code, the product of the labours of learned priests during the exile. When the temple was destroyed and the ritual interrupted, the old practices were written down that they might not be lost. Thus in the exile the ritual became matter of teaching, of Torah; the first who took this step, a step prescribed by the circumstances of the time, was the priest and prophet Ezekiel. In the last part of his book Ezekiel began the literary record of the customary ritual of the temple; other priests followed in his footsteps (Lev. xvii.-xxvi.); and so there arose during the captivity a school of men who wrote down and systematized what they had formerly practised. When the temple was restored this theocratic zeal still went on and produced further ritual developments, in action and reaction with the actual practice of the new temple; the final result of the long-continued process was the Priestly Code.

This Code, incorporated in the Pentateuch and forming the normative part of its legislation, became the definitive Mosaic law. As such it was published and put in action in 444 B.C. by the Babylonian priest and scribe Ezra. Ezra had come to Jerusalem as ear'y as 458, at the head of a considerable body of zealous Jews, with full authority from Artaxerxes Longimanus to reform the community of the second temple in accordance with the law of God in his hand. But Ezra did not introduce this law immediately on his arriva¹ it took him fourteen years to effect his purpose. The external circumstances of the young community, which were exceedingly unfavourable, made it at first undesirable to introduce legislative innovations; perhaps, also, Ezra needed time to correct the product of Babylonian learning by the light of Judæan practice, and wished, moreover, to train assistants for his task. The chief reason of the delay seems, however, to have been that, in spite of the royal favour, he could not get any energetic support from the local representatives of the Persian Government, and without this he could not have given authority to his new law. But in 445 a kindred spirit, Nehemiah b. Hakkeleiah, came to Jerusalem as Persian governor of Judæa. Ezra's opportunity had now arrived, and he was able to introduce the Pentateuch in agreement with the governor. The record of this step is contained in Neh. viii.-x.; it is closely analogous to the narrative of the introduction of the Deuteronomic law under Josiah in 2 Kings xxii. Just as we are told there that Deuteronomy became known in 621 B.C., having been unknown previously, so we are told here that the Torah in the rest of the Pentateuch became known in 444, and was unknown till that date. This shows us, in the first place, that Deuteronomy contains an earlier stage of the law than the priestly Torah. And further, as the date of Deuteronomy can be inferred from the date of its publication and introduction under Josiah, so in like manner the date of the composition of the Priestly Code can be inferred from its publication and enforcement by Ezra and Nehemiah.

The establishment of the right date for the written law is of the highest importance for our understanding of the prophets, and for our whole conception of the history of Israel. See the articles ISRAEL and PROPHET. (J. WE.)

PENECOST, a feast of the Jews, was in its original meaning, as has been explained in PENTATEUCH (*supra*, q. 511), the closing feast of the harvest gladness, at which,

according to Lev. xxiii. 17, leavened bread was presented at the sanctuary as the firstfruits of the new cereal store. Hence the names "Feast of Harvest" (Exod. xxiii. 16), "Day of Firstfruits" (Num. xxviii. 26); but the commoner Old Testament name (Exod. xxxiv. 22; Deut. xvi. 10, 16; 2 Chron. viii. 13) is "Feast of Weeks," because it fell exactly seven weeks (Deut. xvi. 9), or, on the Jewish way of reckoning an interval by counting in both termini, just fifty days (Lev. xxiii. 16) after the offering of the first sheaf of the harvest at the Feast of Unleavened Bread. Pentecost or "Fiftieth" day is only a Greek equivalent of the last name (πεντηκοστή in the Apocrypha and New Testament). The orthodox later Jews reckoned the fifty days from the sixteenth of Nisan, cutting the ritual sheaf on the night of (that is, on our division of days, the night preceding) that day (see PASSOVER). In Deuteronomy Pentecost, like the other two great annual feasts, is a pilgrimage feast (Deut. xvi. 16), and so it was observed in later times; but, unlike the others, it lasts but one day, agreeably to its character (expressed in the name פֶּנֶקֶסֶת, 'Ασπαρά, given to it by Josephus and the later Jews) as merely the solemn closing day of harvest-time. Like the other great feasts, it came to be celebrated by fixed special sacrifices. The amount of these is differently expressed in the earlier and later priestly law (Lev. xxiii. 18 sq.; Num. xxviii. 26 sq.); the discrepancy was met by adding the two lists. The later Jews also extended the one day of the feast to two. Further, in accordance with the tendency to substitute historical for economic explanations of the great feasts, Pentecost came to be regarded as the feast commemorative of the Sinaitic legislation.

To the Christian church Pentecost acquired a new significance through the outpouring of the Spirit (Acts ii.). See WHITSUNDAY.

PENZA, a government or eastern Russia, bounded on the N. by Nijni Novgorod, on the E. by Simbirk, and on the S. and W. by Saratoff and Tamboff, and having an area of 15,000 square miles. The surface is undulating, with deep valleys and ravines, but even in its highest parts it does not reach more than 600 to 900 feet above sea-level. It is chiefly made up of Cretaceous sandstones, sands, marls, and chalk, covered in the east by Eocene deposits. Chalk, potter's clay, peat, and iron are the chief mineral products, in the north. The soil is a black earth, more or less mixed with clay and sand; the only marshes of any extent occur in the Krasnoslobodsk district; and considerable sand-areas appear in the broad valleys of the larger rivers. There are extensive forests in the north, but the south shows the characteristic features of a steppe-land. The government is watered by the Moksha, the Sura (both navigable), and the Khoper, belonging respectively to the Oka, Volga, and Don systems. Timber is floated down several smaller streams, while the Moksha and Sura are important means of conveyance for grain, spirits, timber, metals, and oils. The climate is harsh and continental, the average temperature at Penza being only 39°·8 (12°·2 in January and 68°·5 in July).

The population—1,356,600 in 1881, and in 1884 estimated at about 1,465,000—consists principally of Russians, mixed to some extent with Mordvinians; there are also about 150,000 Mordvinians who are to a large extent Russified; some 40,000 Mescheryaks, who have undergone the same process still more fully; and 60,000 Tatars, who still keep their own religion, language, and customs. The Russians profess the Greek faith, and very many, especially in the north, are Raskolniks. Somewhat less than 10 per cent. of the population (133,250 in 1881) live in towns; the chief occupation of the inhabitants is agriculture, 61 per cent. of the soil being arable. Wheat and millet are raised only to a limited extent, the chief crops being rye, oats, buckwheat, hemp, potatoes, and beetroot. The averages for 1870-77 were 3,900,000 quarters of corn and 1,779,200 bushels of potatoes. The chief centres of corn export are Penza, Narovtchal, and Golovinshtchina. Market-gardening is successfully

carried on in several districts, and improved varieties of fruit-trees are being introduced through the imperial botanical garden at Penza and a private school of gardening in the Gorodishte district. Fourteen per cent. of the area is under meadows or grazing land; and in 1881 there were within the government 244,000 head of cattle, 383,000 horses, and 235,000 pigs. Sheep-breeding is especially developed in Tchambar and Insar (670,000 sheep, including 72,000 of finer breeds, in 1881). The Mordvinians are very partial to bee-keeping. The forests (620,000 acres) are a considerable source of wealth, especially in Krasnoslobodsk and Gorodishte, whence timber, a variety of wooden wares, and also pitch and tar are exported to the south. As many as 30 per cent. of the adult male population leave the government in search of employment, either on the Volga or in southern Russia.

The manufactures are few, employing only 13,300 hands. The yearly returns in 1879 did not exceed 13,325,000 roubles (£1,332,500). The distilleries come first (£973,200), followed by the woollen cloth industry (£237,000), the paper industry (£37,200), tanneries, soap-works, glass-works, machine-works, iron-works, and beetroot-sugar factories. Trade, which has been favoured by the completion of the railway from Tula to Samara, is still limited to the export of corn, spirits, timber, hemp-seed oil, tallow, hides, honey, wax, some woollen cloth, potash, and cattle, the chief centres for trade being Penza, Nijni Lomoff, Mokshan, Saransk, Krasnoslobodsk, and Golovinshtchina.

The government is divided into ten districts, the chief towns of which are:—Penza (41,650), Gorodishte (3200), Insar (5230), Kerensk (12,450), Krasnoslobodsk (7000), Mokshan (13,050), Narovchat (5150), Nijni Lomoff (10,500), Saransk (13,450), and Tchambar (5320). Troitsk (5700), Verkhni Lomoff (7300), and Sheshkéeff (3500) also have municipal institutions.

The present government of Penza was formerly inhabited by Mordvinians, who had the Mescheryaks in the west, the Bulgars in the north, and the Burtases in the south. In the 13th century these populations fell under the dominion of the Tatars, with whom they fought against Moscow. As early as the 14th century they possessed the town of Narovchat. The Russians penetrated into the country in the 16th century, founding the town of Mokshan in 1535, and several others in the course of that and the following centuries. Penza was founded in the beginning of the 17th century, the permanent Russian settlement dating as far back as 1666. Its wooden fort, on the site of the present cathedral of the Saviour, protected the neighbourhood against risings of the Mordvinians and Mescheryaks. In 1776 it was taken by Pugatcheff. The town was almost totally destroyed by the great conflagrations of 1836, 1839, and 1858.

PENZA, capital of the above province, is situated 440 miles by rail south-east from Moscow. It is mostly built of wood, on the slopes of a plateau 730 feet above the sea, at the confluence of the little Penza with the navigable Sura. The Spassko-brajensky cathedral was built in the end of the 17th century, the monastery of the same name, which formerly adjoined it, being now in the suburbs. A few educational and philanthropic institutions, a theatre which has played some part in the history of the Russian stage, and a municipal bank are the chief buildings of Penza, which derives its importance chiefly from its being the seat of the provincial authorities and the see of a bishop. The great bulk of the inhabitants are peasants, who support themselves by agriculture or fishing in the Sura, some artisans, and a few merchants. An imperial botanical garden is situated within 2 miles of the town. Apart from a paper-mill and two steam flour-mills, the manufacturing establishments (producing soap, candles, wax-candles, cosmetics, machinery), distilleries, breweries, and saw-mills are small. Trade in corn, oil, tallow, and spirits is on the increase. There are two fairs where cattle and horses are sold for export, grocery and manufactured wares being the corresponding imports. The population in 1881 had reached 41,650.

PENZANCE, a seaport and municipal borough of Cornwall, and the westernmost borough of England, is finely situated on gently rising ground on the north-western shore of Mount Bay, at the terminus of the Great Western Railway, 10 miles east-north-east of Land's End and 20 west-south-west of Truro. It is the nearest port to the Scilly Isles, which are about 40 miles distant to the west-south-west. The market-place is in the centre of the town, and near it the four principal streets intersect each other at

right angles. The southern arm of the pier was built in 1772, the Albert or new pier on the east in 1845. The piers are connected by a wharf, viaduct, and swing-bridge (1882); and a dock is being at present constructed at a cost of £60,000, which will extend to about 3 acres. The limits of the port have lately (1884) been extended. The churches are St Mary's, constructed of cut granite, in the Perpendicular style, with lofty pinnacled tower and peal of eight bells; St Paul's, of cut and rubble granite, in the style of the 13th century (1843); and St John's, of stone, Early English (1881). The public buildings, erected of granite in the Italian style in 1867, include the town-hall and council-chambers, St John's Hall for public meetings, the lecture-hall, the public library (upwards of 16,000 volumes), the news-rooms, the masonic hall, the museum of the Penzance Natural History and Antiquarian Society, and the museum and other rooms of the Geological Society of Cornwall. The market-house (1837), in the Grecian style, with a central dome, includes a meat-market on the ground-floor with a corn-market above, and in the east end of the building is the grammar-school, founded in 1789. In front of the east end is a marble statue of Davy. Somewhat east of the market-house are the post and telegraph offices, completed in 1883. Among the benevolent institutions is the West Cornwall Infirmary (1874), which includes the dispensary (1809). The town has a considerable shipping trade, the total number of vessels which entered the port in 1882 being 1829 of 197,933 tons burden, the number which cleared 1774 of 187,569 tons. The exports include tin, copper, granite, serpentine, and fish, and the imports coal, timber, and provisions. Large quantities of pilchard are annually exported to Italy. Fruits, flowers, and vegetables are grown in the neighbourhood for the London market. On account of its sheltered situation and its remarkably mild and equable climate, the town has a high repute as a winter residence for persons suffering from pulmonary complaints; and on account of its fine scenery it is also becoming a favourite watering-place. The population of the municipal borough in 1871 was 10,414, and in 1881 it was 12,409.

Penzance is said to mean "holy head," the name being derived from a chapel dedicated to St Anthony, formerly situated on a headland now forming the base of the old pier, around which a few fishermen built their huts and thus originated the town. A castle built by the Tyes, possessors of the manor of Alwerton or Alverton, is supposed to have occupied the present site of St Mary's Church. Alice de Lisle, sister and heiress of the last Baron Tyes, obtained for the town the grant of a weekly market from Edward III. In the 16th century Penzance was known as a "place of ships and merchandise;" and on the 16th March 1512 it received from Henry VIII. a charter granting to the inhabitants all profits arising from ships visiting the harbour upon condition that the quays and bulwarks of the town were kept in repair. In 1595 the town was burned and pillaged by the Spaniards, and in 1644 sacked by Fairfax. In 1614 it was incorporated by James I.; and in 1663 it obtained a coinage charter,—a privilege it retained till 1833. On account of the usurpation of its chief magistrate its municipal charter was forfeited in the beginning of the reign of Queen Anne, but was restored in 1706. By the Municipal Act of 1835 the government was made to consist of a mayor, six aldermen, and eighteen councillors.

Lach-Szyrma, *History of Penzance, 1678*; Millett, *Penzance Past and Present, 1870-1880*.

PEONY. See PÆONY.

PEORIA, a city of the United States, capital of Peoria county, Illinois, lies on the edge of a rolling prairie at the lower end of the so-called Lake Peoria, an expansion of the Illinois river, and is connected by the Michigan Canal with Chicago. It is a flourishing place, the meeting-point of nine railway lines, the trading centre for an extensive district, and the seat of a large grain traffic and of various manufactures; 117,158,670 proof gallons of high wines were made in 1883. From 5095 in 1850 its population increased to 14,045 in 1860, 22,849 in 1870, and 29,259 in 1880. Though its permanent settlement dates

only from 1811 and its city charter from 1844, Peoria was one of the trading ports established by La Salle (1680), and was long known as a point of some importance on the route between Canada and Louisiana.

PEPPER, a name applied to several pungent spices known respectively as Black, White, Long, Red or Cayenne, Ashantee, Jamaica, and Melegueta Pepper, but derived from at least three different natural orders of plants.

Black pepper is the dried fruit of *Piper nigrum*, L., a perennial climbing shrub indigenous to the forests of Travancore and Malabar, from whence it has been introduced into Java, Sumatra, Borneo, the Malay Peninsula, Siam, the Philippines, and the West Indies. It is one of the earliest spices known to mankind, and for many ages formed a staple article of commerce between India and Europe,—Venice, Genoa, and the commercial cities of central Europe being indebted to it for a large portion of their wealth. Tribute has been levied in pepper; one of the articles demanded in 408 by Alaric as part of the ransom of Rome was 3000 lb of pepper. Pepper-corn rents prevailed during the Middle Ages, and consisted of an obligation to supply a certain quantity of pepper, usually 1 lb, at stated times; and the term still lingers in use at the present day. The price of the spice during the Middle Ages was exorbitantly high, and its excessive cost was one of the inducements which led the Portuguese to seek a sea-route to India. The discovery of the passage round the Cape of Good Hope led (1498) to a considerable fall in the price, and about the same time the cultivation of the plant was extended to the western islands of the Malay Archipelago. Pepper, however, remained a monopoly of the Portuguese crown as late as the 18th century. In Great Britain it was formerly taxed very heavily, the impost in 1623 amounting to 5s., and as late as 1823 to 2s. 6d. per lb.

The largest quantities of pepper are produced in Penang, the island of Rhio, and Johore near Singapore,—Penang affording on an average about half of the entire crop. Singapore is the great emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. In 1880 the imports into England from Singapore amounted to 21,179,059 lb, valued at £385,108, and from other countries 559,909 lb, valued at £12,979, the re-exports being 12,925,886 lb, chiefly to Germany, Italy, Russia, Holland, and Spain. The varieties of black pepper met with in commerce are known as Malabar, Aleppy or Tellicherry, Cochín, Penang, Singapore, and Siam. The average market value in the London market is—Malabar, 3½d to 5½d per lb; Penang, 2½d to 4½d; Singapore, 3½d to 4½d.

Pepper owes its pungency to a resin, and its flavour to a volatile oil, of which it yields from 1·6 to 2·2 per cent. The oil agrees with oil of turpentine in composition as well as

in specific gravity and boiling point. In polarized light it deviates the ray, in a column 50 mm. long, 1°·2 to 3°·4 to the left. Pepper also contains a neutral crystalline substance, called piperin, to the extent of 2 to 8 per cent. This substance has the same empirical formula as morphia, $C_{12}H_{19}NO_3$, but differs in constitution and properties. It is insoluble in water when pure, is devoid of colour, flavour, and odour, and may be resolved into piperic acid, $C_{12}H_{16}O_4$, and piperidin, $C_5H_{11}N$. The latter is a liquid colourless alkaloid, boiling at 106° C., has an odour of pepper and ammonia, and yields crystallizable salts. A fatty oil is found in the pericarp of pepper, and the berries yield on incineration from 4·1 to 5·7 of ash. The only use of pepper is as a condiment. Notwithstanding its low price and the penalty of £100 to which the manufacturer, possessor, or seller of the adulterated article is liable, powdered pepper is frequently diluted with starch, sago, meal, and other substances, which can be readily detected under the microscope.¹

In the south-west of India, where the pepper-plant grows wild, it is found in rich, moist, leafy soil, in narrow valleys, propagating itself by running along the ground and giving off roots into the soil. The only method of cultivation adopted by the natives is to tie up the end of the vine to the neighbouring trees at distances of at least 6 feet, especially to those having a rough bark, in order that the roots may easily attach themselves to the surface. The underwood is then cleared away, leaving only sufficient trees to provide shade and permit free ventilation. The roots are manured with a heap of leaves, and the shoots are trained twice a year. In localities where the pepper does not grow wild, ground is selected which permits of free drainage, but which is not too dry nor liable to inundation, and cuttings are planted at about a foot from the trees either in the rainy season in June or in the dry season in February. Sometimes several cuttings about 18 inches long are placed in a basket and buried at the root of the tree, the cuttings being made to slope towards the trunk. In October or November the young plants are manured with a mixture of leaves and cow-dung. On dry soils the young plants require watering every other day during the dry season for the first three years. The plants bear in the fourth or fifth year, and if raised from cuttings are fruitful for seven years, if from seed for fourteen years. The pepper from plants raised from cuttings is said to be superior in quantity and quality, and this method is in consequence most frequently adopted. Where there are no trees the ground is made into terraces and enclosed by a mud-wall, and branches of *Erythrina indica* are put into the ground in the rainy season and in the course of a year are capable of supporting the young pepper plants. In the meantime mango trees are planted, these being preferred as supports, since their fruit is not injured by the pepper plant, while the *Erythrina* is killed by it in fourteen or fifteen years.

In Sumatra the ground is cleared, ploughed, and sown with rice, and cuttings of the vine are planted in September 5 feet apart each way, together with a sapling of quick growth and rough bark. The plants are now left for twelve or eighteen months and then entirely buried except a small piece of bent stem, whence new shoots arise, three or four of which are allowed to climb the tree near which they are planted. These shoots generally yield flowers and fruits the next year. Two crops are collected every year, the principal one being in December and January and the other in July and August, the latter yielding pepper of inferior quality and in less quantity. Two or three varieties are met with in cultivation; that yielding the best kinds has broadly ovate leaves, five to seven in number, nerved and stalked. The flower-spikes are opposite the leaves, stalked and from 3 to 6 inches long; the fruits are sessile and fleshy. A single stem will bear from twenty to thirty of these spikes. The harvest commences as soon as one or two berries at the base of the spikes begin to turn red, and before the fruit is mature, but when full-grown and still hard; if allowed to ripen, the berries lose pungency, and ultimately fall off and are lost. The spikes are collected in bags or baskets and dried in the sun, on mats or hard ground, for two or three days. When dry the pepper is put into bags containing from 64 to 128 lb, and is then ready for the market. The yield varies in different localities. In Sumatra it is estimated at about 1½ lb per plant per annum. In Malabar each vine gives 2 lb a year up to the fifteenth or twentieth year, or about 2 lb from each tree, a single tree sometimes supporting eight or twelve vines; an acre is calculated to bear 2500 plants, to cost about £4 in outlay to bring it into bearing, and to yield a produce of £80 when in its best condition.

Piper nigrum. a, Twig with fruit; b, longitudinal section of flower; c, section of fruit.

White pepper is obtained from the same plant as the black, and differs only in being prepared from the ripe fruits. These, after collection, are kept in the house three days and then bruised and washed in a basket with the hand until the stalks and pulpy matter are removed, after which the seeds are dried. It is, however, sometimes prepared from the dried black pepper by removing the dark outer layer. It is less pungent than the black but possesses a finer flavour. It is chiefly prepared at the island of Rhio, but the finest comes from Tellicherry. The Chinese are the largest consumers. In 1877 Singapore exported 48,461 piculs (a picul = 133½ lb) to that country. The London market value is about 4½d to 7d per lb. White pepper affords on an average not more than 1·9 per cent. of essential oil; but, according to Cazeneuve, as much as 9 per cent. of piperin, and of ash not more than 1·1 per cent.

Long pepper is the fruit-spike of *Piper officinarum*, C. DC., and *P. longum*, L., gathered shortly before it reaches maturity and dried. The former is a native of the Indian Archipelago, occurring in Java, Sumatra, Celebes, and Timor. It has oblong, ovate, acuminate leaves, attenuated to the base, which are pinnate and veined. The latter is indigenous to Ceylon, Malabar, eastern Bengal, Timor, and the Philippines; it is distinguished from *P. officinarum* by the leaves being cordate at the base and five-veined. Long pepper appears to have been known to the ancient Greeks and Romans under the name of *πίπερι μακρόν*; and in the 10th century mention is made of long pepper, or macropiper, in conjunction with black and white peppers. The spice consists of a dense spike of minute baccate fruits closely packed around the central axis, the spike being about 1½ inch long and ½ inch thick; as met with in commerce they have the appearance of having been limed. In Bengal the plants are cultivated by suckers, which are planted about 5 feet apart on dry rich soil on high ground. An English acre will yield about 3 maunds (80 lb) the first year, 12 the second, and 18 the third year; after this time the yield decreases, and the roots are therefore grubbed up and sold as *pipli mul*, under which name they are much used as a medicine in India. After the fruit is collected, which is usually in January, the stem and leaves die down to the ground. Long pepper contains piperin, resin, and volatile oil, and yields about 8 per cent. of ash. Penang and Singapore are the principal centres in the East for its sale. In 1871 Singapore shipped 3366 cwt., of which 447 were sent to Great Britain. Penang exports annually about 2000 to 3000 piculs. The value in the London market is from 37s. to 45s. a cwt.

Ashantee or West African pepper is the dried fruit of *Piper Clusii*, C. DC., a plant widely distributed in tropical Africa, occurring most abundantly in the country of the Niam-niam. It differs from black pepper in being rather smaller, less wrinkled, and in being attenuated in a stalk, like cubeb, to which it bears considerable resemblance externally. The taste, however, is pungent, exactly like that of pepper, and the fruit contains piperin. It was imported from the Grain Coast by the merchants of Rouen and Dieppe as early as 1364, and was exported from Benin by the Portuguese in 1485; but, according to Clusius, its importation was forbidden by the king of Portugal for fear it should depreciate the value of the pepper from India. In tropical Africa it is extensively used as a condiment, and it could easily be collected in large quantities if a demand for it should arise.

Jamaica pepper is the fruit of *Pimenta officinalis*, Lindl., an evergreen tree of the Myrtle family. It is more correctly termed "pimento," or "allspice," as it is not a 'rue pepper.

Melegueta pepper, known also as "Guinea grains," "grains of paradise," or "alligator pepper," is the seed of

Amoszum Melegueta, Roscoe, a plant of the Ginger family; the seeds are exceedingly pungent, and are used as a spice throughout central and northern Africa. See vol. vi. p. 36.

For Cayenne pepper, see vol. v. p. 280. (E. M. H.)

PEPPERMINT, an indigenous perennial herb of the natural order *Labiata*, and genus *Mentha*, the specific name being *Mentha Piperita*, Huds., is distinguished from other species of the genus by its stalked leaves and oblong-obtuse spike-like heads of flowers. It is met with, near streams and in wet places, in several parts of England and on the Continent, and is also extensively cultivated for the sake of its essential oil in England,¹ in several parts of continental Europe, and in the United States. Yet it was only recognized as a distinct species late in the 17th century, when Dr Eales discovered it in Hertfordshire and pointed it out to Ray, who published it in the second edition of his *Synopsis Stirpium Britannicarum* (1696). The medicinal properties of the plant were speedily recognized, and it was admitted into the *London Pharmacopœia* in 1721, under the name of *Mentha piperitis sapor*.

Two varieties are recognized by growers, the one being known as white and the other as black mint. The former

has purplish and the latter green stems; the leaves are more coarsely serrated in the white. The black is the variety more generally cultivated, probably because it is found to yield more oil, but that of the green variety is considered to have a more delicate odour, and obtains a higher price. The green is the kind chiefly dried for herbalists; it is said to be of less vigorous

FIG. 1.—*Mentha Piperita*. a, Flowering branch; b, flower showing form of calyx teeth.

growth than the black. The annual yield of peppermint oil from all parts of the world has been estimated at 90,000 lb, but this is probably much below the mark, without taking into consideration the Chinese and Japanese oils of peppermint, which, however, are obtained from a different species of mint.

Peppermint oil varies considerably in commercial value, that of Mitcham commanding nearly three times the price of the finest American. The flavour varies to a slight extent even with particular plots of land, badly drained ground being known to give unfavourable results both as to the quantity and quality of the oil. That of the Japanese and Chinese oil also differs slightly from the English, and is thus distinguishable by experts. In America the oil is liable to be injured in flavour by aromatic weeds which grow freely among the crop, the most troublesome of these being *Erigeron canadense*, L., and *Erechtithes hieracifolia*, Raf. When pure the oil is nearly colourless and has an agreeable odour and powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. It has a specific gravity of 0·84 to 0·92, and boils at 365° Fahr. Mitcham oil, when examined by polarized light in a column 50 mm. long, deviates from 14°·2 to 10°·7

¹ Near Mitcham in Surrey (219 acres in 1864), Wisbeach in Cambridgeshire, Market Deeping in Lincolnshire (150 acres in 1881), and Hitchin in Hertfordshire.

to the left, the American 4°3. When oil of peppermint is cooled to 4° C. it sometimes deposits colourless hexagonal prisms of menthol, $C_{10}H_{20}O$, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92° Fahr. The liquid portion of the oil appears to consist chiefly of the compound $C_{10}H_{18}O$, but it has not been thoroughly investigated. Oil of peppermint is often adulterated with a third part of rectified spirit, which may be detected by the milkiness produced when the oil is agitated with water. Oil of rosemary and rectified oil of turpentine are sometimes used for the same purpose. If the oil contains turpentine it will explode with iodine. If quite pure it dissolves in its own weight of rectified spirits of wine. Peppermint oil is largely distilled at Canton, a considerable quantity (about 300 catties annually) being sent to Bombay, also about 600 catties of menthol. The exports from Canton in 1883 amounted to about 1200 lb. The species cultivated in the neighbourhood of Canton, and probably at Shanghai also, is *Mentha arvensis*, var. *glabrata*. Peppermint is chiefly cultivated in the province of Keang-se; and according to native statements as much as 40 piculs of oil of peppermint are sent annually to ports on the coast. In Japan also the distillation of oil of peppermint forms a considerable industry, the plant cultivated

FIG. 2.—*Mentha arvensis*, var. *piperascens*. a, Flowering branch; b, calyx showing form of teeth.

being *M. arvensis*, var. *piperascens* (see *Ph. Journ.* [3] vol. ii. p. 324), of which both a purplish and a white form appear to be grown. The oil, under the name of *hakka no abura*, is exported from Hiogo and Ozaka, but is said to be frequently adulterated. Since 1872 the peppermint camphor or menthol has been largely exported in the separate state from Japan to Germany and Great Britain. The menthol is obtained by subjecting the oil to a low temperature, when it crystallizes out and is separated. The two varieties of *M. arvensis* just named yield much more menthol than *M. Piperita*. It is remarkable, however, that the *M. arvensis*, var. *javanica*, Blume, growing in Ceylon, has not the flavour of peppermint but that of garden mint, while the typical form of *M. arvensis* grown in Great Britain has an odour so different from peppermint that it has to be carefully removed from the field lest it should spoil the flavour of the peppermint oil when the herb is distilled. *M. incana*, Willd., cultivated near Bombay as a herb, also possesses the flavour of peppermint. In the form in which menthol is imported it bears some resemblance to Epsom salts, with which it is said to be sometimes adulterated. It is usually not entirely free from the essential oil, and consequently undergoes purification and recrystallization in England and on the Continent. The amount of menthol imported by a large firm at Leipsic between September 1883 and April 1884 is stated by them to have been 6380 lb, while it is certain that at least an equal quantity is imported into England from Yokohama. Although the Japanese peppermint plant has been imported by a London merchant, no attempt has as yet been made to cultivate the plant in order to manufacture menthol in England. Menthol is now (1884), however, manufactured from *M. Piperita* in the United States, where also *M. arvensis*, var. *piperascens*, is cultivated.

Oil of peppermint is used in medicine as an antispasmodic for the relief of griping pains in the alimentary canal, to expel flatulence, to relieve nausea, to hide the taste of other medicines, and to act as an adjunct to purgatives. The dose is usually from one to three minims. It forms a most valuable remedy in diarrhoea, acting as an antiseptic, and as a stimulant to the circulation, and as an anodyne. The oil rubbed over the head is used in China to cure sunstroke. Menthol has lately come largely into use as a remedy for neuralgia, being moulded by heat into the form of small cones, which are rubbed over the part affected.

Peppermint placed on the tongue frequently relieves headache, and catarrh and coryza if placed in the nostril. The largest consumption of the oil is in the manufacture of peppermint lozenges.

The following mode of cultivation is adopted by Mr Holland, at Market Deeping. A rich friable soil, retentive of moisture, is selected, and the ground is well tilled 8 to 10 inches deep. The plants are propagated in the spring, usually in April and May. When the young shoots from the crop of the previous year have attained a height of about 4 inches they are pulled up and transplanted into new soil. They grow vigorously the first year, and throw out numerous stolons on the surface of the ground. After the crop has been removed these are allowed to harden or become woody, and then farmyard manure is scattered over the field and ploughed in. In this way the stolons are divided into numerous pieces, and covered with soil before the frost sets in. If the autumn is wet they are liable to become sodden, and rot, and the next crop fails. In the spring the fields are dressed with Pernyan guano. In new ground the peppermint requires hand-weeding two or three times, as the hoe cannot be used without injury to the plants. Moist heavy weather in August is apt to cause the foliage to drop off and leave the stems almost bare. Under these circumstances rust (*Puccinia Menthae*) also is liable to attack the plants. This is prevented to a certain extent by a rope being drawn across the plants, by two men walking in the furrows, so as to remove excessive moisture. The average yield of peppermint is about 165 cwt. per acre. The first year's crop is always cut with the sickle to prevent injury to the stolons. The herb of the second and third year is cut with scythes, and then raked by women into loose heaps ready for carting. The field is then gleaned by boys, who add what they collect to the heaps. The plants rarely yield a fourth crop on the same land. The harvest usually commences in the beginning or middle of August, or as soon as the plants begin to flower, and lasts for six weeks, the stills being kept going night and day. The herb is carted direct from the field to the stills, which are made of copper, and contain about 5 cwt. of the herb. Before putting the peppermint into the still water is poured in to a depth of about 2 feet, at which height a false bottom is placed, and on this the herb is thrown and trodden down by men. The lid, which fits into a water-joint, is then let down by pulleys and fastened by two bars, any excess of pressure or temperature being indicated by the water that is ejected at the joint. The distillation is conducted by the application of direct heat at the lowest possible temperature, and is continued for about four and a half hours. When this operation is completed, the lid is removed and a rope is attached to a hook on the false bottom, which, as well as the herb resting on it, is raised bodily by a windlass and the peppermint carried away in the empty carts on their return journey to the fields, where it is placed in heaps and allowed to rot, being subsequently mixed with the manure applied in the autumn as above stated.

At Mitcham extra payment is given to the reapers to induce them to keep the mint free from corn mint (*Mentha arvensis*) and other herbs, which would injure or spoil the flavour of the oil if not removed before distillation. The usual yield of oil, if the season be warm and dry, is said to be 1 oz. from 5 lb of the fresh flowering herb, but, if wet and unfavourable, the product is barely half that quantity. Mr Holland estimates the yield of a charge of the still at from 1 lb 12 oz. to 5 lb. The oil improves in mellowness even if kept as long as ten or fourteen years. The green colour sometimes present in the oil is stated to be due to a quantity of water larger than necessary having been used in the distillation; on the other hand, if the herb be left in the still from Saturday to Monday, the oil assumes a brown tint.

In France peppermint is cultivated on damp rich ground at Sens, in the department of the Yonne. In Germany it is grown in the neighbourhood of Leipsic, where the little town of Colleda produces annually as much as 40,000 cwt. of the herb. In the United States peppermint is cultivated on a most extensive scale, chiefly in southern Michigan, the west districts of New York State, and Ohio. The amount of peppermint oil now produced in the United States has been estimated at 70,000 lb annually, of which 30,000 lb are exported, about two-thirds of this quantity being produced in

New York State and the remaining one-third in Michigan. The yield averages from 10 to 30 lb per acre. The cultivation of peppermint has recently been extended to the southern States. In Michigan the plant was introduced in 1855, and in 1858 there were about 2100 acres under cultivation, and 100 distilleries yielding 15,000 lb of oil. In 1870 one of the best-known growers of New York State is said to have sent out as much as 57,365 lb. In 1876 the United States exported to Hamburg 25,840 lb of peppermint oil against 14,890 lb sent by Great Britain to the same port. (E. M. H.)

PEPPER TREE. The tree usually so called has no real consanguinity with the true pepper (*Piper*), but is a member of the Anacard family, known botanically as *Schinus Molle* or *Mulli*, the latter epithet representing, it is said, the Peruvian name of the plant. It is a small tree with unequally pinnate leaves, the segments linear, entire or finely saw-toothed, the terminal one longer than the rest, and all filled with volatile oil stored in large cells or cysts, which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as violently to agitate them. The flowers are small, whitish, arranged in terminal clusters, and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushion-like disk surrounding the base of the three-celled ovary). The style is simple or three-cleft, and the fruit a small, globose, pea-like drupe with a bony kernel enclosing a single seed. The fleshy portion of the fruit has a hot aromatic flavour from the abundance of the resin it contains, and to this circumstance the tree probably owes its popular name. The resin is used for medicinal purposes by the Peruvians, and has similar properties to mastic. The Japan pepper tree is *Xanthoxylum piperitum*, the fruits of which have also a hot taste. Along the Riviera the tree known as *Melia Azedarach*, or the "Pride of India," a very ornamental tree with elegant foliage and dense clusters of fragrant lilac flowers, is also incorrectly called the pepper tree by visitors.

PEPSIN. See **NUTRITION**, vol. xvii. p. 675 *sq.*

PEPYS, SAMUEL (1633-1703), was the fifth child of John Pepys and Margaret (Perkins? *Diary*, 17th September 1663), and was born on 23d February 1632/3. His family was of the middle class, and at this time was in humble circumstances, his father being a tailor in London, while an uncle and an aunt, named Perkins, lived in poverty in the Fens near Wisbeach. His father's elder brother Robert had a small property at Brampton in Huntingdonshire, and Samuel was at school at Huntingdon about 1644. Thence he went to St Paul's, London, and on 21st June 1650 was entered as a sizar at Trinity College, Cambridge, but was transferred on 1st October in the same year to Magdalene, where he became pensioner on 4th March following. On 3d April 1651 he was elected scholar on the Spendliffe foundation, and on 4th October 1653 on that of Dr John Smith. Exactly a fortnight afterwards he was admonished by the registrar before all the fellows in residence for being "scandalously overserved with drink the night before." His love of drink, so constantly illustrated in the early pages of his *Diary*, would have been a serious drawback to his advancement, had not his love of work and order been a still stronger impulse. The crisis was reached on Sunday, 29th September 1661, when he was too drunk to trust himself to read prayers to the household. After that he makes resolute vows against wine, which he often breaks, and with regard to which he displays curious powers of self-deception.

Nothing more is known of Pepys's college career, though he tells us that he was addicted to writing romances. He became a moderate classical scholar; it is, however, a curious commentary upon the university training of those

days that, after his appointment to the navy board, he is found busy with the multiplication table, which he speaks of as entirely new to him, and of his daily progress in which he is not a little proud. After this he becomes enamoured of arithmetic and teaches his wife the science also.

In October¹ 1655 Pepys married Elizabeth St Michel, a girl of fifteen, of great beauty, whose father, a Huguenot refugee in England, was at this time in very poor circumstances. She was a good cook and a good house-keeper, and was both clever and warm-tempered; Pepys, vain, quarrelsome, fussy, and pedantic, was unfitted, save by a general goodness of heart, to manage a high-spirited girl; and the pages of the *Diary* are full of bickerings and downright quarrels arising out of trifles, the entries of which, though often amusing, are as often extremely pathetic. Pepys and his wife, who were destitute of funds, were received by Sir Edward Montagu, afterwards earl of Sandwich, whose mother had married Pepys's grandfather. Pepys probably acted as Montagu's secretary. He was successfully cut for the stone on 26th March 1657/8, an anniversary which he always notes with gratitude. In March 1658/9 he accompanied Montagu and Algernon Sidney to the Sound on board the "Naseby" (afterwards the "Charles"). To this he more than once refers as the beginning of his fortunes. On his return he was employed as a clerk in the army pay-office of the exchequer under Downing, afterwards Sir George Downing.

In January 1659/60 Pepys began to keep his *Diary*. He was at this time living in Axe Yard, Westminster, in a small house with one servant, on straitened means. On 29th January he can count but £40; his great object is to get on and to "put money in his purse;" and by 24th May 1661 he is worth £500. Political principles he had none, though his personal attachment to James (II.) makes him call himself a Tory; but it is noticeable that even before the Restoration he regularly attended the Church of England service carried on by Peter Gunning, afterwards successively bishop of Chester and of Ely. Of active religious convictions Pepys leaves no trace, but he was ever a steady church-goer; and the epithets he applies to the sermons are very happy in their causticity. In February he went to Cambridge to settle his brother in his old college. One side of what was distinctly a coarse-grained nature is exhibited in an entry during this week, where he describes himself (as on many other occasions) as "playing the fool with the lass of the house." His views of women, indeed, are almost always vulgar; he was given to clumsy gallantry, and he was certainly unfaithful to his wife. In March Montagu gave Pepys the post of secretary to the generals at sea. While the fleet lay off the Dutch coast he made a short journey into Holland. At this time he secured the favour of the duke of York; and he retained it through life. On 28th June he became clerk of the acts of the navy, an office which Montagu had procured for him against powerful competition. A salary of a little over £100 a year, afterwards increased to £350, was attached to the post, but Pepys had to pay an annuity of £100 to his predecessor in office. On 23d July he became clerk of the privy seal, the fees from which, at any rate for a time, brought him in an additional £3 a day (*Diary*, 10th August 1660). In this month he took his M.A. degree. On 24th September he was sworn in as J.P. for Middlesex, Essex, Kent, and Southampton. He now lived in Seething Lane, in front of the navy office, Crutched Friars. In July 1661, on the death of his uncle, the Brampton estate, worth £80 a year, came to his father, and on the latter's

¹ Pepys himself gives 10th October as the date; the registers of St Margaret's church (Westminster) say that the banns were published on 19th, 22d, and 29th October, and that he was married on 1st December. See *Notes and Queries*, 30th August 1884.

death in 1680 to Pepys himself. In July 1662 he was made a younger brother of the Trinity House.

Pepys's untiring industry in office, his prudence, his unfailing usefulness, his knowledge of business, which he was ever diligent to increase, and his general integrity secured him the greatest confidence at headquarters. As early as August 1662, when placed on the Tangier commission, he had found himself "a very rising man." In March 1664.5 he was made treasurer to the commission, and received also the contract for victualling the garrison, both lucrative appointments; and in October, through the influence of Sir W. Coventry, he was further made surveyor-general of the victualling office, a post which he resigned at the conclusion of the peace. His conduct during the Great Plague, when, alone of all the navy board, he stayed in the city of the dead and carried on the whole administration of the navy, was admirable. During the Fire also his readiness and presence of mind were of the greatest service in staying the conflagration.

In the spring of 1667/8, in the blind rage at the national disgrace generally termed the miscarriage of Chatham, the whole navy board were summoned before the House of Commons to give an account of their conduct. Pepys was deputed by his colleagues to conduct the defence, and he did so with complete success on 5th March in a speech of three hours' duration, which gained him great reputation.

In 1669 the increasing weakness of his eyesight compelled him to discontinue the *Diary*, his last entry being on 31st May. What was to us an irremediable misfortune was to Pepys "almost as much as to see myself go into the grave." He now took leave of absence and spent some months in travelling through France and in revisiting Holland. On the day of his return his wife fell ill, and died in the early spring, before 3d March 1669/70. In July 1669 Pepys stood as the duke of York's nominee, backed by the Howard influence, for the borough of Aldborough in Suffolk, but was defeated. In November 1670 we find him engaged in a quarrel with the Swedish resident, which was likely to have been followed by a duel, as Pepys, doubtless to his exceeding comfort (for he was a great coward), received an order from the king neither to send nor accept a challenge. In 1672 he was promoted to the secretaryship of the admiralty; and, when James resigned his office of lord high admiral, Pepys did all the work until the commission was appointed. He was placed also upon the new commission for Tangier.

In June 1673 he was chosen at a by-election, again as James's nominee, for Castle Rising, a Howard borough, but a vote of the committee of privileges declared the election void. Pepys, on the authority of Sir J. Banks and the earl of Shaftesbury, was denounced before the House of Commons as being a Papist; but, when these persons were called upon, they denied any definite knowledge of the altar and crucifix which he was charged with having in his house. The parliament being prorogued, he retained his seat, and is recorded as speaking on 17th May and 26th October 1675, on the latter occasion against the proposal made, in distrust of the crown, to lodge the money for the ships in the chamber of London instead of in the exchequer; and again on 11th May 1678, in the debate on the king's message to quicken supply for the navy, when he was sharply reprov'd by Sir R. Howard for speaking "rather like an admiral than a secretary, 'I' and 'we,'" an amusing instance of how completely Pepys had obtained control of the business of the navy and had identified himself with the work. He was afterwards, in 1678/9, returned for Harwich (see a note on p. 122 of vol. vi. of Bright's edition of the *Diary*). In the list, however, of members of the parliament which met on 6th

March in that year, which is given by the *Parliamentary History* (vol. iv. p. 1082), the members for Harwich are recorded as being Sir Anthony Deane and Sir Thomas Pepys. An investigation of the records of Harwich leaves no doubt that the *Parliamentary History* is wrong upon this point, and that Pepys did sit for the borough during this parliament.

On 7th August 1677 Pepys was elected master of the Clothworkers' Company, who still possess the silver cup he gave them on the occasion. He continued to hold the secretaryship until 1679, when fresh complaints of miscarriages in the navy were made before the House. The country was then in the throes of the popish terror. Pepys was accused, on the evidence of one Colonel Scott, an infamous character, "a very great vindicator of the Salamanca doctor" (*Intelligencer*, 20th May 1681), of sending secret information regarding the English navy to France (*Intelligencer*, 23d May 1681), and was again charged with being a Papist. On 22d May he was sent, nominally on the first charge, though really on the second, to the Tower, with his colleague Sir Anthony Deane. As he himself wrote to James on 6th May, "a papist I must be, whether I will or no, because favoured by your royal highness." On 2d June he appeared before the King's Bench, and was remanded three times, bail being refused by Jones, the attorney-general. At length Pepys was allowed out on bail for £30,000. The trial was four times postponed, in the hope that evidence would be obtained, and at last on 12th February 1680 he was released only because Scott refused to swear to his depositions, and no prosecutor appeared, and because his old servant, who had given evidence against him, being now on his deathbed, confessed that it was utterly false. This illustrates admirably the wild injustice that prevailed during that feverish time.

In April 1680 Pepys attended the king by command to Newmarket, and there took down in shorthand from his own mouth the narrative of his escape from Worcester. His post had meantime been abolished, or at any rate the constitution of the navy board changed. We find him writing to James on 6th May 1679, asking leave to lay down "this odious secretaryship," and to be placed on the commission of the navy. James urged his claims upon Charles, but the imprisonment in the Tower probably put an end to the affair. In May 1682 Pepys accompanied James when he took the government of Scotland, and while there made with Colonel Legge a tour of the chief towns. In the autumn of 1683 he sailed with the same Colonel Legge, then Lord Dartmouth, on the expedition to destroy the fortifications of Tangier, though not aware when he started of the object of the expedition. The ships reached Tangier on Friday, 14th September. Here he stayed, with the exception of a short visit to Spain, until 5th March, and arrived in London on 6th April.

On his return Pepys was again made secretary to the admiralty. In this same year (1684) he was elected president of the Royal Society. At the coronation of James II. he figured as one of the barons of the Cinque Ports; and he sat in James's parliament for his old seat of Harwich along with his former colleague Sir Anthony Deane, — a fact which illustrates how completely the crown had regained possession of political power in the boroughs. He lost both his seat and his secretaryship at the Revolution, though he was consulted on navy matters to the time of his death. Having been rejected at Harwich in the new elections, he tried in vain to find another seat. His well-known intimacy with and regard for James made him a special object of suspicion to the Government, and in 1690, in common with others suspected for similar reasons, though without cause, he was suddenly arrested and sent to the Gate House, but was almost immediately released.

15th. October, on bail (see his letter, Bright, vol. vi. p. 169). He was, however, afraid of fresh attacks as late as Easter 1692 (Letter to Evelyn, Bright, vi. p. 173). It was about this time that he published his long-intended *Memoirs of the Navy*. He gave, as in former years, great attention to the government of Christ's Hospital, and especially to the mathematical foundation; and he was concerned with the establishment of Sir William Boreman's mathematical school at Greenwich. He was, too, a benefactor of his old school of St Paul's, and of Magdalene College.

In the spring of 1700, being very ill with the breaking out of the wound caused by the operation of 1658, he removed to the house of his old clerk William Hewer, at Clapham, and, against the urgent advice of his doctors (Bright, Preface), gave himself up to indefatigable study, feeling that his health was restored by the change. He himself, however, on 7th August 1700, wrote in a charming letter¹ that he was doing "nothing that will bear naming, and yet I am not, I think, idle; for who can, that has so much of past and to come to think on as I have? And thinking, I take it, is working." And he speaks of himself in September as making several country excursions. He was, immediately after this, confined entirely to the house with his old disease of stone, and gradually failed. He bore his long and acute sufferings with extreme fortitude, and died, in reduced circumstances (though he claimed a balance of £28,007 2s 1½d against the crown), on 26th May 1703. He was buried by the side of his wife in St Olave's, Crutched Friars, London, on 5th June. His library of 3000 volumes, which he had collected with much labour and sacrifice, and which he would not allow to be divided, was bequeathed to Magdalene College.

The last fact to be recorded of Pepys is that on 18th March 1884, two centuries after his official employment, a monument was unveiled in the church, where he was buried to the "Clerk of the Acts and Secretary to the Admiralty" (*Times*, 19th March 1884).

The importance of Pepys's *Diary*, historically speaking, may be summed up by saying that without it the history of the court of Charles II. could not have been written. We do not, it is true, gain from it any information as to what was going on in the country. Utterly destitute of imagination or political knowledge, Pepys could only record the sights and the gossip that were evident to all. It is because he did record these, without hesitation or concealment, that from his *Diary* we can understand the brilliancy and wickedness of the court, as well as the social state and daily life of the bourgeois class. Viewed in another light, it is unique as the record of a mind formed of inconsistencies. To him especially would his own motto apply, "Mens cujusque, is est quisque." Probity in word and integrity in office, along with self-confessed mendacity and fraud; modesty, with inordinate self-conceit; independence of mind, with the vulgarest striving after and exultation at the marks of respect which he receives as he rises in the world, and at little advantages gained over others; high-mindedness, with sordid spite; dignity, with buffoonery; strong common sense, with great superstition; kindness, with brutality; the eager pursuit of money, with liberality in spending it,—such are a few of the more obvious contrasts. He gained his reputation by fair means, and yet was willing enough to lie in order to increase it; he practised extreme respectability of deportment before the world, while he worshipped the most abandoned of Charles's mistresses, and now and again gave loose rein to his own very indifferent morals; and he combined with courage amid difficulties and devotion to duty in the face of almost certain death a personal poltroonery to which few men would care to confess. The best tribute to him as a man is that in his later years Evelyn became his firm and intimate friend, and that he died amid universal respect.

Authorities.—*Diary* (Bright's edition; compared with which other editions are of slight value); Rev. J. Smith, *Life, Journals, and Correspondence of Pepys* (1841); *Parliamentary History*, vol. iv.; *Journals of the House of Commons*; Evelyn, *Diary*; Wheatley, *Samuel Pepys and the World he Lived in* (1880); and articles in various magazines and reviews. ¹ He carried on an active correspondence with literary friends, among them being Dryden, Sloane, and Evelyn.

PERCEVAL, AMAND-PIERRE CAUSSIN DE (1795-1871), Orientalist, was born at Paris, where his father was professor of Arabic in the Collège de France, on 13th January 1795. In 1814 he went to Constantinople as a student interpreter, and afterwards travelled in Asiatic Turkey, spending a year with the Maronites in the Lebanon, and finally becoming dragoman at Aleppo. Returning to Paris, he became professor of vulgar Arabic in the school of living Oriental languages in 1821, and also professor of Arabic in the Collège de France in 1833. In 1849 he was elected to the Academy of Inscriptions. He died at Paris during the siege, 15th January 1871, regretted not only for his ripe scholarship but for the gentleness and modesty of a character which represented the best features of the old school of French savants.

Caussin de Perceval published a useful *Grammaire Arabe vulgaire*, which passed through several editions (4th ed. 1858), and edited and enlarged Boethor's *Dictionnaire Français-Arabe* (3d ed. 1864); but his great reputation rests almost entirely on one book, the *Essai sur l'histoire des Arabes* (3 vols., Paris, 1847-48), in which the native traditions as to the early history of the Arabs, down to the death of Mohammed and the complete subjection of all the tribes to Islam, are brought together with wonderful industry and set forth with much learning and lucidity. One of the principal MS. sources used is the great *Kitāb al-Aghāny*, which has since been published in Egypt; but no publication of texts can deprive the *Essai*, which is now unhappily very scarce, of its value as a trustworthy guide through a tangled mass of tradition.

PERCEVAL, SPENCER (1762-1812), prime minister of England from 1809 to 1812, was the second son of John, second earl of Egmont, and was born in Audley Square, London, in November 1762. He was educated at Harrow and at Trinity College, Cambridge, where he graduated M.A. in 1781. He was called to the bar at Lincoln's Inn in 1786. A very able speech in connexion with a famous forgery case having drawn attention to his talents, his success was from that time rapid, and he was soon regarded as the leading counsel on the Midland circuit. Entering parliament for Northampton in April 1796, he distinguished himself by his speeches in support of the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic emancipation, he delivered in 1807 a speech on the subject which helped to give the deathblow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of the first rank, he succeeded in retaining office till he was shot by an assassin, perhaps a madman, named Bellingham, in the lobby of the House of Commons, 11th May 1812. Perceval will be chiefly remembered for his strenuous opposition to Catholic emancipation, an opposition due to a conscientious dread of the political evils that might result from it. He was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage.

PERCH (*Percia fluviatilis*), a freshwater fish generally distributed over Europe, northern Asia, and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the *Percidae*, which is represented in European freshwaters by several other fishes such as the pike (*Esox lucius*) and the pike-perch (*Lucioperca*). It inhabits rivers as well as lakes, but thrives best in waters with a depth of not less than 3 feet; in large deep lakes it frequently descends to depths of 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 feet.

The shape of its body is well proportioned, but many

variations occur, some specimens being singularly high-backed, others low and long-bodied, sometimes such variations are local, and Agassiz and other naturalists at one time thought it possible to distinguish two species of the common perch of Europe, there are not even sufficient grounds, however, for separating specifically the North-American form, which in the majority of ichthyological works is described as *Perca flavescens*. The brilliant and

The Perch, *Perca fluviatilis*.

striking colours of the perch render it easily recognizable even at a distance. A rich greenish-brown with golden reflexions covers the back and sides, which are ornamented with five or seven dark cross-bands. A large black spot occupies the membrane between the last spines of the dorsal fin; and the ventral, anal, and lower part of the caudal are bright vermillion. In the large peaty lakes of north Germany a beautiful variety is not uncommon, in which the golden tinge prevails, as in a gold-fish.

The perch is strictly carnivorous and most voracious; it wanders about in small shoals within a certain district, playing sad havoc among small fishes, and is therefore not to be tolerated in waters where valuable fry is cultivated. Perch of three pounds in weight are not unfrequently caught in suitable localities; one of five would now be regarded as an extraordinarily large specimen, although in older works we read of individuals exceeding even that weight.

Perch are good wholesome food, and highly esteemed in inland countries where marine fish can be obtained only with difficulty. The nearly allied pike-perch is one of the best European food-fishes. The perch is exceedingly prolific; it begins to spawn when three years old, in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands, on water plants.

PERCIVAL, JAMES GATES (1795-1856), an American writer of many-sided activity, but chiefly remembered by his verses, was born at Berlin, Connecticut, on 15th September 1795, and studied at Yale, graduating in 1815, and taking a medical degree in 1820. His life was straitened by poverty and divided among a variety of occupations. He was by turns an army surgeon, professor of chemistry at West Point, a recruiting surgeon at Boston, geological surveyor of Connecticut (writing a *Report* published in 1842), and State geologist of Wisconsin, where he died at Hazel Green, 2d May 1856. The intervals of these employments were filled up with literary work of a miscellaneous kind. An edition of his collected poems appeared at Boston in 1859 (2 vols. 8vo). Some of his miscellaneous and patriotic verses hold a high place in American poetry.

PERCY. This family, whose deeds are so prominent in English history, claimed descent from one Manfred de Perce, who was said to have come out of Denmark into Normandy before the adventure of the famous Rollo. But it is more certain that two brothers, William and Serlo de Percy, came into England with William the Conqueror, who endowed his namesake the elder with vast possessions in Hampshire, Lincolnshire, and Yorkshire, among which were Topcliffe in the North Riding and Spofforth in the

West Riding, the principal seats of the family for many ages afterwards. This William deserves special notice besides, since he refounded the noble abbey of Whitby, which had been destroyed by the Danes,—obtaining a grant of the lordship from Hugh, earl of Chester. Yet his piety would seem to have been of a rather unsteady character; for, having endowed the abbey with certain lands, he resumed them in order to reward a faithful dependant, till his brother Serlo, the abbot, complained to King William, and caused him to make restitution.

The family, however, did not really descend in a direct male line from this William; for in the reign of Henry II. his male descendants became extinct, and the inheritance was divided for a time between two sisters, though by failure of issue of one of them it was reunited in the next generation. Agnes, the sister from whom all the subsequent Percies were descended, accepted as her husband Josceline, a son of Geoffrey, duke of Louvain, on the express condition that he and his posterity should bear the surname of Percy, and assume the arms of her family, relinquishing their own. This Josceline was a brother of Adalais or Alice of Louvain, the second queen of Henry I., and by an arrangement with his sister, confirmed by Henry II. when duke of Normandy, he became possessed of the honour of Petworth in Sussex. He was also castellan at Arundel, and held several other important posts in the south of England. His son Richard and Richard's son William were among the barons who rose in arms against John and Henry III. respectively; but the grandson made his peace with his sovereign, and had his lands restored to him. It should be remarked, however, as a feature of the times, that Richard de Percy was not the eldest but the youngest son of Josceline, and that, according to modern notions, he was really a usurper, who occupied the inheritance of a nephew; his right, however, passed undisputed. He was one of the twenty-five barons appointed to enforce the observance of Magna Charta.

The next important member of the family is Henry de Percy, whom Edward I., after the deposition of John Baliol, appointed governor of Galloway, and who was one of his most active agents in the subjugation of Scotland, till the success of Robert Bruce drove him out of Turnberry Castle, and made him withdraw into England. He was rewarded by Edward II. with the barren title of earl of Carrick, declared to be forfeited by the Scottish hero, and the same king appointed him governor of the castles of Bamborough and Scarborough. But he himself made his position strong in the north of England by purchasing lands from Anthony Beck, bishop of Durham, among which was the honour of Alnwick, the principal seat of the family ever since. His son, another Henry, took part in the league against Edward II.'s favourites the Despencers, was in favour with Edward III., and obtained from Edward Baliol as king of Scotland grants of Lochmaben, Annandale, and Moffatdale, which he surrendered to the English king for the castle and constablership of Jedburgh or Jedworth, with the forest of Jedworth and some neighbouring towns. A few years later, in fuller recompense of the unprofitable gift of Baliol, a grant of 500 marks a year was made to him out of the old customs at Berwick; and in 1346 he did splendid service to his sovereign by defeating and taking prisoner David, king of Scotland, at the battle of Neville's Cross.

To him succeeded another Henry Percy, a feudal baron like his predecessors, who fought at Crécy during his father's lifetime; and to him another Henry, who was made earl of Northumberland at the coronation of Richard II. It may be remarked incidentally that the succession of the name of Henry in this family is altogether extraordinary. For three generations before this first earl of

Northumberland, and for five different descents after him (making altogether a period of 238 years), the head of the house invariably was a Henry. Such a remarkable continuance of a single Christian name would have been less surprising in later and more peaceful times, when we might reasonably have expected the eldest born to succeed his father quietly through many generations. But the first four earls of this family were all slain in battle or in civil tumult, and the heir-apparent of the first, a Henry like the rest, was cut off in the same way during his father's lifetime. Was it that the incessant activity due to Border raids and moonlight expeditions created in these men a physical vigour of constitution which protected them to a large extent against disease and infirmity?

The first earl of Northumberland, certainly, had led a busy life enough, not only on the Borders but elsewhere. He had been in the French wars of Edward III.; he had been at times a warden of the marches against Scotland, or a commissioner to treat for peace with that country. He had ravaged the lands of the earl of Dunbar and had won Berwick. Powerful in the south as well as in the north, he was the Lord Henry Percy who protected Wickliffe when cited before the archbishop at St Paul's. As earl of Northumberland he exhibited his independence of Richard II. in a way characteristic of a northern baron. Sent for to court, he neglected to come, was disgraced and banished, and thereupon fled to Scotland. He repaired to Henry of Lancaster soon after his landing at Ravenspur, and helped treacherously to decoy Richard II. into his hands at Conway. Naturally he received great honour from Henry after he had become king. He was made constable of England for life, and received a gift of the Isle of Man and a number of important offices in Cheshire, Wales, and the borders of Scotland. He was even appointed one of the commissioners for the marriage of the king's daughter Blanche with Louis, duke of Bavaria; and for the first three years of the reign both he and his family seemed faithful to the new dynasty which they had greatly helped to establish. In 1402 he and his brave son Henry, the celebrated Hotspur, won the battle of Homildon Hill and took the earl of Douglas prisoner. But immediately afterwards Harry Hotspur, whose character is so well known through Shakespeare's play of *Henry the Fourth*, resenting the king's injustice to his brother-in-law, Sir Edmund Mortimer, who had been taken prisoner by the Welsh, and whom Henry, for reasons of policy, declined to ransom, entered into a league with Owen Glendower, in whose custody Mortimer was, for a combined war against the king.

The whole family of the Percies seem to have felt that their services to Henry of Lancaster were ill requited. The earl himself joined the conspiracy. His brother Thomas Percy, earl of Worcester (so created by Richard II.), stood also to all appearance in high favour with the king, who had entrusted him with the care of his son Henry, prince of Wales. But he suddenly left the court and joined his nephew in the north, both sending forth proclamations and raising the country. The rebellion was crushed in the battle of Shrewsbury (1403), in which Hotspur was slain, and the earl of Worcester was beheaded just after the fight, while Northumberland was marching southwards to join with them. Having taken no active part in the movement, the earl pretended that he had really been going to assist the king, and had wished to avert hostilities. He afterwards went peaceably to the king at York, and was placed in custody; but such was his power and influence that next year he was acquitted of treason in full parliament, and had all his honours and possessions restored to him. All confidence, however, between him and the king was at an end, and in 1405 he joined the insurrection of Arch-

bishop Scrope, who, after being beheaded as a rebel, was venerated as a martyr over the whole north of England. Then he fled to Scotland, afterwards to Wales, and in the end, returning to his own country, perished in a new rebellion at Bramham Moor.

The title and estates were thus forfeited. But, by an act no less gracious than politic, Henry V. restored them to this earl's grandson, then a prisoner with the Scots, whose liberation he had no difficulty in procuring from the duke of Albany during the time of James I.'s captivity. From that day the loyalty of the family to the house of Lancaster was steadfast and undeviating. The second earl died fighting for Henry VI. at the first battle of St Albans in 1455; the third was slain in the bloody field of Towton (1461); the fourth was killed in quelling an insurrection in the time of Henry VII. So strong was the Lancastrian feeling of the family that even Sir Ralph Percy, a brother of the earl who fell at Towton, though he had actually submitted once to Edward IV., turned again, and when he fell at Hedgley Moor consoled himself with the thought that he had, as he phrased it, "saved the bird in his bosom."

No wonder, then, that in Edward IV.'s days the title and estates of the family were for a time taken away and given to Lord Montagu, brother of Warwick the king-maker. But the north was so accustomed to the rule of the Percies that in a few years Edward saw the necessity of restoring them, and did so even at the cost of alienating still further the powerful family of the Nevilles, who were then already on the point of rebellion.

A crisis occurred in the fortunes of the family in the reign of Henry VIII. on the death of the sixth earl, whose two brothers, much against his will, had taken part in the great insurrection called the "Pilgrimage of Grace." A thriftless man, of whom it is recorded that in his youth he was smitten with the charms of Anne Boleyn, but was forced to give her up and marry a woman he did not love, he died childless, after selling many of the family estates and granting the others to the king. The title was forfeited, and was granted by Edward VI. to the ambitious Dudley, earl of Warwick, who was attainted in the succeeding reign. It was restored in the days of Queen Elizabeth to Thomas Percy, who, being a staunch Catholic, was one of the three earls who took the lead in the celebrated "Rising in the North," and was beheaded at York. His brother Henry, who succeeded him, was no less unhappy. Involved in Throgmorton's conspiracy, he was committed to the Tower, and was supposed to have shot himself in bed with a pistol found beside him; but there were grave suspicions that it had been discharged by another hand. His son, the next earl, suffered like his two predecessors for his attachment to the religion of his forefathers. The crown lawyers sought in vain to implicate him in the Gunpowder Plot; but he was imprisoned for fifteen years in the Tower and compelled to pay a fine of £30,000. The son who next succeeded was a Parliamentary general in the Civil War. At length, in 1670, the male line of this illustrious family became extinct, just five hundred years after the marriage of Agnes de Percy with Josceline of Louvain.

Not one of the English noble houses is so distinguished as the Percies throughout the whole range of English history. It is remarkable alike for its long unbroken line, its high achievements, its general culture of arts and of letters. Pre-eminent also, as remarked by Sir Harris Nicolas, for its alliances among the peerage, it continues to this day, though represented once more by a female branch. The present dukedom of Northumberland was created in 1766 in the family of Smithson, who assumed the name of Percy and have borne it ever since. Sir Hugh Smithson, who became the first duke, married a granddaughter of a daughter of the last earl. (J. GA.)

PERCY, THOMAS (1729-1811), bishop of Dromore, the editor of the *Percy Reliques*, was born at Bridgnorth 13th April 1729 and baptized at St Leonard's Church 29th April. His father, Arthur Lowe Percy, a grocer by trade, lived in a large house at the bottom of the street called "The Cartway," and acquired sufficient means to send his son, who had received the rudiments of his education at Bridgnorth grammar-school, to Christ Church, Oxford, in 1746. He graduated in 1750 and proceeded M.A. in 1753. In the latter year he was appointed to the vicarage of Easton Maudit, Northamptonshire, and three years later instituted to the rectory of Wilby in the same county, benefices which he retained until 1782. On the 24th of April 1759 Percy was married at Desborough, Northamptonshire, to Anne, daughter of Barton Gutteridge. During his residence in the delightful but secluded neighbourhood of Easton Maudit most of the literary work for which he is now remembered—including the *Reliques*—was completed. When his name became famous through his publications he complied with the request of the duke and duchess of Northumberland that he would reside with them as their domestic chaplain, and was tempted into the belief that he belonged to the illustrious house of Percy. Through this connexion he became dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1782, from which date he was a constant resident in his adopted country. His wife predeceased him at Dromore Palace, 30th December 1806; the good bishop, blind but otherwise in sound health, lived until 30th September 1811; both of them were buried in the transept which he added to Dromore Cathedral.

For many years Dr Percy enthusiastically laboured in the fields of literature. He translated the Song of Solomon and published a key to the New Testament, a work often reprinted; he edited poetry from the Icelandic language and translated Mallet's *Northern Antiquities*. His reprint of *The Household Book of the Earl of Northumberland in 1512* is of the greatest value for the illustrations of domestic life in England at that period. But all of these works are of little estimation when compared with the *Reliques of Ancient English Poetry*, a publication which has entranced successive generations of schoolboys and students since its first appearance in February 1765. It was based on an old manuscript collection of poetry, but, unfortunately for the editor's peace of mind, it was modernized in style, a circumstance which exposed him to the sneers and suspicions of Ritsou. The work as originally issued by Percy has been re-edited by many British antiquaries, whilst selections have been issued for boys and girls, and the manuscript on which he worked has been edited in its complete form by J. W. Hales and F. J. Furnivall. The bishop was possessed of great poetic feeling. His ballad of "The Hermit of Warkworth" was too simple for the austere taste of Dr Johnson, but it has always and deservedly been popular; and his song now generally known as "O Nanny, wilt thou gang wi' me?" is a universal favourite, from its own merits as well as from the musical setting of an Irishman called Thomas Carter. The greater part of the seventh volume of Nichols's *Illustrations of the Literary History of the 18th Century* is filled with Bishop Percy's correspondence.

PERDICCAS, son of Orontes, a distinguished Macedonian general under Philip and Alexander the Great, and regent of the empire from the death of the latter till he perished in a mutiny in 321 B.C. See MACEDONIAN EMPIRE, vol. xv. p. 142, and PERSIA, *infra*, p. 585.

The same name was borne by three kings of Macedonia. PERDICCAS I., whom Herodotus calls the founder of the monarchy of Macedon; PERDICCAS II., the enemy of Athens in the Peloponnesian War (died c. 414 B.C.); and PERDICCAS III. (died 359 B.C.).

PEREKOP, a town of European Russia, in the Crimea, 60 miles south-east of Kherson on the isthmus which connects the peninsula with the continent, and, as its name (*perekop*, a cutting) indicates, commanding the once defensive ditch and dyke which cross from the Black Sea to the Sivash lagoon. It was formerly an important place, with a great transit trade in salt (obtained from the great salt lakes of the immediate neighbourhood), which occupied

so large a place in popular estimation that the Tatars of the Crimea were usually styled the "Perekop horde" and their khans the "Perekop khans." Since the opening of the railway route to the Crimea it has greatly declined. In 1865 the population of Perekop and its mercantile suburb (Armyanskii Bazar, 3 miles to the south) was only 4927, and the number has slightly decreased since.

In ancient times the isthmus was crossed (about 1½ miles south of the present town) by a ditch which gave the name of Taphros to a Greek settlement. This line of defence having fallen into decay, a fort was erected and a new ditch and dyke constructed in the 15th century by Mengli Girai and his son and successor Sahib Girai. The fort, known as Kapu or Or-Kapu, became the nucleus of the town. In 1736 Perekop was captured by Field-Marshal Münnich, and in 1738 by Field-Marshal Lasey, who blew up the fort and destroyed a great part of the dyke. In 1754 the fort was rebuilt by Krim Girai; but the Greek and Armenian inhabitants of Perekop preferred to form a new settlement at Armyanskii Bazar (Armenian Market). Captured by the Russians in 1771, the town passed into Russian possession with the rest of the Crimea in 1783.

PEREYASLAF, a town of European Russia, in the Poltava government, 175 miles west-north-west of Poltava, at the junction of the Trubezh and the Alta, which reach the Dnieper 5 miles lower down at the town's port, the village of Andrushli. Besides the town proper there are three considerable suburbs. Though founded in 993 (by Vladimir Svyatoslavitch in memory of his signal success over the Petchenegs), Pereyaslav has now few remains of antiquity; while the original erection of some of the churches goes back for many hundred years (that of the Assumption, *e.g.*, to 1010), the actual buildings are not older than the 17th century. The town has trade in grain, salt, cattle, and horses, and some manufactures—tallow, wax, tobacco, &c. The population was 10,835 in 1865 and 9300 in 1870.

From 1054 Pereyaslav was the chief town of a principality which passed from one prince to another of the Mstislavitches, Vladimirovitches, and Olgovitches. As a southern outpost it often figures in the 11th, 12th, and 13th centuries; in later times it was one of the great centres of the Cossack movement; and in 1623 the neighbourhood of the town was the scene of the extermination of the Polish forces known as "Taras's Night." It was by the treaty of Pereyaslav that in 1654 Bogdan Khmyelnitskii and the Cossacks acknowledged the supremacy of Alexis. At that time the town contained from 25,000 to 30,000 inhabitants.

PEREYASLAVL, or PERESLAVL (called Zalyesskii, or "Beyond the Forest," to distinguish it from the older town in Poltava after which it was named), is one of the earliest and most interesting cities in north-west Russia, situated in Vladimir government, 87 miles east of Moscow on the road to Yaroslavl, and on both banks of the Trubezh near its entrance into Lake Pleshtchevo. Pereyaslavl was formerly remarkable for the number and importance of its ecclesiastical foundations (there were in 1764 no fewer than eleven monasteries in the town and neighbourhood, and the churches about the same period numbered thirty-seven). Among those still standing are the 12th-century cathedral of the Transfiguration (with ancient wall-paintings and the graves of Demetrius, son of Alexander Nevskii, and other princes), and the church of the Birth of John the Baptist, founded by Euphrosyne, wife of Demetrius Donskii, in the close of the 14th century. It is by its extensive cotton manufactures (the spinning factory alone employing 1700 hands and producing to the annual value of £195,000) that Pereyaslavl is now best known throughout Russia; and it also manufactures linen, leather, and tobacco. The fisheries on the lake (20 square miles in extent and 175 feet deep) have long been of great value. The population was 6253 in 1864, 7210 in 1870, and 8700 in 1880.

Founded in 1152 by Yurgii (George) Vladimirovitch Dolgoruki, prince of Suzdal, Pereyaslavl soon began to play a considerable part in the history of the country. From 1195 till 1302 it had princes of its own; and the princes of Moscow, to whom it was then bequeathed, kept it (apart from some temporary alienations

in the 14th century) as part of their patrimony throughout the 15th and 16th centuries. The town enjoyed a great many privileges, and in return was bound to furnish the court with fish. Its earthen walls, from 20 to 50 feet in height and 7260 feet in circuit, remained till 1759. Lake Pleshtchevo was the scene of Peter the Great's first attempts at creating a fleet.

PEREZ, ANTONIO (c. 1540-1611), for some years the favourite minister of Philip II. of Spain and afterwards for many more the object of his unrelenting hostility, was by birth an Aragonese. His reputed father, Gonzalo Perez, an ecclesiastic, has some place in history as having been secretary both to Charles V. and to Philip II., and in literature as author of a Spanish translation of the *Odyssey* (*La Ulysea de Homero*, Antwerp, 1556). Antonio Perez, who was legitimated by an imperial diploma issued at Valladolid in 1542, was, however, believed by many to be in reality the son of the well-known Ruy Gomez, prince of Eboli, to whom, on the completion of a liberal education at home and abroad, he appears at least to have owed his first introduction to a diplomatic career. In 1567 he became one of the secretaries of state, receiving also about the same time the lucrative appointment of protonotary of Sicily, and in 1573 the death of Ruy Gomez himself made room for Perez's promotion to be head of the "despacho universal," or private bureau, from which Philip attempted to govern by assiduous correspondence the affairs of his vast dominions. Another of the king's secretaries at this time, though in a less confidential relation, was a friend and contemporary of Perez, named Juan de Escovedo, who, however, after the fall of Tunis in 1574, was sent off to supersede Juan de Soto as secretary and adviser of Don John of Austria, thus leaving Perez without a rival. Some time after Don John's appointment to the governorship of the Netherlands Perez accidentally became cognizant of his inconveniently ambitious "empresa de Inglaterra," in which he was to rescue Mary queen of Scots, marry her, and so ascend the throne of England. This secret scheme the faithful secretary at once carried to Philip, who characteristically resolved to meet it by quietly removing his brother's aider and abettor. With the king's full cognizance, accordingly, Perez, after several unsuccessful attempts to poison Escovedo, succeeded in procuring his assassination in a street of Madrid on 31st March 1578. The immediate effect was to raise Perez higher than ever in the royal confidence and favour, but, wary though the secretary had been, he had not succeeded in obliterating all trace of his connexion with the crime, and very soon a prosecution was set on foot by the representatives of the murdered man. For a time Philip was both willing and able to protect his accomplice, but ultimately he appears to have listened to those who, whether truly or falsely, were continually suggesting that Perez had had motives of his own, arising out of his relations with the princess of Eboli, for compassing the assassination of Don John's secretary; be this as it may, from trying to screen Perez the king came to be the secret instigator of those who sought his ruin. The process, as such matters often are in Spain, was a slow one, and it was not until 1589 that Perez, after more than one arrest and imprisonment on a variety of charges, seemed on the eve of being convicted and condemned as the murderer of Escovedo. At this juncture he succeeded in making his escape from prison in Castile into Aragon, where, under the ancient "fueros" of the kingdom he could claim a public trial in open court, and so bring into requisition the documentary evidence he possessed of the king's complicity in the deed. This did not suit Philip, who, although he instituted a process in the supreme tribunal of Aragon, speedily abandoned it and caused Perez to be attacked from another side, the charge of heresy being now preferred, arising out of certain reckless and even blasphemous expressions Perez had used in connexion with

his troubles in Castile. But all attempts to remove the accused from the civil prison in Saragossa to that of the Inquisition raised popular tumults, which in the end led to Perez's escape across the Pyrenees, but unfortunately also furnished Philip with a pretext for sending an army into Aragon and suppressing the ancient "fueros" altogether (1591). From the court of Catherine de Bourbon, at Pau, where he was well received, Perez passed to that of Henry IV. of France, and both there and in England his talents and diplomatic experience, as well as his well-grounded enmity to Philip, secured him much popularity. While in England he became the "intimate coach-companion and bed-companion" of Francis Bacon, and was also much in the society of the earl of Essex. The peace of Vervins in 1598 greatly reduced his apparent importance abroad, and Perez now tried to obtain the pardon of Philip III., that he might return to his native country. His efforts, however, proved vain, and he died in comparative obscurity in Paris on 3d November 1611. Some years afterwards his wife and family were relieved from the ban of the Inquisition, under which, along with himself, they had been laid.

Perez's earliest publication was a small quarto, dedicated to the earl of Essex, written and apparently printed in England about 1594, entitled *Pedazos de Historia*, and professedly published at Leon. A Dutch translation appeared in 1594, and in 1598 he published his *Relaciones*, including the *Memorial del Hecho de su Causa*, drawn up in 1590, and many of his letters. The Paris edition is dedicated to Henry IV., but apparently another issue was inscribed to the pope. Both dedications are given in the fullest reprint, that of Geneva (1654), which includes a collection of "aphorisms" culled from the author's writings. The literary performances of Perez owe their importance almost exclusively to the fascination of his personal narrative, which, however, gives no great impression of simplicity and straightforwardness; the letters, though admittedly models of idiomatic Castilian, are somewhat tedious reading. Much has recently been done, by Mignet (*Antonio Perez et Philippe II.*, 1845, 4th ed., 1874) and by Froude ("An Unsolved Historical Riddle," *Nineteenth Cent.*, 1883) among others, towards the elucidation of various difficult points in Perez's somewhat perplexing story.

PERFUMERY is the art of manipulating odoriferous substances for the gratification of the sense of smell. Perfumes may be divided into two classes, the first of which includes all primitive or simple odoriferous bodies derived from the animal or vegetable kingdom, as well as the definite chemical compounds specially manufactured, while the second comprises the various "bouquets" or "mélanges" made by blending two or more of the foregoing in varying proportions;—toilet powders, dentifrices, sachets, and the like. To the former class belong (1) the animal products, ambergris, castor, civet, musk; (2) essential oils (more properly called attars), mostly procured by distillation; (3) the philicome butters or oils, which are either solid or liquid fats charged with odours by the processes of inflorescence or maceration; (4) the odoriferous gum-resins or balsams which exude naturally or from wounds in the trunks of various trees and shrubs, such as benzoin, opoponax, peru, tolu, storax, myrrh; (5) a few chemical bodies, similar in odour to or identical in odoriferous active principle with certain plants, e.g., nitrobenzol, called attar of mirbane or false almond, vanillin or methyl-protocatechuic aldehyde, coumarin or coumaric anhydride, and a few others. Ammonia and acetic acid are used respectively as smelling salts and in the preparation of aromatic vinegar, but can scarcely be considered as perfumes. The second class contains the endless combination of tinctures for scenting the handkerchief sold under fancy names which may or may not afford a clue to their composition, such as "comédie française," "eau de senteur," "eau de Cologne," "lavendre ambrée," "blumengeist." These are sometimes made upon a quasi-scientific basis, namely, that of the odophone or gamut of odours of the late Dr Septimus Piesse. Their numbers may be almost

infinite; one large firm in London is known to manufacture several hundreds.

Sources and Commercial Values.—For the sources of the various animal perfumes the reader is referred to the articles AMBERGRIS¹ (vol. i. p. 660), BEAVER² (vol. iii. p. 476), CIVET³ (vol. v. p. 796), and MUSK⁴ (vol. xvii. p. 106). The sources of the attars are the different parts of the plants which yield them,—the wood (lign aloe, santal, cedar), the bark (cinnamon, cascarilla), the leaves (patchouli, bay, thyme), the flowers (rose, lavender, orange-blossom), the fruit (nutmeg, citron), or the seeds (caraway, almond). Some plants yield more than one, such as lemon and bergamot. They are mostly obtained by distilling with water that part of the plant in which they are contained; but some few, as those from the rind of bergamot (from *Citrus bergamia*), lemon (citron zeste, from *C. Limonum*), lime (*C. Limetta*), by “expression.” The outer layer of the cortex is rasped off from the unripe fruits, the raspings placed in a canvas bag, and squeezed in a screw or hydraulic press. The attars so obtained are separated from the admixed water by a tap-funnel, and are then filtered (see OILS, ESSENTIAL, vol. xvii. p. 748). Certain flowers, such as jasmine, tuberose, violet, cassia, either do not yield their attars by distillation at all, or do it so sparingly as not to admit of its collection for commercial purposes; and sometimes the attar, as in the case of orange (neroli), has an odour quite different from that of the fresh blossoms. In these cases the odours are secured by the processes of inflorescence (enfleurage), or by maceration. Both depend upon the remarkable property which fats and oils possess of absorbing odours. The former process has already been described in the article JASMINE (vol. xiii. p. 595). Maceration consists in soaking the flowers in heated fat; in due time they are strained off and replaced by fresh ones, as in the enfleurage process. The whole of the necessary meltings and heatings of the perfumed greases are effected by means of water-baths, whereby the temperature is kept from rising too high. For the manufacture of perfumes for the handkerchief the greases now known as pomades, butters, or philocomes are treated with rectified spirit of wine 60° overproof, i.e., containing as much as 95 per cent. of absolute alcohol by volume, which practically completely abstracts the odour.

The gum-resins have been employed as perfumes from the earliest ages; many are referred to in the Old Testament; see INCENSE (vol. xii. p. 718) and FRANKINCENSE (vol. ix. p. 709). They are largely used in the manufacture of perfumes, both for burning as pastilles, ribbon of Bruges, incenses, &c., and in tinctures, to which they impart their characteristic odours, affording, at the same time, a certain fixity to other perfumes of a more fleeting nature when mixed with them. The chemical perfumes are relatively new. Vanillin, the odoriferous principle of vanilla (*V. planifolia*), was first artificially prepared by Tielman and Hermann in Germany, who obtained it from the sap of certain kinds of fir, and established its composition. Their research was afterwards remarkably verified by Dr C. R. Alder Wright, who prepared it from crude opium. It is a pale straw-yellow crystalline substance, smelling exactly like vanilla, and said to be forty times stronger. Its value commercially is about 23s. per oz. Coumarin, the odoriferous principle of Tonquin beans (*Dipterix odorata*), is also artificially prepared. In appearance it resembles vanillin, and is valued at 9s. per oz. Some similar bodies with fancy names, such as “hemerocalle,” “bromelia,” “aubépine,” are in the market, but have scarcely yet found

their way into the perfume manufactory. Nitro-benzol, before mentioned, is employed only for imparting an almond-like odour to inferior soaps. The various compound ethers called artificial fruit essences, from their resemblance to the odours of certain fruits (jargonelle pear, pine-apple, plum, &c.), find no place in perfumery, though largely used in confectionery for flavouring.

As before stated, the bouquets constituting the second class of perfumes are but alcoholic solutions, i.e., tinctures of some of the foregoing blended together in various proportions, of which the following well-known recipes are examples:—

| “Roudeletia.” | | “Bouquet du Roi.” | |
|------------------------|----------|-------------------|----------|
| Ext. Vanilla | 2 pints. | Ext. Neroli | 2 pints. |
| „ Musk | 1 „ | „ Rose | 2 „ |
| „ Civet | 1 „ | „ Musk | 1 „ |
| Attar Rose | 1 oz. | „ Vanilla | 1 „ |
| „ Mitcham Lavender 1 „ | | Attar Rose | 1 dram. |

The Odophone.—The late Dr Septimus Piesse endeavoured to show that a certain scale or gamut existed amongst odours as amongst sounds, taking the sharp smells to correspond with high notes and the heavy smells with low. He illustrated the idea by classifying some fifty odours in this manner, making each to correspond with a certain note, one-half in each clef, and extending above and below the lines: For example, treble clef note E (4th space) corresponds with Portugal (orange), note D (1st space below clef) with violet, note F (4th space above clef) with ambergris. It is readily noticed in practice that ambergris is much sharper in smell (higher) than violet, while Portugal is intermediate. He asserted that properly to constitute a bouquet the odours to be taken should correspond in the gamut like the notes of a musical chord,—one false note among the odours as among the music destroying the harmony. Thus on his odophone, santal, geranium, acacia, orange-flower, camphor, corresponding with C (bass 2d line below), C (bass 2d space), E (treble 1st line), G (treble 2d line), C (treble 3d space), constitute the bouquet of chord C.

Other Branches of Perfumery.—For the preparation of scented soaps two methods are in use; both start with a basis either of fine yellow soap (which owes its odour and colour to the presence of resin), or of curd soap (which is hard, white, and odourless, and is prepared without resin). In one process the soap is melted by superheated steam, and while still hot and semi-fluid mixed by means of a T-shaped stirrer of wood with iron cross-bar, technically called a “crutch,” with the attars and colouring matter. It is then removed from the melting pan to a rectangular iron mould or box, the sides of which can be removed by unscrewing the tie-rods which hold them in position; when cold the mass is cut into slabs and bars with a thin brass wire. In the other or cold process the soap is first cut into chips or shavings by a plane or “chipping machine,” then the colouring matters are added and thoroughly incorporated by passing the soap between granite rollers driven by steam-power; the tinted soap emerges in a continuous sheet but little thicker than paper. The attars are then added, and after standing for about twelve hours the soap is again sent through the rolling machine. It is next transferred to a bar-forming machine, which consists of an Archimedean screw with tapering thread revolving in a box; the soap in sheets is roughly squeezed through a hopper over the widest threads of the screw and is forced, as this revolves, towards the distant end of the box, to an opening of the required size, through which it emerges in a continuous bar almost as hard as wood. Soap thus worked contains less than 10 per cent. of water; that prepared by melting contains 20 and even 30 per cent. The amount of attars added depends upon the nature of the perfume, and amounts usually to about 7 or 8 per cent. The finest soaps are always manufactured by the cold process. **Toilet powders** are of various sorts. They consist of rice-starch or wheat-starch, with powdered orris-root in varying proportions, and with or without the addition of oxide of zinc, oxide of bismuth, or French chalk. The constituent powders, after the addition of the attars, are thoroughly incorporated and mixed by sifting through a fine sieve. Violet powder for the nursery should consist entirely of powdered violet root (*Iris florentina*), from the odour of which the powder is named. It is of a yellowish tint, soft, and pleasant to the touch. The white common so-called “violet powders” consist of starch only scented with attar of bergamot, and are in every sense inferior. **Tooth powders** consist for the most part of mixtures of powdered orris-root with precipitated chalk, and some other constituent destined to particularize it as to properties or flavour, such as charcoal, finely-pulverized pumice, quassia, sugar, camphor, &c. The perfume of the contained orris-root is modified, if required, by the addition of a little of some attar. **Tooth pastes** are not much in vogue; they are formed of the same constituents as the powders, and are worked into a paste by the addition of a little honey or glucose-

¹ The présent (1884) value of ambergris is about 90s. per oz.

² The present value of castoreum is about 32s. per lb.

³ Its price is about 9s. per oz.

⁴ Average value about 25s. per oz.

symp, which substances are usually believed ultimately to have an injurious effect on the teeth. *Perfume sachets* consist either of a powder composed of a mixture of vanilla, musk, Tonquin beans, &c., one or other predominating as required, contained in an ornamental silk sac; or of some of the foregoing substances spread upon card or chamois leather or flannel after being made into a paste with mucilage and a little glycerin. When dry the card so prepared is daintily covered with various party-coloured silks for sale. Where the ingredients employed in their manufacture are of good quality these cards, known as "peau d'Espagne" sachets, retain their odour unimpaired for years.

Adulterations.—There is, as might be expected, considerable scope for the adulteration of the "matières premières" employed in perfumery, and it is to be stated with regret that many unscrupulous dealers avail themselves of the facilities offered for this dishonourable practice. Thus, in the case of musk, the "pods" are frequently found to be partially emptied of the grain, which has been replaced by hide or skin, while the weight has been increased by the introduction of lead, &c. In other instances the fraud consists in the admixture of refuse grain, from which the odour has been exhausted with spirit, with dried blood, and similar substances, whilst pungency is secured by the addition of carbonate of ammonia. Attar of rose is diluted down with attar of *Palma rosa*, a variety of geranium of only a quarter or a fifth of the value. The main adulterant of all the attars, however, is castor oil. This is a bland neutral body, practically odourless, and completely soluble in alcohol; it therefore presents all the requisites for the purpose. Its detection is difficult even by chemical analysis, which is obviously inapplicable in most instances; the safeguard of the purchaser is the knowledge resulting from experience.

Statistics.—In Europe, flower-farming for perfumery purposes is almost exclusively confined to that triangular portion of the valley of the Var (France) which has Grasse for its apex and the Mediterranean shore between Nice and Cannes for its base, with an area of about 115,000 English acres. It is here that the jasmine, tuberose, cassia, rose, and violet grow to such perfection, and that the processes of enfleurage and maceration are commercially worked. Subjoined is an estimate¹ of the weight of flowers annually employed.

| | Tons. | Harvest Time. |
|-----------------------|-------|----------------------------------|
| Orange blossoms | 1860 | 20th April to 31st May. |
| Roses | 980 | May. |
| Violets | 147 | 15th January to 15th April. |
| Jasmine | 147 | 20th July to 10th October. |
| Tuberose | 74 | August, September, and October. |
| Cassia | 80 | October, November, and December. |
| Jonquil | 15 | February and March. |

Great praise is due to the pioneers of flower-farming in the British colonies of South Africa and Australia, and especially to Colonel Talbot in Jamaica, whose efforts in this direction bid fair to meet with complete commercial success.

The attars from peppermint (*Mentha Piperita*), thyme (*T. vulgaris*), and lavender (*Lavandula vera*), the finest in the world, are distilled from plants grown in the neighbourhood of Mitcham in Surrey. It is estimated that between 8000 and 10,000 ounces of musk are annually imported from all sources, while the quantity of alcohol employed in the manufacture of perfumes is calculated to exceed 60,000 gallons.

See Pissac's *Art of Perfumery*, 4th ed., 1890.

(C. H. P.)

PERGAMUM, an important city of Teuthrania, a district in Mysia; it is usually named Πέργαμον by Greek writers, but Ptolemy has the form Πέργαμος. The name, which is related to the German *burg*, is appropriate to the situation on a lofty isolated hill in the broad and fertile valley of the Caicus, about 120 stadia, less than 15 miles, from its mouth. According to the belief of its inhabitants, the town was founded by Arcadian colonists, led by Telephus, son of Heracles. Auge, the mother of Telephus, was priestess of Athena Alca at Tegea, and daughter of Aleus; fleeing from Tegea, she became the wife of Teuthras, the eponymous king of Teuthrania, and her son Telephus succeeded him. Athena Polias was the patron-goddess of Pergamum, and the legend combines the ethnological record of the connexion claimed between Arcadia and Pergamum with the usual belief that the hero of the city was son of its guardian deity, or at least of the priestess who represented her. Nothing more is recorded of the city till the time of Xenophon, when it was a small fortified town on the summit of the hill. Its importance began under

Lysimachus, who deposited his treasures, 9000 talents, in this strong fortress under the charge of a eunuch Philetærus of Tium. In 283 B.C. Philetærus rebelled, Lysimachus died without being able to put down the revolt, and Pergamum became the capital of a little principality. Partly by clever diplomacy, partly through the troubles caused by the Gaulish invasion and by the dissensions among the rival kings, Philetærus contrived to keep on good terms with his neighbours on all sides (283-263 B.C.). His nephew Eumenes (263-241) succeeded him, increased his power, and even defeated Antiochus of Syria in a pitched battle near Sardis. His successor Attalus I. (241-197) won a great battle over the Gauls, and assumed the title of king. The other Greek kings who aimed at power in Asia Minor were his natural enemies. On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus perceived the advantage of their alliance against his Greek rivals, connected himself with them from the first, and shared in their continuous success. Under the reign of Attalus Pergamum became the capital of a considerable territory and a centre of art and regal magnificence. Sculptors were attracted by the wealth of the state and the king's desire to celebrate his victories by monuments of art, and thus arose the so-called "Pergamenian school" in sculpture. The Pergamenian kings appear to have been far more truly Hellenic, and to have admitted far less of the "barbarian" Oriental character to their court, than the other Hellenistic sovereigns, whose habits and surroundings were those of Eastern sultans with a thin surface-gloss of Greek manners. We hear more of the munificence of Attalus towards Athens, then the educational centre of Greece, than to his own capital. The splendour of Pergamum was at its height under Eumenes II. (197-159). He continued true to the Romans during their wars with Antiochus and Perseus, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, great part of Phrygia and Caria. To celebrate the great achievement of his race, the defeat of the barbarian Gauls, he built in the agora a vast altar to Zeus Soter, adorned with sculptures and especially with a gigantic frieze, in which the symbolic theme of the defeat of the barbarian giants by the gods was treated on such a scale, and with such wealth of detail and perfection of technical skill, as made the monument one of the marvels of the ancient world. He devoted great care to the improvement and embellishment of the city. It is not certain when the old Doric temple of Athena Polias and Nicephorus on the Acropolis was replaced by a more magnificent marble temple, but Eumenes planted a grove in the Nicephorion, the sacred precinct of the goddess, and established libraries and other great works in the city. He left an infant son, Attalus (III.), and a brother, Attalus II. (Philadelphus), who ruled 159-138, and was succeeded by his nephew, Attalus III. (Philometor). The latter died in 133, and bequeathed his kingdom to the Romans, who erected it into a province under the name of Asia. Pergamum continued to rank, with Ephesus and Smyrna, as one of the three great cities of the province, and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the acropolis a magnificent temple to Augustus. It was the seat of a *conventus*, including the cities of the Caius valley and some of those in the northern part of the Ilernus valley. Under the Roman empire Pergamum was one of the chief seats of the worship of Asclepius; invalids came from distant parts of the country to ask advice from the god and his priests. The temple and the curative establishment of the god were situated outside the city. Pergamum was one of the early seats of Christianity, and one of the seven churches enumerated in the Revelation was situated

¹ Kindly furnished by M. Bruno Court, head of the well-known house of Notre Dame des Fleurs of Grasse.

there. Two tributaries of the Caicus, named Selinus and Cetius, flowed through or near the city. The ancient name is still preserved under the form "Bergamo."

The excavations conducted by the Prussian Government at Pergamum under the direction of Humann and Bohn have disclosed many of the buildings with which the acropolis was adorned, the temples of Athena and Augustus, the Stoa, &c., have recovered great part of the frieze on the altar of Zeus, and have given materials of every kind for the elucidation of Pergamian history and Greek antiquities generally, which it will take years to classify and place before the public (see the preliminary reports published by Conze, Bohn, and Humann).

PERGOLESI (or PERGOLESE), GIOVANNI BATTISTA (1710-1736), Italian musical composer, was born at Jesi, Ancona, 3d January 1710, and educated at Naples in the Conservatorio dei Poveri di Gesù Cristo, where he studied the violin under Domenico de Matteis, and counterpoint under Gaetano Greco, Durante, and Francesco Feo. While learning all he could from these great teachers he struck out from the very first a style of his own, and brought it prominently forward in his earliest known composition, an oratorio, called *La Conversione di S. Guglielmo*, performed in the church of S. Agnello in 1731, in which year he also produced his first opera, *Sallustia*, at the Teatro Fiorentino. After receiving further instruction from Vinci he produced another opera, *Recimiro*, which failed lamentably. This disappointment led him to devote his chief attention to church music; and his next great works—two masses, one for two and the other for four choirs, with double orchestra—established his reputation as a genius of the highest order, and proved that he was at least as great in his newly-adopted style as in his dramatic pieces. Nevertheless, the greatest success that he was ever destined to attain was reserved for his celebrated intermezzo¹—or, as we should now call it, operetta—*La Serva Padrona*. This delightful work, fairly successful on the occasion of its first production in 1731 or 1733, became after Pergolesi's death a recognized favourite at every theatre of importance in Europe. In 1746 it found its way to Paris, and had a long run at the Théâtre Italien, followed in 1752 by an equally successful one at the Académie. Two years later it was translated into French, and ran for 150 successive nights. As late as 1867 it was revived in this form at the Opéra Comique; and in 1873 it was revived in London at the Royalty Theatre. The libretto by Nelli is unusually bright and sparkling; and so fresh is the music that it still sounds as if composed but yesterday. In this characteristic, indeed, lies the secret of its extraordinary success, for the scale on which it is written is of the smallest imaginable dimensions. The dramatic personæ consist of three characters only, one of them being mute, and the orchestra is limited entirely to the stringed band, unrelieved by a single wind instrument. But the fire of genius breathes in every bar, and the whole work has the character of a continuous inspiration.

In 1734 Pergolesi was appointed maestro di cappella at Loreto. Soon after this his health began to fail rapidly, but he worked on incessantly to the end. His last compositions were a cantata for a single voice, *Orfeo ed Euridice*; a lovely *Salve Regina*, also for a single voice; and his famous *Stabat Mater*, for two female voices. For this last-named work—the best known of all his sacred compositions—he received in advance ten ducats (£1 15s.), and thought the price enormous. He was barely able to finish it before his death, which took place at Pozzuoli, 16th March 1736.

Pergolesi's works comprise fourteen operas and intermezzi, nineteen sacred compositions, and many charming pieces of chamber music,—a long list, when one remembers that he died at the age of 26 years and 3 months. The purity of his style has not been ex-

ceeded by any composer of the Italian school; and in his orchestral effects and other points of little less importance he shows himself immensely in advance of all his predecessors.

PERIANDER was born about 665 B.C. and succeeded his father Cypselus as despot of Corinth in 625 B.C. His rule appears to have been at first mild and beneficent, but evil advice or domestic calamity converted him into a cruel tyrant. There runs a well-known story that he sent to ask the advice of Thrasybulus, tyrant of Miletus, who, instead of replying, walked with the messenger through a cornfield and struck off as he walked the tallest and fairest of the ears. Periander took the hint, and proceeded to exterminate the most eminent of his subjects.¹ Whatever the cause, there seems no reason to doubt that the latter part of the despot's life was darkened by crime. Goaded by the slanders of concubines, he murdered his beloved wife Melissa, daughter of Procles, tyrant of Epidaurus, and then, in a fit of remorse, burned the slanderers alive.² The murder of his wife alienated from the tyrant the affection of his favourite son Lycophron, whom, failing to move either by rigour or blandishments, he banished to Corcyra, then a dependency of Corinth. At last, enfeebled by age, Periander offered to resign the tyranny to his son and to retire himself to Corcyra; but the prospect alarmed the Corcyreans, and they put Lycophron to death. The tyrant took his revenge by sending three hundred of the noblest Corcyrean youths to Alyattes, king of Lydia, to be made eunuchs of; they were rescued, however, by the Samians. Periander did not long survive his son; he fell into a deep despondency, and died either of grief or by violence voluntarily incurred in 585 B.C., at the age of eighty.

The accounts of Periander's character are at first sight discrepant. One writer (Heraclides) describes him as just and moderate, an enemy of vice and luxury, which he severely repressed. But more commonly he appears as cruel and oppressive. He surrounded himself with a body-guard, and, according to Aristotle, reduced tyranny to a system by putting down eminent and aspiring citizens, impoverishing the rich, maintaining spies, and sowing distrust between classes and individuals. His costly offerings to the gods drained the resources, while his public works and constant wars taxed the energies and distracted the attention of the citizens. The privilege of settling in Corinth was placed by him under certain restrictions. On the other hand, he not only patronized literature in the person of the poet Arion but was himself the author of a collection of moral maxims in 2000 verses. His reputation for wisdom stood so high that he was commonly reckoned amongst the seven wise men, though some, as Plato, denied his claim. Amongst the wars to which he owed his military fame were successful expeditions against Epidaurus and Corcyra. He built a fleet and scoured the sea on both sides of the isthmus, through which it is said that he meditated cutting a canal. To him were due the Greek colonies of Apollonia, Anactorium, and Leucas. On the whole, Periander would appear to have been one of those brilliant despots whose personal vices have not destroyed their literary and artistic sense, and who by their abilities have raised the states which they governed to a high pitch of outward prosperity and power. Certain it is that with the close of his dynasty, which happened a few years after his death, when his successor Psammetichus perished in a popular rising, the golden age of Corinthian history came to an end.

There was another Periander, tyrant of Ambracia, said to have been a relative of the tyrant of Corinth. He was deposed by the people, probably not long after the death of the latter.

The chief authorities for the life of Periander are Herodotus (iii. 48-53; v. 92), Aristotle (*Pol.*, v. 11, 12), Heraclides Ponticus (v.), Nicol. Damasc. (59, 60), Diog. Laert. (i. 7). The letters in Diogenes ascribed to Periander are no doubt spurious.

¹ In Aristotle's version of the story the rôles of Periander and Thrasybulus are reversed.

² The relations of Periander to his dead wife form the subject of a curious tale. It is said that he got a necromancer to call up the spirit of Melissa (as Saul called up Samuel), in order to question her about a hidden treasure, just as people in Württemberg used to call up ghosts in churchyards for a similar purpose. But the ghost refused to answer. "For," said she, "I am cold; I cannot wear the garments laid in my grave, because they have not been burned." So Periander called together all the women of Corinth in their best attire as for a festival, stripped them, and burned their garments on the grave of his wife, that her ghost might not go naked. Similar to this is the story in Lucian of the ghost of a dead wife appearing to her husband and begging him to find and burn one of her golden sandals which had fallen underneath the ehest and so had not been burned with the other.

¹ A light buffo piece, the acts of which were interpolated, for the sake of relief, between those of a serious opera.

PERICLES, a great Athenian statesman, and one of the most remarkable men of antiquity, was the son of Xanthippus, who commanded the Greeks at the battle of Mycale in 479 B.C. By his mother Agariste, niece of Cleisthenes, who reformed the democracy at Athens after the expulsion of the Pisistratidæ, he was connected both with the old princely line of Sicyon and with the great but unfortunate house of the Alcmaeonidæ.¹ The date of his birth is unknown, but his youth must have fallen in the stirring times of the great Persian war. From his friendship with the poet Anacreon, his father would seem to have been a man of taste, and as he stood in relations of hospitality to the Spartan kings his house was no doubt a political as well as literary centre. Pericles received the best education which the age could supply. For masters he had Pythocles and the distinguished musician Damon, who infused into his music lessons a tincture of philosophy, whereby he incurred the suspicions of the vulgar, and received the honour of ostracism.² Pericles listened also to the subtle dialectics of the Eleatic Zeno. But the man who swayed him most deeply and permanently was the philosopher Anaxagoras. The influence of the speculative genius and dignified and gentle character of the philosopher who resigned his property that he might turn his thoughts more steadily to heaven, which he called his home, and who begged as his last honour that the school-children might have a holiday on the day he died, can be traced alike in the intellectual breadth and the elevated moral tone of the pupil, in his superiority to vulgar superstitions, and in the unruffled serenity which he preserved throughout the storms of political life.³ It was probably the grand manner of Pericles even more than his eloquence that won him the surname of Olympian Zeus.⁴ In his youth he distinguished himself in the field, but eschewed politics, fearing, it is said, the suspicions which might be excited in the populace not only by his wealth, high birth, and powerful friends, but by the striking resemblance to the tyrant Pisistratus which old men traced in his personal appearance, musical voice, and flowing speech. But, when the banishment of Themistocles⁵ and the death of Aristides had somewhat cleared the political stage, Pericles came forward as the champion of the democratic or progressive party, in opposition to Cimon, the leader of the aristocratic or conservative party. The two leaders differed hardly less than their policies. Both indeed were men of aristocratic birth and temper, honourable, brave, and generous, faithful and laborious in the service of Athens. But Cimon was a true sailor, blunt, jovial, freehanded, who sang a capital song, and was always equally ready to drink or fight, to whose artless mind (he was innocent of even a smattering of letters⁶) the barrack-room life of the barbarous Spartans seemed the type of human perfectibility, and whose simple programme was summed up in the

maxim "fight the Persians." Naturally the new ideas of political progress and intellectual development had no place in his honest head; naturally he was a sturdy supporter of the good old times of which, to the popular mind, he was the best embodiment. Pericles, grave, studious, reserved, was himself penetrated by those ideas of progress and culture which he undertook to convert into political and social realities; philosophy was his recreation; during the whole course of his political career he never accepted but once an invitation to dinner, and he was never to be seen walking except between his house and the popular assembly and senate-house. He husbanded his patrimony and regulated his domestic affairs with rigid economy that he might escape both the temptation and suspicion of enriching himself at the public expense.

The steps by which he rose to the commanding position which he occupied in later life cannot be traced with certainty. According to Plutarch, Pericles, whose fortune did not allow him to imitate the profuse hospitality by which Cimon endeared himself to the people, sought to outbid him by a lavish distribution of the public moneys among the poorer classes; this device was suggested to him by Damonides, says Plutarch on the authority of Aristotle. We may doubt the motive alleged by Plutarch, but we cannot doubt the fact that Pericles did extend, if not originate, the practice of distributing large sums among the citizens either as gratuities or as payment for services rendered,—a practice which afterwards attained most mischievous proportions. According to Plato (*Gorgias*, 515 E), it was a common saying that Pericles, by the system of payments which he introduced, had corrupted the Athenians, rendering them idle, cowardly, talkative, and avaricious. It was Pericles who introduced the payment of jurymen, and, as there were 6000 of them told off annually for duty, of whom a great part sat daily, the disbursement from the treasury was great, while the poor and idle were encouraged to live at the public expense. But the payment for attendance on the public assembly or parliament (of which all citizens of mature age were members), though probably suggested by the payment of the jurymen, was not introduced by Pericles, and indeed does not seem to have existed during his lifetime.⁷ It was he who instituted the payment of the citizens for military service,⁸—a measure but for which the Athenians would probably not have prolonged the Peloponnesian War as they did, and in particular would not have been so ready to embark on the fatal Sicilian expedition. There was more justification, perhaps, for the practice, originated by Pericles, of supplying the poorer citizens from the public treasury with the price of admission to the theatre. For in an age when the study of the poets formed a chief element of education, and when the great dramas of Æschylus, Sophocles, and Euripides were being put on the stage in all their freshness, such a measure may almost be regarded as a state provision for the education of the citizens. It was part of the policy of Pericles at once to educate and delight the people by numerous and splendid festivals, processions, and shows. But the good was mixed with seeds of evil, which took root and spread, till, in the days of Demosthenes, the money which should have been spent in fighting the enemies of Athens was squandered in spectacles and pagants. The Spectacular Fund or *Theorikon* has been called the cancer of Athens. Vast sums were further spent by Pericles in adorning the city with those buildings which even in their ruins are the wonder of the world. Amongst these were the Parthenon, or Temple of the Virgin (Athene), and the Erechtheum;

¹ Herod., vi. 131.

² Plut., *Per.*, 4; cp. Plato, *Laches*, pp. 180, 197, 200, and *Rep.*, 400, 424.

³ If the statement reported by Diogenes Laertius (ii. 3, 7), that Anaxagoras spent thirty years at Athens, is correct, he probably arrived there about 462, and Pericles must have reached maturity before he met him (see Zeller, *Die Philosophie der Griechen*, i. p. 865 sq.).

⁴ It is said that once, when Pericles was transacting business in public, a low fellow railed at him all day long, and at nightfall dogged him to his house, reviling him in the foulest language. Pericles took no notice of him till he reached his own door, when he bade one of the servants take a torch and light the man home.

⁵ Various placed in 476 (Krüger), 471 (Cluitor), and 470 (Curtius). Considerable divergence of opinion prevails as to the dates of most events between the Second Persian War and the outbreak of the Peloponnesian War (see Pierson, in *Philologus*, 1869; Classen's *Thucydides*, book i. Anh.). Pericles, who died in 429, is said to have had a public life of forty years; hence he probably began to take part in politics about 469.

⁶ Plut., *Cim.*, 4. It is amusing to read of this stout old salt sitting in judgment on the respective merits of Æschylus and Sophocles (ib., 8).

⁷ See Boeckh, *Staatshaushaltung der Athener*, i. p. 320; Curtius *Griech. Gesch.*, ii. pp. 227, 842.

both on the Acropolis, the former completed in 438,¹ the latter left unfinished at Pericles's death; the magnificent Propylæa or vestibule to the Acropolis, built 437-432; and the Odeum or music-hall, on the south-eastern slope of the Acropolis, completed before 444. The musical contests instituted by Pericles, and for which he himself laid down the rules and acted as judge, took place in the Odeum. Many artists and architects were entrusted with the execution of these great works, but under the direction of the master-mind of Phidias, sculptor, architect, painter,—the Michelangelo of antiquity. But Pericles fortified as well as beautified Athens. It had been the policy of Themistocles to make her primarily a naval and commercial power, and to do so he strengthened the marine, and gave to the city as far as possible the advantages of an insular situation by means of fortifications, which rendered both it and its port (the Piræus) impregnable on the land side. By thus basing the Athenian state on commerce instead of, like Solon, on agriculture,² he at the same time transferred the political predominance to the democratic or progressive party, which is as naturally recruited from a commercial as a conservative or aristocratic party is from an agricultural population. This policy was fully accepted and carried out by Pericles. It was in his time and probably by his advice that the Long Walls were built, which, connecting Athens with Piræus, converted the capital and its seaport into one vast fortress.³ Further, in order to train the Athenians in seamanship, he kept a fleet of sixty ships at sea eight months out of every year. The expenses entailed by these great schemes were chiefly defrayed by the annual tribute, which the confederates of Athens originally furnished for the purpose of waging war against Persia, but which Athens, as head of the league, subsequently applied to her own purposes. If, as seems probable, the transference of the treasury of the league from Delos to Athens, which sealed the conversion of the Athenian headship into an empire, took place between 460 and 454, the step was probably suggested or supported by Pericles, and at all events he managed the fund after its transference.⁴ But, though the diversion of the fund from its original purpose probably did not begin with Pericles, yet, once established, he maintained it unwaveringly. The Athenians, he held, fulfilled the trust committed to them by defending their allies against all comers, and the tribute (increased during his administration from 460 to 600 talents annually) was their wages, which it was their right and privilege to expend in works which by employing labour and stimulating commerce were a present benefit, and by their beauty would be "a joy for ever." That Athens ruled by force, that her empire was in fact a

tyranny, he fully admitted, but he justified that tyranny by the high and glorious ends which it subserved.⁵

The rise of Pericles to power, though it cannot be followed step by step, has an obvious and sufficient explanation in his combined wisdom and eloquence. Plato traces his eloquence largely to the influence of Anaxagoras; intercourse with that philosopher (he says) filled the mind of Pericles with lofty speculations and a true conception of the nature of intelligence, and hence his oratory possessed the intellectual grandeur and artistic finish characteristic of the highest eloquence (*Phædrus*, 270 A). The range and compass of his rhetoric were wonderful, extending from the most winning persuasion to the most overwhelming denunciation. The comic poets of the day, in general very unfriendly to him, speak with admiration of his oratory: "greatest of Grecian tongues," says Cratinus; "persuasion sat on his lips, such was his charm," and "he alone of the orators left his sting in his hearers," says Eupolis; "he lightened, he thundered," says Aristophanes. His speeches were prepared with conscientious care; before rising to speak he used to pray that no inappropriate word might fall from his lips.⁶ He left no written speeches,⁷ but the few sayings of his which have come down to us reveal a passionate imagination such as breathes in the fragments of Sappho. Thus, in speaking of those who had died in war, he said that the youth had perished from the city like the spring from the year.⁸ He called the hostile island of Ægina "the eye-sore of the Piræus," and declared that he saw war "lowering from Peloponnesus." Three of his speeches have been reported by Thucydides, who may have heard them, but, though their substance may be correctly recorded, in passing through the medium of the historian's dispassionate mind they have been shorn of the orator's imaginative glow, and in their cold iron logic are hardly to be distinguished from the other speeches in Thucydides. An exception to this is the speech which Thucydides reports as having been delivered by Pericles over the slain in the first year of the Peloponnesian War. This speech stands quite apart from the others; and as well in particular touches (e.g., the saying that "the grave of great men is the world") as in its whole tenor we catch the ring of a great orator, such as Thucydides with all his genius was not. It is probably a fairly close report of the speech actually delivered by Pericles.

The first public appearance of Pericles of which we have record probably fell about 463. When Cimon, on his return from the expedition to Thasos, was tried on the utterly improbable charge of having been bribed by the Macedonian king to betray the interests of Athens, Pericles was appointed by the people to assist in conducting the prosecution; but, more perhaps from a conviction of the innocence of the accused than, as was said, in compliance with the entreaties of Cimon's sister Elpinice, he did not press the charge, and Cimon was acquitted. Not long afterwards Pericles struck a blow at the conservative

¹ The date of the commencement of the Parthenon is variously put at 444 (Leake), 454 (Michaelis), and 460 (Wachsmuth). From an inscription it would seem that the building of the temple extended at least as far back as 447. See Curtius, *Gr. Gesch.*, ii. p. 852.

² Solon's classification of the citizens for political purposes rested exclusively on the possession of cultivated land.

³ There were three of these walls, of which the northern (to Piræus) and the southern (to Phalerum) were completed after the battle of Ænophyta (Thucyd., i. 108) in 456. The foundation of these two walls seems to have been laid by Cimon (Plut., *Cim.*, 13) about 462. See Leake's *Topography of Athens*, i. p. 424. Some scholars, relying on an interpretation of Thucydides (i. 107, 108), suppose that these walls were begun in one year and finished in the next. But considering the length of the walls (8 miles) and their massiveness (as shown by their remains) this seems quite impossible. The middle wall, which ran parallel to the northern wall and at no great distance from it, was built later (it was not begun before 449, Andocides, *De pace cum Laced.*, 7, and the progress was slow, Plut., *Per.*, 13), and there is no doubt that Pericles advised its construction (Plato, *Gorgias*, 455 E). The wall to Phalerum seems afterwards to have fallen into decay, and the middle wall then went by the name of the southern, and it and the northern were known as the Long Walls (Harpocration, s.v. *ἀπὸ τοῦ ῥείχους*; Leake, i. p. 427).

⁴ Justin, iii. 6, 4; Diod., xii. 38; Curtius, *Gr. Gesch.*, ii. 168, 837.

⁵ Cp. Thucyd., i. 143, and ii. 63, 64; Plut., *Per.*, 12.

⁶ Compare the story in Plutarch (*De educ. puer.*, 9), that on one occasion, though repeatedly called on by the people to speak, he declined to do so, saying that he was unprepared.

⁷ Plut., *Per.*, 8. In the time of Cicero there were some writings bearing his name (*Brutus*, 7, 27; *De Or.*, ii. 22, 93), but they were no doubt spurious. Cp. Quintilian, iii. 1, 12; xii. 2, 22 and 10, 49.

⁸ Cope (on Aristotle, *Rhetoric*, i. 7, 34) denies that Pericles was the author of the saying. His only plausible ground is that a similar saying is attributed to Gelon by Herodotus (vii. 162). But from the clumsy way in which the simile is there applied it has all the appearance of being borrowed, and Herodotus, who long survived Pericles, may have borrowed it from him. It is more open to question whether the simile occurred in the funeral speech delivered at the close of the Samian War, or in that during the Peloponnesian War, but the former is more probable. In Thucydides's report of the latter speech the simile does not occur.

party by attacking the Areopagus, a council composed of life-members who had worthily discharged the duties of archon. The nature of the functions of the Areopagus at this period is but little known; it seems to have had a general supervision over the magistrates, the popular assembly, and the citizens, and to have exercised this supervision in an eminently conservative spirit. It sat also as a court for the trial of certain crimes, especially murder. Pericles seems to have deprived it of nearly all its functions, except its jurisdiction in cases of murder.¹ The poet Æschylus composed his *Eumenides* in vindication of the ancient privileges of the Areopagus. Though Pericles was the real author of the attack on the Areopagus, the measure was nominally carried by Ephialtes. It was, indeed, part of Pericles's policy to keep in the background, and to act as far as possible through agents, reserving himself for great occasions. Ephialtes, a friend of Pericles, and a patriot of inflexible integrity, paid dearly for the distinction; he fell by the hand of an assassin employed by the oligarchical party,—an event the more striking from the rarity of political assassinations in Greek history. The popular party seems to have immediately followed up its victory over the Areopagus by procuring the ostracism of Cimon,² which strengthened the hands of Pericles by removing his most influential opponent (461). Pericles took part in the battle of Tanagra (457) and bore himself with desperate bravery. After the battle Cimon was recalled from banishment, and it was Pericles who proposed and carried the decree for his recall. In 454 Pericles led an Athenian squadron from the port of Pegæ on the Corinthian Gulf, landed at Sicyon, and defeated the inhabitants who ventured to oppose him; then, taking with him a body of Achæans, he crossed to Acarnania, and besieged the town of Cœniadæ, but had to return home without capturing it. Not long afterwards³ Pericles conducted a successful expedition to the Thracian Chersonese, where he not only strengthened the Greek cities by the addition of 1000 Athenian colonists, but also protected them against the incursions of the barbarians by fortifying the isthmus from sea to sea. This was only one of Pericles's many measures for extending and strengthening the naval empire of Athens. Colonies were established by him at various times in Naxos, Andros, Oreus in Eubœa (in 446), Brea in Macedonia (about 443), and Ægina (in 431). They served the double purpose of establishing the Athenian power in distant parts and of relieving the pressure of population at Athens by providing the poorer citizens with lands. Somewhat different were the famous colonies established under Pericles's influence at Thurii in Italy, on the site of the ancient Sybaris (in 443), and at Amphipolis on the Strymon (in 437), for, though planted under the conduct of Athens, they were not exclusively Athenian colonies, other Greeks being allowed, and even invited, to take part in them. This was especially true of Thurii, which was in a manner a national Greek colony, and never stood in a relation of subjection to Athens. On one occasion (some time apparently between 454 and 449)⁴

Pericles sailed at the head of a splendid armament to the Black Sea, where he helped and encouraged the Greek cities and overawed the barbarians. At Sinope he left a force of ships and men under the gallant Lamachus, to co-operate with the inhabitants against the tyrant Timesileus, and on the expulsion of the tyrant and his party he carried a decree for the despatch of 600 Athenian colonists to Sinope, to occupy the lands vacated by the exiles. But, with the sober wisdom which characterized him, Pericles never allowed his plans to exceed the bounds of the possible; he was no political dreamer like Alcibiades, to be dazzled with the vision of a universal Athenian empire in Greece, Italy, and Africa, such as floated before the minds of many in that and the following generations.⁵ The disastrous expedition which the Athenians sent to Egypt, to support the rebel Inarus against Persia (460-455), received no countenance from Pericles.

When Cimon died in 449 the aristocratical party sought to counterbalance the power of Pericles by putting forward Thucydides, son of Melesias, as the new head of the party. He seems to have been an honest patriot, but, as the event proved, he was no match for Pericles. The Sacred War in 448 showed once more that Pericles knew how to defend the interests of Athens. The Phocians, under the protection of Athens, had wrested the control of the Delphic oracle from their enemies the Delphians. The latter were friendly to Sparta, and accordingly the Spartans marched into Phocis and restored the oracle to the Delphians. When they had departed, Pericles, at the head of an Athenian force, placed the oracle once more in the hands of the Phocians. As the seat of the great oracle, Delphi was to ancient Greece much what Rome was to mediæval Europe, and the friendship of the god, or of his priests, was no small political advantage. When the Athenians despatched a small force under Tolmides to crush a rising in Boeotia, they did so in spite of the warnings of Pericles. These warnings were soon justified by the unfortunate battle of Coronea (447), which deprived Athens at a blow of the continental dominion she had acquired a few years before by the battle of Cœnophyta (456). The island of Eubœa now revolted from Athens, and hardly had Pericles crossed over with an army to reduce it when word came that the Megarians had massacred the Athenian garrison, and, in league with Corinth, Sicyon, and Epidaurus, were up in arms, while a Peloponnesian army under King Plistoanax was on the point of invading Attica. Pericles recrossed in haste to Attica. The Peloponnesians returned home, having advanced no farther than Eleusis and Thria. It was said that Pericles had bribed Cleandridas; certain it is that both Cleandridas and Plistoanax were charged at Sparta with having misconducted the expedition and were found guilty. Having saved Attica, Pericles returned to Eubœa, reduced it to subjection, expelled the Histians, and settled the Athenian colony of Oreus (446) on their lands. The thirty years' peace, concluded soon afterwards (445) with Sparta, was probably in large measure the work of Pericles. The Athenians had evacuated Boeotia immediately after the battle of Coronea, and by the terms of the peace they now renounced their other continental possessions,—Achæa, Trœzen, Nisæa, and Pegæ. The peace left Pericles at liberty to develop his schemes for promoting the internal welfare of Athens, and for making it the centre of the intellectual and artistic life of Greece. But first he had to settle accounts with his political rival Thucydides; the struggle was soon decided by the ostracism of the latter in 444. Thenceforward to the end of his life Pericles

mentioned by him immediately after the expedition against Cœniadæ (454) and before the Sacred War (449).

⁵ Thucyd., vi. 15, 90; Diod., xii. 54; Plut., *Per.*, 20, and *Alcib.*, 17; Pausan., i. 11, 7.

¹ Cp. Philochorus, 141 b, in Muller's *Fragm. Hist. Græc.*, vol. i.; Plut., *Per.*, 9, and *Cim.*, 15; Aristotle, *Pol.*, 1274 a, 7; Thirlwall's *Hist. of Greece*, ii. pp. 458, 459.

² The ostracism of Cimon lasted between four and five years (Theopompus, 92, in *Fr. Hist. Gr.*; cp. Corn. Nep., *Cimon*, 3). Hence, if his recall took place shortly after the battle of Tanagra (Plut., *Cim.*, 17, and *Per.*, 10), say at the beginning of 456, he must have been ostracized about the middle or latter part of 461. Diodorus (xi. 77) places the attack on the Areopagus in 460; but, if that attack preceded (as Plutarch implies) the banishment of Cimon, it would be necessary, in order to harmonize Diodorus and Theopompus, to place the recall of Cimon in 455 or 454—i.e., between one and two years after the battle of Tanagra—and this seems forbidden by Plutarch's narrative.

³ In 453, according to Diod., xi. 83.

⁴ The expedition is only recorded by Plutarch (*Per.*, 20), and is

guided the destinies of Athens alone; in the words of the historian Thucydides, the government was in name a democracy, but in fact it was the rule of the first citizen. The unparalleled ascendancy which he wielded so long over the fickle people is one of the best proofs of his extraordinary genius. He owed it entirely to his personal character, and he used it for the wisest and purest purposes. He was neither a vulgar demagogue to truckle to the passions and caprices of the mob, nor a vulgar despot to cow it by a hireling soldiery; he was a citizen among citizens, who obeyed him because they trusted him, because they knew that in his hands the honour and interests of Athens were safe. The period during which he ruled Athens was the happiest and greatest in her history, as it was one of the greatest ages of the world. Other ages have had their bright particular stars; the age of Pericles is the Milky Way of great men. In his lifetime there lived and worked at Athens the poets Æschylus, Sophocles, Euripides, Cratinus, Crates, the philosophers Anaxagoras, Zeno, Protagoras, Socrates, the astronomer Meton, the painter Polygnotus, and the sculptors Myron and Phidias. Contemporaries with these, though not resident at Athens, were Herodotus, the father of history; Hippocrates, the father of medicine; Pindar, "the Theban eagle"; the sculptor Polyclitus; and the philosophers Empedocles and Democritus, the latter joint author with Leucippus of the atomic theory. When Pericles died other stars were rising or soon to rise above the horizon,—the historians Thucydides and Xenophon, the poets Eupolis and Aristophanes, the orators Lysias and Isocrates, and the gifted but unscrupulous Alcibiades. Plato was born shortly before or after the death of Pericles. Of this brilliant circle Pericles was the centre. His generous and richly-endowed nature responded to all that was beautiful and noble not only in literature and art but in life, and it is with justice that the age of Pericles has received its name from the man in whom, more than in any other, all the various lines of Greek culture met and were harmonized. In this perfect harmony and completeness of nature, and in the classic calm which was the fruit of it, Pericles is the type of the ideal spirit, not of his own age only, but of antiquity.

It seems to have been shortly after the ostracism of Thucydides that Pericles conceived the plan of summoning a general congress of all the Greek states to be held at Athens. Its objects were the restoration of the temples which the Persians had destroyed, the fulfilment of the vows made during the war, and the establishment of a general peace and the security of the sea. Invitations were sent to the Greeks of Asia, the islands from Lesbos to Rhodes, the Hellespont, Thrace, Byzantium, Bœotia, Phocis, Peloponnesus, Locris, Acarnania, Ambracia, and Thessaly. The aim of Pericles seems to have been to draw the bonds of union closer between the Greeks and to form a national federation. The beneficent project was defeated by the short-sighted opposition of the Spartans. But, if in this scheme Pericles rose above the petty jealousies of Greek politics, another of his measures proves that he shared the Greek prejudices as to birth. At an early period of his career (apparently about 460) he enacted, or perhaps only revived,¹ a law confining the rights of Athenian citizenship to persons both of whose parents were Athenian citizens. In the year 444, on the occasion of a scrutiny of the list of citizens, nearly 5000 persons claiming to be citizens were proved to be aliens under this law, and were ruthlessly sold into slavery.

The period of the thirty years' peace was not one of uninterrupted tranquillity for Athens. In 440 a war broke out between the island of Samos (a leading member

of the Athenian confederacy) and Miletus. Athens sided with Miletus; Pericles sailed to Samos with an Athenian squadron, and established a democracy in place of the previous oligarchy. After his departure, however, some of the exiled oligarchs, in league with Pissuthnes, satrap of Sardis, collected troops and, crossing over to Samos, overpowered the popular party and revolted from Athens. In this revolt they were joined by Byzantium. The situation was critical; the example set by Samos and Byzantium might be followed by the other confederates. Pericles discerned the danger and met it promptly. He led a squadron of sixty ships against Samos; and, after detaching some vessels to summon reinforcements from Chios and Lesbos, and others to look out for the Phœnician fleet which the Persians were expected to send to the help of Samos, he gave battle with forty-four ships to the Samian fleet of seventy sail and defeated it. Having received reinforcements of sixty-five ships, he landed in Samos and laid siege to the capital. But, when he sailed with sixty ships to meet the Phœnician vessels which were reported to be near, the Samians sallied out with their vessels, defeated the besiegers, and remained masters of the sea for fourteen days. On his return, however, they were again blockaded, and were compelled to surrender, nine months after the outbreak of the war (spring of 439).

Though Pericles enjoyed the confidence of the people as a whole, his policy and opinions could not fail to rouse the dislike and suspicions of many, and in the last years of his life his enemies combined to assail him. Two points in particular were singled out for attack, his administration of the public moneys and his religious opinions. With regard to the former there must always be a certain number of persons who will not believe that others can resist and despise a temptation which to themselves would be irresistible; with regard to the latter, the suspicion that Pericles held heretical views on the national religion was doubtless well grounded. At first, however, his enemies did not venture to impeach himself, but struck at him in the persons of his friends. In 432² Phidias was accused of having appropriated some of the gold destined for the adornment of the statue of Athene in the Parthenon. But by the prudent advice of Pericles the golden ornaments had been so attached that they could be taken off and weighed, and when Pericles challenged the accusers to have recourse to this test the accusation fell to the ground. More dangerous, for more true, was the charge against Phidias of having introduced portraits of himself and Pericles into the battle of the Amazons, depicted on the shield of the goddess: the sculptor appeared as a bald old man lifting a stone, while Pericles was represented as fighting an Amazon, his face partly concealed by his raised spear. To the pious Athenians this seemed a desecration of the temple, and accordingly Phidias was clapped into gaol. Whether he died there or at Elis is uncertain.³ Even more deeply was Pericles wounded by the accusation levelled at the woman he loved. This was the famous Aspasia, a native of Miletus, whose talents won for her general admiration at Athens. Pericles divorced his wife, a lady of good birth who had borne him two sons, Xanthippus and Paralus, but with whom he was unhappy, and attached himself to Aspasia. With her he lived on terms of devoted affection to the end of his life, though, as she was a foreigner, their union was not a legal marriage. She enjoyed a high reputation as a teacher of rhetoric, and

² A scholiast on Aristoph., *Pax*, 605, places the condemnation of Phidias seven years before the outbreak of the Peloponnesian War, or in 438 (according to Palmer's correction); see Müller *ad l.*, in *Frag. Hist. Gr.*, v. p. 18.

¹ See Schömann's *Antiquities of Greece*, p. 357, Eng. tr.; Hermann's *Staatsalterthümer*, § 118.

³ Different views of the fate of Phidias are taken by scholars. See PHIDIAS.

seems to have been the centre of a brilliant intellectual society, which included Socrates and his friends. The comic poet, Hermippus, brought her to trial on the double charge of impiety and of corrupting Athenian women for the gratification of Pericles. A decree was further carried by a religious fanatic named Diopithes, whereby all who denied the existence of the gods or discussed the nature of the heavenly bodies were to be tried as criminals. This blow was aimed directly at the aged philosopher Anaxagoras, but indirectly at his pupil Pericles as well as at Aspasia. When this decree was passed, and apparently while the trial of Aspasia was still pending, Pericles himself was called upon by a decree of the people to render an account of the money which had passed through his hands. The result is not mentioned, but we cannot doubt that the matter either was dropped or ended in an acquittal. The perfect integrity of Pericles is proved by the unimpeachable evidence of his contemporary, the historian Thucydides. Aspasia was acquitted, but not before Pericles had exerted all his eloquence in her behalf. Anaxagoras, tried on the charge of impiety, was obliged to quit the city.¹

It was in the same year (432) that the great contest between Athens and Sparta, known as the Peloponnesian War, broke out. We may dismiss as a vulgar calumny the statement, often repeated in antiquity,² but quite unsupported by Thucydides, that the war was brought about by Pericles for the purpose of avoiding a prosecution. The war was in truth inevitable; its real cause was Sparta's jealousy of the growing power of Athens; its immediate occasion was the help lent by Athens to Coreyra in its war with Corinth. At first, with a hypocritical regard for religion, the Spartans demanded as a condition of peace that the Athenians should expel the race of the Alcmaeonidae (including, of course, Pericles), whose ancestors had been guilty of sacrilege about two centuries before. The Athenians retorted in kind, and, after a little more diplomatic fencing, the Spartans were constrained to show their hand by demanding bluntly that Athens should give back to the Greeks their independence,—in other words, renounce her empire and abandon herself to the tender mercies of Sparta. Pericles encouraged the Athenians to reject the demand. He pointed out that Athens possessed advantages over the Peloponnesians in superior wealth and greater unity of counsels. He advised the Athenians, in case of war, not to take the field against the numerically superior forces of the Peloponnesians, but to allow the enemy to ravage Attica at will, while they confined themselves to the defence of the city. Through their fleet they would maintain communication with their island empire, procure supplies, and harass the enemy by sudden descents on his coasts. By pursuing this defensive policy without attempting to extend their empire, he predicted that they would be victorious. The people hearkened to him and replied to the Spartan ultimatum by counter-demands, which they knew would not be accepted. Pericles had not neglected in time of peace to prepare for war, and Athens was now well equipped with men, money, and ships. In June of the following summer (431) a Peloponnesian army invaded Attica. By the advice of Pericles the rural population, with their movables, had taken refuge in the city, while the cattle had been sent for safety to the neighbouring islands. The sight of their country ravaged under their eyes excited in the Athenians a longing to march out and meet the enemy, but in the teeth of popular clamour and obloquy Pericles steadily adhered to

his defensive policy, content to protect the suburbs of Athens with cavalry. Meanwhile, Athenian fleets retaliated upon the enemy's coasts. About the same time, as a punishment for the share that they were supposed to have had in bringing on the war, the whole population of Ægina was expelled from their island to make room for Athenian colonists. This measure, directed by Pericles, relieved to some extent the pressure in the overcrowded capital, and secured a strong outpost on the side of the Peloponnesus. In the autumn, after the Peloponnesian army had been obliged by want of provisions to quit Attica and disband, Pericles conducted the whole available army of Athens into the territory of Megara, and laid it waste.

It was a custom with the Athenians that at the end of a campaign the bones of those who had fallen in battle should be buried with public honours in the beautiful suburb of Ceramicus, the Westminster of Athens, and the vast crowd of mourners and spectators gathered about the grave was addressed by a citizen chosen for his character and abilities to pay the last tribute of a grateful country to its departed brave. On the present occasion the choice fell on Pericles. Once before, at the close of the Samian War, it had been his lot to discharge a similar duty. The speech which he now delivered, as reported to us by Thucydides, is one of the noblest monuments of antiquity. It is indeed the creed of Athens and of Greece. In its aristocratic republicanism—recognizing at once the equal legal rights and the unequal intrinsic merits of individuals—it differs alike from the monarchical spirit of mediæval and modern Europe, with its artificial class distinctions, and from that reactionary communism which preaches the natural as well as the legal equality of men. In its frank admiration of art and letters and all the social festivals which humanize and cheer life it is as far from the sullen asceticism and the wild debauchery of the East, as the grave and manly simplicity of its style is removed from the fanciful luxuriance of Oriental rhetoric. Finally, in the words of comfort and exhortation addressed to the bereaved, the speech—to adopt Thirlwall's description of another great effort of Athenian oratory³—"breathes the spirit of that high philosophy which, whether learnt in the schools or from life, has consoled the noblest of our kind in prisons, and on scaffolds, and under every persecution of adverse fortune."

The fortitude of the Athenians was put to a still severer test in the following summer (430), when to the horrors of war (the Peloponnesians had again invaded Attica) were added the horrors of the plague, which spread havoc in the crowded city. Pericles himself escaped the scourge,⁴ but many of his relations and best friends, amongst them his sister and his two sons Xanthippus and Paralus, were struck down. With the elder of his sons, Xanthippus, a worthless young man, the father had been on bad terms, but the death of his surviving son, at an interval of a few days, affected him deeply, and, when he came to lay the wreath upon the corpse, though he struggled hard to maintain his habitual calm, he broke down, and for the first time in his public life burst into a passion of weeping.⁵ But neither private grief nor public calamity shook for a moment the lofty courage and resolution with which he continued to the last to oppose a firm front alike to enemies without and to cravens within. While refusing as before to risk a battle in Attica, which he allowed the Peloponnesians

³ The speech of Demosthenes "On the Crown."

⁴ Plutarch, admitting that Pericles was not attacked by the plague in its acute form, believes that it so far affected him as to throw him into a lingering decline. But we do not gather from Thucydides's description of the plague that it ever had this effect.

⁵ Not inconsistent with this are the accounts of the general fortitude with which he bore his bereavement (Plut., *Consol. ad Apoll.*, 33; Ælian, *Var. Hist.*, ix. 6; Val. Max., v. 10).

¹ The accounts of the issue of the trial are somewhat discrepant; see Zeller, *Die Philosophie der Griechen*, i. p. 872.

² Aristophanes, *Pax*, 605 sq., with schol. ad l.; Diod., xii. 88-90; Plat., *Per.*, 31, 32; Aristodemus, xvi.; Suidas, s.v. "Φειδίας."

to devastate at pleasure, he led in person a powerful fleet against Peloponnesus, ravaged the coast, and destroyed the town of Prasie in Laconia. But the Athenians were greatly disheartened; they sued for peace, and when their suit was rejected by Sparta they vented their ill-humour on Pericles, as the author of the war, by subjecting him to a fine. However, they soon repented of this burst of petulance, and atoned for it by re-electing him general¹ and placing the government once more in his hands. Further, they allowed him to legitimate his son by Aspasia, that his house might not be without an heir. He survived this reconciliation about a year, but his name is not again mentioned in connexion with public affairs. In the autumn of 429 he died. We may well believe that the philosophy which had been the recreation of his happier days supported and consoled him in the clouded evening of his life. To his clement nature it was a peculiar consolation to reflect that he had never carried political differences to the shedding of blood. Indeed, his extraordinary, almost fatherly, tenderness for the life of every Athenian citizen is attested by various of his sayings.² On his deathbed, when the friends about him were telling his long roll of glory, rousing himself from a lethargy into which he had fallen, he reminded them of his fairest title to honour: "No Athenian," he said, "ever put on black through me."

He was buried amongst the great dead in the Ceramicus, and in after years Phormio, Thrasybulus, and Chabrias slept beside him.³ In person he was graceful and well made, save for an unusual height of head, which the comic poets were never weary of ridiculing. In the busts of him which we possess, his regular features, with the straight Greek nose and full lips, still preserve an expression of Olympian repose.

The chief, perhaps the only trustworthy, authority for the life of Pericles is the history of his contemporary Thucydides. The biography by Plutarch is compiled from Thucydides, Ephorus, Ion, Stesimbrotus, Duris of Samos, Aristotle, Idomeneus, Eschines, and Heracleides Ponticus, together with the comic poets Cratinus, Teleclides, Hermippus, Plato, Eupolis, and Aristophanes. Ephorus, a pupil of Isocrates, must have had plenty of means of ascertaining the facts, but how little his judgment is to be trusted is shown by his account of the origin of the Peloponnesian War,—an account also followed by Diodorus Siculus, whose history adds nothing of importance to the narratives of Thucydides and Plutarch. Ion and Stesimbrotus were contemporaries of Pericles, but, as both were admirers of Cimon and opposed to the policy of Pericles, their accounts have to be received with caution. (J. G. FR.)

PERIDOTE, a name applied by jewellers to the green transparent varieties of olivine. When yellow, or yellowish-green, the stone is generally known as "chrysolite." The colour of the peridot is never vivid, like that of emerald, but is usually some shade of olive-, pistachio-, or leek-green. Although sometimes cut in rose-forms and *en cabochon*, the stone displays its colour most advantageously when it is worked in small steps. Unfortunately the peridot is the very softest of gem-stones, its hardness being only about 6·5, or but little above that of glass; hence the stone, when polished, rapidly loses its lustre, and readily suffers abrasion by wear. There is considerable difficulty in polishing the peridot; the final touch is given on a copper wheel moistened with sulphuric acid, yet, curiously enough, the mineral is soluble in this medium. The peridot is a silicate of magnesium and iron, having a specific gravity of about 3·4, and crystallizing in the orthorhombic system (see fig. 468, MINERALOGY, vol. xvi. p. 410). Good crystals,

however, are extremely rare, the mineral being usually found as rolled fragments. The localities for peridot and chrysolite are Egypt, Ceylon, Pegu, and Brazil, while the dull varieties of olivine enjoy a world-wide distribution in various eruptive rocks and in serpentine. Olivine is found also in meteorites.

There can be little doubt that the ancient "topazion" was our peridot or chrysolite, and that the mineral now called topaz was unknown to ancient and mediæval writers. The earliest mention of the word "peridot" is said to occur in the Wardrobe Book of 27 Edward I., where, among the jewels of the bishop of Bath and Wells which had escheated to the crown, mention is made of "unus annulus auri cum *pereditis*." The origin of the word has given rise to much speculation, some authorities deriving it from *περίδοτος*, "a wager," and others from *περίδοτος*, "banded," while others, again, refer it to an Arabic origin.

For the history of the stone see Kiur's *Natural History, Ancient and Modern, of Precious Stones*, 1865.

PÉRIGORD, an old province of France which formed part of the military government of Guienne and Gascony, and was bounded N. by Angoumois, E. by Limousin and Quercy, S. by Agenais and Bazadais, and W. by Bordelais and Saintonge. It is now represented by Dordogne and part of Lot-et-Garonne. The capital was PÉRIGUEUX (*q.v.*).

PÉRIGUEUX, formerly capital of Périgord, now chief town of the department of the Dordogne, France, situated on the slope of an eminence commanding the right bank of the Isle, one of the tributaries of the Dordogne. It is 310 miles by rail south-south-west of Paris and 79 miles east-north-east of Bordeaux. Périgueux is divided into three distinct parts. In the middle, on the slope of the hill, is the town of the Middle Ages, with narrow, crooked, and dirty streets, above which rises the cathedral of St Front; higher up comes the modern town, its houses separated by gardens and public walks; and at the foot of the hill and lying along the Isle are small houses of modern construction, built on the fine ruins of the Roman town. Three bridges connect Périgueux with the left bank of the Isle, where stood Vesunna, the capital of the Petrocorii. Hardly a trace of this old Gallic oppidum remains, but not far off, on the Plateau de la Boissière, the rampart of the old Roman camp, 1970 feet long and half as wide, is still to be recognized. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the 1st or 2d century, which had a frontage of 200 feet, and were supplied by an aqueduct 4 miles long, which spanned the Isle. In several places numerous mosaics have been found, some of which have been placed in the museum. A circular building, called the "Tower of Vesunna," 68 feet in diameter and 89 feet in height, stands at what was formerly the centre of the city, where all the chief streets met. It is believed to have been originally the cella or main part of a temple, of which the peristyle has disappeared, probably dedicated to the tutelary deities of Vesunna. Of the amphitheatre there still remain huge fragments of wall built of pebbles and cement, staircases, vomitories, and partly uncovered vaults. The building, which held 40,000 spectators, had a diameter of 1312 feet, that of the arena being 876 feet; judging from its construction it must be as old as the 3d or even the 2d century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters took from it the stones required for the construction of their nunnery. At present it is private property. The most remarkable, however, of the ruins of old Vesunna is the Château Barrière. It rests on stones of great size, and dates in part from a very remote period. Two towers date from the 3d or 4th century, and formed part

¹ There were ten generals at Athens annually elected by the votes of the people. They seem to have had civil as well as military duties, and the importance of the office must have increased in proportion to the degradation of the offices which were filled by lot. After the ostracism of Thucydides Pericles was elected to the office again and again.

² Plut., *Per.*, 18, 33, 38; *Reg. et imp. Apoph.*; *Præcept. ger. Reip.*, xvii. 4.

Pausan., i. 29, 3; cp. Cic., *De Fin.*, v. 2.

of the fortified enceinte; the highest tower is of the 10th century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century. Lastly, there are still to be traced the two tiers of wall of the enceinte, built round the city in the 5th century; but these are partly hidden by restorations of a later date. Numerous courses of stone are also to be seen, shafts of columns, and marbles of various shapes and sizes. Of the mediæval town the feature most worthy of notice is the cathedral of St Front, which is indeed (or rather was) one of the most interesting of sacred buildings. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and was built from 984 to 1047, contemporaneously with the latter (977-1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 69 feet in width, and the whole is 184 feet long. These cupolas, 89 feet high from the keystone to the ground, and supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture, served as models for many other churches in Aquitania; thus St Front is entitled to a prominent place in the history of art. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. The restoration of the edifice, begun in 1865, resulted, unfortunately, in an almost complete reconstruction, in which the old features have been largely lost. The belfry of St Front is the only one in the Byzantine style now extant; it dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. The interior of the church has a fine altar-screen of carved oak. Near St Front are the ruins of the old basilica built in the 6th century. The bishop's palace, in the grounds of the ancient abbey, has a curious subterranean cloister of the 12th, 13th, and 14th centuries. Périgueux has several old and curious houses of the mediæval and Renaissance periods; a large prefecture of some architectural merit, built at great expense a few years ago in the style of the Renaissance

and of the 18th century; a museum which is singularly rich in Roman, Frank, Egyptian, and pre-Celtic antiquities; and a library of 30,000 volumes. In the squares are statues of Montaigne, Fénelon, General Daumesnil, the defender of Vincennes (1814-15), and Marshal Bugeaud. The town has iron and copper foundries, serge and bombasin factories, tanneries, and dye-works. It does a large trade in flour, wine, brandy, hides, poultry, and in the celebrated patés du Périgord. It is the junction of the railway from Paris to Agen with that from Bordeaux to Lyons *via* Clermont. The population in 1881 was 25,036.

Vesunna, as has already been said, was the capital of the Petrocorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle opposite the site of the Gallic oppidum. It contained public buildings, and Roman roads led from it to Limoges, Agen, Bordeaux, and Saintes. The barbarian invasion brought this prosperity to a close. In the 6th century St Front preached Christianity here, and over his tomb there was raised in the 10th century an abbey, which became the centre of the new town, called Puy St Front. The latter soon began to rival the old city in importance, and it was not until 1269 that they were united by a solemn treaty. After the time of Charlemagne Périgord was governed by a line of counts. During the Hundred Years' War Périgueux was twice attacked by the English, who took the fortified town in 1356; and the town was ceded to them by the treaty of Bretigny, but returned to the French crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV., and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a Calvinist stronghold, and it also suffered during the troubles of the Fronde.

PERINTHUS, a town of Thrace, on the Propontis, 22 miles to the west of Selymbria, strongly situated on a small peninsula on the Bay of Perinthus, on the site of the modern Eski Eregli. It is said to have been a Samian colony, and to have been founded about 599 B.C. According to Tzetzes, its original name was Mygdonia; later it was called Heraclea (Heraclea Thraciæ, Heraclea Perinthus). It figures in history chiefly by its stubborn and successful resistance to Philip of Macedon in 340, at which period it seems to have been even more important than Byzantium itself. A number of extant coins of Perinthus show that it was the seat of large and celebrated festivals.

PERIODICALS

PERIODICALS may be broadly divided into two classes, the one chiefly devoted to general literature, apart from political and social news (a subject dealt with under the heading of NEWSPAPERS), and the other more exclusively to science and art, or to particular branches of knowledge or trade. The former class, and those of general interest only, will be principally dealt with in this article, where an endeavour is made to trace briefly the history of the rise and progress of that vast and increasing body of printed matter which, under the different names of reviews, magazines, &c., forms so large a part of current literature.

BRITISH.

The first literary periodical in English was the *Mercurius Librarius*, or a Faithful Account of all Books and Pamphlets (1680), a mere catalogue, followed by *Weekly Memorials for the Ingenious* (16th January 1681/82 to 15th January 1683), which was more of the type of the *Journal des Savants*, whence it borrowed many contributions, and by the *Bibliothèque Universelle et Historique* (January 1686-93), begun by Jean Leclerc, continued with the assistance of J. de la Crosse, and carried on during the last six years of its existence by J. Bernard. Of the *History of Learning* (1691; another with the same title in 1694) only a few

numbers appeared, as the conductor, De la Crosse, started the *Works of the Learned* (August 1691 to April 1692), devoted principally to Continental scholarship. The *Complete Library* (1692 to December 1693) was a venture of John Dunton; the *Memoirs for the Ingenious* (1693) ran to six monthly numbers, and another with the same title appeared in the following year, only to enjoy an equally brief career. The first periodical of merit and influence was the *History of the Works of the Learned* (1699-1712), largely consisting of descriptions of foreign books. The *Memoirs of Literature*, the first English review consisting entirely of original matter, published in London from 1710 to 1714, had for editor Michel de la Roche, a French Protestant refugee, who also edited at Amsterdam the *Bibliothèque Angloise* (1717-19), and subsequently *Mémoires Littéraires de la Grande Bretagne* (1720-24). Returning to England in 1725, he recommenced his *New Memoirs of Literature* (1725-28), and in 1730 a *Literary Journal*. Dr Samuel Jebb started *Bibliotheca Literaria* (1722-24), which dealt with medals and antiquities as well as with literature, but only ten numbers appeared. The *Present State of the Republick of Letters* was commenced by Andrew Reid in January 1728, and completed in December 1736. It contained not only excellent reviews of English books but papers from the works of foreigners, and, as well as the *Historia Literaria*

(1730-34) of Archibald Bower,¹ was very successful. The *Bee* (1733-34) of the unfortunate Eustace Budgell, and the *Literary Magazine* (1735-36), with which Ephraim Chambers had much to do, were very short-lived. In 1737 the *History of the Works of the Learned* appeared again, and was continued without intermission until 1743, when its place was taken by *A Literary Journal* (Dublin, 1744-49), the first review published in Ireland. The *Museum* (1746) of R. Dodsley united the character of a review of books with that of a literary magazine. Although England can show nothing like the *Journal des Savants*, which has flourished almost without a break for 220 years, a nearly complete series of reviews of English literature may be made up from 1681 to the present day.

After the close of the first quarter of the 18th century the literary journal began to assume more of the style of the modern review, and in 1749 the title and the chief features were united in the *Monthly Review*, established by Ralph Griffiths,² who conducted it until 1803, whence it was edited by his son down to 1825. It came to an end in 1845. From its commencement the *Review* dealt with science and literature, as well as with literary criticism. It was Whig in politics and Nonconformist in theology. The Tory party and the established church were defended in the *Critical Review* (1756-1817), founded by Archibald Hamilton and supported by Smollett, Johnson, and Robertson. Johnson took a considerable part in the *Literary Magazine* (1756-58). The reviews rapidly increased in number towards the end of the century. Among the principal were the *London Review* (1775-80), *A New Review* (1782-86), the *English Review* (1783-96), incorporated in 1797 with the *Analytical Review* (1788-99), the *Anti-Jacobin Review and Magazine* (1798-1821), and the *British Critic* (1793-1843), the organ of the High Church party, and first edited by Archdeacon Nares and Beloe.

These periodicals had now become extremely numerous, and many of the leading London publishers found it convenient to maintain their own particular organs. It is not a matter of surprise, therefore, that the authority of the reviews should have fallen somewhat in public estimation. The time was ripe for one which should be quite independent of the booksellers, and which should also aim at a higher standard of excellence. As far back as 1755 Adam Smith, Blair, and others had endeavoured to carry on such a quarterly without achieving success, and in 1773 Gilbert Stuart and William Smellie issued during three years an *Edinburgh Magazine and Review*. To the northern capital is also due the first high-class critical journal which has kept up its reputation to the present day. The *Edinburgh Review* was established in 1802 by Jeffrey, Scott, Horner, Brougham, and Sydney Smith. It created a new era in periodical criticism, and assumed from the commencement a wider range and more elevated tone than any of its predecessors. The first editor was Sydney Smith, then Jeffrey for many years, and afterwards Macvey Napier. At one time 20,000 copies are said to have been published, but the circulation declined in 1832 to less than 9000. Scott, being dissatisfied with the new review, persuaded John Murray to start its brilliant Tory competitor, the *Quarterly Review* (1809), first edited by William Gifford, then by Sir J. T. Coleridge, and subsequently by J. G. Lockhart. The *Westminster Review* (1824), established by the disciples of Jeremy Bentham, advocated radical reforms

in church, state, and legislation. In 1836 it was joined to the *London Review* (1829), founded by Sir William Molesworth, and then bore the name of the *London and Westminster Review* till 1851, when it returned to the original title. The other quarterly reviews are the *Eclectic Review* (1805-68), edited down to 1834 by Josiah Conder and supported by the Dissenters; the *British Review* (1811-25), the *Christian Remembrancer* (1819-68); the *Retrospective Review* (1820-26, 1828, 1853-54), for old books; the *Foreign Quarterly Review* (1827-46), afterwards incorporated with the *Westminster*; the *Foreign Review* (1828-29); the *Dublin Review* (1836), still continued as the organ of the Roman Catholics; the *Foreign and Colonial Quarterly Review* (1843-47); the *Prospective Review* (1845-55), given up to theology and literature, previously the *Christian Teacher* (1835-44); the *North British Review* (1844-71); the *British Quarterly Review* (1845), successor to the *British and Foreign Review* (1835-44); the *New Quarterly Review* (1852-61); the *Scottish Review* (1853-62), published at Glasgow; the *Wesleyan London Quarterly Review* (1853); the *National Review* (1855-64); the *Diplomatic Review* (1855-81); the *Irish Quarterly Review* (1851-59), brought out in Dublin; the *Home and Foreign Review* (1862-64); the *Fine Arts Quarterly Review* (1863-65); the *New Quarterly Magazine* (1873-80); the *Catholic Union Review* (1863-74); the *Anglican Church Quarterly Review* (1875); *Mind* (1876), dealing with mental philosophy; the *Modern Review* (1880); and the *Scottish Review* (1882).

The monthly reviews include the *Christian Observer* ^{Moasn.} (1802-57), conducted by members of the established church ^{lies.} upon evangelical principles, with Zachary Macaulay as the first editor; and the *Monthly Repository* (1806-37), originally purely theological, but after coming into the hands of the Rev. W. J. Fox made entirely literary and political. The *Fortnightly Review* (1865) was intended as a kind of English *Revue des Deux Mondes*. Since 1866 it has appeared monthly. The *Contemporary Review* (1866) and the *Nineteenth Century* (1877) are similar in character, consisting of signed articles by men of mark of all opinions upon questions of the day. The *National Review* (1883) was brought out to supply the demand for an exclusively Conservative review, and *Modern Thought* (1879) for the free discussion of political, religious, and social subjects.

The weekly reviews dealing generally with literature, ^{weel} science, and art are the *Literary Gazette* (1817-62), first ^{lies.} edited by William Jerdan, which had for many years a circulation of 6000 copies; the *Athenæum* (1828), established by Silk Buckingham, but which was not very successful until it was taken over by C. W. Dilke; and the *Academy* (1869), founded, and at first edited, by Dr Appleton. Those which also include political and social topics are the *Examiner* (1808-81), the *Spectator* (1828), the *Saturday Review* (1855), and the *Chronicle* (1867-68). The reviews in the *Academy* are signed.

Soon after the introduction of the literary journal in England, one of a more familiar tone was started by the eccentric John Dunton in the *Athenian Gazette*, or *Casistical Mercury*, resolving all the most Nice and Curious Questions (1689/90 to 1695/96), a kind of forerunner of *Notes and Queries*, being a penny weekly sheet, with a quarterly critical supplement. In the last part the publisher announces that it will be continued "as soon as ever the glut of news is a little over." Defoe's *Review* (1704-13) dealt chiefly with politics and commerce, but the introduction in it of what its editor fittingly termed the "scandalous club" was another step nearer the papers of Steele and the periodical essayists, the first attempts to create an organized popular opinion in matters of taste and manners. These little papers, rapidly thrown off for a temporary purpose, were destined to form a very important part of

¹ Archibald Bower (1686-1766) was educated at Douai, and became a Jesuit. He subsequently professed himself a convert to the Anglican Church, and published a number of works, but was more esteemed for his ability than for his moral character.

² The biographers of Goldsmith have made us familiar with the name of Griffiths, the prosperous publisher, with his diploma of LL.D. granted by an American university, and with the quarrels between him and the poet.

the literature of the 18th century, and in some respects its most marked feature. Although the frequenters of the clubs and coffee-houses were the persons for whom the essay-papers were mainly written, a proof of the increasing refinement of the age is to be found in the fact that now for the first time were women specially addressed as part of the reading public. The *Tatler* was commenced by Richard Steele in 1709, and issued thrice a week until 1711. The idea was at once extremely popular, and a dozen similar papers were started within the year, at least one half bearing colourable imitations of the title. Addison contributed to the *Tatler*, and together with Steele established and carried on the *Spectator* (1710-14), and subsequently the *Guardian* (1713). The newspaper tax enforced in 1712 was a sore blow. Before this time the daily issue of the *Spectator* had reached 3000 copies; it then fell to 1600; the price was raised from a penny to twopence, but the paper came to an end in 1714. Dr Drake (*Essays illustr. of the Rambler*, &c., ii. 490) drew up an imperfect list of the essayists, and reckoned that from the *Tatler* to Johnson's *Rambler*, during a period of forty-one years, 106 papers of this description were published. Dr Drake continued the list down to 1809, and described altogether 221 which had appeared within a hundred years. The following is a list of the most considerable, with their dates, founders, and chief contributors.

Tatler (12th April 1709 to 2d January 1710/11), Steele, Addison, Swift, Hughes, &c.; *Spectator* (1st March 1710/11 to 20th December 1714), Addison, Steele, Budgell, Hughes, Grove, Pope, Parnell, Swift, &c.; *Guardian* (12th March 1713 to 1st October 1713), Steele, Addison, Berkeley, Pope, Tickell, Budgell, &c.; *Rambler* (20th March 1750 to 14th March 1752), Johnson; *Adventurer* (7th November 1752 to 9th March 1754), Hawkesworth, Johnson, Bathurst, Warton, Chabone; *World* (4th January 1753 to 30th December 1756), E. Moore, earl of Chesterfield, R. O. Cambridge, earl of Orford, Soame Jenyns, &c.; *Connoisseur* (31st January 1754 to 30th September 1756), Colman, Thornton, Warton, earl of Cork, &c.; *Idler* (15th April 1758 to 5th April 1760), Johnson, Sir J. Reynolds, and Bennet Langton; *Bee* (6th October 1759 to 24th November 1759), O. Goldsmith; *Mirror* (23d January 1779 to 27th May 1780), Mackenzie, Craig, Abercromby, Home, Bannatyne, &c.; *Lounger*, (5th February 1785 to 6th January 1787), Mackenzie, Craig, Abercromby, Tytler; *Observer* (1785 to 1790), Cumberland; *Looker-on* (10th March 1792 to 1st February 1794), W. Roberts, Peresford, Chalmers.

As from the "pamphlet of news" arose the weekly paper wholly devoted to the circulation of news, so from the general newspaper was specialized the weekly or monthly review of literature, antiquities, and science, which, when it included essay-papers, made up the magazine or miscellaneous repository of matter for information and amusement. Several monthly publications had come into existence since 1681, but perhaps the first germ of the magazine is to be found in the *Gentleman's Journal* (1691-94) of Peter Motteux, which, besides the news of the month, contained miscellaneous prose and poetry. In 1722 Dr Samuel Jebb included antiquarian notices as well as literary reviews in his *Bibliotheca Literaria* (1722-24), but the *Gentleman's Magazine*, founded in 1731, fully established, through the tact and energy of the publisher Edward Cave, the type of the magazine, from that time so marked a feature of English periodical literature. This magazine, so long a source of fortune to its successive owners, was vainly offered during four years to different publishers before Cave was able to start it himself. The first idea is due to Motteux, from whom the title, motto, and general plan were borrowed. The chief feature in the new venture at first consisted of the analysis of the journals, which Cave undertook personally. Prizes were offered for poetry. In April 1732 the leading metropolitan publishers, jealous of the interloper Cave, started the *London Magazine*, or *Gentleman's Monthly Intelligencer* (1732-84), which

had a long and prosperous career. The new magazine closely copied Cave's title, plan, and aspect, and bitter war was long waged between the two. The rivalry was not without benefit to the literary public, as the conductors of each used every effort to improve their own review. Cave introduced the practice of giving engravings, maps, and portraits, but his greatest success was the addition of Johnson to the regular staff. This took place in 1738, when the latter wrote the preface to the volume for that year, observing that the magazine had "given rise to almost twenty imitations of it, which are either all dead or very little regarded." The plan was also imitated in Denmark, Sweden, and Germany. Cave edited his magazine down to his death in 1754, when it was continued by his brother-in-law David Henry, afterwards by John Nichols and his son. The specially antiquarian and historical features were dropped in 1868, and it was changed to a miscellany of light literature.

Many other magazines were produced in consequence of the success of these two. It will be sufficient to mention the following. The *Scots Magazine* (1739-1817) was the first published in Scotland; from 1817 to 1826 it was styled the *Edinburgh Magazine*. The *Universal Magazine* (1747) had a short, if brilliant, career; but the *European Magazine*, founded by James Perry in 1782, lasted down to 1826. Of more importance than these, or than the *Royal Magazine* (1759-71), was the *Monthly Magazine* (1796-1843), with which Priestley and Godwin were originally connected. During thirty years the *Monthly* was conducted by Sir Richard Phillips, under whom it became more statistical and scientific than literary. Class magazines were represented by the *Edinburgh Farmer's Magazine* (1800-25) and the *Philosophical Magazine* (1798), established in London by Alexander Tilloch; the latter at first consisted chiefly of translations of scientific articles from the French. The following periodicals, all of which date from the 18th century, are still published:—the *Gentleman's Magazine* (1731), the *Gospel Magazine* (1768), *Wesleyan Methodist Magazine* (1778), *Curtis's Botanical Magazine* (1786), *Evangelical Magazine* (1793), *Methodist New Connexion Magazine* (1797), *Philosophical Magazine* (1798).

The increased influence of this class of periodical upon the public opinion of our own era was first apparent in *Blackwood's Edinburgh Magazine*, founded in 1817 by the publisher of that name, and carried to a high degree of excellence by the contributions of Scott, Lockhart, Hogg, Maginn, Syme, and John Wilson, the editor. It is still issued, and has always remained Liberal in literature and Conservative in politics. The *New Monthly Magazine* is somewhat earlier in date. It was founded in 1814 by the London publisher Colburn, and was edited in turns by Campbell, Theodore Hook, Bulwer Lytton, and Ainsworth. Many of Carlyle's and Thackeray's pieces first appeared in *Fraser's Magazine* (1830), long famous for its personalities and its gallery of literary portraits. The *Metropolitan Magazine* was started in opposition to *Fraser*, and was first edited by Campbell, who had left its rival. It subsequently came into the hands of Captain Marryatt, who printed in it many of his sea-tales. The *British Magazine* (1832-49) included religious and ecclesiastical information. From Ireland came the *Dublin University Magazine* (1833). The regular price of these magazines was half a crown; the first of the cheaper ones was *Tait's Edinburgh Magazine* (1832-61) at a shilling. It was Radical in politics, and had Roebuck as one of its founders. *Bentley's Miscellany* (1837-68) was exclusively devoted to novels, light literature, and travels. Several of Ainsworth's romances, illustrated by Cruikshank, first saw the light in *Bentley's*. The *Nautical Magazine* (1832) was addressed specially to

sailors, and Colburn's *United Service Journal* (1829) to both services. The *Asiatic Journal* (1816) dealt with Oriental subjects.

From 1815 to 1820 a number of low-priced and unwholesome periodicals flourished. The *Mirror* (1823-49), a two-penny illustrated magazine, begun by John Limbird,¹ and the *Mechanics Magazine* (1823) were steps in a better direction. The political agitation of 1831 led to a further popular demand, and a supply of cheap and healthy serials for the reading multitude commenced with *Chambers's Edinburgh Journal* (1832), the *Penny Magazine* (1832-45) of Charles Knight, issued under the patronage of the Society for the Diffusion of Useful Knowledge, and the *Saturday Magazine* (1832-44), begun by the Society for Promoting Christian Knowledge. The first was published at 1½d. and the last two at 1d. Knight secured the best authors and artists of the day to write for and illustrate his magazine, which, though at first a commercial success, may have had the reason of its subsequent discontinuance in its literary excellence. At the end of 1832 it had reached a sale of 200,000 in weekly numbers and monthly parts. It came to an end in 1845 and was succeeded by *Knight's Penny Magazine* (1845), which was stopped after six monthly parts. These periodicals were followed by a number of penny weeklies of a lower tone, such as the *Family Herald* (1843), the *London Journal* (1845), and *Lloyd's Miscellany*; the two former are still thriving. In 1850 the sale of the first of them was placed at 175,000 copies, the second at 170,000, and *Lloyd's* at 95,000. In 1846 fourteen penny and three halfpenny magazines, twelve social journals, and thirty-seven book-serials were produced every week in London. A further and permanent improvement in cheap weeklies for home reading may be traced from the foundation of *Howitt's Journal* (1847-49), and more especially *Household Words* (1850), conducted by Charles Dickens, *All the Year Round* (1859), by the same editor, and afterwards by his son, *Once a Week* (1859), and the *Leisure Hour* (1852). The plan of *Notes and Queries* (1849), for the purpose of intercommunication among those interested in special points of literary and antiquarian character, has led to the adoption of similar departments in a great number of newspapers and periodicals, and, besides several imitators in England, there are now parallel journals in Holland, France, and Italy.

Recent shilling monthlies began with *Macmillan* (1859), the *Cornhill* (1860), and *Temple Bar* (1860). The *Cornhill*, first edited by Thackeray, was known for its specially literary tone down to 1883. *St James's Magazine* (1861), *Belgravia* (1866), *St Paul's* (1867-74), *London Society* (1862), and *Tinsley's* (1867) are devoted chiefly to novels and light reading. The sixpenny illustrated magazines commenced with *Good Words* (1860) and the *Quiver* (1861), both religious in tendency. In 1882 *Fraser* changed its name to *Longman's Magazine*, and was entirely popularized and reduced to sixpence. The *Cornhill* followed the same example in 1883, reducing its price to sixpence and devoting its pages to light reading. The *English Illustrated Magazine* (1883) was brought out in competition with the American *Harper and Century*. Of the artistic periodicals we may signalize the *Art Journal* (1849), long known for its line engravings, the *Portfolio* (1870), which has done much to popularize etching, and the *Magazine of Art* (1878).

The following statistics furnish an idea of the marvelous increase in the number of periodicals issued at different times during the last fifty years. In figures submitted

to the House of Commons in 1864 Sir Edward Baines estimated the circulation of the monthly magazines in 1831 at no more than 125,000 copies; when he spoke the number had increased to 3,609,350. The weeklies might be reckoned in 1831 at about equal to the monthlies in circulation, and the miscellaneous serials at 120,000, amounting altogether to 420,000 copies. In 1864 the circulation of weeklies and monthlies reached a total of 6,094,950 (*Journal of Statist. Soc.*, 1864, pp. 410-412). Concurrently with this increase in the whole number published there may be observed an equally regular decrease in the average cost of each. In 1831 there were issued in London alone 177 monthlies, costing £17, 12s. 6d., or an average of 2s. apiece. At the end of 1833 there were 236 of the same class, costing £23, 3s. 6d., and the average price had decreased to 1s. 11½d. Twenty years later, in 1853, there were 362 monthlies, costing £14, 17s. 6d., the average cost of each being now only 9½d. (Knight's *Old Printer and Modern Press*, 263).

In London itself the increase of the weeklies, monthlies, and quarterlies at different periods has been as follows:—

| | Weekly | Monthly | Quarterly, | Total |
|------|----------------------------------|---------|------------|-------|
| 1838 | 21 | 236 | 26 | 283 |
| 1837 | 50 | 183 | 84 | 220 |
| 1844 | 60 | 237 | 83 | 325 |
| 1853 | 56 | 362 | 50 | 468 |
| 1863 | { Included in } { monthlies } | 453 | 75 | 528 |
| 1874 | 60 | 463 | 84 | 596 |
| 1884 | 110 | 669 | 126 | 905 |

Extending the inquiry to the whole of the United Kingdom, and including every description of periodical, with the exception of annuals and newspapers, May's *British and Irish Press Guide* for the years 1874 and 1884 supplies this comparison:—

| | 1874. | 1884. | | 1874 | 1884 |
|--------------------|-------|-------|--------------------------|------|------|
| Metropolis | 541 | 771 | Daily | 1 | 12 |
| England | 66 | 104 | Three times a week | 2 | 2 |
| Wales | 15 | 26 | Weekly | 68 | 114 |
| Scotland | 27 | 61 | Twice a month | 5 | 13 |
| Ireland | 11 | 25 | Monthly | 482 | 699 |
| Channel Isles, &c. | 2 | 8 | Bi-monthly | 5 | 9 |
| Total | 662 | 1041 | Quarterly | 84 | 129 |
| | | | Half-yearly | 4 | 16 |
| | | | Irregular | 28 | 47 |
| | | | Total | 662 | 1041 |

The chief classes into which the same periodicals may be divided are:—

| | Religious. | Illustrated. | Juvenile. | Trade-organs. |
|------|------------|--------------|-----------|---------------|
| 1863 | 196 | 175 | 69 | 64 |
| 1874 | 297 | 833 | 100 | 181 |
| 1884 | 350 | 833 | 100 | 187 |

Among the different periodicals issued in 1884 there were also 73 advocating temperance, 28 devoted to agriculture, 57 family magazines, 31 financial, 15 insurance, 18 medical, 7 secularist, 9 tailoring, and 7 bicycling.

Indexes to English Periodicals.—Lists of the separate indexes to particular series are given in H. B. Wheatley's *What is an Index?* 1879, and *List of Bibliographies in the Reading Room of the British Museum*, 1881. The valuable and elaborate work of W. F. Poole, *Index to Periodical Literature*, Boston (Massachusetts), 1832, supplies an exhaustive alphabetical index to the titles of articles in 6205 volumes of English and American serials of the present century. Monthly supplements appear in the *Library Journal*.

Authorities.—"Periodicals," in the British Museum catalogue; Lowndes, *Bibliographer's Manual*, by Hy. G. Bohn, 1884; *Cat. of Periodicals in the Bodl. Lib.*, part i., "English Periodicals," 1878; *Cat. of the Hope Collection of Early Newspapers and Essayists in the Bodl. Lib.*, 1865; Scudder, *Cat. of Scientific Serials*, 1879; Andrews, *Hist. of Brit. Journalism*, 1859; Cuheval Clarigny, *Hist. de la Presse en Angleterre et aux États-Unis*, 1857; Madden, *Hist. of Irish Period. Lit.*, 1867; J. Grant, *The Great Metropolis*, ii. pp. 229-237; "Periodical Essays of the Age of Anne," in *N. American Rev.*, xlv.; Drake, *Essays on the "Spectator," "Tatler," &c.*, 1810-14; Courthope, *Addison* ("Engl. Men of Letters"), 1884; "Forgotten Periodical Publications," in *Notes and Queries*, ser. iii., vol. ix. 63; "Account of Periodical Literary Journals from 1681 to 1749," by S. Parkes, in *Quart. Journ. of Sc., Lit., &c.*, xlii. 36, 289; "Last Century Magazines," in *Fraser's*

¹ John Limbird, to whom even before Chambers or Knight is due the carrying out the idea of a cheap and good periodical for the people, died so recently as 31st October 1883, without having achieved the worldly prosperity of his two followers.

Mag., Sept. 1876, 925; "Periodicals during 1712-32," in *Notes and Queries*, ser. iii., vol. ix. 72, &c., x. 134; "Catholic Period. India and the British Colonies.—The first Indian periodical was the *Calcutta Monthly Register* (1790), which lasted but a short time. A *Calcutta Literary Gazette* came out in 1830. In 1844 appeared the first number of the *Calcutta Review* (1844), which is still the most important serial of the Indian empire. The *Bombay Quarterly Review* was founded in 1855. Madras had a *Journal of Literature and Science* and the *Oriental Magazine and Indian-Hurkuru* (1819). The *Religious and Theological Magazine* was produced at Colombo in 1833. The *Christian College Magazine* was commenced in 1833. At Singapore the *Journal of the Indian Archipelago* appeared from 1847 to 1855. The *Chinese Repository* (1832), edited at Canton by Morrison, dealt with the farther East.

See "Periodical Literature in India" in *Dark Blue*, 1872-73.

Hubbard (*Newspaper Directory*) estimates the existing periodicals (omitting newspapers) of British North America at 652.

The number of weekly, monthly, and quarterly publications of Australia, Tasmania, and New Zealand is placed by the same authority at 570. The *Melbourne Review* (1876) deserves special mention.

FOREIGN.

France.—We owe the literary journal to France, where it soon attained to a degree of importance unapproached in any other country. The first idea may be traced in the *Bureau d'Adresse* of Théophraste Renaudot, giving the proceedings of his conferences upon literary and scientific matters (1633-42). About the year 1663 Mézeray obtained a privilege for a regular literary periodical, which came to nothing, and it was left to Denis de Sallo, counsellor of the parliament of Paris and a man of rare merit and learning, to actually carry the project into effect. The first number of the *Journal des Savants* appeared on 5th January 1665, under the assumed name of the sieur d'Hédouville. The prospectus promised to give an account of the chief books published throughout Europe, obituary notices, a review of the progress of science, besides legal and ecclesiastical information and other matters of interest to cultivated persons. The criticisms, however, wounded alike authors and the clergy, and the journal was suppressed after a career of three months. Colbert, seeing the public utility of such a periodical, ordered the abbé Gallois, a contributor of De Sallo's, to re-establish it, an event which took place on 4th January 1666. It lingered nine years under the new editor, who was replaced in 1675 by the abbé de la Roque, and the latter in his turn by the president Consin in 1686. From 1701 commenced a new era for the *Journal*, which was then acquired by the chancellor de Pontchartrain for the state and placed under the direction of a commission of learned men. Just before the Revolution it developed fresh activity, but the troubles of 1792 caused it to be discontinued until 1796, when it again failed to appear after twelve numbers had been issued. In 1816 it was definitively re-established and replaced under Government patronage, remaining subject to the chancellor or garde-des-sceaux until 1857, when it was transferred to the control of the minister of public instruction. The present organization much resembles that of an academy. The members of the commission are elected, approved of by the minister, and divided into assistants and authors, the latter furnishing at least three articles per annum at a fixed and modest rate of payment. All communications are discussed at fortnightly conferences.

Louis Auguste de Bourbon, sovereign prince of Dombes, having transferred his parliament to Trévoux, set up a printing press, and was persuaded by two Jesuits, Michel le Tellier and Philippe Lallouman, to establish the *Mémoires pour servir à l'Histoire des Sciences et des Arts* (1701-67), more familiarly known as the *Journal de Trévoux*, long the best-informed and best-written journal in France. One feature of its career was its constant appeal for the literary assistance of outsiders. It was continued in a more popular style as *Journal des Sciences et des Beaux-Arts* (1768-75) by the abbé Aubert and by the brothers Castillon (1776-78), and as *Journal de Littérature, des Sciences, et des Arts* (1779-82) by the abbé Grosier.

The first legal periodical was the *Journal du Palais* (1672) of Blondeau and Guéret, and the first devoted to medicine the *Nouvelles Découvertes dans toutes les Parties de la Médecine* (1679) of Nicolas de Blégné, frequently spoken of as a charlatan, a term which sometimes means simply a man of many ideas. Religious periodicals date from 1680 and the *Journal Ecclésiastique* of the abbé de la Roque. The prototype of the historic-literary periodical may be discovered in *La Clef du Cabinet des Princes de l'Europe* (1704-5), familiarly known as *Journal de Verdun*, and carried on under various titles down to 1794.

Literary criticism was no more free than political discussion, and

no person was allowed to trespass either upon the domain of the *Journal des Savants* or that of the *Mercure de France* without the payment of heavy subsidies. This was the origin of the clandestine press of Holland, and it was that country which for the next hundred years supplied the ablest periodical criticism from the pens of French Protestant refugees. During that period thirty-one journals of the first class proceeded from these sources. From its commencement the *Journal des Savants* was pirated in Holland, and for ten years a kind of joint issue made up with the *Journal des Trévoux* appeared at Amsterdam. From 1764 to 1775 miscellaneous articles from different French and English reviews were added to this reprint. Bayle, a born journalist and the most able critic of the day, conceived the plan of the *Nouvelles de la République des Lettres* (1684-1718), which at once became entirely successful and obtained for him during the three years of his control the dictatorship of the world of letters. He was succeeded as editor by La Roque, Barrin, Bernard, and Leclerc. Bayle's method was followed in an equally meritorious periodical, the *Histoire des Ouvrages des Savants* (1687-1704) of H. Basnage de Beauval. Another continuator of Bayle was Jean Leclerc, one of the most learned and acute critics of the 18th century, who carried on three reviews, the *Bibliothèque Universelle et Historique* (1686-93), the *Bibliothèque Choisie* (1703-13), and the *Bibliothèque Ancienne et Moderne* (1714-27). They form one series, and, besides valuable estimates of new books, include original dissertations, articles, and biographies like our modern learned magazines. The *Journal Littéraire* (1713-22, 1729-36) was founded by a society of young men, who made it a rule to discuss their contributions in common. Specially devoted to English literature were the *Bibliothèque Anglaise* (1716-23), the *Mémoires Littéraires de la Grande Bretagne* (1720-24), the *Bibliothèque Britannique* (1733-34), and the *Journal Britannique* (1750-57) of Maty,¹ who took for his principle, "pour penser avec liberté il faut penser seul." One of these Dutch-printed reviews was *L'Europe Savante* (1718-20), founded chiefly by Themiseul de Saint-Hyacinthe, with the intention of placing each separate department under the care of a specialist. The *Bibliothèque Germanique* (1720-40) was established by Jacques Lenfant to do for northern Europe what the *Bibliothèque Britannique* did for England. It was followed by the *Nouvelle Bibliothèque Germanique* (1746-59). The *Bibliothèque Raisonnée des Ouvrages des Savants* (1728-58) was supplementary to Leclerc, and was succeeded by the *Bibliothèque des Sciences et des Beaux-Arts* (1754-80). Nearly all of the preceding were produced either at Amsterdam or Rotterdam, and, although out of place in a precise geographical arrangement, really belong to France by the close ties of language and of blood.

Taking up the exact chronological order again, we find the success of the English essay-papers led to their prompt introduction to the Continent. An incomplete translation of the *Spectator* was published at Amsterdam in 1714, and many volumes of extracts from the *Teller*, *Spectator*, and *Guardian* were issued in France early in the 18th century. Marivaux brought out a *Spectateur Français* (1722), which was coldly received; it was followed by fourteen or fifteen others under the titles of *La Spectatrice* (1728-30), *Le Radoteur* (1775), *Le Babillard* (1778-79), &c. Of a similar character was *Le Pour et le Contre* (1723-40) of the abbé Prévost, which contained anecdotes and criticisms, with special reference to Great Britain. Throughout the 18th century, in France as in England, a favourite literary method was to write of social subjects under the assumed character of a foreigner, generally an Oriental, with the title of *Turkish Spy*, *Lettres Chinoises*, &c. These productions were usually issued in periodical form, and, besides an immense amount of worthless tittle-tattle, contain some valuable matter.

During the first half of the century France has little of importance to show in periodical literature. The *Nouvelles Ecclésiastiques* (1728-1803) were first printed and circulated secretly by the Jansenists in opposition to the *Constitution Unigenitus*. The Jesuits retaliated with the *Supplément des Nouvelles Ecclésiastiques* (1734-48). The promising title may have had something to do with the temporary success of the *Mémoires Secrets de la République des Lettres* (1744-48) of the marquis d'Argens. In the *Observations sur les Ecrits Modernes* (1735-43) Desfontaines held the gates of Philistia for eight years against the Encyclopedists and even the redoubtable Voltaire himself. It was continued by the *Jugements sur quelques Ouvrages nouveaux* (1744-45). The usmo of Fréron, perhaps the most vigorous enemy Voltaire ever encountered, was long connected with *Lettres sur quelques Ecrits de ce Temps* (1749-54), followed by *L'Année Littéraire* (1754-90). Among the contributors of Fréron was another manufacturer of criticism, the abbé de la Porte, who, having quarrelled with his confrère, founded *Observations sur la Littérature Moderne* (1749-52) and *L'Observateur Littéraire* (1758-61).

A number of special organs came into existence about this period. The first treating of agriculture and domestic economy was the *Journal Economique* (1751-72); a *Journal de Commerce* was founded

¹ Matthew Maty, M.D., born in Holland, 1718, died principal librarian of the British Museum, 1776. He settled in England in 1740, published several books, and wrote the preface to Gibbon's first work, *Etude de la Littérature*.

in 1759; periodical biography may be first seen in the *Nécrologe des Hommes Célèbres de France* (1764-82); the political economists established the *Ephémérides du Citoyen* in 1765; the first *Journal d'Éducation* was founded in 1768, and the *Courrier de la Mode* in the same year; the theatre had its first organ in the *Journal des Théâtres* (1770); in the same year were produced a *Journal de Musique* and the *Encyclopédie Militaire*; the sister service was supplied with a *Journal de Marine* in 1778. We have already noticed several journals specially devoted to one or other foreign literature. It was left to Fréron, Grimm, Prévost, and others in 1754 to extend the idea to all foreign productions, and the *Journal Étranger* (1754-62) was founded for this purpose. The *Gazette Littéraire* (1764-66), which had Voltaire, Diderot, and Saint-Lambert among its editors, was intended to swamp the small fry of criticism; the *Journal des Dames* (1759-78) was of a light magazine class; and the *Journal de Monsieur* (1776-83) had three phases of existence, and died after extending to thirty volumes. The *Mémoires Secrets pour servir à l'Histoire de la République des Lettres* (1762-87), better known as *Mémoires de Bachaumont*, from the name of their founder, furnish a minute account of the social and literary history for a period of twenty six years. Of a similar character was the *Correspondance Littéraire Secrète* (1774-93), to which Métra was the chief contributor. *L'Esprit des Journaux* (1772-1818) forms an important literary and historical collection, which is rarely to be found complete.

The movement of ideas at the close of the century may best be traced in the *Annales Politiques, Civiles, et Littéraires* (1777-92) of Linguet. The *Décade Philosophique* (year V. or 1796/97), founded by Ginguené, is the first periodical of the magazine class which appeared after the storms of the Revolution. It was a kind of resurrection of good taste; under the empire it formed the sole refuge of the opposition. By a decree of 17th January 1800 the consulate reduced the number of Parisian journals to thirteen, of which the *Décade* was one; all the others, with the exception of those dealing solely with science, art, commerce, and advertisements, were suppressed. A report addressed to Bonaparte by Fiévée¹ in the year XI. (1802-3) furnishes a list of fifty-one of these periodicals. In the year XIII. (1804/5) only seven non-political serials were permitted to appear.

Between 1815 and 1819 there was a constant struggle between freedom of thought on the one hand and the censorship, the police, and the law-officers on the other. This oppression led to the device of "semi-periodical" publications, of which *La Minerve Française* (1818-20) is an instance. It was the *Satire Ménippée* of the Restoration, and was brought out four times a year at irregular intervals. Of the same class was the *Bibliothèque Historique* (1818-20), another anti-royalist organ. The censorship was re-established in 1820 and abolished in 1828 with the monopoly. It has always seemed impossible to carry on successfully in France a review upon the lines of those which have become so numerous and important in England. The short-lived *Revue Française* (1823-30), founded by Guizot, Rémusat, De Broglie, and the *doctrinaires*, was an attempt in this direction. The well-known *Revue des Deux Mondes* was established in 1829 by Ségur-Dupeyron and Mauroy, but it ceased to appear at the end of the year, and its actual existence dates from its acquisition in 1831 by François Buloz,² a masterful editor, under whose energetic management it soon achieved a world-wide reputation. The most distinguished names in French literature have been among its contributors, for whom it has been styled the "vestibule of the Academy." It was preceded by a few months by the *Revue de Paris* (1829-45), founded by Véron, who introduced the novel to periodical literature. In 1834 this was purchased by Buloz, and brought out concurrently with his other *Revue*. While the former was exclusively literary and artistic, the latter dealt more with philosophy. The *Revue Indépendante* (1841-48) was founded by Pierre Leroux, George Sand, and Viardot for the democracy. The times of the consulate and the empire were the subjects dealt with by the *Revue de l'Empire* (1842-48). In *Le Correspondant* (1843), established by Montalembert and De Falloux, the Catholics and Legitimists had a valuable supporter. The *Revue Contemporaine* (1852), founded by the comte de Belval as a royalist organ, had joined to it in 1856 the *Athenæum Français*. The *Revue Germanique* (1858) exchanged its exclusive name and character in 1865 to the *Revue Moderne*. The *Revue Européenne* (1859) was at first subventioned like the *Revue Contemporaine*, from which it soon withdrew Government favour. The *Revue Nationale* (1860) appeared quarterly, and succeeded to the *Magasin de Librairie* (1853).

The list of current periodicals, to which should be added the

Revue des Deux Mondes and the *Correspondant*, include the following. Among those devoted to literature and criticism may be mentioned the *Revue Britannique* (1825); the *Revue Critique d'Histoire et de Littérature* (1866), one of the first of European weekly reviews; *Revue Politique et Littéraire*, successor to the *Revue des Cours Littéraires* (1863), also weekly; *Le Livre* (1880), confined to bibliography and literary history, monthly; and the *Nouvelle Revue* (1879), already a serious rival of the *Revue des Deux Mondes*, which it resembles in character and mode of publication, although distinctly Republican in politics. History and archaeology are represented by the *Bibliothèque de l'École des Chartes* (1839), which deals especially with the Middle Ages, and is published every two months; the *Cabinet Historique* (1855), a monthly, devoted to MSS. and unpublished documents; the *Revue Historique* (1876), two-monthly; and the monthly *Revue Archéologique* (1860). The fine arts are cared for by the *Gazette des Beaux-Arts* (1859), monthly, and *L'Art* (1875), published weekly. We may also mention the *Revue Philosophique* (1876), monthly, and *Le Tour du Monde* (1860), an illustrated weekly, consisting entirely of voyages and travels.

In 1833, apart from political newspapers, there were published in Paris 1379 periodicals of all kinds. They may be classified in the following order:—theology 96, jurisprudence 130, reviews 75, popular reading 169, history and geography 37, political economy and finance 243, science generally 26, mathematics 6, medicine 101, natural science 21, military 14, naval 12, fine arts 75, fashion 81, education 46, technology 137, agriculture 46, sport 24, miscellaneous 40.

Authorities.—The subject of French periodicals has been exhaustively treated in the valuable works of Eugène Hatin, *Histoire de la Presse en France*, 1859-61, 8 vols.; *Les Gazettes de Hollande et la Presse Clandestine aux 17^e et 18^e Siècles*, 1865; and *Bibliographie de la Presse Périodique Française*, 1866. See also *Catalogue de l'Histoire de France*, 1855-79, 11 vols.; V. Gêbe, *Catalogue des Journaux*, etc., publiés à Paris, 1879; Brunet, *Manuel du Libraire*, avec Supplément, 1860-80, 8 vols.; H. Le Soudier, *Catalogue-tarif des Journaux, Revues, et Publications Périodiques parus en France jusqu'en 1883*, 1883; F. Mège, *Les Journaux et Revues Périodiques de la Basse Auvergne*, 1869.

Germany.—The earliest trace of the literary journal in Germany is to be found in the *Erbauliche Monatsunterredungen* (1663) of the poet Johann Rist and in the *Miscellanea curiosa medico-physica* (1670-1704) of the Academia naturæ curiosorum Leopoldina-Carolina, the first scientific annual, uniting the features of the *Journal des Savants* and of the *Philosophical Transactions*. D. G. Morhof, the author of the well-known *Polyhistor*, conceived the idea of a monthly serial to be devoted to the history of modern books and learning, which came to nothing. While professor of morals at Leipzig, Otto Mencke planned the *Acta Eruditorum*, with a view to make known, by means of analyses, extracts, and reviews, the new works produced throughout Europe. In 1680 he travelled in England and Holland in order to obtain literary assistance, and the first number appeared in 1682, under the title of *Acta Eruditorum Lipsiensium*, and, like its successors, was written in Latin. Among the contributors to subsequent numbers were Leibnitz, Seckendorf, and Cellarius. A volume came out each year, with supplements. After editing about 30 volumes Mencke died, leaving the publication to his son, and the *Acta* remained in the possession of the family down to 1745, when they extended to 117 volumes, which form an extremely valuable history of the learning of the period. A selection of the dissertations and articles was published at Venice in 7 vols. 4to, 1740. The *Acta* soon had imitators. The *Ephemerides Litterariæ* (1686) came out at Hamburg in Latin and French. The *Nova Litteraria maris Baltici et Septentrionis* (1698-1703) was more especially devoted to north Germany and the universities of Kiel, Rostock, and Dorpat. Supplementary to the preceding was the *Nova Litteraria Germaniæ collecta Hamburgi* (1703-9), which from 1707 widened its field of view to the whole of Europe. At Leipzig was produced the *Teutsche Acta Eruditorum* (1712), an excellent periodical, edited by J. G. Rabener and C. G. Jöcher, and continued from 1740 to 1758 as *Zuerlässige Nachrichten*. It included portraits.

The brilliant and enterprising Christian Thomasius brought out periodically, in dialogue form, his *Monatsgespräche* (1688-90), written by himself in the vernacular, to defend his novel theories against the alarmed pedantry of Germany, and, together with Strahl, Buddeus, and others, *Observationes selectæ ad rem litterariam spectantes* (1700), written in Latin. W. E. Tenzel also published *Monatliche Unterredungen* (1689-98), continued from 1704 as *Curieuse Bibliothek*, and treating various subjects in dialogue form. After the death of Tenzel the *Bibliothek* was carried on under different titles by C. Woltereck, J. G. Krause, and others, down to 1721. Of much greater importance than these was the *Monatlicher Auszug* (1701), supported by J. G. Eccard and Leibnitz. Another periodical on Thomasius's plan was *Neue Unterredungen* (1702), edited by N. H. Gundling. The *Gundlingiana* of the latter person, published at Halle (1715-32), and written partly in Latin and partly in German by the editor, contained a miscellaneous collection of juridical, historical, and theological observations and dissertations.

Nearly all departments of learning possessed their several special periodical organs about the close of the 17th or the beginning of the 18th century. The *Anni Franciscanorum* (1680) was edited by the Jesuit Stiller; and J. S. Adami published, between 1690 and 1713, certain theological repertoires under the name of *Deliciae*.

¹ The novelist and publicist Joseph Fiévée (1767-1839), known for his relations with Napoleon I., has been made the subject for a study by Sainte-Beuve (*Causeries*, v. 172).

² This remarkable man (1804-1877) began life as a shepherd. Educated through the charity of M. Naville, he came to Paris as a compositor, and by translating from the English earned sufficient to purchase the moribund *Revue des Deux Mondes*, which acquired its subsequent position in spite of the tyrannical editorial behaviour of the proprietor. M. Monod (*Academy*, 29th Jan. 1877) states that latterly Buloz enjoyed an income of 365,000 francs from the *Revue*.

Historical journalism was first represented by *Electa Juris Publici* (1709), philology by *Neue Aetna Philologica* (1715-23), philosophy by the *Acta Philosophorum* (1715-27), medicine by *Der patriotische Medikus* (1725), music by *Der musikalische Patriot* (1725), and education by *Die Matrone* (1728). Reference has already been made to the *Miscellanea curiosa medico-physica* (1670-1704); the *Monatliche Erzählungen* (1689) was also devoted to natural science.

Down to the early part of the 18th century Halle and Leipzig were the headquarters of literary journalism in Germany. Other centres began to feel the need of similar organs of opinion. Hamburg had its *Niedersächsische neue Zeitungen*, styled from 1731 *Niedersächsische Nachrichten*, which came to an end in 1736, and Mecklenburg owned in 1710 its *Neuer Vorrath*, besides others brought out at Rostock. Prussia owes the foundation of its literary periodicals to G. P. Schulze and M. Lilienthal, the former of whom began with *Gelehrtes Preussen* (1722), continued under different titles down to 1729; the latter helped with the *Erläutertes Preussen* (1724), and was the sole editor of the *Acta Borussica* (1730-32). Pomerania and Silesia also had their special periodicals in the first quarter of the 18th century. Franconia commenced with *Nova Litteraria*, and Hesse with the *Kurze Historie*, both in 1725. In south Germany appeared the *Württembergische Nebenstunden* (1718), and the *Parnassus Boicus*, first published at Munich in 1722. The *Frankfurter gelehrte Zeitungen* was founded in 1736 by S. T. Hocker, and existed down to 1790. Austria owned *Das merkwürdige Wien*.

In 1715 the *Neue Zeitungen von gelehrten Sachen* was founded by J. G. Krause at Leipzig and carried on by various editors down to 1797. It was the first attempt to apply the form of the weekly political journal to learned subjects, and was imitated in the *Vermischte Bibliothek* (1718-20), and the *Bibliotheca Novissima* (1718-21), both founded by J. G. Francke in Halle. Shortly after the foundation of the university of Göttingen appeared *Zeitungen von gelehrten Sachen* (1739), still famous as the *Göttingische gelehrte Anzeigen*, which during its long and influential career has been conducted by professors of that university, and among others by Haller, Heyne, and Eichhorn.

Influenced by a close study of English writers, the two Swiss Bodmer and Breitinger established *Die Discurse der Mäler* (1721), and, by paying more attention to the matter of works reviewed than to their manner, commenced a critical method new to Germany. The system was attacked by Gottsched, who, educated in the French school, erred in the opposite direction. The war between the two parties gave fresh life to the literature of the country, but German criticism of the higher sort can only be said really to begin with Lessing. The Berlin publisher Nicolai founded the *Bibliothek der schönen Wissenschaften*, and afterwards handed it over to O. F. Weisse in order to give his whole energy to the *Briefe, die neueste Literatur betreffend* (1759-65), carried on by the help of Lessing, Mendelssohn, and Abbt. To Nicolai is also due the *Allgemeine deutsche Bibliothek* (1765-1806), which embraced a much wider field and soon became extremely influential. Herder founded the *Kritische Wälder* in 1766. *Der deutsche Merkur* (1773-89, revived 1790-1810) of Wieland was the solitary representative of the French school of criticism. A new era in German periodical literature began when Bertuch brought out at Jena in 1785 the *Allgemeine Literaturzeitung*, to which the leading writers of the country were contributors. On being transferred to Halle in 1804 it was replaced by the *Jenaische allgemeine Literaturzeitung*, founded by Eichstädt. Both reviews enjoyed a prosperous career down to the year 1848.

At the commencement of the present century we find the *Erlanger Literaturzeitung* (1799-1810), which had replaced a *Gelehrte Zeitung* (1746); the *Leipziger Literaturzeitung* (1800-34); the *Heidelbergerische Jahrbücher der Literatur* (1808); and the *Wiener Literaturzeitung* (1813-16), followed by the *Wiener Jahrbücher der Literatur* (1818-48), both of which received Government support and were like the *Quarterly Review* in their conservative politics and high literary tone. *Hermes*, founded at Leipzig in 1819 by W. T. Krug, was distinguished for its erudition, and came out down to 1831. One of the most remarkable periodicals of this class was the *Jahrbücher für wissenschaftliche Kritik* (1827-40), first published by Cotta. The *Hallische Jahrbücher* (1838-42) was founded by Ruge and Eichtermeyer, and supported by the Government. The *Repertorium der gesammten deutschen Literatur*, established by Gersdorf in 1834, and known after 1843 as the *Leipziger Repertorium der deutschen und ausländischen Literatur*, existed to 1860. Buchner founded the *Literarische Zeitung* at Berlin in 1834. It was continued by Brandes down to 1849. The political troubles of 1848 and 1849 were most disastrous to the welfare of the literary and miscellaneous periodicals. Gersdorf's *Repertorium*, the *Gelehrte Anzeigen* of Göttingen and of Munich, and the *Heidelberg Jahrbücher* were the sole survivors. The *Allgemeine Monatsschrift für Literatur* (1850), conducted after 1851 by Droysen, Nitzsch, and others, continued only down to 1854; the *Literarisches Centralblatt* (1850) had a longer existence. The *Blätter für literarische Unterhaltung* sprang out of the *Literarisches Wochenblatt* (1818), founded by Kotzebue; since 1865 it has been edited by R. Gottschall with considerable

success. Many of the literary journals did not disdain to occupy themselves with the fashions, but the first periodical of any merit specially devoted to the subject was the *Bazar* (1856). The first to popularize science was *Natur* (1852). The *Hausblätter* (1855), a bi-monthly magazine, was extremely successful. The *Salon* (1868) followed more closely the type of the English magazine.

About this period arose a great number of serials for popular reading, known as "Sontagsblätter," of which the *Gartenlaube* (1858) and *Daheim* are examples. Of a more solid character are the *Deutsches Museum* (1851-57) of Prutz and Frenzel; the *Grenzboten*; the *Preussische Jahrbücher* (1858); the *Berliner Revue* (1856); *Unsere Zeit* (1857), at first only a kind of supplement to Brockhaus's *Conversationslexikon*, but now an important review of matters of contemporary interest; *Die Gegenwart* (1872); the new *Literaturzeitung* (1874) of Jena; the *Deutsche Rundschau* (1874), conducted upon the method of the *Revue des Deux Mondes*; and many others.

Periodicals have been specialized in Germany to an extent perhaps unequalled in any other country. Those of a really high class have become so numerous and form so marked a feature in the current literature that it may be useful to give a classified list of the chief of them, including the many *Jahresberichte* which supply summaries of the works published annually in particular departments. BIBLIOGRAPHICAL AND LITERARY:—*Petzhold's neuer Anzeiger*; *Centralblatt für Bibliothekswissenschaft*; *Allgemeine Bibliographie für Deutschland*; *Bibliographie und literarische Chronik der Schweiz*; *Polytechnische Bibliothek*; *Blätter für literarische Unterhaltung*, ed. by Rud. von Gottschall; *Literarisches Centralblatt für Deutschland*; *Die Gegenwart*; *Die Grenzboten*; *Deutsche Rundschau*; *Im neuen Reich*; *Preussische Jahrbücher*; *Magazin für die Literatur des In- und Auslandes*; *Die neue Zeit*; *Archiv f. Literaturgeschichte*; *Westermann's illustrierte deutsche Monatshefte*. THEOLOGY:—*Der Katholik*; *Theologische Literaturzeitung*; *Theologische Studien und Kritiken*; *Theologische Studien aus Württemberg*; *Theologische Quartalschrift*; *Zeitschrift für Kirchengeschichte*; *Neue evangelische Kirchen-Zeitung*; *Protestantische Kirchen-Zeitung*; *Monatsschrift für Geschichte d. Judenthums*. LAW, POLITICAL ECONOMY, &c.:—*Jahrbuch f. Gesetzgebung*; *Jahrbuch der deutschen Gerichtsverfassung*; *Zeitschrift für Rechtsgeschichte*; *Jahrbuch der preussischen Gerichtsverfassung*; *Annalen d. Reichsgerichts*; *Seuffert's Archiv für Entscheidung der obersten Gerichte*; *Seuffert's Blätter f. Rechtsanwendung*; *Jahrbuch für das deutsche Versicherungswesen*; *Jahrbücher für Nationalökonomie und Statistik*; *Zeitschrift f. gesamte Staatswissenschaft*; *Vierteljahrsschrift für Volkswirtschaft*; *Statistische Monatsschrift*. MEDICINE AND SURGERY:—*Archiv für Anthropologie*; *Archiv f. experimentelle Pathologie*; *Schmid's Jahrbücher der in- und ausländischen ges. Medicin*; *Zeitschrift f. klin. Medicin*; *Archiv für Anatomie und Physiologie*; *Morphologisches Jahrbuch*; *Archiv für Gynäkologie*; *Deutsche Zeitschrift für Chirurgie*; *Archiv f. klin. Chirurgie*; *Graef's Archiv*; *Vierteiljahrsschrift für gerichtl. Medicin*. NATURAL SCIENCE:—*Archiv für Anatomie u. Physiologie*; *Archiv für Naturgeschichte*; *Annalen der Physik und Chemie*; *Annalen der Mathematik und Physik*; *Botanischer Jahresbericht*; *Botan. Jahrbücher*; *Flora*; *Botanische Zeitung*; *Zoologischer Jahresbericht*; *Zeitschrift für wissenschaftl. Zoologie*; *Jahresbericht über d. Fortschritte d. Chemie*; *Liebig's Annalen d. Chem.* PHILOSOPHY:—*Philosophische Monatshefte*; *Zeitschrift für Philosophie*. EDUCATION:—*Rheinische Blätter*; *Neue Jahrbücher für Philologie*; *Pädagogischer Jahresbericht*. JUVENILE LITERATURE:—*Hersblätters Zeitortreib*; *Deutsche Jugend*. CLASSICAL ARCHEOLOGY AND PHILOLOGY:—*Jahrbücher für class. Philologie*; *Hermes*; *Rheinisches Museum*; *Philologus*; *Archäologische Zeitung*; *Jahresberichte üb. d. Fortschritte d. class. Alterthumswissenschaft*. ORIENTAL LITERATURE:—*Zeitschrift d. deutschen morgenländischen Gesellschaft*; *Zeitschrift f. Völkerpsychologie*. MODERN LANGUAGES:—*Anglia*; *Archiv f. d. Studium d. neueren Sprachen*; *Germania*; *Zeitschrift f. deut. Alterthum*. HISTORY, &c.:—*Sybel's hist. Zeitschrift*; *Jahresberichte der Geschichtswissenschaft*; *Archiv f. Anthropologie*; *Archiv f. oesterr. Geschichte*; *Das Staatsarchiv*; *Forschungen z. deut. Geschichte*; *Baltische Studien*; *Zeits. f. Museologie*; *Zeits. f. Numismatik*. GEOGRAPHY:—*Geogr. Jahrbuch*; *Globus*; *Das Ausland*; *Petermann's Mittheilungen*; *Zeitschrift f. Ethnologie*. MATHEMATICS AND ASTRONOMY:—*Jahrbuch üb. d. Fortschritte d. Mathematik*; *Archiv d. Mathematik u. Physik*; *Journal f. d. reine u. angewandte Math.*; *Zeitschrift f. Mathematik*; *Astronomische Nachrichten*. ARMY AND NAVY:—*Jahresberichte üb. d. Veränderungen im Militärwesen*; *Deutsche Heeres-Zeitung*; *Jahrbücher f. d. deut. Armes u. Marine*; *Militär-Literaturzeitung*; *Militär-Wochenblatt*; *Streifflur's österr. Militär-Zeitschrift*. TRADE ORGANS, &c.:—*Börsenblatt f. d. deut. Buchhandel*; *Deutsches Handelsarchiv*; *Stammer, Jahresbericht u. d. Zuckerfabrikation*; *Gewerbeblatt*; *Polytechn. Notizblatt*. ARCHITECTURE, ENGINEERING, &c.:—*Allgemeine Bauzeitung*; *Der Civilingenieur*; *Dingler's polytechnisches Journal*; *Zeitschrift f. Bauwesen*; *Österr. Zeitschrift f. Berg- u. Hüttenwesen*; *Jahrbuch der Erfindungen auf d. Gebieten der Physik u. Chemie, der Technologie, u. s. v.* RAILWAYS, TELEGRAPHY, SHIPPING, &c.:—*Hansa*; *Mittheilungen aus d. Gebiete d. Seewesens*; *Elektrotechnische Zeitschrift*;

Nautisches Jahrbuch; Der Maschinbauer. FORESTRY AND SPORTING:—*Försliche Blätter; Allg. Forst- u. Jagdzeitung; Zeitschrift f. Forst- u. Jagdwesen.* AGRICULTURE, GARDENING, &c.:—*Bienenzeitung; Forschungen auf d. Gebiete d. Agrikulturphysik; Landwirthschaftliche Jahrbücher; Allg. Zeitung für deut. Land- u. Forstwirth; Gartenflora; Neubert's deut. Gartenmagazin; Deut. allg. Zeitung f. Landwirthschaft, u. s. v.* THEATRES:—*Neuer Theaterdiener; Münchener Theater-Journal.* FINE ARTS:—*Jahrbuch d. k. preuss. Kunstsammlungen; Die graphischen Künste; Zeitschrift f. Kunst- und Antiquitätensammler.* MUSIC:—*Neue Berliner Musikzeitung; Neue Zeitschrift f. Musik.* FICTION:—*Deut. Romanzeitung.* STENOGRAPHY:—*Jahrbuch d. Schule Gabelsbergers; Allg. deutsche Stenografenzeitung.* POPULAR READING:—*Daheim; Die Gartenlaube; Ueber Land und Meer; Vom Fels zum Meer.* FREEMASONRY:—*Freimaurerzeitung.* HUMOROUS:—*Fliegende Blätter; Kladderadatsch.* CHESS:—*Deutsche Schachzeitung.* MISCELL. ILLUSTRATED:—*Illustrierte Zeitung.*

There were in Austria in 1848 22 literary and 41 special periodicals, and in 1873 110 literary and 413 special periodicals (see the extremely valuable statistical inquiry of Dr Johann Winckler, *Die period. Presse Oesterreichs*, 1875). Germany possessed in 1848 about 947 periodicals (*Deutscher Zeitungs-Katalog*, 1848), and in 1884 1550 (*Gracklaner's Deutscher Journal-Katalog für 1884*). According to the *Deutscher Zeitschriften-Katalog*, 1874, there were published in Austria, Germany, and Switzerland in 1874 2219 periodicals in the German language.

Authorities.—For the general history of the subject consult C. Juncker, *Schediasma de ephemeridibus eruditum*, Leipsic, 1692; H. Kurz, *Geschichte der deutschen Literatur*, Leipsic, 1852; R. Prutz, *Geschichte des deutschen Journalismus*, vol. i., 1845—unfortunately it does not go beyond 1713; H. Wuttke, *Die deutschen Zeitschriften*, 1875; and P. E. Richter, *Verzeichniss der Periodica im Besitze der k. off. Bibl. zu Dresden*, 1880.

Switzerland.—The *Nova Litteraria Helvetica* (1703-15) of Zurich is the earliest literary periodical which Switzerland can show. From 1728 to 1734 a *Bibliothèque Italique*, and towards the end of the century the *Bibliothèque Britannique* (1796-1815), dealing with agriculture, literature, and science, in three separate series, were published at Geneva. The latter was followed by what still remains the leading periodical of French-speaking Switzerland, the *Bibliothèque Universelle* (1816), which also has a scientific and a literary series. The *Revue Suisse* (1838) was produced at Neuchâtel.

Italy.—Prompted by M. A. Ricci, Francesco Nazzari, the future cardinal, established in 1668 the *Giornale de' Letterati* upon the plan of the *Journal des Savants*. His collaborateurs each agreed to undertake the criticism of a separate literature, while Nazzari retained the general editorship and the analysis of the French books. The journal was continued to 1675, and another series was carried on to 1769. Bacchini brought out at Parma (1688-90) and at Modena (1692-97) a periodical with a similar title. A much better known *Giornale* was that of Apostolo Zeno, founded with the help of Maffei and Muratori (1710), continued after 1718 by Pietro Zeno, and after 1728 by Mastraca and Paitoni. Another *Giornale*, to which Fabroni contributed, was published at Pisa in 1771; it has been continued almost down to our own times. The *Galleria di Minerva* was first published at Venice in 1696. One of the many merits of the antiquary Lami was his connexion with the *Novelle Letterarie* (1740-70), founded by him, and after the first two years almost entirely written by him. Its learning and impartiality gave it much authority. The *Frusta Letteraria* (1763-65) was brought out at Venice by Giuseppe Baretti under the pseudonym of Aristarco Scamabue. The next that deserve mention are the *Giornale Enciclopedico* (1806) of Naples, followed by the *Progresso delle Scienze* (1833-48) and the *Museo di Scienze e Letteratura* of the same city, and the *Giornale Arcadico* (1819) of Rome. Among the contributors to the *Poligrafo* (1811) of Milan were Monti, Perticari, and some of the first names in Italian literature. The *Biblioteca Italiana* (1816-40) was founded at Milan by the favour of the Austrian Government, and the editorship was offered to and declined by Ugo Foscolo. It rendered service to Italian literature by its opposition to the Della-Cruscan tyranny. Another Milanese serial was the *Conciliatore* (1818-20), which, although it only lived two years, will be remembered for the endeavours made by Silvio Pellico, Camillo Ugoni, and its other contributors to introduce a more dignified and courageous method of criticism. After its suppression and the falling off in interest of the *Biblioteca Italiana* the next of any merit to appear was the *Antologia*, a monthly periodical brought out at Florence in 1820 by Gino Capponi and Giampetro Vieusseux, but suppressed in 1833 on account of an epigram of Tommaseo, a principal writer. Some striking papers were contributed by Giuseppe Mazzini. Naples had in 1832 *Il Progresso* of Carlo Troya, helped by Tommaseo and Centofanti, and Palermo owned the *Giornale di Statistica* (1834), suppressed eight years later. The *Archivio Storico*, consisting of reprints of documents with historical dissertations, dates from 1842, and was founded by Vieusseux and Gino Capponi. The *Civiltà Cattolica* (1850) is still the organ of the Jesuits. The *Rivista Contemporanea* (1852) was founded at Turin in emulation of the *Revue des Deux Mondes*, which has been the type followed by so many Continental periodicals; it still appears. The *Politecnico*

(1839) of Milan was suppressed in 1844 and revived in 1859. The *Nuova Antologia* (1866) has already acquired a well-deserved reputation as a high-class review and magazine. Its rival, the *Rivista Europea*, is now considered the special organ of the Florentine men of letters. The *Rassegna Settimanale* was a weekly political and literary review, which after eight years of existence gave place to a daily newspaper, the *Rassegna*. The *Archivio Trentino* (1882), is the organ of "Italia Irredenta." The *Rassegna Nazionale*, conducted by the marchese Manfredo di Passano, a chief of the moderate clerical party, the *Nuova Rivista* of Turin, the *Fanfulla della Domenica*, and the *Gazzetta Letteraria* may also be mentioned. During the last few years Italy has been showing such vigour in her periodical literature that it may be worth while to append the titles of the chief of those which are now appearing: *Annali di Matematica* (1867); *Annuario di Giurisprudenza* (1883); *Archivio di Statistica* (1876); *Archivio storico Lombardo* (1874); *Archivio Veneto* (1871); *Archivio per lo Studio delle Tradizioni popolari*; *Archivio per la Zoologia*; *Il Bibliografo*; *Bollettino di Archeologia cristiana*; *Il Filangieri* (1876); *La Natura* (1884); *Nuovo Giornale botanico* (1869); *Giornale degli Eruditi* (1883); *Giornale di Filologia Romanza*; *Giornale storico della Letteratura Italiana* (1883); *Nuova Rivista internazionale* (1879); *Il Politecnico* (1853); *La Rassegna Italiana* (1891); *Rivista storica Italiana* (1884); *Revue Internationale* (1883).

Not counting political newspapers, there were published in Italy in the year 1871 133 literary periodicals, 43 devoted to the fine arts, 132 commercial, 49 scientific, 19 administrative, 20 humorous, &c. showing a total of 416. Ten years later, in 1881, the number had increased to 892, of which 46 were religious, 23 administrative, 114 scientific, 52 agricultural, 36 humorous, &c.

Authorities.—See G. Ottino, *La Stampa periodica in Italia*, Milan, 1875; *Raccolta dei periodici presentati all'Esposizione in Milano*, 1881; A. Roux, *Lo littérature contemporaine en Italie* (1873-83), Paris, 1883.

Belgium.—The *Journal Encyclopédique* (1756-93), founded by P. Rousseau, made Liège a propagandist centre for the philosophical party. In the same city was also first established *L'Esprit des Journaux* (1772-1818), styled by Sainte-Beuve "cette considérable et excellente collection," but "journal voleur et compilateur." The *Journal historique et littéraire* (1788-90) was founded at Luxembourg by the Jesuit De Feller; having been suppressed there, it was transferred to Liège, and subsequently to Maestricht. It is one of the most curious of the Belgian periodicals of the 18th century, and contains most precious materials for the national history. A complete set is very rare and much sought after. The *Revue Belge* (1835-43), in spite of the support of the best writers of the kingdom, its successor the *Revue de Liège* (1844-47), the *Trésor National* (1842-43), published at Brussels, and the *Revue de Belgique* (1846-51) were all shortlived. The *Revue de Bruxelles* (1837-48), supported by the nobility and the clergy, had a longer career. The *Revue Nationale* was the champion of Liberalism, and came to an end in 1847. The *Messenger des Sciences historiques* (1833), which still comes out at Ghent, has been much more successful, and is in repute on account of its historical and antiquarian character. The *Revue Catholique* is also still published by the professors of the university of Louvain. In 1846 it began a controversy with the *Journal historique et littéraire* of Kersten (1834) upon the origin of human knowledge, which lasted for many years and excited great attention. The *Revue Trimestrielle* was founded at Brussels by Van Bommel in 1854. The *Athenæum Belge* (1863) did not last long.

Among Flemish serials may be mentioned the *Verderwitsche Letteroefeningen* (1834); the *Belgisch Museum* (1836-46), edited by Willems; the *Broederhand*, which did not appear after 1846; the *Taalverbund* of Antwerp; the *Kunst- en Letterblad* (1840-43); and the *Vlaemsche Rederyker* (1844).

The *Annales des Travaux Publics* (1843), the *Bulletin de l'Industrie* (1842), the *Journal des Beaux-Arts* (1858), the Catholic *Précis historiques* (1852), the Protestant *Chrétien Belge* (1850), Van Beneden's *Archives de Biologie*, the *Revue de Belgique* (1868), and the *Revue de Droit international* are representative of their several respective classes.

It has been calculated that in 1860 there were 51 periodicals published in Belgium. In 1884 the number had increased to 412. See U. Capitaine, *Recherches sur les journaux et les écrits périodiques Liégeois*, 1880; *Relevé de tous les écrits périodiques qui se publient dans le royaume de Belgique*, 1875; *Catalogue des journaux, revues, et publications périodiques de la Belgique*, 1883; *Annuaire de la librairie Belge*, 1884.

Holland.—This country occupies a distinguished position in the history of the periodical literature of the 18th century, from the labours of the French refugees already referred to (see p. 539). The first serial written in Dutch was the *Boekzaal van Europa* (1692-1708, and 1715-48), which had several changes of name during its long life. The next of any note was the *Republiek der Geleerden* (1710-48). The English *Spectator* was imitated by J. van Effen in his *Misanthrope* (1711-12), written in French, and in the *Hollandsche Spectator* (1731-35), in Dutch. An important serial was the long-lived *Vaderlandsche Letteroefeningen* (1761). The *Algemeene Kunst- en Letterbode* (1788) was long the leading review of Holland: in

1860 it was joined to the *Nederlandsch Spectator* (1855). Of those founded in the present century may be mentioned the *Reccensent* (1803) and *Nieuwe Recensent*; the *Nederlandsch Museum* (1835); the *Gids* (1837); the *Tijdstroom* (1857); the *Tijdspeigel*, a literary journal of Protestant tendency; the *Theologisch Tijdschrift* (1867), the organ of the Leyden school of theology; and the *Dietsche Warande*, a Roman Catholic review devoted to the national antiquities. Colonial interests have been cared for by the *Tijdschrift voor Nederlandsch Indie* (1848). The *Nederlandsch Magazin* and *Minerva* are still published.

See *Alphabetische Naamlijst van Boeken* (1790-1875), Amsterdam, 1835-78.

Scandinavia.—Early in the 18th century Denmark had the *Nye Tidender* (1720), continued down to 1836 under the name of *Dansk-Litteraturlidende*. The *Minerva* (1785) of Rahbek was carried on to 1819, and the *Skandinavisk Museum* (1798-1803) was revived by the *Litteratur-Selskabs Skrifter* (1805). These were followed by the *Lærde Efterretninger* (1799-1810), afterwards styled *Litteratur-Tidende* (1811-36), the *Athene* (1813-17), and *Historisk Tidsskrift* (1840). In more modern times appeared *Tidsskrift for Litteratur og Kritik* (1832-42, 1843); *Maanedsskrift for Litteratur* (1829-38); *Nord og Syd* (1848-49) of Goldschmidt, succeeded by *Uds og Hjemme*, still published; and the *Dansk Maanedsskrift* (1858) of Steenstrup, with signed historical and literary articles. One of the most noteworthy Scandinavian periodicals has been the *Nordisk Universitets Tidsskrift* (1854-64), a bond of union between the universities of Christiania, Upsala, Lund, and Copenhagen.

See *Revue des Deux Mondes*, 1st August 1861.

Iceland has had the *Istenzk Sagnablið* (1817-26), *Skirnir* (1827), still published, *Ný Fjölgrit* (1841-73), and *Gefn* (1870-73).

See T. Mobius, *Cat. lib. Island. et Norvegiarum*, Leipzig, 1856-80.

The first trace of the serial form of publication to be found in Norway is in the *Ugentlige korte Afsandlinger* (1760-61), "Weekly Short Treatises," of Bishop Fr. Nannestad, consisting of moral and theological essays. The *Maanedlige Afsandlinger* (1762), "Monthly Treatises," was supported by several writers and devoted chiefly to rural economy. These two were followed by *Politik og Historie* (1807-10), *Saga* (1816-20), a quarterly review edited by J. S. Munch; *Den Norske Tilskuer* (1817-21), a miscellany brought out at Bergen; *Hermøder* (1821-27), a weekly æsthetic journal; *Iduna*, (1822-23), of the same kind but of less value; *Vidar* (1832-34), a weekly scientific and literary review; *Nor* (1840-46), of the same type; *Norsk Tidsskrift for Videnskab og Litteratur* (1847-55); *Illustreret Nyhedsblad* (1851-66), "Illustrated News"; *Norsk Maanedsskrift* (1856-60), "Monthly Review for Norway," devoted to history and philology; and *Norden* (1866), a literary and scientific review. Popular serials date from the *Skilling Magazin* (1835), which first introduced wood-engraving, and is still published. The *Norsk Familjeblad* is a current weekly of the same class.

See P. Botten-Hansen, *La Norvège Littéraire*, Christiania, 1868; *Norsk Bogfortegnelse* (1814-72).

The *Svenska Argus* (1733-34) of Olof Dalin is the first contribution of Sweden to this subject. The next were the *Tidningar om den Lärdes Arbete* (1742) and the *Lärda Tidningar*. The patriotic journalist C. C. Gjörrwell established about twenty literary periodicals, of which the most important was the *Svenska Mercurius* (1755-89). After him and some fellow-students founded about 1810 a society for the deliverance of the country from French pedantry, which with this end carried on a periodical entitled *Phosphoros* (1810-13), to propagate the opinions of Sehlagel and Schelling. The *Svensk Litteratur-Tidning* (1813-25) of Palmblad and the *Polysem* (1810-12) had the same objects. Among more recent periodicals we may mention *Skandia* (1833-37); *Litteraturbladet* (1838-40); *Ställningar och Förhållanden* (1838) of Crusenstolpe, a monthly review of Scandinavian history; *Tidsskrift för Litteratur* (1850); *Norsk Tidsskrift* (1852), weekly, still published; *Förr och Nu*; and the *Revue Suédoise* (1858) of Kramer, written in French. The *Ny illustreret Tidning* and *Hemvännen* are current illustrated weeklies; the *Svenska Veckoblad* is also weekly.

See *Revue des Deux Mondes*, 1st August 1861.

Spain and Portugal.—Spain owes her intellectual emancipation to the monk Benito Feijóo, who in 1726 produced a volume of dissertations somewhat after the fashion of the *Spectator*, but on graver subjects, entitled *Teatro Crítico*, which was continued down to 1739. His *Cartas Eruditas* (1742-60) were also issued periodically. The earliest critical serial, the *Diario de los Literatos* (1737-42), kept up at the expense of Philip V., did not long survive court favour. Other periodicals which appeared in the 18th century were Maher's *Mercurio* (1738); the *Diario Noticioso* (1758-81); *El Pensador* (1762-67) of Joseph Clavijo y Fajardo; *El Belianis Literario* (1765), satirical in character; the *Semanario Erudito* (1778-91), a clumsy collection of documents; *El Correo Literario de la Europa* (1781-82); *El Censor* (1781); the valuable *Memorial Literario* (1784-1808); *El Correo Literario* (1786-91), devoted to literature and science; and the special organs *El Correo Mercantil* (1792-98) and *El Semanario de Agricultura* (1797-1805). In the present century we have *Variedades de Ciencias, Literatura, y Artes* (1803-5), among whose contributors have been the distinguished names of Quintana, Moratin, and Antillon; *Miscelánea de*

Comercio (1819); and *Diario general de las Ciencias Médicas*. The Spanish refugees in London published *Ocios de Españoles Refugiados* (1823-26) and *Miscelánea hispano-americana* (1824-28), and at Paris *Miscelánea escogida americana* (1826). "The *Crónica científica y literaria* (1817-20) was afterwards transformed into a daily newspaper. Subsequently to the extinction of *El Censor* (1820-23) there was nothing of any value until the *Cartas Españolas* (1832), since known as the *Revista Española* (1832-36) and as the *Revista de Madrid* (1838). Upon the death of Ferdinand VII. periodicals had a new opening; in 1836 there were published sixteen journals devoted to science and art. The fashion of illustrated serials was introduced in the *Semanario pintoresco Español* (1836-57), noticeable for its biographies and descriptions of Spanish monuments. *El Panorama* (1839-41) was another literary periodical with engravings. Of more recent date have been the *Revista Ibérica* (1861-63), conducted by Sanz del Río; *La América* (1857-70), specially devoted to American subjects and edited by the brothers Asquerino; and the *Revista de Cataluña*, published at Barcelona. The chief of those published at the present time are the *Revista de España*, the *Revista Contemporánea*, the *Revista Europea* and the *Revista de Archivos*.

Apart from newspapers, there were issued at Madrid in 1867 47 periodicals, of which 10 were religious, 32 literary, 17 official, 7 satirical, &c. In 1882 the number of periodicals issued in Spain was 377—24 legal, 24 agricultural, 35 commercial, 15 army and navy, 14 theatrical, 45 illustrated, 36 literature and science, 52 medical, 11 fashions, 51 education, 44 religion, 26 miscellaneous.

See G. Tiekner, *History of Spanish Literature*, New York, 1872; G. Hubbard, *Histoire de la littérature contemporaine en Espagne*, Paris, 1876; E. Hartzband, *Periodicos de Madrid*, 1876; Lapeyre, *Catálogo-tarifa de los periódicos, revistas, y ilustraciones en España*, 1882.

Portugal could long boast of only one review, the *Jornal Enciclopédico* (1779-1806), which had many interruptions; then came the *Jornal de Coimbra* (1812-20); the *Panorama* (1836-57), founded by Herculano; the *Revista Universal Lisbonense* (1841-53), established by Castilho; the *Instituto* (1853) of Coimbra; and the *Arquivo Pittoresco* (1857) of Lisbon; and the *Jornal da Sociedade dos Amigos das Letras*. In 1868 a review called *Voz Feminina*, and conducted by women, was established at Lisbon.

I. F. Da Silva, *Dicionário Bibl. Portuguez*, 1868.

Greece.—The periodical literature of modern Greece commences with 'O *Διόχορ* Ερμής, brought out at Vienna in 1811 by Anthimos Gazi and continued to 1821. A philological serial with the same title is still published. In *Ægina* the *Αλφειά* appeared in 1831, edited by Muetoxidis; and at Corfu, in Greek, Italian, and English, the *Ανδοκρυα* (1834). After the return of King Otho in 1833 a literary review called *Ίππος* was commenced. *Le Spectateur de l'Orient*, in French, pleaded the national cause before Europe for three years from 1853. A military journal was published at Athens in 1855, and two years later the archaeological periodical conducted by Pittakis and Rangavi. For many years *Πανόραμα* (1850-72), edited by Rangavi and Paparrigopoulos, was the leading serial. Among existing periodicals *Φύσις* deals with natural science, the *Γεωπονία* with agriculture, and the *Ἑρμηνεύματα* with theology.

See A. R. Rangabé, *Hist. littéraire de la Grèce Moderne*, Paris, 1870; R. Nicolai, *Geschichte der neugriechischen Literatur*, 1876.

Russia.—The historian Müller made the first attempt to establish periodical literature in Russia in his *Fejem'yesyatchniya Sotchineniya* (1755-64), or "Monthly Works." In 1759 Sumarokoff founded the *Trudolyubivaya Ptchela*, or "Industrious Bee," giving translations from the *Spectator*, and, for the first time, critical essays. Karamsin brought out in 1802 the *V'estnik Evrope*, an important review with Liberal tendencies, which is still appearing. The Conservative *Russkoi V'estnik* (1808) was revived at Moscow in 1856 by Kartkoff and is also published now. The romantic school was supported by *Sin Otchestva* (1812), "Son of the Fatherland," united in 1825 to the *Svernoi Arkhiv* (1822), which dwindled and came to an end soon after 1830. One of the most successful Russian reviews has been the *Biblioteka dl'ya Tshleniya* (1834), or "Library of Reading." The Slavophile party is represented by the *Russkaya Missl*, "Russian Thought," published in Moscow.

Finland has had *Suomi* (1841), written in Swedish.

See C. Courrière, *Histoire de la littérature contemporaine en Russie*, Paris, 1875, and the bibliographical works of Méjoff.

Slavonic Countries.—Bohemia has had the *Casopis Ceskeho Museum* (1827), founded by Palacky; *Ziva* (1853), a review of natural history; and the *Samatky Archeologiske*.

Hungary can show the *Ungarisches Magazin* (1781-87, 1791), published at Pressburg, and the *Magyar Museum* (1788). The *Tudományos gyűjtemény* (1817-41) and the *Figyelmező* (1837-43) deserve mention. *Uj Magyar Museum* was a scientific magazine, and the *Budapesti Szemle* (1857) of a more general character.

Before the revolution of 1830 Poland had the *Pamiętnik Warszawski* of Lach Szyrma. Among other reviews may be mentioned the *Diennik Literacki* of Lemberg, the *Biblioteka Warszawska* of Warsaw, and the *Przeglad Polski* of Cracow.

Roumania commenced with the *Magasinul istorica pentru Dacia* (1845), containing valuable historical documents, and Moldavia with *Dacia Literaria* (1840) and *Archiva Romonesca* (1841).

The best literary review Servia has had was the *Wila*, edited by Novakovic.

See A. Bourgeant, *Histoire des littératures étrangères*, 1876, 3 vols.; D. Iarcu, *Bibliografia chronologica romana*, 1873.

UNITED STATES.

Spurred by the success of the *Gentleman's Magazine* in England, Benjamin Franklin printed and published the earliest miscellany in America, under the title of the *General Magazine* (1741), at Philadelphia, which, owing to want of support, expired after six monthly numbers had appeared. Franklin's rival, John Webbe, brought out in opposition the *American Magazine* (1741), which ran only to two numbers. Further attempts at Philadelphia in 1757 and 1769 to revive periodicals with the same name were both fruitless. The other pre-revolutionary magazines were the *Boston American Magazine* (1743-47), in imitation of the *London Magazine*; the *Boston Weekly Magazine* (1743); the *Christian History* (1743-44); the *New York Independent Reflector* (1752-54); the *New England Magazine* (1758-60), a collection of fugitive pieces; the *Boston Royal American Magazine* (1774-75); and the *Pennsylvania Magazine* (1775-76), which, founded by R. Aitken, with the help of Thomas Paine, came to an untimely end upon the commencement of the war. The *Columbian Magazine* (1786-90) was continued as the *Universal Asylum* (1790-92). Matthew Carey brought out the *American Museum* in 1787, and it lasted until 1792. Five or six more magazines ran out a brief existence before the end of the century. One of the most successful of them was the *Farmer's Museum* (1793-99), supported by perhaps the most brilliant staff of writers American periodical literature had yet been able to show, and edited by Dennie, who in 1801 commenced the publication of the *Portfolio*, carried on to 1827 at Philadelphia. For five years it was a weekly miscellany in quarto, and afterwards an octavo monthly; it was the first American serial which could boast of so long an existence. The *Literary Magazine* (1803-8) was established at Philadelphia by C. B. Brown, who, with Dennie, may be considered as having been the first American professional man of letters. The Anthology Club was founded at Boston in 1803 by Phineas Adams for the cultivation of literature and the discussion of philosophy. Ticknor, Everett, and Bigelow were among the members, and were contributors to the organ of the club, the *Monthly Anthology* (1803-11), the forerunner of the *North American Review*. In the year 1810 Thomas (*Printing in America*, ii. 292) informs us that 27 periodicals were issued in the United States. The first serious rival of the *Portfolio* was the *Analectic Magazine* (1813-20), founded at Philadelphia by Moses Thomas, with the literary assistance of W. Irving (for some time the editor), Paulding, and the ornithologist Wilson. In spite of a large subscription list it came to an end on account of the costly style of its production. The first southern serial was the *Monthly Register* (1805) of Charleston. New York possessed no periodical worthy of the city until 1824, when the *Atlantic Magazine* appeared, which changed its name shortly afterwards to the *New York Monthly Review*, and was supported by R. C. Sands and W. C. Bryant. For many years *Graham's Magazine* was the leading popular miscellany in the country, reaching at one time a circulation of about 35,000 copies. The first western periodical was the *Illinois Monthly Magazine* (1830-32), published, owned, edited, and almost entirely written by James Hall, who followed with his *Western Monthly Magazine* (1833-36), produced in a similar manner. In 1833 the novelist C. F. Hoffman founded at New York *The Knickerbocker* (1833-60), which soon passed under the control of Timothy Flint and became extremely successful, most of the leading native writers of the next twenty years having been contributors. Equally popular was *Putnam's Monthly Magazine* (1853-57, 1867-69). The *Dial* (1841-44), Boston, the organ of the transcendentalists, was first edited by Margaret Fuller, and subsequently by R. W. Emerson and G. Ripley. Among other extinct magazines may be mentioned the *American Monthly Magazine* (1833-38), the *Southern Literary Messenger* (1834), Richmond, the *Gentleman's Magazine* (1837-40), and the *International Magazine* (1850-52), edited by R. W. Griswold. The *Yale Literary Magazine* dates from 1836. The *Merchants' Magazine* was united in 1871 with the *Commercial and Financial Chronicle*. Foremost among existing magazines come *Harper's Monthly Magazine* (1850) and *Scribner's Monthly* (1870), now *The Century*, both famous for their unrivalled wood-engraving and literary excellence. Within the last few years the circulation of these two periodicals has increased to a remarkable degree both at home and abroad. Not less admirable in their way are the *Atlantic Monthly* (1857), *Lippincott's Magazine*, and the *Manhattan*.

The first attempt to carry on an American review was made by Robert Walsh in 1811 at Philadelphia with the *American Review of History and Politics*, which lasted only a couple of years. Still more brief was the existence of the *General Repository and Review* (1812), brought out at Cambridge by Andrews Norton with the help of the professors of the university, but of which only four numbers appeared. Niles's *Weekly Register* (1811-48) was political, historical, and literary. The *North American Review*, the oldest and most prosperous of all the American reviews, dates from 1815,

and was founded by William Tudor, a member of the previously mentioned Anthology Club. After two years' control Tudor handed over the review to the club, then styled the North American Club, whose most active members were E. T. Channing, R. H. Dana, and Jared Sparks. On his return from Europe in 1819 E. Everett became the editor; his elder brother Alexander acquired the property in 1829. The roll of the contributors to this review numbers almost every American writer of note. Since January 1879 it has been published monthly. The *American Quarterly Review* (1827-37), established at Philadelphia by Robert Walsh, came to an end on his departure for Europe. The *Southern Review* (1828-32), conducted by H. Legaré, S. Elliott, and G. W. Simms in defence of the politics and finance of the South, enjoyed a shorter career. It was resuscitated in 1842, and lived another ten years. These two were followed by the *Democratic Review* (1838-52), the *American Review*, afterwards the *American Whig Review* (1845-52), the *Massachusetts Quarterly Review* (1847-50), and a few more. The *New Englander* (1843), the *Biblical Repository* and *Princeton Review* (1825), and the *National Quarterly Review* (1860) are still published. The critical weeklies of the past include the *New York Literary Gazette* (1834-35, 1839), *De Bow's Review* (1846), the *Literary World* (1847-53), the *Criterion* (1855-56), the *Round Table* (1863-64), the *Citizen* (1864-73), and *Appleton's Journal* (1869). The leading weeklies of the day include the *Nation* (1865), the *Literary World* (1870), and the *Critic* (1881).

Religious periodicals have been extremely numerous in the United States during the last hundred years. The earliest was the *Theological Magazine* (1796-98). The *Christian Examiner* dates from 1824 and lasted down to 1870. The *Panoplist* (1805), changed to the *Missionary Herald*, still represents the American Board of Missions. The *Methodist Magazine* dates from 1813 and the *Christian Disciple* from 1813. The *American Biblical Repository* (1831-50), a quarterly, was united with the *Andover Bibliotheca Sacra* (1843) and with the *Theological Eclectic* (1865). *Brownson's Quarterly Review* began as the *Boston Quarterly Review* in 1838, and did much to introduce to American readers the works of the modern French philosophical school. Among more recent serials of this class we may notice the *Protestant Episcopal Quarterly Review* (1854), the *Presbyterian Magazine* (1851-60), the *Catholic World* (1865), the *Southern Review* (1867), the *New Jerusalem Magazine* (1827), *American Baptist Magazine* (1817), the *Church Review* (1848), the *Christian Review* (1836), the *Universalist Quarterly* (1844). Among historical periodicals may be numbered the *American Register* (1806-11), *Stryker's American Register* (1848-51), *Edwards's American Quarterly Register* (1829-43), the *New England Historical and Genealogical Register* (1847), *Folsom's Historical Magazine* (1857), the *New York Genealogical Record* (1869), and the *Magazine of American History* (1877).

For many years the leading English periodicals have been regularly reprinted in the United States, and many serial publications have been almost entirely made up of extracts from English sources. Perhaps the earliest example is to be found in *Select Views of Literature* (1811-12). The *Eclectic Magazine* (1844) and *Littell's Living Age* (1844) are still published.

In 1817 America possessed only one scientific periodical, the *Journal of Mineralogy*. Professor Silliman established the journal known by his name in 1818. Since that time the *American Journal of Science* has enjoyed unceasing favour. Among other special periodicals of the day may be mentioned the *American Naturalist*, the *American Journal of the Medical Sciences*, the *American Journal of Speculative Philosophy*, the *American Journal of Philology*, the *American Railroad Journal*, the *Banker's Magazine*, the *Index Medicus*, and the *Journal of the Franklin Institute*.

The number of periodicals devoted to light literature and to female readers has been, and still remains, extremely large. The earliest in the latter class was the *Lady's Magazine* (1792) of Philadelphia. The name of the *Lovell Offering* (1841), written chiefly by factory girls, is well known in England. *Godey's Ladies' Book* is still issued. Children's magazines originated with the *Young Misses' Magazine* (1806) of Brooklyn; *St Nicholas* is a modern high-class representative of this kind; another current example is the *Child's Paper* (1852).

The following estimate of the number of periodicals now appearing in the United States is taken from G. P. Rowell and Co.'s *American Newspaper Record* (1883). Weeklies, and those published more frequently than once a week, are omitted on account of the difficulty of distinguishing them from newspapers. The numbers given are—bi-weeklies 47, semi-monthlies 176, monthlies 1034, bi-monthlies 12, quarterlies 59; total 1327.

See an excellent article on the subject in Ripley and Dana's *American Cyclopaedia*; Concheval Clarigny, *Histoire de la presse en Angleterre et aux États Unis*, 1857; H. Stevens, *Catalogue of American Books in the Library of the British Museum*, 1866, and *American Books with Titles to 'em*, 1873; L. Thomas, *History of Printing in America*, Albany, 1874; J. Nichol, *American Literature* (1820-1880), 1882; *Pettengill's Newspaper Directory* for 1878; G. P. Rowell and Co.'s *American Newspaper Directory*, New York, 1869-83; *Hubbard's Newspaper Directory of the World*, New York, 1882-84. The leading periodicals of the United States are indexed in W. F. Fools's *Index*, Boston, 1882, and *Library Journal*. (H. R. T.)

PERIPATETICS was the name given in antiquity to the followers of Aristotle, from their master's habit of walking up and down as he lectured conversationally to his pupils. Others derive the name from the *περίπατος*, or covered walk of the Lyceum. An account of the Aristotelian philosophy will be found in the articles ARISTOTLE, ETHICS, LOGIC, and METAPHYSIC. Here it must suffice to recall those features of the system which mainly conditioned the development of the school. Aristotle's central conception is the correlative opposition of form and matter. This may be called the supreme category under which he views the world; it is the point where, as Zeller puts it, Aristotle's system at once refutes and completes the Platonic doctrine of the "idea" in its relation to phenomena. But Aristotle did not succeed in expelling the dualism which he blamed in Plato. His deity is pure form, and dwells in abstract self-contemplation withdrawn from the actual life of the world. The development of the world remains, therefore, unrelated to the divine subject. In Aristotle's doctrine of man, precisely the same difficulty is experienced in connecting the active or passionless reason with the individual life, the latter being a process of development bound up with sense, imagination, and desire. The soul is originally defined as the entelechy of the body, and, moreover, not of body in general but of its particular body. It is impossible therefore, from this point of view to speak of soul and body as separate entities. Yet Aristotle holds that besides the individual mind, which is all things potentially—which *becomes* all things—there is superinduced upon the process of development the active or creative reason, the pure actuality (*ἐνέργεια*) which the development presupposes as its necessary *præ*sumption, just as the world-process presupposes God. This reason is "separable," and is said to enter "from without" when it unites itself to the process of individual life. It must therefore exist before the individual, and it alone outlasts the death of the body; to it alone properly belong the titles of "immortal" and "divine." But its relation to the universal divine reason was not handled by Aristotle at all. The question was destined to become the *crux* of his commentators. In general it is evident that, if reason in man be identified with the process of natural development (and there is Aristotelian warrant for declaring these to be simply two aspects of the same thing), we drift into a purely naturalistic or materialistic doctrine. On the other hand, the doctrine of the "active reason" may be maintained, but what Aristotle left vague may be further defined. The rational soul of each individual may be explicitly identified with the divine reason. This leads to the denial of individual immortality and the doctrine of one immortal impersonal reason, such as we find, for example, in the rationalistic pantheism of Averroes. A third position is possible, if the statements of Aristotle be left in their original vagueness. Aristotle may then be interpreted as supporting monotheism and the immortality of separate rational souls. This was the reading adopted by the orthodox scholastic Aristotelians, as well as by those early Peripatetics who contented themselves with paraphrasing their master's doctrine.

Aristotle's immediate successors, Theophrastus, who presided over the Lyceum from 322 to 288 B.C., and Eudemus of Rhodes, were distinguished by a learned diligence rather than by original speculative power. They made no innovations upon the main doctrines of their master, and their industry is chiefly directed to supplementing his works in minor particulars. Thus they amplified the Aristotelian logic by the theory of the hypothetical and disjunctive syllogism, and added to the first figure of the categorical syllogism the five moods out of which the fourth figure was afterwards constructed. The impulse towards natural science and the systematizing of empirical details which

distinguished Aristotle from Plato was shared by Theophrastus. His two works on the *History of Plants* and *Causes of Plants* prove him to have been a careful and acute observer. The same turn for detail is observable in his ethics, where, to judge from the imperfect evidence of the *Characters*, he elaborated still further Aristotle's portraiture of the virtues and their relative vices. In his doctrine of virtue the distinctive Peripatetic position regarding the importance of external goods was defended by him with emphasis against the assaults of the Stoics. He appears to have laid even more stress on this point than Aristotle himself, being doubtless led to do so, partly by the heat of controversy and partly by the importance which leisure and freedom from harassing cares naturally assumed to a man of his studious temperament. The metaphysical *ἀπορίαι* of Theophrastus which have come down to us show that he was fully alive to the difficulties that start up round many of the Aristotelian definitions. But we are ignorant how he proposed to meet his own criticisms; and they do not appear to have suggested to him an actual departure from his master's doctrine, much less any radical transformation of it. In the difficulties which he raises with reference to the relation of the active and the passive reason, as well as in his ascription of the physical predicate of motion to the activity of the soul, we may perhaps detect a leaning towards a naturalistic interpretation. The tendency of Eudemus, on the other hand, is more towards the theological or Platonic side of Aristotle's philosophy. The *Eudemian Ethics* (which, with the possible exception of the three books common to this treatise and the *Nicomachean Ethics*, there need be no hesitation in ascribing to Eudemus) expressly identify Aristotle's ultimate ethical ideal of *θεωρία* with the knowledge and contemplation of God. And this supplies Eudemus with a standard for the determination of the mean by reason, which Aristotle demanded, but himself left vague. Whatever furthers us in our progress towards a knowledge of God is good; every hindrance is evil. The same spirit may be traced in the author of the chapters which appear as an appendix to book i. of Aristotle's *Metaphysics*. They have been attributed to Pasicles, the nephew of Eudemus. For the rest, Eudemus shows even less philosophical independence than Theophrastus. Among the Peripatetics of the first generation who had been personal disciples of Aristotle, the other chief names are those of Aristoxenus of Tarentum and Dicaearchus of Messene. Aristoxenus, "the musician," who had formerly belonged to the Pythagorean school, maintained the position, already combated by Plato in the *Phædo*, that the soul is to be regarded as nothing more than the harmony of the body. Dicaearchus agreed with his friend in this naturalistic rendering of the Aristotelian entelechy, and is recorded to have argued formally against the immortality of the soul.

The naturalistic tendency of the school reached its full expression in Strato of Lampsacus, who succeeded Theophrastus as head of the Lyceum, and occupied that position for eighteen years (287-269 B.C.). His predilection for natural science earned for him in antiquity the title of "the physicist." He is the most independent, and was probably the ablest, of the earlier Peripatetics. His system is based upon the formal denial of a transcendent deity. Cicero attributes to him the saying that he did not require the aid of the gods in the construction of the universe; in other words, he reduced the formation of the world to the operation of natural forces. We have evidence that he did not substitute an immanent world-soul for Aristotle's extra-mundane deity; he recognized nothing beyond natural necessity. He was at issue, however, with the atomistic materialism of Democritus in regard to its twin assumption

tions of absolute atoms and infinite space. His own speculations led him rather to lay stress on the qualitative aspect of the world. The true explanation of things was to be found, according to Strato, in the forces which produced their attributes, and he followed Aristotle in deducing all phenomena from the fundamental attributes or elements of heat and cold. His psychological doctrine explained all the functions of the soul as modes of motion, and denied any separation of the reason from the faculties of sense-perception. He appealed in this connexion to the statement of Aristotle that we are unable to think without a sense-image.

The successors of Strato in the headship of the Lyceum were Lyco, Aristo of Ceos, Critolaus (who, with Carneades the Academic and Diogenes the Stoic, undertook in 155 B.C. the famous embassy to Rome, more important in its philosophical than in its political bearings), Diodorus of Tyre, and Erymneus, who brings the philosophic succession down to about the year 100 B.C. Other Peripatetics belonging to this period are Hieronymus of Rhodes, Prynianis, and Phormio, the *delirus senex* who attempted to instruct Hannibal in the art of war. Sotion, Hermippus, and Satyrus were historians rather than philosophers. Herachides Lembus, Agatharchides, and Antisthenes of Rhodes are names to us and nothing more. The philosophic unfruitfulness of the school during this whole period is expressly charged against it by Strabo, who explains it by his well-known story of the disappearance of Aristotle's writings after the death of Theophrastus. But it is impossible that this story should be true in the shape in which it is told by Strabo; and a sufficient explanation of the barrenness of the school may be found in the general circumstances of the time. From the outset the characteristic of the Aristotelian philosophy had been its disinterested scientific character; but the age was one for which speculation as such had lost its attractiveness. At such a time it was natural, therefore, that the Peripatetic school should suffer more than the others. It had also in practical matters taken up a mediatizing position, so that it lacked the attractions which, in the case of extreme views, enlist supporters and inspire them with propagandist zeal. The fact, at all events, is not to be denied that, after Strato, the Peripatetic school has no thinker of any note to show for about 200 years. With Strato, moreover, the scientific activity of the school has an end; when it received a new infusion of life its activity took another direction. Strato accuses the Peripatetics of this period of devoting themselves to the tricking out of commonplaces. This seems in great measure true of those who still occupied themselves with philosophy; they cultivated ethics and rhetoric, and were noted for the elegance of their style. But the majority followed the current of the time, and gave themselves up to the historical, philological, and grammatical studies which mark the Alexandrian age.

Early in the 1st century B.C. all the philosophic schools began to be invaded by a spirit of eclecticism. This was partly the natural result of the decay of speculative interest and partly due to the unconscious influence of Rome upon the philosophers. The Roman mind measured philosophy, like other things, by the standard of practical utility. As an instrument of education, and especially as the inculcator of moral principles, the Roman welcomed and appreciated philosophy; but his general point of view was naively put by the proconsul Gellius (about 70 B.C.), who proposed to the representatives of the schools in Athens that they should settle their differences amicably, at the same time offering his personal services as mediator. Though the well-meant proposal was not accepted, this atmosphere of indifference imperceptibly influenced the attitude of the

contending schools to one another. Thus Boethus the Stoic deserted the pantheism of his school and assigned the deity, as Aristotle had done, to the highest sphere. He likewise embraced the Peripatetic doctrine of the eternity of the world. A similar approximation to Peripateticism is seen in Panætius. About the same time, Antiochus of Ascalon, founder of the so-called fifth Academy, tried to combine Plato, Aristotle, and Zeno, asserting that they differed only in words. Meanwhile the Peripatetic school may be said to have taken a new departure and a new lease of life. The impulse was due to Andronicus of Rhodes, the well-known editor of Aristotle's works, who presided over the Lyceum towards the middle of the 1st century B.C. His critical edition indicated to the later Peripatetics the direction in which they could profitably work, and the school devoted itself henceforth almost exclusively to the writing of commentaries on Aristotle. Boethus of Sidon and Aristo of Alexandria carried on the work of interpretation begun by Andronicus. Boethus appears, like many of his predecessors, to have taken the naturalistic view of Aristotle's doctrines, and even in some respects to have approximated to the Stoic materialism. Staseas, Cratippus, and Nicolaus of Damascus need only be named as belonging to this century. The most interesting Peripatetic work of the period is the treatise *De Mundo*, which has come down to us under Aristotle's name, but which internal evidence obliges us to assign to a date later than the writings of the Stoic Posidonius. The interest of the treatise lies in the evidence it affords within the Peripatetic school of the eclectic tendency which was then in the air. The admixture of Stoic elements is so great that some critics have attributed the work to a Stoic author; but the writer's Peripateticism seems to be the more fundamental constituent of his doctrine.

Our knowledge of the Peripatetic school during the first two centuries of the Christian era is very fragmentary; but those of its representatives of whom anything is known confined themselves entirely to commenting upon the different treatises of Aristotle. Thus Alexander of *Ægæ*, the teacher of Nero, commented on the *Categories* and the *De Cælo*. In the 2d century Aspasius and Adrastus wrote numerous commentaries. The latter also treated of the order of the Aristotelian writings in a separate work. Somewhat later, Herminus, Achaicus, and Sosigenes commented on the logical treatises. Aristocles of Messene, the teacher of Alexander of Aphrodisias, was the author of a complete critical history of Greek philosophy. This second phase of the activity of the school closes with the comprehensive labours of Alexander of Aphrodisias, the exegete *par excellence*, called sometimes the second Aristotle. He became head of the Lyceum during the reign of Septimius Severus, some time between 198 and 211 A.D. Alexander's interpretation proceeds throughout upon the naturalistic lines which have already become familiar to us. Aristotle had maintained that the individual alone is real, and had nevertheless asserted that the universal is the proper object of knowledge. Alexander seeks consistency by holding to the first position alone. The individual is prior to the universal, he says, not only "for us," but also in itself, and universals are abstractions which have merely a subjective existence in the intelligence which abstracts them. Even the deity must be brought under the conception of individual substance. Such an interpretation enables us to understand how it was possible, at a later date, for Aristotle to be regarded as the father of Nominalism. Form, Alexander proceeds, is everywhere indivisible from matter. Hence the soul is inseparable from the body whose soul or form it is. Reason or intellect is bound up with the other faculties. It exists primarily in man only as a disposition or capacity—*νοῦς ὑλικὸς καὶ φυσικὸς*—and

as afterwards developed into actual intelligence—*νοῦς ἀπύκτιστος*—the *intellectus acquisitus* of the Scholastics. The active reason—*νοῦς ποιητικός*—which effects this development is, according to Alexander, no part of the soul, but simply the divine reason acting upon it. The influence of God upon nature is elsewhere reduced by Alexander, as far as possible, to a mechanical process. Aristotle's ethico-mystical conception of God as the ultimate and transcendental object of desire is set aside; and the influence of the deity is represented simply as a diffusion of force, first into the heavens and thence downwards, each lower element receiving less according to its greater distance from the source. The commentaries of the Aphrodisian formed the foundation of the Arabian and Scholastic study of Aristotle. Soon after Alexander's death the Peripatetic school was merged, like all others, in the Neoplatonic. Neoplatonists like Porphyry, Iamblichus, Themistius, Dexippus, Syrianus, Ammonius, Simplicius, and Philoponus carried on the work of commenting on Aristotle till the final disappearance of Greek philosophy. For the further history of Aristotelianism, see ARABIAN PHILOSOPHY and SCHOLASTICISM.

The authorities on whom we depend for our knowledge of the Peripatetics are collected and sifted with exhaustive care by Zeller in the relative sections of his *Philosophie der Griechen* (ii. 2 and iii. 1).

PERIPATUS. See MYRIAPODA, vol. xvii. p. 116.

PERITONITIS, inflammation of the peritoneum or membrane investing the abdominal and pelvic cavities and their contained viscera. It may exist in an acute or a chronic form, and may be either localized in one part or generally diffused.

Acute peritonitis may attack persons of both sexes and of any age. It is sometimes brought on, like other inflammations, by exposure to cold, but it would appear to arise quite as frequently in connexion with some antecedent injury or disease in some of the abdominal organs, or with depraved conditions of the general health. It is an occasional result of hernia and obstructions of the bowels, of wounds penetrating into the abdomen, of the perforation of viscera by disease (*e.g.*, in ulcer of the stomach and in typhoid fever), of the bursting of abscesses or cysts into the abdominal cavity, and also of the extension of inflammatory action from some of the abdominal or pelvic organs. Not infrequently it is at first localized, and then, spreading onwards, becomes general.

The changes which take place in the peritoneum are similar to those undergone by other serous membranes when inflamed, viz., (1) congestion; (2) exudation of lymph in greater or less abundance, at first greyish in colour and soft, thereafter yellow and becoming tough in consistence, causing the folds of intestine to adhere together; (3) effusion of fluid, either clear, turbid, bloody, or purulent; (4) absorption more or less complete of the fluid and lymph. Occasionally shreds or bands of unabsorbed lymph remain, constituting a subsequent danger of strangulation of the bowel. The symptoms usually begin by a rigor, together with vomiting and pain in the abdomen of a peculiarly severe and sickening character, accompanied with extreme tenderness, so that the slightest pressure causes a great aggravation of suffering. The patient lies on the back with the knees drawn up, and it will be noticed that the breathing is rapid and shallow and performed by movements of the chest only, the abdominal muscles remaining quiescent, unlike what takes place in healthy respiration. The abdomen becomes swollen by flatulent distension of the intestines, which increases the patient's distress. There is usually constipation. The skin is hot, although there may be perspiration; the pulse is small, hard, and wiry; the urine is scanty and high-coloured, and passed with pain. The patient's aspect is

one of anxiety and suffering. These symptoms may subside in a day or two, but if they do not the case is apt to go on rapidly to a fatal termination. In such an event the pain and tenderness subside, the abdomen becomes more distended, hiccough and vomiting of brown or blood-coloured matter occur, the temperature falls the face becomes pinched, cold, and clammy, the pulse, exceedingly rapid and feeble, and death takes place from collapse, the patient's mental faculties generally remaining clear till the close. When the peritonitis is due to perforation, as may happen in the case of the gastric ulcer, or the ulcers of typhoid fever, the above-mentioned symptoms and the fatal collapse may all take place in from twelve to twenty-four hours. Further, the puerperal form of this disease, which comes on within a day or two after parturition, is always very serious and is often rapidly fatal. The symptoms are similar to those already described, but in addition there are generally superadded those of septicæmia (blood-poisoning).

Chronic peritonitis occurs in two forms—(1) as a result of the acute attack; (2) as a tubercular disease. In the former case, the acute symptoms having subsided, abdominal pain to some extent continues, and along with this there is considerable swelling of the abdomen, corresponding to a thickening of the peritoneum, and it may be also to fluid in the peritoneal cavity. Occasionally a condition of this kind appears to develop slowly without there having been any preceding acute attack. In this form of peritonitis there is considerable constitutional disturbance, together with loss of strength and flesh; nevertheless, although the disease is essentially a chronic one, it is often recovered from. The tubercular form of peritonitis occurs either alone or associated with tuberculous disease of the lungs or other organs. The chief symptoms are abdominal pain and distension, along with disturbance of the functions of the bowels, there being either constipation or diarrhoea, or each alternately. Along with these local manifestations there exist the usual phenomena of tuberculous disease, viz., high fever, with rapid emaciation and loss of strength. Cases of this kind are of grave import, and their tendency is to a fatal termination.

In the treatment of acute peritonitis the remedy upon which most reliance is to be placed is opium, which affords relief to the pain, and appears to exercise a certain controlling influence upon the inflammatory process. It requires to be given in considerable quantity, yet with due care, so as to avoid its narcotic action. The old plan of covering the abdomen with leeches is now seldom resorted to; nevertheless a moderate abstraction of blood by this means in a previously healthy person may contribute to the relief of the pain. Hot fomentations with turpentine or opium applied over the abdomen are of value. The strength must be maintained by milk, soups, and other light forms of nourishment. It is not in general desirable that the bowels should act, and this is one of the benefits obtained by the internal administration of opium. In the simple chronic form the use of iodine externally and of tonics with cod-liver oil internally will be found of service; while in the tubercular form remedies are as a rule of little value, but such symptoms as pain, fever, diarrhoea, &c., must be dealt with by palliative measures appropriate to these conditions.

PERIZONIUS, JACOB (1651-1715), classical scholar, the most distinguished member of a learned Dutch family of that name (Voorbroek in the vernacular), was the eldest son of Anton Perizonius, author of a once well-known treatise, *De ratione studii theologicæ*, and was born at Dam in Groningen on 26th October 1651. He received his school education at Dam and Deventer, and afterwards studied in the university of Utrecht, where he came under the influence of Grevius and abandoned theology for pure literature. The death of his father and other untoward circumstances involved him in a struggle with various outward difficulties, but the influence of Heinsius and Grevius, who already appreciated him highly, and expected great things from him, ultimately procured for

him in 1682 the appointment to the chair of eloquence and history at Franeker, where his expositions of Cicero, Terence, Florus, and Suetonius, as well as his lectures on general history, attracted a large and increasing number of hearers. In 1693 he was promoted to the corresponding chair at Leyden, where he succeeded F. Spanheim in 1701. His death took place in that city on 6th April 1715.

The works of Perizonius both as an author and as an editor were very numerous, and by universal consent entitle him to a place of the highest rank among the scholars of his age. Special interest attaches to his edition of the *Minerva* of Sanctius or Sanchez (1st ed. 1687, 4th ed. 1714), which may be said to be one of the last developments of the study of Latin grammar while in its pre-scientific stage, when the phenomena of language had not yet ceased to be regarded as for the most part disconnected, conventional, or fortuitous. Mention must also be made of his *Animadversiones historice, in quibus quam plurima in prisca Romanarum rerum sed utriusque lingue auctoribus notantur, multa etiam illustrentur atque emendantur, varia denique antiquorum rituum eruantur et uberius explicantur* (1685), a work which Bayle has characterized as deserving to be entitled "The Errata of scholars and critics," and of his *Dissertationes duæ de Republica Romana*, alluded to with honour by Niebuhr in the preface to his *Roman History* (4th ed., 1833) as marking the beginning of that new era of classical study with which his own name is so closely associated.

PERJURY is an assertion upon an oath duly administered in a judicial proceeding, before a competent court, of the truth of some matter of fact, material to the question depending in that proceeding, which assertion the assessor does not believe to be true when he makes it, or on which he knows himself to be ignorant (Stephen, *Digest of the Criminal Law*, Art. 135). In the early stages of legal history perjury seems to have been regarded rather as a sin than as a crime, and so subject only to supernatural penalties. The injury caused by a false oath was supposed to be done not so much to society as to the Divine Being in whose name the oath was taken (see OATH). One of the practical effects of this view was to make perjury so common in the Middle Ages that the probable reason for preserving trial by combat was the difficulty of securing a just cause against the perjury of witnesses (Hallam, *Middle Ages*, ch. ix. pt. 1). The almost universal existence of compurgation was no doubt another explanation of the frequency of perjury. In cases of compurgation, or in cases where wager of law was allowed, it is difficult to imagine that the defence could as a rule have been an honest one. In Roman law, even in the time of the empire, the perjurer fell simply under divine reprobation, and was not dealt with as a criminal, except where he had been bribed to withhold true or give false evidence, or where the oath was by the genius of the emperor. In the latter case punishment was no doubt inflicted more for the insult to the emperor than for the perjury. False testimony leading to the conviction of a person for a crime punishable with death constituted the offence of homicide rather than of perjury. In England, perjury, as being a sin, was originally a matter of ecclesiastical cognizance. At a later period, when it had become a crime, the jurisdiction of the spiritual courts became gradually confined to such perjury as was committed in ecclesiastical proceedings, and did not extend to perjury committed in a temporal court. The only perjury which was for a long time noticed at common law was the perjury of jurors. Attaint of jurors (who were originally rather in the position of witnesses than of judges of fact) incidentally subjected them to punishment for perjury.* Criminal jurisdiction over perjury by persons other than jurors seems to have been first assumed by the Star Chamber, acting under the powers supposed to have been conferred by 3 Hen. VII. ch. 1. After the abolition of the Star Chamber by the Long Parliament in 1641 and the gradual diminution of the authority of the spiritual courts, perjury (whether in the strict sense of the word or the taking of a false oath in non-judicial

proceedings) practically fell entirely within the jurisdiction of the ordinary criminal tribunals. The jurisdiction of the spiritual courts over perjury may now be considered obsolete. An unsuccessful attempt was made as lately as 1876 to induce the Court of Arches to entertain a criminal suit against a layman for a false oath taken before a surrogate (*Phillimore v. Machon*, *Law Rep.*, 1 Prob. Div., 481). See further, for the history of the law of perjury, Stephen, *History of the Criminal Law*, vol. ii. p. 408; vol. iii. p. 240. At common law only a false oath in judicial proceedings is perjury. But by statute the penalties of perjury have been extended to extra-judicial matters, e.g., false declarations made for the purpose of procuring marriage (19 and 20 Vict. c. 119, s. 18), and false affidavits under the Bills of Sale Act, 1878 (41 and 42 Vict. c. 31, s. 17). False affirmation by a person permitted by law to affirm is perjury (32 and 33 Vict. c. 68, s. 4; 33 and 34 Vict. c. 49). In order to support an indictment for perjury the prosecution must prove the authority to administer the oath, the occasion of administering it, the taking of the oath, the substance of the oath, the materiality of the matter sworn, the falsity of the matter sworn, and the corrupt intention of the defendant. The indictment must allege that the perjury was wilful and corrupt, and must set out the false statement or statements on which perjury is assigned, subject to the provisions of 23 Geo. II. c. 11 (which also applies to subornation of perjury). By that Act it is sufficient to set out the substance of the offence, without setting forth the bill, answer, &c., or any part of the record, and without setting forth the commission or authority of the court before whom the perjury was committed. The matter sworn to must be one of fact and not of mere belief or opinion. It is not homicide, as in Roman law, to procure the death of another by false evidence, but the Criminal Code, ss. 118, 164, proposes to make such an offence a substantive crime of greater gravity than ordinary perjury, and punishable by penal servitude for life. It is a rule of evidence, founded upon obvious reasons, that the testimony of a single witness is insufficient to convict on a charge of perjury. There must be corroboration of his evidence in some material particular. Perjury is a common law misdemeanour, not triable at quarter-sessions. Proceedings may also be taken under 5 Eliz. c. 9, but this Act is of little practical importance, as the common law is more extensive than the statute. Most persons in a judicial position have the right of directing the prosecution of any witness, if it appears to them that he has been guilty of perjury (14 and 15 Vict. c. 100, s. 19). The provisions of the Vexatious Indictments Act (22 and 23 Vict. c. 17) extend to perjury and subornation of perjury. By that Act no indictment for either of such offences can be preferred unless the prosecutor or accused is bound by recognizance, or the accused is in custody, or the consent of a judge is obtained, or (in the case of perjury) a prosecution is directed under 14 and 15 Vict. c. 100.

Subornation of perjury is procuring a person to commit a perjury which he actually commits in consequence of such procurement. If the person attempted to be suborned do not take the oath, the person inciting him, though not guilty of subornation, is liable to fine and corporal punishment. Perjury and subornation of perjury are punishable at common law with fine and imprisonment. By the combined operation of 2 Geo. II. c. 25 and later statutes, the punishment at present appears to be penal servitude for any term, or imprisonment with or without hard labour for a term not exceeding seven years (see Stephen, *Digest*, Art. 137). Perjury or prevarication committed before a committee of either House of Parliament may be dealt with as a contempt or breach of privilege as well as by prosecution. As to false oaths not perjury, it is a

misdeemeanor at common law, punishable by fine and imprisonment, to swear falsely before any person authorized to administer an oath upon a matter of common concern, under such circumstances that the false swearing, if committed in judicial proceedings, would have amounted to perjury. There are some cases of making false declarations which are punishable on summary conviction, *e.g.*, certain declarations under the Registration of Births and Deaths Act, 1874, and the Customs Consolidation Act, 1876. A conviction for perjury subjects the person convicted to certain disqualifications. He cannot hold a parish office (4 and 5 Will. IV. c. 76, s. 48). If a solicitor, and he attempt to practise after conviction, he is liable on summary conviction by a judge to seven years' penal servitude (12 Geo. I. c. 29, s. 4). If the prosecution be under the statute of Elizabeth, the person convicted is disabled from giving evidence for the future (5 Eliz. c. 9, s. 2). The provisions of the last two Acts may, however, be regarded as virtually obsolete. The perjury of a witness may be a ground for pardon where the perjury has taken place in a criminal trial in which accused was convicted, or for a new trial in a civil action. In order to procure a pardon or a new trial it is generally necessary to show that the witness was a material one, and also that the perjurer has been prosecuted to conviction.

In Scotland the law, as a general rule, agrees with that of England. Perjury may be committed by a party on reference to oath as well as by a witness. A witness making a false affirmation is guilty of perjury (28 Vict. c. 9). The Acts 14 and 15 Vict. c. 100 and 22 and 23 Vict. c. 17 do not extend to Scotland. The trial, though usually by the Court of Justiciary, may be by the Court of Session if the perjury is committed in the course of an action before that court. The punishment is penal servitude or imprisonment at the discretion of the court. Formerly a person convicted of perjury was disabled from giving evidence in future: this disability was abolished by 15 Vict. c. 27, s. 1.

In the United States the common law has been extended by most States to embrace false affirmations and false evidence in proceedings not judicial. Perjury in the United States courts is dealt with by an Act of Congress of 3d March 1825, by which the maximum punishment for perjury or subornation of perjury is a fine of \$2000 or imprisonment for five years. The jurisdiction of the States to punish perjury committed in the State courts is specially preserved by the same Act. Statutory provisions founded upon 23 Geo. II. c. 11 have been adopted in some States, but not in others. In the States which have not adopted such provisions, the indictment must set out the offence with the particularity necessary at common law. (J. Wt.)

PERKINS, JACOB (1766-1849), inventor and physicist, was born at Newburyport, Massachusetts, in 1766, and apprenticed to a goldsmith. He soon made himself known by a variety of useful mechanical inventions, and in 1818 came over to England with a plan for engraving bank-notes on steel, which, though it did not find acceptance at once, ultimately proved a signal success, and was carried out by Perkins in partnership with the English engraver Heath during the rest of his long business life. Perkins continued to be fertile of inventions, and his steam-gun, exhibited in 1824, attracted much attention, though the danger attending the use of highly-compressed steam prevented its practical adoption. His chief contribution to physics lay in the experiments by which he proved the compressibility of water and measured it by a piezometer of his own invention; see vol. vii. p. 801, and *Phil. Trans.*, 1820, 1826. He retired in 1834, and died in London, 30th July 1849.

PERM, a government of Russia, on both slopes of the Ural Mountains, with an area of 128,250 square miles. Though Perm administratively belongs entirely to Russia in Europe, its eastern part (about 57,000 square miles) is situated in Siberia, in the basin of the Obi. It is traversed from north to south by the Ural range, a low ridge, from 30 to 45 miles in width, thickly covered with forests, and deeply excavated by rivers. The highest summits do not

rise above 3600 feet in the northern section of the range (the Vogulian Ural); in the central portion, between 59° and 60° 30' N. lat., they once or twice exceed 5000 feet, (Denezhkin, 5027 feet, and Konzhakovskii Kamen, 5135 feet); but the chain soon sinks towards the south, where it barely attains an elevation of 3000 feet. Where the great Siberian road crosses the ridge the highest point is 1400 feet. Westward the plain of the river Kama is still 500 feet above sea-level at a distance of 120 miles from the main watershed, but to the east the secondary ridges and spurs of the central chain fall away somewhat more rapidly,—Kamyshloff, 100 miles distant, being situated amidst the lowlands of the Obi at an altitude of less than 200 feet.

The geology of Perm has been the subject of very many investigations since the journeys of Humboldt and Murchison; but several parts of the government still remain unexplored. Granites, diorites, porphyries, serpentines, and Laurentian gneisses and limestones, containing iron, copper, and zinc ores, constitute the main axis of the Ural chain; their western slope is covered by a narrow strip of Huronian crystalline slates, which disappear in the east under the Post-Tertiary deposits of the Siberian lowlands, while on the west narrow strips of Silurian limestones, quartzites, and slates, and separate islands of Devonian deposits appear on the surface. These in their turn are covered with Carboniferous clays and sandstones, containing Coal-measures in several isolated basins. The Permian deposits extend as a regular strip, parallel to the main ridge, over these last, and are covered with the so-called "variegated marls," which are now considered as Triassic, and which appear only in the western corner of the territory. Perm is the chief mining region of Russia, owing to its wealth in iron, silver, platinum, copper, nickel, lead, chrome ore, and auriferous alluvial deposits. Many rare metals, besides, such as iridium, osmium, rhodium, and ruthenium, are found along with the above, as also a great variety of precious stones, such as sapphires, jacinths, beryls, phenacites, chrysoberyls, emeralds, aquamarines, topazes, amethysts, jades, malachite. Salt-springs appear in the west; and the mineral waters, though still little known, are also worthy of mention.

The government is very well watered by rivers belonging to the Petchora, Tobol (affluent of the Obi), and Kama systems. The Petchora itself rises in the northern corner of the government, and its tributary the Volosnitsa is separated by a distance of only 4900 yards from the navigable Vogulka, a tributary of the Kama,—a circumstance of some commercial importance. The tributaries of the Tobol (Sosva, Tura, Isset, and Ui) are far more important. Their sources, which approach those of the tributaries of the Kama very closely, early became a link between Russia and Siberia, and the first section of the Siberian railway (completed for 312 miles from Perm to Ekaterinburg) has been planned to connect the Kama at Perm with the Tura at Tumen, whence there is a navigable route by the Siberian rivers to the very heart of western Siberia at Tomsk. The chief river of Perm is, however, the Kama whose great navigable tributaries the Tchusovaya, Sylva, and Kelva are important channels for the export of the heavy iron goods to Russia,—5,000,000 cwts., valued at upwards of £2,000,000, being annually shipped on these rivers to the Volga. Timber also is floated down many of the smaller streams. Altogether, the rivers supply to some extent the want of roads or the defects of those which exist, the great Siberian highway oven (*via* Kazan, Okhansk, Perm, Ekaterinburg, and Tumen) being usually in a bad state.

The government is dotted with a great number of lakes of comparatively trifling size, and marshes also are extensive

in the hilly tracts of the north. No less than 45,750,000 acres are forest; of this large area only 2,175,600 acres are under proper forest administration. The forests are distributed very unequally, covering 95 per cent. of the area in the north, and only 25 per cent. in the south-east. Fir (*Abies sibirica*, *Picea obovata*), pine (*Pinus sylvestris*), cedar (*Pinus Cembra*), larch (*L. sibirica*), birch, alder (*Alnus*), and lime are the most common woods; the oak appears only in the south-west. The flora of Perm (956 Phanerogams) presents a mixture of Siberian and Russian species, several of which have their north-eastern or south-western limits within the government. The climate is severe, the average temperature at different places being as follows:—

| | Lat. N. | Altitude. | Yearly average. | January average. | July average. |
|------------------|---------|-----------|-----------------|------------------|---------------|
| | | Feet. | Fahr. | Fahr. | Fahr. |
| Bogoslovsk | 59° 45' | 630 | 29°·3 | 3°·0 | 62°·6 |
| Usolie (Kama)... | 59° 25' | 300 | 34°·0 | 4°·5 | 63°·8 |
| Nijne-Taghilsk | 57° 55' | 590 | 33°·1 | 2°·0 | 64°·9 |
| Ekaterinburg ... | 56° 48' | 890 | 32°·9 | 2°·5 | 63°·5 |

The population in 1881 amounted to 2,520,100, of which number 106,500 lived in towns. It consisted chiefly of Great Russians, Bashkirs (about 100,000, including Mescheryaks and Teptyars), about 65,000 Permyaks or Permians, 25,000 Tatars, 8000 Tcheremisses, and some 2500 Voguls. More than a million of the Great Russians are Nonconformists, their number having rapidly increased within the last twenty years. Except in the northern districts, which are covered with marshes and tundras, and in a zone 70 miles wide, which includes the higher and stony parts of the Ural Mountains to the north of the 53th parallel, agriculture is the general occupation of the inhabitants, who are favoured with a very fertile soil in the southern districts. Nevertheless, only 8,000,000 acres are under crops, the proportion of arable land ranging from 2 to 34 per cent. of the area in different districts. Rye, oats, barley, and hemp are raised in all parts, and wheat, millet, buckwheat, and flax in the south. The average crops in recent years have been 4,198,000 quarters of grain and 1,866,400 bushels of potatoes.

Cattle-breeding is specially developed in the south-east among the Bashkirs, who have large numbers of horses, but is at present decreasing. In 1881 there were 837,000 horses, 820,000 horned cattle, 1,055,000 sheep, and 267,000 pigs. These figures vary, however, from year to year, in consequence of the murrains that periodically destroy great numbers of horses and cattle. Agriculture is widely spread among the Bashkirs, Teptyars, and Tcheremisses, and the chase is still a source of wealth, especially among the Voguls. Shipbuilding is developed on the Kama, Vishera (a tributary of the Kama), Sylva, and Tchusovaya; and large amounts of timber, pitch, and tar, as also wooden implements, are exported to the Volga. Some 100,000 hands find occupation in connexion with the mining industry, and a number are engaged in the transport trade to and from Siberia, or in shipping. Mining increases every year, especially since private enterprise has been allowed to develop freely. In 1879 the total production of metals on the mining-works of the crown and of private individuals was (in cwts.):—gold, 102·7; copper, 12,913; pig-iron, 4,457,000; iron, 2,704,000; steel, 599,600; salt, 3,750,000. The working of coal, although recent, promises to be most valuable. In 1865 the aggregate of all manufactures connected with mining hardly exceeded 15,000,000 roubles (£1,500,000) in value. In 1879 it was:—copper, 879,800 roubles; pig-iron, 14,076,900; iron, 9,077,900; and steel, 2,218,000. The aggregate of other manufactures, employing 7400 hands, in the same year reached 20,962,000 roubles, against 5,802,000 in 1865. The first place is taken by flour-mills (£973,500), followed by distilleries (£566,500) and tanneries (£212,300); next in order come the manufactures of spirits, saddlery, woollen cloth, ropes, oils, cakes, paper, chemicals, candles, tallow, soap, matches, wax-candles, glass, pottery, &c. The cutting of precious stones is extensively carried on throughout the villages on the eastern slope of the Ural Mountains, the chief market for them being at Ekaterinburg. Besides, a variety of petty trades are carried on, the manufacture of carpets in the south-east (Tumen carpets), as also that of boots at Kungur, being especially worthy of mention.

An active trade, greatly favoured by the easy communication of the chief centres of the mining industry with the great market of Nijni Novgorod on the one side and with the great network of Siberian rivers on the other, is carried on in metals and metal wares, minerals, timber and wooden wares, tallow, skins, cattle, furs, corn, and linseed. Large caravans descend the affluents of the Kama every spring, and reach the great fairs of Laisheff and Nijni Novgorod, or descend the Volga to Samara and Astrakhan; while Ekaterinburg is an important centre for the trade with

Siberia. The fair at Irbit, second in importance only to that of Nijni Novgorod, is a great centre for supplying Siberia with grocery and manufactured wares, as also for the purchase of tea, of furs for Russia, and of corn and cattle for the mining districts. About 130 other fairs are held every year within the government. The chief commercial centres are Ekaterinburg, Irbit, Perm, Kamyshlov, Shadrinsk, Tcherdyu, and several iron-works (*zavody*).

Perm is more largely provided with educational institutions and primary schools than most of the governments of central Russia. Besides the usual lyceum and ecclesiastical seminary at Perm, there are a mining school at Ekaterinburg and lower mining schools at Bogoslovsk and Kushva, and two lyceums for women at Perm and Ekaterinburg. The number of primary schools in 1881 was 621 (39,773 scholars, including about 8000 girls). The Nonconformists are very diligent in teaching reading (in Old Slavonian) to their girls. The Ural Society of Naturalists, at Ekaterinburg, issues valuable scientific serials, and there are within the government two first-rate meteorological and magnetic observatories, at Ekaterinburg and Bogoslovsk.

Perm is divided into twelve districts having for their chief towns (with populations in 1879)—Perm (32,350), Kungur (14,000), Krasnoufmsk (3700), Okhansk (1650), Osa (2850), Solikamsk (16,900), and Tcherdyn (3260) in Europe; Ekaterinburg (25,150), Irbit (4250), Kamyshlov (2160), Shadrinsk (11,550), and Verkhoturie (8900) in Asia. Alapaevsk (5450), Dalmatoff (4350), and Dedyukhin (3900, with important salt-works) have also municipal institutions. The iron-works form the following important towns:—Nijne-Taghilsk (30,000 in 1881), Neviansk (14,000), Kyshtyn (12,350), Revdinsk (9950), Upper and Lower Turinsk (9750), Nyazepetrovsk (9000), Verkh-Issetskii (7000), Nijne-Issetskii, Sysertsinskii (5900), Bogoslovsk (4500), Verkhne-Taghilsk (3850), and Suksunsk (3150). The salt-works of Usolie (7700) and Lenva (3250) may also be mentioned.

History.—Remains of Palaeolithic man, everywhere very scarce in Russia, have not yet been discovered in the upper basins of the Kama and Obi, with the exception, perhaps, of a single human skull found in a cavern on the Tchanva (basin of Kama), together with a skull of *Ursus spelæus*. Neolithic remains, on the other hand, are met with in immense quantities on both Ural slopes throughout the territory of Perm. Still larger quantities of implements belonging to an early Finnish, or rather Ugrian, civilization are found everywhere in the basin of the Kama, even in its northern parts, the present district of Tcherdyn. Even Herodotus speaks of the richness of this country inhabited by the Ugrians, who kept up a brisk traffic with the Greek colony of Olbia, and with the Bosphorus by way of the Sea of Azoff and the Volga. The precise period at which the Ugrians left the district for the southern steppes of Russia (the "Lebedia" of Constantine Porphyrogenitus) is not known. In the 9th century the Scandinavians were acquainted with the country as Biarmia, and Byzantine annalists knew it as Permia. Nestor describes it as a territory of the Perm; a Finnish people, some 50,000 of whom still remain, and whose name seems to have been derived from *parma*, a Finnish word denoting hilly tracts thickly covered with forests.

The Russians penetrated into this region at an early date. In the 11th century Novgorod levied tribute from the Finnish inhabitants, and undertook the colonization of the country, which in the treaties of the 13th century is dealt with as a separate territory of Novgorod. In 1471, after the fall of Novgorod, Perm was annexed to Moscow, which in the following year erected a fort to protect Russian settlers and tradesmen from the Voguls, Ostyaks, and Samoyedes. Tcherdyn, the oldest town of Perm, was already in existence in the 15th century. The mineral wealth of the country soon attracted the attention of the Moscow princes, and Ivan III. sent two Germans to search for ores; these they succeeded in finding south of the upper Petchora. A great impulse to colonization and mining was given by the Strogonoofs, when in the 16th century they received immense tracts of land on the Kama and Tchusovaya. They founded the first salt and iron works, built forts, and colonized the Ural region. Solikamsk, Osa, Okhansk, and Verkhoturie were founded during this century. By the latter part of the century the Russian colonies had spread beyond the Ural Mountains; and in this direction the Strogonoofs continued to extend their mining operations. The rapidly-growing trade with Siberia gave a new impulse to the development of the country. This trade had its centres at Perm and Solikamsk, where merchandise brought up the Kama was unshipped and transported by land to Verkhoturie, at that time the first Siberian town and custom-house on the great highway. Kungur, too, attained some commercial importance. The fair of Irbit in the 17th century became the chief seat of the trade in merchandise, brought both from Russia to Siberia and from Siberia and Bokhara to Russia. Communication with Siberia having taken a northern route, the southern parts of the territory were not colonized until the next century, when Ekaterinburg, Krasnoufmsk, and Alapaevsk were founded. In 1780 the provinces of Perm and Ekaterinburg were instituted, but were soon united into one. (P. A. K.

PERM, capital of the above government, stands on the left bank of the Kama, on the great highway to Siberia, 930 miles north-east from Moscow. During summer it has regular steam communication with Kazan, 685 miles distant, and it is connected by rail with Ekaterinburg. The town is mostly built of wood, with broad streets and wide squares, and has a somewhat poor aspect, especially when compared with Ekaterinburg. It is the see of a bishop, and has an ecclesiastical seminary and a military school. The manufactures are few; the Government manufactory of steel guns and munitions of war, in the immediate neighbourhood of the town, turns out about 1600 tons of guns annually. The aggregate production of the private manufactories of all kinds did not exceed £165,000 in 1879; they included tanneries (£78,600), distilleries (£61,000), rope-works (£9500), brick-works, breweries, soap and candle works, iron-wire and copper-ware works. Numerous flour-mills and several oil-works occur within the district. The town derives its commercial importance as being the chief place of storage for merchandise to and from Siberia (tea, metals and metal-ware, skins, leather, butter, wool, bristles, tallow, cedar nuts, linseed, &c.), which is unshipped here from the steamers coming up the Kama, and despatched by rail or on cars and sledges to Siberia, or vice versa. The trade is chiefly in the hands of Nijni Novgorod, Kazan, Ekaterinburg, and Siberian merchants. The population of Perm in 1879 was 32,350.

The present site of Perm was occupied, as early as the year 1568, by a settlement named Brukhanovo, founded by one of the Stroganoffs; this settlement seems to have received the name of Perm in the 17th century. The Yagzhikhinsky copper-work was founded in the immediate neighbourhood in 1723, and in 1781 it received officially the name of Perm, and became an administrative centre both for the country and for the mining region. The mining authorities left Perm for Ekaterinburg in 1830.

PERMUTATIONS. See ALGEBRA, vol. i. p. 560.

PERNAMBUCO, or RECIFE, a city and seaport of Brazil and the chief town of the extensive province of Pernambuco. As it is situated on the coast in 8° 3' 27" S. lat. and 34° 50' 14" W. long. (Fort Picao), not far from the point where the continent begins to trend towards the south-west, it is naturally the first port visited by steamers from Lisbon to Brazil. The reef, which can be traced more or less distinctly along the Brazilian seaboard for several hundred miles, rises at Pernambuco into a perfectly straight artificial-looking wall, 3½ miles long, with even

duced by the successive growth and death of the small shells of *Serpulæ* with some few barnacles and nullipores, proves so effectual a protection of the outer surface that though it is exposed to the full force of the waves of the open Atlantic the oldest pilots know of no tradition of change in its appearance.¹ The belt of water within the reef is about a mile in width and forms a safe but rather shallow harbour; vessels drawing 19½ feet can enter, and there is abundant room for mooring along the shore and reef, but mail-steamers usually anchor in the roads and discharge by means of lighters. Sir John Hawkshaw's scheme for the improvement of the harbour (1874) was rejected by the Government as too costly; but extensive dredging operations are being prosecuted. The city of Pernambuco lies low, and is surrounded by a swampy stretch of country, with no high ground nearer than the hill on which Olinda is built, 8 miles to the north. It used to be considered the most pestilential of Brazilian seaports; but its sanitary condition has greatly improved, partly owing to drainage-works executed by an English company. There are three natural divisions in the city—Recife ("the Reef"), situated not on the reef proper but on an island forming the southern end of a sandbank that stretches north towards Olinda; Sant' Antonio, on a peninsula separated from the island by the united waters of the Capibaribe and the Biberibe; and Boa Vista, the fashionable residential district on the mainland opposite Sant' Antonio. In Recife the streets are narrow and crooked and many of the houses are of great age and present Dutch characteristics, but Sant' Antonio has broad straight streets, with well-paved side-walks, tramways (worked by mules), and modern-looking houses. Among the public buildings in Pernambuco it is enough to mention the governor's palace, the episcopal palace, the hospital of Pedro II. (5000 patients per annum, with French sisters of mercy as nurses), the founding hospital, the poorhouse, the new lunatic asylum (1881), the university (18 professors and 530 students in 1879), the normal school, and the provincial library (13,000 vols., 11,581 readers, in 1880). The great commercial staple is sugar, and the brown sticky mud of the streets owes its peculiar character to the juice of the cane; 825,711 bags of sugar were brought to the market in 1875-76 and 1,715,637 bags in 1879-80. Cotton, which was first exported in 1778 and continued a small item till 1781, now holds the second place,—130,925 bales in 1875-76 and 60,117 in 1879-80. Coal began to be imported in 1834,—25,314 tons in 1879-80. The total value of the exports and imports has greatly increased.

| | 1816. | 1836. | 1856. | 1876. | 1880. |
|---------------|----------|----------|------------|------------|------------|
| Imports | £193,923 | £952,120 | £1,517,493 | £1,821,104 | £2,478,823 |
| Exports | £209,794 | £947,603 | £1,507,019 | £1,508,958 | £2,021,513 |

The port was opened to British vessels in 1808, and goods, which formerly had to pass through Portugal, began to be brought to England direct. A cemetery for British subjects was opened in 1814, a British hospital in 1821, and a British chapel in 1836. In 1880, out of a total of 1047 vessels (674,227 tons) calling at Pernambuco 451 (249,912 tons) were British. Pernambuco is connected with Olinda by a steam-tramway line and with Caxanga (8½ miles) by a mule-tramway; the Recife and San Francisco Railway (1856-62) runs 78 miles to Una, and is continued by a narrow-gauge line to Garanhuns; and another narrow line strikes up the Capibaribe 52 miles to Limociro. In 1878 the population of the town and immediate suburbs was 94,493.

The name of Pernambuco (*pera*, "a stone," *nambuco*, "pierced") appears to have been originally applied to Itamaracá (a town in

¹ See Darwin's account in *Lond., Edinb., and Dubl. Phil. Mag.*, vol. xix. 1841, p. 257; and *Naturalist's Voyage*, p. 493.

Plan of Pernambuco.

sides and a smooth and almost level top from 30 to 60 yards in width. It is of a hard pale-coloured sandstone, breaking with a very smooth fracture; and a tough layer of calcareous matter, generally several inches thick, pro-

7° 44' S. lat., now decayed, but formerly the capital of an independent captaincy), where also there is an opening in the reef. In 1532 Duarte Coelho founded the city of Olinda, which continued to be the capital of the captaincy of Pernambuco till 1710. When in 1580 the country passed into the hands of Spain it had 700 stone houses, 4000 to 5000 negro slaves were employed in its sugar-plantations, and from 40 to 50 vessels came annually to load with sugar and Brazil wood, often called simply Pernambuco or Fernambuk. Recife, which was a mere collection of fishers' huts when occupied by the French under Villegagnon in 1561, shortly afterwards began to attract attention as a port. It was captured and held for thirty-four days in 1595 by Sir JAMES LANCASTER (*q.v.*), who did not, however, succeed in his attack on Olinda. In the 17th century this part of Brazil was the scene of a great struggle between the Spaniards and the Dutch. Olinda and Recife were captured by the Dutch under Admiral Loeuq in 1630, and in the following year, when they were obliged to retreat to the reef, they left Olinda in flames. Fort Brun was built in 1631. In 1639 (Recife already containing 2000 houses) Count Maurice laid out a new town (Mauritsstad) on the island of Antonio Vaz, and built himself a palace (Vrijburg or Sans Souci) of materials obtained by the demolition of Olinda. A bridge was thrown across from Recife to Mauritsstad, and another from Mauritsstad to the mainland, where the count had his summer palace of Schoonzicht or Boa Vista. An observatory was erected under Maregraf and De Laet. In 1654 the Dutch garrison, neglected by the authorities at home, who were at war with Cromwell, was obliged to capitulate to the Portuguese (26th January).

See J. B. Fernandes Gama, *Mem. hist. da Prov. de Pernambuco* (Pernambuco, 1814); Barleus, *Rerum in Brasilia gestarum historia* (1660); and Netscher, "Les Hollandais au Brésil," in *Le Moniteur des Indes Orient. et Occid.* (1848-49).

PERNAU, in Russian PERNOFF, a seaport town and watering-place of European Russia, in the government of Livonia, is situated in 58° 23' N. lat. and 24° 30' E. long., 155 miles north of Riga, on the left bank of the Pernau or Pernova, which about half a mile farther down enters the Bay of Pernau, the northern arm of the Gulf of Riga. The town proper is well and regularly built, and contains two public gardens and two public parks (Salon Park and Bade Park), a town-house, a hospital, and a public library. On the right side of the river lies the suburb of Bremerseide. The harbour is small, and the depth of water on the bar under 10 feet. The exports, which consist mainly of flax (to Great Britain, France, and Portugal), linseed (to Germany), mats, and cereals, had a value of 8,220,421 silver roubles in 1880, and of 5,427,465 in 1881 (a bad year). The population was 6690 in 1863, 9525 in 1867, and 12,918 in 1881.

Founded on the right side of the river in 1255 by one of the Bishops of Oesel, Pernau, with its walls and castle, soon became a flourishing place. In the 16th century it was occupied in succession by the Swedes, the Poles, and the knights of the Teutonic order. After 1599 the Poles transferred the town to the left side of the river; and in 1642 the Swedes, who had been in possession since 1617, strengthened it with regular fortifications. In 1710 it was besieged and taken by the Russians, and the fortress is now demolished.

PERNE, ANDREW (1519-1589), a notable character in 16th-century history, was born at East Bilney in Norfolk in 1519. He received his education at St John's College, Cambridge, was afterwards a fellow of Queens' College, and finally master of Peterhouse in the same university. He is best known as a remarkable example of the tergiversation in reference to religious profession which, owing to the sudden changes in the prescribed theological belief of the state, was only too common in his age. In the reign of Henry VIII. he defended the adoration of saints, but subsequently abandoned this doctrine in the reign of Edward VI., and became distinguished as an active promulgator of Reformation tenets. In the reign of Mary he subscribed the Roman Catholic articles, and when the remains of Martin Bucer and Paulus Fagius, —two Protestant professors in the university—were exhumed and burnt, he preached on the occasion. He was rewarded for his subservience by being promoted to the deanery of Ely. Notwithstanding this discreditable compliance, he succeeded in gaining Elizabeth's favour on her accession; he signed the grace for restoring the names of Bucer and Fagius in the lists of honours and dignities

from which they had been expunged; and he was elected by the university to the office of vice-chancellor. He thus, like Symond Symonds, the vicar of Bray, was twice a Papist and twice a Protestant. During the remainder of his career he was known as a moderate supporter of Church of England doctrine against the Puritan party. "What bishop or politician in England," asks Gabriel Harvey, "was so great a temporizer as he?" The wags of the university invented a verb, *perno*, which, they declared, meant, "I rat," "I change often." Yet the satirist, notwithstanding, admits his many excellent qualities and eulogizes him for his urbanity and singular tact in his intercourse with men of every class and shade of opinion. To this latter characteristic we must attribute the fact that, while, throughout his life, Perne preserved the friendship of austere churchmen like Whitgift, he was popular with critics of a very different stamp, such as the dissolute Thomas Nash, who declares that "few men lived better." It is not a little to Perne's credit that the social influence which he thus acquired was uniformly exerted to bring about the ends which he had in view as a philanthropist and a true lover of learning. He was a distinguished benefactor of the university in which his life was mainly passed, and its library was restored chiefly through his efforts. His own library at Peterhouse was said to be the best at that time in England. Dr Perne died in 1589 while on a visit to Archbishop Whitgift, on whose gratitude he had established a lasting claim by the protection he accorded him during the persecution under Mary. He belongs to the class of men whose influence during their lives is felt rather than seen; and the services he rendered to his generation become increasingly apparent in proportion as this period of English history is more closely studied.

PÉRONNE, chief town of an arrondissement of the department of the Somme, France, and a fortified place on the right bank of that river at its confluence with the stream called the Doingt or Cologne, lies 94 miles north-north-east of Paris on the railway from Paris to Cambrai. Wet moats surround the ramparts, which are built of brick. The church of St Jean (1509-1525) was greatly damaged during the bombardment of 1870-71, but has since been restored. The castle of Péronne, in one of the bastions of the enceinte, was partially destroyed by fire in 1877; it still retains four large conical-roofed towers dating from the Middle Ages, one of which is said to have been the prison of Louis XI., when he had his famous encounter with Charles the Bold (1468). The town-hall, which was built in the 16th century, has an elegant campanile of modern construction. The population of Péronne in 1881 was 4696.

The Frankish kings had a villa at Péronne, which Clovis II. gave to Erchinoaldus, mayor of the palace. The latter founded a monastery here, and raised in honour of St Furey a collegiate church, which was a wealthy establishment until the Revolution; it is the burial-place of Charles the Simple, who died of starvation in a dungeon in Péronne, into which he had been thrown by the count of Vermandois (929). After the death of Philip of Alsace, Péronne, which he had inherited through his wife, escheated to the French crown (1199), and in 1209 received a charter with municipal privileges from Philip Augustus. By the treaty of Arras (1435) it was given to the Burgundians; bought back by Louis XI., it passed again into the hands of Charles the Bold in 1465. On the death of Charles, however, in 1477, Louis XI. resumed possession. In 1536 the emperor Charles V. besieged Péronne, but without success; in its defence a woman called Marie Fourré greatly distinguished herself, and the anniversary of the raising of the siege was celebrated at Péronne for many years. It was the first town after Paris at which the League was proclaimed in 1577. Péronne's greatest misfortunes occurred during the late Franco-German war. It was invested on 27th December 1870, and bombarded from the 28th to the 9th of the following January, upon which date, on account of the sufferings of the civil population, among whom smallpox had broken out, it was compelled to capitulate. Out of 700 houses 600 were

more or less injured and eighty-two buildings set on fire; the tower of the church of St Jean was also burnt, its roofing and timber-work destroyed, and the bells melted by the flames. This damage has since been repaired.

PÉROUSE. See LA PÉROUSE, vol. xiv. p. 298.

PERPETUAL MOTION, or PERPETUUM MOBILE, in its usual significance does not mean simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed. Briefly, a perpetual motion usually means a machine which will create energy.

The earlier seekers after the "perpetuum mobile" did not always appreciate the exact nature of their quest; for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat. Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding corn, and so on. Like the exact quadrature of the circle, the transmutation of metals, and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest. Just as some of the most interesting branches of modern pure mathematics sprang from the problem of squaring the circle, as the researches of the alchemists developed into the science of modern chemistry, so, as the result of the vain search after the perpetual motion, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreatable and indestructible in the ordinary course of nature; even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master's work; and it was just as reasonable to suppose that a structure of wood, brass, and iron could be found to work under like conditions. The disproof is in both cases alike. No such spirit has ever existed, save in the imagination of his describer, and no such machine has ever been known to act, save in the fancy of its inventor.

The principle of the conservation of energy, which in one sense is simply a denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment is not half a century old, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been proved to accord with experience, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to

trace its power to some hidden source of a kind already known; or in the last resort he would seek for a source of energy of a new kind and give it a new name. Any assertion of creation of energy by means of a mere machine would have to be authenticated in many instances, and established by long investigation, before it could be received in modern science. The case is precisely as with the law of gravitation; if any apparent exception to this were observed in the case of some heavenly body, astronomers, instead of denying the law, would immediately seek to explain the occurrence by a wider application of it, say by including in their calculations the effect of some disturbing body hitherto neglected. If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, and, provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays. The interest of such cases is that attaching to the morbid anatomy of the human mind. Perhaps the most striking feature about them is the woful sameness of the symptoms of their madness. As a body perpetual-motion seekers are ambitious, lovers of the short path to wealth and fame, but wholly superficial. Their inventions are very rarely characterized even by mechanical ingenuity. Sometimes indeed the inventor has simply bewildered himself by the complexity of his device; but in most cases the machines of the perpetual motionist are of child-like simplicity, remarkable only for the extraordinary assertions of the inventor concerning them. Wealth of ideas there is none; simply assertions that such and such a machine solves the problem, although an identical contrivance has been shown to do no such thing by the brutal test of standing still in the hands of many previous inventors. Hosts of the seekers for the perpetual motion have attacked their insoluble problem with less than a schoolboy's share of the requisite knowledge; and their confidence as a rule is in proportion to their ignorance. Very often they get no farther than a mere prospectus, on the strength of which they claim some imaginary reward, or offer their precious discovery for sale; sometimes they get the length of a model which wants only the last perfection (already in the inventor's brain) to solve the great problem; sometimes fraud is made to supply the motive-power which their real or pretended efforts have failed to discover.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the "perpetuum mobile" was an impossibility. We find the Parisian Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they class with solutions of the duplication of the cube, the trisection of an angle, and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his *Principia* states, so far as ordinary mechanics are concerned, a principle which virtually amounts to the same thing (see *MECHANICS*, vol. xv. p. 715).

The famous proof of De la Hire simply refers to some of the more common gravitational perpetual motions, to which we shall refer shortly. The truth is, as we have said already, that, if proof is to be given, or considered

necessary, it must proceed by induction from all physical phenomena.

It would serve no useful purpose here to give an exhaustive historical account of the vagaries of mankind in pursuit of the "perpetuum mobile." The reader may consult on this subject the two volumes by Henry Dircks, C.E., published by E. and F. N. Spon, London, 1861 and 1870, from which, for the most part, we select the following facts to give the reader some idea of this department of the history of human fallibility.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids. We have not read of any actual proposal of the kind, but the most obvious thing to imagine in this way would be to procure some substance which intercepts gravitational attraction. If this could be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work; then, removing the plate, we could allow the body to fall and do work; eccentrics or other imposing device being added to move the gravitation interceptor, behold a perpetual motion complete! The great difficulty is that no one has found the proper material for an interceptor.

Fig. 1 represents one of the most ancient and oftenest-repeated of gravitational perpetual motions. The idea is that the balls rolling in the compartments between the felloe and the rim of the wheel will, on the whole, so comport themselves that the moment about the centre of those on the descending side exceeds the moment of those on the ascending side. Endless devices, such as curved spokes, levers with elbow-joints, eccentrics, &c., have been proposed for effecting this impossibility. The modern student of dynamics at once convinces himself that no machinery can effect any such result; because, if we give the wheel a complete turn, so that each ball returns to its original position, the whole work done by the ball will, at the most, equal that done on it. If we were to start the wheel and balls in the most general way possible, we should doubtless have a very pretty problem to solve; but we know that, if the laws of motion be true, in each step the kinetic energy given to the whole system of wheel and balls is equal to that taken from the potential energy of the balls less what is dissipated in the form of heat by frictional forces, or *vice versa*, if the wheel and balls be losing kinetic energy,—save that the friction in both cases leads to dissipation. So that, whatever the system may lose, it can, after it is left to itself, never gain energy during its motion.

The two most famous perpetual motions of history, viz., the wheels of the marquis of Worcester and of Councillor Orffyreus were probably of this type. The marquis of Worcester gives the following account of his machine in his *Century of Inventions* (art. 56).

"To provide and make that all the Weights of the descending side of a Wheel shall be perpetually further from the Centre than those of the mounting side, and yet equal in number and left to the one side as the other. A most incredible thing, if not seen, but tried before the late king (of blessed memory) in the *Tower*, by my directions, two Extraordinary Embassadors accompanying His Majesty, and the Duke of Richmond, and Duke Hamilton, with most of the Court, attending Him. The Wheel was 14 Foot over, and 40. Weights of 50. pounds apiece. Sir William Balfore, then Lieutenant of the *Tower*, can justify it, with several others. They all saw, that no sooner these great Weights passed the Diameter-

Fig. 1.

line of the lower side, but they hung a foot further from the Centre, nor no sooner passed the Diameter-line of the upper side but they hung a foot nearer. Be pleased to judge the consequence."

Orffyreus (whose real name was Bessler) also obtained distinguished patronage for his invention. His last wheel, for he appears to have constructed more than one, was 12 feet in diameter and 1 foot 2 inches broad; it consisted of a light framework of wood covered in with oil-cloth so that the interior was concealed, and was mounted on an axle which had no visible connexion with any external mover. It was examined and approved of by the landgrave of Hesse-Cassel, in whose castle at Weissenstein it is said to have gone for eight weeks in a sealed room. The most remarkable thing about this machine is that it evidently imposed upon the mathematician's Gravesande, who wrote a letter to Newton giving an account of his examination of Orffyreus's wheel undertaken at the request of the landgrave, wherein he professes himself dissatisfied with the proofs theretofore given of the impossibility of perpetual motion, and indicates his opinion that the invention of Orffyreus is worthy of investigation. He himself, however, was not allowed to examine the interior of the wheel. The inventor seems to have destroyed it himself. One story is that he did so on account of difficulties with the landgrave's Government as to a licence for it; another that he was annoyed at the examination by Gravesande, and wrote on the wall of the room containing the fragments of his model that he had destroyed it because of the impertinent curiosity of Professor's Gravesande.

The history of this case is noteworthy, because it contains all the characters that usually appear in such comedies even now,—the fraudulent paradoxer, the illustrious and intelligent patron, the simple-minded, unbiassed, scientific witness.

It is worthy of remark that the overbalancing-wheel perpetual motion seems to be as old as the 13th century. In his second series Dircks quotes an account of an invention by Wilars de Honecort, an architect whose sketch-book is still preserved in the Écoles des Chartes at Paris. De Honecort says, "Many a time have skilful workmen tried to contrive a wheel that shall turn of itself; here is a way to do it by means of an uneven number of mallets, or by quicksilver." He thereupon gives a rude sketch of a wheel with mallets jointed to its circumference. It would appear from some of the manuscripts of Leonardo da Vinci that he had worked with similar notions.

Another scheme of the perpetual motionist is a water-wheel which shall feed its own mill-stream. This notion is probably as old as the first miller who experienced the difficulty of a dry season. One form is figured in the *Mathematical Magic* of Bishop Wilkins (1614-1672); the essential part of it is the water-screw of Archimedes, which appears in many of the earlier machines of this class. Some of the later ones dispense with even the subtlety of the water-screw, and boldly represent a water-wheel pumping the water upon its own buckets.

Perpetual motions founded on the hydrostatical paradox are not uncommon; Papin, the well-known inventor of the digester, exposes one of these in the *Philosophical Transactions* for 1685. The most naive of these devices is that illustrated in fig. 2, the idea of which is that the larger quantity of water in the wider part of the vessel weighing more will overbalance the smaller quantity in the narrower part, so that the water will run over at C. and so on continually.

Fig. 2.

Capillary attraction has also been a favourite field for

the vain quest; for, if by capillary action fluids can be made to disobey the law of never rising above their own level, what so easy as thus to produce a continual ascent and overflow, and thus perpetual motion? Various schemes of this kind, involving an endless band which should raise more water by its capillary action on one side than on the other, have been proposed. The most celebrated is that of Sir William Congreve, who invented the rockets that bear his name. EFG (fig. 3) is an inclined plane over pulleys; at the top and bottom travels an endless band of sponge, *abcd*, and over this again an endless band of heavy weights jointed together. The whole stands over the surface of still water. The capillary action raises the water in *ab*, whereas the same thing cannot happen in the part *ad*, since the weights squeeze the water out. Hence, inch for inch, *ab* is heavier than *ad*; but we know that if *ab* were only just as heavy inch for inch as *ad* there would be equilibrium, if the heavy chain be also uniform; therefore the extra weight of *ab* will cause the chain to move round in the direction of the arrow, and this will go on continually.

Fig. 3.

The more recondite vehicles of energy, such as electricity and magnetism, are more seldom drawn upon by perpetual-motion inventors than might perhaps be expected. Instances do occur, but devices of this kind have not become a common part of the folklore of nations like the overbalancing wheel and the self-sufficient water-mill. Gilbert, in his treatise *De Magnete*, alludes to some of them, and Bishop Wilkins mentions among others a machine "wherein a loadstone is so disposed that it shall draw unto it on a reclined plane a bullet of steel, which, still as it ascends near to the loadstone, may be contrived to fall through some hole in the plane and so to return unto the place whence at first it began to move, and being there, the loadstone will again attract it upwards, till, coming to this hole, it will fall down again, and so the motion shall be perpetual." The fact that screens do exist whereby electrical and magnetic action can be cut off would seem to open a door for the perpetual-motion seeker. Unfortunately the bringing up and removing of these screens involves in all cases just that gain or loss of work which is demanded by the inexorable law of the conservation of energy. A shoemaker of Linlithgow called Spence pretended that he had found a black substance which intercepted magnetic attraction and repulsion, and he produced two machines which were moved, as he asserted, by the agency of permanent magnets, thanks to the black substance. The fraud was speedily exposed, but it is worthy of remark that Sir David Brewster thought the thing worth mentioning in a letter to the *Annales de Chimie*, 1818, wherein he states "that Mr Playfair and Captain Kater have inspected both of these machines and are satisfied that they resolve the problem of perpetual motion."

Fig. 4.

Not very long ago the writer of this article received by post an elaborate drawing of a locomotive engine which

was to be worked by the agency of permanent magnets. He forgets the details, but it was not so simple as the plan represented in fig. 4, where M and N are permanent magnets, whose attraction is "screened" by the wooden blocks A and B from the upper left and lower right quadrants of the soft iron wheel W, which consequently is attracted round in the same direction by both M and N, and thus goes on for ever.

One more page from this chapter of the book of human folly; the author is the famous John Bernoulli. We translate his Latin, as far as possible, into modern phraseology.

In the first place we must premise the following (see fig. 5).

1. If there be two fluids of different densities whose densities are in the ratio of G to L, the height of equiponderating cylinders on equal bases will be in the inverse ratio of L to G.
2. Accordingly, if the height AC of one fluid, contained in the vase AD, be in this ratio to the height EF of the other liquid, which is in a tube open at both ends, the liquids so placed will remain at rest.
3. Wherefore, if AC be to EF in a greater ratio than L to G, the liquid in the tube will ascend; or if the tube be not sufficiently long the liquid will overflow at the orifice E (this follows from hydrostatic principles).
4. It is possible to have two liquids of different density that will mix.
5. It is possible to have a filter, colander, or other separator, by means of which the lighter liquid mixed with the heavier may be separated again therefrom.

Construction.—These things being presupposed, I thus construct a perpetual motion. Let there be taken in any (if you please, in equal) quantities two liquids of different densities mixed together (which may be had by Hyp. 4), and let the ratio of their densities be first determined, and be the heavier to the lighter as G to L, then with the mixture let the vase AD be filled up to A. This done, let the tube EF, open at both ends, be taken of such a length that $AC:EF > 2L:G+L$; let the lower orifice F of this tube be stopped, or rather covered with the filter or other material separating the lighter liquid from the heavier (which may also be had by Hyp. 5); now let the tube thus prepared be immersed to the bottom of the vessel CD; I say that the liquid will continually ascend through the orifice F of the tube and overflow by the orifice E upon the liquid below.

Fig. 5.

Demonstration.—Because the orifice F of the tube is covered by the filter (by constr.) which separates the lighter liquid from the heavier, it follows that, if the tube be immersed to the bottom of the vessel, the lighter liquid alone which is mixed with the heavier ought to rise through the filter into the tube, and that, too, higher than the surface of the surrounding liquid (by Hyp. 2), so that $AC:EF = 2L:G+L$; but since (by constr.) $AC:EF > 2L:G+L$ it necessarily follows (by Hyp. 3) that the lighter liquid will flow over by the orifice E into the vessel below, and there will meet the heavier and be again mixed with it; and it will then penetrate the filter, again ascend the tube, and be a second time driven through the upper orifice. Thus, therefore, will the flow be continued for ever. Q.E.D.

He then proceeds to apply this theory to explain the perpetual rise of water to the mountains, and its flow in rivers to the sea, which others had falsely attributed to capillary action,—his idea being that it was an effect of the different densities of salt and fresh water.

One really is at a loss with Bernoulli's wonderful theory, whether to admire most the conscientious statement of the hypothesis, the prim logic of the demonstration, so carefully cut according to the pattern of the ancients, or the weighty superstructure built on so frail a foundation. Most of our perpetual motions were clearly the result of too little learning; surely this one was the product of too much. (G. CH.)

PERPIGNAN (Spanish, Perpiñan), the ancient capital of Roussillon, and now the chief town of the department of Pyrénées Orientales, France, and a first-class fortress,

stands about 66 feet above sea-level, on the right bank of the Tet, 7 miles above the point where it falls into the Mediterranean. The streets of Perpignan are narrow and crooked, and the houses have no architectural pretensions. The cathedral of St Jean, in the Third Pointed style, was commenced in 1324 by the bishop of Elne, and carried on by Sancho II., king of Majorca. The chancel, built when Louis XI. was master of Roussillon, bears the arms of France. The nave is 259 feet long, 64 wide, and 89 high. The most noteworthy feature in the building is an immense reredos of white marble, begun in 1618 by Bartholomew Soler of Barcelona. The tomb of Louis de Montmor, first French bishop of Elne after the annexation of Roussillon to France, is also worthy of notice; the black marble sarcophagus is supported by four white marble lions, and surmounted by the recumbent figure of the bishop. The bede-tower, built over a small Romanesque chapel, is crowned by an iron cage which dates from 1742. The Place de la Loge, which derives its name from the Spanish word *lonja* (market or bazaar), was built in 1396 in a Pointed style suggestive of the Moorish, and was in-

Plan of Perpignan.

tended for a cloth-exchange. The gate-house adjoining the Narbonne road, built in the time of Louis XI., has elegant turrets. The fortifications of the citadel, which is large enough to contain 3000 men, are of various times. The kings of Majorca had a castle on the terrace commanding the town, of which all that now remains is the keep. The chapel is remarkable as being a mixture of the Romanesque, Pointed, and Moorish styles; the top of its tower commands a view of the whole plain of Roussillon, with its flourishing market-gardens and vineyards, overhung on the south-west by Mount Canigou, and bounded by the Corbières on the north, the Albères on the south, and the Mediterranean on the east. The ramparts surrounding the citadel are the work of Louis XI., Charles V., and Vauban. The sculptures and caryatides still to be seen on the gateway were placed there by the duke of Alva. Perpignan was the seat of a university founded by the kings of Aragon, and the town still possesses an interesting museum of sculptures and pictures, where are to be seen the first photographic proofs produced by Daguerre, a natural history collection, and a library containing 30,000 volumes. In one of the squares of the town is the statue of Arago, unveiled in 1879. The manufactures of Perpignan are cloth-making, cork-cutting, tanning, and cooperage, and it has a large trade in wine, brandy, honey, fine wool, fruit, and vegetables. The population in 1881 was 31,735.

Perpignan had its origin in a Benedictine monastery, and its name first appears in charters of the 10th century. The place had

already grown into a town when Philip the Bold, king of France, died there in 1285, as he was returning from an unsuccessful expedition into Aragon. At that time it belonged to the kingdom of Majorca, which was created in 1262, and its sovereigns resided there until, in 1344, that small state reverted to the possession of the kings of Aragon. When Louis XI. occupied Roussillon as security for money advanced by him to the king of Aragon, Perpignan resisted the French arms for a considerable time, and only yielded through stress of famine (15th March 1475). Roussillon was restored to Aragon by Charles VIII., and Perpignan was again besieged in 1542 by Francis I., but without success. Later on, however, the inhabitants, angered by the tyranny and cruelty of the Spanish governor, surrendered the town to Louis XIII. The citadel held out until the 9th of September 1642, and the place has ever since belonged to France, to which it was formally ceded by the treaty of the Pyrenees.

PERRAULT, CHARLES (1628-1703), the most prominent author of France in a specially French kind of literature—the fairy tale—and one of the chief actors in the famous literary quarrel of ancients and moderns, was born at Paris on 12th January 1628. His father, Pierre Perrault, was a barrister, all whose four sons were men of some distinction,—Claude, the second, who was first a physician and then an architect, being the best known next to Charles the youngest. The latter was brought up at the Collège de Beauvais, until he chose to quarrel with his masters, after which (an incident rather rare at the time when patriarchal government of families was in full fashion) he was allowed to follow his own bent in the way of study. He took his degree of "licencié en droit" at Orleans in 1651, and was almost immediately called to the Paris bar, where, however, he practised for a very short time. In 1654 his father bought himself the post of receiver-general at Paris, and made Charles his clerk. After nearly ten years of this employment he was, in 1663, chosen by Colbert as his secretary in a curious and not easily describable office. Put shortly, Perrault's duties were to assist and advise the minister in matters relating to the arts and sciences, not forgetting literature. The protection of Colbert procured a place in the Académie Française for his protégé in 1671, and Perrault justified his election in several ways. One was the orderly arrangement of the business affairs of the Academy, another was the suggestion of the custom (which more than anything else has given the institution a hold on the French public) of holding public *séances* for the reception of candidates. Colbert's death in 1683 put an end to Perrault's official career, but even before that event he had experienced the morose and ungenerous temper which was the great drawback of that very capable statesman. He now gave himself up to literature, in which, like most men of his time, he had made some experiments already. The famous dispute of ancients and moderns is said to have arisen in consequence of some words used by Perrault in one of the regular academic discourses, on which Boileau, with his usual rudeness, commented in violent terms. Perrault, though a very good-natured man, had ideas and a will of his own, and the *Parallèle des Anciens et des Modernes*, which appeared between 1688 and 1696, was the result. The well-known controversy that followed in its train raged hotly in France, passed thence to England, and in the days of La Motte and Fénelon broke out again in the country of its origin. As far as Perrault is concerned, he was inferior to his adversaries in learning, but decidedly superior to them in wit. It is not known what, except the general popularity of the fairy tale in the last decade of the century, drew Perrault to the composition of the only works of his which are still read. The first of them, *Grisélidis*, which is in verse, appeared in 1691, *Peau d'Ane* and *Les Souhaits Ridicules*, also in verse, in 1694. But Perrault was no poet, and the merit of these pieces is entirely obscured by that of the prose tales, *La Belle au Bois Dormant*, *Petit Chaperon Rouge*, *La Barbe Bleue*, *Le*

Chat Botté, Les Fées, Cendrillon, Riquet à la Houppe, which, after being published in a miscellany during 1696 and 1697, appeared in a volume with the last-named year on the title-page, and with the general title of *Histoires du Temps Passé*. No criticism of these famous productions is necessary, and it is scarcely less superfluous to observe that Perrault has no claim to the invention of the subjects. His merit is that he has treated them with a literary skill in adapting style to matter which cannot possibly be exceeded. Of his other work some *Mémoires* and academic *Éloges* need alone be mentioned. He died on 16th May 1703.

Except the tales, Perrault's works have not recently been reprinted. Of the tales the best recent editions are those of Giraud (Lyons, 1865) and Lefèvre (Paris, 1875).

PERRONE, GIOVANNI (1794-1876), Roman Catholic theologian, was born at Chieri (Piedmont) in 1794, studied theology at Turin, and in his twenty-first year went to Rome, where he joined the Society of Jesus, and, after his ordination to the priesthood, became a teacher in the Collegium Romanum. From Ferrara, where he was rector of the Jesuit college after 1830, he returned to his teaching work in Rome, being made head of his old college in 1850. He died on 26th August 1876. He was the author of numerous dogmatic works, which, as clearly and faithfully reflecting the prevailing tendencies of Roman theology, obtained wide currency and were extensively translated. They may still be regarded as representing most nearly the modern orthodoxy of his church. The *Praelectiones Theologicae* may be specially named (1st ed. 1835, 31st ed. 1866).

PERRY, an alcoholic beverage, obtained by the fermentation of the juice of pears. The manufacture is in all essentials identical with that of CIDER (*q.v.*), though there are some variations in detail arising from the more abundant mucilage of the pear. The clearest and most concise account of making cider and perry is contained in the fourth part of the *Herefordshire Pomona* for 1881 (p. 133 *sq.*). The fruits are either taken at once to the crushing mill or allowed, like apples, to remain in heaps so as to ripen uniformly; they are then crushed between rollers of granite or millstone grit, and the must or juice poured into casks. In making the better kinds of perry only the best sorts of pears are used without admixture; but for ordinary purposes pears of various kinds are mixed indiscriminately, although, as in the case of the apple, the fruits used for the manufacture of perry are not those which are the most suitable for dessert. It is considered better not to crush the pips, as the flavour of the perry is thereby deteriorated. The most scrupulous cleanliness is absolutely requisite, and all the metal-work of the machinery should be sedulously kept bright, otherwise the acids of the juice dissolve the oxides, and, in the case of lead, produce poisonous salts. Pear-juice contains grape-sugar, tannic, malic, and tartaric acids, albumen, lime, pectin, mucilage, and other ingredients. The quantity of potash and phosphoric acid in the juice is relatively large. At a temperature ranging from 50° to 80° the juice undergoes natural fermentation without the addition of yeast. This fermentation, however, is brought about by the agency of a "ferment" (saccharomyces), which feeds on the grape-sugar of the juice, decomposing it, and causing the rearrangement of its constituents in the form of alcohol, carbonic-acid gas, glycerin, &c. The saccharomyces ferments in the first instance absorb oxygen and liberate carbonic acid, as in the process of respiration, but the air of the fluid in which they live speedily becomes exhausted of its oxygen, and then the ferments obtain further supplies from the glucose, in effecting the decomposition of which they set free more oxygen than they require, and this,

uniting with the hydrogen and the carbon, forms the products of fermentation.

In practice the pulp is removed from the mill and placed in open vats for forty-eight hours or longer. Gentle fermentation sets in, as shown by the formation of froth and bubbles of carbonic-acid gas. The pulp is then placed in layers separated by hair-cloths, which act as sieves or filters when the mass is placed in a press like a cheese-press. The pressure is gradual at first and afterwards increased. The juice or must is poured into hogsheads, leaving an unfilled space as "ullage." The hogsheads are placed in a cool cellar, when fermentation begins as above explained, and a thick scum forms on the surface called the "upper lees." At the same time mucilage and ferment-cells with the more solid particles sink to the bottom and form the "lower lees" at the bottom of the barrel. When the fermentation has subsided the liquor between the upper and lower lees should be bright, but in the case of perry, owing to the large quantity of mucilage, the juice has to be filtered through filters of Forfar linen,—a tedious process. The clear liquor is now racked off into clean casks, not quite filled, but leaving space for "ullage," and kept uncorked at a low temperature. A better practice is to close the cask with a bung, through which a curved siphon-like tube is passed, one end of it being in the "ullage" and the portion of it outside the cask being bent downwards and then upwards; then either the bend of the tube may be filled with one or two tablespoonfuls of water, or the outer end of the bent tube may be plunged in a cup of water,—the object in all cases being to provide for the escape of gas from the cask and to prevent the passage of air into it. In a week or so the fermentation ceases or nearly so, the liquor becomes clear and quiet, when isinglass is added in the proportion of one ounce to a hogshead of 100 to 115 gallons. (In Devonshire, the hogshead contains uniformly fifty gallons.) In January or February the bungs are driven in firmly. While fermentation is going on, a temperature of 50° to 70° is most propitious, but after the liquor has been racked off it should be kept in a uniformly cool cellar as near to 40° Fahr. as can be done. When it is desirable to restrain over-violent or hasty fermentation, sulphur or salicylic acid is employed. The latter, being the simpler and cleaner, is the better agent to be adopted. An ounce or an ounce and a half to a hundred gallons should be poured into the fermenting liquor immediately after it has been racked. It is very effectual, and leaves no sensible effects on the liquor if carefully used, being tasteless and free from smell. Great care should be taken, however, not to allow the acid to come into contact with any metal such as iron, or a black colour will result. Perry contains about 7 per cent. of alcohol, and will keep in casks if well made for three or four years, or longer if in bottle. It does not, however, travel well.

PERSEPHONE. See PROSERPINE.

PERSEPOLIS. In the interior of Persia proper, some 40 miles north-east of Shīráz, and not far from where the small river Pulwār flows into the Kur (Kyrus), there is a large terrace with its east side leaning on Kāhi Rahmet ("the Mount of Grace"). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 14 to 41 feet; and on the west side a magnificent double stair, of very easy steps, leads to the top. On this terrace, which is not perfectly level, stand and lie the ruins of a number of colossal buildings, all constructed of exquisite dark-grey marble from the adjacent mountain. The stones were laid without mortar, and many of them are still *in situ*, although the iron clamps by which they were fastened together have been stolen or destroyed by rust. The mason-work is excellent, and the

style of the lofty palaces, colonnades, and vestibules most imposing. Especially striking are the huge pillars, of which a number still stand erect. No traveller can escape the spell of these majestic ruins.¹ It is impossible to give a minute account of them here; the reader must refer to the numerous descriptions and illustrations in the works of ancient and modern travellers.² It is to be observed that several of the buildings were never finished. Stolze has shown that in some cases even the mason's rubbish has not been removed, and remarks accordingly that in those early times, just as at the present day, an Oriental prince would rather commence a new building of his own than complete the unfinished work of his predecessor.

These ruins, for which the name *Chihil menâre* or "the forty minarets"³ can be traced back to the 13th century,⁴ are now known as *Takhti Jamshîd*, "the throne of Jamshîd" (a mythical king). That they represent the Persepolis captured and partly destroyed by Alexander the Great has been beyond dispute, at least since the time of Pietro della Valle.⁵ Amongst the earlier scholars the fanciful notions of the Persians, who are utterly ignorant of the real history of their country before Alexander, often received too much attention; hence many of them were of opinion that the buildings were of much higher antiquity than the time of Cyrus; and even those who rightly regarded them as the works of the Achæmenians were unable to support their theory by conclusive evidence.⁶ The decipherment of the cuneiform Persian inscriptions found on the ruins and in the neighbourhood has put an end to all doubt on this point. We now read with absolute certainty that some of the edifices are the work of Darius I., Xerxes, and Artaxerxes III. (Ochus), and with equal certainty we may conclude that all the others were built under the Achæmenian dynasty.

Behind *Takhti Jamshîd* are three sepulchres hewn out of the rock in the hillside, the façades, one of which is incomplete, being richly ornamented with reliefs. About 8 miles to the north-north-east, on the opposite side of the Pulwâr, rises a perpendicular wall of rock, in which four similar tombs are cut, at a considerable height from the bottom of the valley. The modern Persians call this place *Nakshi Rustam* ("the picture of Rustam") from the Sasanian reliefs beneath the opening, which they take to be a representation of the mythical hero Rustam. That the occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at *Nakshi Rustam* is expressly declared in its inscription to be the tomb of the great Darius, concerning whom Ctesias relates

that his grave was in the face of a rock, and could be reached only by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persian kings, either that their remains were brought to *Ilépas*, "to the Persians," or that they died there.⁷ Now we know that Cyrus was buried at Pasargadæ, the modern Murgâb, two days' journey north-east from Persepolis,⁸ and if there is any truth in the statement that the body of Cambyses was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at *Nakshi Rustam* are probably, besides Darius, Xerxes I., Artaxerxes I., and Darius II. Xerxes II., who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sogdianus. The two completed graves behind *Takhti Jamshîd* would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Arses, who reigned at the longest two years, or, if not his, then that of Darius III. (Codomanus), who is one of those whose bodies are said to have been brought "to the Persians."⁹

Another small group of ruins in the same style is found at the village of *Hâjî âbâd*, on the Pulwâr, a good hour's walk above *Takhti Jamshîd*. These formed a single building, which was still intact 900 years ago, and was used as the mosque of the then existing city of *Istakhr*. For there is no other place that can have answered to the description of the eminent geographer Makdisî, who was himself in this neighbourhood, when he says: "The chief mosque (*jâmi*) of *Istakhr* is situated beside the bazaars. It is built after the fashion of the principal mosques in Syria,¹⁰ with round pillars. On the top of each pillar is a cow.¹¹ Formerly it is said to have been a fire-temple. The bazaars surround it on three sides" (p. 436).

In the time of its greatest prosperity the Persian metropolis must undoubtedly have covered a great part of the extremely fertile valley of the Pulwâr. It is not at all necessary to suppose that its limits are determined by the two heaps of ruins. The great bulk of the houses would, of course, be built in the wretched manner which is all but universal in the East.

Since Cyrus was buried in Pasargadæ, which moreover is mentioned in Ctesias as his own city,¹² and since, to judge from the inscriptions, the buildings at Persepolis commenced with Darius I., it was probably under this king, with whom the sceptre passed to a new branch of the royal house, that Persepolis became the capital.¹³ At least it is probable that the great city, in the original home of the dynasty, with its lordly palaces and royal sepulchres, was theoretically considered the metropolis of the whole empire. But certainly, as a residence for the rulers of such extensive territories, a remote place in a

¹ See the description of Mas'ûdi (ed. Barbier de Meynard, iv. 76 sq.), written 944 A.D.; and that of Makdisî (Mokaddasî, ed. De Goeje, p. 444), written forty years later.

² See especially Chardin, Kaempfer, Niebuhr, and Ouseley. Niebuhr's drawings, though good, are, for the purposes of the architectural student, inferior to the great work of Texier, and still far more to that of Flandin and Coste. Good sketches, chiefly after Flandin, are given by Kossowicz, *Inscriptiones palæo-persicæ*, St Petersburg, 1872. In addition to these we have now the photographic plates in Stolze's *Persepolis* (2 vols., Berlin, 1882). Stolze's "photogrammetric" plan surpasses all previous attempts in accuracy. The numerous reliefs found in this group of ruins (especially on the great double stair), executed in a very remarkable style of art, were first brought within the scope of accurate examination by these works, since, with some individual exceptions (as in Ouseley), the drawings of the figures in the older works were quite inadequate.

³ Neither "the forty towers" nor "the forty pillars" is a correct rendering of the expression. The round pillars with their heavy capitals have a much closer resemblance to the turrets of the Mohammedan mosques than to our church towers. An older name for all the splendid ruins through the Pulwâr valley is *hazâr sutûn*, "the thousand pillars" (Hamza Isp., ed. Gottwaldt, p. 38). A thousand is, of course, like forty, a round number.

⁴ Sir W. Ouseley, *Travels*, ii. 369.

⁵ Lettera xv. (ed. Brighton, 1843, ii. 246 sq.).

⁶ See the discussion of this question in Ouseley.

⁷ This statement is not made in Ctesias (or rather in the extracts of Photius) about Darius II., which is probably accidental; in the case of Sogdianus (Sekydanus), who as a usurper was not deemed worthy of honourable burial, there is good reason for the omission.

⁸ See art. PERSIA (p. 567 below). The complete proof will be found in Stolze's work already mentioned, and in his paper cited below.

⁹ Arrian, iii. 22, I.

¹⁰ This refers only to its solidity and magnificence, and perhaps also to some of its minor features, but not to its general style. These Moslems had no great discernment in matters of style. For instance, Makdisî and others compare the ruins of *Takhti Jamshîd* to those of Palmyra and Baalbek.

¹¹ Capitals formed of recumbent animal figures are peculiar to the buildings of the Achæmenians.

¹² Cf. also in particular, Plutarch, *Artax.*, iii., where Pasargadæ is distinctly looked on as the sacred cradle of the dynasty.

¹³ The story of Ælian (*H. A.*, i. 59), who makes Cyrus build his royal palace in Persepolis, deserves no attention.

difficult alpine region was far from convenient. The practical capitals were Susa, Babylon, and Ecbatana.

This, at the same time, accounts for the fact that the Greeks were not really acquainted with the city until it was taken by Alexander.¹ Ctesias must certainly have known of it, and it is possible that he may have named it simply Πέρσαι,² after the people, as is undoubtedly done by certain writers of a somewhat later date.³ But whether the city really bore the name of the people and the country is another question. And it is extremely hazardous to assume, with Sir H. Rawlinson and Oppert, that the words *and Pársá*, "in this Persia," which occur in an inscription on the gateway built by Xerxes (D. lin. 14), signify "in this city of Pársá," and consequently prove that the name of the city is identical with the name of the country.

The name Persepolis appears to have been first used by Clitarchus, one of the earliest, but unfortunately one of the most imaginative annalists of the exploits of Alexander. The word was no doubt meant to allude to the "Persians," but apparently he preferred this extraordinary form⁴ to the regular "Persopolis"⁵ for the sake of a play on the destruction (πέρις) which he relates. Later writers have followed him in the use of the name Persepolis.⁶ For information about the capture and treatment of the city by Alexander we are almost entirely dependent on narratives which are based on Clitarchus, since Arrian unfortunately disposes of this episode in a very summary fashion. The course of events may be traced somewhat as follows.

Alexander, having crushed the resistance of the Persian army under Ariobarzanes at the "Persian Gates,"⁷ marched rapidly on the capital. Ariobarzanes had made his way thither with a few followers, but was refused admission by Tiridates, the commandant of the citadel, who had already commenced negotiations with Alexander, and at last surrendered the place with its immense treasures to the conqueror. In a subsequent battle Ariobarzanes was killed.⁸ Alexander then ordered a general massacre, and gave up the city to be plundered. In the citadel he placed a garrison of 3000 men under Nearchides,⁹ and then caused

¹ Eschylus, whose knowledge of the world is certainly not very extensive, takes the "city of the Persians" to be Susa. Cf. especially *Pers.*, v. 15 with v. 761 (τόδ' ἄστυ Σούσαν). Herodotus does not mention the capital of Persis at all.

² The only expression that could be interpreted in this sense is *ἐς Πέρσας*, "to the Persians." But perhaps *ἐς Πέρσας*, with him, means only "to the land of Persis." No doubt, when he says that the body of Cyrus was conveyed *ἐς Πέρσας*, this might be explained on the supposition that he wrongly imagined that Cyrus was buried in Persepolis. Xenophon, who knew of Pasargadae from Ctesias, calls it Πέρσαι (*Cyr.*, viii. 5, 21); but, as he was not acquainted with the country, this goes for nothing. Of more importance is the fact that Plutarch, *Alex.*, iii. (probably after Dione), places Pasargadae *ἐν Πέρσας*, where the expression applies to the country and not to the city.

³ So undoubtedly Arrian (iii. 13, 1, 10), or rather his best authority, King Ptolemy. So, again, the Babylonian Berossus, shortly after Alexander. See Cleaves *Alex.*, *Admon. ad gentes*, c. 5, where, with Georg Hoffmann (*Pers. Märtyrer*, 137), *sal* is to be inserted before Πέρσας, and this to be understood as the name of the metropolis.

⁴ Περσέπολις means strictly "city-destroying." Περσάπολις, a well-authenticated reading in Strabo and Aelian (*l.c.*), is no improvement.

⁵ This form is actually restored by later scholars, and seems to have been used by the geographer Ptolemy (vi. 4).

⁶ Besides the historians who draw upon Clitarchus (Diodorus, Curtius, Justin, Plutarch in *Alexander*), Strabo (79 *sq.*, 727 *sq.*), Pliny (vi. 115, 213), and several others. Justin (i. 6, 3) introduces the name Persepolis in an account which is based on Ctesias, just as Arrian (vi. 1, 1) once employs it, although he can scarcely have got it from his excellent sources.

⁷ On this locality, see the paper of Fr. Stolze in the *Verhandlungen der Gesellschaft für Erdkunde in Berlin*, 1883, Nos. 3 and 6.

⁸ This is mentioned by Curtius only, but it has great intrinsic probability. The massacre at the taking of the city appears to be confirmed by Plutarch (*Alex.*, 37) from the letters of the king.

⁹ This again is only found in Curtius. Alexander was in the heart of a country which he had laid waste, but by no means thoroughly subdued, which hated him bitterly, and which was the native land of the dynasty; he was amongst a people who still felt themselves to be

the royal palaces to be set on fire,—certainly not in a drunken freak, but apparently with deliberate calculation on the effect it would produce on the minds of the Asiatics.¹⁰

Now it has hitherto been universally admitted that "the palaces" or "the palace" (τὰ βασιλεια) burned down by Alexander are those now in ruins at Takhti Jamshid, as already described. From Stolze's investigations it appears that at least one of these, the castle built by Xerxes, bears evident traces of having been destroyed by fire.¹¹ The locality described by Diodorus after Clitarchus corresponds in important particulars with Takhti Jamshid, for example, in being supported by the mountain on the east.¹² And, if there are other details, such as the triple wall, which it is difficult to reconcile with the existing state of things, we must bear in mind on the one hand the great destruction that must have been wrought in the course of thousands of years, and on the other that small inaccuracies are not to be wondered at in a writer like Clitarchus, who is constantly straining after effect. There is, however, one formidable difficulty. Diodorus says that the rock at the back of the palace containing the royal sepulchres rises so steep that the bodies could be raised to their last resting-place only by mechanical appliances. This is not true of the graves behind Takhti Jamshid, to which, as Stolze expressly observes, one can easily ride up; on the other hand, it is strictly true of the graves at Nakshi Rostam. Stolze has accordingly started the theory that the royal castle of Persepolis stood close by Nakshi Rostam, and has sunk in course of time to shapeless heaps of earth, under which the remains may be concealed. He and Andreas, our highest authorities on the topography of this district,¹³ consider this spot peculiarly adapted for the site of a citadel, while the water-supply would suffice for a numerous court-retinue and garrison, and for a royal residence with its palaces and gardens. Nevertheless we are unable to adopt this suggestion. The vast ruins of Takhti Jamshid, and the terrace constructed with so much labour, appear to us of more importance than any number of doubts and conjectures. These remains can hardly be anything else than the ruins of palaces and the other belongings of a kingly residence; as for temples, the Persians had no such thing, at least in the time of Darius and Xerxes. And it can hardly be supposed that such solid structures were much more numerous in former times, and that these alone have survived owing to their peculiar situation on the terrace. For, in the first place, it is evident at a glance that the situation itself is of an exceptional kind. Moreover, Persian tradition at a very remote period knew of only three architectural wonders in that region, which it attributed to the fabulous queen Humāi (Khumāi)—the grave of Cyrus at Murgāb, the building at Hāji Ābād, and those on the great terrace.¹⁴ It is safest therefore to identify these last with the royal palaces destroyed by Alexander. Clitarchus, who can scarcely have visited the place himself, has simply, with his usual

the dominant race, and knew that their king was still alive. That in these circumstances he should have a strong garrison under a trustworthy Macedonian was simply a matter of course. Nearchides afterwards commanded a trireme in the fleet that sailed from the Indus to the Tigris (Arrian, *Indica*, xix. 5; after Nearchus).

¹⁰ See art. PERSIA (p. 532 below).

¹¹ Dr Stolze has kindly explained to the writer of this article that the layer of charcoal in the "hall of a hundred pillars" is apparently the result not of a conflagration but of gradual decomposition.

¹² The name of this mountain too, βασιλικὸν ὄρος, is identical with *Shāh-kūh*, which is at least tolerably well established by Ouseley (ii. 417) as a synonym of *Kūh rahmet*.

¹³ We are here again indebted to private communications from Stolze, as well as to his published papers.

¹⁴ See especially Hamza Isf., 33; Tabari, i. 690, 816 (cf. Noldeke, *Geschichte der Perser . . . aus . . . Tabari*, p. 8). The ruins at Takhti Jamshid are alluded to as the work of Humāi, in connexion with an event which occurred shortly after 200 A.D.

recklessness of statement, confounded the tombs behind the palaces with those of Nakshi Rustam; indeed he appears to imagine that all the royal sepulchres were at the same place. It is possible, however, that the discrepancy originated with Diodorus, who often makes his extracts in a very perfunctory manner.¹

If it should prove that, after all, the terrace is not large enough to have contained the treasure-houses and the barracks of the garrison, in addition to the palaces, or that Alexander could not have set fire to the latter without endangering the former and the safety of the whole fortress, then we should have to assume that a separate citadel (*ἀκρά*) stood somewhere outside of the terrace with the palaces. There are many positions naturally adapted for defence in the vicinity. But, as far as yet appears, such an assumption is scarcely required. Of course we need not suppose that the number 3000 represents the actual strength of Alexander's garrison; and we must consider that, when Darius, in the height of his power, laid out this place in the heart of his empire, he was thinking more of regal magnificence than of security. A high wall and a guard of 200 men would suffice for the protection of the treasures at a time when battering engines were unknown.

In 316 B.C. Persepolis is still the capital of Persia as a province of the great Macedonian empire (see Diod., 19, 21 sq., 46; probably after Hieronymus of Cardia, who was living about 316). The city must have gradually declined in the course of time; but the ruins of the Achæmenians remained as a witness to its ancient glory.

It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About 200 A.D. we find there the city Istakhr² as the seat of the local governors. There the foundations of the second great Persian empire were laid, and once more there arose round the tombs of the Achæmenians what was for centuries the theoretical metropolis of a great monarchy whose administrative capitals lay far to the west. Istakhr acquired special importance as the centre of priestly wisdom and orthodoxy. In its most flourishing days it was probably as large as Persepolis had been, whose ruins undoubtedly furnished much of the material for its houses. The peaceable resident, intent on building his house or hut, has too often proved more destructive to ancient buildings than a foreign invader or even the disintegrating forces of nature. The Sasanian kings have covered the face of the rocks in this neighbourhood, and in part even the Achæmenian ruins, with their sculptures and inscriptions, and must themselves have built largely here, although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis, and this in spite of the fact that for four hundred years they maintained relations, friendly or hostile, with the empire, while their own sway extended far into the heart of Asia. So remote is Persia!

At the time of the Arabian conquest Istakhr offered a desperate resistance, which was renewed again and again before the place was finally subdued. Blood flowed like water in these struggles for religion and liberty. Nevertheless the city was still a place of considerable importance in the first century of Islam, although its greatness was speedily eclipsed by the new metropolis Shirâz. In the 10th century Istakhr had become an utterly insignificant place, as may be seen from the descriptions of Istakhrî, a native (c. 950), and of Makdisi (c. 985). At this time the little town occupied approximately the site assigned to it on Flandin's map, near the present village of Hâjî âbâd, surrounding the ruined structure of the Achæmenians, and principally on the left side of the stream. During the following centuries Istakhr gradually declined, until, as a city, it ceased to exist. This fruitful region, however, was covered with villages till the frightful devastations of last century; and even now it is, comparatively speaking, well cultivated.

The "castle of Istakhr" played a conspicuous part several times during the Mohammedan period as a strong fortress. It was the middlemost and the highest of the three steep crags which rise from the valley of the Kur, at some distance to the west or north-west of Nakshi Rustam.³ We learn from Oriental writers that one

of the Buwaihîd sultans in the 10th century of the Flight constructed the great cisterns, which may yet be seen, and have been visited, amongst others, by James Morier and Flandin.⁴ Ouseley, who has extracted a vast amount of information from Persian authors about the ruins of Persepolis and about Istakhr,⁵ points out that this castle was still used in the 16th century, at least as a state prison. But when Della Valle was there in 1621 it was already in ruins. (TH. N.)

PERSEUS, a hero of Grecian fable, son of Danaë (*q.v.*) and Zeus. When Perseus was grown to manhood Polydectes, the wicked king of Seriphus, cast his eye on Danaë; and, that he might rid himself of the son, he exacted of him a promise that he would bring him the head of the Gorgon Medusa. Now the dreadful GORGONS (*q.v.*) dwelt with their sisters the Grææ (the Gray Women) by the great ocean, far away in the west. Guided by Hermes and Athene, Perseus came to the Grææ. They were three hags, with but one eye and one tooth between them, which they handed one to the other. Perseus stole the eye and tooth, and would not restore them till the Grææ had guided him to the Nymphs, from whom he received the winged sandals, the wallet (*κιβιστός*), and the cap of invisibility. These he put on, and, being armed by Hermes with a scimitar (*ἀρπη*), came upon the Gorgons as they slept and cut off Medusa's head, while with averted eyes he looked at her image on his brazen shield lest he should be turned to stone. Perseus put the Gorgon's head in his wallet and fled. Coming to Æthiopia he delivered and married ANDROMEDA (*q.v.*). With her he returned to Seriphus in time to rescue his mother and Dictys from Polydectes, whom he turned to stone along with all his court by showing them the Gorgon's head. The island itself was turned to stone, and was still and lonely ever after; the very frogs of Seriphus (so ran the proverb) were dumb. Perseus then gave the head of Medusa to Athene, who put it on her shield, and, with Danaë and Andromeda, he hastened to Argos to see his grandfather, Acrisius, once more. But he, fearing the oracle, had gone to Larissa in Thessaly. Thither his grandson followed him, but at some games given by Teutamias, king of Larissa, he threw a quoit which lighted on his grandfather's foot and caused his death. Ashamed to return to Argos, Perseus gave his kingdom to Megapenthes, and received from him Tiryns in return. There he reigned and founded Midea and the famed Mycenæ, and became the ancestor of the Persides, amongst whom were Eurystheus and Heracles.

The legend of Perseus was a favourite theme of Greek poetry and art. Sophocles and Euripides had each several dramas on the subject, and sculptor and painter vied with each other in depicting the rescue of Andromeda from the sea-monster. The story was localized in various places. Italy claimed that the ark with Danaë and Perseus had drifted to the Latin coast (Servius on Virg., *Æn.*, vii. 372, and viii. 345). The Persian kings were said to have sprung from a son of Perseus (Apollod., ii. 4, 5; Herod., vii. 61); and, according to Pausanias Damascenus, Perseus taught the Persians to worship fire, and founded the Magian priesthood. The tale of the rescue of Andromeda by Perseus from the sea-beast is akin to that of Heracles and Hesione. Both have been interpreted of the sun slaying the darkness, Andromeda or Hesione being the moon, whom the darkness is about to devour. According to one version Heracles rescued Hesione from the sea-beast by leaping into its mouth, from which he came forth after three days spent in the belly of the beast. This points to a connexion with the Semitic story of Jonah and the fish. Greek sculptures of Andromeda's monster were the models for Jonah's fish in early Christian art, and on a rock at Joppa they showed the chains which had bound Andromeda, and the bones of the sea-beast (Pliny, *H. N.*, v. 13; Mela, i. 11).⁶ Tarsus in Cilicia was said to have been founded by Perseus, who appears on coins of the city, as well as on coins of Pontus and Cappadocia.

⁴ See the plans and sketches in Flandin, to whom it was stated that the castle-rock was called *Kalai sarr*, "castle of the cypress," from a solitary cypress growing there. It is unfortunate that for this particular locality the newest map of Hausknecht (Berlin, 1882) is quite unreliable.

⁵ These references are still very useful, although we have now the advantage of knowing the extremely valuable Arabian sources of many of his Persian narratives from printed texts.

¹ Curtius repeatedly confounds the palace with the metropolis (both being *τὰ βασίλεια*), and so speaks of the city being set on fire.

² Properly *Stakhr*, as written in Pahlavi; on the coins of the Sasanids "st" stands as an abbreviation for the name. The Armenians write *Stahr*. The form with the prosthetic vowel *Istakhr* is New Persian; the Syrians used at a still earlier time the form *Istahr* or *Istahr*.

³ This height is now called, from its situation, *Miyânkala* (middle fortress). Older writers and travellers give other names, the nomenclature of all this part of Persia having greatly altered; but the name "castle" or "hill of Istakhr" appears not to have entirely disappeared.

P E R S I A

PERSIA, or IRÁN. In modern political geography these two terms are synonymous; the kingdom which we call Persia the Persians themselves call Írán. But each of the words has a somewhat complicated history, a brief sketch of which will best explain the connexion between the several subjects which, in an encyclopædic treatment, naturally demand notice under one or other of the names which head this article.

Persia, or rather Persis (Greek exclusively Περσίς), is the Latinized form of a name which originally and strictly designated only the country bounded on the N. by Media and on the N.W. by Susiana, which of old had its capital at Persopolis or Istakhr, and for almost twelve centuries since has had it at Shíráz. This country and its people were anciently called Pársa (now Párs or Fárs). The oldest certain use of the name is in Ezekiel (xxvii. 10, xxxviii. 5). The Greek form Πέρσαι, with ε for α, which all European languages follow, seems to have come from the Ionians, who disliked to pronounce α even in foreign words. Thus Πέρσαι would stand for Πήρσαι, which in turn stands to Pársa as Μηδοί to Máda.

The name of Persia was naturally extended to the great monarchy of the Achæmenians who came forth from Persis; and so again, when a second great empire, that of the Sásánians, arose from the same land, all its subjects began to be called Persians, and Persis or Persia was sometimes used of the whole Sásánian lands (Ammianus, xxiii. 6, 1). The prevalent language of this empire (see PAHLAVÍ) had a still better right to be called Persian, for it seems to have had its basis in the language of the old Persis. The same thing is true of the so-called New Persian, which has been a literary language for the last thousand years.

Historically, then, the term Persian is fitly applied to the two great empires which rose in Párs or Persis—the form Persis will be used in this restricted sense throughout the present article—and not unfitly to the modern state which embraces Persis and its sister lands, and in which a descendant of the ancient tongue of Persis is still the official and literary language.

The name Írán, on the other hand, was originally of much wider signification than Persia, and the whole upland country from Kurdistán to Afghánistán may, in accordance with the native use of its ancient inhabitants, be called the Iranian upland. The inhabitants of this upland, together with certain tribes of the same race in adjacent lands, shared with their near kinsmen in India the name of Aryans (Ariya, Airya of the *Avesta*; Sk. Árya). King Darius calls himself "Persian son of a Persian, Aryan son of an Aryan," and Herodotus (vii. 62) knows Ἀριοί as an old name of the Medes. The ancient nobles affected names compounded with Arya,—Ariyarámna (Ἀριαράμνης), Ariobarzanes, and the like. The lands of the Aryans, as a whole, were called Ariyána (Airiya of the *Avesta*); Eratosthenes and after him Strabo and others are certainly wrong in limiting Ἀριανή, Ἀριοανοί, to eastern Írán (Afghánistán, Baluchistán, &c.).¹

Ardashír, the first Sásánian, is called on coins and inscriptions "king of the kings of Érán," his son Shápúr or Sapor is "king of the kings of Érán and not-Érán." Now Ardashír, as well as his son, had non-Aryan subjects, the main population of Babylonia and other provinces being of Semitic race; Érán and not-Érán therefore must here be used not ethnographically but in a definite politico-geographical sense. The official name of the empire, however, was always Érán, and the great officers of state had such titles as Érán-Spáhpat, "general of Érán," Érán-Anbárakpat, "store-master of Érán."²

For the last 500 years most Persians have pronounced Írán instead of Érán (more recently also Írón, Írún), and this is the official title of the kingdom which once had Ispahán and now has Teherán, as capital. Modern Írán, or Persia, does not embrace nearly the whole Iranian upland, still less all men of Iranian nationality, that is, all who speak an Iranian dialect akin to Persian. On the other hand, the modern kingdom of Írán has many subjects who are not Iranians ethnographically, but come originally from Central Asia or Arabia, and speak Turkish or Arabic.

PART I.—ANCIENT IRAN.

SECTION I.—MEDO-PERSIAN EMPIRE.

The Babylonian Berosus, writing soon after Alexander the Great, states that at a very early time, which we must place somewhat over two thousand years before Christ, the Medes conquered Babylonia, and that eight Median kings reigned thereafter in Babylonia for a space of 224 years.³ This is an early instance of the occupation of the rich lowlands by warlike tribes of the neighbouring highlands; and indeed the contrast between the plain of the Euphrates and Tigris, peopled mainly by Semites, and the tableland of the Iranians, surrounded by lofty mountains, is a very important factor in the whole history of wide regions of Asia. But it is, to say the least, not certain whether Berosus means the Iranian people afterwards called Medes. The expression might have a merely geographical signification, and it is at all events possible that at that distant period tribes of different descent dwelt in the land. In any case, we have here no Iranian empire, but only a Babylonian dynasty founded by foreigners.

Be this as it may, it is certain that at an early period there were regular monarchies of some size even in the distant Iranian lands. Unmistakable traces lead us to

assume an old empire in Bactria—the Iranian land far to the east, in the region of the Oxus, beyond the great tableland—which must have developed a tolerably high civilization. But we have no exact information about it.

The series of the great Iranian monarchies begins for Media with the Median empire of Ecbatana. Unfortunately we possess but little trustworthy information about its history, being almost wholly dependent on what two Greeks, Herodotus and Ctesias, who wrote long after the fall of the kingdom, report from the mouths of Orientals. These two authorities differ so widely that their statements are to a great extent mutually exclusive. Nevertheless careful investigation has shown that many of the statements of Ctesias (which are only preserved through the medium of later writers, like Diodorus) rest on the same basis as those of Herodotus. This common basis included an artificially arranged chronology.⁴ According to Herod-

³ Sásánian inscriptions in Chaldaic Pahlaví still show the ancient form Arián (𐭠𐭮𐭲𐭠), and Greek inscriptions of the older kings have the genitive pl. Ἀριανῶν. But the corresponding common Pahlaví inscriptions and the coins already show the form Érán (𐭠𐭮𐭲𐭠), following an established law of phonetic decay.

⁴ The information is preserved by Eusebius, who took it from Alexander Polybistor; see Eusebius, *Chronicon*, ed. Schoeno, 25.

⁵ See Hupfeld, *Exercitationes Herodoteæ Spec. II.: sive de veter Medorum regno*, Rinteln, 1843.

¹ Less careful writers, like Pliny, confuse Ariana with Aria, properly Haría, the land of Haralva, the later Harév, Haré, Harí; Arabic Harát.

otus the Medes freed themselves from the Assyrians, and lived for a time without a master till Deioces obtained the kingly power by stratagem. There reigned then

| | | | |
|-----------|----------|------------|--------------|
| Deioces | 53 years | } 75 years | } 150 years. |
| Phraortes | 22 " | | |
| Cyaxares | 40 " | | |
| Astyages | 35 " | | |

The totals show how the figures are arranged on an artificial system. The duration of the kingdom is exactly a century and a half, divided into two exactly equal portions, each of which is occupied by the reigns of two kings. But further, according to Herodotus, the rule of the Medes over Upper Asia, *i.e.*, the land east of the Halys, lasted 128 years, save only (*παρ' ἑξ*) the twenty-eight years during which the Scythians ruled. It is easy to see that "save only" means "minus," and that thus the foreign supremacy of the Medes is reckoned at exactly 100 years, or two-thirds of the total duration of the kingdom. Obviously such figures can at most be only approximately correct. Now the number 128 is got by adding the reigns of the first king and the last two. This number is certainly due to an error on the part of Herodotus, who has committed similar mistakes in arithmetic elsewhere; in adding up he took the reign of Deioces for that of Phraortes. We may conjecture that the original statement received by Herodotus was that the supremacy, represented by the last three reigns, lasted a century, a round number being put for 97 (22 + 40 + 35). With regard to the individual items, it is somewhat suspicious that the second half (75 years) is divided into its two most convenient fractions, 40 and 35. Consequently we cannot place much reliance on the figures representing the reigns of the first two rulers either, especially as it can be made probable that they also rest on an artificial basis.

Now it can be proved that Ctesias's list of nine or properly ten kings was based on that of Herodotus, but with all the numbers doubled. Probably this list of Ctesias assigned 350 years as the total duration of the empire, which is the number given in Justin, i. 6, 17. The Mede from whom Ctesias derived his information, or the Median source on which his informant drew (there is no mistaking the Median colouring which pervades Ctesias's narrative), wished to glorify the empire of his people by the length of its duration, hence the doubling. The source from which the names of the Median kings in Ctesias are derived is still a mystery; they are quite different from those of Herodotus. Even Oppert's hypothesis, that the names of the last four kings in Ctesias are the Iranian translation of the non-Iranian names in Herodotus and belong to the language of the second kind of cuneiform writing, though perhaps plausible at first sight, is on close examination untenable. In general there is no warrant for the assumption that as late as the time of the Median and Persian empires there was a large non-Iranian population in Media,—an assumption which conflicts with all tradition and originates solely in the difficulty of finding a home for the second kind of cuneiform writing. But the names of the kings in Herodotus are now all authenticated, directly or indirectly, by the inscriptions lately discovered. Probably too the reckoning of the total duration of the empire at a century and a half is about right. Indeed such chronological systems sometimes correspond better, on the whole, with the facts than their artificiality would lead us to expect.

Ctesias's narrative opens with a highly-coloured description of a real event, namely, the destruction of Nineveh by the leader of the Medes, called by him Arbaces, with the help of the Babylonian Belshazzar (the historical Nabopolassar). But the fact that by this event the position of Media as a great power was for the first time assured is mixed up by

Ctesias with the beginning of the monarchy itself. In addition, he grossly exaggerates the duration of the empire; so that we arrive at the monstrous result that between 606 or 607, the real date of the destruction of Nineveh, and 550, the year of the fall of the Median supremacy, more than 300 years are supposed to have elapsed.

Down to the destruction of Nineveh we must ignore Ctesias almost completely and follow Herodotus alone.

We will not repeat Herodotus's naive story of the foundation of the Median kingdom by Deioces, son of Phraortes, a story in which Greek and Oriental colours are charmingly blended. We may assume as certain that Deioces possessed a principality, the central point of which was Ecbatana (or Agbatana; Old Persian *Hagmatāna*, now Hamadān), a place which for thousands of years has held the rank of a capital. This principality probably never embraced the whole of Media (*i.e.*, nearly the present provinces of Irāk Adjemi and Azerbāijān with a portion of Turkish Kurdistan), but by his successors it was enlarged into the great Median empire. Of course there was no smooth and formal constitution, no fixed frontier, no exact determination of the prerogatives of different chiefs in the particular districts. From old the Assyrians had made frequent attempts to subjugate the country of the Medes, but perhaps never quite possessed the whole land with its numerous inaccessible mountains and warlike robber tribes. Nevertheless they made successful expeditions into the interior of Media even down to the time at which Herodotus regards Media as independent.¹ Neither the liberation of Media nor the foundation of the monarchy is an event which can be limited to a particular year, the thing took place gradually. In the period not long before Deioces, according to Herodotus's reckoning, very many tributary Median chieftains are mentioned in the Assyrian inscriptions; this confirms, in some measure at least, the statement that "anarchy" then prevailed.² In 715 B.C. there was carried off as prisoner one Dajaukku; this is certainly the same name, perhaps the same person (for his captivity may have been brief), as Däiokēs, which appears in Herodotus in the Ionic form Dēiokēs. We can certainly identify Herodotus's first king with the prince whose land, called Bit Dajaukku, *i.e.*, land of Dajaukku, King Sargon of Assyria conquered in 713 B.C. The man who thus gave his name to the land must have occupied a high station. The date is not very remote from that assigned by Herodotus to Deioces; for we get from Herodotus as the date of Deioces 709-656, or, if we correct his error in dating the end of the empire, 700-647. Deioces was not a king of kings; he was forced to bow to the Assyrians repeatedly, but he was the founder of the empire. Three kings followed him. It is possible that there were really more, and that in the summary list the shorter reigns are passed over. Nor can we place much reliance on Herodotus's assertion that each successive ruler was the son of his predecessor.

In perfect harmony with the conditions of development of a small state into a great power is the statement of Herodotus that the second king of the Medes, Phraortes (*Φραρτης*; according to Herodotus's reckoning 656-634 [647-625]), extended his sway beyond the limits of Media and first of all subjugated Persis, or Persia proper, the secluded mountain-land south-east of Media. During all this time indeed, as we learn from Darius's great inscription, Persis had kings of its own; but these were simply vassals of the sultan

¹ For this and what follows compare, besides the works of the Assyriologists, A. v. Gutschmid, *Neue Beiträge zur Geschichte des alten Orients*, 87 *sq.*

² That parts at least of Media were subject to Assyria at that period is further shown by 2 Kings xvii. 6, xviii. 11—surer evidence than that of the inscriptions, which may not always be rightly interpreted, and contain, besides, many exaggerations.

who had his seat in Ecbatana. After conquering the Persian, Phraortes, says Herodotus, subjugated piece after piece of Asia, until he was discomfited and slain in the attempt to conquer the Assyrians in Nineveh, whose empire was by that time completely lost. Allowing for some exaggerations with respect to the extent of the empire, there is nothing in these statements that need excite suspicion. Independent evidence seems to show that towards the middle of the 7th century the Assyrian empire had fallen very low;¹ and that the inhabitants of the cluster of vast cities to which Nineveh belonged were able to repel the first attack of an enemy who could hardly have been their match in the art of siege-warfare is perfectly natural. Besides, the stability of the Median military, political, and court institutions, which were afterwards taken over unaltered by the Persians, must surely have required for its development a longer time than some modern inquirers, following exclusively the cuneiform inscriptions, have assumed for the actual duration of the Median empire.

Phraortes's successor Cyaxares (*Huwakhshatara*); according to Herodotus's reckoning 634-594 [625-585] brought the empire to the highest pitch of power. He is said to have introduced fixed tactical arrangements into the army. It was to him that the pretenders whom Darius had to overcome traced their descent, as he tells us himself. Cyaxares, according to Herodotus, took the field successfully against Nineveh, but as he was besieging the city the inroad of the "Scythians" compelled him to forego for a time all the fruits of victory. Who these Scythians were is unknown. Herodotus took them for the people tolerably familiar to the Greeks, whose true name was Scolotæ; but his evidence does not go for much, since he often falls into the popular misuse of the term "Scythian" as a name for all the peoples of the steppes, and brings the inroad of these Scythians into a most unlikely connexion with the desolating raids of Thracian tribes (the Trares or Treres, commonly called Cimmerians) in Asia Minor. We must content ourselves with assuming that we have here one of those irruptions of northern barbarians into Iran of which we hear so often in later times. Probably these nomads came, as Herodotus indicates, through the natural gate between the Caucasus and the Caspian Sea, the pass of Derbend, though it is quite possible that they came from the east of the Caspian, from the steppes of Turkestan. Whether these Scythians are really the same people who made their way as far as Palestine and Egypt² is, indeed, far from being as certain as is commonly supposed, nor can the date of the irruption into these countries be determined. At any rate, the barbarians overthrew the Medes and flooded the whole empire. From what we know of the doings of Huns, Khazars, Turks, and Mongols in later times we can infer how these Scythians behaved in Iran. Cyaxares must have come to some sort of terms with them; and at last he rid himself of them in a truly Eastern fashion, by inviting most of them—i.e., of their chiefs—to a feast, where he made them drunk and slew them at their wine.³ It is not in the least surprising that Cyaxares afterwards had Scythians in his service; savages like these have no steady national feeling, and serve any potentate for pay.

With the Scythian disorders we might combine the contests which, according to Ctesias, the Parthians and Sacæ (i.e., the inhabitants of the Turkoman desert, who are also called "Scythians" by the Greeks) waged with

Cyaxares or Astibaras, as Ctesias calls him. But it is not safe to do so, as the whole narrative is only the framework for a pretty romance.

Cyaxares marched a second time against Nineveh and destroyed it about 607. Not only Ctesias but also Berosus⁵ asserts that the king of the Medes achieved this great success in league with the king of Babylon. That the Median tradition represented the Mede and the Babylonian tradition the Babylonian as suzerain, and the other king as a vassal, is not surprising. The more powerful of the two was doubtless the Median, the richer the Babylonian. Unfortunately Herodotus's work does not include the "Assyrian memoirs," in which he intended to give a fuller account of the fall of Nineveh,—probably because he died before completing the task. In order to protect himself against his ally, who by the fall of the Assyrian empire had grown too powerful, the Chaldaean king had recourse to a double precaution: he married his son, afterwards the potent Nebuchadnezzar, to Amytis or Amytis, daughter of the Median king; but he also erected extensive fortifications. After the fall of Nineveh, Nebuchadnezzar made himself master of Syria and Palestine, and Cyaxares acquired most of the rest of the Assyrian territory. Probably Assyria proper belonged to him also, and we can thus explain Xenophon's error that the Assyrian cities before their destruction belonged to the Medes (*Anab.*, iii. 4, 7-10). When Cyaxares afterwards began the war with the Lydians he was already master of Armenia and Cappadocia, though he probably did not acquire them until after he had got rid of the Scythians and destroyed Nineveh. The pretext for the war was afforded by the flight of some Scythians in Cyaxares's service to Alyattes,⁶ king of Lydia; but the real cause was doubtless thirst of conquest. The war lasted for five years with varying fortune, and was ended by the battle during which the eclipse of the sun, said to have been predicted by Thales, took place. The terrified combatants saw in this a divine warning and hastily concluded peace. An impression so profound could be produced by nothing short of a total eclipse. Now, according to Airy's calculation, of all the eclipses of that period the only one which was total in the east of Asia Minor (where we must necessarily look for the seat of war) was that of 28th May 585. Ancient writers⁷ also place the eclipse in this year. But this only proves that learned Greeks of a much later age calculated the year of an eclipse which they took to be that of Thales; yet in this case they have hit the truth. More exact calculations have shown that the eclipse of 30th September 610, formerly regarded as that mentioned by Herodotus, was total only to the north of the Black Sea. Besides, it is inconceivable that this war and the new grouping of states which it involved should have taken place before the destruction of Nineveh. The 28th of May 585 is perhaps the oldest date of a great event which can be fixed with perfect certainty down to the day of the month. The conclusion of peace which followed affords us a remarkable instance of diplomatic mediation in

Nineveh taken.

War with Lydians

⁴ See Diod., ii. 34; Nicol. Dam., 6; Anonymus de mulieribus.

⁵ See Euseb., *Chronicon*, pp. 30, 35, 37, and Syncellus, 210 B. The first passage refers to Abydenus, who made use of Berosus. He names the Median king 'Αστυάγης, which Gutschmid regards as a corruption of 'Αστυάρης = 'Αστυβάτης. This is acute, but it seems better to suppose that Abydenus or an excerptor confused Cyaxares with the last king of the Medes.

⁶ He reigned, according to Herodotus's reckoning, from 613 to 561. As this is narrated by Herodotus in his history of Lydia, he probably has it from Lydian sources, and we may regard this as a welcome confirmation of what we are told on Median authority about the destruction of the Scythians.

⁷ Pliny, *H. N.*, ii. § 53, and other passages; compare Gelzer, in *Rhein. Museum für Philologie*, N. F., xxx. 264 sq. An astronomer, a friend of the writer of this article, has by independent calculations confirmed the dates assigned in the text for both eclipses.

¹ The Assyrian inscriptions break off abruptly with the year 644; Gutschmid, *op. cit.*, 89.

² Herod., i. 105; compare Trogus, in Justin, ii. 3, and Jordanes, *De orig. Get.*, 6, whose account perhaps goes back to Diodorus.

³ Between the years 1030 and 1040 A.D. we know three cases where princes of Iranian lands despatched inconvenient Turkomans in exactly similar fashion; see Ibn Athir, ix. 266 sq., 272.

ery ancient times. The peace was brought about by Syennesis, prince of Cilicia, and Nebuchadnezzar, king of Babylon.¹ Astyages, son of Cyaxares, married Aryenis, daughter of Alyattes. But according to Herodotus's calculation the above date does not fall within the time of Cyaxares; and even with the necessary correction (of nine years; see below) Astyages ascended the throne in this same year. We might suppose that the battle fell in the father's, the peace in the son's time. But, as we saw above, the dates of these reigns are not of a sort in which we can place much confidence, and it is more likely that the reign of Astyages did not last so long as tradition asserts. Thus Cyaxares probably died after 585.

Of the reign of his son Astyages (in Ctesias Astyigas, in a Babylonian inscription *Ishturigu*) we have no particulars. It is not even certain that he was cruel, for Herodotus's account of him and of the revolt of Cyrus is not impartial, based as it is on the narratives of the descendants of Harpagus, who had an interest in portraying in unfavourable colours the prince whom their ancestor had betrayed. On the other hand, Ctesias's Median authority (Nicolaus Dam., 64 sq.), which sets Astyages in a very favourable light, has no better claim to credence on this point.

State of
Median
empire.

The Median empire must at this time have reached a tolerably high degree of civilization. As remarked above, the political and military institutions of the Persians are substantially those of the Medes; even the dress (of the Persian troops) was borrowed from the Medes.² Of buildings erected by the Median kings there are, so far as we know, no remains. The colossal lion, still to be seen, though in a sadly mutilated state, at Hamadán, and about which Arabian writers have all sorts of wonderful tales, is perhaps a monument of the Median age. The fortifications of Ecbatana must certainly have been magnificent; according to Herodotus's description, they showed strong traces of the influence of the star-worship practised by the neighbouring Babylonians, whose civilization was of a much earlier date.³ It may be that careful explorations in the neighbourhood of Hamadán or excavations will one day bring to light traces of that distant age, perhaps even some distinct inscriptions of Median kings. Such inscriptions would be of the highest value; and we might almost conjecture that the language and writing would be identical with those of the Persian kings. Since the Magi are expressly described by Herodotus as a Median tribe, and since in the age of the Achæmenians the Persian priests were drawn as exclusively from the Magi as in later times, it is highly probable that the Median kings established the Zoroastrian religion as the state religion, and appointed this Median tribe to be the priests. The religion itself arose in the far east, probably in Bactria. It is often assumed nowadays to have originated in Media, but the fact that its sacred books know nothing of the Magi tells particularly against this view. How firmly the Median Magi were in possession of the priesthood in Persia proper (Persis) about the year 522 we learn from the circumstance that they maintained their position in spite of the catastrophe of the false Smerdis. They must therefore have already held it for some time, and this carries us back almost necessarily to the influence of the Median empire. If this is correct, the Median empire has an extraordinary importance in the history of religions. The consideration enjoyed by the Median monarchy is proved by the fact that in Western lands which never came in contact with it at all its name

was so familiar that more than a hundred years after its fall the Persians were still mostly called Medes by the Greeks; in particular the wars of independence with the Persians still went at a much later date simply by the name *τὰ Μηδικά*.⁴

Nor was the Median empire properly destroyed by Cyrus; it was only transformed. Another race of the Iranian people and another dynasty stood at the head of the Iranian empire and carried out, as far as it was at all possible, Cyaxares's scheme for the conquest of Asia and the border-lands. That the Persian empire was the direct heir of the Median was known both to the Greeks—for only on this supposition were the above-mentioned expressions possible—and to the Hebrews (Isa. xiii. 17; Ezra i. 3, &c.).

We possess three accounts of the mode in which the transition was effected, that of Herodotus, that of Ctesias, (of which that of Dinon, preserved only in some fragments and vestiges, is merely a variation), and that of Xenophon in the *Cyropædia*. Though Xenophon had before him the works of both Herodotus and Ctesias, we must, with Niebuhr,⁵ regard his book as nothing more than an extremely silly romance; the attempts to employ it as an independent historical source have always failed. Herodotus probably got his charming narrative directly or indirectly from the descendants of Harpagus, a man who undoubtedly played a chief part in transferring the supremacy from the Medes to the Persians. Ctesias's narrative, which we are obliged to piece together from Nicolaus Damascenus, Photius, Justin, Polyænus, and Diodorus, is highly coloured, but in parts very pretty, and has, in contradistinction to Xenophon's romance, a genuinely Oriental stamp. It appears to be based on the account of a Mede, who gave a marked preference to his own people, and represented the founder of the Persian empire in as unfavourable a light as it was possible for a Persian subject (and probably an official) to do. There was no denying the fact of Cyrus's final victory, but in Ctesias's narrative he achieves his greatest successes by cunning and deceit. He is a genuine herdsman's son, takes early to robbery, and discharges menial services, in the course of which, significantly enough, he gets plenty of hard knocks. His accomplice Cebares is a cowardly rascal. Astyages defeats Cyrus in Persis itself and pursues him to his home, Pasargadæ; he is only saved by the intervention of the women. On the other hand, Astyages magnanimously spares Cyrus's father, who had fallen into his power. It is particularly significant that over the corpse of Astyages, who had been left by stratagem to pine in the wilderness, a royal guard of lions kept watch and ward. Of course all this does not exclude the supposition that this partisan narrative is founded on a genuine Persian legend. For, the rest, the narrative of Ctesias agrees in some particulars, and even in some names, with that of Herodotus.

That Cyrus (*Kuru*, nominative *Kurush*, or rather *Kûru*, *Kûrush*⁶) was not of lowly descent but of a princely house was long ago seen to be a necessary supposition. Popular legend loves the elevation of sons of the people to the throne, but as a matter of fact national kingdoms are not easily founded anywhere, and least of all amongst primitive peoples, except by persons of distinguished birth. A knowledge of the Persian inscriptions has put it beyond a doubt

¹ For the latter Herodotus wrongly substitutes his successor Nabunetus (Nabunaid; Persian *Nabunaita*).

² Herod., vii. 62.

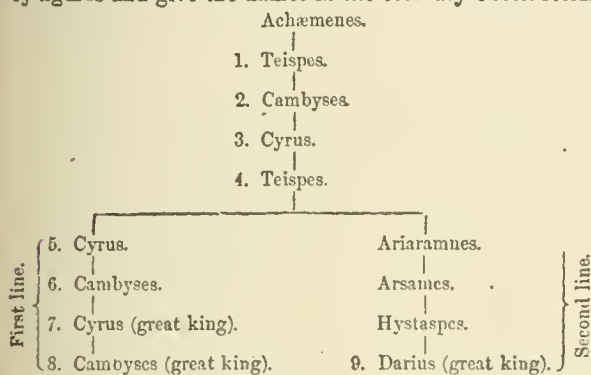

³ See Sir H. Rawlinson, in G. Rawlinson's *Herodotus*, i. 98, and Joh. Brandis, in *Hermes*, ii. 264.

⁴ It is noteworthy, however, that Æschylus in the *Persæ* says "Persians" almost exclusively, but "Medes" only exceptionally (ver. 236, 791, and so in his epitaph); perhaps the poet chose "Persians" as the less usual expression.

⁵ *Lectures on Ancient History*, i. 96, Eng. tr.

⁶ The *u* is long, as is shown by the agreement of *Kûpos*, Æschyl., *Pers.*, 768, and כורש of the Old Testament. The long *u* makes it impossible to identify the name with the Indian *Kûrû*, as Spiegel proposes.

that Cyrus was of royal blood. A cylinder with an inscription of his, found lately at Babylon,¹ affords us fuller information. Cyrus's father was, just as Herodotus tells us, Cambyses (*Kambujiya*), his grandfather Cyrus, his great-grandfather Sispis (*i.e.*, the Persian *Chaispi*, Greek Teispes). We can combine the contents of this cylinder, on the one hand with the list of Darius's ancestors in Herodotus (vii. 11), and on the other hand with Darius's own statements in the great Behistún inscription. The last list is shorter by three than that of Herodotus; but, as Darius says that eight of his family were kings, and that they reigned in two lines, while neither he nor his successors in their inscriptions give the title of king to his immediate predecessor, we must assume that the Behistún list of ancestors is somewhat curtailed; and we can with some probability draw out the complete list in exact harmony with Herodotus.² We shall indicate the kings by figures and give the names in the ordinary Greek form.

Achæmenes (Persian *Hakhâmani*), ancestor of the whole family, is perhaps not an historical personage, but a heros eponymus. According to our calculation Teispes, the first king, flourished about the year 730, therefore somewhat earlier than the foundation of the Median empire, but somewhere about the time which Herodotus assigns for the beginning of the independence of Media. Perhaps the rise of the provincial dynasty is connected with the weakening of the Assyrian power in Iran. Now on the cylinder Cyrus calls himself and his forefathers up to Teispes not kings of Persia but kings "of the city Anshan." Similarly on a lately-discovered monument of still greater importance, a Babylonian tablet,³ he is called "king of Anshan," but also "king of Persia." Anshan has been looked for, without sufficient grounds, in the direction of Susiana. Even if it be true that Anshan, written as here in two ways, elsewhere means Susiana—and this Oppert emphatically denies—we should still have to regard this only as a Babylonian inexactitude of expression. It is far more likely that Anshan was a place in Persis, the proper family seat of the Achæmenians, therefore perhaps near Pasargadæ or identical with it. An attempt has even been made, in consequence of this designation, to deny that Cyrus was a Persian at all, although Darius calls himself an Aryan and a Persian, and therefore regarded Cyrus and Cambyses as such; indeed he expressly designates them members of his family. It may be that the Achæmenians ruled in a part only of Persis, but we have just as good a right to assume that, as Herodotus and Ctesias assert, Cyrus's father at least was governor of the whole province. His mother, according to Herodotus, was the daughter of Astyages. This may very well be historical,

though the confirmation by the oracle which describes him as a "mule" (Herod., i. 55) does not go for much, since these oracles are tolerably recent forgeries, and it is conceivable that we have here nothing more than an example of the well-known tendency of lords of new empires in the East to claim descent, at least in the female line, from the legitimate dynasty. Ctesias indeed tells us that Cyrus afterwards married a daughter of the dethroned Astyages, Amytis (which was also the name of Astyages's sister, wife of Nebuchadnezzar). Of course this does not absolutely exclude the possibility of Cyrus being the son of another daughter of the king.

Stripped of its romantic features, Herodotus's narrative of the rise of Cyrus is in fundamental harmony with the new document which we possess on the subject, in the shape of annals inscribed on a Babylonian tablet. According to Herodotus, Cyrus and the Persians revolted; Harpagus the Mede, who was in league with him, was despatched against him. A part of the Median army fought, but another part went over to Cyrus or fled. In a second battle Astyages was defeated and taken prisoner. Now the tablet tells us among other things: "and against Cyrus king of Anshan, . . . went . . . Ishtuvigu, his army revolted against him and in hands took, to Cyrus they gave him." Thereupon, it proceeds, Cyrus took Ecbatana and carried off rich booty to Anshan. This summary account of the Babylonian annalist by no means excludes the supposition that Cyrus had fought a previous battle against Astyages. Both accounts say that the treachery and faithlessness of the army procured Cyrus the victory. We might even harmonize the Babylonian document with Ctesias's narrative that Cyrus was at first hard pressed and driven back as far as Pasargadæ, if there were not other grounds, quite apart from its fabulous embellishments, which render this account improbable.

The date of the overthrow of Astyages and the taking of Ecbatana is, according to the Babylonian tablet, the sixth year; and, as it is in the highest degree probable that the years in this memorial are those of the Babylonian king Nabunaid, we must place these events in the year 550. Hitherto it has been supposed, following Herodotus, that the reign of Cyrus (559-530) was to be reckoned from the fall of the Median empire, and that accordingly the latter event was to be placed in 559. But now we see that Cyrus numbered his years from the time when he ascended the throne in Persia. Whether the revolt against Astyages began when he ascended the throne, we do not know. We may very well believe Herodotus (i. 130), that Cyrus treated Astyages well down to his death. On this point Ctesias agrees with Herodotus.

After the taking of Ecbatana, which made Cyrus the great king, he must have had enough to do to subdue the lands which had belonged to the Median empire. Little reliance can be placed on Ctesias's account of these struggles. Herodotus (i. 153) states that the Bactrians, who according to Ctesias were soon subdued, were, like the Sacæ, not subjugated until after the conquest of Babylon.

The next war was against the powerful and wealthy king Croesus of Lydia, who ruled over nearly the whole western half of Asia Minor. It was a continuation of the war between the Medes and Lydians which had been broken off in 585. Here again the story in Herodotus is embellished with many marvellous incidents, and is employed to exemplify moral doctrines. If Croesus really began the war, he assuredly did so not frivolously but deliberately, in order to anticipate the inevitable attack. A fierce struggle seems to have taken place in Cappadocia (Herod., i. 76, and especially Polyænus, vii. 8, 1 *sq.*), which already belonged to Cyrus. Croesus retreated to prepare for another campaign, but Cyrus followed hard after him, routed him

² See Büdinger, *Die neu entdeckten Inschriften über Cyrus*, p. 7 (Vienna, 1881). The pedigree is almost certain, though possibly it may be incomplete and may not contain all "kings."

³ *Transactions of the Soc. of Bible Arch., vii. 139 sq.* (Punches).

when he offered oattle, and captured the capital Sardis after a short siege. Not only Herodotus but also apparently his contemporary Xanthus the Lydian, quite independently of Herodotus, told how Cyrus would have burned Cræsus alive.¹ The statements of Ctesias and Xenophon to the same effect are borrowed from Herodotus. But there is also a vase of the time of Pericles representing Cræsus seated on a pyre and majestically pouring out a libation.² We may not of course infer from this that Cræsus offered himself as a willing sacrifice; but it certainly shows that a hundred years later there was a general belief that Cræsus had stood upon the pyre. And it is by no means inconceivable that Cyrus, whom we must picture to ourselves, not as the chivalrous and sentimental hero of Xenophon, but as a savage conqueror, should have destined such a punishment for a vanquished foe, against whom he may personally have been especially embittered. No doubt to pollute the fire with a corpse was even in those days an impiety in the eyes of the Persians, but who knows whether Cyrus in his wrath paid much more heed to such religious maxims than did his son Cambyses? However, Cræsus was pardoned, after all, perhaps because some external circumstance interposed (because a sudden shower prevented the fire from burning?), or because the conqueror changed his mind before it was too late. The pious and believing saw in the event a direct intervention of Apollo on behalf of the man who had honoured the Delphic shrine so highly.³

The date of Cræsus's fall is not quite certain. It may have been 547 or 546. When Cyrus had marched away, the Lydian Pactyas, whom Cyrus had appointed guardian of the treasures, raised a revolt, but it was speedily put down by the king's generals. From that time forwards the Lydians never made the slightest attempt to shake off the Persian rule.

War with
Asiatic
Greeks

But now began that struggle of the Persians with the Greeks which has had so much importance for the history of the world. The Lydian kings had subdued a number of Greek cities in Asia Minor; but even these latter shrank from submitting to the still barbarous Persians, whose rule was far more oppressive, inasmuch as they ruthlessly required military service. But Harpagus and other Persian leaders quickly took one Greek town after the other; some, like Priene, were razed to the ground. Some of the Ionians, such as the Teians, and most of the Phocæans, avoided slavery by emigrating. Miletus alone, the most flourishing of all these cities, had early come to an understanding with Cyrus, and the latter pledged himself to lay no heavier burden on it than Cræsus had before him. In most of the cities the Persians seem to have set up tyrants, who gave them a better guarantee of obedience than democratic or aristocratic governments. In other respects they left the Greeks alone, just as they left their other subjects alone, not meddling with their internal affairs so long as they paid the necessary contributions, and supplied men and ships for their wars. Most of the other peoples in the west of Asia Minor submitted without much resistance, except the freedom-loving Lycians. Driven into Xanthus, the capital, they perished in a body rather than surrender.⁴ Some Carian cities also defended themselves stoutly. This

may have given a Persian here and there an inkling even then that the little peoples on the western sea were, after all, harder to manage than the nations of slaves in the interior of Asia. Sardis became and remained the mainstay of the Persian rule in western Asia Minor. The governorship was one of the most influential posts in the empire, and the governor seems to have exercised a certain supremacy over some neighbouring governorships.

Though Cyrus had made, and continued to make, conquests in the interior of Asia, he was still without the true capital of Asia, Babylon, the seat of primeval civilization, together with the rich country in which it lay, and the wide districts of Mesopotamia,⁵ Syria, and the borderlands over which it ruled. Now that we know the two Babylonian memorials mentioned above we can dispense with most of the various, often very fabulous, accounts which Greek writers give of the conquest of Babylon; but when these documents are rightly understood the divergence between them and the account of Berosus⁶ is, on the main points, not very great. Before the capture of the city, in the summer of 539, a great battle took place, in consequence of which Cyrus occupied the capital without any further serious fighting, since the Babylonian troops had mutinied against their king. Late in the autumn of 539⁷ Cyrus marched into Babylon, Nabunaid, the king, having previously surrendered himself. According to Berosus, Cyrus appointed Nabunaid governor of Carmania, east of Persia⁸; but in the annals inscribed on the tablet it is said to be recorded that Nabunaid died when the city was taken. If both memorials represent Cyrus as a pious worshipper of the Babylonian gods, if, according to the cylinder, the Babylonian god Merodakh, wroth with the king of Babylon because he had not served him aright, actually himself led and guided Cyrus, such a piece of priestly diplomacy ought not to impose on any student of history. The priests turned to the rising sun, whether they had been on good or bad terms with Nabunaid. Cyrus certainly did not put down the Babylonian worship, as the Hebrew prophets expected; he must even have been impressed by the magnificence of the service in the richest city of the world, and by the vast antiquity of the rites. But he was no more an adherent of the Babylonian religion, because the priests said he was, than Cambyses and the Roman emperors were worshippers of the Egyptian gods, because Egyptian monuments represent them as doing reverence to the gods exactly in the style of Egyptian kings. Sayce doubts whether Cyrus could read their documents; we doubt whether Cyrus understood their language at all, and regard it as inconceivable that he learned their complicated writing; indeed, on the strength of all analogies, we may regard it as scarcely probable that he could read and write at all.⁹ The countries subject to

⁵ We always use "Mesopotamia" in the sense in which alone this geographical conception ought to be used, viz., as equivalent to the Arabic *Jazīra*, i.e., to denote the cultivated land between the middle Euphrates and the Tigris, which is separated by the Mesopotamian desert from the totally different *Irāk* (Babylonia).

⁶ In Josephus, *c. Ap.*, i. 20. On many particular points in these memorials the Assyriologists themselves hold different opinions; but the part which concerns us most seems to be free from doubt.

⁷ On 3d Marheshwān, which month corresponds nearly to our November. The year which begins with 5th January 538 is, in the astronomical canon, the first year of Cyrus as king of Babylon. If, as the strict rule requires, we make the small remainder of the year after the taking of the city to be the first year of Cyrus's reign, then the events in the text fall in 538. But probably the remainder of the year was not reckoned in, and for this there are analogies. (See below.)

⁸ This statement is further supported by that of Abydenus, doubtless taken from Berosus, that Darius drove Nabunaid out of Carmania (Euseb., *Chron.*, p. 41). This is certainly not an invention. At the most, the former king of Babylon might have been confounded with another Babylonian prince.

⁹ Even the comparatively simple Persian cuneiform writing was certainly always the secret of a few; otherwise it could not have

¹ See Nicolaus Dam., 67 (apparently put together from Herodotus and Xanthus).

² *Mon. de l'Inst. Arch.*, i. 54.

³ Cræsus's good repute amongst the Greeks of the mainland (see Pindar, *Pyth.*, i. 184 [94]) was due to his liberality to the Delphians. Even 400 years afterwards the Delphians appealed to their old friendship with the people of Sardis (i.e., with Cræsus). *Bulletin de corresp. hellénique*, v. 383, 389 sq. That Cræsus could also be inhuman enough is shown by Herod., i. 92.

⁴ About 500 years later the inhabitants of Xanthus followed their example in the struggle with that champion of freedom, Brutus.

Babylon seem to have submitted without resistance to the Persians. The fortress of Gaza alone, in the land of the Philistines, perhaps defended itself for a time.¹ On the other hand, the Phœnician cities, some of which offered a sturdy resistance to other conquerors, submitted immediately, and remained steadily obedient to the Persians down almost to the end of the empire. It seems, however, that, as the real prop of the naval power of Persia, they were almost always treated with special consideration by the latter. In the very first year of his reign in Babylon² (538) Cyrus gave the Jewish exiles in Babylon leave to return home (2 Chron. xxxvi. 22 sq. = Ezra i. 1 sq.). Comparatively few availed themselves of this permission, but these few formed the starting-point of a development which has been of infinite importance for the history of the world.

How far to the east Cyrus extended his dominion we do not know, but it is probable that all the countries to the east which are mentioned in the older inscriptions of Darius as in subjection or rebellion were already subject in the time of Cyrus. In this case Chorasmia (Khârezm; the modern Khiva) and Sogdiana (Samarkand and Bokhârâ) belonged to him. Agreeably with this, Alexander found a city of Cyrus (Cyropolis)³ on the Jaxartes, in the neighbourhood of the modern Khokand. He doubtless ruled also over large portions of the modern Afghânistân, though it is hardly likely that he ever made his way into the land of the Indus. The story of his unsuccessful march on India⁴ seems to have been invented by way of contrast to Alexander's fortunate expedition.

Different accounts of Cyrus's death were early current. Herodotus gives the well-known didactic story of the battle with Tomyris, queen of the Massagetæ, as the most probable of many which were told. If we accept Herodotus's statements, we must look for the Massagetæ beyond the Jaxartes. In Ctesias Cyrus is mortally wounded in battle with the Derbices, who probably dwelt near the middle or upper Oxus. A fragment of Berosus⁵ says that Cyrus fell in the land of the Dai (Dahæ), i.e., in the modern Turkoman desert, perhaps in the southern or south-western portion of it; this account may very well be derived from contemporary Babylonian records. Be that as it may, Cyrus met his death in battle with a savage tribe of the north-east. The battle was probably lost, but the Persians rescued his body, which was buried at Pasargadæ in the ancient land of his race. To this day there is to be seen at Murghâb, north of Persepolis (on the telegraph line from Abûshehr to Teherân), the empty tomb and other remains of the great mausoleum, which Aristobulus, a companion of Alexander, described from his own observation⁶; and on some pillars there the inscription is to be read: "I am Cyrus, the king, the Achæmenian." Till lately the same inscription was also to be found high on the pillar which bears in bas-relief a winged figure of a king. This figure is furnished with a "pschent," i.e., such an ornamented crown as is worn by kings and gods on Egyptian monuments.⁷ This was no

doubt meant by Cambyses as a special mark of honour to his father, whose monument must have required years to finish. It is quite natural that the ancient art of Egypt should have made a deep impression even upon those of its conquerors who in other respects had little liking for Egyptian ways.

If one could accept without question the judgment of the Persians as recorded by Herodotus (iii. 89, 160), expanded by Xenophon, and repeated by later writers (from Plato downwards), Cyrus must have been the most perfect model of a ruler. But we must view with great suspicion a tribute of praise like this paid to the founder of an empire by those who reaped the fruits of his labours. The founder of the Sasanian empire is also described as a paragon of wisdom and virtue, though his deeds strikingly belie such an estimate. We must be content to know that we are no better informed about the character of many other great men of the past than about that of Cyrus. That he was a very remarkable man and a great king is a matter of course. Whether he deserves the reputation of a great statesman, which even in modern times has been accorded to him, we cannot say. Certain it is he left the empire still in a very unformed condition. To expend the immense treasures of Ecbatana, Sardis, and Babylon for the benefit of the empire was to be sure an idea which certainly would never have entered into the head of any Eastern conqueror. The treasures simply became the property of the king, though of course a large part went to the leading Persians and Medes who filled the most important offices.

Cyrus died in the beginning of the year 529. He left behind him two sons, Smerdis⁸ (Persian *Bardiya*) and Cambyses (*Kambujiya*); their common mother was according to Herodotus an Achæmenian, according to Ctesias the daughter of the Median king. The great inscription of Darius states that Cambyses caused Smerdis to be put to death without the people being aware of it. From this it follows that the partition of the kingdom between the two brothers, of which Ctesias speaks, can hardly have taken place; for the murder of a king or consort could not have remained concealed. Besides, in both the Babylonian inscriptions, of which mention has been frequently made, Cambyses is spoken of in a way which distinctly shows him to have been heir-apparent. This fratricide, the true motives of which we do not know, was the forerunner of many similar horrors in the dynasty. The inscription proves, as against Herodotus, that the deed was done before the expedition to Egypt. Nothing else is told us about the earlier part of the reign of Cambyses. It is only when we come to his conquest of Egypt that we have more exact information. The pretexts for the Egyptian war need not detain us. The riches of Egypt had from of old allured the lords of the neighbouring lands, and Herodotus takes it for a matter of course that Cyrus had occupied himself with plans against Egypt. According to the statements of Manetho⁹ and of the Egyptian monuments, the conquest of Egypt took place in the spring of 525. Vast warlike preparations preceded the expedition. The Greeks of Asia Minor, the Cyprians, who had just submitted, and the Phœnicians had to furnish the fleet. A countryman of Herodotus, the mercenary captain Phanes of Halicarnassus, deserted from the Egyptians to the

happened that, e.g., the Behistûn inscriptions of Darius should have been described to Ctesias as those of Semiramis (Diod., ii. 13).

¹ According to the conjecture of Valesius in Polyb., xvi. 40, *την Περσῶν*, which, though not absolutely certain, is still the best emendation of the passage.

² This statement goes to show that the small remainder of the year after the taking of Babylon was not reckoned in Cyrus's first year. For he had at that time something more important to do than to trouble himself straightway about the Israelites.

⁵ Euseb., *Chron.*, p. 29.

⁶ See Strabo, 730; Arrian, vi. 29, 4 sq.

⁷ See the copies in the great works of Texier and of Flandin and Coste. The most exact representations are those from photographs in Stolze, *Persepolis* (Berlin, 1882), tab. 128 sq., 132 sq. The proof that this is really the grave of Cyrus is given in Stolze's Introduction, as

well as in his paper in the *Verhandl. der Gesellschaft für Erdkunde zu Berlin*, 1883, Nos. 5 and 6 (p. 19 sq. of the separate edition).

⁸ So Herodotus (the name being assimilated to a genuine Greek name Smerdis, Smerdes). Aeschyl., *Pers.*, 774, has Mardos; Justin, i. 9, 9 sq., Mergis; the scholium on Aesch., l. c., Merdis.

⁹ See Wiedemann, *Geschichte Ägyptens von Psammetich I. bis auf Alexander den Grossen*, p. 218 sq.; comp. too Diod., i. 68. For what follows, and for all that concerns the relations between Egypt and Persia, the work of Wiedemann is to be consulted. At the same time the assumption of the year 525 as the date of the conquest is open to some objections; there are many arguments in favour of 527.

Persians and made himself very useful in the conquest. It seems that only one great battle was fought, at Pelusium, the gateway of Egypt. The Egyptians, utterly beaten, fled to Memphis, which soon fell into the enemy's hands. Thus Egypt became a province of Persia; and a pretext was soon found for executing the captured king Psammenitus. This was followed by the submission of the neighbouring Libyans and the princes of the Greek cities of Cyrene and Barca. The peculiar religious feelings of the Egyptians were almost as easily wounded as those of the Jews were in later times. The Persians, flushed with victory, recked little of Egyptian wisdom or folly, least of all recked the brutal king. It is true that even Egyptian inscriptions represent him as a pious worshipper of the Egyptian gods, but this is only the courtly ecclesiastical style, which the Egyptians, partly from servility, partly from long habit, can never drop. And, even if Cambyses did once in a way gratify a pious Egyptian, *e.g.*, by ordering his troops to quit a temple which they had occupied as a barrack, no great importance is to be attached to the fact. No doubt the Egyptian priests grossly exaggerated the king's wickednesses, but enough remains after all deductions. The dreadful hate which again and again goaded the naturally patient and slavish nation into revolt against the Persians dates from this time; Darius could not atone for the guilt of Cambyses. The brutality of the latter began with maltreating and burning the mummy of the former king Amasis, who had personally insulted him or his father; to the Persians, as Herodotus expressly says, the burning of the body was no less an impiety than to the Egyptians. From Egypt he sent an expedition to the shrine of Ammon in the Libyan Desert, but, caught presumably in a simoom, it was never heard of again. He led in person a great expedition to Nubia ("Æthiopia"). It does not seem to have been such an utter failure as one might at first infer from Herodotus's narrative, for some districts to the south of Egypt were conquered; but the results purchased by hecatombs of men who perished by fatigue or were buried in the sands were far from contenting the king. Returning to Memphis, he found the people exulting over the discovery of a new Apis. Their joy did not fall in with his mood. In a fury, or perhaps out of a tyrant's caprice, he inflicted with his own hand a mortal wound on the sacred steer and instituted a massacre among its worshippers. We may well believe Herodotus that from that time his barbarity to the Egyptians showed itself in ever darker colours. He spared not even the Persians. Ctesias too calls him bloodthirsty. Added to this was his drunkenness. But his marriage with one or two sisters, at which Herodotus takes offence, was really, according to Persian notions, an act of piety.¹ Similarly, when he put to death a corrupt judge of the highest family and caused his skin to be made into a covering for the seat on which his son was to sit and administer justice, the act was one which all Orientals recognized as truly kingly (Herod., v. 25).

The empire was extended in another direction, when Polycrates, the powerful tyrant of Samos and the neighbouring islands, sought safety in submission to the great king.

Suddenly, however, the empire rang with the news that the king's brother Smerdis had seized the crown in Persis. We are now in possession of Darius's own account of these events, and can fairly dispense with the Greek narratives; but we may note that here again, in spite of his poetical colouring, Herodotus stands the test much better than Ctesias.² Gaumáta (in Ionic form *Gōmētēs*, Justin, i. 9), a

Magian, gave himself out as Smerdis (spring of 522) and formally assumed the government. Even Darius's account lets us see that Cambyses was very unpopular, and the same thing appears from the fact that everybody sided with the new king. Cambyses seems to have marched against him as far as Syria, but there he put an end to himself,—an end plainly affirmed by the great inscription, and quite in keeping with the wildly passionate nature of the man. Gaumáta reigned, universally acknowledged, and, as it seems, beloved, because he granted extensive remissions of taxes. He appeared in the character of Smerdis, son of Cyrus, and therefore as Persian king. This is enough to show that there can be here no question of a political opposition of the Medes to the Persians, such as Herodotus imagines, nor yet of a religious opposition to the Persians by the Magians. The changes for the worse now introduced, and abolished again by Darius when he ascended the throne,³ seem to imply no more than a very intelligible disregard of the leading Persian families, whom Gaumáta could not but fear, since they knew much better than the people that he was an impostor. He fell, not through the patriotic indignation of the Persian people, but through the enmity of these families. Seven persons conspired against him; their names, each with that of his father, are given by Darius in full agreement with Herodotus, while the list of Ctesias presents somewhat more divergence.⁴ No doubt they were members of the seven most illustrious houses, but certainly not the actual heads of these houses; for such a life-and-death enterprise, where all depended upon energy and silence, could not be entrusted to persons who happened to be heads of families and some of them perhaps old men. Moreover, Darius himself, who was undoubtedly from the outset the real leader, was certainly not the head of his house, for his father Hystaspes (*Visht-áspa*) was still alive and in full vigour, since he afterwards governed a province and fought the rebels. But the ring-leaders would choose one out of each of the seven families in order to commit the families themselves. The conspiracy was completely successful; and the seven killed Gaumáta in the fortress *Sikathahuvati* near *Ecbatana*, in the land of *Nisa* in *Media*. This happened in the beginning of 521. Darius was then made king. He was probably the only one of the seven who was qualified to be so, for he alone belonged to the royal family, of which, it is true, there may have been many members more nearly related to Cambyses. At any rate there was hardly another candidate for the crown as able as he.

Darius (*Dárayavahu*, in the nominative *Dárayavahush*) was then, according to Herodotus (i. 209), about thirty years of age. Amongst other measures for securing himself and adding to his dignity he took to wife *Atossa*, daughter of *Cyrus*, who had already been married to her brother *Cambyses* and to the false *Smerdis*. He soon showed that his six comrades were not his peers by executing *Intaphernes*, who had forgotten the respect due to the king, together with his whole family. That at first his seat on the throne was far from firm is intimated by Herodotus (iii. 127), who also mentions cursorily an insurrection of the Medes against him (i. 130), but it is only from the king's great inscription that we learn the gigantic nature of the task he undertook when he ascended the throne. He had first to unite the empire again; one province after the other was in insurrection; the west alone remained quiet, but it was partly in the hands of governors of

³ Unfortunately in this interesting passage of the great Behistún inscription the particulars are very obscure.

⁴ In Ctesias the name of a son is twice given for that of the father. It is obvious that we are here dealing with the ancestors of the seven great families, and one generation could very easily be named by mistake for another.

¹ Herodotus's Persian informants told him much of the real or pretended virtues of their people, but concealed things which would have offended him.

² Small remains of another ancient and trustworthy account are to be found in Justin

doubtful loyalty. Darius gives the day of the month for the most important events, but unfortunately not the year. Moreover, in consequence of the mutilation of the Babylonian text it is only of some of the Persian months that we can say with certainty to what parts of the year they roughly correspond.¹ Thus the particular chronology of these insurrections remains in many points quite uncertain, especially as it can be seen that many events narrated as successive were contemporaneous. In any case Darius acted very energetically and promptly; and the chief provinces were undoubtedly again reduced to subjection in the first three years of his reign. The insurrection of Athrina in Susiana was promptly suppressed by a Persian army. More dangerous was the revolt in Babylon of Nidintubel (*Nadintabaira*), a real or pretended member of the Babylonian royal house who assumed the august name of Nabukadrezzar (Nebuchadnezzar). Darius hastened thither and defeated him in several battles. But the long siege after which, according to Herodotus, the rebel city fell into the hands of Darius, cannot have taken place then.² While Darius was in Babylon a whole series of revolts broke out. That of Martiya in Susiana, who called himself Imani, and appeared in the character of king of that country, was indeed soon put down with the help of the people of Susiana themselves, but in Media, the heart of the monarchy, the situation was much more grave. Phraortes (*Frawarti*), who gave himself out to be a scion of the old royal house of Media, was made king of Media, and the Parthians and Hyrcanians to the eastward, whose satrap was Hystaspes, father of Darius, sided with him. The king's generals could effect nothing decisive against Phraortes; at last he was overthrown by the king in person. Like all rebels who devoted their descent rightly or wrongly from the old dynasties, he was put to death with circumstances of especial cruelty. In the meantime one of Darius's generals had put down a second false Nebuchadnezzar in Babylon; others had to suppress insurrections in two regions of Armenia, which were, perhaps, connected with the revolt of Phraortes, and a rising in the distant Margiana (the district of Merv). Even Persis had risen. Another false Smerdis, Vahyazdāta, appeared in the east while Darius was in Babylon, and crowds flocked to him. His power increased so much that he was even able to send an army to Arachosia (a part of western Afghanistan). While Darius, in person took the field against Phraortes, he despatched against Vahyazdāta a general who at last overthrew the rebel. Arachosia, too, was reduced to subjection. So, too, was the nomad tribe of the Sagartii (perhaps on the northern or north-eastern frontier of Persis), with Chitratahma at their head, who also claimed to be of the royal house of Media. Afterwards Gobryas (*Gaubruva*), one of the seven, suppressed a third revolt in Persis. The king in person reconquered the Sacæ, who had been in subjection before. The generals employed by Darius were Persians and Medes; but there was one Armenian among them. His faithful army was composed of Persians and Medes, but his adversaries were also supported in part by Persians and Medes. Darius must have been a great ruler to conquer them all. Picture his position when he took

the field against Phraortes; Babylonia was his once more, 521-515 and its wealth must have supplied him with the means of war, but almost the whole of Iran and Armenia was in the hands of men whom he calls rebels and liars, but some of whom, at least, had perhaps more right than he to the sovereignty, and whose people were devoted to them. No sooner had he reached Media than Babylon was again in arms. Nothing but great energy and circumspection could have carried him safely through all his difficulties.

The satrap of Sardis, Oroetes, had not revolted, but his conduct was that of an independent prince. Him Darius put out of the way by stratagem (Herod., iii. 120 sq.). At the same time Samos became definitively a Persian province, after a royal army had, with much bloodshed, set up as tyrant Syloson, brother of Polyerates, whom Oroetes had put to death. The removal of Aryandes,³ governor of Egypt, who assumed, even at that date, the royal privilege of minting money, seems to have followed not long afterwards.⁴ He had extended his power westwards. But we see from Herodotus that to the west of the last mouth of the Nile the Persian rule was always precarious; and that he can have conquered Carthage, whose naval power was perhaps a match for that of the whole Persian empire, is quite incredible. At the most it is possible that the prudent leaders of that commercial state may in negotiations and treaties have occasionally recognized the king in ambiguous phrases as their lord.

The experience gained by Darius in the first unsettled years of his reign must have been in part the occasion of his introducing numerous improvements into the organization of the empire. Governors with the title of satraps (*khsathrapāvan*, i.e., land-rulers) there had been before, but Darius determined their rights and duties. Vassal princes of dangerous power were tolerated only with reluctance. The satrap had indeed the power and splendour of a king, but he was nevertheless under regular control. The court received from special officials direct reports of the conduct of the governors, and from time to time royal commissioners appeared with troops to hold an inspection. The satrap commanded the army of his province, but the fortresses he was obliged to leave in the hands of troops directly under the king. But the most important part of the reform was that Darius regulated the taxes and imposed a fixed sum upon each province, with the exception of the land of his fathers, which enjoyed immunity. The Persians were discontented at this, and dubbed Darius in consequence "higgler" (*κάπηλος*); but this is doubtless only the cry of high officials, to whom any regulated fiscal system was objectionable, as making it somewhat more difficult for them to fleece their subordinates. It is not at all to be supposed that the irregular contributions ("presents," Herod., iii. 89) previously levied were less burdensome to the subjects. However imperfect the Persian state system was, and however illusory the measures of control may often have been, still the organization introduced by Darius marks a great step in advance over the thoroughly rude old Asiatic system.

In the Behistūn inscription, which is placed not long after the conclusion of the great revolts, India does not as yet appear as a province, though it does in the later inscriptions of Persepolis, and in the epitaph of Darius. Herodotus says that Darius caused the Indus to be explored from the land of the Pactyans (Pakhtu, Afghāns) to its mouth by Scylax, a Greek or rather Carian, and then conquered the country. But in any case this Persian "India" was only one portion of the region of the Indus. If this conquest was somewhat adventurous, much more so was

¹ The obvious assumption that the strange name *Anāmaka*, i.e., "anonymous," for a month means an intercalary month would compel us to infer that all the events falling in this month belonged to one and the same year, for two successive years or every other year cannot each have an intercalary month. But a careful consideration of the particulars shows that all these events could not fall in the same year. Another obstacle to regarding *Anāmaka* as an intercalary month is the circumstance that it corresponds to the tenth Babylonian month Tebet, i.e., probably to December or January, whereas intercalary months usually follow the twelfth or sixth month.

² See below under Xerxes.

³ Polyænus, vii. 10, 7, calls him Oryandres.

⁴ Wiedemann, *op. cit.*, p. 236, fixes as the date the year 517; but his grounds are not conclusive.

the enterprise against the Scythians. Profound motives for this expedition have been sought for, but it no doubt sprang simply from the longing to conquer unknown lands. That Darius, an energetic and valiant Eastern prince, always hitherto favoured by fortune, should have been free from lust of conquest is in itself very unlikely. The expedition against the Scythians falls about 515. With regard to the preparations and the beginning of the expedition up to the crossing of the Danube we are well informed. The Greek subjects, of whom even by this time there were many on the European (Thracian) side—such as the inhabitants of Byzantium and the Thracian Chersonese—were obliged to supply the fleet. Mandrocles of Samos built a bridge over the Bosphorus. The Persians must soon have found how useful the skill of the Greeks might be to them, without suspecting the dangers with which the Greek spirit threatened them. The king's march may be followed as far as the Danube; it lay pretty nearly due north, the warlike Getæ, a Thracian people, being subdued on the way. With the entry into the Scythian country itself Herodotus's narrative becomes completely fabulous. His chief error is in leaving out of sight the enormous distances in these regions (the southern part of modern Russia) and the great rivers. Hence he represents the native tribes and Darius as marching the distance between the Danube and the Don, or even the Volga, twice in not more than two months, as if the distances were as in Greece. Darius, who passed the Danube by a bridge in the neighbourhood, perhaps, of Isakichi, can hardly have crossed even the Dniester. Strabo, who either possessed more exact accounts of the expedition, or drew correct inferences from the disaster which afterwards overtook King Lysimachus in this neighbourhood, forms a very intelligent judgment on these matters. The expedition failed, not through the superior tactics of the Scythians, who behaved just as might be expected of such nomads, with a mixture of timidity and audacious greed of booty, but through the impassable and inhospitable nature of the country, through hunger and thirst, through exhaustion and disease. After sustaining heavy losses Darius was obliged to retreat across the Danube. The king, or at all events his army, was saved by the Greek tyrants, especially Histæus of Miletus, who refused to follow the advice of their colleague Miltiades to break down the bridge. But the damage to the prestige of the empire was great; the Greeks had seen their lord and master in distress. Nevertheless the district south of the Danube was retained. That the Scythians immediately followed up their enemy, or that they even opened negotiations with the Spartans, as Herodotus states,¹ is not to be supposed. Moreover, Megabyzus, whom Darius on his return left behind in Europe, subdued great districts of Thrace along with the Greek cities on the coast. The king of Macedonia also acknowledged the great king as his liege lord. The cities on the Hellespont,² which after the failure of the expedition made no secret of their feeling towards the Persians, and in part expressed their hostility in overt acts against them, received sharp punishment. The islands of Lemnos and Imbros were occupied. At the mouth of the Hebrus (Maritza) Doriscus was converted into a fortress with a standing garrison.³

¹ The story of the dealings of King Cleomenes with the Scythians (Herod., vi. 84) rests on a joke,—he drank immoderately, "like a Scythian."

² This expression is used to designate the towns lying on the Hellespont, Propontis, and Bosphorus.

³ To the same time may be referred the foundation on the Asiatic side of Dareium, named after Darius, just as Harpagium probably has its name from Harpagus. It is to be observed that in the district of Old Phrygia such towns called after persons are found from of old, as Midæium, Gordæium, Dascylium, and others.

The eyes of the Persians were now turned towards Greece proper. While the Greek coast of Asia Minor was indispensable to the power which held the interior, the possession of the mother-country of Hellas was, as we can easily see, not only unnecessary but positively dangerous to the Persians, especially as they were themselves absolutely unfitted for the sea. But to the Persians of those days, absorbed in schemes of universal empire, considerations such as these could not present themselves. Besides, the enterprises of the Persians against the Greeks were to a large extent suggested and furthered by the Greeks themselves. Repressed factions, tyrants in exile or in danger, were but too ready to invoke the help of the foreigner at the price of slavery. When the Persians attacked a Greek state there was always another at enmity with it which at once took their side. Even the inconsiderable enterprise which was the outward occasion of the Ionian revolt, namely, the attack of the Persians on Naxos, was brought about by the banished aristocrats of the island, who applied to Aristagoras, lord of Miletus, and hence to his superior, Artaphernes, the king's brother and satrap of Sardis. The enterprise failed, and in his embarrassment Aristagoras gave the signal for the revolt which he and his father-in-law Histæus, the proper tyrant of Miletus, who was detained at the court of Susa, had planned long before.

The great rising of the Ionians and other Greeks and non-Greeks shows a vigorous love of freedom, and much individual boldness and skill on the side of the insurgents; but, quite apart from the vast odds against them and the unfavourableness of their geographical situation, their enterprise was from the outset doomed to failure, because they did not form a compact party, because not even the Ionian cities practised that discipline and subordination which for war are indispensable, and lastly because Aristagoras and Histæus were adventurous intriguers and tyrants, but without the gifts of rulers or generals. Of the history of the revolt, in addition to the excellent accounts which he derived from Hecateus of Miletus, a contemporary and actor in the events he describes, Herodotus has all sorts of popular fables to tell. The chronology is uncertain; probably the revolt began in 500 or 499, and was substantially ended by the capture of Miletus in 495 or 494 (six years later, Herod., vi. 18). Aristagoras made himself master of the fleet on its return from Naxos, took prisoner the tyrants on board at the head of the contingents of their cities, and restored the republic in Miletus, only of course with the view of thereby ruling the confederacy. The Spartans, admittedly at that time the first power of Greece, were sober enough to refuse the help requested. But the Athenians, who had already excited the wrath of the Persians by refusing to comply with the demand of Artaphernes that they should receive back Hippias as tyrant, had the courage or rather the foolishness to despatch twenty ships to the help of the Ionians. They thus mortally insulted the Persians without really benefiting their friends. The Athenians shared in the march on Sardis. The confederates burned the city, but could not capture the citadel; on the contrary, they were obliged to beat a hasty retreat, and were after all routed at Ephesus. However, the Persian army did not as yet permanently take up quarters in Ephesus. The Athenians, who may have dreamed of pressing forward into the interior of Asia, returned home with their illusion dispelled, and Athens took no further part in the war. But the impression produced by this unsuccessful expedition upon a modern critic is very different from that which it produced upon the Asiatics of those times. They said: "The Ionians have risen against the king; the Ionians from beyond the sea have come to their help; they have

Revolt of
Ionians

burned the king's capital," and many added, "It is all over with the king's supremacy!" Not only did the Hellenistic cities, with Byzantium at their head, join the Ionians, but also a great part of the Carians, the Greeks in the Troad, and almost the whole of the very flourishing island of Cyprus. By this time the possession of these lands was really endangered by the revolt. But now the Persians came with a great fleet to Cyprus. The Ionians sailed to meet them, beat them at sea off Salamis in Cyprus, but were beaten by the Persians on land. After great struggles, which are described in an almost epic style, befitting the primitive state of the island, Cyprus came once more under the power of the Persians, after being free only one year. This was the first heavy blow to the insurrection. Much fighting took place on the mainland; and most of the Persian enterprises were successful, but not all. In particular the Carians, who in general displayed great gallantry in this war, annihilated a whole Persian army under a son-in-law of Darius. But the longer the war lasted, the more marked became the progress made by the Persians. Aristagoras left the seat of war, and withdrew to his possessions of Myrcinus on the Lake of Prasias in the south of Thrace, near what was afterwards Amphipolis, but was there slain by natives as early as 497.¹ Darius then despatched Histæus, whom he still continued to believe faithful, to Ionia, probably in order to open negotiations. He availed himself of the opportunity to seek to regain the lordship of Miletus and put himself at the head of the whole revolt, but the Milesians would have nothing more to do with him or with Aristagoras. The great intriguer had connexions on all sides, but no one trusted him in the long run. He became at last a pirate on his own account; and after many adventures he fell into the hands of the Persians and was crucified. It is a noteworthy fact that Histæus had actually concerted a conspiracy with the Persians in Sardis, against Artaphernes and Darius, the discovery of which cost many their head. Fidelity has never been an Iranian virtue.

The decisive struggle was concentrated about Miletus. There, at the little island of Lade, as Grote points out, the odds against the Greek fleet (600 triremes against 353) were not so unfavourable as they were at Salamis, and the want of unity of leadership was not much greater than it was there; but the Ionians and Lesbians were not, or were no longer, the equals of the European Greeks in bravery and warlike skill. A complete overthrow was the result, in which treachery on the Greek side had its share. Miletus long defended itself by sea and land, but was at last taken and destroyed; the women and children were sold as slaves. The captured Milesians were carried off into the heart of Asia and settled at Susa. Miletus, up to that time by far the most important of all Greek cities in Asia, though it afterwards recovered, still never regained its old position. The most important city of the coast was henceforward Ephesus, which took no part in the battle of Lade, and perhaps had at that time already submitted amicably to the Persians.

The subjugation of the rest of the Greeks of the mainland and islands, as well as of the Carians, now rapidly followed, not without dreadful massacres and devastations. The Phœnicians, who formed the main body of the Persian fleet, seem to have been especially zealous in the work of destruction. The old bitterness between the Canaanites and the Hellenes, so vividly shown during these centuries in Sicily, cannot have died out in the east. In ruined Ionia a frightful state of things must have prevailed, so that at last Artaphernes saw himself obliged to undertake a regular organization to ensure the peace of the country. At

the same time he caused the land to be surveyed, and established fixed imposts.² These were not higher than before the war, but naturally they now pressed much harder on the impoverished Ionians. Thereupon the young Mardonius, son of the Gobryas who has been mentioned before, and brother-in-law and son-in-law of the king, established democracies in all Ionian cities. The weakened communities might well seem to the Persians at that time less dangerous than ambitious tyrants. However, this measure apparently applied only to the Ionians of the mainland, not to the islanders nor to the other Greeks of the mainland.

Mardonius cherished great designs. He wished to conquer Greece itself. He did actually conquer Greeks and non-Greeks in the north-west of the Archipelago, but at the promontory of Athos his fleet was shattered by a storm.

The second expedition against Greece was on a greater scale. Under the conduct of the Mede Datis and the younger Artaphernes, son of Darius's brother of the same name, the Persians took Naxos, and destroyed Eretria in Eubœa, the inhabitants of which had sent five ships to help the Ionians at the beginning of the revolt. But at Marathon they were utterly defeated by the Athenians and Plataeans (September or October 490). They quickly renounced the project of subjecting Athens to Hippias as tyrant and to Darius as suzerain, and departed home. Miltiades, who, as lord of the Thracian Chersonese, had once been the king's vassal and had afterwards been obliged to fly, had taken the measure of the Persian. By his victory Athens had rendered immortal service to Europe and the cause of civilization. It was the first great victory of the Greeks over the Persians in the open field; the moral impression had an immense effect in the sequel, when the danger was much greater.

The south-west of the empire alone had hitherto remained free from rebellion against Darius. Darius, who had been with Cambyses in Egypt (Herod., iii. 139), treated the Egyptians with forbearance, and in return loyal priests praised him to fellow-countrymen and Greeks. If a notice of Polyænus is to be trusted, he must have gone in person to Egypt in the year 517,³ in order to lighten the burdens of the people. Amongst other measures which promoted the material wellbeing of the land, he made a canal from the Nile to the Red Sea, as an inscription of the king himself testifies to this day. But the hatred of the Egyptians to the Persians was too great. In the year 486 (Herod., vii. 1, 4) the first great insurrection of the Egyptians against the Persians took place. From an inscription we know that during it Khabbash or Khabash was king of Egypt. Darius did not live to see the revolt put down, for he died in the following year, 485.

Darius is the most remarkable king of the dynasty of the Achæmenians, and perhaps the most remarkable of all the native kings of Iran. So far as we know, only the Sāsānid Khosrau I. in the 6th and the Safavid Abbās the Great in the 17th century A.D. can be compared with him. He was as energetic as he was prudent. He was of course a despot, and could be ruthless and even cruel, but on the whole he was inclined to be mild. We lay especial weight on the testimony of Æschylus, who had himself fought at Marathon against the army of Darius, and who shared the exasperation of the Athenians against the Persians, but nevertheless in his *Persæ* expresses very high respect for the king. This, then, was the judgment of educated Greeks on the prince who had brought such untold misery upon their nation. To such a judgment great weight is to be attached. In harmony with it are the particulars which we know of the doings and ordi-

³ See Wiedemann, *op. cit.*, p. 237.

ances of Darius. He seems, too, to have shown a correct insight in his choice of the persons to whom he entrusted important positions.

Xerxes I. He was succeeded, apparently without any disturbance, by his son Xerxes (*Khshayārshā*) I., who, as son of Atossa, elder daughter of Cyrus, had probably always been regarded as heir-apparent.¹ The time was not yet come when claimants to the throne and suspects were assassinated. On the contrary, the king's blood-relations played under Xerxes as under Darius a great rôle as leaders and counsellors. But the whole generation was probably deeply degenerate, though the difference could hardly anywhere have been so great as that between Darius and Xerxes, who begins the series of weak and unworthy kings.

The subjugation of Egypt was effected in 484 (Herod., vii. 7). The measures taken by Khabbash to protect the mouths of the Nile against the "fleet of the Asiatics" had thus been unsuccessful. According to Herodotus a much harder yoke was laid on Egypt than before. The king's own brother Achæmenes was made satrap of the country.

Babylon revolts. Babylon too seems to have again risen in revolt. Ctesias assigns to this date the revolt with which the well-known story of Zopyrus² is connected, naming instead of Zopyrus his son Megabyzus. The long siege of which Herodotus speaks does not, as we saw, fit in with the revolt under Darius; it belongs, perhaps, to the time of Xerxes. Ctesias gives us to understand that Xerxes wounded the religious feelings of the Babylonians, and Herodotus speaks expressly of the desecration of their sanctuaries by the same king (i. 183). To the victorious Macedonians, who emphatically asserted that they were come to avenge the destruction of Greek temples by Xerxes, the Babylonian priests afterwards told many tales of the outrages he perpetrated on their sanctuaries.³ Doubtless they grossly exaggerated, but they did not invent everything. Of course such sacrileges may equally well have taken place when the city was reconquered, or have been the occasion of a revolt.

Invasion of Greece. Darius was firmly resolved to wipe out the disgrace of Marathon, and to bring the whole of Greece under the yoke. His mighty preparations for the march thither had been interrupted by the revolt of Egypt, and, if our conjecture is right, of Babylon. They were now vigorously recommenced; and provision was made for the maintenance of the army, at least within the limits of the Persian domain. Xerxes himself went to Sardis, the first great rendezvous. From there he set forward in the spring of 480. We will not further describe the great expedition, which, after the dearly-bought successes at Thermopylæ and Artemisium, ended with the defeats of Salamis (September 480) and Plataea (479)—all this belongs rather to the history of Greece—but we will briefly discuss the causes which procured for the disunited and far from numerous Greeks a victory over the mighty power of the great empire. It may very well be said that it would have been possible to subdue even Hellas, and to put an incalculable check upon the Greek spirit, if the great enterprise had been conducted with more sagacity. There was no lack of Greek traitors, nor even of traitor states, from which the king might have learned how to set about the business. But the blind arrogance of the Asiatic king was bent on bearing down everything by the sheer weight of his masses, and when he failed in this his arrogance passed at once into childish cowardice. The fleet certainly mustered over 1200 sail at the beginning of the war, and even

after the heavy losses by storms at Eubœa, losses, however, which the Greeks no doubt exaggerated, it must with reinforcements have numbered fully 1000 ships of war,—a force too large to operate, at least in a single mass, in the narrow Greek seas. Moreover, it was without an able head. If the ships furnished by the Phœnicians and the subject Greeks were fairly a match for those of the free Greeks, on the other hand the Persians, Medes, and Saces who manned the fleet as soldiers probably cut but a sorry figure, and the Persian officers associated with the native ship captains cannot have contributed to the more efficient working of these powerful engines of war. Again, the army, which in any case numbered over a million men, was far too numerous to find sufficient sustenance for any length of time, in spite of the frugal habits which mostly characterize Asiatics. To this must be added the circumstance that the levies were drawn from peoples many of whom were totally unused to the Greek climate. Famine and pestilence must have wrought dreadful havoc among the soldiers. By far the most of them were a useless rabble. Of the Asiatics proper probably only some Persian and Median regiments of guards were well armed, but even they were not to be compared, man for man, with the heavy-armed soldier-citizens of Greece. Moreover, in the use of their weapons on land the Greeks, and above all the Spartans, were far superior to all the Persians. Even the Greeks on the Persian side were no match for the Greeks of Europe; some of them fought half-heartedly, and an anxious watch was kept on them, so that they were more a hindrance than a help. If the Persians were kept well informed of the enemy's affairs by means of traitorous Greeks, much more so were the Greeks through deserters and friends in the enemy's camp. Even when the Persians were driven by necessity to take the resolution of sending back all worthless troops, and when the king had fled, Greece was still in great danger, for an able man, Marathonius, now stood with the best part of the army in the heart of the country. But even with a defeat at Plataea all would not have been over, for the enemy was without his fleet. Add to all this the excellent bearing of those Greeks who remained faithful to their fatherland. Exemplary above all was the conduct of Athens; she durst not allow the laurels won at Marathon to wither. The Spartans, too, with their morbidly exaggerated sense of military honour, earned immortal renown. Even petty Greek communities like Thespiæ, Tegea, and Ægina came gloriously to the front. At the head of the Greeks stood many distinguished men, above all Themistocles. On the whole, we may say that here Greek intellect, Greek valour, and Greek virtue triumphed over the spiritless and helpless hordes of Asiatic slaves.

Here and there a modern⁴ has expressed the opinion that the conquest of the Greeks by the Persians would have been no such great misfortune after all, inasmuch as the intellectual superiority of the former would have asserted itself even under a foreign dominion, especially as the Persians were not regular barbarians; but this opinion is entirely false. Only in a free country could the Greek spirit fully unfold itself, only in democratic Athens could it accomplish its highest work and achieve imperishable results for all time. In the externals of civilization the Asiatics might, in some respects, be actually the superiors of the Greeks; but genuine free human culture first arose among the latter, and if there was one pride that was justified it was that of the cultivated Greeks as against all barbarians. The Greeks themselves had no inkling of the high sense in which the watchword at Salamis, "All is at stake" (*Æschyl., Pers., 405*), was applicable to the whole of human culture.

¹ In spite of the anecdote in Herod., vii. 2-4; Justin, ii. 10; Plut., *De frat. amore*, p. 488, and *Reg. apophth.*, p. 173.

² This story, with all sorts of variations, is very widely spread in the East, but it can hardly rest on an historical fact.

³ Arrian, vii. 17, 2; Strabo, 738.

⁴ E.g., Maspero, *Hist. ancienne des peuples de l'Orient*, chap. xv.

King Xerxes had shown himself in the war a thoroughly commonplace Eastern despot, as boastful as he was effeminate. The dreadful sacrifice described by Herodotus (vii. 114) may be excused on the ground of religious superstition, but the mutilation of the corpse of Leonidas and the decapitation of the Phœnicians who commanded the fleet show the spirit of the man. His disgraceful flight must have been welcome to Mardonius. The latter fell like a man at Plataea; indeed the battle of Plataea did honour to a large part of the vanquished. Of course great masses of the vast army returned to Asia, several doubtless still in good order, but many, very many, must have perished in Greece, and in Thrace, where the savage Thracians cut off large numbers of the fugitives.

The Greek fleet did not at first venture to pursue the Persians to Asia, but afterwards it crossed at the request of the Greek islanders. At the headland of Mycale, not far from Miletus, the remainder of the Persian fleet was annihilated just about the time of the battle of Plataea. The liberation of the islands and of the greater part of the Greek cities on the coast of Thrace followed. Thrace and Macedonia regained their independence without any effort of their own. The whole of the islands were permanently wrested from the Persians, and the liberation of the Asiatic coast was already begun.

We stand here at the decisive turning-point of Persian history. Henceforward Greece might be coveted and designs against it cherished, but no enterprises were undertaken. The Persians were thrown back upon the defensive. Though they often afterwards exercised an influence on the history of Hellas by means of money or diplomacy, still the respect for their fighting power was gone, and so far it is possible to regard Alexander's expedition as a result and continuation of the old struggles, and the saying of Æschylus, "In Salamis the power of the Persians lies buried," may be called prophetic.¹

Xerxes was still in Sardis when his full brother Masistes came thither with the beaten forces from Mycale. Disquieted probably by the neighbourhood of the victors, the king retired into the depths of Asia. About the same time he deeply offended Masistes on a point of family honour; in revenge Masistes intended to go to his province of Bactria and there raise a revolt, but was cut down by horsemen despatched after him (Herod., vii. 108 sq.). This story (like that told by Herodotus in iv. 13) exhibits all those horrors of a later age which Ctesias loves to paint. The idea of a revolt, moreover, was not far to seek after the profound humiliation inflicted by the Greek war and the dreadful losses of men,—how many Sogdianians, Indians, and Nubians can have returned to their homes? The inhabitants of distant frontier lands may even then have severed their connexion with Persia, and even then mountain and desert tribes in the very heart of the empire may have regained their full independence.

Unfortunately the work of Herodotus breaks off abruptly with the battle of Mycale, and with it our only continuous ancient history of the empire comes to an end. The fragments of Ctesias and the occasional statements of other writers can only, to a small extent, supply the deficiency. Henceforward we possess tolerable information on the shifting relations between the Persian empire and the Greek states, but on little else.

Under the conduct of Pausanias, the victor of Plataea, the Greeks sailed (477) first to Cyprus and then to Byzantium. At the capture of the latter many distinguished Persians fell into their hands, and Pausanias, who must have appeared to Xerxes as a sort of king of Greece, took advantage of this opportunity to open a correspondence with

the Persian monarch. Artabazus, son of the Pharnaces who had held a command under Mardonius, received the satrapy of Hellespontine Phrygia (where his family retained the power thenceforward down to the fall of the empire), for the purpose of conducting the negotiations. The definite statements of Thucydides leave no doubt as to Pausanias's guilt. In particular the king's letter (i. 129) bears every mark of genuineness. Happily he proved himself a clumsy intriguer, and when long afterwards in Sparta retribution at last overtook him he had ceased to be dangerous, at least for the freedom of Greece as a whole. The conduct of Pausanias, together with a want of inclination and capacity for distant naval expeditions, caused the Spartans to resign the conduct of the maritime war against Persia. They withdrew, and the command passed into the hands of the Athenians (476). The naval power of Sparta was quite insignificant, and was certainly surpassed by that of some of her allies, such as Ægina and Corinth; and the advantage to Persia of the absence of the Peloponnesian fleet was far more than counterbalanced by the circumstance that the Greek naval forces were now under a single energetic leadership, which aimed at nothing less than the exclusion of the enemy from all Greek seas and coasts. The war lasted for a long time, but few of its details are known to us, though the scanty statements of the Greek writers are partly illustrated by Attic inscriptions. The European coast was soon completely cleared. Eion fell after an arduous siege (about 470). Doriscus alone continued for long to be a Persian possession. The most brilliant episode of this period of the war is the Cimon's great naval expedition of Cimon.² He liberated the Greek naval cities of the Carian and Lycian coast, and took the bilingual towns, which were occupied by a Persian force; all were incorporated in an Attic maritime league. The important Phaselis on the borders of Lycia and Pamphylia also fell into his hands. At the mouth of the Eurymedon the Persian fleet, under a son and a nephew of Xerxes, was defeated and destroyed, and a land-victory for the Greeks followed immediately. Upon this Cimon sailed hastily for Cyprus, where he captured eighty ships. Here for once the Greeks were numerically superior, but nevertheless it was a great exploit to have advanced victoriously so far beyond their own waters.

About this time Xerxes was assassinated. From various writers we can piece together an account of this event by Ctesias, and another by Dinon,³ which differ from each other in numerous particulars; a third version is given by Aristotle (*Pol.*, p. 1311 b). For such scenes, occurring in the interior of the seraglio, an outsider is not a trustworthy authority, but this much is clear: Xerxes was killed by Artabanus, captain of the body-guard; his youngest son Artaxerxes, in league with the murderer, put to death his elder brother Darius, who had a better title to the throne. It does not, however, follow with certainty that Artaxerxes was a paricide. We have here a change of sovereign of the sort which abounds in Oriental history. Artabanus was soon afterwards put out of the way by Artaxerxes. Later chronologists represent him as actually reigning for seven months, but this is probably a mistaken interpretation of expressions used by Dinon.

Artaxerxes (*Artakshashtra*)⁴ I. came to the throne in 464. His surname "Longhand" (*Μακρόχερ*), which seems to have been first mentioned by Dinon, has no doubt a symbolical meaning, "of far-reaching power," but later Greek writers took it literally. Ctesias tells of a

² About 465. Perhaps it falls within the reign of Artaxerxes.

³ He wrote in the time of Alexander.

⁴ A second form, *Artakshashtra*, is represented by Hebrew and Egyptian forms, and by *Ἀρταξέρσης* on a Greek inscription (Le Bas and Waddington, No. 1651).

¹ Æschyl., *Pers.*, 596 sq. The brevity and simplicity of the expression *ἐκεῖ τὰ Περσῶν* cannot be rendered in any modern language.

rising of the Bactrians immediately after his accession to the throne, which may have been instigated by Hystaspes, the king's elder brother, who was then in his satrapy of Bactria (Diod., xi. 69). Two battles took place, the second of which ended in a decisive victory for the royalists, so that Bactria was once more reduced to subjection.

In the early part of the reign of Artaxerxes falls the appearance of Themistocles at the Persian court; so say the contemporary Charon of Lampsacus (Plut., *Themist.*, 27), and also Thucydides (i. 137); to their authority that of all later writers, who here mention Xerxes, must give way. On calmly weighing the trustworthy accounts and taking into consideration the circumstance that even at a later time Themistocles as a "traitor" was refused a grave in Attic earth, we can hardly avoid concluding that the gifted saviour of Greece, the founder of the Attic seapower, a man far superior intellectually to Pausanias, but of boundless ambition, and with a strong propensity to intrigue, was really guilty of entering into traitorous communication with the Persians in his own interest. Certainly he knew admirably how to give himself out as an old friend of the Persians,¹ and to hold out to them the prospect of still doing them valuable service against his countrymen. The king gave him Magnesia on the Mæander in Lydia and two other towns; as the tyrant of these places under Persian supremacy the victor of Salamis lived some time longer.² Like this illustrious fugitive other Greek exiles or adventurers came to the Persian court from time to time, and played there occasionally a certain rôle.

Second Egyptian revolt. Hardly was Artaxerxes seated on the throne when the second great revolt of Egypt broke out. Inarus, son of Psammetichus, a Libyan prince, placed himself at the head of the Egyptians and was made king of the whole country. The satrap Achæmenes, son of Darius, fell in battle. Inarus summoned to his aid the Athenians, who were still at war with the Persians, and the Athenians were rash enough to involve themselves in the struggle (about 460). They had just come once more to Cyprus with 200 ships. They sailed to Egypt, and with the help of the Egyptians shut up the Persians and the Egyptians who sided with them in the castle of Memphis. Persia had recourse to diplomacy: an embassy was sent to Sparta in order to stir up the Spartans to make a vigorous diversion against Athens. When this attempt failed, a large army was at last despatched under Megabyzus, son of Zopyrus, which subdued the country after hard fighting; for, with all their hatred of the Persians, the Egyptians were no match for them in battle. The Athenians in Egypt were annihilated (probably 455); the same fate befell a reinforcement of fifty ships. Inarus fell by treachery into the hands of the Persians and was crucified. His son Thannyras, however, received (Herod., iii. 15) his original province (probably the Libyan nome), which points to the war having been concluded by a treaty, of which Ctesias also makes mention. In the swamps of the Delta Amyrtæus (Amun-art-rut) maintained himself as an independent king; and by him the Athenians were once more invited to Egypt (450 or 449). Cimon, who was again at Cyprus with 200 ships, despatched sixty to his help, but they soon returned, probably without accomplishing much. Cimon died during the siege of Citium, one of the most important cities of Cyprus, and the mainstay of the Phœnician nationality on

that island. The Athenians raised the siege, but achieved on their retreat once more a brilliant victory by sea and land.³

These are the last contests of the Athenians and their allies with the Persians. Peace must have been concluded shortly afterwards. We cannot here enumerate and criticize the arguments which have often been adduced for and against the supposition that a regular peace (though not a "peace of Cimon") was concluded. No one probably would have questioned the reality of such a peace were it not that the Attic orators of the 4th century, by grossly exaggerating the terms of a treaty which in their time had long been a dead letter, had rendered the very existence of the treaty open to suspicion, and that the able historian Theopompus, moved apparently by dislike of the Athenian democracy and a desire to gratify his powerful patron, King Alexander, had attempted by false though learned arguments to disprove the genuineness of the original treaty of peace, of which only a copy was extant in his time. The text of the original document was given by the best authority on Attic decrees, Craterus.⁴ It is hardly conceivable that the great war should have died out of itself without the Athenians getting some security that their possessions and their widely ramifying commerce would be left unmolested. Moreover, all that we are told or can infer as to the contents of the treaty agrees perfectly with the political relations of the time. The treaty was not at all in the spirit of the high-flying plans of Cimon's party; for, while the Persians acknowledged the independence of the Greek towns on the west coast, including the Lycian, and pledged themselves to send no ships of war into Greek waters, the Athenians in return renounced all rights in the eastern seas. The most sagacious of the Athenians had perceived that Cyprus, and much more Egypt and Phœnicia, lay outside the natural sphere of Athenian power. We can understand, however, that Callias, the author of the treaty, earned the dislike of the Athenians for his pains. The balance of advantages secured by the peace was on the side of Athens, but the Persians resigned nothing which they actually possessed, and they were now secured against Athenian raids. It was certainly anomalous that the great empire which owned the rest of Asia Minor should have no rights over the narrow strip of coast, which could everywhere be overlooked from the interior. Even the capital of the Hellespontine-Phrygian satrapy, Dascylium, from which that province is sometimes called Dascyliotis, was now a member of the Attic naval confederacy. The satraps were still obliged as before to pay to the king the taxes due from the coast-lands, and this must have been a constant incitement to them to reconquer those lands. There was no Persian fleet in the Black Sea. The Greek towns on its coast were free, and some of them belonged to the Athenian league and were occasionally visited by Athenian war-ships. At most a portion of the natives of the countries round about the Black Sea were in a state of loose dependence on the Persian empire. In Lycia and Caria there were districts which obeyed neither the king nor Athens, or at least were not closely dependent on any foreign power.⁵

The condition of Egypt at this time is very obscure. Amyrtæus had no doubt been finally overthrown by the Persians, but his son Pausiris was left by them in possession of his father's kingdom. In the year 445 we find an Egyptian or Libyan king, Psammetichus, who presented the Athenians with a great quantity of corn.⁶ This was

¹ But the letter in Thuc., i. 137, cannot be regarded as an authentic document.

² Here, too, he coined money. Of the two specimens known to us, one is plated, "which seems to show that with the coinage the cunning Athenian combined a financial speculation," Brandis, *Münz-, Mass-, und Gewichtswesen Vorderasiens*, p. 459.

³ The epigram which Diodorus (xi. 62) wrongly applies to the battle of the Eurymedon refers to this battle.

⁴ Shortly after Alexander.

⁵ Compare Thuc., ii. 69; iii. 19.

⁶ Philochorus, in schol. Aristoph. *Vesp.*, 716; schol. Aristoph. *Plut.*, 178; Plut., *Pericles*, 37.

perhaps another son of Inarus. But we know nothing more of him and his reign.

The conclusion of peace did not prevent the Persians, or at least individual satraps, from occasionally supporting enemies of Athens. Samian oligarchs, with the help of Pissuthnes, satrap of Sardis, made themselves masters of the island (440 or 439), and estranged it from Athens. The Athenians feared that a Phœnician fleet might come to the help of the oligarchs, but not a Persian interfered when they reduced the island once more to subjection. About 430 Colophon was made over to Itamenes (no doubt a Persian general or governor) and the barbarians by a party among the inhabitants favourable to Persia, and thereupon Notium,¹ a dependency of Colophon, was also occupied by the royalists, for thither also Pissuthnes despatched Persian troops, who entrenched themselves in the town. Amongst these troops were Arcadian mercenaries. This is the first undoubted mention of Greek mercenaries in Persian pay; henceforward they play a very great part in the history of the empire. The Persian rulers had observed how far superior the Greeks were to the Asiatics, and in Greece there were always plenty of stout fellows who were impelled by political events, the love of adventure, or poverty to enter foreign service as soldiers of fortune. Most of them came from the Peloponnesus, presumably from the mountains of Arcadia, which yielded but a scanty subsistence to its inhabitants. The Athenian party in Notium called in the Athenian admiral Paches; by shameful perfidy he made himself master of the entrenchments, and put the garrison to the sword. With Notium, Colophon was now once more a member of the Athenian league. No further consequences followed from these hostilities.

During the early years of the Peloponnesian War the Spartans repeatedly held communications with the Persians, whose assistance they desired against Athens. These negotiations were, for the time being, without result. The Spartan diplomatists were unskilful, and the Persian authorities were cowardly, indolent, ignorant, and selfish.² The impecunious Peloponnesians wished above all for Persian gold, and, moreover, for the Phœnician war-ships. The Athenians also tried to tap the inexhaustible source of wealth for their own benefit, but of course in vain.³

Of the internal state of the empire during the long reign of Artaxerxes I. we know very little. Ctesias, or rather the extract of him made, not always carefully, by Photius, tells us indeed various stories, but he jumbles together fact and fiction, history and anecdote. Of most importance is the quarrel of Megabyzus, conqueror of Egypt, with the Persian court; he maintained a rebellion for several years in Syria, till at last, after several conflicts, a full pardon was assured him by treaty. It is not improbable that this war was the occasion of the destruction of the walls and gates of Jerusalem lamented by Nehemiah (in the year 445). According to Ctesias, Megabyzus afterwards fell into disgrace again, but was again taken into favour. In all these complications an important part is played by those cruel, intriguing, dissolute women, the queen-mother Amestris, daughter of Otanes, of whose character we get a very unpleasant view from Herodotus (vii. 114; ix. 109 *sq.*), and her daughter Amytis, wife of Megabyzus. Even without an exact knowledge of the circumstances, we can well understand how it was that Zopyrus, son of Megabyzus, came to take refuge in Athens. He fell while attempting, in company with the Athenians,

to capture Caunus (in Caria), which had revolted. His grandmother Amestris got the Carian who had killed him into her power and had him crucified.

From Nehemiah's memoirs we see that in those days one who was not a Persian might not only fill the tolerably high office of cupbearer⁴ in the royal household, but might also become deputy-governor over his fellow-countrymen.

The history of Ctesias, untrustworthy as it is in particulars, shows us the manner of life at court. Artaxerxes I. was a very weak man, and women and favourites took the government out of his hands. Still, he may have deserved the praise, often bestowed on him, of good-nature. He may also have been of stately presence; as an Iranian chief he was doubtless an excellent huntsman⁵; but his "incredibilis virtus belli" (Nepos, *De regibus*, 1) is precisely "incredibilis." In reading the eulogies of Persian kings we must always remember that the ultimate sources of writers like Ctesias and Dinon are court news, wherein even the deceased kings are spoken of in a courtly tone.

Artaxerxes died in 424. His successor, Xerxes II., the only one of his eighteen sons who was legitimate,⁶ was murdered after a month and a half by his brother Secydianus or Sogdianus. But after six and a half months⁷ the murderer was in his turn overthrown by his brother Ochus, satrap of Hyrcania, and, in violation of solemn oaths, put to death.⁸ Ochus assumed the name of Darius, ascending the throne about the beginning of the year 423.⁹ Darius II. is called Nothus or Syrus,¹⁰ because his mother Darius was a Babylonian concubine. From the first mention of him by Ctesias his wife and sister Parysatis appears as the prompter of all his acts and all his crimes; and this mischievous woman possessed the greatest influence for many years. The king's full brother Arsites, in conjunction with another son of Megabyzus, Artyphius, raised the standard of revolt, probably in Syria. But his Greek soldiers were bribed, and thus he fell into the hands of the royalists, and, in violation of the oath, was put to death at the instigation of Parysatis. The same fate befell some of those who had taken part in the murder of Xerxes II. Darius had presumably come forward from the beginning as his avenger. Soon after 410 the great revolt of the Egyptians was successfully accomplished. The first independent king was called Amyrtaeus, and was presumably a grandson or other relative of the former Amyrtaeus. The deep decay of the Persian military power is proved by the fact that for sixty years it failed to reduce the unwarlike Egyptians, though the latter were frequently divided amongst themselves by internal dissension and double rulers.

The above-mentioned Pissuthnes, satrap of Sardis, had also revolted. Tissaphernes, who here appears for the first time, put down the rebellion by the usual means of bribery and perjury; the Athenian Lycon, leader of Pissuthnes's Greek mercenaries, plays a far from honourable part in the affair. The events fall after 424, and at least some years before 412. But Pissuthnes's son Amorges continued

⁴ Cp. Herod., iii. 34, and Nicol. Damasc. (*i.e.*, Ctesias), 64.

⁵ Cp. the anecdote of Ctesias in Photius about his lion hunt.

⁶ This probably means that the wife who bore him was of a noble Persian family.

⁷ No reliance is to be placed on these numbers in Ctesias. Others assign to the two monarchs two and seven months respectively. In any case they did not together reign a full year, since the astronomical canon ignores them.

⁸ Cp. also Pausanias, vi. 5, 3, where probably we should read *Σπύριος* with Bekker.

⁹ The beginning of 411 falls, according to the document in Thuc., viii. 58, in his thirteenth year; this is probably a reckoning which begins the year with the spring, and accordingly reckons his first year (or rather the year in which he came to the throne) from the spring of 424 to 423. The astronomical canon begins the year of his accession with 7th December 424.

¹⁰ Hypothesis of Æschyl., *Pers.*, and schol. on v. 6.

¹ In addition to purely political opposition, the local jealousy between Notium and its "superior town" Colophon had its share in the matter. See Aristot., *Pol.*, p. 1303 b.

² See Thuc., ii. 67; iii. 31; iv. 50.

³ Aristophanes, in the *Acharnians* (represented January 425 B.C.), ridicules these long and fruitless negotiations of the Greeks with the Persian king.

the revolt in Caria, and was supported therein by the Athenians, perhaps because they already knew for certain that Tissaphernes was preparing to help the Spartans.¹

When the power of Athens seemed annihilated by the dreadful catastrophe in Sicily, the Persians expected to regain the whole sea-coast. Tissaphernes, satrap of Sardis, and his rival Pharnabazus, satrap of Hellespontine Phrygia, vied with each other in invoking the help of the Spartans. The party hostile to Athens in the cities of the mainland and in the islands displayed great zeal in bringing about the alliance. Moreover, the no less able than infamous Alcibiades strained every nerve to secure so favourable an opportunity of distinguishing himself personally and injuring his native city. Not without reluctance the Spartans resolved on a decisive step. They might have known beforehand that they would only receive real support from the Persians on condition of surrendering to them a great portion of the Greek cities which had once been freed by Athens, though now mostly hostile to her. They chose to attach themselves to the more powerful but, as it soon appeared, wholly untrustworthy Tissaphernes rather than to Pharnabazus. Of course the confederates did the Athenians much damage, and wrested from them a great part of their domain. The Lacedæmonians actually served the satrap as catchpolls against Amorges, who resided in Iassus near Miletus, and so he could be taken captive and carried alive to the king. But the Athenians still exhibited astonishing endurance and resource. It is true that neither of the confederates meant honestly by the other. Whether from avarice or mere whim, Tissaphernes supplied the Peloponnesians in insufficient measure with money and stores, and without these they were not in a position to wage war in Asia. The intrigues of Alcibiades contributed to sow mistrust and confusion. The Spartan leaders repeatedly concluded treaties with the satrap, but they were not ratified. At last it was agreed that the whole mainland of Asia, and therefore all the Greek cities there, should belong to the king, but that in return for this the Persians should give the Spartans effective help. If Tissaphernes had rapidly and energetically carried out the terms of this treaty, the war might perhaps have been ended quickly enough. But to keep faith was contrary to the nature of the man. Moreover, he had probably promised more than he could perform: to bring up the great Phœnician fleet was not quite in his power. The Phœnicians themselves, and perhaps high Persian lords also, had certainly little desire to engage again the Attic galleys which had handled them so roughly at the Eurymedon and at Cyprus. Pharnabazus supported the Spartans much more honourably and effectively. This he showed especially when the Athenians were again making steady progress (410) under the leadership of Alcibiades after his return. The Athenians now devastated the king's territory in various places, and Pharnabazus had at length to engage to forward Athenian envoys to the king for the purpose of conducting negotiations for a peace (409) at the court itself. But events now took a decisive turn. Cyrus, the king's son, was made satrap of Lydia, Great Phrygia, and Cappadocia, and commander-in-chief of all the troops in Asia Minor, Tissaphernes retaining only the coast-cities (408). Cyrus possessed burning ambition, and longed to avenge the defeats which his house had experienced at the hands of the Athenians. Hence he sought to unite himself closely with the Spartans. Just at this time the command fell to the cunning, energetic, and unscrupulous Lysander. These two men were the ruin of Athens. Cyrus granted Lysander, who had

completely won his affection, all the money he wanted, and when after Lysander's temporary recall the relations with Sparta were disturbed, because the noble Callicratidas did not care to play the courtier to the barbarians, the return of Lysander sufficed to put everything on its former footing. When Cyrus was summoned to the bedside of Darius (either really ill or pretending to be so), he left his Spartan friend the most abundant resources and the fullest authority. With this help Lysander succeeded in at last compelling Athens, now completely isolated, to accept the melancholy peace of March 404. Even after all the misfortunes of Athens it was only Persian gold which enabled the Spartans to humble her.

According to Ctesias, Terituchmes revolted against King Darius, caused his wife Amestris, daughter of the king and Parysatis, to be put to death, but was himself slain by treachery. This event, garnished in the usual manner with a full measure of perfidy and cruelty, is perhaps to be connected with the unsuccessful revolt of the Medes mentioned by Xenophon (*Hell.*, i. 2, 19) under the year 410/409. In the fall of Terituchmes his sister Statira, wife of the king's eldest son Arsicas,² was nearly involved; thenceforward the bitterest hatred subsisted between Parysatis and her daughter-in-law Statira.

About the time of the conclusion of peace between Athens and Sparta Darius II. died. Arsicas ascended the throne under the name of Artaxerxes (II).³ The surname "Mnemon" (the mindful) seems again to have been first mentioned by Dinon.⁴ The younger and much able son Cyrus, preferred by Parysatis, came with 300 Greek mercenaries, no doubt to seize the throne, but he was too late. Tissaphernes, professedly the friend of Cyrus, warned the king against him, and with good reason. Cyrus was arrested, but at the instance of Parysatis he was released and sent back to his satrapy,—a very unwise measure, for his ambition was only inflamed by his imprisonment and by his exasperation against Tissaphernes.

Meantime Lysander lorded it over the Greeks. He even possessed sufficient influence to induce Pharnabazus, who in other respects was remarkably respectable⁵ for a satrap, to violate the law of hospitality by causing Alcibiades to be put to death. But even the patience of Pharnabazus was at last worn out by Lysander; he urgently demanded the recall of the latter, and the Spartans, who had allowed the atrocities of Lysander towards the Greeks to pass unnoticed, respected the satrap's demand, and recalled their admiral (402 or 401).

No sooner was Cyrus in his satrapy again than he began to make great encroachments. He gained over the Ionian cities which belonged to the province of Tissaphernes and laid siege to Miletus, which adhered to Tissaphernes. On Orontes, a partisan of the latter, he made open war. Meantime he collected under false prettexts an army of Greek mercenaries, and in 401 set out with the real purpose of seizing the throne. He had with him nearly 13,000 Greek mercenaries commanded by Clearchus, a Spartan exile, and a vast host of Asiatics. But Tissaphernes hastened into the interior before him to carry the tidings. Of this expedition we have the well-known account by Xenophon, who took part in it.⁶ The Spartans favoured

² Arsikas is the form in Ctesias; Plut., *Art.*, 1. From this Photius has wrongly made Arsakes. Dinon called him Oarses. The initial sound was perhaps *w*.

³ At the very beginning of the new reign Ctesias has again some dreadful stories of murder and intrigue to tell. As court physician of Parysatis he had seen only too much of such things, which are characteristic of the Persian court.

⁴ See Plut., *l.c.*

⁵ But the worth of his character has been often over-estimated; the contrast with the baseness of Tissaphernes is apt to place Pharnabazus in too favourable a light.

⁶ Good supplementary information is given by Diodorus, who has

¹ On the other hand, Andocides (*De pace*, p. 27), twenty years later, it is true, represents the support given to Amorges rather as the cause of the king's enmity to the Athenians.

Cyrus
the
satrap

the enterprise of their friend, but without openly breaking with the king. Cyrus advanced boldly, confident in the military superiority of the Greeks, but he had some trouble in carrying them with him as far as Syria and Babylonia, for they were not engaged for so distant a goal. He made his way without difficulty into the heart of the empire. Neither the passes of the Taurus leading from Cappadocia into Cilicia nor those of the Amanus from Cilicia into Syria were blocked. The vassal-prince of Cilicia, Syennesis, put a good face on a bad business and let him through. Even the line of defence between Babylonia and the Mesopotamian desert was unoccupied. At Cunaxa, 500 stadia from Babylon,¹ they came upon the mighty royalist army. The Greeks carried everything before them; the king proved a miserable coward and fled. But, in fighting the Asiatic rabble, Clearchus seems to have adhered too pedantically to the cautious Spartan tactics, and not to have dashed with sufficient rapidity at the enemy's centre. Cyrus, however, rushed foolhardily into the *mêlée* and there fell.

Even if we deduct much from Xenophon's idealistic portrait, we must still admit that Cyrus was a very able and in many respects honourable man, far worthier of the throne than his brother. From his grim mother he probably inherited his spirit and energy. Certainly none of the kings after Darius I. can be compared with him, except perhaps Artaxerxes III. But for Greece, as Grote shows, it was very fortunate that at that time the kingdom of Persia did not fall to a man whose most ardent endeavour it would have been to bring the Greeks into subjugation to himself, and who had learned in the school of Lysander and elsewhere the best means of accomplishing that object.

Cyrus's Greeks were an object of terror to the king's troops. All the deception and crimes employed against them had their source in cowardice. The king's hosts were reinforced by the army of Cyrus, which after their leader's fall passed over to the enemy; but all these Asiatics trembled before the dauntless Greek mercenaries, comparatively few in number as they were and strangers to the country. It is characteristic of the state of the empire that Tissaphernes allowed the Greeks to plunder the villages which were the special property of Parysatis; he probably thought that with the death of her favourite son her power was broken, while he himself had succeeded in appearing as the deliverer of the empire. After electing fresh leaders in place of those who were foully assassinated, the "ten thousand" made themselves a way through wild mountains and wild peoples; they had to endure a thousand dangers and hardships, but from the king's forces they experienced no serious hindrance.

This expedition revealed to the Greeks the weakness of the empire and the cowardice of its rulers and defenders. Cyrus had penetrated to its centre without striking a blow, and an army of ordinary Greek mercenaries proved itself more than a match for the power of the whole empire. It was perceived how helpless the colossus was; it was perceived that great territories, which had been regarded as royal provinces, were completely independent.² Independent at that time were the predatory Mysians (in Olympus), Pisidians, and Lycanians;³ the Lycians (entirely?) and the Bithynians and Paphlagonians half and half,—the last two peoples had kings of their own; further, the Greek

cities on the Euxine; finally, the Carduchi and other wild peoples in the south and north-west of Armenia.

The death of Cyrus widened the breach between Parysatis and Statira. The former could not forget her darling, and succeeded in bringing to a cruel end one after another all who had participated in his death. Statira was exultant; but she was eventually poisoned by her mother-in-law. Artaxerxes was indignant at this deed and banished Parysatis for ever from his sight; but he could not live without the firm guidance of his mother, and soon recalled her.

Tissaphernes succeeded to all the privileges of the post which Cyrus had occupied. This could not but hasten the inevitable conflict with Sparta, which now, at the height of her power, could not bring herself to fulfil the treaty and resign to the Persians all the Greek cities of Asia Minor. The Greeks expected to be protected by Sparta against Tissaphernes, who was already enforcing his rights with the strong arm, and the war which the Spartans began in 401 against the Persians in Asia Minor was no doubt popular, but as a land-power with limited resources they were not in a position to conduct much more than a purely predatory war. The state of Ionia and Æolis must have changed very much for the worse since the termination of the Attic supremacy, and the Asiatic Greeks were now perhaps for the most part unworthy of the blood that ran in streams on their behalf. Tissaphernes and Pharnabazus sought each to shift upon the other the burden of the war, the conduct of which was not essentially altered when the command of the Spartans devolved on Agesilaus (396), who strove in vain to give the struggle the prestige of a Pan-hellenic enterprise. But, when Agesilaus had gained a great victory close to Sardis, Tissaphernes, who had meantime, more from cowardice than treachery, remained inactive in Sardis, was quietly displaced by a successor in the person of Tithraustes, who succeeded in seizing and executing him.⁴ The real cause of his fall was the hatred of Parysatis. The game of treaties, which neither side meant to keep, and the efforts of the one satrap to thrust the Spartans upon the other, began afresh. In course of time Agesilaus certainly gained ground rapidly. But his successes were in part much exaggerated even by contemporaries.⁵ On the whole, they were predatory expeditions on a large scale, which showed with ever greater clearness the weakness of the empire, but did not directly affect its stability. Even after his great victory, Agesilaus did not venture to attack Sardis—a striking contrast to the speed and thoroughness with which Alexander took possession of these lands. In 394 Agesilaus was recalled, for Sparta needed him in Europe more than in Asia; the intolerable nature of the Spartan supremacy had done more than Persian gold to rouse even the proved allies of Sparta, such as the Thebans and Corinthians, into leaguering themselves with Athens in revolt. When Agesilaus reached the frontier of Bœotia he heard the dreadful tidings of Cnidus.

After the decisive defeat at Ægospotami the admiral of the Athenian fleet, Conon, had fled to Evagoras, prince of Salamis in Cyprus. Evagoras, a tyrant of the "grand" type like Pisistratus or Gelo, favoured Conon's efforts to enter into relations with the Persian king with a view to raise Athens from her fall. When the war between Persia and Sparta broke out, Pharnabazus had made it clear to the court that it was absolutely necessary to raise a fleet, and that no better commander could be found for it than the tried sailor-hero of Athens. Under the leadership of such a man the Persians actually dared to send Phœnician ships once more into those Greek waters which they had long anxiously avoided. But Conon's successes, such especially as the revolt of Rhodes from Sparta (probably in 396),

indirectly made use of the narrative of another writer who shared in the expedition.

¹ So says Ctesias, who knew the country. Xenophon says 360 stadia. These figures are equal to nearly 58 and 42 English miles respectively,—about 93 and 67 kilometres.

² On the effect produced by the expedition, see Xenophon, *Hell.*, vi. 1, 12; Isocrates, *passim*.

³ At least in part; such mountain peoples did not, of course, form integral wholes, and, if one tribe was independent, another may have obeyed the satrap.

⁴ See Diod., xiv. 80; Plut., *Art.*, 23; Polyænus, vii. 18, 1.

⁵ Isocrates, *Paneg.*, 70.

were crippled by the miserable Oriental administration, e.g., the tardiness in paying the men. Hereupon Conon went himself to the king at Babylon, obtained a grant of the necessary money and powers and the king's consent to bestow the nominal command of the fleet upon the trustworthy Pharnabazus. Then at the head of the Persian fleet the Athenian admiral utterly defeated the Spartans at Cnidus (beginning of August 394). In a short time nearly all the islands and cities on the Asiatic coast were freed from the Spartan prefects ("harbours"), and Conon carried his point of nowhere occupying the citadels with Persian garrisons. The Spartan sovereignty of the seas, after lasting ten years, was over for ever. Pharnabazus sailed to the Peloponnesus (393), and at Corinth was joyfully greeted by the Greeks gathered for the war with Sparta. He supplied them liberally with money and then returned home, while Conon restored the marine fortifications of Athens. Thus as a matter of fact a Persian fleet now ruled the Archipelago, but it was a menace and danger to Greek freedom no more. It was only with Greek help, under the leadership of a man like Conon, that the king's ships could still achieve much.

As the land-war in Greece dragged on for a long time, the Spartans had again recourse to diplomacy. The new atrop in Sardis, Tiribazus, who in some measure revived the vacillating policy of Tissaphernes, met their advances. He overthrew Conon, who escaped death at his hands only with extreme difficulty and fled to Evagoras, at whose court he must have died soon afterwards.¹ But Tiribazus soon received in the person of Struthas a successor more favourably disposed to Athens. Many conflicts of Greeks against Greeks still took place by land and sea, but all the belligerents were exhausted, at least financially. So, when the Spartans at last succeeded through their ambassador Antalcidas and through Tiribazus in bringing about a peace, all the more important states of Greece found themselves obliged to accede to it, however unwillingly. This is the notorious peace of Antalcidas, which Tiribazus laid before the delegates of the Greeks at Sardis or Ephesus in 387. It is not a mutual compact but a simple edict of the king. It sets forth that in the king's opinion all cities of the Asiatic mainland, as well as the islands of Clazomenæ and Cyprus, ought to belong to him; that, on the other hand, all other Greek states, even the petty ones, ought to be independent, with the single exception of Lemnos, Imbros, and Scyros, which should continue as of old to belong to Athens. If any one refused to accept this decision, upon him the king and his allies (particularly the Spartans) would wage war with all their power.

It is hardly likely that the true import of this document was understood at the Persian court. That the great king should issue a simple order was there regarded as a matter of course, but the Persian statesmen, who really knew the state of affairs, may have had trouble in securing the acknowledgment of the freedom of the islands. By this peace the Spartans personally gained a great success; for they gave up nothing which they still possessed, while by the declaration of the independence of even the pettiest communities they secured this advantage, that the cities which had hitherto ruled over wider areas were restricted to their own special domain, that, e.g., Thebes, hitherto head of Boeotia, now remained only one of many independent Boeotian cities. Thus Greece was split up into a thousand petty communities, which Sparta, who did not dream of extending the independence to her own subjects, could with ease dominate collectively. Through this peace the Spartans gained for about sixteen years a much greater

power over the Greek mainland than they had ever possessed before, and they ruthlessly turned it to account. Athens, slowly regaining her strength, was appeased by the three islands, but nowhere was "the peace sent down by the king" felt to be a disgrace more keenly than at Athens. In that peace the king issued orders to the Greeks as to his subjects, and the express and definitive surrender of all the Greeks on the Asiatic coasts was felt all the more bitterly in the intellectual capital of Greece because there was no prospect of ever again freeing them as in the days of Xanthippus and Cimon. And yet it was known that the Persian empire was now much weaker than it had been then, and that it was only maintained by Greek mercenaries.² The real gain to Persia by the peace was a firm hold on the sea-coast. The domineering attitude towards the other Greeks was a mere appearance. In the following decades the king repeatedly commanded peace, even after Thebes had completely broken the power of Sparta (371). The powers for the time being employed Persian intervention as a means to their own ends, and there were plenty of diplomatic negotiations with the king, but Persia had no advantage from them. Moreover, now one, now another Greek state supported rebel satraps and vassals. They all, the king as well as the rebels, procured mercenaries from Greece.³

Meantime another enemy had arisen to the Persian supremacy in the west—an enemy who, if Athens, his friend and sympathizer, had at that time been once more a great naval power with an aggressive policy, might perhaps have excluded the Persians from all the western seas. Evagoras of Salamis had made himself the almost independent lord of Cyprus, relying on the ancestral antagonism of the Greek to the Phœnician element in the island. As early as 390 forces were levied against him. Athens, under obligations to him on Conon's account, supported him openly, although she was at that time still formally leagued with the Persians against Sparta. After the peace of Antalcidas Persia made great efforts to reduce Evagoras again to subjection. He was in league with Egypt, scoured the seas far and wide, and had even for some time maintained a siege of Tyre. The cunning Cypriot also kept up a secret correspondence with the vassal princes of Caria. After a ten years' struggle he had to yield to superior force, but by skilful negotiation with the satraps he was able to procure a tolerable peace. Soon afterwards he was murdered, but his descendants long continued to be princes of different towns in Cyprus.

About this time probably the expedition of Artaxerxes against the Cadusians took place, of which Plutarch, after Dinon, has given us a detailed account.⁴ The Cadusians are the inhabitants of the modern Gilân, who were probably never completely subdued, and who certainly by their raids inflicted much annoyance on the neighbouring territory of the king. Darius II. had taken the field against them shortly before his death,⁵ and the repeated mention in the fragments of Ctesias of the Cadusians at the time of the Median empire is presumably a reflex of the state of things in his own day. Artaxerxes's campaign turned out disastrously. The king probably thought to crush the wild mountain tribes—who, however, are only to be caught by small and skilfully led armies—by masses of troops; but he fell into an ambush, from which he was only saved by

¹ This follows, in opposition to other statements, from Lysias, *Pro bonis Aristoph.*, p. 155; cp. Isocr., *Paneg.*, 73, and Dinon in Nepos's *Conon*, at the end.

² Compare many passages in the orators and Plato. Especially interesting is the passage in Isocr., *Epist. ad Archid.*, p. 436, on the wild doings of the Greek mercenaries, who were specially burdensome to the Greek cities under Persian rule.

³ We are told that the king desired the internal peace of Greece, because he hoped thereby to procure mercenaries all the more easily from that country (Diod., xv. 38).

⁴ *Artax.*, 24; cp. Diod., xv. 8, 10.

⁵ Xenophon, *Hell.*, ii. 1, 13.

the negotiations which Tiribazus astutely opened with the rebel chieftains. No doubt he had to pay a large sum for his liberation.

Meanwhile the war with Egypt was never quite at a standstill. Even before the subjugation of Evagoras much fighting took place, but without result. Our knowledge of the particulars, even of the chronology, is very inexact. After the conquest of Cyprus the war was renewed. The Egyptian king invited the Athenian Chabrias to take the command, but Pharnabazus contrived that the Athenians should recall him (376/375). Pharnabazus, who by this time must have been about seventy years old, was placed at the head of the army which was being mustered at Acco on the Phœnician coast. The Athenian mercenaries were commanded by Iphicrates, who had been sent from Athens. The campaign opened successfully, but dissensions arose between Iphicrates and Pharnabazus, whose proceedings were much too slow to suit the dashing freelance, for Pharnabazus had to report everything to court and to ask instructions from the same quarter. This, along with other circumstances, saved Egypt once more (374). There is the old story, too, of the difficulties of the wars of this period—a mutiny amongst the mercenaries for arrears of pay. The third of the great Athenian condottieri, Timotheus, son of Conon, who fought in the king's service against Egypt in 372, seems also to have been unable to effect anything.

The last part of the reign of Artaxerxes II. is filled with revolts of the satraps and chiefs of Asia Minor, of which we have numerous but mostly isolated and, to a large extent, inexact accounts. It is impossible to determine the connexion of events. We do not even know in all cases whether the same names designate the same persons; and we are nowhere exactly informed of the motives which induced the individuals to revolt. It is the more difficult to form a judgment on the events because sometimes the same persons side now with, now against the king. These revolts, which lasted in part into the reign of Artaxerxes III., must have weakened immensely the imperial power in the western provinces, and prepared the way for the Macedonians. Rich Greek cities and energetic tyrants probably won for themselves at that time a tolerably independent position. At the head of those who remained faithful to the king we find Autophradates, satrap of Lydia. He fought the rebels repeatedly. Nevertheless Diodorus (xv. 90) names him among the rebels; and it is, after all, possible that there is here no confusion, but that Autophradates was also a rebel for a time. If we omit some smaller risings, such as that of Tachos, who established himself in a fortress on the Ionian coast (after 380), the series begins with Ariobarzanes, successor of Pharnabazus in the Hellespontine satrapy, and no doubt a near relative. Before the beginning of the revolt (about 367) he had formed connexions with Sparta and with Athens, which again stood at the head of a naval confederacy, and he was supported, at least indirectly, by both states. Accordingly, by the diplomatic intervention of Sparta, Autophradates and Mausolus of Caria were induced to raise the siege of Assus (in the Troad), into which Ariobarzanes had thrown himself. The satrap fell by the treachery of his own son Mithradates into the hands of the royalists and was crucified (probably about 365).¹

Mausolus (or rather, according to the inscriptions and coins, *Maussollos*, *Μαύσωλλος*), a native hereditary prince of part of Caria (probably 375-351²), had extended his

power tolerably far. These Carian potentates, who bore the title of satraps, were in point of fact but little dependent on Persia, and were watched by the Persians with great mistrust. In their cunning and in the sagacity with which they profited by circumstances they recall the Macedonian kings of that period, whom they also resemble in their patronage—often perhaps ostentatious—of Greek art and manners. Mausolus appears to have once been in open conflict with his suzerain; but, though nothing definite is known on the subject, there is no doubt that he came off without serious harm.

Datames, satrap of Cappadocia, of Carian race, had rendered many good services; in particular he had reduced the nearly independent Paphlagonians once more to subjection to the great king.³ But at last he also revolted in league with Ariobarzanes. He was a man of great shrewdness and versatility, whose stratagems and adventures afforded much entertainment even to later generations. He long kept the king's troops in check, till he was at last treacherously murdered by Mithradates, son of Ariobarzanes,—the same Mithradates probably whom we found above betraying his father.

The command of the rebel forces was entrusted to Orontes, satrap of Mysia.⁴ From the confused accounts it is unfortunately impossible to determine whether he is identical with one or other of the persons of that name who are elsewhere mentioned. Further, we have no clear conception of the position which he occupied in the revolt, nor of the way in which he came to betray his comrades. We read, moreover, of the treachery of a less conspicuous confederate. The rebels had despatched Rheomithres to Tachos, king of Egypt, who sent them fifty war-ships and much money. Rheomithres summoned the commanders to a rocky fortress on the northern coast of Ionie, bound them, and delivered them up to the king.

In the year 361 Tachos actually assumed the offensive against the Persians. On his side he had once more Chabrias as leader of mercenaries, and the aged Agesilaus, officially sent by the Spartans, who were bitterly enraged at the Persians because they had now, after the destruction of the Spartan power by Epaminondas, recognized the independence of Messenia, though in doing so they only carried out the letter of the peace of Antalcidas. But, when Tachos was engaged in Phœnicia, his nephew Nectanebus set himself up as rival king, and Tachos was obliged to take refuge with the Persians. If the Persians had been still energetic they would have used the opportunity, when the legitimate king of Egypt had fled to them and two claimants were struggling for the throne, to subjugate the country. But they did nothing of the kind, even when Chabrias had returned to Athens and Agesilaus had died on the way home (probably 360).

At the instigation of Parysatis Artaxerxes had married his own daughter Atossa. She used her interest to secure the succession for the energetic and violent Ochus, who is said to have promised to marry her; the Persian religion approved marriage not only with a sister but also with a daughter, and even with a mother. The elder son Darius was already invested with the succession and the royal title, but having engaged in a conspiracy against his father he was tried and executed, and Ochus, it is said, found means of getting rid of his other brothers, who stood in his way. Soon afterwards the aged Artaxerxes died after a reign of forty-six years (in the course of the year 358). Many stories are told of his mildness

¹ Xen., *Cyrop.*, viii. 8, 4; Aristot., *Pol.*, 1312a; Harpocration, s.v. *Ἀριobarζάνης*. He is to be distinguished from Ariobarzanes (about 362-337), ancestor of the kings of Pontus, who, however, seems to have belonged to the same house, and was probably heir to a district on the Propontis.

² See Pliny, xxxvi. 30, 47.

³ The Greek cities on the southern coast of the Euxine, which Xenophon about 400 found quite free, were again subjugated at this time. Datames coined money in Sinope, as did also his (probably indirect) successor Ariarathes.

⁴ Diod., xv. 91. Mysia is not otherwise known as a satrapy proper. But at any rate Asia Minor was the scene of his exploits.

and affability, but, even if they are true, they have little significance. The contempt for his brother which Cyrus exhibited was perfectly justified; under the effeminate king the empire gradually fell to pieces.

But his successor, Ochus, who took the title of Artaxerxes (III.), was of a different stamp. True, it is not perfectly certain that the great restoration of the empire is to be ascribed to his personal influence; it may be that the whole merit belongs to some of his officials, and that he only lent it his name, but it is much more probable that the initiative was his. He was, it appears, one of those great despots who can raise up again for a time a decayed Oriental empire, who shed blood without scruple and are not nice in the choice of means, but who in the actual position of affairs do usually contribute to the welfare of the state as a whole. At the very beginning of his reign he secured himself on the throne by a massacre of his nearest relatives, though no doubt the statement of Curtius (x. 5, 23) is exaggerated.¹ The judgment of the Greek writers on Artaxerxes III. was too much influenced by such deeds as found an historian in Dinon, as well as by the hatred of the Egyptians, whom he humbled and mortally offended; hence it was one-sided and unjustly unfavourable.

Defec-
tion of
Arta-
bazus.

But for a while the empire was in a state of absolute dissolution. Artabazus, satrap of the Hellespontine Phrygia, very probably a son of Pharnabazus and immediate successor of Ariobarzanes, had fought against Autophradates as early as 365 and been taken prisoner by him. At that time the Athenians had acted against him openly enough, at least towards the end.² But it is not clear how far Artabazus then rebelled against the king, who was father to his mother, Apama. But at the time of the so-called Social War (about 355) he fought against the king's satraps and was powerfully supported by the Athenians. Chares won for him a great victory over Tithraustes. And, when, at the king's threats, Athens left him in the lurch, he was able, being well furnished with money, to procure the services of the Theban Pammenes, and maintained himself for a long time. The turn in his fortune seems to have come from the Thebans also entering into an understanding with the king. About 350 we find Artabazus a fugitive at the court of Philip of Macedonia, and with him his brother-in-law, the Rhodian Memnon. However, after the subjugation of Egypt, Memnon's brother Mentor, who, like Memnon, was one of the most distinguished generals of his time, succeeded in procuring pardon for both, and thenceforward Artabazus remained loyal down to the overthrow of the empire.

Revolt of
Orontes.

The revolt of Orontes (or Orontas) fell somewhat later. Probably he is the same whom we found above betraying his comrades. He may very well have received the rule over a wide coast district³ as the price of his treachery (see Diod., xv. 92). He is mentioned in 354 by Demosthenes

(*De symmoriis*, 186) as an enemy of the king. In 349/348 the Athenians formed an alliance with him. From the fragmentary inscription in which this is recorded it does not follow with certainty that at that time he was still in rebellion. About his end we know nothing, but perhaps he was removed after the restoration of Artabazus.

That from the outset Artaxerxes III. was believed to be a person of greater activity than his father may perhaps be inferred from the rumour current in 354/353 that the king was preparing a great expedition against Athens and Greece. Many Greek states may certainly have had a guilty conscience towards the king on account of their wavering policy and the purely mercenary support which they had repeatedly lent to rebellious satraps. Demosthenes warned the Athenians against taking up a hostile attitude to the king on the ground of mere rumours.⁴

The war in Egypt still went on. And now the cities of Phœnicia, previously so trustworthy, also revolted, and so did the kings of Cyprus. Even in Judæa there must have been an insurrectionary movement. The revolted Sidonians showed such exasperation that we can hardly avoid the supposition that Persian rulers had wounded their religious feelings,—the sensitive side of Semitic peoples. The satraps Mazeus (Mazdai) of Cilicia and Belesys of Syria were driven back by Mentor, whom Nectanebus, king of Egypt, had sent to the help of Tennes, king of Sidon. But, when the great king himself took the field at the head of a powerful army, which included 10,000 Greek mercenaries,⁵ Tennes and Mentor made terms. Sidon surrendered—though probably only after a severe siege—and was fearfully punished. More than 40,000 men are said to have burned themselves in Sidon on this occasion. The fate of the first-born of Canaan quickly brought the rest of the Phœnicians to their knees. At this time much blood was shed in Judæa also, though we have only scattered notices of the fact.⁶ Mentor now went over to the king's side and fought against his former employers. It was to him and not to the Persian eunuch Bagoas that the king chiefly owed his success; but undoubtedly the royal presence contributed much to the result by facilitating rapid decisions and preventing dangerous jars. Mentor succeeded in everywhere sowing dissension between the Greek mercenaries of the Egyptian king and the Persians; and even more by intimidation than by the sword Egypt was, after long independence, again made a Persian province (344).⁷ Artaxerxes seems to have made the "væ victis" thoroughly clear to the Egyptians, and to have treated even their religion with little more respect than Canibyses before him: temples were desecrated and sacred animals slaughtered. For a time the Egyptians had to satisfy their rage with nicknaming the king, after the unclean Typhonian beast, "ass." Cyprus, too, was again reduced. The enterprise was conducted by the prince of Caria, Idrieus. The Greek mercenaries were led by the well-known

¹ More distant relatives were left alive, as he who was afterwards Darius III. and his brother, Oxyathres. A son of the Darius who was executed appears in Arrian, i. 16, 3 (334 B.C.). Thus the king did not extirpate even the branch that was most dangerous to him. It is to be remembered that even Alexander the Great, after ascending the throne, put several near relatives out of the way.

² Owing to the inconstant nature of the foreign policy of Athens at that time—a policy too often influenced by the personal interests of the great captains of mercenaries—as well as to the shifting attitude of the satraps, it is impossible for us to form a clear conception of these events from the isolated statements of contemporaries (like Demosthenes and Æneas Tacticus) and later writers. It is to be observed that in these decades violent revolutions took place in some Greek cities under Persian supremacy, and that they even made war on each other. With the restless character of the Greeks such things were not to be averted unless each town was occupied by a Persian garrison, which was certainly not the case.

³ There are coins ascribed to Lampsacus and to Clazomenæ bearing the name of an Orontes

⁴ In the speech *De symmoriis*. Similarly in the speech *De Rhodiorum libertate* (191 sq.) he advises the Athenians not to offend the king frivolously (351 B.C.).

⁵ Through Diodorus and some statements of others we possess by exception fairly good information about these struggles.

⁶ Josephus, *Arch.*, xi. 7, 1; by Eusebius's canon 1657 from Abr., and his copies; Solinus, xxv. 4. The king at that time settled a number of Jews in Hyrcania. Judæa was forcibly pacified, perhaps by Orophernes (or Olophernes), brother of the then satrap of Cappadocia. Orophernes distinguished himself in this war (Diod., xxxi. 28); the assumption that it was he who reduced Judæa would explain why in the book of Judith—mere romance though it is—an Olophernes appears as the wicked commander who fights against the Jews.

⁷ So Manetho, who makes Ochus reign six years in Egypt. In harmony with this we learn from Isocrates (*Phil.*, 102) that in 347/346 Egypt was not yet subdued, while according to the letter of King Philip (Demosth., p. 160) in 340 the reduction of Egypt and Phœnicia had long been effected.

Athenian Phocion,¹ and with him was a pretender Evagoras, of the family of the famous Cyprian prince of that name.

Thus by force and policy the old state of the monarchy was restored in all the western lands. Mentor, the real conqueror of Egypt, was splendidly rewarded. He received the satrapy of the west coast of Asia Minor, and quickly removed by cunning and treachery Hermias, tyrant of Atarneus and the friend of Aristotle, who had concluded treaties like an independent prince² and stood in suspicious relations to King Philip of Macedonia. It has been already mentioned that Mentor procured the pardon of his brother-in-law Artabazus and his brother Memnon. It is not improbable that the bestowal of this province on the skilful general and diplomatist, and the restoration of Artabazus to his hereditary satrapy, may be connected with the attention which the king paid to the plans of the Macedonian, which were gradually disclosing themselves more and more. Of course no one thought of danger to Asia Minor, much less to the whole empire, but Philip's efforts to secure the mastery of the Bosphorus and Hellespont were enough in themselves to excite grave anxiety.

As early as 350 the story went that Philip had sent an embassy to the king,³ and it is definitely stated that he concluded a treaty with Ochus.⁴ The pacific intentions of the Persians, at least for the moment, were no doubt sincere: not so those of Philip, who had to subdue Greece before he could put into execution his designs on Asia Minor, a circumstance overlooked by the honest but politically short-sighted Isocrates in his exhortation to Philip to attack Persia (347/346). Probably Demosthenes was not alone in perceiving that the safety of Greece now lay in an alliance with the Persians against Philip. Negotiations went on busily between Athens and the king, who at all events sent subsidies repeatedly for the conflict with Macedonia. In the year 340 Persia interfered actively by rescuing, in conjunction with Athens, the town of Perinthus on the Propontis (and therefore close to Persian territory), which was besieged by Philip; and the Macedonians could perhaps with some right assert that with this step the war between the Persians and them had begun.⁵ But the Persians did not see, what to us is obvious from the result, that it was necessary for them to prevent the subjugation of Greece; or, if they saw it, they lacked the energy to act.

Artaxerxes probably did not reach the battle of Chæronea (August 338), which made Philip master of Greece. So far as we can judge, however, it was a great misfortune for the empire that this king, the first since Darius I. who had in person energetically conducted a great expedition and restored the empire, died just at this critical moment. Probably he was murdered by Bagoas, who placed Arses, the youngest of the sons of Artaxerxes, on the throne.⁶ But, when Arses was preparing (so it is said) to punish Bagoas, the latter put him and his children to death (335). We know nothing further of this king. Under his reign (spring 336) a Macedonian army first crossed into Asia, after Philip had previously caused himself to be nominated general of the Greeks against the Persians. The Macedonians gained some not unimportant successes, but the undertaking was checked in the very same year by the assassination of Philip. The commander Parmenio returned to Europe, and Memnon, who after Mentor's death commanded in these regions, probably won back from the

Macedonians nearly all their conquests in Asia, though it is likely that Abydus, commanding the passage of the Hellespont, and perhaps one or two more strong places, remained in their hands.

In order to rule securely Bagoas placed on the throne, not a near relation of the murdered man,⁷ but Codomannus,⁸ who reigned as Darius (III.), a great-grandson of Darius II., and a man of about forty-five years of age.⁹ But the king-maker was caught in his own snare, for Darius soon put him out of the way.

Over the last of the Achæmenians misfortune has thrown a halo of romance, but sober criticism can see in him only an incapable despot like so many whom the East has produced. It may be true that in earlier life, under Artaxerxes III., he once proved his personal bravery in the war against the Cadusians, and was rewarded with the satrapy of Armenia;¹⁰ as a king he always behaved like a coward in the moment of danger. Vast attempts and a shameful flight, feeble or rather effeminate behaviour combined with braggart pride, lack of intelligence, especially in the conduct of war,—these are features which fully justify Grote in comparing him with Xerxes. It is no reproach that he was not a match for perhaps the greatest general in history, but an Ochus would doubtless have made the task a somewhat harder one, and would scarcely have been guilty of the folly of beheading, in a fit of bad temper, so useful a man as the old condottiere Charidemus, who thoroughly understood the mode of fighting the Macedonians.

The history of Alexander the Great is given under the Alex-articles ALEXANDER THE GREAT and MACEDONIAN EMPIRE; and here we can only enumerate the chief steps in the downfall of the Persian empire. We see how great is the force of cohesion in such an empire, even after all the shocks it has received, and under an incapable ruler. What the giant powers of Alexander achieved in a few years might never have been accomplished at all by the qualities and resources of an Agesilaus.

After placing a terrible curb on the Greek love of freedom by the destruction of Thebes, Alexander crossed the Hellespont in the beginning of spring 334. A few weeks later, on the Granicus, he annihilated the great Persian army which should have barred his onward march. Sardis, the capital, at once fell into his hands. Here, for the first time, we see the miserable spectacle of a high Persian officer going over to the enemy and surrendering to him the town or district committed by his king to his charge. At the beginning of winter the whole coast as far as Pamphylia was Alexander's; Miletus and Halicarnassus were the only places which he had had seriously to besiege, and it was only the narrowly-enclosed citadel of the latter town which yet withstood all attacks. But there was still a great danger. The Rhodian Memnon, who had been joint-commander at the Granicus, undertook with all his might to kindle a conflagration in Alexander's rear, and to force the king to cross over to Greece. The Persian fleet, which he commanded, ruled the sea; several of the most important islands were occupied; and from the Greek mainland thousands of patriots were looking for Memnon's arrival in order to rise against the Macedonians. But Memnon died suddenly. The death of this man, his only worthy adversary, is perhaps the greatest of those pieces of luck which so highly favoured the great Alexander. His successor Pharnabazus, son of Artabazus, continued, it is true, the naval operations, but he was not able to carry out Memnon's plans. Meanwhile Alexander secured

¹ Diod., xvi. 42; the sources from which our biographers of Phocion (Plutarch and Nepos) draw did not mention this fact, which does not accord very well with the pattern of philosophic virtue which they made out Phocion to be.

² Cp. the treaty with Erythra, Le Bas and Waddington, No. 1535.

³ Demosth., *Phil. I.*, p. 51.

⁴ Arrian, ii. 14, 2.

⁵ Arrian, ii. 14, 5.

⁶ In Plut., *De fort. Alex.*, p. 336 sq., he is called Oarses. The Persian form of the name is not known.

⁷ We read of a son of Ochus in 330 (Arrian, iii. 19, 4). We had above a grandson of Artaxerxes II. Thus Bagoas had not killed all "the brothers" of Arses, and the king's family was not extinct, as Diodorus asserts (xvii. 5).

⁸ The name is given only by Justin (from Dinon), x. 3.

⁹ *Adrian*, iii. 22, 6.

Over-
throw of
Persian
empire.

the most important parts of Asia Minor, and then set out on his forward march. At the farthest extremity of Cilicia Darius in person met him at the head of a huge army, but the field of battle was so badly chosen that the numerical superiority of the Persians did not come into full play. The brilliant victory of Issus (about November 333) and the flight of Darius threw wide regions into the power of Alexander, who, with all his daring, was also cautious, and did not follow the Persian king in his flight into the interior. He sought first to make himself master of the whole Phœnician coast, in order to cut off from the Persians every possibility of annoying him any longer at sea. And in reality the fleet, which was chiefly furnished by the Phœnicians, melted away when Alexander had taken possession of their country. The Cyprian ships, too, returned home, and Cyprus also submitted. But Tyre withstood the great conqueror for seven months¹ (332), and had to pay a dreadful penalty for its resistance. Gaza, too, defended itself bravely. Egypt welcomed exultingly the Macedonian who freed them from the hated Persians. After the acquisition of Egypt Alexander possessed a territory large and strong enough to be able to survive, if need be, a reverse. In the spring of 331 he left Egypt and marched through Syria and Mesopotamia to Assyria proper, where Darius awaited him at the head of vast masses of troops, and this time in a favourable position. But on 1st October 331 Alexander defeated the king at Gaugamela so decisively that henceforward the Persian empire, as such, was shattered. Darius fled to Media. Without striking another blow Alexander captured the capitals, Babylon and Susa, with their vast treasures. In vain the wild independent Uxians (better "Huxians") barred a difficult mountain-pass against him, in vain did a Persian army do the same: he quickly forced a passage through the mountains and marched into Persia proper. Pasargadæ and Persepolis, the cradle of the monarchy, were his. Persepolis, in the immediate neighbourhood of which another conflict took place, was given up by him to his soldiers to plunder; the royal palace he caused to be burned.² In this act we discern, in opposition to the usual view, a well-considered measure, excellently calculated to work upon the Asiatic mind. The burning of the royal castle was meant to show the Asiatics that their empire was utterly overthrown, and that Alexander was their only lord. Besides the Greeks might see in the step an act of vengeance for the destruction of the Greek temples by Xerxes, as the official phrase ran.

Bessus.

Thereupon Alexander hastened to Media in pursuit, once for all, of Darius. The latter fled eastwards. He had still a considerable army with him, but only the Greek mercenaries were absolutely true to him, like the Swiss guard to Louis XVI. At last Bessus, satrap of Bactria (and Sogdiana apparently), seized the person of the king, in order either to make use of him for his own ambitious purposes or to put him out of the way. As a matter of fact, he murdered him in Parthia, just when the pursuing Alexander had nearly overtaken him (July or August 330). Such was the melancholy end of the last of the Achæmenian great kings.

Bessus thereupon hastened into his satrapy and assumed the title of king and the name of Artaxerxes (IV.). We know that he was a "kinsman" of Darius; perhaps in his case this means more than that he was merely connected with him by marriage, and this satrap of Bactria

¹ The resistance of the Tyrians is certainly not explained by their attachment to the Persians, scarcely either by their love of freedom. We suspect here again a religious motive. Alexander desired to offer sacrifice in the temple of Heracles, and probably the pious Canaanites would as little allow this as the Jews would have permitted any foreign ruler to enter their temple.

² Cp. the article PERSEPOLIS.

may have actually belonged to the race of the Achæmenians, like his predecessors the princes Masistes and Hystaspes. It would thus be more easy to explain why various grandees favoured his undertaking, and why he was recognized as king, e.g., by the satrap of Aria (the district of Herât), and vigorously supported. That he enjoyed the royal title for some time is due only to the circumstance that Alexander first made himself securely master of eastern Iran before he marched into Bactria and Sogdiana. After many adventures Bessus fell into Alexander's power on the farther side of the Oxus, and was put to death.

After the return from India the satrap of Media conducted in chains to Alexander a certain Baryaxes, who during Alexander's absence had declared himself king of the Persians and Medes. Of course he was executed. He is said to have been a Mede, not a Persian. Certainly his movement had never even a momentary importance; he is only once mentioned (Arrian, vi. 29, 3). But such last throes of a mighty monarchy are after all, worthy of attention.

Literature.—Rawlinson, *The Five Great Monarchies*, vols. ii., iii. (2d ed., London, 1871), gives a useful account of the Medo-Persian history down to Alexander, as does also vol. ii. of Fr. Spiegel's *Erânische Alterthumskunde* (Leipsic, 1873). Neither work is exhaustive, and in both we frequently miss true historical criticism. For the time down to Xerxes Duncker's *Geschichte des Alterthums*, vol. iv. (5th ed., Berlin, 1880; Eng. tr. by Abbot, 1877-83), is recommended by its very careful use of all the sources and its acute mode of combining them, though the latter quality often leads to somewhat arbitrary construction. Owing to the close contact between Persian and Greek history the larger works on the latter are obliged to cover much of the same ground as the former. In this department Grote's *ἡ πύρις* is to be named above all, unfortunately at the time he wrote it was not in his power to make use of the important Persian inscriptions. (TH. N.)

SECTION II.—GREEK AND PARTHIAN EMPIRES.

After the decisive battle of Gaugamela (331 B.C.) Alexander proclaimed himself king of Asia.³ He never accepted the compromise recommended by Parmenio, which would have left to the Persians the upper satrapies east of Mount Zagrus, and established a sharply-marked natural and ethnographic frontier. Soon a symbolic act, the burning of the palace of Persepolis, announced to the Asiatics that the Achæmenian monarchy was dead, and that Alexander claimed its whole inheritance. The punishment of Bessus, exactly modelled on that inflicted on pretenders by Darius I., showed that Alexander claimed to be the legal heir of the Achæmenians. Bessus's ears and nose were cut off, and he was brought to Ecbatana for execution before the assembled Medes and Persians, for "this Bessus lied and said, I am Artaxerxes king of Persia."

After Alexander had by his rapid and effective movements taken actual possession of the whole empire, Media was swiftly traversed, but the eastern frontier was not subdued and secured so easily. Crossing the mountain-wall that separates the southern margin of the Caspian from the rest of Iran, Alexander received in person the homage of the coast-lands. Khorásan and the region of the Oxus were traversed by his armies in all directions; from Bactria the march was obliquely through Sogdiana to the Jaxartes on the farthest limits of the empire, and an onslaught was even made on the Scythians beyond that river.⁴ Alexander was determined to secure a frontier so important for the trade of Central Asia, and to free the peaceful industry of Iran from the incursions of its here-

³ Plut., *Alex.*, 34, 37, does not prove that there was another, still less a preferable account of the date of this occurrence.

⁴ Here perhaps occurs the first trace in history of the Turkish race. Carthasis, the brother of the Scythian king in Curtius (vii. 7, 1), may be, as Noldeke observes, Turkish *kardâshy*, "his brother," from *dâsh*, of which *tâsh* is the older form.

ditary enemies the Turanian nomads. Prestige rather than material advantage was gained by the rapid fall of the supposed impregnable rocky nests of Arimazes in Sogdiana, of Chorienes or Sisimithres in the mountain region of the upper Oxus,¹ and, above all, of the Indian fortress Aornus. Though usually clement to the conquered, Alexander was terrible to those who rose against him—to the Arians, for example, and to the strong cities that headed the insurrection in Sogdiana; when the movement was crushed, he laid the land waste far and wide and slew all the males; 120,000 Sogdians are said to have thus lost their lives. Alexander too, like Cæsar, did not shrink from a breach of faith if it served his purpose; this was seen in the massacre of the Indian mercenaries who had defended Massaga, which was meant to spread terror before him as he entered India.² The Achæmenian power at its climax had never crossed the Indus; Alexander passed the river and pushed into India proper. This adventurous march was undertaken wholly for the sake of prestige, and was specially meant to impress the imagination of the Greeks, to whom India was a land of marvels. Alexander proposed to reach the Ganges and the ends of the habitable earth; and it was sorely against his will that his own soldiers forced him to confine his plans to the rational scope of securing the Indus as his frontier and adding to his realm its commercially important delta.³ Alexander had now accomplished what, in the eyes of the Arian peoples, was necessary to give the last stamp of legitimacy to the new empire; he had led his armies round all the frontiers and taken personal possession of his lands. To close the circle he had still to march back through Gedrosia and Carmania. But it may well be doubted if he would have faced this last exploit had he known beforehand the full terrors of the burning desert; not a fourth part of the forces that began the march from India survived a journey which has been fitly compared with the retreat from Moscow.

A series of minor expeditions completed the work of the great campaigns by reducing a number of mountain tribes, which had shaken off the weak yoke of the Achæmenians, exacted tribute at the chief passes, and in their irreclaimable savage habits of plunder were like the modern Kurds, the born foes of the Iranian peasant. Such were the Uxians, the Mardians in Persis, and the people of the same name to the south of the Caspian, and finally the Cossæans, whom Alexander disposed of in his last campaign in forty mid-winter days. The future obedience of these brigands was secured by planting fortresses at the most difficult points of the roads, and they were compelled to settle down and take to husbandry.⁴

These vast results were only obtained by the aid of continual fresh levies in Europe, and strong garrisons had to be left in the conquered lands. Alexander's work could not last unless the European occupation became permanent; and therefore he planned a great network of new cities, in which colonies of Greek or Macedonian soldiers were planted. According to Plutarch (*De Alex. fort.*, i. 5, p. 328 F) more than seventy cities owed their origin to Alexander; some forty of these can still be traced.⁵ In Media, in the Cossæan neighbourhood, and in Carmania we

know only two by name, though we are told that in the first two districts there were really a large number of such towns, seemingly inconsiderable places. In the east of Iran the settlements were more important, and twenty-six can be enumerated in Aria, the country of the Parapanisus, Bactria, Sogdiana, India, and the land of the Oritæ, — Bactria and Sogdiana alone claiming eight of these.⁶ The composition of these settlements is illustrated by the details given for Alexandria in the Indian Caucasus; according to Diodorus, the city and one or more minor settlements within a day's journey of it received 7000 barbarians, 3000 camp-followers, and as many of the mercenaries as volunteered to stay; but Curtius, who certainly reproduces the common source more accurately than Diodorus, names 7000 Macedonian veterans and a number of mercenaries whose engagement had expired. The Greek element in this colony must have been large, for the town still keeps its Greek name (Alasadda) in an Indian book of the 4th century A.D. Alexandria on the Tanais (Jaxartes), again, was partly peopled by Sogdian insurgents, forcibly transplanted from their homes, which the conqueror had destroyed. Some of Alexander's last orders refer to the founding of cities and the transplanting of Europeans to Asia and Asiatics to Europe, a measure designed to promote the assimilation of all parts of the empire. Macedonia alone did not suffice for this gigantic scheme of colonization, and it was chiefly Greeks who were planted in the most eastern satrapies, in Bactria and Sogdiana. At such a distance from home the Greeks could have no other interest than loyalty to Macedon; it was the same policy as dictated to the Romans the establishment of Latin colonies in their new conquests. But the antagonism between Greeks and Macedonians was too great to allow the former to forget that they were, after all, really men deported by the great king (*ἀνάσπαστος*); and so even from the first there were seeds of discord between them and the rest of the empire.

Alexander's capital was Babylon, the natural centre of an empire that embraced both Iran and the West, and recommended also by its command of the great lines of international traffic, and by its historical traditions of empire. The Achæmenian system of satrapies was retained; kingships were left only in the exceptional case of India.⁷ The satrapies of the upper country seem to have been fourteen; Persis, Parætacene, Carmania, Media, Tapuria with the Mardian country, Parthia with Hyrcania, Bactria, Aria with Drangiana, Gedrosia with the Oritæ,⁸ Arachosia, the Parapanisus country (which probably was quite independent under the later Achæmenians, and was first placed under a satrap by Alexander), India on this side the Indus, India beyond the Indus (from the Bactrian frontier to the confluence of the Indus and the Acesines), and beyond this the province of the lower Indus extending to the sea. The last three satrapies were also new. Alexander retained the old satraps of Darius in three provinces; in Parætacene and Tapuria it would have been impossible to drive the old rulers from their mountains without a tedious campaign, and in Aria Satibarzanes was confirmed in his post to detach him from Bessus. But in all three

⁶ Strabo, xi. p. 517. Alexandria on the Tanais and twelve other towns are spoken of by Justin (xii. 5, 16), but xii. is perhaps a corruption of vii.

⁷ Oxyartes is sometimes called king by a mere inaccuracy. Dexippus, ap. Phot., cod. 82, p. 64, b. xxii. (Bekker), makes Alexander give Oropius the *Σογδιανῶν βασιλείαν*. The geographical order, and the fact that Sogdiana has been mentioned before, demand the correction *Σουσιανῶν*, and for *κοινῶς* we must read *κοῖνος*; see Justin, xiii. 4, 14. Oropius was the successor of Abulites. The province seems to have been officially designated a kingdom, but that does not make its governor a king.

⁸ This province was perhaps formed by Alexander; it was afterwards joined to Arachosia.

¹ The last two places are identical. All the sources know only two fortresses taken by Alexander in these regions: those which mention Sisimithres omit Chorienes and *vice versa*: and the essential points are the same in Arrian (iv. 21) and Curtius (viii. 2, 19-33).

² Diod., xvii. 84. The official Macedonian account in Arrian (iv. 27) ignores the treachery.

³ As the Greeks then knew India only from Ctesias, whose geography is of the vaguest, Alexander probably under-estimated the vast size of the peninsula.

⁴ Arrian, *Ind.*, 40, 8.

⁵ See the careful enumeration in Droysen, *Gesch. d. Hellenismus*, 2d ed., vol. iii. pt. 2, p. 187 sq.

331-323. cases the old satraps were superseded on the first opportunity. Most new appointments, however, were given to Persians; at first there were Macedonian satraps only in rebellious Arachosia, Gedrosia, and the three new Indian provinces. This policy helped the subjects to fall in with the new rule; but on second appointments Macedonians generally took the place of Persians, and at Alexander's death there were Persians only in Media (from which Atropates, as the sequel proved, could not have been removed without a fight), in Parthia, and in the Paropanisus, which was held by Alexander's father-in-law. The power of the satraps was considerably reduced; in Parthia, Aria, and the Paropanisus there seems to have always been a Macedonian resident (*ἐπίσκοπος*) beside the satrap, with the control of the military. Indeed in all the provinces the command of the forces seems to have been separated from the office of satrap, though it was not always entrusted to a single officer. The satraps also lost the right to engage mercenaries and to coin; and in the western countries, of which we know most, a single officer—always a Macedonian—was sometimes charged with the tribute of several provinces. Perfect order and an exact definition of the functions of every officer could not be attained from the very first; yet even in this period of transition the finances of the empire improved. At Alexander's death 50,000 talents (£11,288,515) lay in the treasury, and the annual tribute was 30,000 talents, or six and three-quarters millions sterling. What was of more consequence, the treasures of the East were no longer hoarded in the old Oriental fashion, but put in circulation and applied to a number of great and useful enterprises. Such were the exploration of the course and mouths of the Indus; the voyage of Nearchus, which opened the sea-road between the Indus and the Euphrates; the restoration of the trade of Babylon by removing the weirs which obstructed navigation, and by works on the canals and the Fallacopas; the attempt to discover a sea-way round Arabia, in which Hiero of Soli explored the east coast of the peninsula; and the commission given to Heraclides for exploration of the Caspian.

Alexander sought to assure the permanence of the empire by fusing Greeks and Persians into one mass. Thirty thousand Persians, the so-called *ἐπίγονοι*, were armed and disciplined like Macedonians, and Persians were received on equal footing in the Macedonian corps and even, to the disgust of the Macedonian nobles, in the *corps d'élite* of the cavalry, in which the latter served. Macedonia, in truth, was not populous enough to keep the *cadres* full. Alexander adopted the regal robes of Persia and the regal state. The court was served by eunuchs, and men kissed the ground before the great king. It was a strange sight for Hellenes when a poor wretch from Messene was ordered to execution because he had inadvertently sat on the kingly throne.¹

To the Greeks a union with a barbarian was no regular marriage; but the Bactrian Roxana was Alexander's queen. His friends were urged to follow his example; eighty of his courtiers married Persians on the occasion of the great wedding at Susa, and 10,000 soldiers who had chosen Asiatic wives received gifts on the occasion. Still more startling was the introduction of polygamy; the king took a second wife, Statira, daughter of Darius, and a third, Parysatis, daughter of Ochus.

All this was Persian fashion; but when Alexander claimed divine honours as the son of Jupiter Ammon he asked both Persians and Macedonians to adopt from the Egyptians the most perfect model of devout submission to their sovereign. Could this compound of nationalities prove more than a kingdom of iron and clay? The answer

lay in the attitude of that part of its subjects which still retained a vigorous life. The western nations, long schooled to slavery, were passive under the change of rule. The Persians, too, and all western Iran acquiesced after the first conflict was decided. In the east it was not so. Here the northern province of Chorasmia had been independent of the later Achæmenians, and its kings had ruled the great plains as far as the north-east slopes of the Caucasus.² Bactria, Sogdiana, Aria, Arachosia, Drangiana, and the borderlands towards India had obeyed Persian satraps, but Bessus and his partisans did not forfeit their allegiance by the murder of Darius. These eastern Iranians, who had no close connexion with Persia, opposed the most obstinate resistance to the conqueror: the Arians rose again and again; and an energetic chief like Spitamenes could always stir up a party in Sogdiana. These risings began in the castles of the numerous chieftains (*ὑπαρχοι*), but it was a national spirit that made them so obstinate and bloody; the Iranians of Sogdiana and Bactria had acquired in their constant wars with the Turanians a sense of self-respect which the effeminate Medes and Persians wanted. Their situation, too, favoured their resistance; for their ancient enemies in the desert had a common interest with them in opposing a strong central government, and were easily persuaded to lend them succour or shelter. Sacæ and Dahæ fought for Bessus, and Spitamenes found refuge with the Massagetæ; the wilderness offered a retreat where regular troops could not follow, and from which a petty warfare could always be renewed. In India the Brāhmins had been the soul of a still more vigorous resistance; they preached revolt to the rajahs of the lower Indus, and were the object of Alexander's special severity. Eastern Iran was the cradle and always remained the chief support of Zoroastrianism,³ and religion must have had its part in the patriotic resistance of Bactria and Sogdiana. Alexander forbade the practice of throwing the dying to the dogs (Onesicritus, ap. Strabo, xi. p. 517), which the Bactrians certainly took from the *Avesta*; and this was just the kind of decree which drives an Oriental people to desperation. The Macedonians did pay some attention to Iranian thought; a magian Osthanes is said to have been in the train of Alexander, and Theopompus, a contemporary of the conqueror, shows the first traces of acquaintance with the *Avesta*. The Persian tradition that Alexander burned the twenty-one *nosks* of the original *Avesta*, and that only one part of the holy book was subsequently recovered from memory, is of course not historical, but it rests on a very true feeling that the new order of things was at irreconcilable war with the old faith.⁴

Alexander desired to fuse the Greeks and barbarians together, but the practical means directed to this ideal aim were such as brought him into conflict with the natural leaders of the new state. By asking the Greeks as well as the barbarians to worship him as divine he destroyed the whole effect of the theatrical arts in which he was a master, and by which he hoped to recommend his mission as an eminently Hellenic one to the masses; even Callisthenes, the enthusiastic herald of the new era, was bitterly undeceived, and, turning against Alexander, fell a victim to the despotism of the man who had been his idol. But, what was still more fatal, the net result of his efforts at a fusion of races was not to Hellenize the Persians but to teach the Macedonians to exchange their old virtues for the effeminacy and vices of the East. It is not fair to say that if the Macedonians had possessed a riper civilization they

² So in the Middle Ages Khârezm and Kipchak stood under the same sovereign, and were not included in the realm of Jagatai.

³ Sisimithres's wife was his own mother, a union which the *Avesta* specially approves.

⁴ See Spiegel, *Z. D. M. G.*, ix. 174.

¹ Plut., *Alex.*, 73.

might have resisted the foreign influence; their numbers were too small, and Alexander pushed his plans too hastily and with too exclusive regard to surface-effect, to make any other issue possible. Nay, Alexander wished to have it so, and there was no surer path to his favour than to wear a Persian coat and talk broken Persian like the scheming Peucestas. Alexander liked Oriental splendour and the Oriental ceremony which placed an infinite distance between the king and his highest subjects; great statesmen generally love to be absolute, and Alexander enjoyed Oriental despotism and mechanical obedience much more than councils of state and discussions of policy with the Macedonian soldier-nobility, whose sturdy independence was always asserting itself, and whose kings, unless in virtue of great personal qualities, had never been more than *primi inter pares*. Then, too, Alexander, in the splendour and magnitude of his conquests, lost touch of the movements that were going on at home. The true task of Macedonia in the world's history was to unite Greece under its hegemony,—a task clearly marked out, and one which Philip had pursued with masterly skill. But the completion of this task called for a modest and unsensational line of action quite foreign to Alexander's spirit; Antipater's hard-won victory at Megalopolis, but for which his father's work would have fallen to pieces behind him, was received with a characteristic sneer on the war of mice which seemed to be going on in Arcadia.¹ Philip's old generals judged otherwise and judged better; it was not blindness to the conqueror's genius, but a just perception of what was practicable and desirable, and an instinctive dread of the unknown issues of the king's plans, which gradually estranged from him his truest counsellors; and it was an evil sign that his only close friend was a poor creature like Hephæstion, who could not boast of a single service. Then came the first conspiracy and the murder of the aged Parmenio, whose son Philotas was mixed up with it,—a crime to which Alexander was led simply through fear. The wild extravagances of grief that marked the death of Hephæstion, and of which a pyre worth two and a half millions sterling was the least, show how Alexander lost himself more and more as he broke with the Macedonian character. His last orders, cancelled at his death by Perdiccas, included an invasion of Carthage by land and sea, with a further view to Spain, and the erection to King Philip of a tomb surpassing the Great Pyramid. The extravagance of these plans was as palpable to the Macedonian soldiery as to their leaders, and they too shared the growing alienation from the monarch. There were mutinies as well as conspiracies; the soldiers were tired of following from adventure to adventure, and at the Hyphasis they had their way. In his later days Alexander was repeatedly wounded, a fact significant of a change in the spirit of the troops, for no great general would expose himself as Alexander did—for example, in storming the city of the Malli—unless his men required this stimulus.

The want of coherence in the empire was seen even while Alexander was in India. Many satraps broke all restraint, renewed the old oppressions of the Persian time, hired mercenaries again, and only awaited a fit moment for open rebellion; the generals of the army that lay in Media committed sacrilege and crimes of every kind; the treasurer Harpalus violated his trust and escaped with his plunder. Alexander, on his return, soon restored order with terrible severity, but the ferment was still at work, especially in the west, and was increased through the disbanded mercenaries of the satraps who returned to the coast. There is one event of the time of anarchy when Alexander was in India which, though passed over in the official sources of Arrian, deserves special notice as a pre-

lude of what was to come (326 B.C.). The Greeks settled in Bactria and Sogdiana rose against the Macedonians on a false rumour of Alexander's death. Three thousand of them seized the citadel of Bactra, gained the support of the natives, and, crowning their leader Athenodorus, proposed to make their way home. Athenodorus was assassinated, but his followers remained unmolested, and joined the mass of their countrymen in the general rising of the Greek military stations after Alexander's death.

One Macedonian custom Alexander had retained, that of carousing with his generals. A series of debauches in the malarious climate of Babylon brought on a violent fever, which ended in his death (13th June 323).² The object of his life, the fusion of Macedonians and Persians, was not attained. The Persians still felt themselves subject to a foreign power, and in eastern Iran this feeling was bitter. The Macedonians again had been carried by Alexander's genius far out of their true path of development into a giddy career, in which a capable and valiant nation found its ruin. Alexander did not die too soon, if he was not to see the collapse of his work.

Terrible civil wars broke out at once on Alexander's death, and lasted almost unbroken for forty-two years, tearing his work to pieces, and scattering to the winds Macedonia's claims to universal empire. There was no legitimate heir, but the name of "king" was borne by Philip (323-317), a bastard of the elder Philip, and by Alexander II., Alexander's posthumous son by Roxana (323-311). The real power lay at first with Perdiccas, who as regent governed the whole empire from Babylon, and, after Perdiccas was killed in a mutiny in the Egyptian campaign of 321, passed for the moment to Pitho and Arrhidæus, till in the same year the regency fell to Antipater. As he ruled from Macedonia, the eastern satrapies were pretty much left to themselves, but Pitho, who held the chief of these—that of Media—took the first place, and soon appears as strategus of all the upper satrapies. But his ambition united the satraps against him, and he was driven not only out of Parthia, which he had occupied after murdering the satrap Philip, but out of Media too. The satraps now joined hands with Eumenes and placed themselves under his leadership when he came to Susa in 316 as the king's strategus at the head of the argyraspsids. Pitho had meantime fled to Seleucus, satrap of Babylon, and with him sought help from Eumenes's great enemy, Antigonus. A war in Media and Susiana ensued, and Eumenes, whose military successes were constantly frustrated by disobedience and treason in his followers, was betrayed to Antigonus and put to death in 315. Antigonus, already furnished with a commission as strategus from Antipater, now lorded it over all. Pitho, still greedy of power, and thinking of conspiracies to recover it, was executed; the Persian satrap, Peucestas, who had led the allies against Pitho, was superseded, and Seleucus fled to Ptolemy. Soon, however, the other potentates united against the threatening power of Antigonus, and in the war that followed Seleucus, with some help from Ptolemy's soldiers, repossessed himself of his satrapy of Babylon,—an important event, which forms the epoch of the Seleucid era (1 Sel. = 312/311 B.C.). Presently a victory over Nicanor, who held Media for Antigonus, made Seleucus master of Media and the adjoining provinces. Antigonus had still some temporary successes, but at the end of the war Seleucus was acknowledged lord of Babylonia and the upper satrapies.

In these conflicts we can distinguish two main interests, represented by the cavalry and the infantry, or, what is

² The exact date in our calendar, which cannot be calculated from the Macedonian date 27 or 29 Dasius, is found by the aid of Pseudo-Callisthenes (Cod. A in C. Muller's ed., p. 151; Arm. Tr. in Zacher, *Pseudo-Cal.*, p. 100).

¹ *Plut., Agesil.*, 15.

312-280. the same thing, by the higher and lower nobility respectively. The former fought for the unity of the realm of Alexander, the latter for the national traditions of Macedon. In the first years the mass of the army made its wishes very distinctly felt, e.g., in the rising against Perdiccas; even the *esprit de corps* of a single body like the argyraspids had often a decisive influence on general politics. The fall of Perdiccas was really the end of the Perso-Macedonian empire founded by Alexander, as was made manifest by the fact that Babylon ceased to be the capital, and Antipater with the kings passed into Europe. On the ruin of Alexander's political structure the ruin of his house directly followed; all the political and military talent of Eumenes, its one sincere defender, could not avert the catastrophe, for Eumenes, who as a Greek was always looked on with suspicion, soon fell a victim to Macedonian jealousy. With him the kingship really came to an end, though the empty name of it lasted a little longer. The later conflicts have a different character; a certain number of leaders had risen gradually above the mass of the officers, attaching to their parties the less prominent men, and it was the conflicting interests of these leaders which were now represented in politics and war. Last of all, the particular interests of the subject provinces came to find expression in the conflicts of their chiefs, and the signal was given for the formation of distinct kingdoms. In the wild struggles for supremacy the last remains of Macedonian loyalty disappeared; when we are told that the strategoi and satraps of the upper provinces were still faithful to the royal house, and that Antigonus, as late as 315, counted on it in making war against Cassander, the loyalty can hardly be regarded as a genuine sentiment, but was merely a cover for the pride of chieftains who were willing to acknowledge a distant and merely nominal sovereign, but not to obey men who had lately been their equals. And in truth the sentiments of the upper satrapies were of little consequence. The power to give them effectual expression was lacking, and these lands, till much later, received all their political impulses from the west.

To make up for this, Iran was little touched by the civil wars; only Media and Parthia were seats of war, and that for a short time. Among the satraps Peucestas of Persia, Tlepolemus of Carmania, and Stasanor of Bactria are represented as good rulers, beloved by the natives; when Antigonus deposed Peucestas, a Persian notable told him to his face that the Persians would obey no one else, and lost his life for his frankness. Antigonus's realm was less than Alexander's by Egypt, Syria, Thrace, and Macedonia, and the tribute from it was 11,000 talents (two and a half millions sterling). The ordinary taxes, therefore, had not been raised; but Antigonus raised special war-taxes also, 5000 talents at one time in Susiana and as much in Media.

The list of satrapies at this period is known from the records of the partitions of Babylon (323), Triparadisus (321), and Persepolis (315). There were twelve upper satrapies, Persis, Carmania, Great Media, Lesser Media, Parthia with Hyrcania, Bactria with Sogdiana, Aria with Drangiana, Arachosia with Gedrosia, the Parapanisadae, India from the Parapanisadae to the Indus, India between the Indus and Hydaspes, India on the lower Indus with Pattala. Of Alexander's satrapies we miss Paratracene, included in Persis, and Tapuria, which Alexander himself seems to have joined to Parthia. The only new satrapy is Lesser Media. It was thought proper to place Media, the most important Iranian province, in the surer hands of the Macedonian Pitho, son of Craterus, but the north-west part of the province was left to the old satrap Atropates, whom Alexander had sent to Media in 328. He was father-in-law of Perdiccas, and so claimed consideration, but probably he could not have been displaced if it had been tried.¹ At the new division on

¹ On Atropates see Arrian, iv. 18, 3, and Pseudo-Cal. in C. Müller, p. 149, where after Πενέστη read Ἀρπαδάτην Ὀφειδάτην μεταστρέψαι ἀπὸ τῆς Μηδίας. His connexions in north-east Media are illustrated by the fact that he had with him at Gangamela Cadusians, Albanians, and Cacesinae.

the death of Perdiccas (321) Pitho was confirmed in Media as far as the Caspian Gates, but nothing is said of Lesser Media, which was really no longer part of the empire. Thus Atropates was the founder of a small separate kingdom, which thenceforth continued to bear his name, in Greek Atropatene, in Arabic and Persian Adharbajân, and in Armenian (more nearly conformed to the original) Atrpatakan. It was never a very important state, but is worth notice as the first new native realm within the empire of Alexander and the first symptom of the Iranian reaction against Hellenism.²

Except in the case of Media the partition of Babylon made no change in the holders of the upper satrapies. So we are expressly told (Curt., x. 10, 4, and Just., xiii. 4, 19, where for *ulteriores* read *ulterioriusque*), and the apparent exceptions to the principle are perhaps merely due to our ignorance of previous changes. The most remarkable of these is that Pitho, son of Agenor, who under Alexander shared with a Persian the satrapy of the lower Indus, is now found in India Citerior in room of Nicanor, while his old satrapy has fallen to no other than King Porus.³ We may be sure that the Macedonians sanctioned this extension of the power of the Indian king only because they could not help it, and it is probable that Porus had usurped the province in the troubles that broke out in India as soon as Alexander left it in 326 (Arr. vi. 27, 2). Thus one more province was now only nominally attached to the empire Porus, indeed, was assassinated through Macedonian intrigue between 321 and 315, but the country never again came permanently under their power.

The partition of 321 was less conservative. Nicanor was removed from Aria to Bactria, and Philip from Bactria to Parthia, superseding Phrataphernes. These changes had probably some connexion with the rising of the Greeks in Bactria and Sogdiana after Alexander's death. No Persian satraps now remained except Atropates and Oxyartes, who had connexions by marriage with the conquerors. Antigonus, to please the natives, changed this policy, and even put the Mede Orotobates in the great province of Media, but he returned at the same time to Alexander's policy of limiting the satraps' power. We hear nothing of strategoi in the satrapies from 321 to 315, so it is probable that Perdiccas and his immediate successors had allowed the satraps to hold also the military command in their provinces. Antigonus again appointed strategoi, who were always Macedonians.

In a time of civil war it is not surprising that the old disorders of the Achaemenian period reappeared. During the wars of Eumenes and Antigonus the Uxians and Cossaeans again appear as independent, and as plundering travellers. But a much more serious outbreak was that of the Greek settlers in the north-east against the Macedonians. On the news of Alexander's death in 323 the military colonies rose under Philo, the Ænian, and with 20,000 foot and 3000 horse attempted to fight their way home. They were met by Pitho, governor of Media, and defeated by an inferior force through the treachery of one of their chiefs. Pitho granted them terms if they would lay down their arms and return home, but the Macedonians refused to respect the convention; they knew Perdiccas had ordered the extermination of the rebels, and, falling on the disarmed foe, they massacred them and divided their spoil.

Such a catastrophe could not fail to embitter the relations between eastern and western Iran, between Greeks and Macedonians. It is hardly accidental that the only notice we have as to how Seleucus Nicator (reigned 312-280) came into possession of the upper satrapies is that he subdued Bactria by force of arms. To his Asiatic subjects Seleucus appeared as a king from the first; officially, and among the Greeks, he received this title only in 306. His first care was directed to India, where, probably during the wars of Eumenes and Antigonus, the Macedonian officials had been slain and obedience transferred to Chandragupta, founder of the Maurya kingdom. Seleucus crossed the Indus, but Chandragupta obtained peace on favourable terms, giving Seleucus five hundred war-elephants, but increasing his dominions by the parts of the Parapanisadae, Arachosia, and Gedrosia that lay towards

² The hypothesis that Atropatene was an important place as a refuge for the fire-worshippers has no other basis than a false etymology, Adharbajân = Fireland. It became important politically only in the later Middle Ages, when it was the gateway of the Turkish migration westward and received a Turkish population.

³ This is certain from Arrian, ap. Phot., cod. 92, p. 71, b. xl (Bekker), where Pattala is said to have obeyed Porus.

the Indus. The kings swore to this treaty and became lasting allies.

Instead of the twenty-one Asiatic satrapies of the partitions Seleucus divided his empire into seventy-two, thus diminishing the dangerous strength of the individual governors. But the old arrangement was restored later, and at the beginning of the reign of Antiochus III. we find Media, Persia, Susiana, and the district of the Erythraean Sea (separated off from Babylonia) standing each under one head (Polyb., v. 40-54). Apparently an eparch came to be appointed with military command over all the sections of each old satrapy, and gradually drew to himself all the functions of the satraps in the old régime, so that he could be spoken of indifferently as satrap or strategus.

Seleucus had built for himself a new capital, Seleucia on the Tigris, but in process of time his chief attention came to be more and more engrossed by the affairs of the west, and the seat of power was shifted to Antioch in Syria. A kingdom like that of Seleucus could hardly be governed from Syria, which lay so far from its natural centre, and about 293 or a little later Seleucus found it advisable to make over the upper satrapies to Antiochus, his son by his first marriage with Apama, daughter of Spitamenes, giving him Seleucia as his capital and his stepmother Stratonice as wife. Seleucus, like Antigonus, dreamed of regaining the whole monarchy of Alexander, and fancied himself within reach of his goal after the fall of Lysimachus, when he was himself removed by assassination. Antiochus Soter (280-261) was prudent enough to be content with what he possessed and acquiesce in the actual division of the empire into three realms, practically corresponding to the three continents.

No one had been so zealous as Seleucus in extending Alexander's schemes of colonization; he is said to have founded seventy-five cities. Among such of these as we know an unusual proportion lies in Media—the breast of Iran, as the Orientals call it—where it was doubly important to strengthen the Macedonian element. A Greek settlement in Ecbatana and the cities of Laodicea, Apamea near Rhagæ, and Europus were his foundations; Alexandria Eschata, in the extreme north-east, was strengthened by new recruits; and even beyond this city, as it seems, in the land of the Scythians, an Antioch was founded. These last undertakings probably came after the association in the empire of Antiochus, who, through his grandfather Spitamenes, had special reasons for interest in these parts. It was then that Demodamas crossed the Jaxartes and raised altars beyond it to the Apollo of Didyma, the patron god of the dynasty. Then, too, Alexander's plan of exploring the Caspian was resumed; the admiral Patrocles made a voyage of discovery, and got only just far enough to be confirmed in the false notion of a north-east passage to India,—probably, therefore, to the extremity of the peninsula of Mangishlak. It was seen, on the other hand, that the Caspian was not connected with the Mæotis; but Seleucus shortly before his death still entertained a plan for a canal from the Caspian to the Cimmerian Bosphorus. Antiochus carried on his father's work of founding cities, and built Laodicea in the east of Persia; but he gave more attention to eastern Iran. A wall of 1500 stadia (about 172 miles) was carried round the oasis of Merv, and there, at the confluence of the Margus and the Zothales, the ruined city Syriana was rebuilt as Antioch, with a circuit of 8 miles. In Aria Antiochus Soter founded Sotira, his general Achæus Achæaia; the older chief towns Artacabane and Alexandria on the Arius received new walls, the latter with a circuit of from 3 to 6 miles. Alexandropolis in Arachosia had been similarly strengthened by Seleucus. With all these efforts, however, Hellenism made no such deep impression on Iran as on the west, nor did the loosely-jointed

empire attain to anything higher than a Hellenistic reproduction of the kingdom of the Achæmenians. Even in the fragmentary records that we possess we hear from the first of rebellions little favourable to consolidation of the realm; Seleucus, like Alexander, still had an army of Macedonians and Persians together, while the later Seleucids, at least in their western wars, used natives sparingly and only as bowmen, slingers, or the like, and preferred for these services the wild desert and mountain tribes of Iran.¹ Of the Persian troops of Seleucus we read that 3000 rebelled, and were mastered and destroyed only by treachery; another and seemingly connected story speaks of a rising of 3000 Macedonians (Polyænus, vii. 39, 40). Antiochus himself executed his eldest son, Seleucus, on suspicion of conspiracy against his life; the heir of the kingdom was his second son, Antiochus II. Theos (261-246), a drunken and dissolute prince, who neglected his realm in the society of unworthy favourites.

This king is mentioned in a remarkable contemporary Indian inscription. The Seleucids were constant allies of the great Maurya (Magadha) kingdom. Between 311 and 302 Megasthenes repeatedly went as ambassador from Seleucus to Chandragupta, and Daimachus went in like manner from Antiochus to the court of Chandragupta's successor, Amitraghata (280-276). The next king, Asoka, became a Buddhist about 263. He then founded hospitals for men and beasts throughout his realm, planted places where nothing had grown before, and provided wells and grew trees along the roads for the refreshment of man and beast. Further, he tells us, he caused his example in these things to be followed by his neighbours, whether southern or western. Among the latter Antiochus king of the Greeks has the first place.

Under the weak Antiochus II. north-eastern Iran was lost to the empire. While the Seleucids were busy elsewhere, probably in the long war with Ptolemy Philadelphus, which occupied Antiochus's later years, Diodotus, viceroy of Bactria, took the title of king. The new kingdom included Sogdiana and Margiana from the first, while the rest of the East, with a single exception scarcely noticed at the time, adhered to the Seleucids.² Now the formation of a strong local kingdom, heartily supported by the Greek colonies, and likely to control the neighbouring nomads and protect its own frontiers with strictness, was by no means agreeable to the chiefs of the desert tribes who, like the modern Turcomans, had been wont to pillage the settled lands, and raise blackmail with little hindrance from the weak and distant central authority at Antioch.³ Accordingly two brothers, Arsaces and Tiridates, whose tribe, the Parnians, a subdivision of the Dahæ, had hitherto¹ pastured their flocks in Bactria, on the banks of the Oxus, moved west into Seleucid territory near Parthia. An insult offered to the younger brother by the satrap Pherecles moved them to revolt; Pherecles was slain, and Parthia freed from the Macedonians. Arsaces was then proclaimed first king of Parthia (250 B.C.). Such is the later official tradition, and we possess no other account of the beginnings of the Arsacid dynasty. But when the official account transforms Arsaces, who, according to genuine tradition, was the leader of a robber horde and of uncertain descent, into a Bactrian, the descendant of Phriapites, son of Artaxerxes II. (who was called Arsaces before his accession), and makes him conspire with his brother and five others, like the seven

¹ See the accounts of the army of Antiochus III. in Polyb., v. 79, and Livy, xxxvii. 40.

² Justin, xli. 4, 5, exaggerates rhetorically, on the basis of some such expression as that used by Strabo, in speaking of the event.

³ These brigands had destroyed two of Alexander's cities, Alexandria in Margiana and Heraclea in Media, before the time of Antiochus I.; Pliny, N. H., vi. 47, 48.

who slew the false Smerdis, we detect the inventions of a period when the Arsacids had entered on the inheritance of the Achæmenians, and imitated the order of their court. The seven conspirators are the heads of the seven leading noble houses to whom, beyond doubt, the Karen, the Suren, and the Aspahapet belonged.¹ And further, genuine tradition does not know the first Arsaces as king of Parthia at all, and as late as 105 B.C. the Parthians themselves reckoned the year (autumn) 248/247 as the first of their empire.² But 248 is the year in which Arsaces I. is said to have been killed, after a reign of two years, and succeeded by his brother, who, like all subsequent kings of the line, took the throne-name of Arsaces. The first Arsaces must have existed, for he appears as deified on the reverse of his brother's drachmæ, but he was not king of Parthia. Nay, we have authentic record that even in the epoch-year 248/247, the year of the accession of Tiridates, Parthia was still under the Seleucids. These contradictions are solved by a notice of Isidore of Charax (*Geog. Gr. Min.*, i. 251), which names a city Asaak, not in Parthia, but north-west from it, in the neighbouring Astauene, where Arsaces was proclaimed king, and where an everlasting fire was kept burning. This, therefore, was the first seat of the monarchy, and Pherecles was presumably satrap of Astauene, not eparch of Parthia.

Seleucus
II.

Arsaces
Tiridates
in
Parthia.

The times were not favourable for the reduction of the rebels. When Antiochus II. died, the horrors that accompanied the succession of his son Seleucus II. Callinicus (246-226) gave the king of Egypt the pretext for a war, in which he overran almost the whole lands of the Seleucids as far as Bactria. Meantime a civil war was raging between Seleucus and his brother Antiochus Hierax, for whom the Galatians held, and at the great battle of Ancyra in 242 or 241 Seleucus was totally defeated and thought to be slain. At this news Arsaces Tiridates, whom the genuine tradition still represents as a brave robber-chief, broke into Parthia at the head of his Parnians, slew the Macedonian eparch Andragoras, and took possession of the province.³ These Parnian Dahæ were a branch of the Dahæ who lived beyond the Sir Darya and the Sea of Aral (the Tanais and Mæotis of Strabo, xi. p. 515, and Curt., vi. 2, 13, 14), and were called Xandians or Parnians; but, in consequence of internal dissensions, they had migrated at a remote date to Hyrcania and the desert adjoining the Caspian.⁴ Here, and in great measure even after they conquered Parthia, they retained the peculiarities of Scythian nomads. The Parthian language is described as a sort of compound between Median and Scythian; and, since the name of the Dahæ and those of their tribes (Strabo, xi. p. 511) show that they belonged to the nomads of Iranian kin, who in antiquity were widely spread from the Jaxartes as far as the steppes of south Russia, we must conclude that the mixed language arose by the action and reaction of two Iranian dialects, that of the Parthians and that of their masters.⁵ Their nomad costume the Parnians in Parthia gradually gave up for the Median dress, but they kept their old war-dress, the characteristic scale-armour, com-

pletely covering man and horse. The founder of the empire appears on coins in this dress, with the addition of a short mantle, and so again does Mithradates II. The hands and feet alone are unprotected by mail; shoes with laces, and a conical helmet with flaps, to protect the neck and ears, complete the costume.⁶ The conquerors of Parthia continued to be a nation of cavalry; to walk on foot was a shame for a free man; the national weapon was the bow, and their way of fighting was to make a series of attacks, separated by a simulated flight, in which the rider discharged his shafts backwards. Many habits of the life they had led in the desert were retained, and the Parthian rulers never lost connexion with the nomad tribes on their frontiers, among whom several Arsacids found temporary refuge. Gradually, of course, the rulers were assimilated to their subjects; the habitual faithlessness and other qualities ascribed to the Parthians by the Romans are such as are common to all Iranians. The origin of the Parthian power naturally produced a rigid aristocratic system: a few freemen governed a vast population of bondsmen; manumission was forbidden, or rather was impossible, since social condition was fixed by descent; the 10,000 horsemen who followed Surenas into battle were all his serfs or slaves, and of the 50,000 cavalry who fought against Antony only 400 were freemen.

Arsaces Tiridates soon added Hyrcania to his realm and raised a great host to maintain himself against Seleucus, but still more against a nearer enemy, Diodotus of Bactria. On the death of the latter, however, the common interests of the Parthians and Bactrians as against the Seleucids brought about an alliance between Arsaces Tiridates and Diodotus II. With much ado, Seleucus had got the better of his foreign and intestine foes and kept his kingdom together, and in 238 or a little later, having made peace with Egypt and silenced his brother, he marched from Babylon into the upper satrapies. Tiridates at first retired and took shelter with the nomadic Apasiacæ, but he advanced again and gained a victory, which the Parthians continued to commemorate as the birthday of their independence. Seleucus was unable to avenge his defeat, being presently called back by the rebellion stirred up by his aunt Stratonice at Antioch. This gave the great Hellenic kingdom in Bactria and the small native state in Parthia time to consolidate themselves. Tiridates used the respite to strengthen his army, to fortify towns and castles, and to found the city of Dara or Dareium in the smiling landscape of Abévard. Tiridates, who on his coins appears first merely as Arsaces, then as King Arsaces, and finally as "great king" (probably in imitation of Antiochus Magnus), reigned thirty-seven years, dying in 211/10. His nation ever held his memory in almost divine honour.

Seleucus III. Soter (226-223) died early, and was followed by Antiochus III. Magnus (223-187), who in his brother's lifetime had ruled from Babylon over the upper satrapies. Molon, governor of Media, supported by his brother Alexander in Persis, rose against him in 222 and assumed the diadem.⁷ The great resources of his province, which followed him devotedly, enabled Molon to take the offensive and even to occupy Seleucia after a decisive battle with the royal general Xenætas. Babylonia, the Erythræan district, all Susiana except the fortress of Susa, Parapotamia as far as Europus, and Mesopotamia as far as Dura were successively reduced. But the young king soon turned the fortunes of the war. Crossing the Tigris in person, he

¹ Moses of Chorene (ii. 28) knows only these three lines besides the Arsacids. Other Armenian historians, however (Langlois, i. 109, 199), know four lines of Arsacids which may have taken the place of lost families.

² See the cuneiform tablet in G. Smith, *Assyrian Discoveries*, p. 389, which agrees with Euseb., *Chron.*, p. 299 (Aucher).

³ Justin, xii. 4, 2. What is said of Andragoras in xii. 4, 12, rests on a slip of the memory.

⁴ The common tradition connects the migration with the conquests of the Scythian king Indysus, a contemporary of Sesostris. It adds that Parthian means "fugitive" or "exile" (Zend, *pēritu*). But the name Parthava is found on the inscriptions of Darius long before the immigration of the Parnians.

⁵ An idea of the difference between the two may be got from the fragments of Khârezmian, preserved by Bérûni.

⁶ Mithradates I. was the first to adopt the robes of a Persian great king.

⁷ The coins of "King Molon" show that his rebellion has nothing to do with the King Antiochus of C. I. G., 4458. The latter, appearing in a list of deified kings arranged in the order of their deification or death, is the eldest son of Antiochus III., who died in 193.

penetrated into Apolloniatis and cut off Molon's retreat. Molon was forced to accept battle near Apollonia; his left wing passed over to the enemy, and, after a crushing defeat, he and all his kinsmen and chief followers died by their own hands (220). Antiochus now marched to Seleucia to regulate the affairs of the East. He used his victory with moderation, mitigating the severities of his minister Hermias; but he had effectually prevented the rise of a new kingdom in the most important province of Iran. In the same year, before he returned to Syria, he marched across Mount Zagrus against the aged Artabazanes, the most powerful of the native princes, who ruled not only Atropatene but the neighbouring lands, especially east Armenia (Polyb., v. 55, 7), and by the terror of his approach extorted an advantageous treaty.

A period followed in which the king was fully occupied in the west, but after this he began a campaign of several years in the upper satrapies, to which his contemporary renown was mainly due. First he regulated the affairs of the Armenian kingdom of Arsamosata, whose king, Xerxes, had fallen by the intrigues of his own wife, a sister of Antiochus.¹ Then, descending the Euphrates by ship to Seleucia, he appeared in Media in 209, hardly as an enemy, though he seized the gold and silver decorations of the temple of the goddess Aene in Ecbatana. Thence with 100,000 foot and 20,000 horse he marched against the new Parthian king, Arsaces II.,² son and successor of Tiridates. Crossing the desert obliquely to Hecatompylus, he forced his way into Hyrcania over Mount Labus (the eastern part of the Elburz mountains), defeating the Parthians on the summit, and besieged the fugitives in Sirynca. The Parthians planned an escape by night, and massacred the Greek residents to prevent its betrayal; but the plan failed. The city yielded, and the war ended in a treaty which left Arsaces his kingdom, but beyond question reduced him to a vassal. In 208 began the much more serious war with Bactria. Here the successors of Diodotus had been dethroned by a usurper, Euthydemus of Magnesia, whose coins indicate a long reign. Euthydemus tried to defend the line of the Arius (Herirud), but Antiochus effected a passage a little west of the city Guriana,³ inflicted a decisive defeat on the hostile cavalry, and forced Euthydemus to retreat to Zariaspa. But the siege of Bactra, the capital, proved tedious, and the war made little progress. Antiochus himself opened negotiations and was impressed by the declaration of the Bactrian king, that if he were reduced to extremities he must call in the help of the nomads, which would be fatal to the Greek civilization of the land. At length, in 206, a peace was arranged, and Antiochus was visited in his camp by Demetrius, the youthful son of Euthydemus, who pleased the king so well that he betrothed to him his daughter; Euthydemus was left on his throne, and the two powers swore an alliance offensive and defensive, which cost Bactria no more than certain payments of money, the victualling of the Macedonian troops, and the surrender of the war-elephants. The Bactrian Greeks were grateful for this moderation; their memorial coins place Antiochus Nicator with Euthydemus Theos, Diodotus Soter, and Alexander Philippi among the founders of their political existence.⁴ Antiochus next

crossed the Paropanisus into the valley of Cabul, renewing the friendly relations of his dynasty with the Indian king Subhagasena, and receiving from him 150 war-elephants. The return march was through Arachosia and Drangiana, the winter being spent in Carmania. Thus it appears that south of the Paropanisus political relations had remained unchanged for a hundred years, and the successes of Antiochus in Upper Asia, together with the prudent limitation of his schemes to what was practicable, did much to give permanence to the empire in the East, notwithstanding its many points of weakness. The series of victorious campaigns was concluded by a maritime excursion in 205 against the rich merchant-community of Gerrha on the Arabian shore of the Persian Gulf, in which Antiochus again showed his moderation, receiving from the Gerrhæans a gift, 500 talents of silver, 1000 talents of incense, and 200 talents of oil of myrrh, but leaving them the freedom they had enjoyed from time immemorial.

Under very different circumstances did Antiochus revisit the eastern lands eighteen years later, his prestige broken by the war with Rome, and his position as a great power shattered in a way that could not fail ultimately to react on his Asiatic subjects. His most urgent difficulty, however, lay in an exhausted treasury, and the demands of Rome for a heavy war-tribute. Antiochus came to Susa in search of money and seized a pretext to plunder the rich and famous temple of Bel in Elymais; but the attempt was fatal to its author, who was destroyed, together with his followers, by a rising of the Elymæans (187). This, no doubt, was the moment when Elymais became independent and formed a small separate kingdom in the upland part of Susiana.

Antiochus was followed in the kingdom by his sons, first the weak Seleucus IV. Philopator (187-175), and then the gifted Antiochus IV. Epiphanes (175-164), who had a clear insight into the evils that were sapping the empire, but attempted to cure them and bind the loose complex of provinces more closely to the centre with such impatience and violence that he only hastened the fall of his dynasty. He too, like all the later Seleucids, was in chronic want of money, and it was chiefly to raise tribute that he marched into the East in 166. He first made for Greater Armenia and the neighbouring Sophene, which had never paid much more than nominal allegiance to Macedon, and after the defeat of Antiochus the Great by Rome (189) had formed themselves into kingdoms under Artaxias and Zadiades, the former strategi. Antiochus penetrated into Armenia and took Artaxias prisoner, but restored him to his kingdom. He was next called by urgent affairs to the shores of the Persian Gulf. Over the Persians we read that his lieutenant in Mesene gained a double victory in one day, by sea and by land, at the promontory of Naumachæa⁵ over against the Carmanian coast. This victory, however, implies that Persis had already cast off the Macedonian yoke,⁶ and that the new kingdom had already extended its sway over the opposite coast of 'Omân, as we know to have been the case about 70 A.D.⁷

At the mouth of the Tigris Antiochus restored an old city of Alexander's and called it Antioch;⁸ it had been destroyed by an inundation, a sign that the negligent government of the later Seleucids had let the canal system,

¹ John of Antioch, in Müller, iv. 557.

² This king seems to have had Arsaces as his proper name, for Justin always uses the proper name of Parthian kings. Vailant's conjecture, which gives him the name of Artabannus I., has no basis.

³ For Ταρκεπλὰρ, Polyb., x. 49, where all editors adopt the geographically impossible Ταρκεπλὰρ of Reiske, read τὰ Τερπλὰρ, comparing Ptol., vi. 10, 4.

⁴ That Antiochus Nicator is Antiochus III. Magnus follows from Malalas, l. 261; if the style of his Bactrian coins, resembling as they do those of Diodotus, really demands an earlier date, they must belong to the last of the Diodotides not mentioned by the authors, not, as the numismatists enjoin, to Antiochus II.

⁵ Pliny, vi. § 162; but one is tempted to suspect a corruption of the text and read Drymatina, Macæ; horum, &c.

⁶ Strabo, xv. p. 736, gives a general confirmation of the existence of a kingdom here in the time of the Macedonians.

⁷ Periplus M. E. (Geog. Gr. Min., i. 283). The connexion of the opposite coasts is natural; in the 10th century the Buwaihids ruled over Omân.

⁸ Pliny, N. H., vi. 130, says "Antiochus quintus regum," reckoning Antiochus Hierax. We call Eupator Antiochus V., but he cannot be meant, and there is no way of counting which would make Sidetes the 5th Antiochus.

191-171. restored by Alexander, fall again into ruin. Another of Epiphanes's measures directed to the strengthening of the Hellenic element in the East was the occasion of the change to Epiphaneia of the name of the Median capital. But against these useful efforts must be set the plundering of the temples of the barbarians, a sure way to exhaust Oriental patience, and one which involved the king in a catastrophe so like to that of his father that we should suspect some confusion were the accounts not so well confirmed.¹ The king, we are told, heard of a rich temple of the goddess Nanæa in Elymais stored with the gifts of many generations; he marched out to plunder it, but was driven back by the natives to Babylon. In Persis he received tidings of the formidable rising in Judæa, excited by similar acts of violence; apparently he was then on his way against the Persian rebels, but on the journey he died of consumption in the Persian town of Tabæ (164).

Antiochus had given Mesene with its capital, Antioch, to a native dynast, Hyspaosines, as satrap; and, when Antioch, like its predecessor Alexandria, was soon ruined by floods, the city was removed to an artificial hill and protected by an embankment. Under the name of Spasinu Charax (Hyspaosines's pile-town) the new city rose to commercial prosperity, and became the capital of the petty kingdom of Characene, which probably became independent at the death of Antiochus. Thus the Seleucid empire was now quite cut off from the Persian Gulf by a circle of small native states.²

Now followed the troubled reign of the child-king Antiochus V. Eupator (164-162), which was cut short by Demetrius Soter (162-150). The latter was constantly persecuted by the Romans, who raised enemies against him on every side, and so the times seemed to invite a renewal of the enterprise of Molon. Since the time of Epiphanes the satrap of Media had been one Timarchus of Miletus, brother of the intriguing and influential treasurer Heraclides, and, like the latter, a favourite of the late king, who had often sent him to Rome. Knowing the ground there, he went to Rome, and easily persuaded the senate to grant him the title of king (161).³ He made a treaty with Artaxias of Armenia against Demetrius, compelled the neighbours of Media to acknowledge him, and extended his power as far as Zeugma, and finally over Babylonia.⁴ But he fared in the end no better than Molon. The Babylonians were oppressed and hated him, and the self-conceived majesty of Timarchus, who on his coins called himself "the Great," soon broke down in conflict with Demetrius, one of the most gifted princes of a highly-gifted dynasty. Timarchus was slain, his brother fled, and the victor was saluted as "saviour" (Soter) by the grateful Babylonians (160). It was a great victory for Demetrius; he had saved the best part of Iran for his monarchy, and he had shown all who speculated on the support of Rome that the decrees of the republic were powerless in regions to which its arm could not reach.

The true danger for the Macedonian monarchy came not from rebellious lieutenants but from the ever stronger reaction of the Oriental element, of which the little state of Parthia was the most vigorous champion. The kings of Parthia had long kept quiet after the war with Antiochus the Great. Phriapatius, successor of Arsaces II, who reigned fifteen years (c. 191-c. 176), calls himself on his coins

"Arsaces Philadelphus," perhaps because he had married a sister, and (first of all Parthian kings) Philhellen.⁵ By the last title he presents himself, at a time when the Seleucid power was sinking, as the protector of his present and future Greek subjects. His eldest son and successor, Phraates I. (Arsaces Theopator of the coins), conquered the brave Mardian highlanders and transplanted them to Charax in the neighbourhood of the Caspian Gates, a proof that the Parthians had already detached Comisene and Choarene⁶ from Media (Strabo, xi. 514), probably just after the death of Antiochus the Great.

About 171 Phraates died and left the crown not to his sons but to his brother Mithradates (Arsaces Epiphanes and apparently also, on tetradrachms of 139, 138, Arsaces Philhellen), a prince of remarkable capacity, who made Parthia the ruling power in Iran. His first conquests, it would seem, were made at the expense of Bactria.

The kingdom of Bactria had made vast advances under Euthydemus, whose son Demetrius crossed the Indian Caucasus and began the Indian conquests, which soon carried the Greeks far beyond the farthest point of Alexander. The Punjab was reduced and the city of Çakala, under the name of Euthydemia, became the capital of the Indian conquests; but besides this it appears that Demetrius himself marched down the course of the Indus, conquered Pattala and the kingdoms of Saraostes (Surāshtra) and Sigerdis, probably the district of the commercial city Barygaza. The object, it is plain, was to reach the sea and get a share in the trade of the world; and it is possible that the extension of the power of the Bactrian Greeks over Chinese Tartary as far as the Seres and Phaunians had a similar object, viz., to protect the trade-route with China along the Tarym river. For the Seres are the Chinese, and the Phauni, according to Pliny,⁷ lay west of the Attacori (the mythical people at the sources of the Hoang-ho) and east of the Tochari, whose earlier settlements were east of Khoten. They occupied, therefore, the very region which, according to Chinese sources, was then held by a nomadic pastoral people, the Tibetan No-kiang. History shows that Chinese Tartary is easily conquered from the Oxus and Jaxartes, but very hard to hold, and there is thus no reason to doubt the truth of the Bactrian advance in this direction. Strabo, unluckily, does not tell us whether the campaign was made by Demetrius; it must have fallen before 177, when the great conquests of the Hiung-nu began, but after 201, when the founder of the Han dynasty regained the country as far as the Great Wall, and put China in a position to take part in the trade of inner Asia. This is precisely the period of the greatest power of the Greeks in Bactria. Demetrius, having succeeded his father, was displaced in Bactria by the able usurper Eucratides, some time between 181 and 171.⁸ A thousand cities obeyed Eucratides, and both he and his rival Demetrius sought to extend the Greek settlements, the one founding Eucratidia in Bactria, the other Demetrias in Arachosia. Now Justin tells us that the Bactrians were so exhausted by wars with the Sogdians, Arachosians, Drangians, Arians, and Indians that they at length fell an easy prey to the weaker Parthians; but Eucratides he describes as a valiant prince, who once with 300 men held out during five months, though besieged by 60,000 men of Demetrius, king of India, and then, receiving succours, subdued India.

¹ Comp. Gran. Licinian., p. 9, with the first confused account in the letter of the Jews to Aristobulus, 2 Mac. i. 10 sq.

² Hyspaosines was not an Arab, as Pliny states, vi. § 139. The Iranian names of the older kings of Characene justify Juha's account of their extraction.

³ The corrupt passage of Diodorus, *Exc. Escur.*, 13, ought to run *αὐτὸς, Τιμάρχῳ ἐξείναι καὶ αὐτῷ βασιλεὺς εἶναι*.

⁴ In Diod., *l.c.*, read *τῆς Βαβυλωνίας* for *τῆς βασιλείας*. Hence the error of Appian, who does not mention Media at all.

⁵ For these and other Parthian coins P. Gardner's work is the authority. One of them is dated 125 Sel. = 187 B.C.

⁶ Choarene contains the only Greek city in the older conquests of the Parthians, and the coin with Greek date and title is of the year of Antiochus's death.

⁷ *N. H.*, vi. 55, where read "Phuni et Thocari."

⁸ Sallet's numismatic arguments, which place Eucratides about 200 B.C., are not conclusive, and do violence to the other testimonies.

Characene.

Demetrius I.

Antiochus the Great.

This implies that besides the kingdom of Bactria and that of Demetrius—the latter now confined to India and probably to the lands east of the Indus—there were independent states in various districts still Seleucid in 206. Justin's statement is confirmed by the coins, which also show that Eucratides came forth as victor from a series of wars with the lesser states. Sogdiana, according to Chinese authorities, was occupied by the Scythians in the lifetime of Eucratides; Antimachus, to judge from a naval victory recorded on his coins, once reigned on the lower Indus; the principal place where coins of him and his successor Antialcidas have been found is the Cophen valley; the latter prince, who borrows from Antiochus Epiphanes the title "Nicephorus," may be viewed as his younger contemporary. The neighbouring realm of Plato was ephemeral, but his money is unique as giving a date by the Seleucid era (165 B.C.). Pantaleon and Agathocles, whose coins are chiefly to be found in Begram, Cabul, Ghazni, Kandahar, and Sistan, were doubtless kings of Arachosia and Drangiana. Before this these countries belonged to Demetrius, and even, as the coins show, to his father Euthydemus, who cannot have been contemporary with the last years of Antiochus the Great, so that they were probably given as a dowry to his daughter when she married Demetrius. This marriage really took place, for the Seleucid name Laodice is found among the Bactrian Greeks. The victories of Eucratides are proved by his surrappé coins. Thus he restruck coins of Antialcidas and appears posthumously as "God of the city Kariçi" on money of Apollodotus, king of the Indian Heliocles, co-regent and successor of Eucratides, and Strato, apparently the successor of Apollodotus, restruck each the money of the other, and Heliocles's name also appears over what is perhaps a coin of Philoxenus, who reigned in the region of Peshawar.²

On his way back from the conquest of India Eucratides was murdered by his son and co-regent, probably Heliocles.³ The date of this murder may be fixed by that of Demetrius, who must have been born not later than 224, and may be taken to have lost his kingdom not later than 159. Eucratides cannot, according to Justin's account, have lived many years longer. This would give c. 155 B.C. as the lowest possible date for the death of Eucratides. A little before this time notable signs of concession to the rising spirit of the natives appear on the coins. The medals of the older Greek kings follow the Attic standard and have only Greek legends, but from the time of Demetrius the reverse bears a legend in the Indian language spoken in the Cabul valley and in the so-called Arianian character, a letter derived from the Semitic. At the same time we begin to find square coins, and in the later part of the reign of Eucratides a new native standard begins to prevail.⁴

In the midst of the civil wars, which became more serious after the death of Eucratides, Mithradates of Parthia began to extend his dominions at the expense of Bactria; even in the lifetime of Eucratides he succeeded in annexing the satrapies of Aspiones and Turia. These seem to have covered Aria, for the Hindu-Kush is named as the eastern boundary of the Parthians (Justin, xli. 6, 8),—whence perhaps the mention of Arians amongst the foes of Eucratides. Another account makes Mithradates rule as far as India, and declares him to have obtained without war the old kingdom of Porus, or the rule over all nations between the Indus and the Hydaspes.⁵ The two accounts are reconciled by Chinese records, which tell that c. 161 B.C. the nomad people Sse broke into the valley of the Cophen and founded a kingdom in the very place of the

Parthian conquests in India, which must therefore have been ephemeral. This fact has its importance, as illustrating the way in which the internal wars of the east Iranian Greeks helped to prepare the ground for the Scythian invasion. After this success in the east Mithradates turned his attention to the west, where the chances of success were not less inviting. Demetrius had at length fallen before a coalition of the neighbouring sovereigns, powerfully supported by the Romans through their instrument the exile Heraclides. A pretender, who called himself son of Antiochus Epiphanes, was put up as king by the coalition; he appeared in Syria in 152, and slew Demetrius in battle in 150. The pretender, who took the name of Alexander Theopator Euergetes, proved quite incompetent, and lost the support of Ptolemy Philometor, who in 147 put up Demetrius, the son of Demetrius, against him. At length, in 145, Alexander, utterly defeated by Ptolemy, was slain in his flight by an Arab chieftain. Demetrius II. Nicator, however, soon made himself bitterly hated, and a certain Diodotus of Casiana, in the region of Apamea, a man of Deme-
trius I
trian origin, was able first to set up against him Alexander's young son Antiochus Epiphanes Dionysus, and then to murder his puppet and proclaim himself as King Trypho. Five years of fighting drove Demetrius out of the greater part of Syria. Such was the state of the empire when war broke out between Media and Parthia, and was finally decided in favour of the latter. Mithradates left Bacasis in Media and turned to Hyrcania. Media in this account appears as independent, and that this was so is confirmed by the notice in Diod., *Exc. Esc.*, 25, that a certain Dionysius "the Mede" raised Mesopotamia in 142 against Trypho to avenge the murder of the young Antiochus. Dionysius must be a son of Timarchus; Heraclides, when he installed Alexander in Syria, must have thought also of his own family, and raised it again to the throne of Media, which the senate had already recognized as a separate kingdom. But the short-lived independence of Media was, as we have seen, soon cut short by Mithradates, who did not lose the opportunity afforded by the civil wars of Syria in 147. Babylonia followed the fate of Media; Demetrius's lieutenant was defeated; and the whole province, with its capital Seleucia, fell into the hands of the Parthians. Thus the East was finally lost to the Macedonians.

The change of rule was not well received by the new subjects of Parthia, least of all by the Greeks and Macedonians of the upper provinces, who sent embassy after embassy to Demetrius. That prince, who had now little to lose in Syria, at length accepted their invitation to come and take the rule over them, hoping that if he could secure the upper satrapies they would help him against Trypho. In 140 he marched into Mesopotamia, and thence by Babylon to the upper provinces. He was well received by the natives, and even the small native states made common cause with him against the proud barbarians, whose neighbourhood they felt as oppressive. He was joined by the Persians and Elymæans, and the Bactrians helped him by a diversion, appearing now for the last time as an independent people. At first things went well, and the Parthians were defeated in several battles, but in Media in 139 Demetrius was surprised by the lieutenant of Mithradates during negotiations for peace; his forces were annihilated, and he himself taken prisoner and dragged in chains through the provinces that had joined his cause. The Parthian king received his captive with favour and assigned him a residence and suitable establishment in Hyrcania. He even gave him his daughter Rhodogune, and promised to restore him to his kingdom, but this plan was interrupted by death.

Mithradates's last campaign was against the king of Elymais, Demetrius's ally; the rich temples of Elymais.

¹ I.e., Charis, a Greek town, which Appian, *Syr.*, 57, placed in Parthia with two other towns which really lay in Aria.

² See in general, A. v. Sallet's "Nachf. Alex. d. Gr.," in *Zeitschr. f. Num.*, vi., and Cunningham, *Num. Chron.*, ix. x.

³ This is the usual assumption, for Heliocles appears on coins both as contemporary and as successor of Eucratides, and there is a surrappé coin of his which was originally struck by Eucratides for the marriage of Heliocles with Laodice (perhaps a daughter of Demetrius by his Seleucid queen). But there is much to be said for the view of Cunningham (*Journ. As. S. Beng.*, 1840, p. 869; *Num. Chron.*, ix. 239), that the murderer was Apollodotus, whose title "Philopator" always points to a co-regency.

⁴ Sallet, *op. cit.*, p. 25 sq.

⁵ This account goes back through Oros., v. 4 (following Livy), and Diod., p. 597, to the excellent authority of Posidonius.

that of Athena, and that of Artemis or Nanæa in Azara yielded him a booty of 10,000 talents (£2,258,000), and the great town of Seleucia on the Hedyphon was taken¹ (Strabo, xvi. p. 744). The country was brought under Parthia, but continued to have its own kings. The coins make it likely that Mithradates simply set up a new dynasty, a branch of his own house.² Mithradates died in a good old age in 138, or a little later.³ His memory was revered almost equally with that of the founder of his house, but his real glory was much greater, for it was he who made Parthia a great power. He is praised as a just and humane ruler, who, having become lord of all the lands from the Indian Caucasus to the Euphrates, introduced among the Parthians the best institutions of each country, and so became the legislator of his nation.

The divisions of the empire which he founded can be sketched by the aid of an excerpt from the itinerary of Isidore of Charax (at the beginning of the Christian era) and of Pliny (*N. H.*, vi. 44, 112). The empire was divided into the upper and lower kingdoms, separated by the Caspian Gates. The lower kingdoms were seven—(1) Mesopotamia and Babylonian, (2) Apolloniatis, (3) Chalonitis,⁴ (4) Carina,⁵ (5) Cambadene, (6) Upper Media, (7) Lower or Rhagian Media.⁶ The upper kingdoms were eleven—(8) Choarene, (9) Conisene,⁷ (10) Hyrcania, (11) Astauene, (12) Parthyene, (13) Apanartecene,⁸ (14) Margiana, a part of Bactria, (15) Aria, (16) the country of the Anauans (a division of Aria), (17) Zarangiana,⁹ (18) Arachosia, now called "White India." The eighteen Parthian kingdoms thus correspond to six old satrapies; the new divisions were probably derived from the provinces of Seleucus Nicator (see especially Posidonius in Strabo, xvi. p. 749). But upper and lower provinces have changed their meaning; apart from Arachosia, the upper provinces are the old conquests of the Parthians before they occupied Media and became lords of Iran, and the lower all the later conquests in the west. The Parthians, we see, gave much less attention to the west than did their predecessors, and they still left Mesopotamia as the only great satrapy, and perhaps first added Babylonian to it when Ctesiphon became the residence of the Arsacids. We note also that they cared little for reaching the sea, which they can have touched only for a little way at the mouth of the Euphrates; and even here they allowed the petty Characene quite to outstrip them in competing for the great sea-trade. As compared with the older Macedonian empire, the Parthian realm lacked the east Iranian satrapies, Bactria with Sogdiana, and the Paropamisadae, and also the three Indian ones, which, with Paratracene, or, as it was afterwards called, Sacastane, remained under the Bactrian Greeks and their successors. In the north they lacked Lesser Media, which had long been an independent state, and in the south they lacked Susiana, which now belonged to Elymais, and the satrapies of Persis and Carmania, which the Persians held along with the

western part of Gedrosia (*Per. Mar. Er.*, § 37). In the extreme west they lacked Arbelitis proper, which formed a small kingdom under the name of Adiabene, first mentioned in 69 B.C. (Plut., *Lucullus*, 27). The kingdom of Mannus of Orrha (Μάννου "Oppas, so read) in north Mesopotamia, which according to Isidore (§ 1) reached a good way south of Edessa, seems also to have been independent, and, like Adiabene, probably existed before the Parthian time. From these small kingdoms the Parthians asked only an acknowledgment of vassalship. When Parthia was vigorous the vassalship was real, but when Parthia was torn by factions it became a mere name (Strabo, xvi. p. 732). The relation was always loose, and the political power of Parthia was therefore never comparable to the later power of the Sasanians. Arsaces Tiridates and his successors called themselves "great king," Mithradates, as overlord of the minor kingships, first bore the title "great king of kings." The title seems to have been conferred, not assumed in mere boastfulness; for (apart from a single usurper in times of disorder who calls himself "king of kings") none of his successors bears it until Phraata III., seventy years later,—a fact clear from the coins, but hitherto unnoticed. The nobility had great influence in all things, and especially in the nomination of the king, who, however, was always an Arsacid. Next to the king stood the senate of *probuli*,¹⁰ from whom all generals and lieutenant-governors were chosen. They were called the king's kin, and were no doubt the old Parthian martial nobility. A second senate was composed of the Magians and wise men, and by these two senates the king was nominated (Posidonius, ap. Strabo, xi. p. 515). The Parthians were, in fact, very pious, conscientious in observing even the most troublesome precepts of Zoroastrianism as to the disposal of dead bodies, which were exposed to birds of prey and dogs, the bare bones alone being buried (Justin, xli. 3, 5, 6). When the Parthian prince Tiridates visited Nero he journeyed overland that he might not be forced to defile the sea when he spat, and his spiritual advisers the Magians travelled with him (Plin., xxx. 17). The Magians were not, indeed, so all-powerful as under the Sasanians, but it is quite a mistake to think that the Parthians were but lukewarm Zoroastrians.

The complete annihilation of the Macedonian empire in Iran was closely followed by the destruction of Greek independence in eastern Iran, north of the Paropamisus. The last mention of independent Bactria is in 140; no king of Bactria and Sogdiana is known from coins after the parricide Heliclos. Classical writers give only two laconic accounts of the catastrophe. Strabo says that "the nomadic peoples of the Asii, Pasiani, Tochari, and Sacaraucae (so read for Σακάραυλοι καὶ in xi. p. 511), dwellers in the land of the Sacæ, beyond the Jaxartes [in its middle course], opposite to the Sacæ and Sogdians, came and took Bactria from the Greeks." Trogus (*Prol.*, xli.) names the Scythian peoples Saraucæ and Asiani.¹¹ Fortunately the lively interest taken by the Chinese in the movements of the nomads of Central Asia enables us to fill up this meagre notice from the report of the Chinese agent in Bactria in 128, as recorded a little later by the oldest Chinese historian, and from other notices collected by the Chinese after the opening of the regular caravan route with the west, about 115, and embodied in their second oldest history.¹² According to these sources the Yue-chi, a nomad people akin to the Tibetans, lived aforesaid between Tun-hoang (i.e., Sha-chau) and the Kilien-shan mountains, and about 177 were subjugated, like all their neighbours, by the Turkish Hiung-nu. Between 167 and 161 they renewed the struggle without success; Lao-shang, the great khan of the Hiung-nu, slew their king Chang-

In giving this order of events it is assumed that the capture of Demetrius, omitted in Justin's epitome of Trogus, xli. 6, comes after § 7, not, as has been assumed since Vaillant, after § 8. When Trogus mentions such unimportant events as the nomination of Bacasis to Media and the visit of Mithradates to Hyrcania, we must suppose that these facts bore on others of more note, that Bacasis was the captor of Demetrius, and that the royal court was in Hyrcania when the captive was brought before the Parthian king.

² Coins of the venerable Camuascres, whom Pseudo-Lucian *Maecrobii* calls a Parthian, but separated from the great kings by Armenia and Characene, have been brought from Baghdad and Shuster, and can hardly have been struck elsewhere than to Elymais. He was preceded by an Arsaces, not one of the main Parthian line. See Sallet, in *Z. f. Num.*, viii. 207 sq.

³ Demetrius had married Rhodogune when Antiochus VII. married his deserted wife Cleopatra in 138, and there were children by the marriage, though not earlier than the time of Demetrius's second attempt to escape; hence both attempts must have been after the death of Mithradates.

⁴ These three make up the old satrapies of Mesopotamia (with Arbelitis) and Babylonian. The whole land between the Euphrates and the Tigris was now put together, and the countries to the east of the Tigris detached, Apolloniatis being taken from Babylonian, and Chalonitis from Arbelitis.

⁵ In Isid., § 4 (*Geog. Min.* i. 250), read Ἐντεῦθεν Μηδία καὶ χώρα Κίρινα, ἥτις κατέχει σχολοῦντος κῆρ, ἡ ἀρχὴ αὐτῶν.

⁶ Nos. 4 to 7 are all parts of the old satrapy of Media.

⁷ The two most eastern parts of Media that were the first Parthian conquests.

⁸ Nos. 10 to 13 form the old satrapy of Parthia and Hyrcania.

⁹ Nos. 15 to 17 belong to the old satrapy of Aria with Drangiana. Sacastane, another part of this satrapy, was not Parthian, but, as Isidore remarks, belonged to the Sacæ.

¹⁰ For *populorum* (Just., xli. 2, 2) = synonym of *senatus* (xlii. 4, 1) is wanted; write, therefore, *probulorum*.

¹¹ Modern writers since Bayer make the Greek kingdom in Bactria fall before the Parthians, appealing to Just., xli. 3, 2. But the epitome here contradicts its source, and confounds the fall of the kingdom with the earlier loss of two satrapies to the Parthians under Eucratides. The right account is to be found elsewhere in Justin himself, ii. 1, 3; 3, 6.

¹² Comp. the *Sseki* of Ssematsien (100 B.C.), tr. by Brosset, *Nour. Journ. As.*, ii. 418 sq., and the *Annals* (of the first Han) of Panku (80 A.D.), excerpts from which are given by Ritter, *Erchk.*, pt. vii. bk. 3, pp. 604-728; Deguignes, *Hist. des Huns*, i. 2, p. lxiv sq., 41 sq., and "Recherches sur quelques événements," &c., in *Mém. Ac. Inscr.*, xxv. 17 sq.; Abel Rémusat, on the *Fo-shoué-ki*, p. 37 sq. The account given in the text is based wholly on the two oldest sources, without reference to the newer Chinese encyclopedias. Comp. further Richthofen, *China*, p. 447.

lun, and made a drinking-cup of his skull,¹ and the great mass of the vanquished people (the great Yue-chi) left their homes and moved westward, and occupied the land on Lake Issyk-kul, driving before them another nomad race, the Sse. The Sse took the road by Utch and Kashgar, ultimately reaching and subduing the kingdom of Kipin (the Cabul valley), while their old seats were occupied by the Great Yue-chi, till they in turn were soon attacked by the Usun, who lived west of the Hiung-nu, and forced to move farther west (160 or 159). The older Chinese account ignores the residence of the Yue-chi at Lake Issyk-kul, which can at most have lasted only for a few years; the later account goes on to say that, moving westward, they conquered the Ta-hia, i.e., the Bactrians. The language of the older narrative has been held to imply that they went by way of Ferghana and remained there for some time; but in reality it only says that they retired beyond Ferghana and conquered the Ta-hia, thereupon pitching the royal camp north of the Oxus, and so it appears that in 159 they moved straight on Sogdiana, reaching that land just at the time when internal wars were undermining the might of Eucratides. The conquest, however, may have been gradual, since Bactria is still named as independent in 140.

When the Yue-chi were already settled in their new homes the king of China sent a certain Chang-kien to urge them to return and help him to clear the caravan-road by thrusting back the Hiung-nu. He was arrested on his way by the latter, but escaped in 129 to Ferghana, and thence was led to the Yue-chi through the land of the Khang-kiu, on the middle course of the Jaxartes. But the Yue-chi were too happily settled in a rich and peaceful land to listen to his representations, and after a year's residence (128-127) he returned to China, which he reached in 126, after falling again into the hands of the Hiung-nu on the way. From him are derived almost all the accounts of the country and its inhabitants given by the Chinese historians. There were, we are told, settled and agricultural peoples in Great Wan (Ferghana), Ta-hia (Bactria), and An-si (Parthia). All the races from Ferghana to Parthia had deep-set eyes and strong beard and moustache; their dialects varied, but as they all understood each other all must have been Iranian in speech. Their manners, too, were much alike; they paid great respect to women, and the men were very complaisant to their wives. This is almost exactly what Bardesanes says of the position of women in his time among the Kushan in Bactria;² but it was quite otherwise in Parthia, where the Oriental seclusion of women was carried to the extreme (Just., xli. 3, 1, 2). They were all knowing traders, and understood the preparation of silk and lac, but not metallurgy till they were taught that art by Chinese agents and deserters. They then imported the precious metals from China and made gold and silver vessels, but not money, being in this respect behind the Parthians.³ Great Wan probably corresponds to the *Ὀβάρη* of Ptolemy (though he misplaces them) and the *Varena* of the *Vendidad*; it was a separate kingdom, with a population estimated at 300,000 souls in the 1st century B.C., and seventy subject cities. The king, probably a native who had risen on the fall of the Greeks, lived in Kuei-shan (probably Khojend, at the mouth of the Ferghana valley), and could call out an army of 60,000 men,—lanes, archers, and mounted bowmen. The land was famous for its wine and for horses of divine race which sweated blood, and for the possession of which China went to war with Great Wan in 104-103, and again in 102-98. Lucerne and grapes were exported to China; the name of the latter, "po-tao," is held to be the Greek *πότρυς*, which would show that the vine was introduced by the Greeks of Alexandria Eschata. South of the Wei or Oxus lies Ta-hia (probably Zend *Dahyu*, the land⁴). Here there was no king, but the several cities were the seats of chiefs, a state of things such as Alexander had found in the country and as reappeared under the Turks in the 7th century A.D. Chang-kien estimated the population at a million; they were bad and cowardly soldiers, but excelled in trade, and the chief town, Lan-shi, had rich bazaars of many wares. This town must be one of the commercial cities on the river Bactrus, along which lay the trade-route from India to the north (Pliny, vi. 52), i.e., either Bactra or Eucratidia (which, according to Ptolemy, vi. 11, 8 [Codd. B., E., Pal. 1], lay lower down the stream on the left bank). In the latter case Lan-shi may stand for *Ἐλάνης*. North of Ta-hia lay the Great Yue-chi,

and west of the latter was An-si towards the Oxus. This was a very great country, whose length might be 1000 li (353 miles), and it had 100 cities great and small. The first caravan from China to An-si passed on its way from the east frontier to the capital (called in the 1st century B.C. Pan-teu, i.e., probably Parthau), a dozen walled cities, which lay almost close together, so dense was then the population of the fertile part of Khorasan. The merchants of An-si visited the neighbouring lands with waggons or with ships for distances of several thousand li. The coinage was silver, with the image of the king, and was called in and restamped on a new accession.⁵ Writing was on skins in horizontal lines. Now, though the money as here described fits Parthia, the mercantile character of the race does not at all correspond to that of the Parthian aristocracy. Both here and in the general description given above, which also contains features not applicable to the Parthians, we see that the Chinese did not distinguish the ruling race from their subjects, and mainly described the latter, who were in point of fact very similar to the people of Bactria and Ferghana. As An-si extends to the Oxus the description is taken from the inhabitants of Margiana, a country which must have been then subject to Parthia. A later Chinese account, referring to the period 24-220 A.D., places on the east frontier the city Mo-lu or Little An-si, which is plainly the Mouru of the *Vendidad*, modern Merv-i-rud, and the Greek Antioch *ἡ ἐν ῥόδῳ*; An-si is a corruption of the last name, just as the Persians call the Syrian Antioch Andiv, and so came to be a name for the Parthian rulers of the city. West of An-si, on the western (Caspian) sea, lay Tiao-chi (Media), an agricultural country with a dense population, a dependency of An-si, and in part governed by tributary chiefs. Chang-kien is thinking less of the central parts of Media than of Gilan and Mazandaran, for he speaks of the warm moist climate where rice is produced. And in this quarter there were really various petty states; not only Atropatene but Dilem had its own king, as appears for the year 65 B.C. from Plutarch, *Pomp.*, 36 (where for *Ἐλυπάλων* read *Δελυπάλων*), and the Gelæ and Cadusians doubtless stood under their own mountain chiefs as they had done under the later Achemenians, and did again under the first Sasanians. It is a proof of the solid power of the empire founded by Mithradates that Parthia was able to assert some kind of supremacy over these hardly accessible districts. North of An-si lay Li-kan (Ilyreania), whose wizards, with those of Tiao-chi, had great reputation. It is clear from this whole account that the centre of the empire was still in the old Parthian lands, and that the lower satrapies were viewed as mere dependencies, "outer lands." In the following century the Chinese obtained knowledge of the west by the caravan-route which passed through Kipin (the Cabul valley) to U-ghe-shan-li (Arachosia); and now we find a changed state of affairs; these two countries are bounded on the west by Tiao-chi, whose powerful king has his capital a hundred days' journey from the frontier. An-si is now only mentioned incidentally as reached from Arachosia by going first north and then east, which is correct if we take the name in its original sense of the subjects of Parthia in Margiana and its capital Antioch. But the empire of Parthia, which now had its centre in Media and the western lands, is certainly Tiao-chi, a word that is probably connected with the word for "land" in the official language of the Achemenians, old Persian *dahyāus*.

As nomadic peoples Chang-kiu names the Great Yue-chi in Sogdiana, the Khang-kiu on the middle course of the Jaxartes, and the Yen-tsai in Chorasmia. The Yue-chi could put from 100,000 to 200,000 bowmen in the field; later they were reckoned at 100,000 warriors and their families. The royal camp had been north of the Oxus even after the conquest of Bactria, but they finally withdrew entirely to this district. Their capital is called Lan-shi; and the name of Ta-hia disappeared before that of "Land of the Great Yue-chi." At the conquest they had a single king; afterwards they formed five principalities. The fifth of these corresponds to Cabul, so that the division is younger than the Scythian invasion of Asia after the death of Phraates II. Immediately north of Ferghana, but separated from the Yue-chi in the south and the Hiung-nu in the east by a series of small kingdoms, were the pasture-grounds of the Khang-kiu on both sides of the Jaxartes; their force was 80,000 to 90,000 bowmen. North-west of these were the Yen-tsai on the Aral, the northern neighbours of the An-si, and east of Ilyreania, that is, in Chorasmia. If there is no error in the writing of the number they mustered but 10,000 warriors; then again considerable changes had taken place when the Chinese made war on the Khang-kiu in 44 B.C. The small kingdoms south and east of the latter have disappeared, so that the Khang-kiu border on the Hiung-nu and the great Yue-chi; but the latter have now moved south, and now, too, the Khang-kiu are the northern neighbours of An-si, and not the Yen-tsai; the latter are their dependants, and a tribute of mouse-skins is even drawn from the kingdom of Yen beyond the Yen-tsai. Such a tribute cannot have come from any place south of the Mukhajar moun-

¹ The Lombards had the same custom, learned, no doubt, in the childhood of the race from their Avarian neighbours.

² See Langlois, *Coll. d. hist. de l'Arménie*, i. 84.

³ Ssenatsien, in Ritter, vii. 3, p. 642.

⁴ Certainly not Dahæ, for they were never in Bactria.

⁵ On this point the younger Chinese account falls into a confusion with the coins of the kings of Kiplu.

tains. The Khang-kiu have risen in number as the Yue-chi fall, and have now 120,000 bowmen, or a population of 600,000 souls. Like the Yue-chi, they are divided into principalities, which are five in number, and the king is the prince of Su-hiai, with his winter residence in a place of that name east of Ferghana, and his summer court much farther west at Lo-yuei-ni. The east of the Khang-kiu country was often subject to the Hiong-nu, and the pressure of this Turkish tribe seems to have been the cause which pushed the Khang-kiu and Yen-tsai farther west. The latter have now at least 100,000 bowmen, and extend westwards to the limits of Great Tsin or the Roman empire. This compels us to conclude that the Yen-tsai are the Aorsi, the western part of whom ranged between the lower Don and the west coast of the Caspian, while the older upper Aorsi were round the north coast, and so on to the neighbourhood of the lower Jaxartes (Strabo, xi. p. 506; Ptol., vi. 14, 10). When Pharnaces ruled on the Bosphorus (63-47 B.C.) both parts of the Aorsi intervened in the affairs of the neighbouring kingdom with large armies, and as Pharnaces was a client of Rome the Chinese statement is intelligible. Later Chinese accounts relating to the first Christian century give A-lan-na as the later name of the Yen-tsai, which agrees with the fact that the Aorsi appear last in history in 49 A.D. (Tac., *Ann.*, xii. 15 sq.), and that Lucan, ten or fifteen years later, is the first to name the Alans, who succeed to their geographical place. When we understand the Chinese data we can speak with more definiteness about the four nations to whom Strabo ascribes the fall of Greek Bactria, and which Ptolemy also seems to name from a source relating to the time when the invasion began. From these data, compared with our Chinese sources, we can be sure that the Tochari are the great Yue-chi, the former being probably the name of the nation and the latter that of the leading horde. The Asii of Strabo, Asiani of Trogus, Jatii of Ptolemy, will then be all attempts to render the difficult name of the horde which the Chinese call Yue-chi. But, while the classical writers place the Sacarauæ in the west to balance the Tochari in the east, the Chinese know no second great nation between the latter and the Parthians in Margiana. We must therefore suppose that the Sacarauæ are the Scythians who occupied part of the Greek lands, and were in turn conquered by Parthia according to Strabo (xi. 515); that this part was Margiana is known from a drachma of Phraates II. (Gardner, *Parthian Coinage*, p. 33); the conquest must have taken place a good while before 128, when Chang-kien visited Sogdiana, since by that time the Parthians had again displaced them. But he must have known and mentioned the Sacarauæ in some form, and they can hardly be other than the most powerful nation known to him in Transoxiana, the Khang-kiu. These, like the Sacarauæ, came from beyond the Jaxartes; they were the northern neighbours of Parthia just at the time when the Sacarauæ are so described. The only other tribe that can be thought of, the Yen-tsai, are known to the Greeks and Romans by a different name, as the Aorsi; and Trogus (*Prod.*, xlii.) mentions the fall of the Sacarauæ as one of the latest events in Scythian history, which, as he wrote soon after 2 B.C., agrees with the fact that the last mention of the Khang-kiu in Chinese history is in 11 B.C.; while the Aorsi are mentioned much later. Khang-kiu seems to be properly the name of a country identical with the Kaŋgha of the *Khorda-Avesta* and the Gangdiz of Firdausi. Finally, the Pasica or Pasiani are the same as the 'Asiaca' of the earlier Parthian history; the Sacarauæ will have conquered them and swept them with them as the Mongols did with many Tatar tribes. The conquest of Bactria probably followed soon after the last hopes of the Eastern Greeks in Demetrius II. came to nothing. It is very remarkable that Chang-kien notices no difference between the Greeks who had been rulers and the Iranians who were their subjects. This implies not merely some lapse of time but a marked decrease in the number of the Greeks, and probably also that here, as in other Eastern parts, they had become more and more completely Orientalized.

Phraates II.,¹ who succeeded his father in 138, and continued his work, wresting Margiana from the Scythians of Bactria in an expedition commemorated on extant coins, had also to meet the last and most formidable attempt to restore the sovereignty of the Seleucids. Antiochus VII., one of the ablest kings of his race, had put down the civil wars in Syria, even taking Jerusalem and compelling the Jews to acknowledge his might by paying him military service, and in 130 he marched eastward at the head of a force of 80,000 combatants, swollen by camp-followers to a total of 300,000. Many of the small princes, on whom the hand of Parthia lay heavy, joined him as they had joined his brother; the enemy was smitten on the Great Zab, and in two other battles; Babylon and then Ecbatana

opened their gates to the conqueror; and the subject-nations rose against the Parthians, who, when Antiochus took up his winter quarters in Media, were again confined to their ancient limits. When the snows began to melt, an embassy from Phraates appeared to ask for peace; but the terms demanded by Antiochus—the liberation of Demetrius, the surrender of all conquests, and the payment of tribute for the old Parthian country—were such as could not be accepted without another appeal to the fortunes of war. Demetrius, indeed, was released and sent to Syria, but only to stir up a hostile party in his brother's rear. During the winter the Syrian host had been dispersed over a wide range of cantonments; the disorderly insolence of the soldiers, for which the general Athenæus was held to be mainly responsible, and of the levies raised in the towns had disgusted the natives; the Medes made secret terms with Parthia, and all the cantonments were attacked by concert on a single day.² Haŋtening to relieve the nearest corps, Antiochus was met by the Parthian with a superior force of 120,000 men; he refused the advice of his officers to fall back to the neighbouring mountains, and accepted battle on a field too narrow for the evolution of his troops. The Syrian soldiers, enervated by luxury, were readier to imitate the flight of Athenæus than the valour of his master; the whole host was involved in the rout and annihilated. Antiochus himself escaped wounded from the fray and cast himself from a rock that he might not be taken alive. The catastrophe (February 129²) freed the Parthians for ever from danger from Syria.

Phraates paid funeral honours to the fallen king, and afterwards sent his body to Syria in a silver coffin. He entertained his captive family royally, married one of the two daughters, and sent the eldest son Selencus to Syria to claim the sovereignty, and so serve future plans of his own; for an attempt to follow and recapture Demetrius, made immediately after the battle, had proved too late. But dangers in the east soon turned the Parthian's attention away from enterprises in the west. In his distress he had bribed the Scythians³ to send him help; as they arrived too late he refused to pay them, and they in turn began to ravage the Parthian country. Phraates marched against them, leaving his charge at home to his favourite, the Hyrcanian Euhemerus, who chastised the countries that had sided with Antiochus, made war with Mesene, and treated Babylon and Seleucia with the utmost cruelty. But the Scythian war proved a disastrous one; the enemy overran the whole empire, and for the first time for five hundred years Scythian plunderers again appeared in Mesopotamia⁴; in a decisive battle Phraates was deserted by the old soldiers of Antiochus, whom he had forced into his service and then treated with insolent cruelty; the Parthian host sustained a ruinous defeat, and the king himself was slain (spring 128, or somewhat later).⁵

Artabanus I.⁶ (third son of Phriapatius), who now became king, was an elderly man. The Scythians, according to the too favourable account by our chief authority, were content with their victory, and moved homewards, ravaging the country. But we know from John of Antioch (66, 2) that the successor of Phraates paid them tribute; and the southern part of Drangiana must now have been per-

² The date is fixed by Livy, who, according to Orosius, v. 10, and Obsequ., *De Prodig.*, 28, places the expedition in the consular year 130. With this it agrees that Antiochus came to the throne in 138 and reigned nine years. Too much weight is often attached to Porphyry's dates by Olympiads, which are merely calculated from the years of reigns.

³ Justin, xlii. 2, 1-2, plainly distinguishes these Scythians from the Tochari, so the Sacarauæ must be meant.

⁴ Jo. Ant., in Müller, iv. 521.

⁵ The remains of Antiochus reached Syria in the reign of Alexander II., who came to the throne in 128 (Justin, xxxix. 1, 6).

⁶ Arsaces Theopator Nicator of the coins.

¹ In coins Arsaces Theopator Euergetes Epiphanes Philhellen.

manently occupied by the Scythian tribes, who gave it the name of Sacastane (Sistan), for that name appears in Isidore of Charax (1 B.C.), which implies that the Scythian occupation was even then of long standing. Finally, the coins reveal the existence of Arsacids who were rival kings to Artabanus I. and Mithradates II., and perhaps borrow from individual successes against the Scythians the proud titles which so strongly contrast with the really wretched condition of the empire. One of these pretenders, Arsaces Energetes Dicaeus Philhellen, resumes the style "king of kings," which had lapsed since Mithradates I.; and his title "the just," which seems to be imitated from the Bactrian Heliocles, suggests that he may have come with the Scythians from the land where Heliocles once reigned. Meanwhile it would appear that the men of Seleucia, driven to desperation, had seized the tyrant Euhemerus and put him to a cruel death.¹ Artabanus, when they sought his pardon, threatened to put out the eyes of every man of Seleucia, and was prevented only by his death, in battle with the Tochari, after a very short reign.

His son and successor, Mithradates II. the Great,² was the restorer of the empire.³ We are briefly told that he valiantly waged many wars with his neighbours, added many nations to the empire, and had several successes against the Scythians, so avenging the disgrace of his predecessors. His successes, however, must have been practically limited to the recovery of lost ground, and the eastern frontier was not advanced. It has been common to connect with his successes the appearance of Parthian names among the Indo-Scythian princes of the Cabul valley; but this must be false, for even Candahar (U-ghe-shan-li), which lies so much farther west, is represented by the Chinese as an independent kingdom in the middle of the 1st century B.C. On the other hand, Mithradates, if not the first to conquer Mesopotamia, was the first to fix the Euphrates as the western boundary of the empire, and towards the end of his reign he was strong enough to interfere with the concerns of Great Armenia and place Tigranes II. on the throne in a time of disputed succession (94), accepting in return the cession of seventy Armenian valleys. Now, too, the Parthians, as lords of Mesopotamia, came for the first time into contact with Rome, and in 92, when Sulla came to Cappadocia as propraetor of Cilicia, he met on the Euphrates the ambassador of Mithradates seeking the Roman alliance.⁴ This embassy was no doubt connected with the Parthian schemes against Syria; Mithradates about this time was at war with Laodice, queen of Commagene or some neighbouring part; and her cousin, Antiochus X.,⁵ who supported her, fell in battle with the Parthians. A few years later Strato, tyrant of Beroea, called in the Arab phylarch Azizus and the Parthian governor of Mesopotamia, Mithradates Sinaces, against Demetrius III., who reigned at Damascus. The Seleucid was compelled to surrender with his whole army and ended his life as a captive at the Parthian court. Mithradates the Great seems to have died just after this event; there is no reason to suppose that he lived to see the disasters which followed so close on his great successes.

¹ In Diod., *Exc. Vat.*, p. 107, there can be little doubt that *Εὐήμερος* is a corruption of *Εὐήμερος*.

² On coins Arsaces Theos Energetes Epiphanes Philhellen.

³ The time of his accession follows approximately from the date 123 on a coin of his rival, Arsaces Nicephorus.

⁴ The ambassador allowed Sulla to take the place of honour, and on his return was punished for this by death.

⁵ The queen *τῶν Γαλακηνῶν* of Jos., *Ant.*, xiii. 13, 4 (Leyden MS.—the usual text has "queen of Glend"), is doubtless the Laodice Thea Philadelphas, daughter of Antiochus VIII. of Syria, who, as Memnon has shown (*Mithr. Arch. Inst. Athen.*, i. 32), was ancestress of the later sovereigns of Commagene. The word in Josephus is not perhaps a corruption of Commagene but of some neighbouring place—say *Ἀλλιακηνῶν*.

Artabanus II. was the next monarch,⁶ but after him the style of king of kings was taken by the Armenian Tigranes, one of the most dangerous foes Parthia ever had. In 86 it was still a reason for choosing Tigranes as king of part of Syria that he was in alliance with Parthia (Just., xl. 1, 3), but very soon the latter state was so ruined by civil and foreign war that it was no match for Armenia (Plut., *Lucullus*, 36). Of the details in this history we know only the last act. In 77 the Arsacid Sinatruces⁷ returned from the land of the Sacarauca to take the throne at the age of eighty, and reigned seven years. There were probably other usurpers; the silence of the coins does not prove the contrary, but rather that the times were so bad that no money was struck, a case of which Parthian numismatics offer other examples. Tigranes conquered Media—primarily, that is, Atropatene—but he also entered Great Media and destroyed the city of Adrapanan, 7 miles west of Ecbatana, "the castle of those who have their seat in Batana" (Ecbatana),⁸ i.e., of a line of the Arsacids, for, though Mithradates I. had had his seat in Hyrcania, Phraates II. and his successors down to Mithradates III. held their court in Media (Diod., *Exc. Vat.*, p. 603). The seventy valleys which had been the price of his throne were restored to Tigranes, and he also ravaged the country of Arbela and Nineveh, and compelled the cession of Adiabene, hitherto a Parthian dependency, and of Mesopotamia, with the fortress of Nisibis. This last war was against Sinatruces,⁹ and was probably going on in 73 when Mithradates Eupator of Pontus made a vain appeal for help to both combatants (Memnon, in Photius, p. 234 b, 27).

Phraates III. succeeded his father Sinatruces a little before the arrival of Lucullus in the East in 70,¹⁰ and in 69 refused a second invitation to give help against Rome which Mithradates and Tigranes addressed to him jointly, the latter offering to reward him by giving up all that he had taken from the Parthians. His hatred of Tigranes made him more disposed to alliance with Rome; and after a period of hesitating neutrality Phraates accepted the overtures of Pompey and prepared to invade Armenia (66), guided by the younger Tigranes, who had quarrelled with his father and taken refuge in Parthia, where he wedded the daughter of the king. Tigranes the elder fled to the mountains; and, after forming the siege of Artaxata, which proved tedious, Phraates turned homeward, leaving young Tigranes with part of the army to continue the war. The latter, who alone was no match for his father, fled after an utter defeat to Pompey, who was just preparing to invade Armenia, and to whom the elder Tigranes presently surrendered at discretion. The Roman, however, gave him very good terms, altogether abandoning his son's cause and even casting him into chains.

⁶ In Trogus, *Procl.*, 41, the sentence "successores deinde eius Artabanus et Tigranes cognomine Deus a quo subacta est Media et Mesopotamia dictisque in excessu Arabie situs" is wrongly referred (after Vaillant) to Mithradates I. of Parthia. It can really refer only to the famous Tigranes, and in that case must have originally belonged to *Procl.*, 42, having dropped out by homoioteleuton, and been restored from the margin in a false place. Artabanus II., therefore, followed Mithradates II., and his probably are the base coins of Arsaces Energetes Epiphanes Philhellen, which according to Gardner, p. 38, seem to belong to this time.

⁷ On coins Arsaces Autocrator Philopator Epiphanes Philhellen.

⁸ Isid. Char., in *Geog. Gr. Min.*, i. 250.

⁹ Sallust, *Hist.*, iv. fr. 19, § 3.

¹⁰ So Memnon, in Photius, p. 239 a, 13, confirmed by Phlegon, *ibid.*, p. 84 a, 15. These sources, being independent, have more weight than Appian, *Mithr.*, 104, and Dio Cassius, xxxvi. 45, who speak of the arrival of Pompey. Phraates III. is the "king of kings, Arsaces Dicaeus Epiphanes Theos Eupator Philhellen," whose coins Gardner wrongly ascribes to Mithradates III. We have express testimony that Phraates was styled "king of kings" and had the epithet "Theos" (Plut., *Pomp.*, 38; Dio Cass., xxxvii. 6; Phlegon, *ut sup.*).

36-53 B.C. Meantime Phraates had occupied the Parthian conquests of Tigranes, which the Romans had promised him, and invaded Corduene (Beth-Kardo, now Jezirat benî 'Omar), whence he sent an embassy to Pompey to intercede for his son-in-law. But the Romans had no further occasion for Parthian help; and, instead of granting his request, Pompey commanded him to leave Corduene, and followed up the command by sending Afranius to clear the country and restore it to Tigranes. Immediately afterwards Pompey's officer marched into Syria through Mesopotamia, which by treaty had been expressly recognized as Parthian; and it was another grievous insult that Pompey in writing to Phraates had withheld from him the style of "king of kings." This no doubt was done out of regard to Tigranes, who claimed the sole right to the title, and had probably enforced his claim upon the weak predecessors of Phraates. Of the four subordinate kingships, the patronage of which was held to give a right to the title, Atropatene, Adiabene, Corduene are known, and the fourth was probably Orrhoene. All these had once stood under Parthian suzerainty, and, now that Phraates had recovered the lost territory of his predecessors including these states, he resumed, as his coins show, the proud title which had dropped since the days of Mithradates I., and to which Tigranes had lost his real claim. Nevertheless Phraates at first contented himself with again sending a fruitless embassy to demand that Pompey would observe the treaty and acknowledge the Euphrates as the Parthian frontier, and it was only when Pompey had gone to Syria (64) that he again attacked and defeated Tigranes. Pompey declined to interfere by force and burden himself with a Parthian war while Mithradates of Pontus was still under arms, but, as both sides appealed to him, he sent umpires to settle the dispute (which probably turned on the possession of Corduene), and a peaceable solution was effected.¹ The Romans had done more than enough to irritate Parthia and not enough to inspire respect, but, as the Parthians were only beginning to recover from the inner and outer troubles of the last two decennia, they were not yet prepared to enter on a struggle with Rome.

For a century and a half up to the death of Mithradates the Great there had been an unusual degree of unity in the house of the Arsacids; but the corruptions to which every Eastern dynasty ultimately falls a prey appeared at length. About 57 Phraates, the restorer of the empire, Ordes I. was murdered by his two sons, one of whom, Orodes or Hyrodes I. (Zend, *Huraodha*), took the throne, while his brother Mithradates III. got Media;² but the latter ruled so cruelly that he was expelled by the Parthian nobles, and Orodes reigned alone. Mithradates, with a loyal follower, Orsanes, fled to Gabinius, proconsul of Syria, who had already crossed the Euphrates to restore him by force when he was summoned by Pompey to restore Ptolemy XI. to the throne of Egypt (55). Mithradates, dismissed by the Romans, now tried what he could do without help. Orodes had at first to flee, but soon regained his position, mainly through the help of Surenas, a young noble who had the hereditary right of crowning the king, and was the second person in the empire in point of wealth, nobility, and

influence, and the first in courage and political skill. Surenas took Selencia by storm; Babylon received Mithradates, but was reduced by famine; Mithradates then surrendered to his brother and was killed before his eyes. These events carry us far into the year 54.

Meantime Crassus, hoping for a rich and easy prey, had invaded Mesopotamia without a shadow of pretext, had defeated a small Parthian force at Ichnæ, and occupied a number of large towns, such as Nicephorium, Ichnæ, Carrhæ, whose Greek inhabitants welcomed the Romans as liberators. As Mithradates was at this time in arms in Babylonia, we can understand why Crassus was blamed for a grave error of judgment in not marching direct from Nicephorium on Seleucia and Babylon (Plut., *Crassus*, 17). Instead of this, he retired to winter-quarters in Syria, leaving 7000 foot and 1000 horse to garrison the Mesopotamian cities. Thus his hands were tied for the following campaign, and he could not accept the invitation of Artavasdes II. of Armenia to advance through his country and have his co-operation. A Parthian embassy appeared in Syria in spring to remonstrate against the faithlessness of Rome, but at the same time the Parthians were ready for war. Surenas, with Silaces, satrap of Mesopotamia, was pressing the Roman garrisons, and prepared to confront Crassus with an army wholly composed of cavalry, while Orodes in person invaded Armenia. In the spring of 53 Crassus crossed the Euphrates at Zeugma with seven legions and 8000 cavalry and light troops, making up a total of 42,000 or 43,000 men,³ and was persuaded by Abgar of Orrhoene to leave the river and march straight across the plains against Surenas. At mid-day, 6th May (9th June as the calendar then stood) the Romans had crossed the Balissus (Nahr Belik) and met Surenas half way between Carrhæ and Ichnæ, or a little nearer the latter town. They were not, therefore, in the desert—as the older account represents—for it begins beyond the Chaboras.⁴ Surenas kept the mass of his troops concealed by a wooded hill, showing only the not very numerous vanguard of cataphracts till the Romans were committed to do battle. The Roman cavalry under Publius Crassus, son of the proconsul, charged the enemy to prevent a threatening flank movement, and were drawn away from the mass of the army by the favourite Parthian manoeuvre of a simulated flight, and then surrounded and cut to pieces. The mass of the Roman host lost courage at this disaster, and already had suffered terrible loss from the light-armed hordes of Parthian serfs who hovered round the enemy at a safe distance and galled it with arrows shot with deadly precision. The legionaries serried their ranks and covered themselves with their shields; but in this close order they were easily broken by the charge of the Parthian freemen with their long heavy lances and almost impenetrable suits of complete armour. The heat, too, thirst, and dust oppressed the Romans, and this first day would have decided their fate but that the Parthians withdrew before evening, true to their rule of encamping

¹ Dio, using in xxxvii. 6 a different source from that which lay before him at xxxvi. 61, has not observed that the former recapitulates the whole story from the beginning, including the rebellion and defeat of the younger Tigranes as related above.

² This is Dio's account, and, though other writers dissent, it is justified by the coins. The coins of Arsaces Philopator (or Theopator) Euergetes Epiphanes Philhellen belong to Mithradates, —not, as Gardner thinks, to his father, for Theopator denotes a king whose father was Arsaces Theos, and these coins call him only "great king," while Orodes (Arsaces Philopator—or Euergetes—Dicaeos Epiphanes Philhellen) is called "king of kings." Both princes, it will be observed, ultimately give up the title of Philopator, which marks them as colleagues or recognized heirs of their father,—an indirect confirmation of their guilt as parricides.

³ Florus says eleven legions and Appian 100,000 men; but Appian has made the mistake of adding to the legion its auxiliaries and counting the whole at the higher footing adopted under the empire. Seven such legions with the 8000 cavalry and light troops, and the 8000 men in garrison, make up his total. For the campaign of Crassus we have two independent narratives preserved in Plutarch and Dio; Plutarch's is the older account, full of colour and valuable detail, but lacking in topographical precision; in this respect Dio's source is much to be preferred, but it has suffered from that author's somewhat arbitrary way of meddling with his materials. The accounts based on Livy (Perioche lib. 106; Florus, iii. 11; Festus Rufus, *Brev.*, 17, and Orosius, vi. 13) agree in all essential points with Plutarch, who, however, draws not from Livy but from some Greek writer, perhaps Nicolaus of Damascus.

⁴ Plutarch himself speaks of marshes (cap. 25); the only modern account that agrees with the facts is that of G. Rawlinson, p. 163 sq.

at a distance from the foe. Crassus retired at night, leaving all who were badly wounded behind him, and reached Carrhæ safely; but his army was sadly demoralized, and he himself lost his head, and, though fairly secure at Carrhæ, thought only of immediate retreat to Syria.¹ He marched by night northwards towards the mountains; the several divisions lost one another and each sought only to shift for itself. The quæstor Cassius, one of Crassus's best officers, returned to Carrhæ and thence regained Syria in safety. Crassus himself, after getting dangerously entangled in marshy ground, had almost reached the mountains when he was induced, by the despair of his troops rather than by error of his own judgment, to yield to treacherous proposals of Surenas and descend again into the plain. As he mounted the horse which was to convey him to a meeting with the enemy's general the gestures of the Parthians excited suspicions of treachery; a struggle ensued, and Crassus was struck down and slain. Scarcely 10,000 men out of the whole host reached Syria by way of Armenia (Appian, *B. C.*, ii. 18); 20,000 had fallen and 10,000 captives were settled in Antioch, the capital of Margiana. The token of victory, the hand and head of Crassus, reached Orodes in Armenia just as he had made peace with Artavasdes and betrothed his eldest son Pacorus to the daughter of the Armenian king. The Roman disaster was due primarily to the novelty of the Parthian way of assault, which took them wholly by surprise, and partly also to bad generalship; but the Romans always sought a traitor to account for a defeat, and in the present case threw the blame partly on Andromachus of Carrhæ, who really did mislead Crassus in his retreat, and was rewarded by the Parthians with the tyranny of his native town (Nic. Dam., in Athen., vi. p. 252 D),² but had no great influence on the disaster, and partly on Abgar, whose advice was no doubt bad, but not necessarily treacherous,³ while the silence of the older account disposes of Dio's improbable assertion that the men of Orrhoene fell on the rear of the Romans. That the Parthians did not count Abgar their friend and punished him with deposition may be fairly inferred from the list⁴ of kings of Edessa given by Dionysius of Telmahar, which shows that the reign of Abgar II. ended in 53, and was followed by a year of interregnum.

Surenas, the victor of Carrhæ, whose fame was now too great for the condition of a mere subject, was put to death a little later, the victim of Orodes's jealousy; the victory itself was weakly followed up. Not till 52 was Syria invaded, and then with forces so weak that Cassius found the defence easy. In July 51 (Sextilis, according to the old calendar) the attack was renewed with greater forces; the Romans were still weak in troops, their harshness and injustice had alienated the provincials, and some districts—as Judæa—openly sympathized with the foe. Thus all the chances were still favourable to the Parthians, who indeed overran the open country, but were too unskilled in siege to take Antioch. As they drew off, Cassius stopped their way at Antiochia and inflicted on them a defeat in which Osaces, the real leader of their host under the young prince Pacorus, was mortally wounded (August 51). Pacorus wintered in Cyrrhestica, the Romans under the new proconsul Bibulus not venturing beyond the walls of Antioch;

but, the satrap of Mesopotamia⁵ having raised a revolt against Orodes in the name of Pacorus, the latter was recalled by his father and Syria was entirely evacuated by May 50.

Orodes avoided the threatened breach with his son by associating Pacorus in the empire;⁶ but the Parthians took little advantage of the civil wars that preceded the fall of the Roman republic. They occasionally stepped in to save the weaker party from utter annihilation, but even this policy was not followed with energy, and Orodes refused to help Pompey in his distress because the Roman would not promise to give him Syria. The Pompeian Cæcilius Bassus was saved from Cæsar's general Antistius Vetus by the sudden appearance of a Parthian force under Pacorus, which, however, retired when winter came on (December 45). In 43, again, Cassius had a force of mounted Parthian bowmen with him in Syria, but dismissed them when he marched to join Brutus and face the triumvirs. Labienus was with Orodes negotiating for help on a larger scale when the news of Philippi arrived, and remained with him till 40, when he was at last sent back to Syria, together with Pacorus and a numerous host. The Roman garrisons in Syria were old troops of Brutus and Cassius, who had been taken over by Antony; those in the region of Apamea joined Labienus; Antony's legate Decidius Saxa was defeated, and fled from the camp afraid of his own men. Apamea, Antioch, and all Syria soon fell into the hands of the Parthians, and Decidius was pursued and slain. Pacorus advanced along the great coast road and received the submission of all the Phœnician cities save Tyre. Simultaneously the satrap Barzaphranes appeared in Galilee; the patriots all over Palestine rose against Phasael and Herod (see ISRAEL, vol. xiii. p. 425); and five hundred Parthian horse appearing before Jerusalem were enough to overthrow the Roman party and substitute Antigonus for Hyrcanus. The Parthian administration was a favourable contrast to the rule of the oppressive proconsuls, and the justice and clemency of Pacorus won the hearts of the Syrians. Meantime Labienus had penetrated Asia Minor as far as Lydia and Ionia; the Roman governor Plancus could only hold the islands; most of the cities opened their gates to Labienus, the "Parthian Emperor," Stratonicea alone resisting and successfully standing a siege. But Rome even in its time of civil divisions was stronger than Parthia; in 39 Ventidius Bassus, general for Antony, suddenly appeared in Asia and drove Labienus and his provincial levies before him without a battle as far as the Taurus. Here the Parthians came to Labienus's help, but, attacking rashly and without his co-operation, they were defeated by Ventidius, and Labienus's troops were involved in the disaster. Labienus himself escaped to Cilicia, but was captured and executed by the Egyptian governor of Cyprus. In the passes of the Amanus the Romans were again in danger, but Ventidius at length gained a decisive victory at Trapezon, north of the Orontes valley, where Phranipates, the ablest lieutenant of Pacorus, fell; and the Parthians evacuated Syria. Before Ventidius had completed the resettlement of the Roman power in Syria and Palestine, and while his troops were dispersed in winter-quarters, the Parthians fell on him again with a force of more than 20,000 men and an unusually large proportion of free cavaliers in full armour. Ventidius, however, gained time to bring up legions from Cappadocia by deceiving a dynast of Cyrrhestica, who was Pacorus's spy. Then a battle was fought near the shrine of Hercules at Gindarus in Cyrrhestica, on the anniversary, it is said, of the defeat of Crassus (9th June 38), and the Parthians were

¹ That he waited for the new moon—i.e., some twenty days, as Dio says—seems to be a mistake. Perhaps it is due to Dio himself; at all events, the older account is preferable.

² The Parthians leaned much on the despots of the Greek cities, Zenodotia, the only Mesopotamian town that Crassus had to storm, had a despot, Apollonius.

³ The alternative of a march along the Euphrates was also open to serious military objections.

⁴ It must be remembered that a correction of four years has to be made to all the dates in this list.

⁵ The name was Orondapates, corrupted to 'Ορονδάρτης in Dio xl. 30.

⁶ So the coins show, Gardner, p. 41

utterly routed and Pacorus himself slain. His head was sent round to the cities of Syria which were still in revolt to prove to them that their hopes had failed. There was no further resistance save from Aradus and Jerusalem.

Orodes, now an old man and sorely afflicted by the death of his favourite son, nominated his next son, Phraates, as his colleague, and the latter began his reign by making away with brothers of whom he was jealous as the sons of a princely mother, daughter of Antiochus of Commagene, and then strangling his father, who had not concealed his anger at the crime (37). The reign of Orodes was the culminating point of Parthian greatness, and all his successors adopted his title of "king of kings, Arsaces Euergetes" (taken from Phraates II.) "Dicaeos" (first borne by the pretendant spoken of at p. 595, who was perhaps father of Sinatruces, and so ancestor of the succeeding princes) "Epiphanes" (like Mithradates I.) "Philhellen"¹ (like Phriapatius). It was he who moved the capital westward to Seleucia, or rather to Ctesiphon (Taisefün), its eastern suburb.²

Phraates
IV.

Phraates IV. continued his reign in a series of crimes, murdering every prominent man among his brothers, and even his own adult son, that the nobles might find no Arsacid to lead their discontent. Many of the nobles fled to foreign parts, and Antony felt encouraged to plan a war of vengeance against Parthia.³ Antony had no hope of forcing the well-guarded Euphrates frontier, but since the death of Pacorus Armenia had again been brought under Roman patronage, and he hoped to strike a blow at the heart of Parthia through Atropatene. Keeping the Parthians in play by feigned proposals of peace while he matured his preparations, he appeared in Atropatene in 36 with 60,000 legionaries and 40,000 cavalry and auxiliary troops, and at once formed the siege of the capital Phraaspa (Takht-i-Suleimán). The Median king Artavasdes, son of Ariobarzanes,⁴ had marched to join Phraates, who looked for the attack in another quarter. Phraates had only 40,000 Parthians, including but 400 freemen who never left the king, and probably 10,000 Median cavalry;⁵ but these forces were well handled, and the two kings had reached the scene of war before Antony was joined by his baggage and heavy siege-train, and opened the campaign by capturing the train and cutting to pieces its escort of 7500 men under the legate Oppius Statianus. Antony was still able to repel a demonstration to relieve Phraaspa, but his provisions ran short, and the foraging parties were so harassed that the siege made no progress; and, as it was now October, he was at length forced to open negotiations with Phraates. The Parthian promised peace if the Romans withdrew, but, when Antony took him at his word, abandoning the siege-engines, he began a vigorous pursuit, and kept the Romans constantly on the defensive, chastising one officer who hazarded an engagement by a defeat which cost the Romans 3000 killed and 5000 wounded. Still

greater were the losses by famine and thirst and dysentery; and the whole force was utterly demoralized and had lost a fourth part of its fighting men, a third of the camp-followers, and all the baggage when, after a retreat of twenty-seven days from Phraaspa to the Araxes by way of Mianeh (276 miles), they reached the Armenian frontier. Eight thousand more perished of cold and from snowstorms in the Armenian mountains, the mortality among the wounded was terrible, the Romans would have been undone had not Artavasdes of Armenia allowed them to winter in his land. The failure of the expedition was due partly to the usual Roman ignorance of the geographical and climatic conditions, partly to a rash haste in the earlier operations, but very largely also (as in the case of Napoleon's Russian campaign) to the lack of discipline in the soldiers of the Civil War, which called for very stern chastisement even during the siege of Phraaspa, and culminated at length in frequent desertions and in open mutiny, driving Antony to think of suicide. The Romans laid the whole blame on Artavasdes, but without any adequate reason. At the same time the disaster of Antony following that of Crassus seemed to show that within their own country the Parthians could not safely be attacked on any side, and for a century and a half Roman cupidity left them alone.

The Median Artavasdes, whose little country had borne the whole brunt of the war, fell out with the Parthians about the division of booty, and made overtures to Antony for alliance with Rome; and in 33, when the Romans had treacherously seized the person of the Armenian Artavasdes and occupied his land, a treaty was actually concluded by which Symbace, which had once been Median, was again detached from Armenia, and Roman troops were sent to co-operate with the Median king in repelling the efforts of the Parthians to reseat on the throne of his fathers Artaxes, son of the deposed king of Armenia. These troops, however, were recalled before the battle of Actium, and then Media and Armenia fell before the Parthians; the Romans who were still in the country were slain, and Artaxes II. was raised to the Armenian throne (30). In the very next year, however, the course of Parthian affairs led Artaxes to make his peace with Rome.⁶

Phraates's tyranny had only been aggravated by his successes, and open rebellion broke out in 33. We have coins of an anonymous pretender dating March to June 32.⁷ To him succeeded Tiridates II., whose rebellion was at a climax during the war of Actium. Towards the end of 30 Tiridates succumbed and fled to Syria, where Octavian, who was wintering in the province, allowed him to remain. A fresh attempt made from this side, with the help perhaps of the Arabs of the desert, and by crossing the Euphrates at the island now called Koha, had better success. The order of events here given is that deduced by Vaillant and Longuerne, combining the Roman history of Dio with the Parthian of Trogus,—Lachmann, who makes Tiridates be expelled only once and supposes a mistake on the part of Trogus as to place and date of his meeting with Augustus, assigning 1st March 29 as the date of Horace, *Carm.*, iii. 8; but the chronological difficulties of this view are insuperable. Phraates was taken by surprise and fled, slaying his concubines that they might not fall a prey to his victor (Isid. *Char.*, 1). Tiridates seated himself on the throne in June 27,⁸ and Phraates wandered for some time in exile till he persuaded the Scythians to undertake his cause.

⁶ See coins in Eckhel, vi. 82, compared with Dio, li. 16, and the reference in Horace, *Carm.*, ii. 9, 20-22.

⁷ Ascribed to Tiridates II. by Gardner, p. 44 sq.

⁸ Däsius, 285 Sel. In this month there are coins of Phraates and also of an Arsaces Euergetes Autocrator Epiphanes Philhellen, who must be Tiridates II.

¹ Orodes indeed knew Greek and cared for Greek literature. The *Bacchæ* was performed at his son's betrothal.

² Ctesiphon was capital at the time of Crassus's invasion, and Ammianus (xiii. 6, 23) calls Pacorus the second founder of the city, the first Vardanes being perhaps a mythical person. A coin of Orodes with the title *κτιστής* (Gardner, 39) may refer to this.

³ Of this war we have three accounts, all based on one source, probably a monograph by Dellius. The best is Plutarch's (*Ant.*, 37 sq., favourable to Antony). The later minor historians (who drew from Livy) and Dio (xlix. 23 sq.) are hostile to Antony (Octavianist); but the former, while sharing Dio's general point of view, approach Plutarch in many points of detail. Plutarch drew from the original source, indirectly perhaps through Nic. Dam.; Dio used Livy, but not exclusively. The point in the story where the mutual relations of the several narratives come out most clearly is in what is said of the adviser who saved the Romans from utter destruction.

⁴ *Mon. Ancyr.*, col. vi. 1. 12.

⁵ *Plut.*, *Ant.*, 44; *Justin.*, xli. 2, 6. The number 10,000 is given by Apollonides in Strabo, xi. p. 523.

To understand who his helpers were we must take up again the thread of the history of the far Eastern lands. It was now a century since the Tibetan races who had supplanted the Greeks to the north of the Hindu Kush had first exercised a decisive influence on western affairs, and during most of that time there had been little change in the boundaries of empire in eastern Iran. Since the time of Eucratides the centre of Greek influence had lain more to the south of the Hindu Kush and in India proper, and this was perhaps one of the reasons why Sogdiana and Bactria were lost so early; since that loss Greek power and culture had their chief and most lasting seat in the Cabul valley, where colonies of Alexander were particularly numerous.

The places where coins have been found—and these are almost our only source of knowledge¹—prove that on the death of Eucratides the Indian country fell to Apollodotus and Bactria to Helicorles. Each of these held for a time the greater part of east Iran, but Apollodotus was the last Greek king who ruled over Kandahar and Sistan. For a time there were also separate kingdoms in the Cabul valley under Antialcidas, and in the district of Peshawar under Lysias, but after a period of civil wars they were all merged in one great Greco-Indian realm extending from Cabul to the Sutlej, and at times as far south as Barygaza; the capital was Çakala (officially called Euthydemia). Eight Yavana kings, says the *Vayu-Purāna*, reigned eighty-two years, and just eight names² are found on coins whose distribution justifies us in attributing them to kings whose sway extended over the whole Greek realm. This confirms the historical value of the Indian source, and the eighty-two years will have to be reckoned from the time when Demetrius was driven out of Bactria and fixed his residence in the Punjab (c. 175), so that the end of the kingdom will fall about 93. Menander, the most important of the eight (c. 125-c. 95?),³ carried his arms farther than any of his predecessors, which must be sought much farther east than used to be supposed, since his coins are common as far as Mathurā (Muttra) and Rampur, and Indian sources⁴ tell us that the Greeks subdued Ayódhyā, the land of the Panchāla, and Mathurā, and even took the old capital, Pataliputra. The Greeks were too few to hold these exorbitant conquests without much concession to native habits and prejudices, and we learn without very great surprise from a Buddhist book that Menander became a Buddhist. The same source⁵ tells us that Menander was born at Alasanda (Alexandria ad Caucasum) or at the (neighbouring?) village of Kelasi. Buddhism was strong in this quarter at an early date, and a Buddhist stupa appears as type on a coin of Agathocles, who reigned in Arachosia and Drangiana about 180-165 (Sallet, *op. cit.*, p. 95). A Greek source praises Menander's just rule; the *Milinda-prasna* says, "In the whole of Jambudipa there was no one comparable to Milinda Rāja . . . he was endowed with riches . . . and guarded by military power in a state of the utmost efficiency" (*Jour. As. Soc. Beng.*, v. 532). When he died in the camp he received every honour paid to a deceased "chakravartti," and his ashes were divided, as Buddha's had been, in cenotaphs erected in every town. Perhaps political mingled with pious motives; the struggle for the dust of Menander mentioned by a Greek writer may be compared with that among the "diadechi" for the bones of Alexander, and so will be one phase of the many and long divisions among the Indian Greeks testified to by the coins. In little less than a century we have the names of twenty-three kings all later than Eucratides, and nine of them apparently later than Menander. They appear to belong to four kingdoms, the upper and lower Cabul valley, Peshawar, and the Punjab, and as there are but two names common to more than one king we may conclude that the rapid changes were often violent; that these were not fixed dynasties, perhaps that the kings rose by military election. All this confirms the Indian source (in Kern, *ut supra*, p. 38), "the fiercely-fighting Greeks did not stay in Madhyadeśa; there was a cruel dreadful war in their own kingdom between themselves."

All the time that the Greek kingdom lasted there was beside it another whose kings bear Scythian or Parthian names; their coins belong chiefly to the western Punjab, the outrunners of the Kashmir Himalayas, and west of the Indus, Bajāwar, and sometimes Bamian. The founder of this kingdom was Maues, a younger contemporary of Demetrius and Apollodotus, whose types are imitated on his coins. The coins contain the Chinese notice that the Sse, driven from their seats at Balkash and Issi-kul, founded a kingdom in Kipin (Cabul valley) about 161, with the correction that the kingdom did not at once extend so far west, the coins of Maues being found only in the Punjab. Now this is just the country (between the Indus and Hydaspes) which is said to have submitted

without a war to Mithradates I. of Parthia, and we must probably assume that it was the Sse who put themselves under the Parthian empire, but that the arrangement was not a lasting one the parties to it lying so far apart.

The kings of the Sse do not seem to have been Parthians,⁶ but the nation was one of the many Iranian nomad tribes that once roamed over the steppes north of Sogdiana, while their coins show that they were influenced by the culture of the Indian Greeks, from whom they copied the titles of "satrap" and "strategus." The kingdom lay north of the Greeks, roughly bounded by the Cabul river and a line continuing eastward in the same latitude, and it is one of the unsolved puzzles of this obscure history how such a strip of mountain-land ever became so prosperous and powerful as it did under the second king, Azes, and how it was able to resist the might of Menander. We know from the *Periplus* that on the lower Indus the Parthians who fixed themselves there in the first Christian century had been preceded by a Scythian kingdom of sufficient permanency to leave to the district the name of Scythia or Indo-Scythia. But that the Sse were the founders of this remote kingdom is not so certain as is usually supposed; it is quite as possible that at the time when the Scythians overran Iran the founders of the Indo-Scythian kingdom advanced from Sacastane through the Bolan Pass. The Sse certainly did not force themselves wedge-like between the Greek settlements, and the chronology of the coins precludes the easy solution that their power developed only after the fall of the Greeks. The coins name five supreme kings—Maues, Azes, Azilises, Onones, Spalirises; the dynasty began about 161; Azes, the second king, re struck coins of Apollodotus; and there is not the least reason to doubt that he directly followed him, and that the power of the Sse under Azes fell in the time before Menander, when the Greeks were weak and divided. It was probably Menander who again drove the Scythians within narrower limits. The coins show further a lack of unity in the later days of the Scythian kingdom, and, taking this fact with the smallness of the total number of names, we cannot conclude that it lasted much later than the Greek realms.

Hermæus, the last of the Greek kings, held the lower valley of the Cabul river and Peshawar with the district around it and the belt of the Punjab opposite, and he reigned, as the effigies on his coins show, from youth to old age. These last days of Greek rule in the East fortunately receive light from the Chinese *Annals* (of the first Han).⁷ After the opening of trade with the West about 105 B.C. the Chinese also visited Kipin, but their agents in this remote realm were repeatedly plundered by the King U-to-lao (between 105 and 87). At length, under the son of the latter, the Chinese commander on the frontier joined In-mo-fu, son of the king of Yung-kuin, in a sudden attack on the king of Kipin, who was slain and In-mo-fu installed in his place. Difficulties arose between the new king and China, and when In-mo-fu ultimately tried to make his peace the emperor Hiao-yuan-ti had just resolved to break off all connexion with the distant western lands. As the Chinese kept no military guard of the western frontier till 59 A.C.,⁸ and the new policy of Hiao-yuan-ti began soon after 49,⁹ In-mo-fu must have begun to reign in Kipin some time between 59 and 51. In 32 he again, but still in vain, sent tribute and attempted to reopen the profitable commerce with China. The coins keep us so well informed of the names of rulers in this period that In-mo-fu must be capable of identification, and no ruler can be meant but Hermæus, who in the commonest dialect of Prakrit would be Hermāi, a word necessarily mutilated by Chinese inability to pronounce *r*. Yung-kuin is therefore Yónaki "the city of the Greeks." The dethroned king of Kipin and his father U-to-lao must, from what the Chinese records tell of the origin of their power, be kings of the Sse: U-to-lao is probably Azō Ráo, "king Azes."

We have Chinese accounts of the eastern lands of Iran in the time of open trade along the great south road from Pli-shan on the Chinese frontier over the Hsiangling Pass (beside Lake Yashil-Kul to the west end of the Alichur Pamir),¹⁰ and so south-west to Hian-tu (the Indians), and then to the fruitful and temperate plain of Kipin. The king of Kipin, a mighty lord, resided at Sun-Sun (perhaps *Acovāou*, Dionysopolis or Nagara, now Jalalabad). The inhabitants were industrious and ingenious in carving, building, weaving, and embroidery, and in silk manufacture; vessels of gold and silver, utensils of copper and tin, were found in their bazaars. Their coins of gold and silver had a horseman on one side and a human head on the other. The silver pieces here described¹¹ may be those of Hippostratus, or of any other of the later Greek, or of the Scythian kings; but as none of these kings struck gold the pieces of

¹ For the facts used in this paragraph see especially Cunningham, in *Nouv. Chres.*, new series, x, xli.

² Demetrius, Eucratides, Apollodotus, Strato I., Strato II., Zoilus, Menander, Dionysus.

³ He must have had a long reign; see Sallet, *Nachfolger Al. d. Gr.*, p. 31.

⁴ "Gārgi-Samhitā," in Kern, *Varāha-Mihira*, p. 87. This is an astronomical work of the 1st century of our era. The Isanus of Strabo, xi, p. 816, is probably the Sambus of Arr., *Ind.*, 4, 4. The name is presumably corrupt, and Cunningham's conjecture, *Sodavou* (the Çōna) for 'Isāmuu, would suit best but for the graphical difficulty it involves.

⁵ "Milinda-prasna," in Hardy, *Manual of Buddhism*, pp. 510, 449

⁶ Maues differs only by a formative syllable from Μαυαης, leader of the Sacae at Gaugamela (Arr., iii. 8, 3). 'Opauias is a Parthian name, but really identical with that of Eunones, king of the Aorsi (Tac., *Ann.*, xli. 15); the other five names can hardly be Parthian.

⁷ See Ritter, *Erduunde*, vii. 3, 682 sq.; and Abel Rémusat, *Nouveaux Mélanges*.

⁸ *Antiquités*, i. 205 sq.

⁹ Abel Rémusat, *Mém. de l'Ac.*, viii. (1827) p. 110.

¹⁰ See what is related for the year 46 in *Hist. Gén. de la Chine*, iii. 161.

¹¹ This identification is obtained by comparing the old description of the Hsiangling Pass (Rémusat, *Nouv. Mém.*, i. 209) with that of the pass traversed by the Chinese expedition to Badakhshan in 1759 (*Hist. Gén.*, xi. 572).

Eucratides with the bust on one side and the mounted Dioscuri on the other will still have had course. South-west of Kipin lay the hot plain of U-ghe-shan-li (Kandahar and Sistan), where the southern road ended (necessarily at a considerable commercial town, therefore at Alexandria in Arachosia). Hence a road leads to An-si (in its original sense, *supra*, p. 593), first northward (to Herat) and then east (to Merv). The inhabitants of U-ghe-shan-li, which was too remote to be often visited from China, hated bloodshed and had weapons adorned with gold and silver. Their coins are described in the same terms as those of Kipin; and probably the latter had course, and there was no native mint. But there was an independent kingdom; and, as it is certain that Drangiana and Arachosia were not at this time (middle of 1st century B.C.) subject to the Greeks—no coins of the successors of Apollodotus having been found there—we conclude that this kingdom was that of the Sace, who overran Iran in 128. Later Chinese writers say that the country was subject to An-si (Parthia), and Isidore of Charax (1 B.C.) makes Arachosia a Parthian satrapy. It was probably under Orodes that Arachosia was conquered and the Sace confined to Sacastane.

The latest coins of Hermæus bear also the name of a king, Kujula-Kasô, first in the Arrianian and finally also in the Greek legend (Κοῦλο-Κασδίου). Now the Chinese tell us (*Mém. de l'Ac.*, xxv. 27, 29) that about a century after the Tochari (Yue-chi) conquered Bactria—i.e., 39-27—Kieu-tsiu-kuio, prince of Kuei-shuang, conquered the other four principalities of the Tochari and named his whole kingdom Kuei-shuang (Kashan). He then warred against the Parthians and took the great land of Kao-fu (Cabul), which had been subject to India, Kipin, and Parthia, as well as the neighbouring lands of Po-ta (north of U-ghe-shan li; to be identified with the Pactyes or Patans originally settled in Ghôr) and Kipin. The last fact shows that Kieu-tsiu-kuio is none other than Κοῦλο-Κασδίου, who indeed is called on the coins Kashana-Yavugo, "king of Kashan," and "steadfast in the faith," i.e., in Buddhism, which early found entrance among the Tochari. With this account of the conquest of Cabul it agrees that Isidore names Arachosia but not Cabul as Parthian. Now the war of the king of Kashan with the Parthians is none other than that undertaken by the Scythians to restore Phraates to the throne. Troguus had an excursus in this connexion on the Asiatic kings of the Tochari and the fall of the Sacarauce (doubtless before the increased might of the realm of the Tochari). These intestine conflicts of the Scythians seem to have been at their height during the exile of Phraates, and their issue decided his fortunes. The Romans followed these movements with attention because they threatened Tiridates, and Horace has repeated references to them of a kind that is more than poetic fancy (*Carm.*, i. 26, 3 sq., and especially iii. 29, 26 sq.,—"Tanaïs discors," wars of Tochari and Sacarauce; "plans of the Seres," the Chinese stood in close relation to these lands and had powerfully intervened in the affairs of the Sacarauce in 44).

Wars
and
anarchy.

Before the great host of the Scythians Tiridates retired without a contest. On 1st March 26¹ the news of this had not reached Rome; but in June, as the coins prove,² Phraates again held the throne. Tiridates fled to Augustus, who refused to give him up, but agreed not to support him, and restored to Phraates a son whom Tiridates had carried off and placed in his hands as a hostage. The Parthian in return promised to give up the captives and ensigns taken from Crassus and Antony, and fulfilled his promise in 20, when Augustus was in Syria. He would hardly have done so perhaps had not his throne been again insecure; there is a break in the Parthian coinage after October 23, and it is not resumed for many years—a sure sign of inner troubles. There is just one coin known of Phraates's later years (October 10 B.C.; Gardner, p. 62), which probably marks his return from a second exile; for we know from Josephus (*Ant.*, xvi. 8, 4) that between 12 and 9 B.C. Mithradates IV. was on the throne of the Arsacids, and that Herod of Judæa was accused of plotting with him against Rome.³ The revolt of Media Atropatene, which asked a king from Rome some time between 20 B.C. and 2 A.D., and received Ario-

barzanes II., son of Artavasdes, was probably about this time (*Mon. Anc.*, vi. 9). In 10 or 9 B.C. Phraates took the precaution of sending his family to Rome so that the rebels might have no Arsacid pretender to put forward, keeping only and designating as heir his youngest son by his favourite wife Thea Musa Urania, an Italian slave-girl presented to him by Augustus. This was mainly a scheme of Urania's, and she and her son crowned it by murdering the old tyrant. Phraates V., or as he is usually called Phraataces (diminutive), was thus the third Arsacid, in successive generations, to reach the throne by parricide.⁴

Phraates V., whose first coin is of May 2 B.C., tried an energetic policy, expelling Artavasdes III. and the Roman troops that supported him from Armenia, and seating on the throne Tigranes IV., who had been a fugitive under Parthian protection. Ariobarzanes of Atropatene was probably expelled at the same time; a little later we find him in exile at Rome, and (in spite of Strabo, xi. p. 523, who perhaps had not the latest news) the old line of Atropates seems now to have been superseded by a line of Parthian princes. As Augustus did not wish to extend the empire, and Phraates was not very secure on his throne, neither party cared to fight, and an agreement was patched up after some angry words, Phraates resigning all claim on Armenia and leaving his brothers as hostages in Rome (1 A.D.). Phraates now married his mother, who appears with him on coins from April 2 A.D., a match probably meant to conciliate the clergy, as he knew that the nobles hated him. In fact he was soon driven by a rebellion (after October 4 A.D.) to flee to Roman soil, where he died, it seems, not long afterwards.

The Parthians called Orodes II. from exile to the throne. Civil war. Of him we have a coin of autumn 6 A.D.; but his wild and cruel temper soon made him hated, and he was murdered while out hunting. Anarchy and bloodshed now gaining the upper hand, the Parthians sent to Rome (before 9 A.D.), and received thence as king Vonones, the eldest of the sons of Phraates IV., a well-meaning prince, whose foreign education put him quite out of sympathy with his country. He preferred a litter to a horse, cared nothing for hunting and carousals, liked to be with Greeks, and relaxed the stringent etiquette that barred approach to the sovereign, and at the same time he tried to check speculation. A strong reaction of national feeling took place, and the main line of the Arsacids being now exhausted by death or exile, Artabanus, an Arsacid on the mother's side, who had grown up among the Dahæ and had afterwards been made king of Media (Atropatene), was set up as pretendant in 10 or 11 A.D. Artabanus was defeated at first,⁵ but ultimately gained a great and bloody victory and seated himself in Ctesiphon. Vonones fled to Armenia and was chosen as king of that country (16 A.D.), but Tiberius, who was anxious to avoid war, and did not wish to give Artabanus III. any pretext to invade Armenia, persuaded Vonones to retire to Syria. By and by he was interned in Cilicia, and in 19 A.D. lost his life in an attempt to escape.

The clearest proof of the miserable results of continual civil war in Parthia at this time is that a Jewish robber state maintained itself for fifteen years in the marshes of Nearda and the Babylonian Nisibis a little after 21 A.D.,

⁴ Of the Benî Jellâb, who reigned in Tugurt till after the middle of the present century, every sultan is said to have murdered his father, and Mahmud Shah of Guzerat (1538-54) made all his wives procure abortion as the only possible protection for a king against attempts of sons on his life.

⁵ A drachma of King Vonones when he had conquered Artabanus is one of the earliest examples of the use of the personal name of the king instead of the throne name. The practice became common, and marks an era of disputed successions, where it was necessary to indicate to which pretendant a coin belonged.

¹ Hor., *Car.*, iii. 8, 19-20, belongs to this year, as appears from Phraates's coinage of Dæsius, 286 Sel. The reduction of the Cantabrians refers to Augustus's personal presence in Spain in the end of 27 (Dio, liii. 22), not to their second reduction in 25, which could hardly be known in Rome on 1st March. The retreat of the Scythians refers to the Sarmatian war (Florus, iv. 12, 20).

² Prokesch-Osten, *Monnaies des Rois Parthes*, p. 37.

³ Vaillant having missed this passage, no later writer cites it.

and that, when some satrapies were in revolt and others threatened it, the great king made a pact with the bandits to keep Babylonia in control in his absence. Yet amidst such constant rebellions Artabanus III., shrewd and energetic, not merely held his own but waged successful foreign wars, set his son Arsaces on the throne of Armenia, and challenged Rome still more directly by raising claims to lordship over the Iranian population of Cappadocia. Through the whole first century of the Roman empire all relations to Parthia turned on the struggle for influence in Armenia, and, much as he loved peace, Tiberius could not suffer this disturbance of the balance of power to pass unnoticed. He persuaded Pharasmanes, king of Iberia, to put forward his brother Mithradates as claimant to the Armenian throne. The Iberians, after having procured the assassination of Arsaces, advanced and took Artaxata, the capital; and, when the Parthians came against them under Orodes, another son of Artabanus, Pharasmanes strengthened himself by opening the Caucasian Gates to the Sarmatians,¹ whose chiefs were easily gained to fight where there was money or booty to be got. A bloody battle ensued; Orodes was wounded in single combat with Pharasmanes, and his troops fled, believing him to be dead. In 36 Artabanus himself took the field, but a widespread revolt, long prearranged by Tiberius with a Parthian party led by Sinnaces, rose behind him in the name of Tiridates, a grandson of Phraates IV., who had been chosen as pretendant from the Parthian princes at Rome, and Artabanus retired to Hyrcania to resume his old relations with the adjacent nomads. The Roman legate of Syria, Lucius Vitellius, with his legions, led Tiridates into Parthia, where his followers joined him; Mesopotamia, Apolloniatis, and Chalonitis did homage; and the Syrian and Jewish population of Seleucia, which hated the party of Artabanus (the oligarchy of the 300 "adiganes" drawn from the old Greek families), were gratified by democratic institutions. In Ctesiphon Tiridates was crowned by Surenas, but without waiting for Phraates and Hiero, satraps of two chief provinces (Upper and Rhagian Media?), who became his enemies for this slight. Nor were they alone in their jealousy of the absolute court-influence of Sinnaces and his father Abdagases. Artabanus was called back and appeared from Hyrcania with an auxiliary force of Dahæ and Sacæ; Tiridates retired to Mesopotamia, where his party was strongest, but his army melted away, and in 36 A.D. he took refuge in Syria. Much as Artabanus hated the Romans, his insecure position at home drove him in 37 to make an accommodation on terms favourable to them and send his son Darius as hostage to Tiberius. Indeed, he was again for a short time an exile with Izates of Adiabene, who, however, effected his restoration and was rewarded by the transference of Nisibis to him from Armenia, which the Parthians had again got in their hands, taking advantage of the foolish policy of Gaius Cæsar, who had tempted Mithradates of Armenia to Rome and imprisoned him there. Artabanus died soon after his second restoration, probably in 40 A.D., as Josephus (*Ant.*, xviii. 7, 2) still mentions him in 39.

In Artabanus's lifetime the second place in the empire had been held by one Gotarzes, who appears to have been his colleague in the upper satrapies, and perhaps his lieutenant in his flight to Adiabene. But there is monumental evidence² that he was not, as Josephus says and Tacitus

implies, Artabanus's son (except by adoption), and so we find that the succession first fell to Vardanes, who coined money in September 40. But in 41 Gotarzes appears as king. The cruelties of Gotarzes gave Vardanes an opportunity of return; in two days he rode 345 miles, and taking his rival by surprise forced him to flee, and occupied the lower satrapies, where he coins regularly from July 42 onwards. Vardanes now laid siege to Seleucia, which had been in rebellion since it opened its gates to Tiridates in 36, but was presently called away to meet Gotarzes, who had secured the aid of the Hyrcanians and Dahæ. The renewal of civil war enabled the emperor Claudius, with the aid of the Iberians, to drive the Parthian satrap Demoxas from Armenia and reseat Mithradates on the throne.³ Meantime Gotarzes and Vardanes were face to face in the plain of western or Parthian Bactria, but an attempt on the life of the latter having been disclosed by his foe they made peace, and Gotarzes withdrew to Hyrcania, while Vardanes, confirmed in his empire, returned to Seleucia and took it in 43 after a siege of seven years.

Seleucia was then a city of vast resources, in the time of Pliny Seleucia it reckoned 600,000 souls, and the neighbourhood of Ctesiphon had not ruined it as Seleucia had ruined Babylon. Indeed Strabo (xvi. p. 743) is probably to be believed when he says that Ctesiphon was founded as the winter residence of the Parthian kings mainly out of consideration for Seleucia, whose merchants would have been incommoded by the quartering on them of the rude hordes of nomads who formed the larger part of the army which surrounded the court. The friendship of the Parthians was necessarily impaired by the long rebellion and the insolence of the Seleucians: in 41 the Syrians and Greeks put aside their own quarrels and united to slay the Jews; the survivors fled to Ctesiphon, and even here the hatred of the Seleucians followed them in despite of the great king. Probably, therefore, it was as a rival to Seleucia that Volagases (or Vologases) I. founded a little later Vologesocerta (near Hira) on a site very favourable for commerce. From the middle of the first Christian century Greek influence declined, and Orientalism revived in Parthia. The types of the Arsacid drachmæ—the imperial money—grow more and more barbaric from the time of Artabanus III.; and Pahlavi legends, first found on coins of Volagases I., become predominant with Mithradates VI., the contemporary of Trajan.

Vardanes was deterred from an attempt on Armenia by the threatening attitude of Vibius Marsus, legate of Syria from 42 to 44, and the rest of his reign was fully occupied by internal affairs. In February 45 Gotarzes had renewed his pretensions and struck money, supported by the rebellious nobles, and Vardanes, after defeating him at the passage of the Erindes,⁴ pursued him eastwards through the deserts, driving the nomads before him as far as the Sindes (Tejend), which divided the Dahæ from the Arians, and returned boasting "that he had reduced nations who never before had paid tribute to an Arsacid." The glory that was held to surround these exploits on a stage scarcely different from that on which the oldest Parthian history had been enacted is a striking proof of the neglect of the original home of the monarchy under the pressure of Western affairs; but that Vardanes was a great king is plain from the high praise of Tacitus and the attention which the greatest of Roman historians bestows on a reign which had no direct relations to Rome. Vardanes, whose last coin is of August 45, was murdered while hunting—a victim, we are told, to the hatred produced by his severity to his subjects. But in judging of the charges brought against him and his two predecessors we must remember that the rise of a new dynasty like that of Artabanus is

of Artabanus. The last title seems to mean "alter ego"; it appears miswritten Ταλόμενος in Dio, xl. 12, as applied to Silaces, whom Orodes I. sent against Crassus; comp. New Persian *kahermân*, "agent." Philostratus, in his life of Apollonius, which contains much that is useful for this period, regards the expulsion of Gotarzes as a restoration of the Arsacids.

³ In the chronology of what follows Longuerue's arrangement has been brilliantly confirmed by the coins.

⁴ Or Charindas (Ptol., vi. 2, 2), now the Kerind, which separates Mazandaran from Asterabad.

¹ Josephus, *Ant.*, xviii. 4, 4 (according to the MSS.), says Alans; *Σκόθας* is an interpolation. In modern as in ancient times Iberian kings have repeatedly followed the same dangerous policy to increase their strength. The power of the Christian kings of Georgia in the 12th century rested wholly on alliance with the mountain tribes.

² On a Greek inscription at Bisutan he is "satrap of satraps and *Γρόσπορος*" (son of Gôw); on a coin he probably appears as *Côterzês*, king of the kings of the Arceol (east Iranians), son of Go, "kalymenos"

always accompanied by deeds of violence, and that the oppressed subjects are simply the utterly unruly Parthian nobles who had lost all discipline in the long civil wars, and could only be controlled by force.

After another period of dispute we now find Gotarzes again on the throne and coining regularly from September 46 onwards. But his qualities had not improved, and in 47 a secret embassy of malcontents was at Rome asking Claudius to send them as king Meherdates, son of Vonones. In 49 the legate, Gaius Cassius, did in fact conduct Meherdates (Mithradates V.) as far as Zeugma, where he was met by divers Parthian magnates, and ultimately, after a detour through the snows of Armenia, got as far as Nineveh and Arbela. But his only real strength lay in Carenēs, satrap of Mesopotamia; Abgar V. and Izates, the kings of Orrhoene and Adiabene, pretended to be with him, but were in private understanding with Gotarzes, and deserted before the decisive battle in which Carenēs was surrounded and Meherdates taken (50 A.D.). Gotarzes cut off his rival's ears, but spared his life—an act of leniency most unusual in the East, which proves how much the national feeling of the Iranians despised the pretenders foisted on them by Rome.

Gotarzes died of a sickness, not before June 51, and was followed by Vonones II., who had been king in Atropatene, and was probably a brother of Artabanus III. According to the coins his short reign began before September 51 and did not end before October 54.¹ He was succeeded by his eldest son, Volagases I., the brothers acquiescing in his advancement, although his mother was only a concubine from Miletus (comp. Tac., *Ann.*, xii. 44, with Plut., *Crassus*, 32), and receiving their compensation by being nominated to kingdoms which gave them the second and third places after the "king of kings,"—Pacorus to Media or Atropatene and Tiridates to Armenia,² which the Parthians invaded (in 52?) to expel the usurper Radamistus, murderer of King Mithradates. Radamistus was not finally disposed of till 54, when his own people rose against him. The Armenians now offered no resistance to the Parthians, but the Romans were not content to lose their influence in the land, and their plans were favoured by the rising of a new pretendant, the son of Vardanes, against Volagases. The latter had marched to chastise Izates of Adiabene, whose conduct had been very ambiguous in previous embroilments with Rome, when a great army of Dahæ and Sacæ entered Parthia. Of the son of Vardanes³ we have coins from December 55 to July 58, and as the series of coins of Volagases begins only in 61 it was probably not till then that he had quite mastered his more powerful rival and consolidated his own authority. At first he had to evacuate Armenia, and in 55 he even gave up the chief Arsacids as hostages to Domitius Corbulo, Nero's commissioner on the frontier. In 58, however, Volagases was again able to commence great operations in Armenia, though direct war between Parthia and Rome was still avoided, both sides accepting the fiction that what was done in Armenia was the private affair of Tiridates. The Parthians, indeed, were still in no condition for a great war; the intestine discords continued, and in 58 Hyrcania,

one of the oldest Parthian lands, revolted and sent an embassy to seek alliance with Rome. In the same year, and in that which followed, Corbulo was able with little resistance to destroy Artaxata, occupy Tigranocerta, and set on the Armenian throne, supported by Roman troops, Tigranes V., a prince of that branch line of the Herods which had been established in Cappadocia. At length, in 61, Volagases made peace with the Hyrcanians, acknowledging their independence; then, solemnly crowning Tiridates as king of Armenia, he directed his whole forces against Tigranes. Open war with Rome, however, was still delayed by negotiations with Corbulo, who proposed a peace with a secret condition that the Roman troops should be withdrawn from Armenia. He felt, no doubt, that Tigranes, who had inherited the servility but not the vigour of his ancestor Herod, was not strong enough to secure the obedience of a population which greatly preferred the rule of the Parthians as their brethren in faith, manners, and descent. But Rome refused to confirm the treaty, and war was declared.⁴ The first year of the war (62) was unfortunate for the Romans, and ended with the capitulation of Cæsennius Pætus (who now commanded in Armenia) at Randa, on the southern bank of the Arsanias (i.e., Aradzani, the Armenian name for the upper Euphrates), near Arsamosata. The Romans evacuated Armenia and had also to build the Parthians a bridge over the Arsanias. Corbulo meantime was in Syria, and had purposely left Pætus in the lurch, contenting himself with securing the passages of the Euphrates and guarding them by castles on Parthian soil. He now came to an agreement with the Parthian general, Monæses, to raze the castles in return for the evacuation of Armenia by the Parthians till Rome should be again consulted. Next year the war was resumed, and Corbulo, crossing the Euphrates at Melitene, had penetrated into Sophene when the Parthians earnestly sought peace. It was agreed that Tiridates should lay down his diadem and go to Rome in person to receive it again from the emperor, which was done accordingly in 66. The real advantage of the war lay more with Parthia than with Rome, for, if the Roman suzerainty over Armenia was admitted, the Parthians had succeeded, after a contest which had lasted a generation, in placing an Arsacid on the Armenian throne. After Nero's death Volagases formed very friendly relations with Vespasian, which endured till 75. Meantime all Iran was sorely troubled by the Alans, ^{Ala inroa} who had spread themselves a little before over the plains on the north-west slopes of the Caucasus as far as the Don and the Sea of Azoff. In 72 the king of Hyrcania opened the pass of Derbend to these barbarians, who ravaged Media and drove King Pacorus into the recesses of his mountains, even capturing his harem. Armenia was also plundered, and the bandits retired laden with booty. In 75 the Alans entered Parthia itself and pressed Volagases so hard that he made an ineffectual application for help to Vespasian.⁵ Vespasian's refusal very nearly led to war, and Trajan, who was now governor of Syria, was prepared for a Parthian invasion,⁶ but Vespasian's pacific firmness ultimately averted an outbreak.⁷

We have the evidence of Tacitus (*Ann.*, xi. 8) and Josephus (*Ant.*, xx. 4, 2) that Bactria was the eastern limit of the Parthian empire

¹ Gardner (p. 51) is wrong in ascribing this coin to Volagases I. Tacitus makes Volagases come to the throne in 52 or 53, but if this is right he must have been associated in the empire under Vonones.

² Tac., *Ann.*, xv. 2. There was at this time a fourth monarchy under a Parthian king in east Iran and on the Indus, and a fifth among the Scythians (or rather the Maskuth) on the northern slopes of the Caucasus, where an Arsacid reigned in 19 A.D. (Tac., *Ann.*, ii. 63). As the Median kingdom was subsequently united to the chief empire, the later Armenian historians, Agathangelus (Langlois, i. 109) and Sebès (*ibid.*, p. 199), are right in speaking of four Arsacid kingdoms.

³ His name was probably Nanes, for BNANO on a copper coin (Gardner, p. 51) must be read Β[ασ]ιλ[εύς] Νάνος.

⁴ Tacitus and Dio in this part of the history are both dependent on the very mendacious memoirs of Corbulo. Tacitus, as appears from *Ann.*, xv. 16, distrusted his source and followed it with more discrimination than Dio, but is still more favourable to Corbulo than a criticism strictly proceeding on the known facts can admit to be right.

⁵ It must have been against the Alans that Vespasian in this year, according to a Greek inscription of Metskheta (*Journ. As.*, ser. 6, xiii. 93), fortified the castles of the Iberian Mithradates and of the Jamasdaïtes.

⁶ This is all that is meant by "Parthica laurus," Plin., *Paneg.*, 14.

⁷ In Victor, *Cæs.*, 9, 10, read "ab illo" for "ac bello," comparing the epitome.

in 42 and 54 A.D., but in 59 the Hyrcanian ambassadors were able to return home from a port on the Persian Gulf without touching Parthian soil (Tac., *Ann.*, xiv. 26). This implies that all the upper satrapies had been lost to the empire. The Hyrcanians were still independent c. 155 during the reign of Antoninus Pius (Victor, *Epit.*, 16, 4). In 72 they held the whole southern coast of the Caspian, and for a time at least bordered on a Parthian kingdom which had succeeded that of the Scythians in Sacastane at a date subsequent to that of Isidore of Charax (1 B.C.). The names of seven kings of this dynasty, beginning apparently with an Arsaces Dicaeus, are known from coins. The most powerful of these was the Gondophares under whom, according to the legendary *Acta Thomae*,¹ the apostle Thomas came to India in 29 A.D.; he reigned over a great territory, which in large part had formerly belonged to Parthia, his coins being found mainly in Herat, Sistan, and Kandahar, but also in Begram and sometimes in the Punjab; an inscription at Takht-i-Bahi, north-east of Peshawar, makes his twenty-sixth year the hundredth of an era which is probably that of the introduction of Buddhism in the Cabul valley.² The dynasty of Gondophares, however, was but loosely constituted: we often find two kings at one time; and the *Periplus* (70 A.D.), which tells us of the possession of old Indo-Scythia by these Parthians, says that one king was constantly displacing another, a sure symptom of a moribund condition. One of the last kings, Sanabares, reigned a little after 78 A.D. (Sallet, *op. cit.*, p. 158). The author of the *Periplus* had also heard of the independent and very warlike nation of the Bactrians, i.e., the Tochari, whose greatest conquests fall at this time. Kien-tsiu-khio, the founder of their power, died, according to Chinese accounts, at the age of eighty, and was succeeded by his son Yen-kao-chin, who conquered the Indus lands. The Tochari were then more powerful than ever, and ruled as far as Shao-ki or Oude. The coins, on the other hand, lead us to distinguish between Kozala-Kadaphes, the immediate successor of Kozulo-Kadphizu (who borrows the latter's name and titles, and whose copper money found at Manikyala in the Punjab may be dated by its offering a close imitation of the head of Augustus on denarii struck between 4 B.C. and 2 A.D.), and the real conqueror of India, Ooémo-Kadphisés (Ar. Hima Kapiçó), who reigned from about the middle of the 1st century A.D., and whose might is proved by his striking gold, which no one had done since Eucratides. His coins, frequent in Kabulistan and the Punjab, have been found as far as Benares. This evidence is reconciled with the Chinese account by an Indian notice in Kern, *Varāha-Mihira*, p. 39, which shows that the conquests of the Tochari were for a time interrupted. It speaks of a robber Çaka king who was very powerful (i.e., Yen-kao-chin, or Kozala-Kadaphes), after whom there were five native kings. Of these the first four reigned but a few years, while the fifth, who is unnamed, had a reign of twenty years over a happy land, after which the Çakas began their depredations again. The unnamed king may be identified with a king wearing earrings, and therefore Indian, whose coins, found by sackfuls in Begram, and occasionally in the Punjab, Malwa, and even farther east, mark him as a neighbour and probably contemporary of Gondophares; they bear no name, but only the title "king of kings" and "great saviour."³ The recommencement of the Çaka conquest will thus begin with Ooémo-Kadphisés, who was the immediate predecessor of Kanérki or Kenishka, the founder of the Turushka dynasty, whose accession in 79 A.D. is the epoch of the Çaka era (Oldenberg, *Z. f. Num.*, viii. 290 sq.), and marks the consolidation of affairs in the East.

Volagases I. died soon after the Alan wars, leaving a just reputation by his friendly relations to his brothers—a thing so long unknown—his patient steadfastness in foreign war and home troubles, and his foundation of a new capital. Perhaps also he has the merit of collecting from fragments or oral tradition all that remained of the *Avesta*.⁴ From June 78 we find two kings coining and reigning together, Volagases II. and Pacorus II., probably brothers. From 79 there is a long break in the coins of the former, and Artabanus IV. takes his place with a coin struck in July 81. This Artabanus appears as the protector of a certain Terentius Maximus, who pretended to be Nero⁵; he threatened to restore him and displace Titus by force, and, though the pretender was at length given up, the farce, which was kept up till 88, might have ended

in earnest but for the disorders of the times, indicated by a break in the Parthian coinage between 84 and 93, in which latter year Pacorus appears as sole king.⁶

At this time the political horizon of Parthia was very wide, and its intercourse with the farthest East was livelier than at any other date. In 90 the Yue-chi had come to war with the governor of Chinese Tartary and been reduced to vassalship; in 94 a Chinese expedition slew their king, and, advancing to the "North Sea" (Lake Aral), subdued fifty kingdoms.⁷ The Tochari, one sees, like the Greeks before them, had neglected the lands north of the Hindu-Kush in their designs on India; even of Ooémo-Kadphisés no coins are found north of that range. In 97 Chinese envoys directed to Rome actually reached the Mediterranean, but were dissuaded from going farther by Parthian accounts of the terrors of the sea voyage, and in 101 Muon-kiu, king of the An-si (Parthians), sent lions and gazelles of the kind called "fu-pa" (βούβαλος) to the emperor of China. Muon-kiu reigned in Ho-to, i.e., Carta or Zadracarta in Hyrcania; he was therefore a king of the Hyrcanians, who also held the old Parthian lands east of the Caspian Gate, and may be identical with a king, rival to Pacorus, who struck copper coins in 107 and 108, if the latter is not identical with the later monarch Osroes. But anyhow the representative of the Parthian power in the west was still Pacorus II., who in 110⁸ sold the crown of Edessa to Abgar VII. bar Ízat, and died soon after, making way for his brother Osroes, who coins in the same year, but had to reckon with two rivals, viz., Volagases II. (who reappears after an interval of thirty-three years), from 112 onwards, and Meherdates (Mithradates) VI. The latter was a brother of Osroes, and so probably was the former. None of the three was strong enough to conquer the others, and continual war went on between them till Osroes was foolish enough to provoke Roman intervention by taking Armenia from Exedares, son of Pacorus, to whose appointment Rome had not objected, and transferring it to another son of Pacorus called Parthamasiris. Trajan, who had quite thrown over the principle of the Julii and Flavii, that the Danube and the Euphrates were the boundaries of the empire, and was fully embarked on the old Chauvinist traditions of the republic, would not let such an occasion slip; and, refusing an answer to an embassy that met him at Athens, he entered Armenia and took Arsamosata⁹ without battle, after receiving the homage of western Armenia (114). Parthamasiris submitted himself to the emperor, but Trajan declared that Armenia must be a Roman province, appointed an escort to see the Parthian over the border, and when he resisted and tried to escape ordered his execution,—a brutal act, meant to inspire terror and show that the Arsacids should no longer be treated with on equal terms. Armenia and the neighbouring kings to the north having given in their submission, Trajan marched back by Edessa, receiving the homage of Abgar. The campaign of 115 was in Mesopotamia, and the burden of it fell on Mebarsapes of Adiabene and his ally Mannus of Singara. At

⁶ There is a naive personal character about all the feelings of the Arsacids towards the Caesars. Artabanus III. orders deep mourning for Germanicus, and sends Tiberius an insulting letter, advising him to escape the hate of his subjects by suicide. Volagases I. urges the senate to honour the memory of Nero. In the support given to the pseudo-Nero legitimist sympathies with the Julii may have combined with the wish to pay back in their own coin the Romans who had so often backed Parthian pretendants. ⁷ *Hist. Gén. de la Chine*, iii. 393 sq.

⁸ The third year of Abgar VII. was the fifteenth of Trajan (Curetton, *Ant. Syr. Doc.*, p. 41); this involves a correction of +23 years applied to all Dionysius of Telmahar's dates for the later kings of Edessa, as well as a blank or ninety years before Abgar VII.

⁹ Read *μῦθος Ἀρσάμοσα* in Dio, lxxviii. 19. Samosata was a Roman town, and if they had lost it first this would have been mentioned.

¹ See *N. Rhein. Mus.*, xix. 161 sq.

² This was 500 years after Buddha (*Z. f. K. d. Morgenl.*, iii. 129), which would give the date 57 A.D.

³ This is perhaps the king *qui regnavit sine nomine* of Suetonius, *De Reb. pub.* (Arson., *Ep.*, 19).

⁴ Dinkart, in Haug, *Pahl.-Paz. Gloss.*, p. 144, calls the king who did this only Valkosh (i.e., Volkash), descendant of Ashkan.

⁵ *Ponapas*, xl. 18; *Orac. Sib.*, iv. 124, 137.

its close Mesopotamia was made a Roman province; the Cardueni and the Marcomedi¹ of the Armenian frontier had also been reduced, and Trajan received the title of "Parthicus." In 116 the Tigris was crossed in face of the enemy (probably at Jezirát ibn 'Omar), and a third new province of Assyria absorbed the whole kingdom of Mebarsapes. Once more the Tigris was crossed and Babylonia invaded, still without resistance from the Parthians, whose intestine disorders continued. A Roman fleet descended the Euphrates and the ships were conveyed across on rollers to the Tigris, to co-operate with the army; and now Ctesiphon fell and Osroes fled to Armenia, the north-east parts of which cannot have been thoroughly subdued. The Roman fleet descended the Tigris and received the submission of Mesene; but now, while Trajan was engaged in a voyage of reconnaissance in the Persian Gulf—plainly aiming at Bahrein—all the new provinces revolted and destroyed or expelled the Roman garrisons. The rebels, whose centre was in Mesopotamia, set Meherdates VI. at their head;² and, when he died by a fall from his horse in a foray on Commagene, his son, Sinatruces II., took his place, and was aided by an army which Osroes sent from Armenia under his son Parthamaspatas. The reconciliation of the Arsacids among themselves was rewarded by the defeat and death of the Roman general Maximus; but jealousy now sprang up between the cousins, and of this Lusius, a second general sent by Trajan from Babylon, took advantage to draw Parthamaspatas to the Roman side by a promise of the Parthian throne. Sinatruces was defeated and slain, Nisibis retaken, Edessa stormed and destroyed, and the whole rebellion put down; but Trajan now saw what it would cost to maintain direct Roman rule over such wide and distant conquests, and Parthamaspatas was solemnly crowned in the great plain by Ctesiphon in the presence of Romans and Parthians (winter 117). An unsuccessful siege of Atrá (Hatrâ) in the Mesopotamian desert was Trajan's next undertaking; illness and the revolt of the Jews prevented him from resuming the campaign, and after Trajan's death (7th August 117) Hadrian wisely withdrew the garrisons from the new provinces, which would have demanded the constant presence of the imperial armies, and again made the Euphrates the limit of the empire. Parthamaspatas too had soon to leave Parthia, and Hadrian gave him Orrhoene.³ Thus Trajan's Chauvinist policy had no other result than to show to the world the miserable weakness to which discord had reduced the Parthians.⁴ And the discord did not cease even now, for, though Osroes was restored, Volagases still continued to coin, whether as rival or as partner of his rule, in some part of the realm. Hadrian continued to preserve peace, though a war threatened in 123,⁵ and in 130 he restored to Osroes his daughter taken captive by Trajan at Ctesiphon. Osroes died soon after, and Volagases II. became sole monarch, dying in November 148 at the age of about ninety-six, after a reign of seventy-one years.⁶

¹ Eutr., viii. 3; Festus Rufus, *Brev.*, 20. Marcomedi are the Medes called Markh, the plural of Mar, "Mede" in Armenian.

² What follows is drawn from Malalas, who has two passages (i. 351-352 and 357-358) drawn from Arrian's *Parthica*, but placed in a wrong context.

³ He is the Parnathsapat who was king of Edessa from 119 to 123; this fact and its relation to Spart., *Hadrian*, 5, has escaped notice owing to the false chronology of Dion. Telm.

⁴ A proof of this is that very few silver drachmæ and no tetradrachms were struck between 96 and 120.

⁵ See Dürr, *Reisen des K. Hadrian*, p. 48. The removal of Parthamaspatas and restoration of the old dynasty of Osroene may have been a concession made on this occasion.

⁶ The Volagases who appears in connexion with an Alan invasion of Media, Armenia, and Cappadocia in 135 is from the context a different person, viz., the unnamed king of Armenia who was appointed by Hadrian in 117 (Spart., *Hadrian*, 21), and whose successor took the throne between 140 and 143 (Eckhel, *Doch. num. vet.*, vii. 14).

Volagases III., who succeeded, had designs on Armenia, but an interview between him and Antoninus Pius (spring 155) delayed for a time the outbreak of war.⁷ However, martial preparations went on, and on the death of Antoninus Volagases entered Armenia (162),⁸ expelled the Arsacid Sohæmus, who was a client of Rome, and made Pacorus king. The destruction of a Roman legion under the legate of Cappadocia (Ælius Severianus), who fell on his own sword, laid Cappadocia and Syria open to the Parthians; Attidius Cornelianus, legate of Syria, was routed, and the provincials were in such distress that they even began to speak of revolt from Rome. When late in the year Ælius Verus arrived from the capital he found the troops so demoralized by defeat that he was ready to offer peace; but, when Volagases refused to treat, the able lieutenants whom Verus directed from Antioch soon changed the face of affairs. The war had two theatres, and was officially called the Armenian and Parthian war.⁹ Armenia was regained and Sohæmus restored by Statius Priscus and Martius Verus (163, 164), while Avidius Cassius drove Volagases from Syria in a bloody battle at Europus, and, entering north Mesopotamia, took Edessa and Nisibis, though not without serious opposition.¹⁰ At length, deserted by his allies (*i.e.*, by the local kings, who were becoming more and more independent), Volagases abandoned Mesopotamia, and Cassius entered Babylonia, where, on a frivolous pretext, he gave up to rapine and fire the friendly city of Seleucia, still the first city of the East, with 400,000 inhabitants. The destruction of Seleucia was a hideous crime, a mortal wound dealt to Eastern Hellenism by its natural protectors; that Cassius next, advancing to Ctesiphon, razed the palace of Volagases to the ground may, on the other hand, be defended as a symbolical act calculated more than anything else to impair the prestige of the Parthian with his Oriental subjects. Cassius returned to Syria in 165, with his victorious army much weakened through the failure of the commissariat and by the plague, which, breaking out in Parthia immediately after the fall of Seleucia, spread over the whole known world. In the same year Martius Verus won hardly less considerable successes in Media Atropatene, then apparently a separate kingdom.¹¹ The peace which followed in 166 gave Mesopotamia to Rome. This was the greatest of all wars between Rome and Parthia, alike in the extent of the lands involved and the energy of attack shown by the Parthians. The Romans used their victory with moderation, but Parthia, after this last effort, continued steadily to sink.

The Romans at the same time made an effort to compete with Parthia for the Chinese trade (especially in silk), which the latter had jealously kept in their own hands, and in 166 an envoy of An-thun (M. Antoninus) reached the court of the emperor Huan-ti, *via* the sea and Tong-king. But the effort to establish a direct trade with China was unavailing, and the trade still flowed in its old channels when a second Roman agent reached China in 226, a little before the fall of the Parthian empire. The Chinese tell us that with India also the Parthians drove a considerable trade.¹²

¹¹ This seems to follow from the fact that both emperors, who were already called "Armeniacus" and "Parthicus Maximus," also call themselves "Medicus" (on a coin earlier than 28th August 165), Eckhel, iv. 76; inser. of Signia, Orelli, No. 859.

¹² The "Annals of the Second Han," in Deguignes, *Mém. Ac. Inscr.*,

Volagases III. died in 191, having reigned forty-two years without civil war, and was succeeded by Volagases IV. During the civil troubles of Rome which preceded the establishment of the military empire this prince maintained friendly relations with Pescennius Niger; and his vassal Barsenius of Atrā was permitted to supply a force of bowmen, who took part in the fighting against Septimius Severus at Nicæa (194). When Niger's cause declined, however, Volagases allowed his clients of Adiabene to join with Orrhoene, now in revolt against the Roman power. The strongholds of Mesopotamia were taken, and their garrisons put to the sword; Nisibis itself was besieged. In truth, the Parthian could no longer pretend to control the policy of the princes on his frontier, who felt themselves their own masters since they had borne the chief brunt of the last two Roman wars. But in summer 195 Severus appeared in Mesopotamia, received the submission of Abgar VIII. of Orrhoene, and from Nisibis (which, with true insight into its strategic importance, he raised to a colony and great military station) directed two successful campaigns against Adiabene¹ (196) and the Arabs of the Singara district, incorporating the latter in the province of Mesopotamia.² The Parthians made no movement till Severus was busy with Albinus, when they ravaged Mesopotamia and besieged Lætus in Nisibis; but in 198 Severus was again on the scene of war, and they fell back without fighting, leaving the emperor free to prepare for next year a campaign on a great scale. In 199 a fleet on the Euphrates co-operated with the Roman army, and Severus, taking up an unaccomplished plan of Trajan, dredged out the old Naarmalca canal, through which his ships sailed into the Tigris, and took the Parthians wholly by surprise. Seleucia and Coche³ were deserted by their inhabitants; Ctesiphon was taken by the end of the year with terrible slaughter, 100,000 inhabitants being led captive and the place given up to pillage, for the great king had fled powerless at the approach of the foe. Severus, whose force was reduced by famine and dysenteries, did not attempt pursuit, but drew off up the Tigris. The army was again in its quarters by 1st April 200 (*C.I.L.*, vi. 225 a), and for some time thereafter Severus was occupied in Armenia. But in 201 he undertook a carefully organized expedition against Atrā, from whose walls the Romans had been repulsed with great loss when Severus, returning from the Tigris in the previous year, had attempted to carry it by a *coup de main*. This city, which in Trajan's time was neither great nor rich, was now a wealthy place, and the sun-temple contained vast treasures. The classical authors call Atrā Arabian, but the king's name is Syriac, Barsenius, i.e., Bar Sîn, son of the moon, and we may suppose that it was really an Aramæan principality,⁴ which, like Palmyra, had its strength from the surrounding Arab tribes that it could call into the field. Severus lay before Atrā for twenty days, but the enemy's cavalry cut off his foraging parties, the admirable archers galled the Roman troops, a great part of the siege train was burned with naphtha; and, when, in addition, two assaults had been repulsed with tremendous loss on two successive days, the emperor was compelled to raise the siege,—a severe blow to Roman prestige in the East, and one that greatly raised the name of Atrā and its prince, but did not help the decaying power of Parthia in the least.

xxxii. (1768), p. 358; Pian-i-tian, in *Mém. Ac. Inscr.*, viii. (1827) p. 124 sq.; and *Journ. As.*, ser. 3, viii. 278, 280 sq.

¹ In Dio, lxxv. 3, read τὴν Ἀρβηλίτιν for τὴν ἀρχήν.

² Not only Herodian, iii. 9, but Capitol., *Macrinus*, 12, implies that these Arabs were Yemenites; the great migration of southern Arabs, which led to the foundation of the kingdom of Ilīra, had therefore already taken place.

³ Dio, *Ecc.*, lxxv. 9, has Babylon, but it was a mere heap of ruins in the beginning of the 2d century A.D.

⁴ Cp. Noldeke, *Tabari*, p. 34.

In 209 Volagases IV. was succeeded by his son Volagases V., under whom in 212 the fatal troubles in Persis began, while in 213 his brother Artabanus rose as rival claimant of the kingship;⁵ and the civil war lasted for many years. A fresh danger arose when Tiridates, a brother of Volagases IV., who had long been a refugee with the Romans and had accompanied Severus's campaign of 199, escaped, in company with a Cilician adventurer, the Cynic Antiochus, to the court of his nephew Volagases; for the emperor Antoninus (Caracalla) demanded their surrender, and obtained it only by a declaration of war (215). About the same time Artabanus gained the upper hand, and in 216 he held Ctesiphon and its district; but Volagases still held out in the Greek cities of Babylonia, as his tetradrachms prove (till 222). Artabanus's strength lay in the north; the Arab histories of the Sāsānians make him king of the Median region, and agreeably with this he coins only drachmæ.⁶ Presently Artabanus had a war with Rome on his hands; the pretext was that he had refused his daughter to Antoninus, but the emperor was mindful of his father's dying advice to enrich the soldiers and despise all other classes, and saw a prospect of rich booty. In 216 the Romans penetrated to Arbela by way of Carduene and Calachene,⁷ and violated the graves of the kings of Adiabene, which they falsely took for those of the Arsacids. Thus far the Parthians, who had been taken by surprise in full peace, had offered little or no resistance, but Antoninus was murdered (8th April 217) while he was preparing for a new foray, and his successor Macrinus at once found that Artabanus was now armed, and was not the man to let the insult to his territory pass with impunity. An overwhelming Parthian force fell on Mesopotamia and refused to be appeased by the restoration of the captives of the previous year; Macrinus was beaten in two engagements⁸ and compelled to retire to Syria, abandoning the Mesopotamian plain; and in the winter of 217/218 he was glad to purchase peace for an indemnity of 50,000,000 denarii (£1,774,298). In or about 222 Artabanus must also have displaced his brother in Babylonia, for he was a patron of Rab Abba, who became head of the Jewish school of Sura in 219.⁹

Persis, which dealt the last blow to the Arsacids, had Persis. through the whole Parthian period held an isolated position, and is so seldom mentioned that our knowledge of its history and native princes is almost wholly due to recently-found coins.¹⁰

These embrace a triple series of silver coins and a class of copper pieces. The oldest of the latter class bears the name of Camnascires, and his is the only name in the class known to us from other sources, for Hyrodes and Phraates (each of which names was borne by two kings of the series) are not Arsacid great kings, as their title is only "king," not "king of kings" (against Mordtmann). Nor do they seem to have ruled in the same quarter with the kings who struck silver; the latter were native kings of Persis, the former rather Elymæans, who in the times after Camnascires were forced back in a south-east direction (as appears from the places in which the coins are found), and ruled parts of Persis side by side with the

⁵ According to Mani, in the book *Shaturkan*, the 4th year of Ardabān = 216/217; see Al-Bērūnī, tr. by Sachau, pp. 121, 190. This proves that in 216 Artabanus was the recognized sovereign in the district of Ctesiphon to which Mardinu (on Habi Ibrāhīm) belongs; cf. Noldeke, *Tabari*, p. 16.

⁶ See above, p. 601.

⁷ Dio says they invaded Media, but Antoninus had not such a hold of Armenia as to open to him the route of the triumvir Antony, and a march from Gazaca to Arbela over Mount Zagrus is incredible. But, if Media at this time extended so far west as to include Arrapachitis and Calachene (the Marcomedians of Trajan's wars), the campaign is intelligible, and Spartian's mention of the Cadusians and Babylonians can be explained as a misreading of Καρδοαναί and Ἀρβηλίον in a Greek source.

⁸ The lacuna in Dio, lxxviii. 26, is to be supplied by a passage of Xiphilinus, not given in recent editions.

⁹ Jost, *Geach. d. Jud.*, ii. 139.

¹⁰ See Mordtmann in *Z. f. Num.*, lv. 152 sq., vii. 40 sq.

116-228. native princes. Camnascires appears as an old man on coins of 82 and 81 B.C., and his ten successors whom we know from the coins carry us down to 36 A.D., the latest date at which the Elymeans are mentioned as independent (Tac., *Ann.*, vi. 44). The older coins have Greek inscriptions and often figures of Greek gods, but under the fifth successor of Camnascires, i.e., about the time of Christ, Pahlavi takes the place of Greek and Mithras of Serapis.

The silver class, again, has in all three series Pahlavi legends and the fire-altar on the reverse. The first series has seven princes with the unexplained title "Feritkarā," the second has three kings (Malkā), the third ten kings; the names are throughout either Achaemenian (Artahshetr, Dāryav), pointing perhaps to a claim of Achaemenian descent, or sacred names like those common with the Sāsānians (Nersēh, Yezdikert), or are taken from sacred legend (Minūchetr). The second and third series appear to be continuous (against Mordtmann), the last king of the second series is Zātūrdāt (II.), the first of the third Dāryav (I.) son of Zātūrdāt. With Dāryav I. the kings assume a Parthian costume, and his son Artahshetr II. is the only king of that name who from the number and various types of his coins can be fairly identified with the Artaxerxes of Isidore of Charax, who reigned "in the time of his fathers" (c. 80-50 B.C.), and was slain at the age of ninety-three by his brother Gosithres. As Dāryav I. must also have reigned for a considerable time this datum places him about the commencement of the Parthian supremacy, which naturally explains his Parthian dress. Then the princes of the first silver series will be Seleucid vassals, and the shorter series of kings before Dāryav independent princes falling between the Seleucid and Parthian suzerainty. Finally Gosithres, brother of Artahshetr II., has the same name as Gōzihr, the last Bāzrangī king before the rise of the Sāsānians, so that it was probably one dynasty. The eight kings, in at least six different generations, who appear on coins between Artahshetr II. and Tīrdāt II., will carry us roughly to the middle of the second Christian century, leaving a space sufficient for Gōzihr, the last Bāzrangian, and the anarchy of the first days of the Sāsānians.

The emblems on the coins show that Persis was always loyally Zoroastrian, and at Istākhr stood the famous fire-temple of the goddess Anāhédh. Its priest was Sāsān, whose marriage with a Bāzrangian princess, Rāmbehisht, laid the foundation of the greatness of his house, while priestly influence, which was very strong, doubtless favoured its rise. Pābak, son of Sāsān, and Ardāshīr, son of Pābak, begin the history of the Sāsānian dynasty, which occupies the next section of this article. Artabanus did nothing to check the use of the new power till Ardāshīr had all Persis in his hand (224) and had begun to erect a palace and temple at Gōr (Firuzabad). Nīrōfār, king of Elymais, was then sent against him, but was defeated, and now Ardāshīr passed beyond Persis and successively reduced Ispahan (Parætacene), Ahwaz (Elymais), and Mesene.¹ After this victory Ardāshīr sent a challenge to Artabanus himself; their armies met by appointment in the plain of Hormizdjān, and Artabanus fell (28th April 227). Ctesiphon and Babylonia must have fallen not much later, though Volagases V. seems to have re-established himself there on his brother's death, and a tetradrachm of 539 Sel. shows that he held the city till autumn 227. The conquest of Assyria and great part of Media and Parthia is assigned by Dio expressly or by implication to the year 228, and so the Parthian empire was at an end.

The part of Parthia of which Dio speaks can only be Choarene and Comisene; it was only in a later expedition that Ardāshīr reached Sacastane, Hyrcania, Nishapur, and Merv, and these do not seem to have been Parthian. Indeed, from 58 A.D. Comisene appears to have been the most eastern satrapy of the Arsacid empire. Eastern Iran was in this period very flourishing under the Tochari of the dynasty which Indian sources call Turushka, and which can be traced on inscriptions till 213 and 259 (or 359). Kanishka, the founder of the dynasty, is said to have ruled Cabul and all Hindustan, and in fact his coins extend over all northern India. The empire of which Kashmir was a main province was wider than that of the Greeks had been, and also more consolidated, for strategē took the place of the native kings (*Journ. As.*, ser. 3, viii. 264, and ser. 4, x. 95). So,

¹ The flourishing state of Mesene had, as its coins show, been long sinking into barbarism; the latest date they supply is 167 (*Z. f. Num.*, viii. 212 sq.). A little earlier, in 143, they are associated with coins of Meredates, son of Phobas, king of the Omanians. The latter, already known to Pliny as dwelling in the desert west of Charax, must be the Axd from Omān, a part of whom shared the great migration and finally settled in Anbār and Hira.

too, Kanishka banished the native language from his coins, using Greek letters and his own foreign language. His predecessor had supplanted the Greek gods, except Helios, by Oriental divinities, and now Helios too gives way to the Iranian *Mupo* or *Maopo*. The motley pantheon on the coins of Kanishka and his successors gives an interesting glimpse of the faiths of the Indo-Iranian frontier. We find here the old Iranian popular deities: Māo, the moon-god; *Mupo*, the sun-god; *Nava*, the goddess of war; *Oaōo*, the wind-god; *Orlayao*, i.e., *Vērthraghnō* (see Benfey, *Z. D. M. G.*, viii. 459); *Aupo*, identical with the Zoroastrian Ahura-mazda; we find also abstractions like the Izeds of the heavenly hierarchy in official Zoroastrianism, e.g., *Orup*, i.e., Aniran, the eternal self-created lights, and *Φαππο* (Pers., *farr*; synonymous with *Zend*, *hvarənah*), the royal majesty, side by side with Indian deities, such as Siva, and a number of unknown deities with barbarous names brought from the old homes of the Tochari. Heracles and Helios appear transformed by barbarous pronunciation or epithets, and *Σεραπο* is the cosmopolitan Serapis, probably introduced, as in Elymais, by Alexandrian sailors. Buddha, too, appears (*Sallet, Nachf. Al.*, p. 189 sq.). The Buddhists were the most active religious body in the kingdom, and the king, if not actually a convert, as the legend claims, showed them such favour as gave their faith a wide missionary field and unparalleled success. The kings built many Buddhist meeting-houses, monasteries, and shrines, and it was Kanishka who called together in Kashmir the council of 500 fathers that finally redacted the Tripiṭaka collection. Ptolemy (vii. 1, 47) speaks of Tochari as the *Κασπαῖοι*; the Chinese bear witness to their might in 159; and from 220 to 265 their empire retained its old compass (*Journ. As.*, ser. 3, viii. 263, 268). Kashmir was lost in the course of the 3d century, but the western provinces remained. About 100 A.D. Greek ceased to be understood in east Iran, and from this time we can trace a growing Iranian influence on the coins of the Tochari, especially in the Sāsānian period. The latest coins of the Tochari come mostly from Balkh, so that they seem to have been gradually pushed backwards to the point from which they started. Finally, their empire was overthrown by another branch of their own race, for, early in the 5th century, those of the Great Yue-chi who had remained in their old homes, a little west of Badakhshan, were compelled, by the pressure of the Juan-juan of Tartary, to move west to Po-lo or Balkh, and thence, under their warlike king Ki-to-lo (Kidara; whence they are called Cidaritic Huns by Priscus, in *Fr. H. Gr.*, iv. 102), crossed the Hindu-Kush and destroyed the old empire of the Tochari, founding in its place the kingdom of the Little Yue-chi. The date of this invasion can, from a variety of data, be fixed as c. 430, just about the time when the Sāsānians, in 429, destroyed the last of the Arsacids in Armenia; and with this agrees the Indian statement that eighteen Ṣaka kings reigned 380 years (50-430 A.D.). Their successors were still powerful in India about 520, and in their old homes their empire fell in 562.

Sources.—1. FOR THE MACEDONIAN PERIOD.—For Alexander the sources are of two classes. (1) Arrian, and for the most part Plutarch also, drew from official Macedonian sources, especially the works of King Ptolemy and Aristobolus of Cassandrea. (2) An unofficial history, written by a Greek Clitarchus for the Greeks, is faithfully excerpted by Diodorus. Curtius and Justin (or rather Trogus) drew from a later work based on the same source but supplemented by extracts from a book of the first class and another book hostile to Alexander and of very indifferent authority. Droysen follows the writings of the first class exclusively, and indeed for military and historical points they alone are to be trusted. Grote uses also the works of the second class, which, though rhetorical, romantic, and uncritical, have the advantage of telling us many things that the official histories pass over, and, though they show little judgment themselves, are rich in materials to guide our judgment. The historian must deal with the material as a philologist would deal with a book preserved in two classes of MSS., one good, the other interpolated and independent. One must first restore as nearly as may be the archetype of the second class and then use it to correct the text—or here the history—based on the first class. For the immediate successors of Alexander, Diodorus, the excerpts from Arrian in Photina, and Plutarch's lives of Eumenes and Demetrius are our best guides, all three drawing from the excellent Hieronymus of Cardia. Trogus (Justin) makes a defective use of indifferent sources, and is good for little. Droysen's is the best modern book; Grote is useful because he does not take so purely Macedonian a standpoint, but he deals mainly with the West. We have no really continuous ancient account for 301-220 B.C., for Justin's narrative is even less worthy of the name of a history than in the preceding period. The scattered material is best collected by Droysen. From 220 onwards we have the excellent work of Polybius, at first complete and then in large excerpts. There are some good modern monographs, but nothing that can be called even a tolerable general history of the latest period of Macedonian rule in Asia.

2. FOR THE PARTHIAN PERIOD.—The only continuous account of Parthian and Bactrian history which has reached us is Justin's abridgment of Trogus Pompeius, ending with 9 B.C., and having also a lacuna, due to Justin's carelessness, between 94 and 55 B.C. For the wars with Rome in 63 and 53 B.C., Plutarch's *Crispus* and *Antonius* give full accounts. Under the early Caesars the Parthians were, in a sense, viewed as sharing the empire of the world with Rome (Strabo, xi. p. 515; Just., xii. 1, 1), and Roman historians began briefly to note events in Parthian history which had no direct connexion with Roman affairs. Thus, from 69 B.C. to 72 A.D., Dio, Josephus, and Tacitus give us pretty complete accounts. Between 94 and 69 B.C. and between 72 and 227 A.D. the history is very much lost. The coins are most valuable, especially after 37 A.C., when they begin to be dated; for the later period they are our chief aid, the excerpts from Dio not helping us much.

Notes.—Foy Vaillant, *Arsacidarum imperium* (Paris, 1728), and Du Four de Longueville, *Annales Arsacidarum* (Strasb., 1732), are still indispensable compilations, to which G. E. J. Guilhem de Sainte-Croix, "Mém. sur le gouvernement des Parthes," *Mém. Ac. Inscr.*, i. 43 sq., 755 sq., gives a good supplement. The most important modern books are those that explain the coins historically—

E. Q. Visconti, *Icon. Gr.*, iii.; Bartholomæi, "Rech. sur la num. Arsac." *Mém. Soc. Arch.*, ii.; A. de Longpérier, *Mém. sur la chron. et l'iconogr. des rois Parthes Arsac.* (Paris, 1853)—and the catalogues of coins in Prokesch-Osten's *Monnaies des rois Parthes* (Paris, 1874-75) and P. Gardner's *Parthian Coinage* (London, 1877). There are also recent histories of Parthia by Rawlinson, Schneidewirth, and Spiegel, and a book on the coins by Lindsay. As regards Bactria Bayer's *Historia* (Petersb., 1738) is poor, and quite upset by recent finds of coins. The Chinese material is still best given by Deguignes in *Mém. Ac. Inscr.*, xxv. 17 sq. Of recent books see H. H. Wilson, *Artiana Antiqua* (London, 1841); Lassen, *Zur Gesch. der Griech. und Indoskyth. Könige* (Bonn, 1838) and *Ind. Alterthumsk.*, ii. The best works on the coins are by Thomas, in his edition of Prinsep, *Essays on Ind. Antiquities*, ii. 173 sq.; A. Cunningham, in *Num. Chron.*, vols. viii.-xli.; and Salicet, *Nachfolger Alexanders des Gr. in Baktrien und Indien* (Berlin, 1878). (A. v. O.)

SECTION III.—SÁSÁNIAN EMPIRE.

Of the minor kings who ruled in Persis, in the Arsacid period, in real or nominal allegiance to the Parthian "king of kings" we know some names from coins or ancient writers, but we cannot tell whether they were all of one dynasty. In the beginning of the 3d century the kings, who then belonged to a dynasty of which the name probably was Bázrangik, had lost much of their power; lesser potentates ruled in various parts of the land, which, by being all mountainous, falls naturally into ill-connected sections. One of these local princes was Pápak, or, in the more modern pronunciation, Pábak,¹ son or descendant of Sásán, a native of the village of Khír on the southern margin of the great salt lake east of Shíráz. Pábak overthrew Gózihr, the last prince of the Bázrangik, and became master of the district of Istakhr (Persepolis), and the coins and inscriptions of his son give him the title of king. His legitimate heir was his son Shápúr, for whom Pábak is said to have asked recognition from the Arsacids; but on Pábak's death a second son, Ardashír, refused to acknowledge his brother, and was in arms against him when Shápúr died suddenly, and hardly by mere accident. That Ardashír's claims were opposed by his brothers and that he put them to death are not to be doubted, as we have these facts from a tradition of strictly legitimist tendency.

Tradition names various local princes conquered by Ardashír for himself or for his father, and perhaps Pábak before his death was already lord of all Persis. Ardashír, at least presumably, was so when he struck the coins still extant.² Ardashír, who is to the Sásánian what Cyrus was to the Achæmenian empire, probably came to the throne in 211/212 A.D.³ From the first he plainly leaned on the clergy of the Zoroastrian faith, which all through the Macedonian and Parthian eras had undoubtedly continued to be the religion of the people in Irán proper, and especially in Persis. The Parthian monarchs were Zoroastrians, but probably often very lukewarm in the faith. Ardashír, on the contrary, ostentatiously placed symbols of fire-worship on his coins, and on his inscriptions boasts himself a "Mazdayasn," or orthodox Zoroastrian. From his days onward the often fanatical and persecuting clergy enjoyed great power in the Sásánian empire, and the hierarchical organization of the state church, so similar to that of the Christian clergy, probably dates from Ardashír; it is referred to, at least, on the inscriptions of his immediate successors. Popularity and a certain religious prestige were the natural fruits of this orthodox zeal on the part of Ardashír, but his success was essentially the fruit of his energy and

valour. Slowly and not without toil he rose from king of Persis to be king of the kings of Irán. He began by subduing successively Kirmán, Susiana, and the petty states at the mouth of the Tigris. But after this he came into conflict with the great king, whom, according to the contemporary account of Dio Cassius, he smote in three battles. The decisive engagement with Ardaván (Artabanus) in which the last Parthian monarch fell, and where Ardashír gained the title of "king of kings," seems to have been on 28th April 224 (or 227, according to A. v. Gutschmid), and was probably fought in Babylonia or Susiana, for the next enterprise of Ardashír was an unsuccessful attack on the strong walls of Hātra, which perhaps was not taken and destroyed till the reign of his successor. Ardashír conquered Media, where an Arsacid prince was his adversary, and gained the greater part of the Iránian highlands, but failed in Armenia, whither a son of Ardaván had fled.

The Romans saw with concern the rise of a prince who already directed his aims against their Asiatic possessions, and seems to have had some success in this quarter, till in 233 he was smitten by Alexander Severus in a great battle.⁴ Henceforth, though peace was often made between the two powers, they remained constant rivals,—and rivals on equal terms, for, though under able rulers and when the inner condition of the empire was not greatly disturbed, the Europeans of Rome or Byzantium were still too strong for the Asiatics, the tables were not seldom turned, and Rome sustained many a shameful defeat. This struggle fills the chief place in the political history of the Sásánians; and the inner development of the empire, its martial and political institutions, its art and industry, were also most powerfully influenced by the superior civilization of the West.

The nominal capital was always at Istakhr, where, for Sásánian example, the holy "pyreum" of the royal house stood, and where the heads of conquered foreign kings were hung up. But the real metropolis was the Arsacid capital of Ctesiphon, with Ardashír's new foundation of Veh-Ardashír, just across the Tigris on the site of the old Seleucia. The rich alluvial land that surrounded these twin cities was no part of Irán proper, and its inhabitants were mainly Semites; but old example, and probably its vicinity to Roman soil, marked it out for the true seat of government.

The extent of the empire at the time of Ardashír's death is uncertain, for the national tradition ascribes to him some conquests that were really made by his successors, and others which the Sásánians never made at all. Shápúr, his son, calls himself on his inscriptions king of the kings of Irán and non-Irán, where his father says only "of Irán"; so that it was the son who first extended the realm beyond the bounds of what was then known as Irán. Non-Irán may refer to districts in the far East, where, however, the Sásánian power never reached so far as that of the Achæmenians, and it may also include Armenia. At any rate, Ardashír won a great empire and consolidated it, so that it held together for four centuries. He gave a powerful blow to the system of vassal states, which had become more and more prevalent under the Arsacids, and reduced most of these states to provinces. In this sense he is justly viewed by tradition as the restorer of the unity of Irán;⁵ but the

¹ The Arabs, having no *p*, pronounce Bábak; but this is not Persian. In general the forms of proper names followed in this article give the more recent pronunciation, which may have prevailed about the end of the Sásánian period.

² These show a full-face portrait with the legend "Artakshathir king." The reverse has his father's portrait in profile with the legend "son of the divine Pápuk." The older form of Ardashír's name, Artakshathir, is the ancient Achæmenian name, which the Greeks write Artaxerxes, and which, singularly enough (together with the name Darius, Dáryáv, Dáráb, Dárá), had survived in the home of the Achæmenians, although genuine Persian tradition had lost all memory of the old empire.

³ See A. v. Gutschmid, in *Z. D. M. G.*, xxxiv. 734.

⁴ Lampridius, *Al. Sec.*, 56. His statement rests on documentary evidence, and is accepted by Tillemont and by Clinton, who confirms it from coins. The attachment of the troops from Orrhoene for Alexander (Capitol., *Maximinus*, ii.) was probably connected with his liberation of their country from the Persians. Rawlinson's and Spiegel's preference for the statement of the romancer Herodian that the Persians were the victors, is pseudo-criticism.

⁵ It must not be supposed that the Persians had a clear recollection of the might and breadth of the Achæmenian empire, though Western writers, who knew the old history from books, sometimes make Persians speak as if they shared in that knowledge. No doubt a Sásánian would sometimes hear from a Greek or Syrian how his predecessors

unity, of course, was not such as in a modern European state. The great barons in particular were still very powerful, and were more than once a danger to the kings. At bottom they were a continuation of the Parthian nobility, falling into divers classes, headed, as in the Achæmenian empire, by the seven noblest houses. There was also a numerous minor nobility. Later generations looked back upon the founder of the empire as the best of lawgivers and the ideal monarch; and, of course, so great a patron of Zoroastrianism left a high reputation for piety. A man of mark he certainly was, but the fratricide that opened his reign, and such a barbarity as tradition itself relates of his conduct to the conquered Ardaván, whose head he spurned with his feet, show him to have been very far from a pattern character. It is interesting to find his memory intertwined with similar romantic legends to those told of Cyrus. He was born of (we are told) a mean father, and lived as a page at the court of Ardaván, as Cyrus lived at that of Astyages, and so forth. Dreams and portents figure in the later as in the earlier legend, and even a mythical conflict with a dragon is recounted.¹ Fortunately a much more historical picture has been preserved by genuine tradition.

Ardashír is said to have adopted his son Shápúr as partner of his throne, and this is confirmed by coins on which a youthful head appears along with Ardashír's likeness. He died late in 241 or early in 242. Shápúr I. (older form *Shahpuhr*; Sapor or Sapoires of the Westerns) was probably crowned on 20th March 242. Legendary tradition makes his mother an Arsacid princess taken at the capture of Ctesiphon; but, according to a more probable account, Shápúr was already able to bear arms in the decisive battle with Ardaván. Nor can he have been a mere stripling when his reign began, as his prowess against Rome shows; for in Ardashír's last years, in the reign of Maximin (236-238), the war had been renewed, and Nisibis and Carrhæ (Haran), two fortresses which constantly reappear in this history, had been taken. In 242 Shápúr had penetrated to Antioch, before Gordian III., or rather his father-in-law Timesitheus, drove him back and retook the Mesopotamian strongholds. The Persians were defeated at Réshainá, and Gordian proposed to march on the capital by way of the Euphrates, as Julian subsequently did; when almost on the frontier, a little below the junction of the Euphrates and Chaboras, he was murdered by Philip the Arab (244), who concluded a humiliating peace with Shápúr, and is said—for the details are obscure—to have given up to him Armenia and Mesopotamia. Our whole knowledge of the Perso-Roman wars in the 3d century is very defective; but there seems now to have been a lull for some years, till in 251 or 252 Shápúr again was in motion, now at length effecting an occupation of Armenia and compelling its king to flee to Roman soil. The Roman world was at this period so shaken that Syria was again and again invaded,—how often we can hardly say; nay, a Syrian, Cyriades, himself led the Persians to Antioch and assumed the purple under their protection. At last the emperor Valerian took the field in person; but, after protracted operations in Mesopotamia, fortune turned against the Romans and Valerian himself became Shápúr's captive (260), under unknown circumstances, and, according to

Roman accounts, through treachery, but certainly not till he had entered into negotiations and vainly sought to purchase a free retreat for his army with gold. Shápúr now penetrated with an invading host far into Roman territory towards Asia Minor, but he met with not unsuccessful opposition. The general Ballista cut off many Persians; but a heavier blow was struck by Odenathus at the head of his Palmyrenes, who, in this or a subsequent campaign, smote the retreating Persians and even captured the royal harem; nay, once, if not twice, he laid siege to Ctesiphon itself (for details see PALMYRA). Presumably now as in later times the Persian empire proved unable to sustain the cost of prolonged campaigns. These Oriental kingdoms are on the whole poor, though they include some fertile regions, and though the kings accumulate large stores of treasure. The Persians had no great standing army like the Romans, and the levies summoned to the standard could not long be kept together; hence so many brilliant débuts in warfare without lasting result. Shápúr effected no permanent gain of territory, for even Armenia seems now to have fallen again under Roman suzerainty.² But Valerian was not delivered, and died in captivity. The figures of the victorious king and the captive Cæsar are still to be seen hewn, perhaps by Roman subjects, on the rocks of Persis, and Persian tradition, which preserves so few historical facts as to the immediate successors of Ardashír, has not forgotten this crowning humiliation of Rome. Some of the traditional deeds of Shápúr I. really belong to Shápúr II., but we may accept him as the author of the great irrigation works at Shúshtar, and it was he who built Gúndév Shápúr (Ar. Jundai-Sábúr, Syr. Béth Lápát), which was often used by the kings as their second residence, and stood to Ctesiphon as its neighbour Susa in Achæmenian times did to Babylon. Shápúr's sway over non-Íránian peoples has been already referred to; but the Augustan historians are certainly right in speaking of the Bactrians as a nation still independent and often hostile to Persia, and the same is true of the Cadusians (Pollio, *Val.*, ch. i.), i.e., the Délamites of Gilán, who were never subdued by the Sásánians. At the very beginning of Shápúr's reign Mani, founder of the Manichæan sect (see MANICHÆISM), began to preach, against which the Persian priests fought for centuries as vigorously as against the various sections of Nicene Christians.

The close of Shápúr's reign saw great changes in the Roman east (see PALMYRA). At the fall of Palmyra Shápúr was probably no longer alive. His son Hormizd (*Ohrmazd*) I. came to the throne in 272 or 273, having previously been governor of Khorásán. His title, "the hero," appears to have been gained by prowess against the Romans before his accession, for his reign of one year gave little time for great deeds.

His successor, Bahrám (*Varahrán*) I., was not his son as tradition represents, but, according to an inscription, his brother. He is said to have been a weak prince, given to pleasure. The execution of Mani falls within his reign, which (subject to a possible error of as much as two years, which affects all dates of reigns between Bahrám I. and Shápúr II.) may be dated between 274 and 277.

Of his son, Bahrám II. (c. 277-294), Persian tradition has next to nothing to tell. To him may be probably ascribed two long but ill-preserved inscriptions, religious in content, almost sermonizing, and of very clerical colour. He had wars with Rome, of which we only know that they were terminated by a peace with Probus (276-282),³ and that Probus was murdered before he could renew the con-

had reigned as far as Constantinople, but this was not living tradition. Western scholars again sometimes mixed up the old and the new state, as when Libanius supposes that Susa, the residence of Xerxes and Artaxerxes, must also be the residence of his contemporary Sapor (Shápúr). The Sásánians, however, regarded themselves as successors of the mythical kings of Írán.

¹ An abridged extract of the romantic history of Ardashír has been preserved in the original Pahlavi, and has been published by Nöldeke (see p. 135, note 1, above). The same legendary material is used by Firiausi, cp. also *Z. D. M. G.*, xxxiv. 585, 599.

² See an essay by Gutschmid, *Z. D. M. G.*, xxxi. 51, which is instructive as to the relations between Persia and Armenia generally.

³ Vopiscus, *Probus*, 17, who, as Tillemont remarks, wrongly puts "Narseus" for "Bahrám."

flict. Carus, however, in 283 led his army as far as the hostile capital, and had taken Ctesiphon and Coche (a part of Seleucia) when he suddenly died (by lightning, it is said), and the Romans drew off. Carus is said to have been favoured by intestine disorders, which at this period were certainly common in Persia. In 291 a rhetorician mentions the rebellion of a certain Hormizd (Ormies) against his brother the king, in alliance with barbarians.

A youthful son, who appears opposite the queen on coins of Bahrám II., seems never to have ascended the throne, which was probably contested between Bahrám III. (a son of Hormizd I.?) and Narseh (according to an inscription, son of Shápúr I.). Bahrám III., called Sagán Sháh, because he had been governor of Sagastán (Sistán), reigned, or at least held the capital, for a very short time; Narseh reigned from c. 293 to 303, and, following up Shápúr's policy, occupied Armenia and defeated Galerius (probably in 297) between Carrhæ and Callinicus (Rakka) in Mesopotamia. But under Diocletian's wise rule Galerius soon restored the honour of the Roman arms, totally defeating Narseh in Armenia and taking his wives and children. A brilliant peace (298) rewarded the victors; to recover his family the Persian ceded Armenia and Mesopotamia, and even some districts east of the Tigris as far as Kurdistán. The peace lasted forty years.

Narseh's son, Hormizd II., came to the throne about 303 and was succeeded early in 310 by his son, Ádharnarseh, who was soon deposed, and probably slain, ostensibly for his cruelty. The nobles now held the reins of power, and, having blinded one brother of the fallen king and imprisoned another (Hormizd),¹ crowned Shápúr II., the newborn (or unborn) son of Queen Ifrá (?) Hormizd (310). The rule of the queen-mother and nobles was what may be readily imagined in an Oriental empire, which above all things needs a strong man at the head; but such a man young Shápúr, one of the greatest princes of the dynasty, soon proved himself to be. Persian tradition preserves few really historical notices of Shápúr II., but is full of stories of astounding campaigns against the Arabs, highly coloured by hatred of that race; and there is no doubt that Shápúr did devote himself with energy to the always important task of repelling the plundering Bedouins from the civilized lands on which their deserts border. Another notable undertaking was the new foundation of Susa after it had rebelled and been chastised by total demolition, the very ground being stamped down by the king's elephants. NISHÁPÚR² (q.v.), i.e., *Név-sháhpúhr*, may be his foundation, or that of Shápúr I.

In Shápúr's youth fell the victory of Roman Christianity over paganism under Constantine, and the Christians of Persia at once threw in their sympathies with the Christian state. These feelings were openly shown when Shápúr in 337 or 338 began a Roman war, as appears in a homily of the Syrian bishop Aphraates, a subject of Persia. The bishop of the capital, too, ventured to use language against the king which no Oriental prince, least of all one like Shápúr, could submit to. And so almost simultaneously with the Roman war a terrible persecution of the Christians broke out (339/340), of which the Syrian *Acts of Persian Martyrs* give a lively picture,—instructive, too, for the light cast on persons and affairs in the realm. Shápúr was no fanatic, as even the *Acts* of the martyrs show, and he did not molest the Jews, whom his priests hated quite as much as the Christians. But, like Diocletian, he wished to destroy the organization of the church, and therefore used the utmost rigour against the lower as well as the higher clergy, and destroyed the ecclesiastical

buildings. To break up congregations he often constrained prominent church members to stone their own priests. The Persian priests, of course, used the opportunity to gratify their hatred of the Christians, and other impure passions increased the cruelty of Shápúr's hard measures. The Christians on their part showed much heroic courage mixed with not a little cowardice.

Roman sources tell us that the war was begun by the Persians with an invasion of Mesopotamia. Constantine died on 22d May 337, before he could march against them. But Shápúr's great preparations, as we learn from Aphraates, fell in the year that begins with autumn 337. With many vicissitudes and long pauses the war endured for twenty-five years, but only for its second part do we possess fuller accounts by contemporaries and in part eye-witnesses. Shápúr's aim was to drive the Romans from the upper Tigris, where they were dangerously near Ctesiphon, and especially to seize Nisibis, and then to reduce Armenia, that old apple of discord between East and West. Three times Nisibis victoriously resisted a severe siege (338, 346, 350), and other sieges occupy a great place in the story of the war. Constantius, when he took the field in person, was always defeated, as in 348 at the great battle of Singara (Shingár, Ar. Sinjár). Yet Shápúr's successes bore little fruit, mainly perhaps because Diocletian and Constantine had put the fortresses in the best condition, and in all respects had made wise provisions to cover the threatened districts. Even when victorious the Persians could hardly penetrate into western Mesopotamia, and if Shápúr had taken all the strong places he could hardly have garrisoned them. Thus he took Amida (Ámid) after long and costly sieges, and in the very next year (360) the Romans found it ungarrisoned. The Romans were helped, too, by the trouble which Shápúr had with barbarous enemies; the third siege of Nisibis was all but successful when the Persian was called away to Khorásán by urgent affairs there. These eastern conflicts were the prelude to a long pause in the contest (350-358), broken only by small forays. When, however, the Romans opened negotiations (356 to 358) Shápúr had made peace in the east and offered no conditions that could be accepted. In 359 and 360 the war was again hotly renewed, and Shápúr took several important fortresses. Then there was a lull till 363, when the warlike, active, and ambitious Julian, now sole emperor, resolved to strike at the capital of the enemy, as Trajan, Severus, and Carus had done. He left Antioch for Mesopotamia in March and swiftly descended the Euphrates, wasting the enemy's land with fire and sword and taking several cities by short sieges, among others the royal city of Máhóz Malká, not far from Ctesiphon. Julian now occupied Seleucia, but, finding he was not strong enough to take Ctesiphon, the fortified capital on the opposite bank of the Tigris, he ordered a retreat along the left bank. And now for the first time Shápúr's troops began to harass him, but the army might have regained Roman soil without serious loss had not Julian fallen mortally wounded in a skirmish (26th June 363). The army chose Jovian emperor, a man too weak for such an occasion, who managed his soldiers and the negotiations so badly that a shameful peace was the result, and Shápúr regained the lands east of the Tigris lost to Galerius, and part of Mesopotamia with Nisibis and Singara. Nisibis was the gravest loss, for in all future wars it was to the Persians a sure base for advance and a bulwark for defence. But a still more shameful condition was that the Romans should not help their ally Arsaces of Armenia against Shápúr. The Persian, nevertheless, did not find Armenia an easy conquest. He took Arsaces captive, but this did not decide the fate of the whole country, divided as it was by nature into a number of separate regions under almost independent

¹ Hormizd escaped to the Romans in 323 and remained with them all his life. As late as 363 he shared the Roman campaign against his half-brother Shápúr.

captains. The Christian Armenians leaned on the whole towards Rome, while the Zoroastrians, who still formed a large part of the nation, inclined to Persia, and the personal interests of the great barons, who preferred to recognize no lord, inclined them now to this side, now to that. Papa, son of Arsaces, fled to the Romans and got help from them, first secretly and then openly; but he was only their tool in the design of reducing Armenia to a province. Conflicts between the rival empires took place also to the north of Armenia in Iberia, and after five years they were practically again at war. In 371 Shápúr was openly met by Roman troops in Armenia, which both parties were determined to have by force or by fraud. Once and again negotiations failed, but a general war was still averted by external circumstances (on Rome's part by the Gothic war) and considerations of prudence.

Shápúr II., who is justly celebrated by the later traditions, died towards the end of the summer of 379, and was succeeded by his brother, Ardashír II., an old man, who was perhaps chosen king for similar reasons to those which governed the choice of Shápúr as an infant. As prince and governor of Adiabene Ardashír had taken an active part in the suppression of Christianity in 344 and as late as 376, but with his accession the persecution ceased—whether of purpose or merely from the Oriental lack of persistency we cannot tell—and a bishop was again admitted even in the capital. Ardashír was deposed in 383 or 384, having taken strong measures against the nobles and put some of them to death.

His successor, Shápúr III., son of Shápúr II., at once sent ambassadors to Constantinople and made a definite treaty of peace (384). In 388 or 389 he was murdered by the nobles. His successor (a son, or perhaps a brother), Bahrám IV., called Kirmán Sháh,¹ kept peace with Rome and was clement to the Christians. In 390 Armenia was divided by treaty, much the larger part becoming a vassal state of Persia and the rest falling to Rome. The division, with various modifications and vicissitudes, lasted into Arab times. Bahrám was shot by a band of "miscreants" in the summer of 399.

Yazde-
gerd I.

Yazdegerd I., son of Shápúr II. or Shápúr III., seems to have been designated heir to the throne while Bahrám IV. was still alive, or at least he held such high dignity that his name appears on coins of his predecessor. Persian tradition makes him wise but very wicked. Christian witnesses, on the other hand, speak very favourably of him, and it appears certain that his surname, "the Sinner," was gained by a severity, perhaps tyrannical, towards the grandees, by tolerance towards the Christians, and little favour shown to the priests. In 410 the Christians were even allowed to hold a regularly constituted synod in the capital, and the king employed the "Catholicus"—i.e., the primate of the church, a functionary possessed of full religious autonomy—on a mission to the emperor, and even in settling differences with his own brother, who governed Persis. Yazdegerd had no personal inclination towards Christianity, and he severely punished the fanaticism of Bishop 'Abdā, who had insulted a Zoroastrian sanctuary in Susiana, but his habitual tolerance was enough to make him hated of the Persian priests. The warlike nobles also found cause for dissatisfaction in his earnest endeavours to keep on quiet terms with Rome, with whom he made a treaty of peace and friendship in the summer of 408, when he seems to have pledged himself to support the throne of Theodosius II. during his minority. Over Persian Armenia he set his own son Shápúr. We have every reason to deem Yazdegerd an excellent prince for the time and circumstances, but he was not well pleasing to the god of the

Persians, who smote him with sudden and miraculous death in distant Hyrcania. The explanation of the miracle is no doubt that he was murdered by the magnates (probably late in summer 420).

Shápúr, hurrying from Armenia on the news of his father's death, was slain by the grandees, who had resolved altogether to exclude from the throne the seed of the hated Yazdegerd. A distant relation, Khosrau, was made king, but had to contest the throne with another son of Yazdegerd, Bahrám, who in his father's lifetime had dwelt apparently in a sort of exile, with the powerful vassal prince Al-Mondhir (Alamundaros) of Hira, on the borders of the desert to the west of the Euphrates. Mondhir energetically supported the claims of his guest-friend, and appeared with a vast Arab horde before the gates of Ctesiphon, which is only three or four days' march from Hira. As Bahrám doubtless had support among the Persians also, Khosrau gave way, and Bahrám took the throne, but with a promise to reign in a different spirit from his father and please the magnates and the priests. This is the first important intervention of the Arabs in the affairs of Persia.

Bahrám V., surnamed Gôr or Wildass, is the favourite Bahrám hero of Persian tradition, which tells many incredible^V stories about him. He came to the throne young, and was always a jolly prince, very fond of women, and whose personal strength and prowess as a huntsman, perhaps also in war, blinded men's eyes to the real weakness of his sway. The change of policy was at once announced in a systematic persecution of the Christians and in war with Rome. For the latter there were pretexts enough on both sides, but the Romans would not have begun the war merely because the Christians were persecuted; its real authors were presumably the Persian nobles. The chief seat of war was the north of Persian Mesopotamia and the mountain-land above. The Persians were led by one of the greatest nobles, Mihr Narseh, whom Persian tradition represents as taking Constantinople, while we know that he really sustained heavy defeat at the very commencement of the war (August 421). Nisibis was attacked by the Romans, but relieved after a siege of some length. In 422 both parties were glad to make peace; religious freedom was given to Christians in Persia and to Zoroastrians in the Roman empire. There seems to have been no change of frontier, but the Romans promised to receive no Arabs who wished to change their allegiance,² and to pay an annual sum towards the maintenance of the defences of the Caucasian Gates (the pass of Daricl), which protected both powers from the inroads of the northern barbarians. This last condition reappears in almost all treaties and always caused soreness. For, however carefully the provision was worded, both sides looked on the contribution as a tribute, of which the Romans evaded payment whenever they could.

The Persians, we may suppose, were the readier to make peace that they were again embroiled with the nation of Kúshán or Haitál, the Hephthalites or "white Huns," who then ruled in Bactria and the surrounding lands. Constant wars of Persia with this people went on during the 5th century and gave the Romans repose, and we are hardly bound to believe the Persian tradition that Bahrám had a glorious victory over the Hephthalites. A movement for freedom had taken place in Persian Armenia during the Roman war; but after the peace Bahrám established a new vassal king, till in 429 the conduct of the selfish Armenian nobles led the Persians

¹ He had ruled in Kirmán, and from him two towns, in Kúrdistán and in Kirmán, take the name Kirmánsháhán.

² The Bedouin tribes, "*nec amici nobis inquam nec hostes optandi*" (Arrian., xiv. 4, 1), and the petty states that had been formed out of them, under Roman or Persian suzerainty, were a constant trouble to both empires in war and in peace.

to make Armenia a province,—a change which was supported by a strong party among the Armenians themselves. But the Persian governors had as much trouble with barons and clergy as the old kings had had.

Bahrām, dying in 438 or 439, was succeeded by his son, Yazdegerd II., of whom little good can be said. He persecuted both Jews and Christians, abolished the audiences on the first day of each month on which every man of position could approach the king with petitions or complaints, and is recorded to have married his daughter (that, of course, was no crime in a Zoroastrian) and then murdered her.

In 441 he very nearly came to war with Rome, but peace was concluded without further conflict than some harrying of the marches, and it was provided (as in later and probably in earlier treaties) that no new fortresses should be erected on the border by either party. Yazdegerd was much in Khorāsān, where he sustained repeated defeats from the Hephthalites; and in 450/451 he had to deal with a serious rebellion in Armenia, mainly produced by persecution of the Christians, which was not quelled till he promised complete freedom of Christian worship.

On the death of Yazdegerd II. (457) the throne was for two years contested between his two sons by Dínak¹—Hormizd, prince-governor of Sagastān, and Péroz. The latter, who was the younger, proved successful by aid of the Hephthalites and the energy of Rabān of the house of Mihrān, and put his brother and three others of the nearest royal kin to death. Péroz was again a persecutor of Jews and Christians, but had political wisdom enough to favour the reception of Nestorianism by his Christian subjects when that party was driven from the Roman empire. At the synod of Béth Lápāt (483 or 484) the old Christian church of Persia adopted the Nestorian confession, and was thus separated from Byzantium by a wide breach. But in truth Christianity in Persia had never been really much of a danger to the state.²

The Hephthalites and Péroz soon fell out about the reward for their services, and fierce fighting ensued, in which Péroz gained several victories; but the seat of war was a desert very unfavourable to his operations, and twice he had to make peace on disadvantageous terms, while at least once he was himself taken prisoner and released on heavy ransom, leaving his son Kavádih a hostage for its payment for the space of two years. But Péroz always broke faith again with the foe, and at length, in 484, he was among the missing after a terrible battle, in which his daughter was taken captive and placed in the harem of the Hephthalite king. The conquerors now overflowed Persia, which for a time was without a monarch till order was restored by Zarmihr, of the great house of Kāren, who at the time of Péroz's death had been successfully dealing with a revolt in Armenia, and now hastened to the capital and made Balāsh, Péroz's brother, king. The Hephthalites seem to have been bought off by a yearly tribute.³ Balāsh's brother, Zareh, who also claimed the crown, was vanquished and put to death. But the new king had little power, and secured the obedience of the Armenians only by granting that the Persian state religion should be wholly excluded from their land. The clemency of Balāsh is praised by the Syrians and Armenians, possibly for no other reason than that his relations with the Persian priesthood were unfriendly. Their enmity proved fatal to him; his treasures were empty, so that he could neither

gain a party among the nobles nor secure the support of an army, and in 488 or 489 he was deposed and blinded.

His nephew and successor, Kavádih I., son of Péroz, found the land in a very disturbed state; there were rebellions among the barbarous mountain tribes and there was another rising in Armenia. Now Kavádih was not disposed to be the humble servant of the priests and nobles to whom he owed the crown, and to humiliate them he played the dangerous game of encouraging Mazdak, the energetic priest of a new religion, which demanded in the name of justice that he who had a superfluity of goods and several wives should impart to those who had none. This theory was actually put in practice to some considerable extent, but then the nobility and clergy rose, deposed Kavádih, and imprisoned him in the "Castle of Oblivion,"⁴ placing his brother Jámásp on the throne (c. 496). But Kavádih escaped to the Hephthalites, where he had once lived as a hostage, received in marriage the daughter of the king (whose mother was the captive sister of Kavádih), and with his help expelled Jámásp and recovered his kingdom (498 or 499).⁵ Kavádih held severe judgment on the traitors, and it was probably at this time that he gave up Zarmihr into the hands of his most dangerous rival, Shápúr of the house of Mihrān. He does not seem to have carried his Mazdakite experiment farther, and he had put the realm into fair order when he began a war with Rome.

Between Rome and Persia there had been such a series of negotiations and compacts, none of which had been scrupulously observed, that either side could find a *casus belli* at will. Kavádih had the will, and in summer 502 he opened that era of hideous strife between Rome and Persia which so exhausted both powers as to pave the way for the new empire of the Arabs. In August he seized without a fight Theodosiopolis (Karin, Erzerúm), capital of Roman Armenia. On 10th January 503 Amida fell after a siege of three months and was cruelly chastised for its resistance, tens of thousands of the inhabitants being put to the sword.⁶ The Romans acted with little energy or unity of plan, and in the course of the war Mesopotamia suffered terribly. Amida was restored to the Romans by compact, or rather by purchase, after a long siege in 504; and after much fighting a peace was concluded in the autumn of 506, leaving things as they were before the war. The Persians, we are told, were ready for peace because they had on their hands a war with the "Huns,"—a very vague word in the mouth of a Greek. But Kavádih must have been in considerable difficulty, for he tamely submitted to a gross breach of the treaty when Anastasius raised the village of Dara to a great fortress to hold Nisibis in check. There was no more war while Anastasius was emperor, but Justin I. (518-527) seems to have ceased the payment for the Caucasian Gates again stipulated in the peace of 506, to which Kavádih replied by letting loose his Arabs on the empire, and the Romans retaliated by forays in Persian Armenia. There were also serious disputes about the suzerainty of the lands between Caucasus and Pontus, but Kavádih was still anxious to avert war, from which presumably he saw that no permanent advantage could flow. At the same time he was very eager to secure the succession for his favourite son, Khosrau, who was not his eldest; and he thought that if he could induce the emperor to adopt Khosrau as his own son this would form a sort of guarantee and greatly impress the Persians. A nego-

¹ Dínak's likeness is preserved on a gem; see B. Dorn, in *Comptendu de la Com. Arch. pour 1878, 1879*, p. 162 sq. (St Petersburg).

² The Armenians, on the other hand, joined the Monophysites, who had a large party in the Roman empire and often had the upper hand there.

³ Persian tradition makes Sôkhrâ (i.e., Zarmihr) humble the enemy and compel them to restore their booty.

⁴ Identified by Sir H. Rawlinson as Gilgerd in northern Susiana.

⁵ Kavádih's escape and restoration seem to have been favoured by some of the greatest nobles, and Persian tradition, which, however, is very confused in this whole chapter, makes Zarmihr the companion of his flight.

⁶ Of this war we have good accounts in contemporary Syrian sources.

tiation on this and other matters at Nisibis (525 or 526) seems, however, to have been badly managed on both sides, and its failure cost the Roman ambassador his place and the Persian his head. War now began on the borders in 527 before Justin's death (*i.e.*, before 1st August).¹ A Roman attack on Nisibis and a Persian on Dara failed. Fighting, broken by negotiations, went on for several years, and in it Belisarius first came to the front as a general.

An important episode in this war is the invasion of Syria by Mondhir of Hira. This prince seems to have been more powerful than was safe for Persia, and Kavádih had stripped him of all or part of his possessions and given them to Harith, a scion of the widespread house of the kings of the Kinda. When war broke out Mondhir, who was an experienced warrior, was restored to his old sway, and in 529 he fell on Syria, pillaging and holding captives to ransom as far as Antioch. Mondhir was a savage heathen, who on one day sacrificed 400 nuns of a Syrian cloister to his goddess 'Uzzá (the planet Venus). In the same year he slew Harith in battle and executed in Hira a number of captives of the Kinda house. For half a century he was the terror of the subjects of Rome, little recking whether they were at peace or at war with his master, till in 554 he fell in battle with a Roman vassal, Harith ibn Jabala, whose son he had also sacrificed to 'Uzzá.

Under Mondhir's influence Kavádih in 531 undertook a regular campaign against Syria, the first since centuries. The Persians crossed the Euphrates and had pressed far to the north when Belisarius compelled them to turn back. In a battle at Rakka Belisarius was defeated, but the Persians found it expedient to continue their retreat (19th April 531). In Mesopotamia the Persians were this year successful, and had almost reduced the great fortress of Martyropolis (Maiferkat, Arab. Mayáfárikín) when news came of Kavádih's death, and a truce was made.

In 528 or 529 Kavádih, through his son Khosrau, had made a bloody end of the Mazdakites, whose success proved too dangerous to society to be longer endured.

Kavádih died, eighty-two years old, 13th September 531, and was succeeded by his destined heir, Khosrau (Chosroes), surnamed Anósharván, "the Blessed," whom his father is said to have caused to be crowned as he lay on his death-bed.² Khosrau I. was a great king, and deserved the title of "the Just," though he was not the ideal prince that Eastern writers make him. By carrying out the regulation of the land-tax already commenced by his father, and by measures to control the collection of taxes, he benefited his subjects as well as the treasury. In Babylonia at least, the richest province, his fiscal ordinances proved productive, and, according to an Eastern standard, not too oppressive, down to the fall of the Sásánian empire; the Arabs themselves contrast the old Persian system with the oppressive taxation of Moslem times, which was ruinous to the finances of the state as well as to the inhabitants. The public welfare, too, was served by the construction or repair of bridges, canals, embankments, and the like. The priests favoured Khosrau for his extirpation of the Mazdakites, which he completed at the beginning of his reign; but they were not permitted to rule his policy. He managed the great nobles with tact, rather strengthening than weakening the aristocratic basis of the realm, but making it serviceable to himself. Measures were taken to relieve the insecurity which the Mazdakites had introduced in relations of property and the family, and the army was the object of special care. Khosrau had a decided leaning to Western civilization; and, though an Oriental despot could not be expected to sympathize with the highest fruits of Hellenic genius at a time when they

were little appreciated even in Europe, and the heathen philosophers who came to Persia to seek a philosophic state soon returned undeceived, it is to his honour that the Persian secured for them the free exercise of their faith by a clause in the treaty of 549. The Christians, so long as they obeyed the laws, were unmolested; nay, Khosrau helped to maintain the worship not only of the Nestorians but even of the Monophysites, who had much more friendly relations to the Roman empire. Apostasy from Zoroastrianism was forbidden by ancient law, and proselytizing by Christians was strictly prohibited, yet the Monophysite abbot Ahúdemme, who had got a large contribution from the king to build his monastery, and thereafter baptized a son of Khosrau, who presently fled to the Romans, was punished only by a mild imprisonment, in which he was allowed to see his scholars.³ Nor did the Christians suffer for their sympathy with the rebellious prince Anóshazádh; and yet Khosrau was no weakling, but energetic, warlike, and on occasion cruel.⁴

The negotiations begun in 531 issued in September 532 in a "perpetual peace," the Romans promising a large annual subsidy and other concessions, while the Persians gave back certain castles in Láizistán at the eastern end of the Black Sea. Khosrau had need of peace, and used it probably to protect the frontiers from divers barbarous foes, for tradition speaks of his measures for the safety of the borders towards the Caucasus and on the east. Unmanageable tribes, too, were moved to new homes. In a few years he was strong enough to go to war again, feeling perhaps that Justinian's successes in Africa and Italy had made the hereditary foe too strong. This danger, no doubt, was forcibly set before him by the emissaries of the Gothic king Vitiges, and a tempting opportunity was presented by an appeal which came to him from the rebel nobles of Roman Armenia, Christians though they were. Prettexts for war were never lacking, if only through the Arab subjects of the two powers. But Khosrau certainly desired the war, and early in 540 he set forth to attack Syria as Shápúr I. had done, and marched through the land to the shore of the "Roman sea," taking and pillaging such strong cities as did not buy him off. Antioch in particular yielded an enormous booty; it was burned and the inhabitants carried captive. Turning homewards, the Persian traversed north Syria and Mesopotamia from west to east, levying a contribution even from the hated fortress of Dara. Carrhæ alone, whose population was still mainly heathen, and so presumably inclined to the non-Christian empire, escaped scot free. Ctesiphon was reached at the close of summer, the whole campaign having come off without a single pitched battle. Khosrau, still more than Shápúr II., sought in the barbarous old usage of wholesale captivities a means of appropriating to his own service the culture and technical skill of the West. Thus he made for the captive Antiochians a new municipality (Khosrau-Antiochia, or "the Roman town") hard by the royal residence, which was a notable tribute to the superiority of Roman culture and life. The town was made as Western in character as could be, and the inhabitants were established in comfort, and had religious freedom, and even a Christian mayor. They retained their national manners till the fall of the empire. Chariot-races, for example, were as popular as they had been in old Antioch.

Next year Khosrau was invited to Láizistán by the natives, and penetrated to the Black Sea and took the strong place of Petra. In Mesopotamia war went on for several

¹ The principal sources for this war are Procopius and the Syrian account in Land, *Anecdota*, iii.

² That the nomination of Khosrau surprised the Persian nobles is hardly impossible. Procopius, it must be remembered, drew for the events at Khosrau's accession on the tales of the (true or false) pretendant Kavádih, son of Jam, and grandson of King Kavádih. But it is quite possible that such things as the removal of princes and the execution of valuable officials took place under Khosrau.

³ This is known from an unprinted Syrian biography by a disciple of Ahúdemme, who manages to make the king a tyrant by inventing a silly miracle to explain his clemency. Ahúdemme died, after two years' imprisonment, 2d August 575.

⁴ Procopius naturally speaks unfavourably of so dangerous an enemy of the Romans.

years with chequered fortune. In 546 the Romans paid a large sum for a five years' truce, and another five years' truce followed in 553, though Lázistán was excluded from both truces until 556, when the Romans had gained successes there; but during all this time the Persian and Roman Arabs never laid down their arms. At length, about Christmas 562, a fifty years' peace was concluded, the Romans again promising a considerable yearly subsidy, and the Persians withdrawing their claims on Lázistán, though the possession of the neighbouring Suania was left an open question. The treaty also provided for religious freedom to the Persian Christians, while all proselytizing among Zoroastrians was strictly forbidden.

During the truces (546-562) great changes had taken place in the East, where a powerful empire had been formed in the northern steppes by the Turks, whose name then, for the first time, became known in the West. The khákán of the Turks, whom the Greeks call Silzibulos and the Arabs (after the Persians) name Sinjibú, took from the Hephthalites the right bank of the Oxus, while Khosrau (seemingly in alliance with the khákán, whose daughter he wedded) occupied the left bank (c. 560). Thus Bactria, from which the Sásánians had suffered so much, was at length embodied in their empire, and Péróz was fully avenged.¹ But the friendship of Turks and Persians was soon changed to that hostility which has long made the rulers of Turkestan and the deserts appear the natural enemies of the lords of Khorásán. Khosrau must have made other conquests about the same time, for in the negotiations with Rome the Persian representative boasts that his master had conquered ten nations, and tradition enumerates the conquest, or rather recovery, of seven eastern lands. These statements must be taken with some discount, and it is not to be believed that Khosrau really ruled in Afghanistan or Sind, as tradition says, though he doubtless widened and secured the eastern limits of the empire.²

About 570 an expedition was sent against Yemen, which the Christian Abyssinians had conquered in 525. A native prince invited Khosrau to expel the Blacks, and, after some hesitation, he sent a small force under Vahriz which easily effected this object. Persian rule was nominally maintained in Yemen till the time of Islám, and tribute was paid more or less irregularly; but, as the Persians were not a seafaring people, this remote province beyond the waters was of no practical use to them in the way of diverting trade from the hands of the Romans. Khosrau had presumably hoped otherwise, for affairs of trade, especially the overland silk trade in inner Asia, had considerable influence on Sásánian policy.

About 551 Khosrau had to deal with a rebellion of his son Anóshazádh, who was then in disgrace in Susiana; hearing that his father was dangerously ill, he claimed the crown, leaning on the Christians, whose religion was that of his mother. The rebel was easily overpowered and taken; his punishment was not death, but such a partial blinding as made him unfit to reign.

In his last years Khosrau had again to face the Romans. The Roman alliance with the Turkish khákán, the efforts of Khosrau to hamper their intercourse with that potentate, now his dangerous foe, the annoyance of the Christian empire at the fall of the Christian realm in Yemen, and the refusal of Justin II. (565-578) to pay the stipulated subsidy were all pretexts for war, but the decisive thing was that all Armenia suddenly threatened to become Roman. There were already plans of rebellion among the

Armenian nobles when an outburst of popular fanaticism was caused by the attempt to erect a fire-temple in the capital Dovin, and the Persian Súrén³ was slain (spring 571). The rebels and the king of Iberia turned to Constantinople, and were taken under the protection of the incapable emperor, who fancied that he could regain both countries. This, of course, was a declaration of war. The events that followed are known from good contemporary sources, but cannot be arranged in clear chronological order. One of the first operations was an unsuccessful siege of Nisibis by the Romans. Khosrau, on the other hand, took Dara in 573, after a siege of six months, and was joined beneath its walls by his captain Ádharmahán, returning from a successful campaign in Syria on the model of that of 540, in which he had destroyed Apamea.⁴ Tiberius, who with the empress Sophia held the reins of power in Constantinople and was recognized as co-regent in the end of 574, desired peace; but Armenia was excluded from the three years' truce that he procured. In 575 Khosrau penetrated through that country into Cappadocia, and, though he had to retire before the Romans and leave his camp to be pillaged, he escaped safely, burning Sebastia and Melitene on the way. The Romans pressed forward and spent the winter in Persian Armenia, but were driven back next year; they had not even secured the sympathy of the Monophysite population. Even beyond Armenia the war broke out again before the truce had expired, and the Romans conducted it with no more humanity than the Persians, leading captive the Christian inhabitants of Arzanene, and making it a special favour to give them a place in Cyprus (577). Negotiations for peace were frequent; the Romans saw that it was vain to try to hold Armenia and Iberia, and might even have consented to give up the temporal and spiritual heads of the rebellion who had taken refuge at Constantinople, but they very naturally would not make peace without recovering Dara. So things stood when Tiberius became sole emperor, and some months later Khosrau died (c. February 579).

Hormizd IV., son of Khosrau by the Turkish princess, Hormizd was a proud enterprising prince. The Greeks speak ill of him, and indeed were much offended from the first that he neglected the usual courtesy of formally announcing his accession at Constantinople. Persian tradition makes him ill-disposed and a shedder of blood, and we know that he put his brothers to death when he took the throne, but that, as the contemporary Christian narrator says, was a Persian custom. On the other hand, tradition acknowledges the strict impartial justice with which he upheld the cause of the poor against the great. It was the great man who felt his severity. In the army, too, he was careful of the plebeian troops, and lowered the status of the aristocratic cataphracts. Much to his honour is his reply to the priests when they asked him to withdraw his favour from the Christians. "As our royal throne," he said, "cannot stand on its front legs alone, so our rule cannot stand and be firm if we turn against us the Christians and members of other alien religions. Cease, therefore, your attacks on the Christians and follow zealously good works, that the Christians and others of alien faith may see them, and give praise and be drawn towards your faith." In many respects Hormizd seems to have resembled Yazdegerd I., whose fate, too, he shared; the misfortune was that he had not his father's tact in managing the nobles and the clergy.

The war with Rome went on throughout his reign with varying fortune. There was a serious war, too, with the Turks, but over these, or rather over one of their vassals, the Persian general Bahráh Chóbín gained so complete

¹ A curious proof of the late character of Persian tradition is that it regards the Oxus as having always divided Irán and Turán, and the Turks as having always been next neighbours of Persia.

² Purely fabulous exploits, like the conquest of Ceylon, mean only that to the Persians Khosrau, like Bahráh V., was lord of the whole world.

³ A member of the same house with the conqueror of Crassus.

⁴ Part of the captive Apameans were settled in New Antioch.

a victory that he is said to have made the Turks pay instead of receiving tribute. Bahrám was next sent into the lands south of the Caucasus to strike a great blow at Rome (589), but here he was utterly defeated, and Hormizd was foolish enough to dismiss him with disgrace. The general, who was head of the great house of Mihrán, replied by open revolt, feeling, no doubt, that he could reckon on the discontent of the nobles and the other armies. The troops in Mesopotamia which had been driven back on Nisibis by the Romans and were afraid of punishment did in fact mutiny and open communication with Bahrám, who marched against the capital and reached the Great Zab. An army sent forth against him also mutinied, but declared for Hormizd's son, Khosrau, who was on bad terms with his father. Next, part of the troops rose in Ctesiphon, whither Hormizd had hurried from Media. Bindóe, Khosrau's maternal uncle, was in prison there, and his brother Bistám (Vistahm) set him free by force. Hormizd was deposed and soon after put to death, and Khosrau, who had probably consented to a crime he could not prevent, was proclaimed king (summer 590).

Khosrau II. Parvéz, "the conqueror," had now to deal with Bahrám, who sought the crown, or at least the regency, for himself. But the pusillanimous king could not inspire his troops with courage to face the experienced general; he was deserted in the first shock of battle, and fled to Circesium to cast himself on the aid of the emperor Maurice, who undertook to restore Khosrau, but, able prince as he was, missed the great opportunity of securing an adequate equivalent for the service. Himself a man of obscure descent, he seems to have been flattered by the idea of posing as "father" of a legitimate king of ancient stock. The enterprise was not very difficult; for though Bahrám had seized the crown and begun to coin in his own name the nobles would not submit to one of their own peers, and the people were still stricter legitimists than they had been under the Arsacids. In their view the royal majesty (*farrahí kayánik*) was innate in the house of Ardashir, and none outside of it could be king. Bahrám had to put down an insurrection in Ctesiphon itself, and Bindóe escaped and took up his nephew's cause. In the beginning of 591 a Roman host drew near, and Khosrau caused the gates of Martyropolis¹ and Dara to be opened to them. He was now joined by the Persian army of Nisibis, and Persian and some Armenian grandees came in to him day by day. The other armies took the same side. In Atropatene Bistám, Bindóe's brother, gathered a host against Bahrám, while the united Persian and Roman forces advanced along the left bank of the Tigris and smote him in a decisive battle near the Zab (summer 591). Seleucia, Ctesiphon, and New Antioch had already been taken by troops sent through the Mesopotamian desert. Thus Khosrau was restored, and peace with Rome followed of course. The Romans ceased to pay tribute, but only recovered their old frontier, Nisibis still remaining Persian. Bahrám fled to the Turks and was honourably received, but was murdered not long afterwards. Khosrau was still so insecure that he asked a bodyguard of 1000 Romans, and now he set himself to remove all dangerous persons, especially Bindóe and the other conspirators who had overthrown his father and set himself on the throne. Bistám was not so easily reached. When he saw himself condemned he made himself king in Media, and held out for almost six years with the help of the remnants of Bahrám's forces and in alliance with Turks and Délamites. He fell by treachery probably in 595 or 596.

To a land already weakened by long wars all these

disorders were ruinous. Nor was Khosrau II. the king fit for such times. A weak coarse-minded man, at once boastful and timid, avaricious and fond of luxury and splendour, he was at best a very ordinary Oriental despot. He found the treasury empty and left it full, while the empire was impoverished by wars. And in these he won no glory; his victories were those of his generals. To the Christians he long extended protection and favour, and even built them churches; for he fancied that not only the Christian empire but St Sergius himself, the chief saint of the Roman Syrians and Arabs, had a share in his restoration, and he was much under the influence of a Christian wife, Shírin, and of some other Christians, such as his physician Gabriel.² But in later years his disposition toward the Christians was altogether reversed.

When Maurice fell by treason and the hideous tyrant Phocas seized the throne (November 602) Khosrau felt himself called to avenge his "father" and protect Maurice's supposed son, Theodosius, who had fled to the Persian court. Narses too, the commandant of Edessa, called for help against Phocas. Khosrau accordingly imprisoned the ambassadors who came to announce the new accession, and a war began, early in 604, which for twenty years laid the Roman lands open to such ravages as had never before been known; so helpless was the empire under the bad rule of Phocas and through the pressure of Avars and other barbarians. Khosrau was present at the taking of Dara (604),³ but had no personal share in the war after that event. After a few years the Persian armies were seen as far west as Chalcedon over against Constantinople. Yet the real weakness of the Sásanian realm was strikingly exposed in these very years (604-610) in the battle of Dhú Kár, a small affair in itself, but very significant. Khosrau had abolished the kingdom of Híra and put King No'mán to death, thus ridding himself of a troublesome vassal, but at the same time losing a very useful means of influencing and checking the desert tribes. And soon after No'mán's fall the tribe of Bakr ibn Wáil actually defeated a regular army at Dhú Kár near the Euphrates, but a few days' journey from Ctesiphon, and maintained themselves on the soil in spite of the Persians. Arabic vanity greatly exaggerated this success, and the result was a notable increase of self-confidence on the part of the Arabs, by which the Moslems ultimately benefited when they came to attack Persia.

The Romans still had the worst of the war when in October 610 Phocas gave place to the valiant Heraclius. The new emperor, hard pressed on all sides, vainly asked for peace. In 613 Damascus was taken, and the country round it, on which the Persians had never before set foot, was ravaged in a way of which countless ruins bear witness to this day. In June 614 Jerusalem fell, and, to the horror of all Christendom, the "precious and life-giving cross" went into captivity. Next Egypt was conquered, and Asia Minor swept as far as Chalcedon. Heraclius was not able to strike a counter blow till 622, when an expedition towards Armenia and the Pontine territories from the Gulf of Issus restored respect for the Roman arms. His great campaigns began in the following year and carried him deep into the Persian country, often quite cut off from his base, in a way that could not have succeeded with any leader who was not a great politician as well as a great general. In the first year of these campaigns he destroyed one of the holiest of Persian shrines, the fire-temple of Ganjak, near Lake Urmiah, and so

² Shirin and the king even took part in the quarrels of Nestorians and Monophysites, and foolishly took the side of the latter, who were the minority and less Persian in sympathy. There are good contemporary Syriac records of all this which in part are still unused.

³ Land, *Anecd. Syr.*, i. 15.

¹ This town had been betrayed to the Persians, and the Romans had lain before it for some time.

avenged Jerusalem. Now we find him near the Caucasus, now in eastern Asia Minor, now again in Mesopotamia, never beaten, often victorious, but oftener perhaps outwitting superior forces by adroit movements. In 626 Khosrau attempted a diversion by sending his best general, Shahrbaráz, with a great force directly against Chalcedon. It was an anxious summer in Constantinople, with the Avars behind and the Persians in front, and the emperor almost lost in the depths of Asia. But in the beginning of August the Avars drew off, the Persians, who had no ships, having failed to cross the Bosphorus and effect a junction with them. Heraclius replied by drawing the KHAZARS (*q.v.*) down into Persian territory, and in 627 he ventured to strike a blow at the heart of the monarchy. The feast of 6th January 628 he celebrated in Dastagerd, which was but some three days' march from Ctesiphon, and had been Khosrau's usual residence for twenty-four years. Khosrau had fled in terror, and did not deem himself safe till he and his harem were over the bridge of Ctesiphon. The capital was, of course, too strong to be carried by the small forces that the Roman had been able to lead by a rapid march from the Caucasus, and Heraclius turned swiftly before any great army could be gathered against him, and cut his way through the enemy's country back to Ganjak over the Kurdish Alps amid the snows of February and March,—an exploit almost unparalleled in the history of war.

Meantime there was revolution in Ctesiphon. Khosrau's tyranny and greed had offended high and low; his panic flight had made him contemptible; and, to crown all, his legitimate heir Kavádh and most of his brothers were pining in prison to leave the heirship open to Mardánsháh, son of Shírin, who, even in advanced years, had retained absolute command of her husband, in spite of his thousands of other wives. Certain nobles liberated Kavádh and proclaimed him king (25th February 628), and Khosrau, deserted by all, was dragged from his hiding-place and executed (29th February). Thus miserably perished a prince whose armies had covered almost the whole breadth of the Achæmenian empire. No hand was raised to help him, and the Christians, who had never forgiven the insult to the true cross, were the first to welcome the elevation of the parricide Kavádh, in which, indeed, one of their own number, Shamtá, son of the farmer-general Yazdín, had a leading part.

The first act of Kavádh II. Shéróe was to murder some eighteen brothers, his second to ask peace from the Romans. A truce was conceded, but Heraclius was too much master of the situation to agree to a final peace at once. Persian troops were recalled from Roman soil, but, when Heraclius, after a hasty reorganization of Mesopotamia, had gone on to Syria, he learned that the Persian king was already dead after a reign of but six months, in which the chief occurrence was a terrible pestilence.

Ardashír III., son of Kavádh, was now crowned at the age of seven. An era of distress and trouble followed, in which children or women sat on the throne, and the nobles disputed with one another for the reality of power. The holy cross was sent back from Ctesiphon through the primate of the Nestorians; and the feast of the Elevation of the Cross still commemorates the joyful day (14th September 629) when Heraclius solemnly re-erected it in Jerusalem. The Government at Ctesiphon was powerless; the Khazars harried the empire; and it was perhaps at this time that Khosrau, son of Kavádh, and grandson of Hormizd IV., who had been brought up among the Turks, sought to make himself king in Khorásán, but was slain after a few months. A more dangerous pretendant was the victorious general Shahrbaráz, who met with Heraclius in June 629 at Arabissus in Cappadocia, and prob-

ably there obtained an approval of his enterprise from the emperor, who naturally favoured the cause of disorder in Persia. Shahrbaráz took Ctesiphon with a small force aided by treason within; Ardashír was put to death (27th April 630); and robbery, murder, and every terror raged in the royal city. But Shahrbaráz, too, fell on the 9th of June a victim to the envy of his peers and the spirit of legitimism. His body was dragged through the streets, and tradition speaks with grotesque irony of the man who sought to be king but could not, because he was not of the lawful house.

Bórán, daughter of Khosrau II., now sat for a time on the throne (till about autumn 631), and appears to have closed the treaty of peace with Heraclius. The conditions are not recorded, but were probably the same as in the peace with Maurice; at all events the Persians kept Nisibis. Bórán was followed in Ctesiphon by her sister Ázarmídekht, probably after a short interval in which a certain Péróz reigned. But in Nisibis the soldiery of the slain Shahrbaráz put forward Hormizd V., a grandson of Khosrau II., and he maintained himself in that quarter for a time (631-32). Ázarmídekht was dethroned by Rustam, the powerful hereditary marshal of Khorásán, whose father's death she had procured. Our confused records of this age of disorder do not permit us to give a clear chronological or geographical view of all pretenders who arose in the capital and provinces; but in Ctesiphon, we knew, there reigned for a time a certain Ferrukhzádh (or Khorrezádh) Khosrau, apparently a child.¹ But another child, Yazdegerd III., son of Shahríyár, and so a grandson of Yazdegerd II., was put forward by certain nobles in Persis, and crowned in the fire-temple of Ardashír (second half of 632 or first half of 633). Soon Khosrau was slain and Yazdegerd acknowledged in the capital, and without much resistance in the provinces also.

Fond hopes could now be entertained that the wounds of the monarchy might be healed under a legitimate prince unstained by descent from the parricide Shéróe, consecrated in the cradle of the monarchy, and upheld by the strong hand of Rustam. Some temporary recovery seems actually to have taken place; but a new foe more dangerous than Julian or Heraclius was already knocking at the gates of the monarchy. That Yemen and some tracts in north Arabia had already been lost by Persia to the Moslems had scarcely been observed at Ctesiphon amidst so many greater disasters. But now the Moslems already hovered on the frontier. Mothanná, one of the boldest leaders of those Bedouins who since Dhú Kár had made frequent forays on Persian soil, accepted Islám, and had its strength at his back. These attacks became bolder and bolder. Presently Khálid, in all the prestige of his victory over the revolt of the Arabs against Islám (see vol. xvi. p. 562), appeared with a small force on the lower Euphrates to take the lead of these Bedouins. Persian troops and their Arab allies were repeatedly beaten in small engagements, and soon a number of frontier-posts were in the hands of the Moslems.² The inhabitants of the western bank of the lower Euphrates, who were all Christians and had little attachment to Persia, submitted themselves and promised to supply the victors with intelligence. Soon the Arabs ventured to cross the river and plunder the villages west of the Tigris.³ In the early summer of 634, however, Khálid was called away to Syria; his successor, Abú 'Obaid of Táif, though strengthened by reinforce-

Moslem invasion.

¹ He appears beardless on his only known coin. By some accounts he was the only son of Khosrau II. who had escaped massacre.

² The history of the conquest is here given mainly after Beládhori, whose short notices stand examination much better than Tabari and the historians who follow him. The chronology is in many points uncertain.

³ Baghdád, then such a village, was plundered on a fair tide.

ments, was utterly defeated and slain on his first meeting with a regular Persian host in the hard-fought "battle of the bridge" at the Euphrates, and Mothanná had great difficulty in saving the remains of the army (26th November 634). Not without hesitation the caliph 'Omar resolved to send a greater force to 'Irāk, calling on his Arabs to win for themselves the treasures of the Khosraus and paradise; and now for the first time a considerable Persian army was defeated at Bowaib (635 or 636), with the loss of its general, a prince of the house of Mihrán. In Sa'd ibn Abí Wakkás the Moslems had now an energetic and cautious leader, and the Persian court began to see its danger, especially when the news arrived of the battle of Yarmúk, by which Syria was lost to Heraclius. Rustam in person placed himself at the head of a great army, over which, in sign of the gravity of the enterprise, was borne the venerable sacred banner of the empire (*dirafshi káviyán*). Sa'd fell back before the Persian advance and posted himself at Kádísíya on the edge of the desert south or south-west of Híra, where the armies lay facing each other for months. The Arab force must have been inferior in strength, for no great army could have long held such a barren post nourished only by forays and what the caliph could send from Medina. At length, towards the close of the year 636, or in 637, battle was joined and raged for several days, Sa'd giving orders to his men in spite of a sickness under which he laboured. The Persians were better armed, but the Arabs fought with desperate energy. The elephants, which formed part of every regular Persian army, greatly terrified them at first, but ultimately these huge beasts, getting out of command, only aided the discomfiture of the Persians. Of the mass of a Persian host no great bravery was to be expected; yet it was only after a hard fight that the victory was decided, Rustam slain, and the sacred banner taken.

The battle of Kádísíya virtually decided the fate of the Tigris valley; but there was still some fighting on the plains of Babylonia, at Birs (Borsippa), and Seleucia was not taken without a lengthy siege. Then the Arabs crossed the Tigris and fell on Ctesiphon, Yazdegerd fleeing before them to Hólwán on the Medo-Babylonian frontier. At Jalúlá on the road to Hólwan the Arabs gained a fresh victory over Rustam's brother, Khorrezádh, and Yazdegerd continued his flight. Meantime another body of Arabs had occupied Lower 'Irāk and entered Susiana. A strong and wise leader might still perhaps have saved Irán proper, and 'Omar, as energetic as cautious, was in fact slow to allow his armies to assail the highlands. It was not till some time between 640 and 642 that the

"victory of victories," as the Arabs rightly call it, was gained at Nehávend (a little south of the old high road from Babylon to Ecbatana), and the last great army of the Persians was shattered by No'mán, who fell on the field, and the Meccan Hodhaifa. Even now many individual provinces and cities did not yield without stubborn resistance, and in many places rebellion after rebellion had to be crushed, especially in the region around Istakhr, the cradle and sacred hearth of the fallen monarchy. Everywhere the great local barons and even the lesser nobility dealt with the Arabs as independent chiefs, and in many cases came to peaceful terms with them.

Yazdegerd fled from one to another of his lieutenants without venturing himself to strike a blow for his crown and his life. He still retained the forms of sovereignty, and coins were still struck in his name; but one host after another dismissed him as a burdensome guest, and at length he was miserably murdered in the remote district of Merv, not, it would appear, without the connivance of Máhóe, governor of that province (651 or 652).

The great similarity in the ends of the Achemenian and Sásánian empires is no mere accident, but significant of the internal resemblance between the two. Granicus which showed the reality of the danger, Issus which lost Darius his western provinces, Gaugamela which broke up the monarchy and yet did not at once give possession of the several lands of the realm, have their parallels a thousand years later at Bowaib, Kádísíya, and Nehávend. The flight of Darius to the farthest north-east, and his death by the hand of traitors, not of the foe, are repeated in the fate of Yazdegerd, who resembles Darius also in his lack of heroism. The nobles showed more loyalty and patriotism against the Arabs than against Alexander, and indeed religious antipathy and the barbarism of the Arabs made it less easy in the later case for a Persian to accept the foreign yoke; yet even now there were too many traitors and deserters among the nobles high and low. Fully to subdue the Persian monarchy cost the Arabs a much longer time than it had cost the Macedonians; but the conquest went far deeper,—Hellenism never touched more than the surface of Persian life, but Irán was penetrated to the core by Arabic religion and Arabian ways. See MOHAMMEDANISM.

A fragment of the Sásánian empire lasted for a considerable time in the mountains of Tabaristán (Mázandarán), to which the hereditary generals (*Spáhpat, Ispehbedh*) of Khorásán, of the house of Káren, withdrew, and where they reigned for over a hundred years, though sometimes paying tribute to the caliphs. They remained faithful to Zoroastrianism, and apparently viewed themselves as direct successors of Yazdegerd, since the era employed on their coins seems to have his death as its epoch.

Literature.—O Rawlinson, *The Seventh Great Oriental Monarchy* (London, 1876), is inadequate. Fuller but still inadequate use of Oriental sources is made by Spiegel, *Iranische Alterthümer*, vol. iii. (Leipzig, 1878). The documentary evidence is mostly collected in Nöldeke's translation of Tabari (*Geschichte der Perser*, &c., Leyden, 1879). For the relations of the Sásánians with Rome, Tillemont, *Hist. des Empereurs*, and Clinton, *Fasti Romani*, must be used, and Saint-Martin's notes to Lebeau, *Hist. du Bas-Empire* (Paris, 1828-36), are still useful. A great deal of serviceable matter is to be found in Hoffmann's translation of excerpts from the Syriac Acts of Persian Martyrs (*Syrische Akten Persischer Märtyrer*, Leipzig, 1880). (T. H. N.)

PART II.—MODERN PERSIA.

SECTION I.—GEOGRAPHY AND STATISTICS.

LONG prior to the Christian era the satrapies of Cyrus comprehended roughly an immense range of territory, from the Mediterranean to the Indus and from the Caucasian chain and Jaxartes to the Persian Gulf and Arabian Ocean. In the 17th and 18th centuries A.D. the conquests of 'Abbas and Nadir kept up these boundaries more or less on the east, but failed to secure them on the west, and were limited to the Caucasus and Oxus on the north. Persia of the present day is not only, in the matter of geographical definition, far from the vast empire of Sacred Writ and remote history, but it is not even the less extensive, though very expansive dominion of the Safawí kings and Nádir Sháh. It may be said, however, to comprise now quite as much settled and consolidated territory as at any period of its political existence of which we can speak with the authority of intimate acquaintance.

If it has less extent of land than before its latest disastrous war with Russia, there is certainly within its recognized limits less rebellion and more allegiance. And, if the true interests of Persia, considered as a living power, were only understood by her kings and ministers, she might reasonably seek to attain a state of security which would amply compensate for the loss of precarious and profitless expanse.

Boundaries.—The region of Ararat presents a good starting-point for the definition of a western and northern boundary to the kingdom of Násrud-Dín Sháh. East of the Greater Ararat a short oblique line from the Arras to the south-west divides it from Russia. Below this begins the Perso-Turkish frontier, for the settlement of which a mixed commission was appointed in 1843. The outcome of the labours of this commission, which lasted more than twenty-five years, has been rather a careful delineation of the disputed tract than the delimitation of

an exact boundary, while the cession of Kotur to Persia, though part of the general question, must, if carried out at all, be looked upon as a separate result, due only to later diplomacy. The territorial claims of Turkey and Persia bear chiefly upon Kurdistan and the respective tribes which inhabit the plains and valleys of that extensive mountain region. They are founded upon the treaty of Sultan Murád IV. with Sháh Süfí in 1639, a later one of Nádir Sháh with Sultan Mahmúd I. in 1736, and one more recent still between Fath 'Alí Sháh and Mahmúd II. in 1823,—the last two maintaining the *status quo* established by the first. But, when the Anglo-Russian commission first met, the boundary of possession fell far short of Turkish pretensions. These would have extended the pashalik of Baiyazid (Bayazid) in the province of Arzrum (Erzeroum) to a line including Makú, chief place in the district, and situated on the bank of the river of that name.¹ Farther south, again, the sultan insisted on increasing the area of the province of Van by the forcible annexation of Kotur. Such an act, after the assembly of a commission for the demarcation of the disputed frontier, was neither justified by precedent nor could it enhance the merits of the Turkish claim, and the reason alleged, that Kotur was essential to the Ottoman Government for strategical reasons—in other words, that it gave the Turk free access into his neighbour's territory—could scarcely be taken to account in the estimation of their opponents. The question was submitted on behalf of Persia to the Berlin Conference in 1878, and a special Anglo-Russian commission appointed to consider it in July 1880. The proposed cession, if accepted, would substitute for the present curve eastwards a line more direct but with a westerly inclination, whereby the fort and station of Kotur become embodied in Persian territory. This section of frontier is overlooked on the north by the mountains Bebi Kourgui, Guerdi Beranan, and Khidhr Baba, passes through Tépé Avristan on the west to the Turkish road to Kotur, follows this road to the west for half a mile, and then turns due south between Mount Kevlik and the river Shíva Resh to the sources of the latter, whence it zigzags to the eastward to rejoin the general boundary-line overlooked by the Kára Hisár, Mir 'Omar, Guéré-Sourava, and Guéré-Berian Mountains. Sir Henry Rawlinson saw difficulty in defining a line of frontier from Ararat to Kotur; for the country was not only intersected by ranges running in every possible direction, but it wanted a fixed population, and was, moreover, liable to the incursions of wild Kurdish tribes, who would have no respect for boundary-marks. Below Kotur, and south-west of the important Persian town of Khoi, the old line of possession inclined considerably to the westward, but Turkey claimed a more advantageous line running nearly north and south to the passes between Súk Bulak and Rowandiz, one of which was crossed in 1875 by Thielmann, who gives an interesting account of the surrounding country. The plain of Lahijan on the Persian side—some 20 miles long and 20 miles broad—he describes to be at an elevation of 5650 feet, "watered by the two sources of the Little Záb, which, several miles after their junction, traverses the mountain-range through a deep rent . . . and then flows towards the Tigris." On the west of this district is the "gigantic wall of the Zagros Mountains, the frontier-line between Turkey and Persia." Hence, to the latitude of Sulimaniya, or for more than 100 miles, the Turks claimed farther than the ancient limits assigned to them, and sought to include

within the Ottoman territory the border-fort of Sardasht on the left bank of the Aksu.

Continuing the line of disputed frontier to the southward, the same difficult country still presents itself to perplex the decisions of commissioners or arbitrators, but from the warmly-contested district of Zoháb in the province of Karmansháh up to Dizful on the Diz river the mountains may be said generally to indicate Persian and the plains Turkish territory. Lúristan and Khúzistan (with Arabistan) are the frontier provinces of the sháh, and the Hamrin Hills, with Hawízah, Muhamrah, and the east bank of the Shattu 'l-'Arab, show the Persian possessions to the head of the gulf.

The want of a determined line of demarcation between the two countries for the 700 miles from Ararat to the Shatt, or outlet into the sea of the waters of the Tigris and Euphrates, may have political advantages, but is inconvenient to the geographer and most unfavourable to the cause of order and good government. Even without the evidence of open conflict, it may be assumed that there are few inhabited sections of the strip of disputed frontier (from 20 to 40 miles in breadth) where mutual ill feeling is not the rule, and where the Turkish Sunni does not abstain from friendly association with the Persian Shi'ah. More recently attempts have been made, and apparently with success, to reconcile differences by British and Russian mediation, and a renewal of the days need not be anticipated when telegraph-posts were torn up or destroyed, lands laid waste, and villages plundered, owing to the prevalence of the old spirit of hostility. A fixed boundary would, however, in a great measure facilitate settlements of dispute, because it would more clearly make known the actual transgressors.

From the already-adverted-to point on the Arras east of the Greater Ararat the river itself supplies a northern boundary to Persia up to the fortress of 'Abbasabad, where a cession of strategical works to Russia is noted by a loop on the southern bank. Thence the line is generally marked by the bed of the Arras for a distance of about 180 miles, descending as low as 38° 50' N. lat., and rising again to 39° 30' north-east of the steppe of Moghan. An oblique line running south-east to the Bulgari Chái makes that stream the southern boundary for 13 miles to the confluence of the Adina Bazar and Sairkamish, the former of which then limits the Persian territory on the east. From the source of the Adina Bazar the crest of the mountains towering over the more distant Russian ports on the western shores of the Caspian, and separating the Talish from the Arsha, marks the division of the two territories up to the river of Astara, the port of which name completes the demarcation on the sea-coast. Thus far the result of the treaty of Turkmanchái, dated 10 [22] February 1828, which involved Persia in a serious loss. To the southward all is Persian, and the two large maritime provinces of Gilán and Mazandaran, both laved by the waters of the Caspian, represent the northernmost parts of the sháh's dominions between the 49th and 54th meridians of E. long. In the south-eastern corner of the Caspian the island of Ashuráda in the Bay of Astrábád was appropriated by Russia in 1842 as a convenient post for overawing the Türkmans (Turkomans).

Eastward of the Caspian, from the Hasan Küll Gulf, the line of Persian territory cannot be indicated with absolute certainty, because the Russian maps do not correspond with those prepared by the war department in England; and it need hardly be added that the former give to Russia far more land than do the others. According to Colonel Stewart, an officer for some time resident in the vicinity of the Atak, or skirt of the mountains fronting the Black Sand Desert, the line follows the Atrak (Atrek) from its mouth to Shatt, where it leaves the river

¹ Under the treaty of San Stefano (3d March 1878) the old Perso-Turkish became the Perso-Russian frontier as far south as to include the post-road below Baiyazid; but the territory so taken from the Turks was restored under the later treaty of Berlin.

and passes obliquely west of the Simbar to a point within 15 miles of Kizil Arvat,¹ and then turns towards the Tekke range to Darahgáz, which district it includes in an outer curve, passing on to the Tajand at Sarakhs. The Russian official map, however, brings the line south and east of the Simbar, and otherwise impoverishes Persia to the benefit of her powerful neighbour. But the first article of the Russo-Persian treaty signed in December 1881 at Tehran (Teheran) thus describes the situation:—

"From Chat (Shatt?) the frontier-line follows in a north-easterly direction the ridges of the Songou Dagh and Sagirim ranges, thence extending northward to the Chandir river, reaching its bed at Chakan Kala. From this point it runs in a northerly direction to the mountains dividing the Chandir and Simbar valleys, and extends along the ridge of these in an easterly direction, descending into the bed of the Simbar at the spot where the Ak-Agayan stream falls into it. Hence, eastward, the bed of the Simbar marks the frontier as far as the ruins of Masjid Damanah, where a local road forms the boundary to the ridge of the Kopet Dagh, along which the frontier extends south-eastward, turning south among the mountain heights which divide the valley of the Simbar from the source of the Garnáb. Taking a south-easterly course across the summit of the Misino and Chubest Mountains, it then strikes the road between Garnáb and Ribát at a distance of less than a mile north of the latter, and, following a high ridge, proceeds in a north-easterly direction to the boundaries of Giuk Kaital. Hence, after crossing the gorge of the river Firuzé, it turns south-east till it reaches the summits of the mountain range, bounding the valley on the south, through which the road from the Russian station of Askabad to Firuzé passes, and pursues its course along the crest of these mountains to the most easterly part of the range. The frontier-line now crosses over to the northernmost summit of the Aselm range, whence it seeks out the junction of the mountains called Ziri Kuh and Kizil Dagh, extending south-eastward along the summits of the former until it issues into the valley of the Baba Durmaz stream. It then takes a northerly direction and reaches the oasis at the road from Gawars to Lutfabad, leaving the fortress of Baba Durmaz to the east."

The distance from Baba Durmaz to Sarakhs is about 185 miles, and the intervening boundary is that of the ataks of Darahgáz and Kelat, both of which districts belong to Persia. The word "atak," signifying "skirt," applies to the whole hill-country separating Persia from the Türkman desert, though these mountains and their passes and valleys are not all within the sháh's present dominion. That they present a formidable barrier and remarkable geographical features may be inferred from the ascertained height of the loftier peaks, which, though inferior to those situated some 50 miles to the south, can still boast a figure varying from 5000 to 10,000 feet. In the Hazár Masjid range is one of 10,500. Adopting Rawlinson's divisions and distances, the whole Atak, or "Daman-i-Kuh," as the Persians call it, is divided into three districts: the Akhal Atak, extending for 160 miles, from Kizil Arvat to Darahgáz, the last Türkman camp (*obah*) in which is at Gawars; the Darahgáz Atak, 70 miles, to Abivér; and the Kelat Atak, 60 miles, to Mehna. Thence to Sarakhs another 70 miles may be reckoned, to accomplish which the traveller leaves the mountains on his right and the wonderful natural fortress of Kelat-i-Nádír in his rear, to strike the Tajand at the crossing point between Merv and Mashhad (Meshed).

† The subjection by Russia of the Türkman tribes and the planting of her standard in the hill-country on the western side of the Atak have immensely strengthened her power in the region east of the Caspian. These new Cosacks of the Black Sand Desert will be a great acquisition to her force, though their antecedents denote propensities rather aggressive than protective. In one respect the Persians should be gainers by the encroachment. It is hardly probable that under the new arrangements in the Atak the north-east frontier of Persia will be so frequently the scene of plunder and invasion as it has been of old, or that the marauders will be allowed by the Russian con-

querors to continue the unchecked exercise of their infamous profession in Khurásan (Khorásan).

Special mention of Sarakhs, the extreme outpost of Persia in the north-east, appears to be appropriate, both on account of its geographical position and of its political importance. This place, situated on the plain of the same name,² was fifty years ago a mere outpost of Mazdurán, the frontier hill-station on the shortest of three roads (and somewhat more than midway) between Mashhad the capital of Khurásan and Sarakhs. It was visited in 1860 by M. de Blocqueville, who found there a recently-constructed Persian fort, with strong walls and protected by a ditch. Some of the towers contained as many as ten guns. He says nothing of the ruins of the old town on the east of the Tajand, though he forded the river; but Burnes, who in 1833 put up in a ruined tomb amid the Türkman tents or "khargáhs" in that particular locality, had been equally silent regarding it. The last-named traveller speaks of the shrine of a Muhammadan saint, of a small weak fort, and of a few mud-houses only, and states that, at the third mile after leaving his encampment to enter Persia, he crossed the Tajand,—not supposing it, however, to be the Herat river. Sir Charles Macgregor was at New Sarakhs in 1879. He describes the fort as immense,—an irregular polygon, with eleven bastions, and citadel attached. It had a garrison of some 700 infantry, with a few horse-men, and eleven guns of more or less use. From its walls he reviewed the surrounding country. On the north stretched one vast plain almost unbroken by tree, bush, mound, or undulations, for the bed of the Tajand winding round to the north-west was too low to be visible. On the north-east lay the road to Merv stretched out beyond the dark tamarisk foliage of the river. To the east all was clear; south-east were undulating rounded ridges extending towards the Múrgháb; south was Mazdurán; and north of west was a confused mass of rugged hills in the direction of Kelat-i-Nádír. Lastly, we have the testimony of Lessar, the Russian engineer, who, visiting the place in 1882, found it extensively fortified and occupied by a battalion of Persian infantry; the armament of the fortification, however, consisted only of six old guns, which were never discharged, while the artillerymen were ignorant of their duties, and neither drilled nor exercised. Water was supplied from wells inside the walls and by canal from the Tajand.³

To define the eastern boundary of Persia, the lower course of the Hari Rúd, under its name of Tajand, may be accepted generally up to Pul-i-Khátún, whence to Tuman Agha the line is continued by the river in its own name. From this point it runs due south across the mountain range overtopped by the conical peak of the Sang-i-Dukhtar, and through the edge of the Salt Desert, leaving Kuhsan and Zangi Suwar, villages near the Hari Rúd, and the more important Ghurian in Afghan territory.⁴ Again crossing the ranges which intersect the desert from the north-east, the line, inclining somewhat to the west of south, is continued to Cháh Sagak (the "dog's well"), an elevated spot on the old caravan route between India and Persia, as far as which the Afghans have the right of pasturage. To the westward is the Persian province of Káiyán. The surrounding country bears the significant name of Dasht-i-Na-Umaid, or "Waste of Hopelessness." For 8 miles south-east, 8 miles due east, and 24 miles south, in all about 40 miles, the line is carried to the

² West of the Tajand, called by Dr Wolff the "Dariya" (or sea) of Sarakhs.

³ Other modern travellers have written of Sarakhs, among them an intelligent Indian, Dáúd Khan, but they give no information additional to that of the authorities quoted.

⁴ When Mr Forster was at Kháf in 1783, Timur Sháh, the ruler in Afghanistan, had his boundary between that place and Turshiz.

¹ Probably a plural or perversion of *ribát*, a caravansarai.

Siyáh Kuh, or "Black Hill," on the border of the district of Nehbandan. Here begins the line of frontier determined by the Sístan arbitration of 1872. The British commissioner (Sir F. Goldsmid) decided that an oblique line drawn from the Siyáh Kuh to the southern limit of the reedy marsh called "Naizár," and prolonged to the main outlet of the Helmand, would fairly separate and distinguish the possessions of the two states respectively in the north of Sístan. On the east the bed of the Helmand itself would be the boundary up to Kuhak, where was the large "band" or dam which diverted the waters of the river into the more fertile lands to the west. From Kuhak a line south-west to the Kuh Malik Siyáh completed the delimitation by leaving the two banks of the Helmand in the hands of the Afghans, and placing a large tract of partly desert and partly inundated country between the litigants. Subsequent surveys by Sir Charles Macgregor have thrown new light upon the large and little-populated tract to the far south of Sístan, and are suggestive of an Afghan-Baluch as well as of a Perso-Afghan frontier.

In whatever light it be regarded, the line of Persian frontier from the Kuh Malik Siyáh to the sea rather concerns Baluchistan than Afghanistan; but, though roughly delineated by St John and Macgregor, it cannot be described with scientific accuracy until it reaches the district of Jalk, or after a south-easterly passage of 170 miles through the deserts of Pir Kaisar and the Mashkel or Mashkid,—names used as the more likely to identify the region traversed. From Jalk the Perso-Kelat boundary begins, as determined by Major-General Goldsmid, the British commissioner in 1871, and verified in the subsequent year by Captain (now Sir Oliver) St John, R.E. The state of Kelat (Khelat), it should be explained, is now that of western Baluchistan, the western half of that country having become annexed to Persia by a process of gradual encroachment. It was this action of Persia, and the disquiet and mischief which it occasioned in Makran and other parts of Baluch and Brahui territory, that brought about the British mediation.

From Jalk to the sea is about 150 miles as the crow flies. By the line laid down it is very much farther, as the nature of the country and of the claims of the contending parties did not admit of other than a tortuous course. The small district of Kuhak, lying south-east of Jalk, should, in a geographical sense, have been included among the lands on the Persian side, but the evidence of right and possession was insufficient to warrant its separation from Kelat, and, whatever may have been its subsequent fate, it was not made over to the sháh's governors by the original decision, which was expressed in the following terms:—

"The territory of Kelat is bounded to the west by the large Persian district of Dizak, composed of many dehs or minor districts, those on the frontier being Jalk and Kalagán. Below these two last-named is Kuhak, including Kunarbasta and Isfandar. This small district belongs to the Naushirwánis, and, as its chief pays no tribute, cannot be included among the conquests of Persia. It therefore remains as a tract of country within the Kelat frontier. Adjoining Kuhak to the east is the district of Panjgúr, with Párum and other dependencies, which are in the possession of Kelat; while on the Persian side Bampusht is the frontier possession. Below Panjgúr the frontier possessions of Kelat to the sea are Bulaida, including Zamrán and other dependencies, Mand, and Dasht. Within the Persian line of frontier are the villages or tracts belonging to Sarbáz and Babu Dastiári. The boundary of Dasht is marked by a line drawn through the Drabol hill, situated between the rivers Bahu and Dasht, to the sea, in the bay of Gwatar."

The boundaries of the frontier districts or village-lands named are well known, and may be distinguished by mountains, hills, hillocks, rivers, streams, or cultivation. In some places desert tracts occur which can offer no inducement for encroachment on either side, but through which a line may at any time be declared, if necessary, both by geographical computation and the erection of pillars.

The frontiers of Persia on the west, north, and east have now been described. The southern, or more strictly the south-western merging into the southern boundary, is the coast-line of the Persian Gulf and Arabian Ocean. This extends from the Khor Abdullah west to the port of Gwatar east, and may be held to be comprised between the meridians 49° and 61° 30' E. long. It will be observed that the Caspian Sea boundary, on the immediate north of Persia, is only two-fifths of this extent. On the Persian shores of the gulf are the ports of Bushahr (Bushire), Lingah, and Bandar-'Abbás, with the islands of Karag, Shaikh Sh'ab, Hindarabi, Kais, Kishm, Hangám, Hormuz (Ormuz), and Larak, of which the last four are habitually held in lease by the imám of Maskat (Muscat). On the Perso-Baluch coast are the telegraph stations of Jask and the quasi-ports of Chárbár (or Chahbár) and Gwatar. In some parts of the generally dry and barren coast are ranges of rugged mountains, sometimes rising to a very considerable height.

Physical Geography.—Major (now Sir Oliver) St John, R.E., is perhaps the latest recognized authority on the physical characteristics of the large extent of country comprised within the boundaries just described. He has himself surveyed or travelled over no insignificant portion, and has carefully studied the labours of his colleagues and predecessors in a similar field. In the following adaptation of that officer's account of its orography and hydrography attention has been given to the results of independent observation, as well as to those theories put forward by other travellers which seem to merit acceptance.

Persia—that is, modern Persia—occupies the western, and larger half of the great Iranian plateau which, rising to a height of from 4000 to 8000 feet between the valleys of the Indus and Tigris, covers in round numbers more than a million square miles. Taking the Kuren Dag and Kopet Dag to form the northern scarp of this plateau east of the Caspian, we find a prolongation of it in the highlands north of the political frontier on the Arras, and even in the Caucasus itself. In St John's own words:—"The Caucasian provinces of Russia are but an excrescence of the great elevated mass to the south-east; differing from it only in characteristics produced by the more bounteous rainfall which has scooped out the valleys to a greater depth." On the north-west Persia is united by the highlands of Armenia to the mountains of Asia Minor; on the north-east the Paropanisus and Hindu Kush connect it with the Himalayas of ancient India. The lines of boundary on the western and eastern faces are to be traced amid high ranges of mountains broken here and there by deserts and valleys. These ranges lie for the most part north-west and south-east, as do those in the interior, with a marked exception between Tehran (Teheran) and Bújnárd, and in the more recently acquired territory of Baluchistan, where they lie rather north-east and south-west, or, in the latter case, sometimes east and west. The real lowlands are the tracts near the sea-coast belonging to the forest-clad provinces of the Caspian in the north and the shores of the Persian Gulf below Basrah and elsewhere.

With regard to the elevation of the Persian mountains, the Russian Caspian survey gives to the highest, Damávand, 18,600 feet, and to Mount Savalan in Adarbáijan (Azerbaijan) 14,000. St John estimates the Kuh Hazár and summits of the Jamal Báriz in the province of Karman (Kirman) at a greater figure than the last, but he believes the chain of the Kuh Dinár—snow-clad mountains in Fárs, visible from the sea at a distance of 130 miles, and over ranges known to be 10,000 feet high—to present the highest continuous range in Persia. To the Kúrú range, between Ispahan and Kashan, he gives an elevation of above 11,000 feet, and notes the absence of prominent spurs in all ranges

except the Alburz (Elburz), and to a lesser extent in the Khurásan hills.

The Khúzistan delta is cited as the only plain of extent and importance at sea-level. In the north-west, that part of the Moghan steppe which belongs to Persia and the delta of the Safíd Rúd are large and fertile tracts. St John writes :—

"Inland the long and narrow plains between the ridges rise gradually from 1000 feet to eight times that height in the valleys between the ridges on the east side of the western water-parting, and 4, 5, and 6000 farther south and east. The plains of Isfahan, Shiráz, and Persepolis are about 5000 feet; that of Karmán somewhat higher. The valleys of Adarbaiján present alluvial slopes furrowed by torrents, and the only extensive tableland in Persia, that of Sultaniyah.

"As they recede from the east and north, the intervals between the ridges are wider, and the rainfall smaller, till grassy valleys are replaced by gravelly deserts, which culminate in wastes of shifting sand. The valley between Abádah and Yazd, a prolongation of the Zaidarúd valley, contains the first of these sandy wastes, which, under the influence of the strong south-easterly winds, occasionally invade the neighbouring cultivated tracts. The original city of Rhages, south-east of Tehrán, is said to have been abandoned on this account."

Estimating the extent of Persia proper at 610,000 square miles, St John thus distributes the drainage :—(1) into the Arabian Sea and Persian Gulf, 130,000; (2) into the Caspian and Aral Seas, 100,000; (3) into the Sístan Lake, 40,000; (4) into the large lake of Úrmíya or Úrumiyah, 20,000; (5) interior drainage, 320,000. No. (1) comprises the south-west provinces and the whole of the coast-region up to the small port of Gwatar in Baluchistan; (2) relates to the tracts south, south-west, and south-east of the Caspian; (3) is the tract adjudicated to Persia, including the Hámún and part of the Helmand basin; (4) is a comparatively small area on the western frontier containing the basin of Lake Úrmíya, shut off from the rest of the inland draining of Persia; (5) takes in Ispahan, Karman, and the province of Khurásan, with the Dasht-i-Kavir, or "Great Salt Desert." He points out that the area draining into the ocean consists of a long strip nearly parallel to the Tigris and sea-coast without a single protrusion inland, but is uncertain whether an outlet exists from the Bampúr plain in Persian Baluchistan to the sea. A later traveller, Floyer, mentions the names of two rivers debouching on the coast, namely the Sadaich and Gabrig, which might represent such outlets, but their courses have not been traced with sufficient completeness to supply a solution to the problem. If the native evidence taken by Major Goldsmid at Fanoch in 1866 can be relied on, the river entering the pass of that name from the highlands of Bampúr, after undergoing two or three changes of nomenclature, passes out into the ocean as the Kálíg.

According to St John, a narrow strip of land, not more than 30 to 50 miles wide, along the southern coast of the Caspian, drains into that sea. On the west it suddenly widens out to a depth of 250 miles, meeting the watershed of the Tigris on the one side and that of the Euphrates and Lake Van on the other, and embracing between the two the basin of Lake Úrmíya, which forms with the basin of Lake Van what may be termed the supplementary plateau of Armenia, differing only from the Persian and Helmand basins in its superior altitude and smaller area. On the east the watershed of the Caspian gradually increases in breadth, the foot of the scarp extending considerably to the north of the south-east angle of that sea, three degrees east of which it turns to the south-east, parallel to the axis of the Kuren and Kopet ranges, which, as before stated, are a prolongation of the Caucasus. A little short of Herat the Caspian water-parting turns eastward, separating the valleys of the Hári Rúd and Hárút rivers. West of Herat the desert plateau of Kháf divides the Caspian from the Helmand basin.

The three rivers belonging essentially to Persia, in reference to the Caspian watershed, are the Kizil Uzain or Safíd Rúd on the south-west and the Atrak and Gurgan at the south-eastern corner of that inland sea. The first is stated by St John to drain about 25,000 square miles of country east and south of the Úrmíya basin. According to Colonel Stewart, the Atrak has its source in the Hazár Masjid range of mountains, a distance, probably, of 250 miles as the crow flies, from the river mouth. The Gurgan rises to the west of it and passes to the sea south of the Atrak. Observing that the Tajand, taking a sweep round Sarakhs, forms a swamp in the Atak about the 58th meridian, the same authority explains that as far south as 30° N. lat.—

"the eastern slopes of the ranges which shut off the valley of the Helmand from the deserts of eastern Persia drain directly towards the Sístan Lake. South of that parallel the surplus water flows by several channels in a south-easterly direction, or away from the lake. About latitude 29°, the water-parting of the Balúchistan mountain-system, running east and west, changes the direction of these streams, and collects them into a single channel, which, under the name of the Mashkid river, bursts through the northern scarp of the Balúch hills into the Khárán desert. Here it takes a north-westerly course, thus reversing the original direction of its waters, which are lost in the desert not far from their most northern sources. It is very probable that these, finding a subterranean channel some distance farther to the north, aid to fill the Zirreh swamp, the southern of the three depressions which, united by flood-waters, form the Hámún or Sístan Lake."

The great central area of Persia, included in the water sheds he has described, "forms a figure nearly triangular, with a base running south-west about 1000 miles long, and nearly equal sides north and east of 700 miles."

St John observes that the streams draining southern and western Persia into the sea diminish regularly in importance from north-west to south-east. He notes the Diyálah and Karkhah flowing into the Tigris from the mountains of Kurdistan; the Diz and Kárún, which unite below Shústar (Shuster), and reach the Shattu 'l-'Arab at Muhamrah; and the Jaráhi and Táb, which with the Kárún form "the delta of Persian Arabistan, the most extensive and fertile plain in Persia." After these he lays stress upon the fact that not a single stream unfordable at all seasons bars the passage of the traveller along the coast till he reaches the Indus. Those rising amid the high mountains north of Bushahr and Bandar-'Abbás are, with the exception of the Mira, which debouches at 60 miles below Bushahr, nameless in the most trustworthy maps; and in Persian Baluchistan we have the Jagín, Gabrig, Sadaich, Rábij, Kair, and Káju.

The Kárún merits especial notice as a navigable river for small steamers up to within a mile or two of Shústar, though not favourable to the establishment of a regular service, owing to the existence of rapids at Ahwaz. By land there are perhaps somewhat more than 100 miles from Muhamrah to Shústar; and Colonel Champain, an excellent authority, states that from Shústar to Ispahan the distance is as nearly as possible the same as from Shiráz to Ispahan, the high road for ordinary travellers passing to and fro between Tehran and the sea-coast. Little need be said on the streams having no outlet to the sea, the water of which is utilized by cultivators both before they reach the alluvial plain between the ranges and afterwards in irrigating the banks. Referring to these St John notes the constant affluents which prevent the rapid exhaustion of water, and the salt swamps or lakes formed by the rivers at points far removed from their source. Six of these inland streams he mentions by name, viz., the Aji Chái and Jaghatu, flowing into the salt-lake of Úrmíya; the Hamadan Rúd or Kára Sú and the Shúráb, flowing eastwards to the Salt Desert; the Zainda Rúd, a river of Ispahan, lost in an unexplored swamp; and the Kúr or Bandamir, which forms the salt-lake of Níris. He sees

Streams
of west
and
south

cause for believing the lakes of Shíráz and Kazrún to be fed mainly by springs.

St John writes further :—

Rainfall
and
winds.

"It will be readily believed that the rainfall on the Oceanic and Caspian watersheds is far in excess of that on the interior. Wherever the water-parting is formed, as it is in most parts, by a lofty mountain ridge, it intercepts the moisture-bearing clouds from the sea which are discharged from its outer slopes. The Albúrz chain, which shuts off the plateau from the Caspian, may be taken as the typical instance of this. Its northern face is furrowed into deep valleys by the constant and heavy showers which have clothed them in forests of almost tropical luxuriance, while the southern generally presents a single abrupt scarp, rising above long gravel slopes, unchannelled by anything worthy the name of a river, and bare of any vegetation rising to the dignity of a tree. At the most moderate estimate the rainfall of Gilán and Mazandarán may be taken as five times that of the adjoining districts across the ridges to the south.

"In other parts, however, we find the water-parting considerably below the level of the summits farther inland; and here the interior has a more plentiful rainfall than the coast. This is particularly the case in south-eastern Persia, where the Khurasán, Sarhad, and Dizak hills, far exceeding in altitude the ranges to the south, attract to themselves the major portion of the scanty supply of moisture borne inland from the sea. Again the rainfall differs very much in different parts of the country, under apparently similar conditions as regards mountains and distance from the sea; the east and south being far drier than the north and west, while the dampest parts of the Tigris valley have not half the rainfall of the southern and south-eastern shores of the Caspian.

"Two palpable causes unite to produce the prevailing winds throughout Persia and the Persian Gulf. These are, with an extraordinary uniformity, north-west or south-east. The first cause is the position of the Black Sea and Mediterranean on the north-west, and of the Arabian Sea on the south-east. The second is the bearing of the axes of the great mountain chains, which lie mainly in the same direction, and thus tend to guide the currents of air in a uniform course. The south-west, moreover, is not felt, except as moderating the temperature of the Makrán coast inside a line from Rás-al-Hadd, south of Maskat, to Karáchi.

"The effect of the sun on the great Iranian plateau is to produce a heated stratum of air, which, when it rises, is succeeded by a current from the colder atmospheres above the seas to the south-east or north-west. Naturally the latter is the colder, and therefore, as might be expected, north-west winds are most prevalent. But in southern Persia and the gulf it often occurs that the two currents meet, and that a north-westerly gale is raging at Bushahr while a south-easter is blowing at Bandar-Abbaa. This latter wind is the rain-bearer throughout the greater part of Persia, the exception being the north-west, where occasional rain-clouds from the Black Sea and the Caspian find their way across the Kúrdish mountains or the Albúrz. It is true that it often rains even on the gulf during a north-wester, but only when this has followed a succession of south-easterly gales, the moisture borne by which is returned from the opposite quarter."

There are no sufficient statistics available accurately to estimate the rainfall in Persia, but St John, himself a resident of some years in the country, was of opinion that in no part of it excepting the watersheds of the Caspian and Persian Gulf (north of 28° lat.) and their immediate reverse slopes, with perhaps the Úrmíya basin, is there an average of 10 inches, taking mountain and hill together. He believed that throughout the greater part of central and south-eastern Persia and Baluchistan the annual rainfall could not be much more than five inches, and that, were it not for the snow stored on the lofty hills, nine-tenths of the country would be the arid desert which one-half was found to be when he wrote (1876). Cultivation is carried on mainly by artificial irrigation, the most approved arrangement being an underground tunnel called "kanát," whereby wells are connected and supplies of water ensured.

One remarkable feature in the plains of Persia which naturally engaged St John's attention was the salt-swamp called "kavír." He applied the term to those bogs of slimy mud found in the lowest depressions of the alluvial soil, where the supply of water, though constant, was insufficient to form a lake. In winter they are covered with brine, and in summer with a thick crust of salt. The principal kavír is that in Khurasán, and marked in the maps as the Great Salt Desert. St John describes

it as "the eastern part of what is probably the most extensive plain in Persia, that intercepted between the Albúrz and its parallel ridges on the one hand and the heads of the ranges of the central plateau which run south-east on the other. Westward, it is divided into two valleys, originating, one in the Sultániah plateau, and the other north of and near Hamadan. These are drained by rivers named respectively the Shúráb and the Kára Sú, which, with another considerable affluent from Turshiz, on the east, unite to form the great *kavír*." He was unable to determine the altitude of this extensive swamp further than that it might be below the level of the sea, but could not be much above it.

Other kavírs he finds in the Sarjan or Sayidábád plain west of Karman and in the neighbouring valley of Kútrú. Among ordinary kavírs, which are "innumerable," he considers the largest to be on the south of Kháf, and the best known that north of Kúm.

It is clear, from the description given, that the range of these particular salt-swamps or kavírs is confined to the actual depression which has been directly affected by the passage of water, and that the term is not intended to apply to the surrounding wastes. But it seems to have been otherwise understood by the generality of travellers, and the better-known writers on Persia have seldom made the actual distinction here implied. Malcolm in 1800 crossed a "salt-desert" between Pul-i-Dallak and Hauz-i-Sultan, which, he says, was called Dariya-i-Kabir, or "the great sea." Morier, nine years later, calls the place the "swamp of *kavér*," . . . part of the great desert which reaches unto Khurasan, the soil of which is composed of a mixture (at least equal) of salt and earth." Colonel Johnson, passing over precisely the same road in 1817, describes it as leading "over a saline plain, leaving here and there hollows of considerable magnitude, white with salt; . . . eastward it stretches as far as the eye can see, and is said to reach to Mansila, distant 40 miles." The writer would probably have been surprised to learn that it extended for at least ten times the distance named. He does not, however, use the word "kavír," which, while duly recorded as a Persian word in the dictionary, meaning saluginous ground, is strangely like the Arabic adjective "kabir," which Malcolm, as just mentioned, has coupled with "dariya" in his *Sketches of Persia*. St John states that in the south the salt-swamps are called "kafeh."

The last writer asserts that but one European, Dr Bühsé, a Russian, had seen the true kavír, having crossed it in about 34° lat., when going from Damghan to Yazd. Sir Charles Macgregor must have been close upon this traveller's track in 1875, for in the district of Biabának (the "little desert"), which he visited, one of the eight villages, Jandak, is marked in St John's map as an oasis just above the parallel mentioned. Biabának is, according to Macgregor, situated "south of the *kavér*," but it is joined to Semnan (on the Tehran-Mashhad highway) by a "regular road" which "crosses a bit of *kavér* of about 80 miles without water."

The drier deserts of Karman and Bampúr cannot be included in the category of swamps; and the term "lút," made use of by the Russian geographer Khanikoff in reference to the former, whatever its original derivation, must simply be accepted as the common local expression, in eastern Persia and western Baluchistan, for a waste waterless tract.

Geology.—Mr W. T. Blanford has given us an interesting sketch of the geology of Persia. He found that by far the greater number of those who had treated the same subject before him had restricted their inquiries to the north-western provinces, and that few had penetrated east of Damávand or south of Tehran. Mr Loftus had imparted a fair knowledge of western Persia, and Russian and German explorers had made students tolerably acquainted with Adarbajjan, Gilan, and Mazandaran. Khurasán and eastern Persia generally were, however, in a geological sense unknown, and the south was almost equally a *terra incognita*, unless exception were made for certain stray observations on the shores of the Persian Gulf. The following passages are extracted from his paper.

"The most striking circumstance noticed during a journey in Persia is the great prevalence of formations, such as gravel, sand, and clay, of apparently recent origin; the whole of the great plains, covering at least one-half the surface of the country, consist either

of a fine, pale-coloured alluvial loam, which covers the lowest portion of the surface, or of gravel, fine or coarse, which usually forms a long gentle slope from the surrounding hills to the alluvial flat, and fills up with long slopes the broad valleys opening into the larger plains. All these deposits are more conspicuous than they are in most countries in consequence of the paucity of vegetation and the absence of cultivation throughout the greater part of the surface. Nor is this prevalence of recent or sub-recent detrital accumulations confined to the plains, for the slopes of the hills up to a considerable elevation are in some cases composed of similar unconsolidated formations, from which only occasional peaks of solid rock emerge. This, however, is by no means universally the case, many ranges consisting entirely of rock. Again, the descent in Baluchistán from the plateau to the sea-coast is over broad terrace-like flats of gravel and sand, separated from each other by ranges of hills running parallel to the coast-line.

"The mountains and hill-ranges of Persia comprise a considerable variety of geological formations, a few of which, however, prevail over large areas of country. So far as our knowledge at present extends, the great mass of the Zagros chain (the term being used in the widest sense for the whole mountain-range from Mount Ararat to Shiráz, together with the numerous parallel minor ranges north-east of the main chain) consists of cretaceous (hippuritic) and tertiary formations, the former constituting the north-east half of the range and its slope towards the central plain of Persia, whilst the nummulitic and later formations prevail almost exclusively on the south-west watershed overlooking the Tigris valley. Older rocks occur, but they are of subordinate importance, and it appeared probable, both to Mr Loftus and myself, that part at least of the altered rocks which form no inconsiderable portion of the range to the north-east is very probably of cretaceous origin. Old granite rocks, however, form a great band, extending from Lake Urumiah to a point nearly due west of Isfahán, and the same crystalline masses appear in the ranges between Isfahán and Káshán."

The general direction of the Persian mountains north-west to south-east has already been noticed. Speaking of these, Blanford says that, so far as they have been examined, "they have the same geological features as the Zagros, and consist similarly in the main of cretaceous and nummulitic rocks, the former prevailing to the north-east towards the desert, the latter to the south-west near the sea. Here, again, metamorphic rocks occur, some of them granite, others but little altered, and closely resembling in facies the cretaceous beds in their neighbourhood. Volcanic formations also occupy an extensive area, and whilst some appear of very late origin, others are possibly contemporaneous with the cretaceous epoch."

Of the southern border-land of the Persian plateau he writes—"Where crossed by Major St John and myself, between Gwádar and Jalk, it consisted of low ranges running east and west, and, except near the sea, was almost entirely composed of unfossiliferous sandstones and shales, associated with a few beds of nummulitic limestone. So far as could be ascertained, these ranges appear to belong entirely to the older tertiary epoch. Here and there a few isolated masses of basaltic igneous rock have been introduced through the strata, but their occurrence is exceptional. Along the sea-coast, however, from the frontier of Sind to the Persian Gulf, and probably throughout a large portion of the north-east shores of the gulf, a newer series of rocks rests upon the nummulitics. This newer series is easily recognized by the presence of thick beds of hardened clay or marl; it is of great thickness, and abounds in fossils, a few of which appear to be living forms, whilst others are extinct. The exact age has not been ascertained; the mineral character is very different from that described by Loftus as characteristic of the gypseous series, and it is therefore premature to class these beds of the Persian coast, for which I have proposed the name of Makrán group, more definitely than as newer tertiaries. It is highly probable that they represent a portion at least of the gypseous series. Along the coast itself are a few mud-volcanoes."

Remarking that hippuritic limestone had not been noticed on the eastern frontier,¹ he turns to north-western Persia, a region "widely explored by various Russian and German travellers."

"There would appear, both in Adarbáiján and the Alburz range, to be a greater development of older Mesozoic and Palæozoic formations than in any other parts of western or in southern Persia. From the very brief visits I was enabled to pay to the Alburz and the small area examined, I can form but an imperfect conception of the range as a whole, but the impression produced by my visits is that the geological composition of this mountain-chain presents a striking contrast to that of all other parts of Persia which I had previously seen. It appears probable that a very considerable portion of this range consists of carboniferous and Devonian beds, and that Jurassic or Liassic rocks are also extensively developed. The same formations extend to Adarbáiján, but here, as well as in the eastern parts of the Alburz, cretaceous and nummulitic rocks are also found. Metamorphics (granite, &c.) exist in several places,

¹ It has since been found extensively in southern Afghanistan and around Kwatta.

whilst volcanic outbursts occupy a considerable area, and the highest mountain in Persia, Damávand, in the Alburz chain, about 60 miles east-north-east of Tehran, is a volcano which, although dormant in the historical period, is of recent formation, and still gives vent to heated gases. The volcanic masses of Ararat, Sahend, south of Tabriz, and Savalan are also, in great part at least, of geologically recent origin."

Minerals, &c.—Of the value and extent of minerals in Persia much still remains a matter of surmise. Iron and lead are to be found, copper and coal also, but gold and silver have not yet become substantial results, and the turquoise is perhaps the only product of high price and estimation. This gem, however, is not readily procurable at Nishápúr, its birthplace, but should rather be sought for at Tehran or Ispahan, where it comes into the market with other exotics. The mines are situated at the base of the hill of Sulaimaniyah, lying north of Zamánabad, a village on the high-road from Mashhad to Tehran. When the Sístan mission was at Nishápúr in 1872 they were farmed by the Government for 8000 "tumáns" per annum, or about £3200 in English money.

In Malcolm's days, though coining was held to be a choice privilege of royalty, foreign piastres and ducats were in considerable vogue. Accounts are kept in "tumáns," "kráns," and "sháhís," of which the value of the first has deteriorated to 8s., the second is barely the French franc, and the third is about a halfpenny. Less than the last is called "pul-siyáh," or black money. The "sháhí" and the "panabit," a silver coin worth about 5d., have for long been in common circulation. In late years the manufacture of false money and forging the royal seals had become such common practices that the old rough hammer-struck coinage was called in, and medals in gold and silver with milled edges were substituted. But these also were counterfeited, and a head of notice was called in from Austria to endeavour to check the evil.

The Yazd marble has a watered appearance with yellowish tinge. A handsome specimen is to be seen in the tomb of Háfiz at Shiráz. There is a quarry on the road from Yazd to Karman. The petrifactions called Tabriz or Marágha marble are found on the road between those two places.

Eastwick describes the coal obtained from the pits at Hit, in the hill-country west of Tehran, as light, brittle, glittering, and with occasional red stains. There were no large blocks visible.

Though petroleum and naphtha appear indigenous to Persia, and Floyer visited an oil-spring in Báshakard, the produce of which was burnt in lamps at Mináb near Bandar-Abbás, the produce of the oil-wells at Báku has found its way to Meshhad, and meets there with a ready sale. In connexion with this circumstance, Lovett states that a great number of lamps of the most trumpery German manufacture are imported into Khurásan and sold at large profits.

Dr Bellw, referring to the twelve divisions of the district of Nishápúr, and to its 1200 villages and hamlets, mentions the report that it possesses also twelve different mines, yielding turquoise, salt, lead, copper, antimony, iron, together with marble and soap-stone. The statement needs, however, verification.

Climate.—The climate of Persia varies much according to locality. In the Caspian provinces, where rain is frequent, it is hot, humid, and unhealthy for the greater part of the year. In the tablelands it is intensely cold in winter, and, though it is hot in summer, its dry clear heat is temperate in comparison with that of Sind and the Punjab. The spring and autumn are the best seasons. In the south and south-west, towards the Persian Gulf and in Baluchistan, the heat is intense throughout the summer and often in the spring and autumn. The three regions of Nearchus and the old travellers—illustrated by parching heat, sand, and barrenness in the south, a temperate climate, pastures, and cultivation in the centre, and severe cold with bare or snow-clad mountains in the north—may still be accepted as conveying a fairly accurate description of the tracts lying generally between Bushahr and Tehran; but of course there are seasons and seasons, and it may be very hot as well as very cold in the north as elsewhere. In June the traveller, starting from the former place en route to the capital (Tehran), will for more than 50 miles, or up to the bridge of Dálaki, experience a fierce heat during the day, and not always find relief in a cool night. Reaching the plateau of Kunár Takhtah, 12 miles farther, at an elevation of 1800 feet, he will not then necessarily have escaped the influence of hot winds and a thermometer ranging to 100°. Some 50 miles farther he will have felt a most agreeable change at an altitude of 7000 feet; and in another 24 miles, at Khan-i-Zanian, he will

have had every cause to be grateful for a delightful temperature. Shíráz, though some 4750 feet above sea-level, and in respect of climate so belauded by the native poets, can be hot enough in the summer, and is subject to drought, scarcity, and other contingencies of Persia.

Mounsey considers May the finest month, when the plains are fresh and green, the gardens filled with roses and nightingales, the cherries ripe, and the green almonds in vogue. Bioning, writing from Ispahan on the 1st of July, had not seen the thermometer higher than 87° in his room; in the morning at sunrise it was generally 70°. Sleeping, as others, on the roof of his house, he described the air to be very dry, and the nights clear and bright, the little dew which fell being so pure as to be innocuous. He expected hotter weather towards the close of the month, but a long autumn would make amends for a little heat. Many years before Binning, Mr Jukes had recorded that, from the average of 27 days, including the end of May and beginning of June, the thermometer at Ispahan at sunrise was 56°, at 2 P.M. 57°, and at 9 P.M. 67°. Sir John Maleelm remarked that this city appeared to be placed "in the happiest temperature" that Persia could boast. Lady Shell, whose experiences were chiefly gained in Tehran, limits the "glorious weather of Persia" from the "Náu-ruz" or New Year (21st March) to the middle of May; but most persons would perhaps prefer the autumn in the highlands of the north, as in many other parts of the country. September and October are beautiful months. The blue sky, with its tempering haze, as it were a veil of reflected snow gathered from the higher peaks and ridges of continuous mountain chains, is too exquisite a sight to be readily forgotten; and the enjoyment is all the more complete when the temperature is that of October. To those who come from India direct, or to whom an Indian heat is habitual, the change to Persia is most grateful. In the late spring, fashion moves out a few miles from Tehran to the "yalaks of Shamiran," or cooler residences near the hills, and summer rendezvous of the various foreign legations, returning in the late autumn to the precincts of the capital, which, it may be noted, have been considerably extended of late years, and are designed for yet further extension. On the 5th of June 1871 the thermometer in Tehran was at 1 A.M. at 62° and at 2 P.M. at 75°. On the two following days it was at 6 A.M. at 62° and at 2 P.M. at 80°. In February the traveller across the plains of Sulimaniya, or approaching the capital from Tabriz, will sometimes experience the most bitter cold.

Bushahr and the Caspian provinces have already been mentioned, but the heat of the former place is fairly shared by other ports on the seaboard to the south,—among them, Lingah, Bandar-Abbás, and Chárbár. When the Sistan mission was at Bandar-Abbás in December 1871, malarious fevers were prevalent, and enlarged spleen was a common complaint. The average maximum temperature was then only 72° and the minimum 52°; but the summer and winter heats are in this locality extreme. More than a month later the officers of the mission slept out on the desert plains south of Sistan, and woke in the morning to find their beds and bedding covered with frost and icicles. With reference to the Caspian provinces the consular report to the English Foreign Office for 1881 is available. Major Lovett, remarking that the "minimum isotherms passing through the north of continental Europe are deflected considerably to the south on approaching the longitude of the Caspian," calls attention to the fact that, while during the winter the northern part of that large inland sea is frozen over, farther south, at only 10° distance, the climate of Astrábad (if there be no wind from the north and the sun shine) is like that of Madeira at the same time of the year. Though the preceding cold season had been unusually severe, and heavy snow had fallen at Báku and lower down, the lowest reading of the thermometer was 25° Fahr., and the maximum during the months of December, January, and February was 62° in the shade.

The following extract from the report is interesting, as it bears on the products as well as the climate of the north of Persia.

"It must be remembered, in connexion with the influence the Caspian Sea has on the climate of its shores, that its surface is 34 feet below the level of the ocean; and, consequently, the superincumbent strata of air being denser than, *ceteris paribus*, elsewhere, it is also more capable of absorbing solar heat and moisture than the air at ocean-level. This partly accounts for the mildness as well

as for the dampness of the climate. I cannot give the amount of rainfall, having no gauge; but it rained, during the 245 days of recorded observations, forty-five times, and the sky was overcast seventy times besides. This tolerable proportion of rain and cloud is doubtless due to the action of cold northerly blasts impinging on the warm and moisture-laden air shrouding the slopes of the Elburz, and hemmed in, as it were, between them and the icy northern wind. Currents thereupon are set up from the central region of the southern shores of the Caspian that blow to the east and to the west. The central region is a zone of much greater rainfall than the districts more remote. The westerly current, passing over this province, has its fertilizing influence expended on reaching the Goklan hills, 100 miles from the sea. The breadth and intensity of this moisture-bearing current is well marked by the gradually proportionate denseness of the vegetation extending from the sands of the Atrak steppes to the mountain summits. The action of these damp winds is distinctly traceable on all portions of the mountain-range exposed to the sea-breeze, even by the channels afforded by the valleys of the rivers that debouch on to the Caspian. Such are densely clothed with forest of a type similar to that found in sontherly temperate climates. The flora is distinctly not tropical. In addition to the trees already mentioned, I should add that wild hops and plums are to be found. In the spring the hillsides are covered with thick excellent pasture. In the gardens and orchards of Astrabad are to be found vines, fig trees, orange trees, pomegranate, and lemon trees, and the vegetables chiefly cultivated are melons, pumpkins, marrows, lettuce, aubergines, &c., that form at their seasons food-staples for the people. Tobacco, used for manufacturing cigarettes, is also grown here on a small scale.

"The Turkman steppe lying north of Astrabad is, as far as the Atrak, a prairie of exceeding fertility. Wheat reproduces itself more than a hundredfold without artificial irrigation or any trouble beyond sowing."

Soil and Products.—Where there is irrigation the productiveness of the soil in Persia is remarkable, but unfortunately there is too much truth in the notion that two-thirds of the tablelands of the country are sterile from want of water. The desert is the rule, fertility the exception, and generally in the form of an oasis. Yet wheat, barley, and other cereals are grown in great perfection; there are the sugar-cane and rice also, especially in Mazandaran, where the soil is favourable and water procurable; opium, tobacco, and cotton, madder roots, henna, and other dyes, are as well-known exports as the woollen goods of Persia; and the first may be counted of importance in its bearing upon the Indian market.¹ In Gilan, famous for its mulberry plantations, silk has been one of the most valuable of products. Yazd and Mazandaran contribute also the same material, but of late years the worm has comparatively failed to do its office, and disease has destroyed crop after crop. According to Mr Secretary Dickson's report of August 1882 the peasants of Gilan had turned their attention to the cultivation of rice, and, though a marked improvement was perceptible in the silk produce, they were not disposed to revert to this branch of culture on the former large scale. "Silk, once the staple produce of Persia, upon which it mainly depended for repaying the cost of its imports, is not likely," he fears, "to resume its former importance. In its flourishing days about 20,000 bales, or 1,400,000 lb. representing a value of £700,000, were annually exported. Now not more than a fourth of that quantity can be obtained." Rice was found to suit the cultivators better; it gave them less trouble and provided them with an article of daily food. The production of silk, on the other hand, profited the richer landed proprietors, and subjected the cultivators to oppression.

Consul Beresford Lovett, in his report before quoted, says that at Astrábad the soil is so productive, and subsistence is practicable on so small a piece of land and with so little labour and expense, that many very poor emigrants come

¹ In 1881 the crop at Karmansháh yielded about 13,500 lb.; Ispahan claimed to have produced 3000 chests; in Khurásan it was reported that the cultivation of the poppy had increased tenfold, and so extended was the area that the opium realized was estimated at an eighth of the whole produce of the province, the yield for 1882 being reckoned at 33,750 lb. At Yazd it was largely cultivated, at Tehran to a small extent only.

there to settle from distant parts of Persia, Afghanistan, and the Indian border. "Rice," he writes, "is husked under tilt-hammers worked by a water-wheel apparatus, a rude and clumsy contrivance, but strong, simple, and cheap. Corn and barley are ground by water-mills of primitive construction; the best wheat-flour produced is inferior to English 'middlings.' They are careless as to the use of rusty corn; the effect of eating bread made with flour containing any of the noxious element is to render those unused to it very giddy."

Sir John Malcolm considered the shores of the Persian Gulf to be sandy and unproductive in comparison with the rich clayey soil on those of the Caspian. Yet at Bushahr, and elsewhere on the lowlands of the southern border, patches of luxuriant vegetation may be found and a soil producing wheat and barley.

Vines are abundant, and the Persian grapes are not only of a good flavour and kind, but the wines made from them by the Jews and Armenians have more than a mere local reputation. That of Shíráz is the most universally known and celebrated; but a description of port manufactured at Ispahan is equally palatable and less astringent. It might not, however, bear the vicissitudes of export. A light wine made at Hamadan, diluted with water, is found very drinkable by European visitors and residents. Other cities in Persia could be cited where the juice of the grape is turned to similar account. Samuel Gottlieb Gmelin, who explored the southern shores of the Caspian in 1771, observed that the wines of Gilán and Mazandaran were all made from the wild grape only.

Forests.

Flora.—Eastwick refers to the trees in the low country of Gilán as "part of that great forest which extends some 400 miles from Astarabad to Talish." No longer do the sparse olive and occasional plantation of fruit-trees here meet the eye of the traveller descending from the Persian plateau, but his path will be through dense thickets of "jángal," amid which the birch and the box and many familiar friends are recognized. There is an oak-forest in the vicinity of Shíráz, but no part of the country is so thickly wooded as the tract south of the Caspian. For the greater part of the province of Astrábad, Lovett surmises that nine-tenths of the surface is covered with forest. He excepts the pasture-lands of Sháh Kúh, a high mountain-range between Sháh Rúd and the sea. The trees are mostly deciduous. He had counted forty different kinds, including shrubs, but was unable to identify all. There were the oak, beech, elm, walnut, plane, sycamore, ash, yew, box, and juniper, but no pine, fir, or cedar,—though these last were said to exist in the dense forests of Fínderisk, and on the slopes of the Goklan Hills to the eastward. He applies to the oak, beech, and elm used in building the native names of "mázú," "nús," and "azad."

Fruits.

Fruits and flowers are abundant, and are fully appreciated in Persia. Poets sing of them, and prince and peasant delight in them. Of fruits the variety is great, and the quality, though not always the best, is in some cases unrivalled. There is perhaps no melon in the world superior to that of Nusrabad, a village between Kashan and Kúm. It were easier to name the few English fruits—such as the gooseberry, strawberry, raspberry, currant, and medlar—that are seldom, if at all seen, than the many that are commonly enjoyed by Persians. Apples and pears, filberts and walnuts, musk-melons and water-melons, grapes, peaches, plums, nectarines,—all these are to be had in profusion and so cheap as to be within reach of the poorest inhabitant.

Among the flowers are roses of many kinds, the marigold, chrysanthemum, hollyhock, narcissus, tulip, tuberoses, convolvulus, aster, wallflower, dahlia, white lily (much valued), hyacinth, violet, larkspur, pink, and many

ornaments of the European parterre. Of the roses, Lady Sheil observes that they are so profuse during the spring at Tehran that some are cultivated in fields as an object of trade to make rosewater. The double-coloured orange rose at Nishápúr is exceptionally attractive and fragrant.

As with fruits and flowers, so also with vegetables for the table. If the parsnip be excepted, which is probably not found because not wanted, all those commonly used in England are to be had in Persia.

Fauna.—Mr W. T. Blanford has described with great care and minuteness the zoology of Persia. In company with Major St John, R.E., he made a large collection of the vertebrate fauna in a journey from Gwatar to Tehran in 1872. Having added to this a previous collection made by the same officer with the assistance of a native from Calcutta, he had before him the principal materials for his work. Before commencing his analysis he adverted to his predecessors in the same field, i.e., Gmelin (whose travels were published in 1774-84), Olivier (1807), Pallas (1811), Ménétries (1832), Belanger (1834), Eichwald (1834-41), Aucher Éloy (1851), Loftus, Count Keyserling, Kokschy, Chesney, the Hon. C. Murray, De Filippi (1865), Hume (1873), and Professor Strauch of St Petersburg. All of these had, more or less, contributed something to the knowledge of the subject, whether as writers or as collectors, or in both capacities, and to all the due meed of credit was assigned. Blanford divided Persia into five zoological provinces: (1) the Persian plateau, or from the Kopet Dagh southwards to nearly 28° N. lat., including all Khurásan to the Perso-Afghan border, its western limit being indicated by a long line to the north-west from near Shíráz, taking in the whole upper country to the Russian frontier and the Alburz; (2) the provinces south and south-west of the Caspian; (3) a narrow strip of wooded country south-west of the Zagros range, from the Diyálú river in Turkish Arabia to Shíráz; (4) the Persian side of the Shattu'l-'Arab, and Khúzistan, east of the Tigris; and (5) the shores of the Persian Gulf and Baluchistan. The fauna of the Persian plateau he described as "Palæarctic, with a great prevalence of desert forms; or, perhaps more correctly, as being of the desert type with Palæarctic species in the more fertile régions." In the Caspian provinces he found the fauna, on the whole, Palæarctic also, "most of the animals being identical with those of south-eastern Europe." But some were essentially indigenous, and he observed "a singular character given to the fauna by the presence of certain Eastern forms, unknown in other parts of Persia, such as the tiger, a remarkable deer of the Indo-Malayan group, allied to *Cervus aris*, and a pit viper (*Halys*)." Including the oak-forests of Shíráz with the wooded slopes of the Zagros, he found in his third division that, however little known was the tract, it appeared to contain, like the second, "a Palæarctic fauna with a few peculiar species." As to Persian Mesopotamia, he considered its fauna to belong to the same Palæarctic region as Syria, but could scarcely speak with confidence on its characteristic forms. The fifth and last division, Baluchistan and the shores of the Persian Gulf, presented, however, in the animals common to the Persian highlands "for the most part desert types, whilst the characteristic Palæarctic species almost entirely disappear, their place being taken by Indian or Indo-African forms." Blanford adds: "Just as the fauna of the Persian plateau has been briefly characterized as of the desert type with a large admixture of Palæarctic forms, that of Baluchistan and the shores of the Persian Gulf may be described as being desert with a small admixture of Indian species." Irrespective of scientific classification and detail, it may be stated that among the tame animals of Persia the horse, mule, and camel occupy an important position, and, jointly

perhaps with oxen (used for tilling purposes), are first and foremost in usefulness to man. The Persian-Gulf Arab, though not equal to the pure Arabian, is a very serviceable animal, and has always a value in the Indian market. Among others, the Kashgais, or those wandering semi-Turkish tribes brought down from Turkestan to the neighbourhood of Shiráz, have the credit of possessing good steeds. The Türkman horse of Khurásan and the Atak is a large, bony, and clumsy-looking quadruped, with marvellous power and endurance. Colonel C. E. Stewart speaks of a "splendid breed of camels" in the north-eastern district, of which Radkan, a small town of 4000 inhabitants with a deputy-governor, is the capital. He also states that the Khurásan camel is celebrated for its size and strength, that it has very long hair, and bears cold and exposure far better than the ordinary Arabian or Persian camel, and that, while the ordinary Persian camel only carries a load of some 320 lb and an Indian camel one of some 400 lb, the Khurásan camel will carry from 600 to 700 lb. The best animals, he notes, are a cross between the Bactrian or two-humped and the Arabian or one-humped camel. Sheep, goats, dogs, and cats are good of their kind, but not all the last are the beautiful creatures which, bearing the name of the country, have arrived at such distinction in Europe. Nor are these to be obtained, as supposed, at Angora in Asia Minor. Lake Van or Ispahan is a more likely habitat. The cat at the first place, called by the Turks "Van kedisi," has a certain local reputation.

Among the wild animals are the lion, tiger, leopard, lynx, wolf, jackal, fox, hare, wild ass, wild sheep, wild cat, mountain-goat, gazelle, and deer. The tiger is peculiar to the Caspian provinces. Lovett says they are plentiful in Astrábad; "they do not attack men, but hardly a week passes but some cow belonging to this town is reported to have fallen a victim to the tiger's rapacity." He measured two specimens, one 10 feet 8 inches, the other 8 feet 10 inches from the tip of the nose to the end of the tail. Lynxes and bears were to be found in the same vicinity, and the wild pig was both numerous and destructive.

Poultry is good and plentiful, and the game birds, if not of many varieties, have admirable representatives in the "durráj" (black partridge) and the three kinds of partridge called respectively the "kabk," "kabk darah," and "tihú." The "hubára," a kind of bustard, is well known to the sportsman in northern India.

Commerce, &c.—The most direct and accurate information obtainable in England on the trade of Persia must be looked for in the reports of the secretary of H.M. Legation at Tehran, the resident at Bushahr (Bushiro), and the consul-general at Tabriz.

Mr Secretary Dickson's report of the 30th August 1882 is hopeful as to the general prospects of trade and improvement of the condition of the people. There had been a good harvest; but money was scarce at the capital, cash sales were difficult operations, and considerable failures had occurred to render the native bankers cautious. Manchester goods, however, still sold well at Ispahan and elsewhere.

The comparative failure of silk had given an impetus to the cultivation of opium, the greater part of which, when prepared for the market, was shipped to China. Carpets had found new favour in Europe, and the value of those exported was estimated at ten times the amount of former days. But a fear was expressed that the introduction of European designs and dimensions, and deterioration in quality of the articles supplied, would eventually prove prejudicial to the trade.

The larger traffic in opium effected both in 1880 and immediately preceding years is remarkable, and will be seen in the following table—

| Year. | Number of Cases. | Value in Rupees. | Year. | Number of Cases. | Value in Rupees. |
|---------|------------------|------------------|---------|------------------|------------------|
| 1871-72 | 870 | 696,000 | 1876-77 | 2570 | 2,313,000 |
| 1872-73 | 1400 | 1,120,000 | 1877-78 | 4780 | 4,730,000 |
| 1873-74 | 2000 | 1,600,000 | 1878-79 | 5000 | 5,000,000 |
| 1874-75 | 2030 | 1,625,000 | 1879-80 | 6100 | 6,100,000 |
| 1875-76 | 1890 | 1,701,000 | 1880-81 | 7700 | 8,470,000 |

Persian opium was, it appears, first exported from Ispahan in

1853. Since that period it has been grown in several parts of the country. The destination is usually China. In 1879, for instance, eighteen steamers took 4971½ chests from Bushahr, of which all but 236—for London—were for Hong-Kong. Except in Ispahan, there is every probability of extended cultivation, and that the production will increase to an appreciable degree year by year. In the statement of a private firm, quoted by Mr Baring in his report from Tehran in September 1881, is the following passage:—"The Persian drug has already succeeded in throwing out Turkish sorts from the China market, and, with due abstinence from adulteration, it can at any moment command a large outlet in Europe, America, and in the Dutch colonies." Mr Baring himself says:—"Whether the Persian opium trade in its present conditions constitutes a danger to the Indian revenue is, of course, a question to which I can furnish no reply. It depends upon circumstances respecting which I have no information. As matters at present stand, we have a trade that has been increasing steadily for several years past, and which the majority of persons think will continue to increase. The cultivation pays, and the limit of land and labour has not yet been reached. There are so many reasons, in fact, why it should extend, so few why it should fall off."

Carriageable roads were still a desideratum, and the want of these obstructed the development of trade. On the other hand, it was remarked that a fair road had been constructed between Kazvin and Tehran, a supply of carriages and carts had been obtained from Russia, and postal stations had been built at regular distances of 12 miles from each other. In the capital also the streets had been put into repair, and the palace, square, and main streets lit with gas; and there was a greater number of private carriages. A concession had been granted for a railway from Rasht to Tehran; Mr Dickson, while approving of this line as a step in the right direction, was very strongly in favour of another to join Tehran to Baghdád. A branch from Karmansháh or Hamadan to Shústar or Dizful, whence goods could be exported by the Kárún, would, he argued, give Persia an independent outlet for her commerce; but he doubted whether Baghdád, with its prestige and advantages of climate, would not be accepted as the main commercial entrepôt. The navigability of the Kárún river has been already noticed.

The Bushahr reports on the trade of the Persian Gulf for 1880 (imperfect) show that, as regards southern Persia, the year was unfavourable and from a commercial point of view. Large imports from India served to avert famine; but the seed so provided for 1881 was not at hand in time to allow full advantage being taken of an unusually good rainfall in autumn and winter. Increased imports in sugar from France and Java, the introduction of tea from Japan, and a decrease in exports of cotton and other ordinary produce owing to drought were all noticed.

The table showing the total estimated value of imports into Bushahr during the year 1882 gives a total of 10,188,980 rupees, —say something less than £1,000,000. Of this about four-ninths are from England and more than a third is from India. Of the exports, amounting to 6,566,220 rupees, —say £650,000 —more than two-fifths are for China, not a fifth is for England, and more than a fifth is for India. The most valuable items of import are the piece-goods and brass, —the last from England and India only, and of export, opium, of which just three-fourths go to China, and wheat, of which more than two-thirds go to England.

As regards the trade of Lingah, the year 1882 showed a decrease. The total value of imports was 6,922,000 rupees, of which pearl formed the largest portion. These were brought chiefly from Bahrain and the Arab coast, but some from the Persian Gulf and Makran and Aden. Rice, almost wholly from India, was the next most valuable item. The total value of exports was 5,999,945 rupees. In this also pearls formed by far the largest item. Next in value mother-of-pearl shells exemplified a traffic almost entirely carried on with England.

From Gez on the Caspian, Consul Lovett gives to the exports of 1881 a value of £86,280. These consisted of silk, cotton, woollen furs and skins, dried fruits, rice, corn, and miscellaneous articles. Silk represented nearly the half, and furs and skins nearly a quarter of the total figure. The imports he valued at £257,640, of which the amount for piece goods was entered at £256,000. The remaining articles specified were sugar, tea, iron, copper, steel, crockery, hardware, and brass utensils.

Manufactures, &c.—The handbook on Persian art published by Colonel Murdoch Smith, R.E., in 1876, with reference to the collection purchased and sent home by him for the South Kensington Museum, has an instructive account of the more common manufactures of the country. They are classified under the respective heads of "porcelain and earthenware," "tiles," "arms and armour," "textile fabrics," "needlework and embroidery," "metal-work," "wood carving and mosaic-painting," "manuscripts," "enamel," "jewelry," and "musical instruments." Specimens of the greater number are not only to be procured in England, but are almost familiar to the ordinary Londoner. It need scarcely be said that the tiles have rather increased in value than deteriorated in the eyes of the connoisseur, that the ornamentation of metal-work, wood carving and inlaying

gem and seal engraving, are exquisite of their kind, and that the carpets manufactured by the "ustáds" or skilled workmen of local repute, when left to themselves and their native patterns, are to a great extent unrivalled. One shown to Colonel Goldsmid at Karman, under preparation for the tomb of Sháh Niy'amat Ullah, situated at the neighbouring village of Mahun, would have been greatly prized in Europe. In company with Murdoch Smith that officer visited the carpet manufactories of the city in 1865. Of this interesting branch of Persian art Smith writes:—"Carpets are now made in many parts of Persia, but chiefly in Kurdistan, Khurasán, Ferghánah (in Irák), and Karman; each of these districts producing a distinctive kind both in texture and style. The finest are unquestionably those of Kurdistan, of which good specimens exist in the museum. The pattern does not represent flowers, bouquets, or other objects thrown up in relief from a uniform ground, like so many of the inappropriate designs of Europe, but looks more like a layer of flowers strewn on the ground, or a field of wild flowers in spring; a much more suitable style of ornament for a fabric meant to lie under foot. The borders are always well marked and usually of brighter colours than the centre. Besides the ordinary 'kali,' or pile carpet, others, called 'do-ru,' very thin and smooth and alike on both sides, are made in Kurdistan, of which there is a specimen in the museum. These 'do-ru,' from their portability, are much used in travelling for spreading by the roadside during the halts for pipes and tea. The carpets of Ferghánah resemble those of Kurdistan in style, although the texture is looser and the pattern simpler. They are consequently much cheaper and in more general use. . . . The Khurasán carpets are somewhat superior in texture to those of Ferghánah, but the patterns are generally more realistic; the flowers, &c., being represented as standing out of the ground. There is a fine Khurasán carpet in the museum made by the Kurdish settlers on the Turkman frontier. Karman carpets are the next in value to those of Kurdistan, but the designs are usually still more realistic than those of Khurasán. Besides flowers, figures of men and animals are not uncommon." Referring to the Turkman carpet he says: "The texture is very good and the pile is peculiarly velvety to the touch. The design, however, is crude, and the colours although rich are few in number. Still it is astonishing to think that, such as they are, these carpets are woven in the tents of a wild nomadic race like the Turkmen. Of late years there has been unfortunately a slight importation from Europe into Persia both of colours and designs which are far from being an improvement. The carpets of every description are made without even the simplest machinery, the loom being simply a frame on which the warp is stretched. The woof consists of short threads woven into the warp with the fingers without a shuttle. When a row of the woof is thus completed, a sort of comb is inserted into the warp and pressed or hammered against the loose row of woof until it is sufficiently tightened to the rest of the web. The pile is formed by merely clipping the ends of the woof until an even surface is obtained. The weaver sits with the reverse side of the web towards him, so that he depends solely on his memory for the formation of the pattern. . . .

"Felts or namads are made in many parts of Persia, but chiefly at Ispahan and Yazd. The material consists of all kinds of wool mixed together, that of the camel predominating. The colour is generally brown, but the surface on one side, and sometimes on both, is ornamented with geometric and other designs in different colours which are inlaid (so to speak) in the namad, and not simply stamped on the surface.

"The shawls of Karman are not much inferior to those of Kashmir. They are woven by hand similarly to the carpets. The material called 'kúrk' of which the shawls are made is the under wool of a particular kind of white goat: numerous flocks of this animal are in the neighbourhood of Karman. Like the merino sheep in Spain, these flocks migrate annually according to the season, in which respect they are like almost all the flocks and herds of Persia. I therefore made enquiries at Karman why the 'kúrk'-producing goats were only to be found in that neighbourhood, and was informed that in that district the rapid descent from the high plateau of Persia to the plains near the sea afforded the means of keeping the flocks throughout the year in an almost even temperature and in abundant pastures, with a much shorter distance between the summer and winter quarters than in other parts of Persia, and that such an even climate without long distances to traverse in the course of migration was necessary to the delicate constitution of the animal, or rather to the softness of its wool. The whole of the 'kúrk' is not made use of in the looms of Karman, a large quantity being annually exported to Amritsar in upper India, where it is manufactured into false Kashmir shawls. Besides the ordinary long shawls of which men's and women's tunics are made, others of a single colour are made at Karman, which are afterwards richly ornamented with needlework. Of these there are in the museum several specimens, in which the softness of the shawl and the richness of the embroidery are both to be admired. Shawls of a coarser kind are also made at Yazd, of which a specimen may be seen in the museum in a pair of door curtains."

Political Divisions.—According to the latest information obtained, or up to 1884, the 36th year of the reign of Násru'd-Dín Sháh, Persia is found to be portioned out into four large divisions and six smaller governments, of which governors-general or governors are appointed by the king. The four divisions are:—(1) Adarbáijan (Azerbaijan) in the west; (2) the North Central Districts; (3) Khurasán in the east, including Sistán; (4) Southern Persia, or from the Shattu'l-'Arab to the Mashkid. The minor governments are:—(5) Astrábad, (6) Mazandaran, (7) Gilán, (8) Khamsah with Zanjan, (9) Kazvín, (10) Gerra.

Adarbáijan, the ancient Atropatene, is under the "wali-'ahd," or heir-apparent, Muzaffaru'd-Dín Mirza, second son of the sháh, who resides at Tabriz, and appoints governors to the several districts within his range. Among the more important of these are Ardabil, Saráb, and Khalkhal towards the Caspian, Maku, Khoi, and Urumiya in the west, Marágha in the centre, and Solduz, Sanjbulák, and Sain Kalah in the south. Adarbáijan is about 250 miles in length from the Little Ararat to Sardasht, and the same distance in breadth from Kotur to the Talish. It is separated from Armenia in the north by the Arras, which rises in the mountains to the westward, and from Irák in the south by the Kizil Uzain, which, after a long winding course from Kurdistan, and union with other streams, empties itself into the Caspian under the name of Safid Rúd. On the west it is enclosed by the Kurdish mountains, and to a great extent on the east by those overlooking the Caspian shores. It is a land of mountains, ravines, plains, and plateaus. Lake Urumiya, about 75 miles in length by an average breadth of 30, is one of its most remarkable geographical features. In parts it is fertile, and produces wheat, barley, and maize, also cotton and tobacco. Markham says that its villages "are embosomed in orchards and gardens, which yield delicious fruits," and that its most picturesque and flourishing portion is around the towns of Urumiya (west of the lake) and Khoi. Tabriz, the capital, has long been the most populous city of Persia. The other chief towns of the province are Ardabil, Urumiya, Khoi, and Marágha.

The North Central Districts is a name given to the country under the immediate supervision of the naibu s-sultanah, or "deputy of the kingdom," the sháh's third son, who appoints governors to Tehran and Firúzkuh in the north, to Zaránd, Sawah, Kúm, Kashan, and Natanz, south of Tehran, and to Mahálat, Sultanabad in Irák, Malaiyir, Naháwand, Hamadan, and Tusirkán, west of Kúm and Kashan. The places named will serve to indicate the range of this division, one of some 150 miles in length, but of very irregular breadth. There are included in it remarkable centres of population, besides Tehran. Kúm is held in high repute as a sacred city, second in importance to Mashhad only. It contains the tomb of Fátima, the sister, or, as some affirm, the daughter of the imám Ríza, and the bones of thousands of Muhammadans, bequeathed to its honoured soil by the affection or superstition of sorrowing friends and relatives. It is a large, straggling, ill-kept, semi-ruined, uninviting place, relieved by patches of a new and well-built bazaar. The many domes of Kúm recall it readily to memory, but they are more characteristic than striking. Kashan has not much more attraction as a residence, but is held in good estimation for its silks, and is deservedly famous, above all towns in Persia, for its tiles and potteries.

The large province of Khurasán is perhaps not less than 500 Khú miles in length from the Perso-Turkman frontier to the southern limit of Persian Sistán. In breadth it is irregular, but from Pul-i-Khátún or the Lady's Bridge on the Tajand to Pul-i-Abrihm or the Bridge of Silk on the Kal Mura—a fair limitation for Khurasán proper, exclusive of Sistán—it is about 260 miles. The mountainous character of its northern frontier has been noticed in the description of the general boundaries of Persia. It is, however, worthy of remark that the supposed connexion of the Alburz range and that of the Parapanisus does not prevent an easy passage into Herat by the valley of the Ilari Rúd. The mention of rivers east and west of Khurasán must not lead to the inference that the water-supply is abundant; one, the Tajand, has to fertilize the desert tracts of the Persian Atak; at the other, the Kal Mura, the bridge is often useless, owing to the dryness of the river-bed. Central and southern Khurasán are more or less a vast desert with kavirs. Parts of Káiyán and Sistán on the Afghan border are fertile, though barren mountains and desert plains abound in the former, and the second has no lack of waste, notwithstanding the proximity of the Helmand.

The principal city in Khurasán proper is Mashhad, the capital, which may be said to contain, without contradiction, the most venerated and popular shrine in the whole of Persia, that of the eighth imám, Ríza. A pilgrimage to this spot has, owing to its convenient site, become a duty more essential if not more important than one to Karbala in Turkish Arabia, or even to Mecca and Medina; and the thousands who year by year win the privilege of becoming "Mashhadis" testify to the value set upon it. Mashhad, built on the perpetual Persian plain, and admirably situated as to roads of traffic with Búkhára (Bokhara), Khiva, Herat, and Kandahar, has little in its general exterior, except the imám's golden dome, to dis-

tinguish it from other cities in the sháh's territory; but it can boast also the tomb of the famous Hárún al-Rashíd and of Gauhar Sháh Agha, the favourite wife of Sháh Rukh; and its canal and quays merit at least a passing remark from their rarity. It is divided into two towns, the sacred and the secular, each of which has its distinct governor—the first called the "mutawali," the second being also governor of the whole province of Khurásan, and often a prince of the blood-royal. After Mashhad, among the chief towns of Khurásan are Nishápúr and Sabzawár on the highroad to Tehran, the first an ancient city within walls, the second notable for its surrounding cultivation; Bújánd on the north, which in Burnes's time was "a rather large place standing in a spacious valley"; Túrbat-i-Haidari, the chief town of a populous district with ten villages, visited by Conolly in 1830, by Goldsmid in 1872, and by Stewart in 1880; Sultanabad, capital of the Turshiz district (in which there is no specific "Turshiz"), called by Colonel Stewart "a small and flourishing town of some 5000 inhabitants"; Káiyán, once capital of the district of that name, and still a town of some importance, much frequented by "mullas" and "sáiyids"; Tún, which Macgregor describes as "decidedly a picturesquely situated town, surrounded by a wall (of irregular outline), which goes outside all the houses, and encloses besides a space—quite equal to that occupied by the houses—taken up with cultivation and gardens. Thus it is," he adds, "that Tún may be said to be a town 4 miles in circumference, though, if only the space occupied by houses was calculated, it would dwindle to one-eighth of this. There are no buildings of any note in the place, but a few mosques and colleges are to be found, while most of the better houses, of which there is a total of about 1500, have *badgers*."¹ Coupled with Tún is Tabas, to which the same writer gives no importance; then come Birjand, picturesque and clean, with a better class of mud buildings, well situated at the foot of hills, and having rather high mountains to the westward, the modern capital of the Káiyán district; and finally, Sikúha, the true but somewhat insignificant chief town of Sistán, here chosen in preference to Nasrabad, its military headquarters. Mr Rozario, medical attaché to the mission of 1872, described Sikúha as "composed of 200 arch-roofed mud-built houses, connected with each other without any kind of woodwork about them," the land wanting in rice and timber but producing wheat, barley, beans, and cotton in abundance.

The fourth, southern Persia, is a very extensive division, embracing not only the whole seaboard between 48° and 61° 30' E. long, but a great part of the country as far north as 32° 40', the parallel of Isfahan. Nothing could better illustrate the arbitrary and uncertain mode of parcelling out a kingdom than the separation of natural and the combination of abnormal elements of union to be found in this vast territory entrusted to the charge of the "zil-i-sultan," or "shadow of the monarch," the title given to the sháh's eldest son. That such an arrangement can work at all is one of many strange truths which are intelligible only to persons acquainted with the centralizing power exercised in Tehran. General Schindler, an officer of great local knowledge and experience, has guaranteed the correctness of the statement that the prince-governor or governor-general of Southern Persia—residing himself at Shiráz (or at Isfahan)—appoints governors to the following places:—Kurdistan, Karmansháh, Lúristán, Búrújird, Dizful, Shústár, Muhamrah, Behbahan, and Ram Hormuz in the west; the tracts occupied by the Bakhtiáris, Gulpáigan, Khonsar, Faridun, Chahár Mahál, Yazd (with Nain, Baft, and Shahr-i-Babek); Fárs (with Fasa, Darab, Lar, Parum, and Kázarun) in the centre; Bushahr and Lingah on the coast; and Karman (with Bam, Bampur, Rafsinjan, Khabis, Sirjan, Jiruft, and Rudbar) to the east. Among the more prominent cities or towns within this range are:—Isfahan, a fine city, still worthy from its site, buildings, gardens, river, and surroundings to be the royal residence; Shiráz, happily situated with pleasant neighbouring resorts and the ordinary requirements of a first-class Persian town,—possessing, moreover, a special national prestige for high and low, yet not a genial residence for strangers, who can accomplish its lions in a couple of days; Yazd, a large and fairly populated city, with one remarkable mosque and a handsome new bazaar, but somewhat gloomy in character and drearily situated on a flat plain in an amphitheatre of hills; Karman, a place of pleasant recollection to those English travellers who experienced the genuine kindness and hospitality of the wakilu 'l-mulk, Muhammad Ismail Khán, its governor in 1865-66, and not wanting in material attractions of its own; lastly, Bam and Bampur, visited by Lieutenant Pottinger in 1810, more than half a century afterwards by Colonel Goldsmid, and later still by Majors St John and Lovett,—the one a frontier town with associations of border warfare, the other a more Perso-Baluch cantonnement with a fort and mud buildings, long the residence of Ibrahim Khán, a chief of notoriety serving the interests of Persia. Muhamrah, Bushahr, Lingah, and Bandar-'Abbás are ports, but there is no real harbour between Fáo at the mouth of the Shattu 'l-'Arab and Karáchi (Kurrachee) in British India.

Astrábad is a town and district near the entrance of the bay of the same name on the Caspian. In 1884 it was governed by Habib Ullah Khán, the "sá'idu 'l-daulah," or "arm of the state." Mazandaran and Gilán are the Caspian provinces, *par excellence* of Persia. General Schindler makes them distinct governments but they appear to have once formed part of the northern division under the prince-governor.

Khamsah, a district on the high road between Tabriz and Tehran, of which the chief town, Zanjan, is a place of some importance. The governor's name in 1884 was Násr Kúli Khár the "amidu 'l-mulk," or "prop of the kingdom."

Kazvin, a considerable town, with surrounding district, in the plains south of the Alburz, and not a hundred miles from Tehran, was governed in 1884 by Mirza Riza, the "mu'ayyinu 'l-aultanah," or "helper of the kingdom."

Gerrus is a district on the south of Khamsah.

Population.—Although the present section deals with statistics only, the following well-considered remarks of Mr Robert Grant Watson, formerly a secretary in the Persian legation form an appropriate preface to the record of population.

"Persia is peopled by men of various races. A very great proportion of the population is composed of wandering tribes, that is, of a large number of families who pass a portion of the year on the hills. It is in this sense only that they can be considered wanderers. They invariably occupy the same pasture-grounds one year after another. Their chiefs are possessed of great authority over the tribesmen, and all dealings between the Government and the tribes are carried on through the heads of these divisions. Through the chief the taxes, whether in money or in kind, are paid, and through him the regiments which his tribe may furnish are recruited. The office of chief is hereditary. The tents in which the tribesmen dwell are for the most part composed of a light framework of the shape of a beehive. This is covered with a coating of reeds, and above it is placed a thick black felt. It has but one door, and no window or chimney. This is the Turkman tent, which is used by the Shahsavand and other tribes, but the Iliyáts in central Persia make use of tents of another construction, with flat or slightly-sloping roofs.

"The provinces near the Persian Gulf contain many Arabs and men of Arab extraction. Such are for the most part the inhabitants of Laristan and of the country lying to the left of the Shattu 'l-'Arab and of the lower part of the Tigris. The Bakhtiári mountains, between the valley of the lower Tigris and the plain of Isfahan, are the dwelling-place of tribes of another race, and of whom and their country very little is known. The mountains of Kurdistan give birth to a warlike people, who are attached to their own tribe-chiefs, and who never go far from the borders of Turkey and of Persia, sometimes proclaiming themselves subjects to the Porte, and sometimes owing allegiance to the Shah. At the foot of one part of these mountains, on the borders of the lake of Urúmía, there is a plain on which dwell many Christian families who hold the tenets of Nestorius. At Isfahan, at Tehran, at Tabriz, and in other parts of Persia, there is a more or less considerable population of Armenians. At Hamadan, at Isfahan, at Tehran, at Mashhad, at the town of Damávand, and elsewhere in Persia, Jews are found in considerable numbers. The province of Gilan is inhabited by a race of men peculiar to itself, the descendants of the ancient Gelæ. The people of Mazandaran speak, as do the Gilæa, a dialect of their own. The province of Astrabad is partly inhabited by Turkmans; and in the districts claimed by Persia, which border on Afghanistan and Baluchistan, the Afghan and Baluch elements are prominent in the population. At Karman a few Hindús reside, and at Yazd there are about 2000 families of the original fire-worshippers of Iran.² But the two principal races to be met with in Persia are the Turks and the Persians or Mongols. The former are, as a general rule, spread over the northern provinces; the latter over the southern. The Persians of Mongol extraction for the most part speak only the Persian language, while those of Turkish race speak the Turkish language in preference to Persian.

"The inhabitants of Persia may be divided into two classes,—those who inhabit the towns and villages, and those who dwell exclusively in tents. The former class remain stationary during the greater part of the year, the richer orders only leaving the towns for two months during the summer heats, when it is possible to obtain cool air in the hills or upper grounds close by. The tribes who dwell in tents move from place to place with the varying seasons of the year. In the springtime they drive their flocks and herds to their accustomed pasture-grounds, and if they have a right to the pasture of mountains which are inaccessible in spring, they move up to their summer quarters as soon as the snow disappears. Winter finds them on the plains, prepared, in their black tents, to brave its utmost rigour. These Iliyát tribes serve each a separate chief. For the Iliyáts of Fars there is a hereditary chief called the Ikhnání, to whom they all owe allegiance; from whom they receive the laws that rule their conduct; and to whom they pay the revenue imposed upon them. They contribute a certain number

¹ Literally "wind-catchers,"—towers erected on the roofs of houses for purposes of ventilation.

² Since greatly reduced in numbers.

of soldiers to the Shah's army. Very little is known as to the numbers and the peculiarities of these nomads. The *Illyát* tribes of Turkish descent have an *Ilkhání* appointed by the Shah. Besides these tribes there are wanderers who are less numerous, and who occupy a less prominent position.—the gipsies common to so many countries."

It is difficult to form an estimate of the population of Persian towns or districts. In the first place, opinion is divided upon the approximate figure to be accepted for the kingdom at large. According to St John, the discrepancy is between ten and four millions; and if the smaller one were made a basis there would be but a scanty number indeed for partition among the cities and principal centres. The famine of 1870 was, moreover, severe and fatal enough to cause a considerable diminution in the totals calculated prior to its occurrence. When returning through Mashhad in the spring of 1872 the British commissioner for the Sistan boundary settlement was informed that no less than 100,000 persons had been carried off within the limits of the prince-governor's rule, of whom 24,000 were from the city itself, where, exclusive of passing pilgrims, reckoned by thousands, a population of 70,000 might well be supposed. In Yazd and Ispahan the losses were also very great, and must have sensibly affected the figures.

Statistics of population. The official estimate for 1881 is recorded as follows:—inhabitants of cities, 1,963,800; wandering tribes, 1,909,800; inhabitants of villages and country, 3,780,000; total, 7,653,600. It is probable that 8,000,000 would be a fair estimate in round numbers; and this should include the comparatively new accessions of territory in Sistan and western Baluchistan.

The population of certain cities may be recorded as follows. Those figures marked with an asterisk are from the official returns given in the *Statesman's Year Book* for 1884. Tehran, *100,000; Astrábad (city), 8000—in the province, 26,000 (Lovett, 1881); Tabriz, *120,000; Úrumíya, *40,000; Hamadan, *30,000; Karmansháh, 25,000; Rasht, 20,000; Kazvin, 25,000; Zanjan or Zanjánah, 20,000 (Eastwick, 1860); Kúm, 20,000 (Euan Smith said in 1871 that out of 20,000 houses which it originally possessed only 4000 were then habitable); Ispahan, 60,000; Shiráz, *30,000; Bushahr, 11,000; Yazd, *40,000; Karman, 40,000; Birjand, 12,000 (Sistan mission, 1872); Ardakan (Khurásan desert), 20,000 (Colonel Stewart, 1880); Bam, 6000 (Goldsmid, 1866-72).

With regard to three interesting places in eastern Persia visited by Macgregor in 1875, this active explorer gives no clue to the population of Tabas, beyond the fact that it is a wall-enclosed town about half a mile in length by a quarter in breadth, with an "ark" or citadel, but no bazaars; of Tún, his 1500 "better houses" may imply about 6000 well-to-do people only; and Bashruiyah, between Tabas and Tún, he calls a village of some 600 houses, equivalent to a population of between 3000 and 4000.

Administration. Government.—The sháh is regarded as viceregent of the Prophet, and, as such, claims implicit obedience so long as his commands do not go against the Koran and the sacred law. The executive government is carried on by a ministry of which the *personnel* is subject to constant change, and the distribution of duties depends much upon the standing in royal favour of individual ministers. It may be said, as a rule, that those who fill the more important functions and do the most real work are better known by their family names than the official titles accorded them. The somewhat common prefix "mirza" is usually taken by high functionaries of state,—a word which invariably denotes a member of the royal house when used as an affix.¹

The division of the country for administrative purposes has been mentioned above, p. 626. Provinces are further subdivided into districts under "hákims," or chiefs, who collect the revenue as well as exercise a general superintendence. In villages the "katkhudá," or magistrate, administers justice.

Of the Armenians under Persian rule there are said to be 43,000, chiefly in Julfa near Ispahan, and of Nestorians and Chaldeans 23,000, chiefly in Úrumíya and Salmas. There are probably 70,000 Christians of every denomination. The number of Jews given is 19,000, and of Gabars (Guebres) or Parsís 8000. Perhaps the Nestorians have been under-estimated; but the Parsís have greatly diminished in recent years. However tolerant the declared principles of the Government towards aliens in religion, there is no doubt that much could yet be done to improve the condition of the sháh's non-Moslem subjects in respect of taxation, civil and social rights, and general treatment by local authorities. Efforts on behalf of the Nestorians have from time to time been made in late years, with the support of the British Government, and special agents have been deputed to Úrumíya to report upon supposed grievances

with a view to their alleviation or removal. The temporary appointment of a Christian governor was an indication of the sháh's good wishes, but can hardly be said to have attained the desired end. It is just possible that the desire awakened in England in the second half of the 19th century to know more of the Eastern churches may result in the exercise of a beneficial influence over the fortunes of a people who have suffered various forms of oppression for five centuries or more. See NESTORIANS, vol. xvii. p. 357 sq., where statistics, &c., are given.

Army.—Military service is not popular, and could not be provided for at all but by compulsory enrolment. Pay is always kept in arrears, generally for two or three years; and, when issued, it is reduced from its legitimate amount by the exactions of distributing officers, from the "sarhang," or lieutenant-colonel, downwards. The native officers are, as a rule, incapable and ignorant of military affairs; and the European drill-instructors, whatever their local rank, have no actual command in the native army. The common "sarbaz," or Persian infantry soldier, might with good officers and good training be made very efficient. In the performances of his long marches—24 or even 40 miles a day—he has very often a companion, his donkey, without which adjunct no picture of a Persian infantry soldier would be complete. Setting such aid aside, the marching and endurance of the sarbaz are wonderful, and, though better food might in some respects improve his *physique*, his frugality is such as to account in some measure for his bodily strength. If wanting in the discipline that is considered in England essential to the well-being of the service, the fault is that of his superiors, by whom he is ill-commanded, ill-taught, and ever accursed with an evil example. In fact, the moral value of the soldier deteriorates as the social grade rises. It is much the same in Turkey, where the state of things is perhaps Oriental rather than national. The post of "wakíl," or non-commissioned officer, becomes thus the first step to demoralization. Above this person is the "naib," or lieutenant, corresponding to the Turkish "mulázim"; then comes the "sultán," or captain, the Turkish "yuzbashi"; "yáwar," or major, the Turkish "binbashi"; "sarhang," or lieutenant-colonel, the Turkish "káim-makám"; and the "sartip," or colonel, the Turkish "mir-alai"; such are roughly the respective grades which represent the commissioned ranks.

The most business-like cavalry the present writer can recall in the sháh's dominions were the stray horsemen met with in the Karman province. Their dress, brown from top to toe, with the *kupassia* of Herodotus and the carbine slung over the back, appeared simple and soldier-like; and nothing but hereditary aptitude could make the horseman so fitted to the horse. Both in 1866 and in 1871 the governor of Bampur, in Baluchistan, had good stuff to discipline into irregular cavalry in his mounted Baluchis as well as Persians; and the same remark applies to the Persian governor of Sistan in 1872. The "istikbal," or motley troop of cavaliers, sent out to meet the writer by either chief, presented a singular specimen of rough but sufficiently formidable-looking satellites—men who had, clearly, fighting propensities, and might be moulded, without much effort, into very serviceable soldiers. Colonel (now Sir Charles) Macgregor found the few irregular cavalry incidentally brought under his observation in Khurásan very fairly mounted in a working sense. Over the saddle and behind it they seemed to carry all that belonged to them. With less than £2 a year in pay, over and above a grain allowance, he says truly of these cavaliers, that, "if not the best light horsemen in the world, they are the very cheapest." At Mashhad he saw several Persian regiments encamped outside the city. They were composed of men generally of fine physique, bony and muscular; but their small pay of seven "tumáns" (not £2, 16s.) per annum was seldom realized up to half the amount, and they had to subsist chiefly on their rations. Their uniform consisted of a black lamb's-wool busby, with a lion and sun in brass on the front, a dark-blue tunic, on the European model, with white bands across the breast, blue trousers with red stripe, and shoes (if they like to wear them). They had "clumsy percussion," smooth-bore muskets and bayonets, with locks of French manufacture; but they did not clean them, and it was probable that more than half were unfit for actual use. The artillery he states to be probably the most efficient branch of the service, not smart, but rough and ready.

Although there were no English officers employed in training the Persian troops during any of the present writer's visits to Tehran, there were two Englishmen connected with the arsenal to whom the local Government was indebted for useful service. The chief control of the arsenal, however, and indeed the direction of the whole Persian artillery, was in the hands of an Armenian; the two principal drill-instructors were Italians, a Florentine and a Neapolitan; while that vital part of the public works department comprising roads and bridges was under an Austrian officer holding the rank of general. There were, besides, two or three other Europeans holding quasi-military posts.

Sir Henry Rawlinson, who was for five years in the sháh's army, believes that, "if the Persian material were placed at the disposal of a European power who would encourage and take care of the

¹ In 1884 the following were among the more prominent ministers:—*War*.—Naibu 'a-Saltanah, Kamran Mirza.

Interior and Finance.—Mustofiu 'l-Mamálík, Mirza Yúsuf Khán.

Foreign Affairs.—Násru 'l-Mulk, Mirza Mahmúd Khán.

Justice.—Mushira 'd-Daulah, Mirza Abdul Waháb.

Worship and Telegraphs.—Makhbaru 'd-Daulah, 'Alí Kúli Khán.

Of these, Mirza Mahmúd Khán, the "Násru 'l-Mulk," had been minister in London. His predecessor in the cabinet had been always known as simply Mirza Sa'íd Khán.

men, and develop their military instincts, a fine working army, very superior to anything that Turkey could produce, might be obtained in a very short period of time."

It is difficult to rely on statistics in the present case, but the following are found in the latest and most trustworthy records.¹

"The Persian army, according to official returns of the minister of war, numbers 105,500 men, of whom 5000 form the artillery, 53,900 the infantry, 31,000 the cavalry, regular and irregular, and 7200 militia. Of these troops, however, only one-third are employed in active service, the standing army of Persia consisting, on the peace footing, of a total of 30,000 men. By a decree of the Sháh, issued in July 1875, it was ordered that the army should in the future be raised by conscription, instead of by irregular levies, and that a term of service of twelve years should be substituted for the old system, under which the mass of the soldiers were retained for life; but the decree has not been enforced to any extent. The organization of the army is by provinces, tribes, and districts. A province furnishes several regiments; a tribe gives one, and sometimes two, and a district contributes one battalion to the army. The commanding officers are almost invariably selected from the chiefs of the tribe or district from which the regiment is raised. The Christians, Jews, and Guebres in Persia are exempt from all military service. In recent years the army has been under the training and organization of European officers."

Revenue.—According to the *Statesman's Year Book* for 1884 the revenue and expenditure of the Government are known only from estimates. If we accept these as based on consular reports, the total receipts of the Government amounted, on the average of the years 1872 to 1875, to £1,900,000 per annum, while the expenditure during the same period was at the rate of £1,756,000 per annum. The receipts of the year 1882 amounted to £1,600,000 in money, besides £280,000 in kind, consisting of barley, wheat, rice, and silk, making the total revenue equal to £1,880,000; and of this sum £1,520,000 came from direct taxes and £353,600 from customs. The expenditure amounted to £1,800,000, of which £760,000 was for the army; £360,000 for the regal court; the priesthood, &c., £240,000; foreign affairs, £28,000; other departments, £60,000; education, £12,000. The surplus is paid into the sháh's treasury. About one-fourth of the receipts are constituted by payments in kind, mostly reserved for the use of the army and the sháh's own household. The whole revenue is raised by assessments upon towns, villages, and districts, each of which has to contribute a fixed sum, the amount of which is changed from time to time by tax-assessors appointed by the Government. Almost the entire burthen of taxation falls upon the labouring classes, and among these upon the Muhammadan subjects of the sháh. The amount of revenue collected from the Christian population, the Jews, and the Guebres is reported to be very small. The Government has no public debt. The *Almanach de Gotha* adds to the above items of expenditure in 1882 the sum of £80,000 for the priesthood, &c.

In 1868 the revenue demanded from each province, under the divisions then made, was:—Ardabaijan, £248,000; Gilan, £176,000; Isfahan, £168,000; Fars, £152,000; Khurásan, &c., £88,000; Arak, £86,000; Tehran, &c., £84,000; Karman, £84,000; Kermansháh, &c., £80,000; Khamaah, £72,000; Yazd, £68,000; Mazandaran, £44,000; Kazvin, £28,000; Kashan, £28,000; Búrjird, £24,000; Gnlpaigan, £24,000; Kurdistan, £20,000; Hamadan, £12,000; Astrábad, £10,000; Kúm, £6000; total, £1,502,000. The customs were £214,664, and the value of income received in kind was £220,336,—making a total revenue of £1,937,000, or something less than two millions.

A prince-royal appointed to a province is often little more than a nominal ruler. On the other hand, some governors, such as Muhammad Isma'il Khán, the late wakil of Karman, attend to even the minute details of administration, and pay especial attention to the collection of revenue. It is not always an easy matter to pay into the royal treasury the sum insisted on, or even voluntarily offered for the government of a province.

National Character.—Malcolm's *Sketches* and Morier's *Hajji Baba* are still, after more than half a century, unsurpassed as standard records of accurate information on the manners and customs of an Oriental people. A clever volume² published in 1883, which is also worth quoting, contains, among many other faithful delineations, the following:

"The character of the Persian is that of an easy-going man with a wish to make things pleasant generally. He is hospitable, obliging, and specially well disposed to the foreigner. His home virtues are many: he is very kind and indulgent to his children, and, as a son, his respect for both parents is excessive, developed in a greater degree to his father, in whose presence he will rarely sit, and whom he is in the habit of addressing and speaking of as 'master.' The full stream of his love and reverence is reserved for his mother; he never leaves her to starve, and her wishes are laws to him. The mother is always the most important member of the household, and the grandmother is treated with veneration. The

presence of the mother-in-law is coveted by their sons-in-law, who look on them as the guardians of the virtue of their wives. The paternal uncle is a much nearer tie than with us; while men look on their first cousins on the father's side as their most natural wives.

"Black slaves and men-nurses or 'lallaks' are much respected; the 'dyah' or wet nurse is looked on as a second mother and usually provided for for life. Persians are very kind to their servants; a master will often be addressed by his servant as his father, and the servant will protect his master's property as he would his own. A servant is invariably spoken to as 'bacha' (child). The servants expect that their master will never allow them to be wronged. The slaves in Persia have a good time; well fed, well clothed, treated as spoiled children, given the lightest work, and often given in marriage to a favourite son or taken as 'segah' or concubine by the master himself, slaves have the certainty of a well-cared-for old age. They are looked on as confidential servants, are entrusted with large sums of money, and the conduct of the most important affairs; and seldom abuse their trust. The greatest punishment to an untrustworthy slave is to give him his liberty and let him earn his living. They vary in colour and value: the 'Hababi' or Abyssinian is the most valued; the Suháli or Somáli, next in blackness, is next in price; the Bombassi, or coal-black negro of the interior, being of much less price, and usually only used as a cook. The prices of slaves in Shiráz are, a good Habshi girl of twelve to fourteen £40, a good Somáli same age, half as much; while a Bombassi is to be got for £14, being chosen merely for physical strength. They are never sold, save on importation, though at times they are given away. . . . I have never seen a Persian unkind to his own horse or his slave, and when overtaken by poverty he will first sell his shirt, then his slave.

"In commercial morality, a Persian merchant will compare not unfavourably with the European generally. . . . To the poor, Persians are unostentatiously generous; most of the rich have regular pensioners, old servants, or poor relations who live on their bounty; and though there are no workhouses, there are in ordinary times no deaths from starvation; and charity, though not organized, is general. . . . Procrastination is the attribute of all Persians, 'to-morrow' being ever the answer to any proposition, and the 'to-morrow' means indefinite delay. A great dislike is shown generally to a written contract binding the parties to a fixed date; and, as a rule, on breaking it the Persian always appeals for and expects delay and indefinite days of grace. . . .

"Persians are clean in their persons, washing themselves and their garments frequently. The Persian always makes the best of his appearance; he is very neat in his dress, and is particular as to the fit of his hat and the cut of his coat. All Persians are fond of animals, and do not treat them badly when their own property.

"Cruelty is not a Persian vice; torture and punishments, of an unusual and painful nature being part of their judicial system. There are no vindictive punishments, such as solitary confinement, penal servitude for long terms of years, &c. Seldom, indeed, is a man imprisoned more than twelve months, the rule being that there is a general jail delivery at the New Year. Royal clemency is frequently shown, often, perhaps, with want of judgment."

The close adherence to ceremony and etiquette, the ready adaptation to foreign habits, together with the capacity for using and love of receiving the grossest forms of flattery—which in the days of Herodotus were found to be notable features of the national character—are still to be seen in the 19th century.

Morier, in his *Second Journey through Persia*, relates how on arrival at Bombay his fellow-traveller, the Persian ambassador, returning from a mission to the court of St James's, would not call at Government House until the governor had visited him, on the plea that, when in London, the chairman and deputy-chairman, whom he styled the father and grandfather, of the East India Company, as well as the "viziers" and "grand vizier" himself (Mr Spencer Perceval), had made the first call upon him,—clothed, moreover, in the very dress they had worn before their own sovereign! The present writer, when discussing the necessary conduct of British diplomatists accredited to Persia, said:³ "In some courts . . . there is a meaning in ridiculous minutiae, the comprehension of which is of vital importance to the envoy and the cause he advocates. . . . A chair pushed one inch or two forward or backward, so as to transgress the border of a particular carpet marked for its limit, may cause serious offence; a cup of tea, or a tobacco pipe missing from the conventional number offered to a guest, may awake hostile feelings, there may be hidden mischief in a misapplied word of welcome or farewell, in a clumsy gesture, in a new-fashioned article of wearing apparel. Trifles could hardly go further in the way of puerility; but it is a part of common-sense diplomacy to acknowledge with gravity things which are to all seeming the most opposed to common-sense."

Forms of compliment and adulation are in such constant requisition with him that a Persian is never at fault to find occasion for their use. If the following example be too characteristic to be

¹ *Statesman's Year Book*, 1884, pp. 790, 797.

² Wills, *In the Land of the Lion and Sun*, 1883.

³ *Lecture at the Royal United Service Institution*, 26th May 1876.

admitted, be it understood that it indicates a grosser kind of procedure than that which, at the present day, is known to the higher classes. It is a common custom on the arrival at the gate of a town of a distinguished traveller for some duly appointed official to strike off the head of a sheep, and roll it, with the blood dripping, across the path of the new-comer. Morier gives a revolting illustration of the length to which this ceremony was carried on the arrival of the shah at the halting-place of Mochikar. The head man of the village went so far as to strip his own son naked from the waist upwards, and, having tied the lad's hands behind his back, to lift his knife as though to cut the victim's throat. The conclusion of the story is not told; but it is to be hoped that the shah exercised his prerogative of preventing any evil results.

Costume.—The costume¹ of the Persians may be shortly described as fitted to their active habits. The men invariably wear an unstarched shirt of cotton, sewn with white silk, often, particularly in the south of Persia, elaborately embroidered about the neck. It fastens in front by a flap, having two small buttons or knots at the left shoulder, and seldom comes below the hips. It has no collar, and the sleeves are loose. The lower orders often have it dyed blue; but the servant and upper classes always prefer a white shirt. Silk shirts are now seldom seen on men. Among the very religious during the mourning month ("Muharram") the shirt is at times dyed black. The "zir-jamah," or trousers, are of cloth among the higher classes, particularly those of the military order, who affect a garment of a tightness approaching that worn by Europeans. The ordinary "zir-jamah" are of white, blue, or red cotton, very loose, and are exactly similar to the "pai-jamnahs" worn by Europeans in India. They are held up by a thin cord of red or green silk or cotton round the waist, and the labouring classes, when engaged in heavy or dirty work, or when running, generally tuck the end of these garments under the cord, which leaves their legs bare and free to the middle of the thigh. The amplitude of this part of his attire enables the Persian to sit without discomfort on his heels; chairs are only used by the rich, great, or Europeanized. Over the shirt and "zir-jamah" comes the "arkhalik," generally of quilted chintz or print, a closely-fitting garment, collarless, with tight sleeves to the elbow, whence, to the wrist, are a number of little metal buttons, fastened in winter, but not in summer. Above this is the "kamarchin," a tunic of coloured calico, cloth, Kashmir or Karman shawl, silk, satin, or velvet (gold embroidered, or otherwise), according to the time of year and the purse and position of the wearer. This, like the "arkhalik," is open in front, and shows the shirt. It sometimes has a small standing collar, and is double-breasted. It has a pocket-hole on either side, giving access to the pockets which are always in the "arkhalik," where also is the breast-pocket in which watch, money, jewels, and seals are kept. The length of the "kamarchin" denotes the class of the wearer. The military and official classes and the various servants wear it short, to the knee, while fops and sharpers wear it even shorter. Priests, merchants, villagers, especially about Shiráz, townsmen, shopkeepers, doctors, and lawyers wear it very long, often nearly to the heels. Over the "kamarchin" is worn the "kulajah," or coat. This is, as a rule, cast off in summer, save on formal occasions, and is often borne by a servant, or carried over the shoulder by the owner. It is of cloth, shawl, or camel-hair cloth and is lined with silk or cloth, flannel or fur. It has, like the Turkish frockcoat, a very loose sleeve, with many plaits behind. It has lapels, as with us, and is trimmed with gold lace, shawl, or fur, or is worn quite plain. It has a roll collar and false pockets.

Besides these garments there are others: the long "jubba," or cloth cloak, worn by "mirzas" (secretaries), Government employés of high rank, as ministers, farmers of taxes, courtiers, physicians, priests; the "abba," or camel-hair cloak of the Arab, worn by travellers, priests, and horsemen; the "pustin," or Afghan skin-cloak, used by travellers and the sick or aged; the "nimtan," or common sheepskin jacket, with short sleeves, used by shopkeepers and the lower class of servants, grooms, &c., in winter; the "yapanjah," or woollen Kurdish cloak, a kind of felt, having a shaggy side, of immense thickness, worn generally by shepherds, who use it as greatcoat, bed, and bedding. There is also the felt coat of the villager, very warm and inexpensive, the cost being from 5 to 15 krans (a kran = 10d.). The "kamarband," or girdle, is also characteristic of class. It is made of muslin, shawl, or cotton cloth among the priests, merchants, bazaar people, the secretary class, and the more aged Government employés. In it are carried, by literati and merchants, the pen-case and a roll of paper; its voluminous folds are used as pockets; by the bazaar people and villagers, porters and merchants' servants, a small sheath knife is stuck in it; while by "farrashes," the carpet-spreader class, a large "khanjar," or curved dagger, with a heavy ivory handle, is carried. The headgear is very distinctive. The turban worn by priests is generally white, consisting of many yards of muslin. When the wearers are "saiyid" of the Prophet, a green turban is worn, also a "kamarband" of green muslin, or shawl or cotton cloth. Merchants generally wear a turban of muslin embroidered in colours, or of a yellow pattern on straw-

coloured muslin, or of calico, or shawl. The distinctive mark of the courtier, military, and upper servant class is the belt, generally of black varnished leather with a brass clasp; princes and courtiers often replace this clasp by a huge round ornament of cut stones. The "kuláh," or hat, is of cloth or sheepskin on a frame of pasteboard. The fashions in hats change yearly. The Ispahan merchant and the Armenian at times wear the hat very tall. (The waist of the Persian is generally small, and he is very proud of his fine figure and broad shoulders.)

The hair is generally shaved at the crown, or the entire head is shaved, a "kákul," or long thin lock, being sometimes left, often 2 feet long, from the middle of the crown. This is to enable the prophet Muhammad to draw up the believer into paradise. The lower orders generally have the hair over the temporal bone long, and brought in two long locks turning backwards behind the ear, termed "zúlf"; the beaux and youths are constantly twisting and combing these. The rest of the head is shaven. Long hair, however, is going out of fashion in Persia, and the more civilized affect the cropped hair worn by Europeans, and even have a parting in it. The chin is never shaved, save by "beauty men," or "kashangs," though often clipped, while the moustache is usually left long. At forty a man generally lets his beard grow its full length, and cherishes it much; part of a Persian's religious exercises is the combing of his beard. Socks, knitted principally at Ispahan, are worn; they are only about 2 inches long in the leg. The rich, however, wear them longer. They are of white cotton in summer and coloured worsted in winter. Villagers only wear socks on state occasions. Shoes are of many patterns. The "úrússi," or Russian shoe, is the most common; next, the "kafsh" or slipper of various kinds. The heel is folded down and remains so. The priests wear a peculiar heavy shoe, with an ivory or wooden lining at the heel. Green shoes of shagreen are common at Ispahan. Blacking is unknown to Persians generally. Boots are only used by horsemen, and are then worn much too large for ease. Those worn by courtiers often come up the thigh. With boots are worn "shalwars," or baggy riding breeches, very loose, and tied by a string at the ankle; a sort of kilt is worn by courtiers. Pocket-handkerchiefs are seldom used, save by the rich or the Tehranis. Most Persians wear a "shab kuláh," or night hat, a loose baggy cap of shawl or quilted material, often embroidered by the ladies.

Arms are usually carried only by tribesmen. The natives of the south of Persia and servants carry a "kammah," or dirk. The soldiery, on or off duty, always carry one of these or their side-arms, sometimes both. They hack but never thrust with them. On the road the carrying of weapons is necessary.

The costume of the women has undergone considerable change in the last century. It is now, when carried to the extreme of fashion, highly indecent and must be very uncomfortable. The garment doing duty as a chemise is called a "piráhan"; it is, with the lower orders, of white or blue calico, and comes down to the middle of the thigh, leaving the leg nude. Among the upper classes it is frequently of silk. At Shiráz it is often of fine cotton, and elaborately ornamented with black embroidery. With the rich it is often of gauze, and much embroidered with gold thread, pearls, &c. The head is usually covered with a "chár-kadd," or large square of embroidered silk or cotton, folded so as to display the corners and fastened under the chin by a brooch. It is often of considerable value, being of Kashmir shawl, embroidered gauze, &c. "jika," a jewelled feather-like ornament, is often worn at the side of the head, while the front hair, cut to a level with the mouth, is brought up in love-locks on either cheek. Beneath the "chár-kadd" is generally a small kerchief of dark material, only the edge of which is visible. The ends of the "chár-kadd" cover the shoulders, but the gauze "piráhan" is quite transparent. A profusion of jewellery is worn of the most solid description, none hollow; silver is worn only by the very poor, coral only by negroesses. Necklaces and bracelets are much affected, and chains with scent-caskets attached, while the arms are covered with clanking glass bangles called "alangú," some twenty even of these being on one arm. Jewelled "bázubands," containing talismans, are often worn on the upper arm, while among the lower orders and south Persian or Arab women nose-rings are not uncommon, and bangles or anklets of beads.

The face on important occasions is usually much painted, save by young ladies in the heyday of beauty. The colour is very freely applied, the cheeks being as much reddened as a clown's, and the neck smeared with white, while the eyelashes are marked round with "kuhl." This is supposed to be beneficial to the eyes, and almost every woman uses it. The eyebrows are widened and painted till they appear to meet, while sham moles or stars are painted on the chin and cheek; even spangles are stuck at times on the chin and forehead. Tattooing is common among the poor and in villages, and is seen among the upper classes. The hair, though generally hidden by the "chár-kadd," is at times exposed and plaited into innumerable little tails of great length, while a coquettish little skull-cap of embroidery, or shawl, or coloured silk is worn. False hair is common. The Persian ladies' hair is very luxuriant, and never cut; it is nearly always dyed red with henna, or with indigo

¹ Dr. Wills's instructive volume again supplies this information.

to a blue-black tinge; it is naturally a glossy black. Fair hair is not esteemed. Blue eyes are not uncommon, but brown ones are the rule. A full-moon face is much admired, and a dark complexion termed "namak" (salt) is the highest native idea of beauty. Most Persian women are small, with tiny feet and hands. The figure is always lost after maternity, and no support of any kind is worn.

A very short jacket, of gay colour, quite open in front, having tight sleeves with many metal buttons, is usually worn in summer, and a lined outer coat in cold weather. In winter a pair of very short white cotton socks are used, and tiny slippers with a high heel; in summer in the house ladies go often barefoot. The rest of the costume is composed of the "tumbūn" or "shalwār," short skirts of great width, held by a running string,—the outer one being usually of silk, velvet, or Kashmir shawl, often trimmed with gold lace, or, among the poor, of loud-patterned chintz or print. Beneath are innumerable other garments of the same shape, varying in texture from silk and satin to print. The whole is very short, among the women of fashion extending only to the thigh. In winter an over-mantle like the "kulājah," or coat of the man, with short sleeves, lined and trimmed with furs, is worn. Leg-coverings are now being introduced. In ancient days the Persian ladies always wore them, as may be seen by the pictures in the South Kensington Museum. Then the two embroidered legs, now so fashionable as Persian embroideries ("nakoh"), occupied a girl from childhood to marriage in making; they are *all sewing* in elaborate patterns of great beauty, worked on muslin in silk. The outdoor costume of the Persian women is quite another thing. Enveloped in a huge blue sheet, with a yard of linen as a veil perforated for two inches square with minute holes, the feet thrust into two huge bags of coloured stuff, a wife is perfectly unrecognizable, even by her husband, when out of doors. The dress of all is the same and, save in quality or costliness, the effect is similar.

As for the children, they are always when infants swaddled; when they can walk they are dressed as little men and women, and with the dress they generally ape the manners. It is a strange custom with the Persian ladies to dress little girls as boys, and little boys as girls, till they reach the age of seven or eight years; this is often done for fun, or on account of some vow,—oftener to avert the evil eye.

A summary of personal impressions of Persia may serve to convey a tolerably correct idea of the country, without the necessity of serious study or the aid of science and statistics. The reader is asked to suppose a tableland dropping to the Caspian Sea for nearly one-third of its northern frontier, and to the Persian Gulf for its southern limit. The lowlands, naturally, are the coast-tracts. In the north these are covered with forest, and the climate there is damp, feverish, relaxing; in the south they are dry and barren, and the winds are hot and violent, yet a relief to the scorching summer atmosphere. In the central highlands (that is, Persia generally) there are few rivers, and the country is either composed of parallel mountain-ranges and broad intervening plains, or of irregular mountain-masses with fertile valleys, basins, and ravines. One plain on the last is of exceptionally large extent, and is called the Salt Desert of Khurāsān. The theory that this was once a sea is supported by the circumstance that at one of its extreme edges is the village of Yūnsi, so called because the prophet Jonah (Yūnas) is locally believed to have been cast up there by the whale. For irrigation the plains and valleys depend on the mountains, and at the base of these are "kanāts," or underground canals, with watercourses on the surface. Yet where rain and snow fail during the year there is scarcity of water, and where both are wanting there is always distress and sometimes famine. The valleys and ravines are more fertile than the plains, affording often bright, picturesque, and grateful prospects, while the latter are for the most part barren and sandy wastes, scored or streaked, as it were, rather than ornamented with patches of green oases. Forests are rare and, except in Gilan, not dense; numerous gardens are commonly found in the neighbourhood of large towns, not cared for as in Europe, yet pleasant in their wildness; and there are many beautiful trees usually also near the centres of population. Persian cities are not like cities in Europe. The passing stranger sees no street or house in any of them at all comparable to a respectable street or building, as

England, France, or Germany rate structural respectability. Blank mud-walls and narrow ill-paved thoroughfares are the rule; the windowed or terraced front of a Persian house is for the inner court or inner precincts of the abode, and not for the world without. Some mosques are handsome, some caravansarās solid, some bazaars highly creditable to the designer and builder; but everything is irregular, nothing is permanent, and architectural ruin blends with architectural revival in the midst of dirt, discomfort, and a total disregard of municipal method. Even Constantinople and Cairo cannot bear the ordeal of close inspection. Beautiful and attractive as they may be from without—and the first has a charm beyond description, while the second is always interesting in spite of her barbarous boulevard—they are palpably deficient in completeness within; and yet Tehran, Baghdād, Isfahan, Tabriz, Mashhad, Shirāz are far behind them in civilized construction and order.

Sources.—Independently of original sources, information has been obtained from official and parliamentary records, to which access was kindly facilitated under authority; from *Eastern Persia*, 2 vols. (1876); and various books of travel by authors already named. The writer has also to express his thanks to General Schindler, in the service of the shāh, to Mirza Hasan 'Alī Khān, attaché to the Russo-Afghan boundary commission; to Colonel Bateman-Champain, R.E., Mr W. T. Blanford, Mr Andrews (of the Indo-European telegraph), and others, who have more or less favoured him with special information, written or oral.

SECTION II.—HISTORY.

Oriental history, as told by Oriental historians, is for the majority of readers in Europe a study of little attraction. Its genealogies and oft-repeated names are wearisome; its stories of battle, murder, and rapine are monotonous and cast in one mould; the mind cannot readily impart life to the dry bones of the more prominent *dramatis personæ* by conceiving for them any flesh-and-blood individuality. The court-chronicler of an Eastern potentate writes to order, and in accordance with a precedent which fetters style and expression; and even the painter of state-portraits strives rather to turn out a conventional and model monarch than the likeness of an original human being. In the palace of Kirich, near Tehran, is a picture of Fath 'Alī Shāh and his sons. There may be a certain waxwork beauty in some of the faces, but they give no more signs of innate character or mental idiosyncrasy than do the kings and knaves of a pack of cards.

The Timurides in these respects were exceptionally fortunate. Timūr himself, their great progenitor, though not the distinct figure of an English king as delineated by Macaulay, has been handed down to us in some kind of personality in the history called *Ẓafarnāma*,¹ in his *Malfūzāt* or utterances, and in the *Tuzūkāt* or institutes.² There are, moreover, portraits of him in existence which are professed likenesses. Bābar, Akbar, and Jahāngīr were either their own chroniclers or had comparatively competent men to write for them; and, to illustrate the period in which they lived, we obtain—in addition to records of events—biography, memoirs, and something also of the current sayings, writings, and doings. But the reigns of these three monarchs rather concern the annals of India than of Persia, whereas Timūr has so much to do with the latter that a brief retrospect of the career of that conqueror and his immediate descendants as it affected the countries generally south of the Caspian will be an appropriate opening to the present history.

¹ Unfortunately, perhaps, there are two histories bearing this title. In the one, as Sir William Jones explains, "the Tartarian conqueror is represented as a liberal, benevolent, and illustrious prince"; in the other he is "as deformed as impious, of a low birth and detestable principles." The authenticity of the *Malfūzāt* is disputed.

² Both these last terms, however, are indifferently applied to the writings of Timūr. *Tuzūk* is the passive participle of *tuzmak*, "to arrange," hence *tuzūkāt*, "arrangement."

The Timurides and Türkmans (1405-1499).—Tímúr died in 1405, when in the seventieth year of his age and about to enter upon a new war,—an invasion of China. Besides exercising sovereignty over Transoxiana and those vast regions more or less absorbed in Asiatic Russia of the 19th century, inclusive of the Caucasus, Astrakhan, and the lower Volga, and overrunning Mesopotamia, Syria, Asia Minor, Afghanistan, and India, he had at this time left his indelible mark upon the chief cities and provinces of Persia. Khurásan and Mazandaran had submitted to him in 1381, Adarbajian had shortly after followed their example, and Ispahan was seized in 1387. If the chroniclers are to be trusted, the occupation of this place was accompanied by the slaughter of 70,000 inhabitants,—a number in excess of its whole population as officially estimated in 1868. From Ispahan he passed on to Shíráz, and thence returned in triumph to his own capital of Samarkand. Five years later his cruel hand was stretched out to subdue a formidable resistance in Mazandaran, and later still he was again at Shíráz, having effected the subjugation of Lúristan and other provinces in the west. It may be said that from north to south, or from Astrábád to Hormuz, the whole country had been brought within his dominion.

Tímúr's
accession—
Ta.

The third son of Tímúr, Míran Sháh, had ruled over part of Persia in his father's lifetime; but he was said to be insane, and his incapacity for government had caused the loss of Baghdád and revolt in other provinces. His claim to succession had been put aside by Tímúr in favour of Pír Muhammad, the son of a deceased son, but Khalil Sháh, a son of the discarded prince, entered the lists against the nominee and won the day. The reign of this chief, however, was not of any duration. His lavish waste of time and treasure upon a fascinating mistress named Shádu 'l-Mulk, the "delight of the kingdom," soon brought about his ruin and deposition, and in 1408 he gave way to Sháh Rukh, who, with the exception of Míran Sháh, was the only surviving son of Tímúr. In fact the uncle and nephew changed places,—the one quitting his government of Khurásan to take possession of the Central-Asian throne, the other consenting to become governor of the vacated Persian province and abandon the cares of the empire at Samarkand. In the following year Khalil Sháh died; and the story goes that on his death Shádu 'l-Mulk stabbed herself and was buried in the same tomb with her royal lover at Rhé, one of the towns which his grandfather had passed through and partly destroyed.

Sháh Rukh, the fourth son of Tímúr, reigned for thirty-eight years, and appears to have been a brave, generous, and enlightened monarch. He removed his capital from Samarkand to Herat, of which place he rebuilt the citadel, restoring and improving the town. Merv also profited from his attention to its material interests. Sir John Malcolm speaks of the splendour of his court and of his encouragement of men of science and learning. He sent an embassy to China; and an English version of the travels to India of one of his emissaries, 'Abdu 'r-Razzák, is to be found in the volumes of the Hakluyt Society. As regards his Persian possessions, he had some trouble in the north-west, where the Türkmans of Asia Minor, known as the Kára Koiyún,¹ or "Black Sheep," led by Kára Yúsuf² and his sons Iskandar and Jahan Sháh, had advanced upon Tabriz, the capital of Adarbajian, a province in which they had supplanted the settlers of Halaku, called, after him, 'Ilkhání. The distance from Herat—supposing that city to represent

the centre of imperial power—was favourable to intrigue and revolt in these parts. On the death of Sháh Rukh in 1446 he was succeeded by his son Ulugh Bey, whose taste for scientific pursuits and active patronage of scientific men are practically demonstrated in the astronomical tables bearing his name, quoted by European writers when determining the latitude of places in Persia. He was, moreover, himself a poet and patron of polite literature, and built a college as well as an observatory at Samarkand. On the other hand, there is no evidence to show that he did much to consolidate his grandfather's conquests south of the Caspian. Ulugh Bey was put to death by his son 'Abdu 'l-Latif, who, six months later, was in his turn slain by his own soldiers. Bábar—not the illustrious founder of the Mughal dynasty in India, but an elder member of the same house—next obtained possession of the sovereign power, and established himself in the government of Khurásan and the neighbouring countries. He did not, however, achieve any special reputation, and died after a short rule, from habitual indulgence in intemperate habits,—an abuse which he had vainly striven to check by the registry of a solemn vow. After him Abú Sa'id, grandson of Míran Sháh, and once governor of Fárs, became a candidate for empire, and was to a great extent successful. This prince allied himself with the Uzbek Tatars, seized upon Búkhára, entered Khurásan, and waged war upon the Türkman tribe aforesaid, which, since the invasion of Adarbajian, had, under Jahan Sháh, overrun 'Irák, Fárs, and Karman, and pillaged Herat. But he was eventually taken prisoner by Uzun Hasan, and killed in 1468.

It is difficult to assign dates to the few events recorded in Persian history for the eighteen years following the death of 'Abdu 'l-Latif; and, were it not for the happy intervention of chance European missions, the same difficulty would be felt in dealing with the period after the death of Abú Sa'id up to the accession of Isma'il Shífí in 1499. Nor can the chain of events within the range of Persia proper be connected with certainty for the period specified by the aid of native annals or histories. Sultan Ahmad, eldest son of Abú Sa'id, reigned in Búkhára; his brother, 'Umar Shaikh, in Farghána; but the son of the latter, the great Bábar, was driven by the Uzbeks to Kabul (Cabul) and India. More to the purpose is it that Sultan Husaín Mirza, great-grandson of 'Umar Shaikh, son of Tímúr, reigned in Herat from 1487 to 1506. His siege and capture of the fort of that city are incidentally told in Bábar's *Commentaries*, where he is described as an old and experienced soldier. He was a patron of learned men, and as such his reign is remarkable for many brilliant names inscribed as visitors to his court. Among others are those of the historians Mírkhund and Khúndamír, and the poets Jámi and Hátíf. But at no time could the control exercised by this scion of a far-famed stock have extended over central and western Persia. The nearest approach to a sovereignty in those parts on the death of Abú Sa'id is that of Uzun Hasan just mentioned, who achieved his greatness by individual prowess and the force of circumstances. He was the leader of the Ak Koiyún, or "White Sheep" Türkmans, and conqueror of the "Black Sheep," whose chief, Jahan Sháh, he defeated and slew. Between the two tribes there had long been a deadly feud. Both were composed of settlers in Asia Minor, the "Black Sheep" having consolidated their power at Van, the "White" at Diarbekir.

Sir John Malcolm states that at the death of Abú Sa'id, Sultan Husaín Mirza "made himself master of the empire," and, a little later, that "Uzun Hasan, after he had made himself master of Persia, turned his arms in the direction of Turkey"; but the reader is left to infer

¹ They were commonly called Kára Koiyún-lú and the "White Sheep" Türkmans Ak Koiyún-lú, the affix "lú" signifying possession, i.e., possession of a standard bearing the image of a black or white sheep.

² According to Erskine, this chief killed Míran Sháh, whose dwelling-place was Tabriz.

for himself what was the real "empire" of Husáin Mirza, and what the limit of the "Persia" of Uzun Hasan. The second could not well be included in the first, because the Türkmenians were in possession of the greater part of the Persian plateau, as understood in modern geography, while the "sultan" was luxuriating in Herat, to which Khurásan belonged. It may be assumed as a broad fact that an empire like that acquired by Tímúr could not long be maintained by his descendants in its integrity, even though separate kingdoms or sovereignties were formed in its more important divisions. The retention of particular provinces, or groups of provinces, must have depended not only on the loyalty but on the capability of particular rulers and their subordinate governors; and it was manifestly impossible for an emperor at Samarkand or Herat to know what revolutions were taking effect at Baghdád, Tabriz, or similarly remote places, inland or on the seaboard, which passed away from the original "empire" through the weakness or treachery of unfit agents, even when these were lineal descendants of its distinguished founder.

The Turkish adjective *uzun*, *اوزون* "long," applied to Hasan, the Türkman monarch of Persia (called also by the Arabs *Hasanu 't-Tawíl*), is precisely the qualifying Persian word *دراز* used in the compound designation of Artaxerxes Longimanus; and Malcolm quotes the statement of a Venetian envoy in evidence that Uzun Hasan was "a tall thin man, of a very open and engaging countenance." This reference, and a further notice in Markham's more recent history, supply the clue to a store of valuable information on the place and period made generally available by the publications of the Hakluyt Society. The narratives of Caterino Zeno, Barbaro, and Contarini, envoys from Venice to the court of Uzun Hasan, are in this respect especially interesting, and throw much light on the personality of one who was a genuine sháh of Iran. Zeno was sent in 1471 to incite this warlike ruler against the Ottoman sultan, and succeeded so far in his mission as to bring the two powers into open warfare. That the result was disastrous to the sháh is not surprising, but the whole affair seems to hold a comparatively unimportant place in the annals of Turkey.

Uzun Hasan had married Despina (Gr. *Δέσποινα*), daughter of the emperor of Trebizond, Calo Johannes of the house of the Comneni; and Zeno's wife was niece to this Christian princess. The relationship naturally strengthened the envoy's position at the court, and he was permitted to visit the queen in the name of the republic which he represented. Barbaro and Contarini met at Ispahan in 1474, and there paid their respects to the sháh together. The description of the royal residence—"in the middle of a field, through which a river flowed, in a very delightful locality"—recalls the palaces in that city, such as the Haft Dast, where strangers of distinction are lodged in the present day. Moreover, the continual and excessive instalments of "good confections" brought to satisfy the travellers' appetites show that the lavish hospitality of the local authorities is a time-honoured institution. Kúm and Tauris or Tabriz (then the capital) were also visited by the Italian envoys following in the royal suite; and the incidental notice of these cities, added to Contarini's formal statement that "the extensive country of Ussuncassan [*sic*] is bounded by the Ottoman empire and by Caramania," and that Siras (Shíráz) is comprehended in it, proves that at least Adarbáijan, 'Irák, and the main part of the provinces to the south, inclusive of Fárs, were within the dominions of the reigning monarch.

There is good reason to suppose that Jahan Sháh, the Black Sheep Türkman, before his defeat by Uzun Hasan, had set up the standard of royalty; and Zeno, at the

outset of his travels, calls him "king of Persia"¹ in 1450. 1468-149 Chardin alludes to him in the same sense; but, even admitting the validity of his precarious tenure, the limits of his sovereignty were too confined to warrant more than casual mention of his name in an historical summary.

Hasan the Long is a far more prominent figure, and has hardly received justice at the hands of the historian. Indeed, his identity seems to have been lost in the various modes of spelling his name adopted by the older chroniclers, who call him indiscriminately² Alymbeius, Asembeius, Asembec, Assimbeo, or Ussan Cassano. He is said to have earned the character of a wise and valiant monarch, to have reigned eleven years, to have lived to the age of seventy, and, on his death in 1477 or (according to Krusinski and Zeno) 1478, to have been succeeded on the throne of Persia by his son Ya'kúb. This prince, who had slain an elder brother, died by poison, after a reign of seven years. The dose was offered to him by his wife, who had been unfaithful to him and sought to set her paramour on his throne. Krusinski thus tells the story.

"Notwithstanding the assurance she put on at the very moment she was acting the crime, the king her husband fancying he saw an air of confusion in her countenance, had a suspicion of her, and required her to drink first. As she could not get off of it without condemning herself, she swallowed the poison with an affected intrepidity; which deceived the king, and so encouraged him that after he had drunk of it himself, he commended it to the lips of the prince his son, then with him, who was eight years of age. The poison was so quick, that all three died of it that night in the year 1485."

Writers differ as to the succession to Ya'kúb. Zeno's *Anarchy* account is that a son named Allamur (called also Alamut, Alvante, El-wand, and Alwung Bey) was the next king, who, "besides Persia, possessed Diarbekir and part of greater Armenia near the Euphrates." On the other hand, Krusinski states that, Ya'kúb dying childless, his relative Julaver, one of the grandees of the kingdom, seized the throne and held possession of it for three years. Baisingar, it is added, succeeded him in 1488 and reigned till 1490, when a young nobleman named Rustan (Rustam?) obtained the sovereign power and exercised it for seven years. This account is confirmed by Angiolello, a traveller who followed his countrymen Barbaro and Contarini to Persia; and from the two authorities combined may be gathered the further narration of the murder of Rustam and usurpation of the throne by a certain Ahmad, whose death, under torture, six months afterwards, made way for Alamut, the young son of Hasan. These discrepancies can be reconciled on reference to yet another record bound up with the narratives of the four Italians aforesaid, and of much the same period. In the *Travels of a Merchant in Persia* the story of Ya'kúb's death is supplemented by the statement that "the great lords, hearing of their king's decease, had quarrels among themselves, so that for five or six years all Persia was in a state of civil war, first one and then another of the nobles becoming sultan. At last a youth named Alamut, aged fourteen years, was raised to the throne, which he held till the succession of Shaikh Ismail." Who this young man was, is not specified; but other writers call Alamut and his brother Murád the sons of Ya'kúb, as though the relationship were unquestioned.

Now little is known, save incidentally, of Julaver or Rustam; but Baisingar is the name of a nephew of 'Umar Shaikh, king of Farghána (Ferghana) and contemporary of Uzun Hasan. There was no doubt much anarchy and confusion in the interval between the death of Ya'kúb and the restoration, for two years, of the dynasty of the White Sheep. But the tender age of Alamut would, even in civilized countries, have necessitated a regency; and it may be assumed that he was the next legitimate and more

¹ See also Ramusio's preface.

² Knolles, Purchas, Zeno.

generally recognized sovereign. Markham, in designating this prince the last of his house, states that he was dethroned by the renowned founder of the Šafawī dynasty. This event brings us to one of the most interesting periods of Persian history, any account of which must be defective without a prefatory sketch of Isma'īl Šūfī.

The Šūfī or Šafawī Dynasty (1499-1736).—Shaikh Šaifu 'd-Dīn Izhāk¹—lineally descended from Mūsá, the seventh imām—was a resident at Ardabil, south-west of the Caspian, some time during the 14th century. It is said that his reputation for sanctity attracted the attention of Tīmūr, who sought him out in his abode, and was so charmed by the visit that he released, at the holy man's request, a number of captives of Turkish origin, or, as some affirm, Georgians, taken in the wars with Baiyazid, who had been probably reserved for some more cruel end. The act ensured to the shaikh the constant devotion and gratitude of these men,—a feeling which was loyally maintained by their descendants for the members of his family in successive generations. Morier's description of the mausoleum erected to the memory of Shaikh Šūfī in Ardabil enables the reader to form some idea of the extraordinary veneration in which he was held. Among the offerings on the tomb,² which was covered with brocades and shawls, bunches of feathers, ostrich eggs, and other ornaments, was a golden ewer set with precious stones, said to have been presented by the Indian emperor Humáiyūn.

His son Sadru 'd-Dīn and grandson Kwájah 'Alī (who visited Mecca and died at Jerusalem) retained the high reputation of their pious predecessor. Janáid, a grandson of the last, and not a whit less prominent in the pages of history, married a sister of Uzun Ḥasan, and by her had a son named Shaikh Haidar, who married his cousin Martha, daughter of Uzun Ḥasan and Queen Despina. Three sons were the issue of this marriage, Sultan 'Alī, Ibráhīm Mirza, and the youngest, Isma'īl, the date of whose birth is put down as 1480 for reasons which will appear hereafter. So great was the influence of Shaikh Haidar, and so earnestly did he carry out the principles of conduct which had characterized his family for five generations, that his name has become, as it were, inseparable from the dynasty of his son Isma'īl; and the term "Haidari" (leonine) is applied by many persons to indicate generally the Šafawīs of Persia. As to the nature of his teaching, and the peculiar tenets professed, this is hardly the place for their discussion; but it may be broadly stated that the outcome was a division of Muhammadanism vitally momentous to the world of Islām. The Persian mind was peculiarly adapted to receive the form of religion prepared for it by the philosophers of Ardabil.

The doctrines presented were dreamy and mystic; they rejected the infallibility of human wisdom, and threw suspicion on the order and arrangement of human orthodoxy. They breathed in harmony with the feelings of a people who, partly in the Athenian spirit and wholly with Athenian perversity, were ever ready "to tell or to hear some new thing." There was free scope given for the indulgence of that poetical imagination which revels in revolution and chafes at prescriptive bondage. As Malcolm truly and happily remarks, "the natives of Persia are enthusiastically devoted to poetry; the meanest artisan of the principal cities of that kingdom can read or repeat some of the finest passages from their most admired

writers; and even the rude and unlettered soldier leaves his tent to listen with rapture to the strain of the minstrel who sings a mystic song of divine love, or recites the tale of a battle of his forefathers." And he adds, "the very essence of Šūfī-ism is poetry . . . the Masnavi . . . the works of the celebrated Jámī . . . the book of moral lessons of the eloquent Sa'dī, and the lyric and mystic odes of Háfiz . . . to them they (the Šūfīs) continually refer; and the gravest writers who have defended their doctrine take their proofs from the pages of these and other poets whom they deem to have been inspired by their holy theme."

Those authorities who maintain that Ya'qúb Sháh left no son to succeed him consider valid the claim to the vacant throne of Shaikh Haidar Šūfī. At any rate, he could not be otherwise than formidable to a usurper such as Rustam, both from relationship to the deceased monarch and position as one of the most noted of Šūfī teachers. Purchas says that Ya'qúb himself, "jealous of the multitude of Aidar's disciples and the greatness of his fame, caused him to be secretly murdered"; but Krusinski attributes the act to Rustam a few years later. Zeno, the anonymous merchant, and Angioletto affirm that the devotee was defeated and killed in battle,—the first making his conqueror to be Alamut, the second a general of Alamut's, and the third an officer sent by Rustam named Sulaiman Bey. Malcolm, following the *Zubdatu 't-tawárikh*, relates that Shaikh Haidar was vanquished and slain by the governor of Shirwan. The subsequent statement that his son, Sultan 'Alī, was seized, in company with two younger brothers, by Ya'qúb, "one of the descendants of their grandfather Uzun Ḥasan, who, *jealous of the numerous disciples that resorted to Ardabil*, confined them to the hill fort of Istakhr in Fars," seems to indicate a second interpretation of the passage just extracted from Purchas, and that there is confusion of persons and incident somewhere. One of the sons here alluded to was Isma'īl, whom Malcolm makes to have been only seven years of age when he fled to Gílan in 1492. Zeno states that he was then thirteen, which is much more probable,³ and the several data available for reference are in favour of this supposition.

The life of the young Šūfī from this period to his assumption of royalty in 1499 was full of stirring adventure; and his career as Isma'īl I. was a brilliant one for the annals of Persia. According to Zeno, who seems to have carefully recorded the events of the time, he left his temporary home on an island of Lake Van before he was eighteen, and, passing into Karabagh,⁴ between the Arras and Kur, turned in a south-easterly direction into Gílan. Here he was enabled, through the assistance of a friend of his father, to raise a small force, with which to take possession of Bákú on the Caspian, and thence to march upon Shumakhi in Shirwan, a town abandoned to him without a struggle. Hearing, however, that Alamut was advancing to meet him, he was compelled to seek new levies from among the Jengian Christians and others. In this he was quite successful. Finding himself at the head of an army of 16,000 men, he thoroughly routed his opponents, and, having cleared the way before him, marched straight upon Tabriz, which at once surrendered. He was soon after proclaimed sháh of Persia (1499), under the designation which marked the family school of thought.

Alamut had taken refuge at Diarbekir; but his brother Murád, at the head of an army strengthened by Turkish auxiliaries, was still in the field with the object of contesting the paternal crown. Isma'īl lost no time in moving against him, and won a new victory on the plains of Tabriz. Murád fled with a small remnant of his soldiers to Diar-

¹ According to Langlès, the annotator of Chardin, his real designation was Abū 'l-Faṭḥ Izhāk, the Shaikh Šaifu 'l-Hakk wu 'd-Dīn or 'pure one of truth and religion."

² Langlès finds 1334 to be the year of his death. This is impossible if he was contemporary with Tīmūr, who was born in 1336. Malcolm's opinion, derived from the *Zubdatu 't-tawárikh*, that the conqueror's visit was paid to Sadru 'd-Dīn, is, however, the more credible theory.

³ So thinks the editor and annotator of the *Italian Travels in Persia*, Mr Charles Grey.

⁴ Possibly Kára-dágh, as being the more direct road.

bekir, the rallying-point of the White Sheep Türkmans. One authority (Zeno) states that in the following year Isma'íl entered upon a new campaign in Kurdistan and Asia Minor, but that he returned to Tabriz without accomplishing his object, having been harassed by the tactics of Ala'u'd-Daulah, a beylarbey, or governor in Armenia and parts of Syria. Another, ignoring these movements, says that he marched against Murád Khán in 'Irák-'Ajmi ('Irák-'Adjemi) and Shíráz. This last account is extremely probable, and would show that the young Turkman had wished to make one grand effort to save Ispahan and Shíráz (with Kazvin and the neighbouring country), these being, after the capital Tabriz, the most important cities of Uzun Hasan's Persia. His men, however, apparently dismayed at the growing prestige of the enemy, did not support him, and he was defeated and put to flight. One writer says that he was slain in battle; and, since he appears to have made no further attempt on Persia, the statement is perhaps correct. There is similar evidence of the death of Alamut, who, it is alleged, was treacherously handed over to be killed by the sháh's own hands.

Isma'íl returned again to Tabriz (1501) "and caused great rejoicings to be made on account of his victory." In 1503 he had added to his conquests Baghdád, Mosul, and Jazirah on the Tigris. The next year he was called to the province of Gilan to chastise a refractory ruler. Having accomplished his end, he came back to his capital and remained there in comparative quiet till 1507.¹ Malcolm's dates are somewhat at variance with the above, for he infers that Baghdád was subdued in that particular year; but the facts remain. All writers seem to agree that in 1508 the king's attention was drawn to an invasion of Khurásan by Shaibáni, or Sháhi Beg, the Uzbek, a descendant of Jenghiz and the most formidable opponent of Bábar, from whom he had, seven years before, wrested the city of Samarkand, and whom he had driven from Turkestan to Kabul. Since these exploits he had obtained great successes in Tashkand, Farghána, Hissar, Kunduz, and Khwárizm (Kharczm), and, at the time referred to, had left Samarkand intent upon mischief south and west of the Oxus, had passed the Múrháb, and had reached Sarakhs. Isma'íl encamped on this occasion at Ispahan, and there concentrated the bulk of his army,—strengthening his northern (and probably north-eastern) frontier with large bodies of cavalry. Zeno's statement that the royal troops were kept for the whole year in a state of suspense and preparation for encountering their powerful adversaries derives a colour of truth from the circumstance that, before the Uzbek army of invasion could have quite overrun the Khurásan of Husáin Mirza, it found occupation to the eastward in Herat and Kandahar; and it must have been represented, even in Mashhad, Nishápúr, Astrábád, and Turshiz—all named as the scenes of conflict—rather by lieutenants than by the leader in person. Such diversion from any direct invasion of his own territories may have caused the sháh to maintain an attitude of simple watchfulness. In 1510, when Shaibáni had invaded Khurásan the second time, and in person, and had entered the fine province of Mazandaran—then in the possession of an independent chief—it was discovered that his troops, in the wantonness of success, had ravaged the Persian province of Karman. Sháh Isma'íl had asked for redress, referring to the land encroached on as "hereditary"; and Shaibáni had replied that he did not understand on what was founded the claim "to inherit." Mutual taunt and recrimination followed; and eventually the Persian troops were put in movement, and the Uzbeks, having been divided into small detachments scattered over the country, fell back and retreated to Herat. Their leader, however,

¹ Angiolello.

not being in a position to oppose the sháh in the field, repaired to Merv, where he could obtain sufficient reinforcements, or whence he could, if hard pushed, retire across the Oxus. Isma'íl quickly followed him there, and enticed him out to battle by the use of taunt and reproach at his remaining within walls. Shaibáni was defeated and fled, but was overtaken in his flight, surrounded, and put to the sword, together with numerous relatives and companions (see *Mongols*, vol. xvi. p. 749).

The next remarkable event in Isma'íl's reign is his war with Sultan Salim I. Its origin may be traced to the Ottoman emperor's hatred and persecution of all heretical Moslems in his dominions, and the sháh's anger at the fanaticism which had urged him to the slaughter of 40,000 Turks suspected to have thrown off the orthodox Sunni doctrines. The declaration of war sent by Salim in the form of a letter is one of the most singular of documents, and breathes the true spirit of the age: "I, the glorious Sultan . . . address myself to thee, Amír Isma'íl, chief of the Persian troops, who art like in tyranny to Zohak and Afrasiab, and art destined to perish like the last Dara." Words such as these might well provoke a less haughty potentate than the Süffí; and, when to them was added the accusation of iniquity, perjury, blasphemy, impiety, heresy, and schism, it is not surprising that the response was a ready resort to arms.² As a preliminary, however, to this decisive step Isma'íl replied to the sultan in a calm and dignified letter, denying the existence of a *casus belli*, expressing willingness to resume peaceful relations, and regretting the mode of address it had been thought fit to adopt towards himself; but he nullified the conciliatory passages by the ironical conclusion that the sultan's communication must have emanated from the brain of a secretary who had taken an overdose of narcotics,—a remark the significance of which was aggravated by the accompaniment of a box of opium, and the popular belief that Salim was addicted to the use of the drug.

The sultan's army advanced into Adarbaijan and western Persia through Tokat and Arzinjan. Isma'íl had at this time the greater number of his soldiers employed in his newly-conquered province of Khurásan, and was driven to raise new levies in Kurdistan to obtain a sufficient force to resist the invasion. It is asserted by some that his frontier then extended westward to Sivas, a city situated in a large high plain watered by the Kizil Irmak, and that thence to Khoi, 90 miles west of Tabriz, he followed the approved and often successful tactics of ravaging and retreating, so as to deprive his advancing enemy of supplies. There is good evidence to show that the Turkish janissaries were within an ace of open revolt, and that but for extraordinary firmness in dealing with them they would have abandoned their leader in his intended march upon Tabriz. In fine, at or near Khoi, the frontier-town of Adarbaijan, the battle (1514) was fought between the two rival monarchs, ending in the defeat of the Persians and the triumphant entry of Salim into their capital.

There are stirring accounts of that action and of the gallant deeds performed by Salim and Isma'íl, both personally engaged in it, as well as by their generals.³ Others maintain that Isma'íl was not present at all.⁴ It is tolerably

² Creasy's *History of the Ottoman Turks*.

³ Knolles, Malcolm, Creasy, Markham, &c.

⁴ Zeno. Angiolello says that "the Sophi monarch had left for Tauris [Tabriz] in order to assemble more troops." Krusinski infers much to the same effect, for he notes that "Selim came in person and took Tauris from Ismail, but at the noise of his approach was obliged to retreat with precipitation." The battle must thus have been fought and the victory gained when the sháh was himself absent. Yet Markham quotes a journal which thus records his feats of prowess: "It was in vain that the brave Sháh, with a blow of his sabre, severed a chain with which the Turkish guns were fastened together to resist the shock of the Persian cavalry."

certain that the Turks won the day by a better organization of the arms of the military service, superiority of numbers, and more especially the use of artillery. On the side of the Persians the force consisted of little more than cavalry.

Salim remained at Tabriz no more than eight days. Levying a contribution at that city of a large number of its skilled artisans, whom he sent off to Constantinople, he marched thence towards Karabagh with intent to fix his winter quarters in those parts and newly invade Persia in the spring, but the insubordination of his troops rendered necessary his speedy return to Turkey. His expedition, if not very glorious, had not been unproductive of visible fruits. Besides humbling the power of an arrogant enemy, he had conquered and annexed to his dominions the provinces of Diarbekir and Kurdistan.

From 1514 to 1524, although the hostile feeling between the two countries was very strong, there was no serious nor open warfare. Salim's attention was diverted from Persia to Egypt; Isma'il took advantage of the sultan's death in 1519 to overrun and subdue unfortunate Georgia, as Jahan Sháh of the "Black Sheep" had done before him; but Sulaiman had not won without cause his attribute of "great," and was too strong a successor to the imperial throne to admit of retaliatory invasion being carried out with impunity at the cost of Turkey.

Isma'il's
character.

In 1524 Isma'il died¹ at Ardabil when on a pilgrimage to the tomb of his father. "The Persians dwell with rapture on his character," writes Sir John Malcolm, for they deem him "not only the founder of a great dynasty, but the person to whom that faith in which they glory owes its establishment as a national religion. He is styled in their histories Shah Shian, or 'king of the Shiahs,' an appellation which marks the affection with which his memory is regarded. Though he may not be entitled to their extravagant praises, he certainly was an able and valiant monarch." And he quotes a note handed down by Purchas from a contemporary European traveller which reports of him thus. "His subjects deemed him a saint, and made use of his name in their prayers. Many disdained to wear armour when they fought under Ismail; and so enthusiastic were his soldiers in their new faith that they used to bare their breasts to their enemies and court death, exclaiming, 'Shiah! Shiah!' to mark the holy cause for which they fought."

The proposition has been already laid down that Oriental celebrities, whether heroes or tyrants, as depicted by native limners, bear commonly so strong a family resemblance one with another that the European reader is unable to discriminate between the Abbases and Akbars, the Tímúrs and the Nádírs; and it cannot be pleaded that Isma'il Sháh Súff is an exception to the rule. He is belauded and reviled according to the lights or prejudices of his historian. "Reputed one of the greatest and most famous kings that ever ruled in the East,"² he is at the same time charged with acts of the greatest cruelty and most flagrant vice.³ Purchas, apparently guided by the "Italian merchant" and Angiolello, has described him as "of faire countenance, of reasonable stature, thicke and large in the shoulder, shaven al but the mustaches; left-handed, and stronger than any of his nobles."

Sháh Tahmásp,⁴ the eldest of the four sons of Isma'il,

¹ Malcolm says 1523, Krusinski 1525; Angiolello heard of his death at Cairo in August 1524. Krusinski adds that he was forty-five years of age.

² See chaps. xiv. and xxii. of *Travels of a Merchant in Persia*, Hakluyt reprint, 1873.

³ Angiolello calls him "Shiachemes." As an instance of the absurd transliterating current in France as in England the word "Ach-tacon" may be mentioned. It is explained in Chardin's text to mean "les hôpitaux à Tauris: c'est-à-dire lieux où l'on fait profusion de vivres." Chardin's editor remarks, "La dernière partie de ce mot

succeeded to the throne on the death of his father.⁵ The principal occurrences in his reign, placed as nearly as possible in chronological order, were a renewal of war with the Uzbeks, who had again invaded Khurásan, and the overthrow of their army (1527); the recovery of Baghdád from a Kurdish usurper (1528); the settlement of an internal feud between Kizil-bash tribes (Shámlu and Tukúlu), contending for the custody of the royal person, by the slaughter of the more unruly of the disputants (1529); the rescue of Khurásan from a fresh irruption, and of Herat from a besieging army of Uzbeks (1530); a new invasion of the Ottomans, from which Persia was saved rather by the severity of her climate than by the prowess of her warriors (1533); the wresting of Baghdád from Persia by the emperor Sulaiman (1534); the king's youngest brother's rebellion and the actual seizure of Herat, necessitating the recovery of that city and a march to Kandahar (1536); the temporary loss of Kandahar in the following year (1537), when the governor ceded it to Prince Kamran, son of Bábar; the hospitable reception accorded to the Indian emperor Humáiyún (1543); the rebellion of the sháh's brother next in age, Ilkhás, who, by his alliance with the sultan, brought on a war with Turkey (1548);⁶ and finally a fresh expedition to Georgia, followed by a revengeful incursion which resulted in the enforced bondage of thousands of the inhabitants (1552).

Baiyazid, a son of the Turkish emperor, rebelled, and his army was beaten in 1559 by the imperial troops at with Turkey. Koniah in Asia Minor. He fled to Persia and took refuge with Sháh Tahmásp, who pledged himself to give him a permanent asylum. Sulaiman's demand, however, for extradition or execution was too stern and peremptory for refusal; the pledge was broken, and the prince was delivered up to the messengers sent to take him. Another account ignores the pledge and makes the surrender of the guest to have been caused by his own bad conduct. Whatever the motive, the act itself was highly appreciated by Sulaiman, and became the means of cementing a recently-concluded peace between the two monarchs, which theretofore, perhaps, had been more formal than real. Perhaps the domestic affliction of the emperor and the anarchy which in his later years had spread in his dominions had, however, more to do with the maintenance of tranquillity than any mere personal feeling. It is to be feared that at this time not only was there religious fanaticism at work to stir up the mutual hatred ever existing between Sunni and Sháh, but the intrigue of European courts was probably directed towards the maintenance of an hostility which deterred the sultan from aggressive operations north and west of Constantinople. "Tis only the Persian stands between us and ruin" is the reported saying of Busbecq, ambassador at Sulaiman's court on the part of Ferdinand of Austria; "the Turk would fain be upon us, but he keeps him back."

In 1561 Anthony Jenkinson arrived in Persia with

est méconnaissable, et je ne puis deviner quel mot Persan signifiait profusion a pu donner naissance à la corruption qu'on voit ici." In other words, the first syllable "ach" (Anglice *ash*) was understood in its common acceptance for "food" or "victuals"; but "tacon" was naturally a puzzler. The solution of the whole difficulty is, however, to be found in the Turco-Persian *خاسته* *khashtah khánah*, pronounced by Turks *hasta hona*, or more vulgarly *asta khon* and even to a French ear *ash-tacon*, a hospital, literally a sick-house. This word is undoubtedly current at Tabriz and throughout northern Persia.

⁵ The other brothers were Ilkhás, Bahrán, and Sâm Mirza, each having had his particular apanage assigned him.

⁶ Professor Cressy says that "Suliman led his armies against the Persians in several campaigns (1533, 1534, 1535, 1543, 1553, 1554), during which the Turks often suffered severely through the difficult nature of the countries traversed, as well as through the bravery and activity of the enemy." All the years given were in the reign of Tahmásp I.

a letter from Queen Elizabeth to the sháh. He was to treat with his majesty of "Trafique and Commerce for our English Marchants,"¹ but his reception was not encouraging, and led to no result of importance.

Tahmásp died in 1576, after a reign of about fifty-two years. He must have been some sixty-six years of age, having come to the throne at fourteen. Writers describe him as a robust man, of middle stature, wide-lipped, and of tawny complexion. His long reign was hardly a profitable or glorious one to Persia, especially in respect of the losses to Turkey. He was not wanting in soldierly qualities; but his virtues were rather negative than decided. While one writer acquits him of any remarkable vices, and even calls him prudent and generous, another taxes him with love of ease, avarice, and injustice. If it be true that he abandoned his old capital, Tabriz, for Kazvin because the former was too close to Ardabil, his birthplace, and reminded him too keenly of the mean condition of his grandfather, Shaikh Haidar, his *morale* must have been low indeed.²

The deceased sháh had a numerous progeny, and on his death his fifth son, Haidar Mirza, proclaimed himself king, supported in his pretensions by the Kizil-básh tribe of Ustájulú. Another tribe, the Afshár, insisted on the succession of the fourth son, Isma'il. Had it not been that there were two candidates in the field, the contention would have resembled that which arose shortly after Tahmásp's accession. As it was, the claim to guardianship of the royal person was put forward, but each tribe declared for its own particular nominee. Finally Isma'il, profiting from his brother's weak character and the intrigues set on foot against him, obtained his object, and was brought from a prison to receive the crown.

The reign of Isma'il II. was a short one,—less than two years. He was found dead in the house of a confectioner in Kazvin, having left the world either drunk, drugged, or poisoned. No steps were taken to verify the circumstances, for the event itself was a cause of general relief and joy. He has been represented as a tyrant of the worst type, but it is only right to observe that his youth and part of his manhood had been embittered by injustice and ill-treatment. A prisoner in a dreary fort for years, if his accession to power was marked by cruelties such as disgraced the name of Tiberius, he had, like Tiberius, been brutalized by a hard and continuous provocation.

He was succeeded by his eldest brother, Muhammad Mirza, otherwise called Muhammad Khudábanda, whose claim to sovereignty had been originally put aside on the ground of physical infirmity. A few words will dispose of this prince's career as a sovereign of Persia. Historians are divided as to his qualities, though he certainly failed to prove, in any shape, equal to the opportunity opened to him. He had the good sense to trust his state affairs almost wholly to an able minister; but he was cowardly enough to deliver up that minister into the hands of his enemies. His kingdom was distracted by intestine divisions and rebellion, and the foe appeared also from without. On the east his youngest son, 'Abbás, held possession of Khurásan; on the west the sultan's troops again entered Adarbáijan and took Tabriz. His eldest son, Hamza Mirza, nobly upheld his fortunes to the utmost of his power, reduced the rebel chieftains, and forced the Turks to make peace and retire; but he was stabbed to death by an assassin. On the news of his death reaching Khurásan, Murshid Kúlí Khán, leader of the Ustájulú Kizil-básh, who had made good in fight his claims to the guardianship of 'Abbás, at once conducted the young prince from that province to Kazvin, and occupied the royal city. The object was evident, and in accordance with the popular feeling. 'Abbás,

who had been proclaimed king by the nobles at Nishápúr some two or three years before this occurrence, may be said to have now undertaken in earnest the cares of sovereignty. His ill-starred father, at no time more than a nominal ruler, was at Shíráz, apparently deserted by soldiers and people. Malcolm infers that he died a natural death, but when³ or where is not stated. Alluding to him at this period, he writes, "He was never afterwards mentioned." The stories originated by Olearius that Hamza and a second son, Isma'il, each reigned a few months may refer to attempts on the part of the Kizil-básh chiefs to assert, for one or the other, a share of sovereign power, but do not seem to merit particular consideration.

Sháh 'Abbás, the Great, commenced his long and glorious reign (1586) by retracing his steps towards Khurásan, which had been invaded by the Uzbeks almost immediately after his departure thence with the Kizil-básh chief. They had besieged and taken Herat, killed the governor, plundered the town, and laid waste the surrounding country. 'Abbás advanced to Mashhad, the provincial capital and great resort of Persian pilgrims as the burial-place of Imám Riza, but owing to internal troubles he was compelled to return to Kazvin without going farther east. In his absence 'Abdul Munim Khán, the Uzbek commander, attacked the sacred city, obtained possession of it while the sháh lay helplessly ill at Tehran, and allowed his savage soldiers full licence to kill and plunder. The whole kingdom was perplexed, and 'Abbás had much work to restore confidence and tranquillity. But circumstances rendered impossible his immediate renewal of the Khurásan warfare. He was summoned to Shíráz to put down rebellion in Fárs; and, that being over, before he could give his individual attention to drive out the Uzbeks, he had to devise the best means of securing himself against Turkish inroads threatening from the west. He had been engaged in a war with Murád III. in Georgia. Peace was concluded between the two sovereigns in 1590; but the terms were unfavourable to Persia, who lost thereby Tabriz and one or more of the Caspian ports. A somewhat offensive stipulation was included in the treaty to the effect that Persians were not to curse any longer the first three khalifs, —a sort of privilege previously enjoyed by Shí'ahs as part and parcel of their religious faith.

In 1597 'Abbás renewed operations against the Uzbeks, and succeeded in recovering from them Herat and Khurásan. Eastward he extended his dominions to Balkh, and in the south his generals made the conquest of Bahrain (Bahrein), on the Arabian side of the Persian Gulf, and the territory and islands of the Persian seaboard, inclusive of the mountainous province of Lar. He strengthened his position in Khurásan by planting colonies of Kurdish horsemen on the frontier, or along what is called the "atak" or skirt of the Türkman mountains north of Persia. In 1601 the war with the Ottoman empire, which had been partially renewed prior to the death of Sultan Murád in 1595, with little success on the Turkish side, was now entered upon by 'Abbás with more vigour. Taking advantage of the weakness of his ancient enemy in the days of the poor voluptuary Muhammad III., he began rapidly to recover the provinces which Persia had lost in preceding reigns, and continued to reap his advantages in succeeding campaigns under Ahmad I., until under Othman II. a peace was signed restoring to Persia the boundaries which she had obtained under the first Isma'il. On the other side Kandahar, which Tahmásp's lieutenant had yielded to the Great Mughal, was recovered from that potentate in 1609. The following slightly abridged extract from Clements Markham's history of Persia, relating to distinguished Englishmen of the period, will be an appro-

¹ Purchas.² Krusinski.³ Krusinski says in 1685.

prate conclusion of the narrative of events as above summarized.

"In 1598 Sir Anthony and Robert Shirley, two English gentlemen, arrived at the Sháh's court at Kazvín with a numerous retinue. They were well received, and after some months Sir Anthony returned to Europe with credentials to several Christian princes. Robert, with five Englishmen, remained at the court of the Sháh. He married a Circassian lady named Teresa, and in 1607 was sent by 'Abbás as his ambassador to James I. of England. After travelling through Europe and remaining a long time at Madrid, Sir Robert Shirley and his Circassian wife landed in his native country in 1611, and was received by James I. with every respect, as the ambassador of a powerful sovereign. His object was to open a trade between England and Persia, but he did not meet with success, owing to the opposition of the Levant merchants. He sailed from Dover with his wife in 1613, and after visiting the court of the Great Mogul, reached Isfahán in 1615. He was soon afterwards sent as ambassador to Spain, where he remained until 1622. In 1618, while Shirley was residing at Madrid, the government of Philip III. of Spain sent an embassy to Persia, at the head of which was Don García de Silva y Figueroa, an able and learned diplomatist, who made good use of his time in collecting information, and in writing a detailed account of his mission and of Persia, including a Life of Timúr. García de Silva landed at Ormuz, and proceeded thence to Shíráz, where he was most hospitably entertained. The ambassador was forwarded to Kazvín in June, and had an audience of the Sháh, who received him very graciously. Many conversations afterwards took place between 'Abbás and the stately Spaniard, touching Spanish victories over the Turks, and other matters of state. But the main object of the embassy, namely, security for Ormuz, which was now, through the absorption of Portugal, a Spanish possession, was not obtained. García de Silva returned home by way of Aleppo, and embarked at Tripoli for Franca on 12th November 1619, devoutly praying that his friend the Sháh might be victorious over the Grand Turk.

"In the meanwhile Sháh 'Abbás was occupied in establishing and regulating the important trade of the Persian Gulf. Lar had previously been completely subdued; and Fars was ruled by one of the Sháh's most trusty and faithful servants. In 1622 the Sháh determined on the expulsion of the Portuguese from the Persian Gulf. They had seized upon the Isle of Ormuz in 1507, under the famous Albuquerque, and in their hands it had attained great prosperity, and become the emporium of all the commerce of the gulf. But they were quite independent of the Sháh of Persia, whose jealousy and resentment they excited. Assisted by the English East India Company, 'Abbás collected a fleet at Gombroon, and embarked a Persian force under Imám Kúly Khán. They laid siege to Ormuz, and the Portuguese, having no hope of success, were forced to surrender. The island is now covered with desolate heaps of ruins. The port of Gombroon, on the mainland, and sheltered by the islands of Kishm and Ormuz, rose on the fall of the Portuguese city. It received the name of *Bandar 'Abbás*, and both the English and Dutch were allowed to establish factories there.

"In 1623 Sir Robert Shirley again arrived in England on an embassy from the Sháh; and in 1627 sailed for Persia, in company with Sir Dormer Cotton, who was sent as envoy from Charles I. of England to the Sháh of Persia. They landed at Gombroon in 1628, and Sir Dormer obtained a very gracious reception from 'Abbás, at Kazvín, where he soon afterwards died. Sir Robert Shirley had now grown old in the service of Persia. On his return he was delighted by the Sháh and his favourite, Muhammad 'Alý Beg, and he died at Kazvín in July 1628. Of all the brave and gallant adventurers of the glorious age of Elizabeth, Sir Robert Shirley was by far the greatest traveller, with the exception, perhaps, of Anthony Jenkinson."

At the age of seventy, after a reign of forty-two years, 'Abbás died at his favourite palace of Farahabad, on the coast of Mazandaran, on the night of the 27th January 1628. Perhaps the most distinguished of all Persian kings, his fame was not merely local but world-wide. Isfahan was his capital, and he did much for its embellishment and enlargement. At his court were ambassadors from England, Russia, Spain, Portugal, Holland, and India. To his Christian subjects he was a kind and tolerant ruler. His conquests have been already mentioned; but there are few sovereigns of an age so closely following the mediæval who have done such real good to their country by material improvement and development of resources. The establishment of internal tranquillity, the expulsion of interlopers and marauders like Turks and Uzbeks, the introduction of salutary laws, and the promotion of public works of utility—

these alone would render remarkable his two-score years of enlightened government. Even in the last quarter of the 19th century the gratified traveller admires the magnificent caravansarás which afford him rest and shelter, and the solid bridges which facilitate his "chapar" (posting), and of which, if he ask particulars, he invariably hears that they were constructed by Sháh 'Abbás.¹ With a fine face, "of which the most remarkable features were a high nose and a keen and piercing eye,"² he is said to have been below the middle height, robust, active, a sportsman, and capable of much endurance. It is, however, to be regretted that this monarch's memory is tarnished by more than one dark deed. The murder of his eldest son, Súfi Mirza, and the cruel treatment of the two younger brothers, were stains which could not be obliterated from the page of history by an after-repentance. All that can be now said or done in the matter is to repeat the testimony of historians that his grief for the loss of Súfi Mirza was profound, and that, on his death-bed, he nominated that prince's son (his own grandson) his successor. Krusinski adds that, on being told at that time by his confidential officers of a prophecy which some astrologers had made to the effect that the new king would reign but three months at most, he replied, "Let him reign as long as he can, though it be but three days. I shall be glad of the assurance that one day, at least, he will have that crown upon his head which was due to the prince, his father."

Sám Mirza was seventeen years of age when the nobles, in fulfilment of the charge committed to them, took him from the "haram" and proclaimed him king under the title of Sháh Súfi. He reigned fourteen years, and his reign was a succession of barbarities, which can only be attributed to an evil disposition acted upon by an education not only wanting the *ingenue artes* but void of all civilizing elements and influences. Taught to read and write, his diversions were to shoot with the bow and ride upon an ass. There was a rumour, moreover, that his father, to stunt the possible growth of wit, ordered him a daily supply of opium. When left to his own devices, he became a drunkard and a murderer, and is accused of the death of his mother, sister, and favourite queen. Among many other sufferers Imám Kúli Khán, conqueror of Lar and Ormuz, the son of one of 'Abbás's most famous generals, founder of a college at Shíráz, and otherwise a public benefactor, fell a victim to his savage cruelty. During his reign the Uzbeks were driven back from Khurásan, and a rebellion was suppressed in Gilan; but Kandahar was again handed over to the Mughals of Delhi, and Baghdád retaken from Persia by Sultan Murád,—both serious national losses. Tavernier, without charging the sháh with injustice to Christians, mentions the circumstance that "the first and only European ever publicly executed in Persia was in his reign." He was a watchmaker named Rodolph Stadler, who had slain a Persian on suspicion of intrigue with his wife. Offered his life if he became a Moslem, he resolutely declined the proposal, and was decapitated. His tomb is to be recognized at Isfahan by the words "Cy gît Rodolphe" on a long wide slab. Sháh Súfi died (1641) at Kashan and was buried at Kúm.

His son, 'Abbás II., who succeeded him, appears to have possessed some good qualities, and to have been actuated by liberal sentiments; but his accession to the throne in extreme youth, and the restraint put upon him by his advisers, were fatal to healthy development, and on arriving at an age which should have been that

¹ It would be unfair, however, to forget that there are, in parts of Persia, especially Karman, some fine caravansarás whose construction is due to the munificence of governors or private individuals. 'Abbás seems certainly to have set the example, and to have furnished the best specimens.

² Malcolm.

of discretion he became wilfully indiscreet. Beyond the credit of regaining Kandahar, an operation which he is said to have directed in person when barely sixteen, there is not much to mark the period of his life to the outer world. As to foreign relations, he received embassies from Europe and a deputation from the French East India Company; he sought to conciliate the Uzbeks by treating their refugee chiefs with unusual honour and sumptuous hospitality; he kept on good terms with Turkey; he forgave the hostility of a Georgian prince when brought to him a captive; and he was tolerant to all religions,—always regarding Christians with especial favour. But he was a drunkard and a debauchee, and chroniclers are divided in opinion as to whether he died from the effects of drink or licentious living. That he changed the system of blinding his relatives from passing a hot metal over the open eye to an extraction of the whole pupil is indicative of gross brutality. 'Abbás II. died (1668) at the age of thirty-eight, after a reign of twenty-seven years, and was buried at Kúm in the same mosque as his father.

'Abbás was succeeded by his son, Sháh Súfí II., crowned a second time under the name of Sháh Sulaiman.

Sir John Malcolm remarks that from the middle of the reign of 'Abbás II. till the elevation of Nádir Sháh, or for about eighty years, there are but few Persian histories which give particular or authentic accounts of current events; and he attributes this circumstance to the absence for nearly a century of any one political event of magnitude. "And yet," he writes—

"this extraordinary calm was productive of no advantage to Persia. The princes, nobles, and high officers of that kingdom, were, it is true, exempt from the dangers of foreign or internal war; but their property and their lives were the sport of a succession of weak, cruel, and debauched monarchs. The lower orders were exposed to fewer evils than the higher, but they became every day more unwarlike; and what they gained by that tranquillity which the state enjoyed, lost almost all its value when they ceased to be able to defend it. This period was distinguished by no glorious achievements. No characters arose on which the historian could dwell with delight. The nation may be said to have existed upon the reputation which it had before acquired till all it possessed was gone, and till it became, from the slow but certain progress of a gradual and vicious decay, incapable of one effort to avert that dreadful misery and ruin in which it was involved by the invasion of a few Afghan tribes, whose conquest of Persia affixed so indelible a disgrace upon that country, that we cannot be surprised that its historians have shrunk from the painful and degrading narration."

Though weak, dissolute, and cruel, Sulaiman is not without his panegyrists. Chardin, whose testimony is all the more valuable from the fact that he was contemporary with him, relates many stories characteristic of his temper and habits. The statement that on one occasion he compelled his grand wazir to drink to intoxication, and on another to have his hair cut by a barber after the unorthodox fashion of the day, contrary to the old man's religious prejudices, belongs to the record of unworthy and disgraceful acts. He kept up a court at Ispahan which surprised and delighted his foreign visitors, among whom were ambassadors from European states; and one learned writer, Kaempfer, credits him with wisdom and good policy. *Au reste*, during his reign Khurásan was invaded by the ever-encroaching Uzbeks, the Kapchak Tatars plundered the shores of the Caspian, and the island of Kishm was taken by the Dutch; but the kingdom suffered otherwise no material loss. He died in 1694, in the forty-ninth year of his age and twenty-sixth of his reign.

About a year before his death he is described by Sanson,¹ a missionary from the French king Louis XIV., as tall, strong, and active, "a fine prince,—a little too effeminate for a monarch," with "a Roman nose very well proportioned to other parts," very large blue eyes, and "a middling mouth, a beard painted black, shav'd round, and

well turn'd, even to his ears." His air was "affable but nevertheless majestic"; he had a masculine and agreeable voice, and sweet manner of speaking, and was "so very engaging that when you but bow'd to him he seem'd in some measure to return it by a courteous inclining of his head, and which he always did smiling." The same writer greatly praises him for his kindness to Christian missionaries.

Krusinski's memoir is full of particulars regarding Sháh Husáfn, the successor of Sulaiman. He had an elder and a younger brother, sons of the same mother, but the eldest had been put to death by his father's orders, and the youngest secreted by maternal precaution lest a similar fate should overtake him. There was, however, a second candidate for power in the person of a half-brother, 'Abbás. The latter prince was the worthier of the throne, but the other better suited the policy of the eunuchs and those noblemen who had the right of election. Indeed Sulaiman himself is reported to have told the grandees around him, in his last days, that "if they were for a martial king that would always keep his foot in the stirrup they ought to choose Mirza 'Abbás, but that if they wished for a peaceable reign and a pacific king they ought to fix their eyes upon Husáfn." But he himself made no definite choice.

Husáfn was selected, as might have been anticipated. On his accession (1694) he displayed his attachment to religious observances by prohibiting the use of wine,—causing all wine-vessels to be brought out of the royal cellars and destroyed, and forbidding the Armenians to sell any more of their stock in Ispahan. The sháh's grandmother, by feigning herself sick and dependent upon wine only for cure, obtained reversal of the edict; and the process by which the venerable lady made her son, in pure regard to herself, drink the first glass with her (and thereby become a confirmed tippler) is woven into a story good enough to attract a writer of vaudevilles. For the following account of Sháh Husáfn and his successors to the accession of Nádir Sháh, Markham's abstract history has been mainly utilized.

The new king soon fell under the influence of mullas, and was led so far to forget his own origin as to persecute the Sáfis. Though good-hearted, he was weak and licentious; and once out of the hands of the fanatical party he became ensnared by women and entangled in harem intrigues. For twenty years a profound peace prevailed throughout the empire, but it was the precursor of a terrible storm destined to destroy the Safawi dynasty and scatter calamity broadcast over Persia. In the mountainous districts of Kandahar and Kabul the hardy tribes of Afghans had for centuries led a wild and almost independent life. They were divided into two great branches—the Ghilzáis of Ghazni and Kabul and the Sáduzáis of Kandahar and Herat. More than one fanciful explanation is given of the etymology of the first name; the most probable one is perhaps that which connects them with a Turki tribe of Khalji or Khilagi, a word not improbably derived from the Turkish *kılıç*, "a sword," the affix "chi" or "ji" always denoting possession. The second take their name from Sádu, their leader in the time of Sháh 'Abbás. In 1702 a newly-appointed governor, one Sháh Nawáz, called Gúrji Khán from having been "wálí" or ruler of Georgia, arrived at Kandahar with a tolerably large force. He was a clever and energetic man, and had been instructed to take severe measures with the Afghans, some of whom were suspected of intriguing to restore the city to the Delhi emperor. At this time Kandahar had been for sixty years uninterruptedly in the sháh's possession. The governor appears to have given great offence by the harshness of his proceedings, and a Ghilzái chieftain named Mir Wá'iz, who had complained of his tyranny, was sent a prisoner to Ispahan. This person had much ability and no little cunning. He was permitted to go on a pilgrimage to Mecca, and on his return in 1703 he so gained upon the confidence of the Persian court that he was allowed to go back to his country. At Kandahar he planned a conspiracy against the Government, slew Gúrji Khán, and his retinue, seized the city, defeated two Persian armies sent against him, and died a natural death in 1715. His brother, Mir 'Abdallah, succeeded him in the government of the Afghans; but after a few months, Mahmúd, a son of Mir Wá'iz, a very young man, murdered his uncle and assumed the title of a sovereign prince.

In the meanwhile dark clouds were rising all round the horizon

¹ *Present State of Persia*, London, 1695.

ready to overwhelm the doomed Šafawī dynasty. The Sádúzai tribe revolted at Herat, and declared itself independent in 1717; the Kurds overran the country round Hamadan; the Uzbeks desolated Khurásan; and the Arabs of Maskat seized the island of Al-Bahrain and threatened Bandar-'Abbás. Thus surrounded by dangers on all sides the wretched sháh was bewildered. He made one vain attempt to regain his possessions in the Persian Gulf; but the Portuguese fleet which had promised to transport his troops to Al-Bahrain was defeated by the imám of Maskat and forced to retreat to Goa.

The court of Ispahan had no sooner received tidings of this disaster than Mahmúd, with a large army of Afghans, invaded Persia in the year 1721, seized Karman, and in the following year advanced to within four days' march of the city of Ispahan. The sháh offered him a sum of money to return to Kandahar, but the Afghan answered by advancing to a place called Gulnabad, within 9 miles of the capital. The effeminate and luxurious courtiers were taken completely by surprise; no preparation had been made, and the capital was unprovided with either provisions or ammunition. The ill-disciplined Persian army, hastily collected, advanced to attack the rebels. Its centre was led by Shaikh 'Alí Khán, covered by twenty-four field-pieces. The wáli of Arabia commanded the right, and the 'itimádu' d-daulah, or prime minister, the left wing. The whole force amounted to 50,000 men, while the Afghans could not count half that number.

On 8th March 1722 the richly-dressed hosts of Persia appeared before the little band of Afghans, who were scorched and disfigured by their long marches. The wáli of Arabia commenced the battle by attacking the left wing of the Afghans with great fury, routing it, and plundering their camp. The prime minister immediately afterwards attacked the enemy's right wing, but was routed, and the Afghans, taking advantage of the confusion, captured the Persian guns and turned them on the Persian centre, who fled in confusion without striking a blow. The wáli of Arabia escaped into Ispahan, and Mahmúd the Afghan gained a complete victory. Fifteen thousand Persians remained dead on the field. A panic now seized on the surrounding inhabitants, thousands of country people fled into the city, and the squares and streets were filled with a helpless multitude. Ispahan was then one of the most magnificent cities in Asia, containing more than 600,000 inhabitants. After his victory Mahmúd seized on the Armenian suburb of Julfa, and invested the doomed city; but Tahmásp, son of the sháh, had previously escaped into the mountains of Mazandaran. Famine soon began to press hard upon the besieged, and in September Sháh Husáin offered to capitulate. He agreed to abdicate in favour of Mahmúd, and to deliver himself up as a prisoner. Having been conducted to the Afghan camp, he fixed the royal plume of feathers on the young rebel's turban with his own hand; and 4000 Afghans were ordered to occupy the palace and gates of the city.¹ Mahmúd entered Ispahan in triumph, with the captive sháh on his left hand, and, seating himself on the throne in the royal palace, he was saluted as sovereign of Persia by the unfortunate Husáin. When Tahmásp, the fugitive prince, received tidings of the abdication of his father he at once assumed the title of sháh at Kazvin.

Turkey and Russia were not slow to take advantage of the calamities of Persia. The Turks seized on Tiflis, Tahríz, and Hamadan, while Peter the Great, whose aid had been sought by the friendly Tahmásp, fitted out a fleet on the Caspian.² The Russians occupied Shirwan, and the province of Gilán on the south-west corner of the Caspian³; and Peter made a treaty with Tahmásp II. in July 1722, by which he agreed to drive the Afghans out of Persia on condition that Darband (Derbend), Báku, Gilán, Mazandaran, and Astrábad were ceded to Russia in perpetuity. These were all the richest and most important northern provinces of Persia.

Meanwhile the cruel invader was deluging Ispahan with the blood of its citizens. Dreading rebellion, in 1723 he invited three hundred of the principal Persian nobility to a banquet and massacred them. To prevent their children rising up in vengeance they were all murdered also. Then he proceeded to slaughter vast numbers of the citizens of Ispahan, until the place was nearly depopulated. Not content with this, in February 1725 he assembled all the captives of the royal family, except the sháh, in the courtyard of the palace, and caused them all to be murdered, commencing the massacre with his own hand. The wretched Husáin,

frantic with grief, rushed to this scene of horror, and was himself wounded in endeavouring vainly to save his infant son, only five years of age. All the males of the royal family, except Husáin himself, Tahmásp, and two children, are said to have perished. At length the inhuman miscreant Mahmúd died, at the early age of twenty-seven, on 22d April 1725. With scarcely any neck, he had round shoulders, a broad face with a flat nose, a thin beard, and squinting eyes, which were generally downcast.

Mahmúd was succeeded in his usurpation by his first cousin Ashraf, the son of Mir 'Abdallah. He was a brave but cruel Afghan. He gave the dethroned sháh a handsome allowance, and strove, by a mild policy, to acquire popularity. In 1727, after a short war, he signed a treaty with the Turks, acknowledging the sultan as chief of the Moslems. But the fortunate star of Tahmásp II. was now beginning to rise, and the days of Afghan usurpation were numbered. He had collected a small army in Mazandaran, and was supported by Fath 'Alí Khán, the powerful chief of the Kajár tribe. In 1727 the fugitive sháh was joined by Nádír Kúlí, a robber chief, who was already famous for his undaunted valour, and who was destined to become the mightiest conqueror of the age. He murdered Fath 'Alí, and, having easily appeased the sháh, received the command of the royal army. In 1729 Ashraf became alarmed at these formidable preparations in the north, and led an Afghan army into Khurásan, where he was defeated by Nádír at Damghan, and forced to retreat. The Persian general followed close in his rear, and again entirely defeated him outside Ispahan in November of the same year. The Afghans fled through the town; and Ashraf, murdering the poor old sháh Husáin on his way, hurried with the wreck of his army towards Shiráz. On 16th November the victorious Nádír entered Ispahan, and was soon followed by his master the young sháh Tahmásp II., who burst into tears when he beheld the ruined and defaced walls of the palace of his ancestors. His mother, who had escaped the numerous massacres by disguising herself as a slave, and performing the most degrading offices, now came forth and threw herself into his arms. Nádír did not give his enemies time to recover from their defeat. He followed them up, and again utterly routed them in January 1730. Ashraf tried to escape to Kandahar almost alone, but was murdered by a party of Balúch robbers; and thus, by the genius of Nádír, his native land was delivered from the terrible Afghan invaders.

The ambition of Nádír, however, was far greater than his loyalty. On the pretext of incapacity he dethroned Tahmásp II. in 1732, and sent him a prisoner into Khurásan, where he was murdered some years afterwards by Nádír's son, while the conqueror was absent on his Indian expedition. For a short time the wily usurper placed Tahmásp's son on the throne, a little child, with the title of 'Abbás III., while he contented himself with the office of regent. Poor little 'Abbás died at a very convenient time, in the year 1736, and Nádír then threw off the mask. He was proclaimed sháh of Persia by a vast assemblage on the plain of Moghan.

By the fall of the Šafawī dynasty Persia lost, as it were, her race of national monarchs, considered not only in respect of origin and birthplace but in essence and in spirit. The Persians have never been governed by more truly representative kings than Isma'íl, Tahmásp, and 'Abbás; and, whatever their faults and failings, they were Persian and peculiar to Persians. Thoroughly to realize this truth we must endeavour for a moment to change our own for the Oriental standpoint, and accept even the murders and excesses committed as an outcome of the age, place, and circumstances, and as natural as are the freaks of unrestrained childhood. Regarded in a sober English spirit, the reign of the great 'Abbás is rendered mythical by crime. No sovereign could be great in the estimation of civilized Europe who acted as he did on certain occasions. No victory or healthy legislation could compensate for moments of madness, which, under Western orthodoxy, must mar a whole career. But something liberal in the philosophy of their progenitors threw an attractiveness over the earlier Šafawī kings which was wanting in those who came after them. In course of time the old philosophical element disappeared; and one of Sháh Husáin's immediate predecessors not only disavowed all sympathy with Šufism but threatened to crush it where detected. The fact is that, two centuries after Sháh Isma'íl's accession to the throne, the Šafawī race of kings was effete; and it became necessary to make room for a more vigorous if not a more lasting rule. Nádír was the strong man for

¹ We have an account of the Afghan invasion and sack of Ispahan from an eye-witness, Father Krusinski, procurator of the Jesuits at that place, whose interesting work was translated into English in the last century.

² In 1721 Sultan Husáin sent an embassy to the Russians, seeking aid against the Afghans. In May 1722 a flotilla descended the Volga commanded by Czar Peter, and on 19th July the Russian flag first waved over the Caspian. Gilán was occupied by 6000 men under General Matuschkin.

³ The Russians remained in Gilán until 1734, when they were obliged to evacuate it, owing to the unhealthiness of the climate.

the hour and occasion. He has been designated a "robber chief"; but his antecedents, like those of many others who have filled the position, have redeeming points of melodramatic interest. He was driven to this mode of life by injustice, and raised to consideration above ordinary banditti by ability as much as by physical force. It was the repute he had thus obtained which caused Šaifu 'd-Din Beg, a general of Sháh Tahmásp, and chief of a tribe, to unite his fortunes to Nádir's, and so enable him to rise on the ladder of his ambition. That Nádir misused his advantages by acts of treachery is not to be denied. Such was, unfortunately, one of the visible roads to success in those barbarous times.

A map attached to Krusinski's volumes (see Plate VIII.) illustrates the extent of Persian territory in 1728, or one year before Ashraf was finally defeated by Nádir, and some eight years prior to the date on which Nádir was himself proclaimed king. It shows, during the reign of the Šafawís, Fífis, Erivan, Khoi, and Baghdád to have been within the limits of Persia on the west, and in like manner Balkh and Kandahar to have been included within the eastern border. There is, however, also shown, as a result of the Afghan intrusion and the impotency of the later Šafawí kings, a long broad strip of country to the west, including Tabriz and Hamadan, marked "conquests of the Turks," and the whole west shore of the Caspian from Astrakan to Mazandaran marked "conquests of the czar of Muscovy"; Makran, written Mecran, is designated "a warlike independent nation." If further allowance be made for the district held by the Afghan invaders as part of their own country, it will be seen how greatly the extent of Persia proper was reduced, and what a work Nádir had before him to restore the kingdom to its former proportions.

But the former proportions had been partly reverted to, and would doubtless have been in some respects exceeded, both in Afghanistan and the Ottoman dominions and on the shores of the Caspian, by the action of this indefatigable general, had not his sovereign master, Tahmásp II., acting on his own account, been led into a premature treaty with the Turks. Nádir's anger and indignation had been great at this weak proceeding; indeed, he had made it the ostensible cause of the sháh's deposition. He had addressed letters to all the military chiefs of the country, calling upon them for support; he had sent an envoy to Constantinople insisting upon the sultan's restoration of the Persian provinces still in his possession—that is, Georgia and part of Adarbaijan,—and he had threatened Baghdád with assault. As regent, he had failed twice in taking the city of the khalifs, but on the second occasion he had defeated and killed its gallant defender, Topal 'Othman, and he had succeeded in regaining Tiflis, Kars, and Erivan.¹

Russia and Turkey, naturally hostile to one another, had taken occasion of the weakness of Persia to forget their mutual quarrels and unite to plunder the tottering kingdom of the Šafawí kings. A partition treaty had been signed between these two powers in 1723, by which the czar was to take Astrábad, Mazandaran, Gilan, part of Shirwan and Daghistán, while the acquisitions of the Porte were to be traced out by a line drawn from the junction of the Arras and Kur rivers, and passing along by Ardabil, Tabriz, and Hamadan, and thence to Karman-sháh. Tahmásp was to retain the rest of his paternal kingdom on condition of his recognizing the treaty. The ingenious diplomacy of Russia in this transaction was manifested in the fact that she had already acquired the greater part of the territory allotted to her, while Turkey had to obtain her share by further conquest. But the combination to despoil a feeble neighbour was outwitted

¹ Malcolm.

by the energy of a military commander of remarkable type.

Nádir Sháh.—Nádir, it has been said, was proclaimed sháh in the plains of Moghan in 1736. Mirza Mahdi relates how this event was brought about by his address to the assembled nobles and officers on the morning of the 'Náu-ruz,' or Persian New-Year's Day, the response to that appeal being the offer of the crown. In the spirit of the third English Richard, he refused to accept the high dignity, but eventually suffered his petitioners, on certain conditions, to "buckle fortune on his back." The conditions were that the crown should be hereditary in his family, that the claim of the Šafawís was to be held for ever extinct, and that measures should be taken to bring the Shí'ahs to accept uniformity of worship with the Sunnis. The mulla báshi (or high priest) objecting to the last, Nádir ordered him to be strangled, a command which was carried out on the spot. On the day following, the agreement having been ratified between sovereign and people, he was proclaimed emperor of Persia. At Kazvín the ceremony of inauguration took place. Having girt on the royal scimitar and put the crown on his head, he took the accustomed oath. The edict expressing the royal will on the religious question is dated in June, but the date of coronation is uncertain. From Kazvín Nádir moved to Ispahan, where he organized an army for a proposed expedition against Kandahar, then in the possession of a brother of Mahmúd, the conqueror of Sháh Husáin. But before setting out for Afghanistan he took measures to secure the internal quiet of Persia, attacking and seizing in his stronghold the chief of the marauding Bakhtiáris, whom he put to death, retaining many of his men for service as soldiers. With an army of 80,000 men he marched through Khurásán and Sístan to Kandahar, which city he blockaded ineffectually for a year; but it finally capitulated on the loss of the citadel. Balkh fell to Ríza Kulí, the king's son, who, moreover, crossed the Oxus and defeated the Úzbeks in battle. Besides tracing out the lines of Nadirabad, a town since merged in modern Kandahar, Nádir had taken advantage of the time available and of opportunities presented to enlist a large number of men from the Abdáli and Ghilzái tribes. It is said that as many as 16,000 were at his disposal. His rejection of the Shí'ah tenets as a state religion seems to have propitiated the Sunni Afghans, and it is not to be otherwise wondered at that a man of his warlike habits should have succeeded in attaching many of the rough mountaineers to his person. Such a force, in addition to his own army, rendered him a truly formidable foe, and the prospect which now opened out before him must have fired his heart and the hearts of his warriors with restless exultation.

He had sent an ambassador into Hindustan requesting the Mughal emperor to order the surrender of certain unruly Afghans who had taken refuge within Indian territory, but no satisfactory reply was given, and obstacles were thrown in the way of the return of the embassy. The Persian monarch, not sorry perhaps to find a plausible pretext for encroachment in a quarter so full of promise to booty-seeking soldiers, pursued some of the fugitives through Ghazni to Kabul, which city was then under the immediate control of Násr Khán, governor of eastern Afghanistan, for Muhammad Sháh of Delhi. This functionary, alarmed at the near approach of the Persians, fled to Pesháwar. Kabul had long been considered not only an integral part but also one of the main gates of the Indian empire; notwithstanding a stout resistance on the part of its commandant, Shír or Shírzah Khán, the place was stormed and carried (1738) by Nádir, who, after slaughtering the greater part of the garrison, took possession of it and moved on to the eastward. Mirza Mahdi relates

1738-1747. that from the Kabul plain he addressed a new remonstrance to the Delhi court, but that his envoy was arrested and killed, and his escort compelled to return by the governor of Jalálábád. The same authority notes the occupation of the latter place by Persian troops and the march thither from Gandamak. There are some doubts as to the exact route now taken, but it was probably through the Khaibar (Khyber) Pass that he passed into the Pesháwar plain, for it was there that he first defeated the imperial forces.

The invasion of India had now fairly commenced, and its successful progress and consummation were mere questions of time. It will not do to cite a triumphal march of an irresistible horde in example of what may still be achieved by an inroad upon modern Hindustan. The prestige of this Eastern Napoleon was immense. It had not only reached but had been very keenly felt at Delhi before the conquering army had arrived. There was no actual religious war; all sectarian distinction had been disavowed; the contest was between vigorous Muhammadans and effete Muhammadans. Nádir had not, like Cæsar, come, and seen, and conquered. His way had been prepared by circumstances, and as he progressed from day to day his army of invaders increased. There must have been larger accessions by voluntary recruits than losses by death or desertion. The victory on the plain of Karnál, whether accomplished by sheer fighting or the intervention of treachery, was the natural outcome of the previous situation; it was the shifting of the scene as anticipated and prepared, and the submission of the emperor followed as a matter of course. But the coming and going of Nádir are studies quite as interesting and instructive as the coming and going of Alexander, and belong to comparatively recent days.

Delhi must have experienced a sense of relief at the departure of its conqueror, whose residence there had been rendered painfully memorable by carnage and riot. The marriage of his son to the grand-daughter of Aurangzib and the formal restoration of the crown to the dethroned emperor, both prominent parts of the first pageant, were doubtless politic, and his parting counsels to the wretched Muhammad Sháh were, it is probable, good and appropriate; but the descendant of Bábar could not easily forget how humiliating a chapter in history would remain to be written against him. The return march of Nádir to Persia is not recorded with precision. On the 5th May 1739 he left the gardens of Shalimar, north of Delhi, to proceed, by Lahore and Pesháwar, through the passes to Kabul. Thence he seems to have returned to Kandahar and, either in person or by his lieutenants, to have recrossed the Indus into Sind. But the subjection of Núr Muhammad, the Kalhora chief then ruling in that province, would hardly have been a sufficient inducement to bring back the great Nádir Kúli so far as 'Umarkot; and in May 1740—just one year after his departure from Delhi—he was in Herat displaying the imperial throne and other costly trophies to the gaze of the admiring inhabitants. Sind was certainly included in the cession to him by Muhammad Sháh of "all the territories westward of the river Attok," but only that portion of it, such as Thattah (Tatta), situated on the right bank of the Indus.

From Herat he moved upon Balkh and Búkhara, and at a short distance from the latter city received the submission of Abú 'l-Fáiz Khán, the Uzbek ruler, whom he restored to his throne on condition that the Oxus should be the acknowledged boundary between the two empires. The khán of Khwárizm was his next opponent; and, as this chief rejected conciliation, and had given serious cause of offence by repeated depredations in Persian territory, he was made prisoner and doomed, with some of his officers, to execution. Nádir then visited the strong

fortress of Kelat, a place which now bears his name and to which he was greatly attached as the scene of his boyish exploits, and Mashhad, which he constituted the capital of his empire. Here he spent three months in festivity; and if extension of dominion be a cause for gratulation he could well justify the demonstration, for he had extended his boundary on the east to the Indus, and to the Oxus on the north.

On the south he was restricted by the Arabian Ocean and Persian Gulf; but the west remained open to his further progress. He had in the first place to revenge the death of his brother Ibráhim Khán, slain by the Lesghians; and a campaign against the Turks might follow in due course. The first movement was unsuccessful, and indirectly attended with disastrous consequences. Nádir, when hastening to the support of some Afghan levies who were doing good service, was fired at and wounded by a stray assailant; suspecting his son, Riza Kúli, of complicity, he commanded the unfortunate prince to be seized and deprived of sight. From that time the heroism of the monarch appeared to die out. He became morose, tyrannical, and suspicious. An easy victory over the Turks gave him but little additional glory; and he readily concluded a peace with the sultan which brought but insignificant gain to Persia.¹ Another battle won from the Ottoman troops near Diarbekir by Násr Ullah Mirza, the young prince who had married a princess of Delhi, left matters much the same as before. "It was agreed that prisoners on both sides should be released, that Persian pilgrims going to the holy cities of Mecca and Medina should be protected, and that the whole of the provinces of Irak and Adarbáijan should remain with Persia, except an inconsiderable territory that had belonged to the Turkish Government in the time of Sháh Ismail, the first of the Suffavi kings."²

The last years of Nádir's life were full of internal trouble. On the part of the sovereign, murders and executions; on that of his subjects, revolt and conspiracy,—these were the ordinary topics of common interest throughout the country. Such a state of things could not last, and certain proscribed persons plotted together for the destruction of a sovereign who had now become a half-demented tyrant. He was despatched by Salah Bey, captain of his guards, to whom, with three others, was committed the work of his assassination (1747). He was some sixty years of age, and had reigned eleven years. About the time of setting out on his Indian expedition he was described as a most comely man, upwards of 6 feet high, well-proportioned, of robust make and constitution; inclined to be fat, but prevented by the fatigue he underwent; with fine, large black eyes and eyebrows; of sanguine complexion, made more manly by the influence of sun and weather; a loud, strong voice; a moderate wine-drinker; fond of simple diet, such as piláus and plain dishes, but often neglectful of meals altogether, and satisfied, if occasion required, with parched peas and water, always to be procured.³

Malcolm winds up a long account of his idiosyncrasies with the following.

"The character of this wonderful man is, perhaps, exalted in its truest colours in those impressions which the memory of his actions has left upon the minds of his countrymen. They speak of him as a deliverer and a destroyer; but while they expatiate with pride upon his deeds of glory, they dwell with more pity than horror upon the cruel enormities which disgraced the latter years of his reign; and neither his crimes, nor the attempt he made to abolish their religion, have subdued their gratitude and veneration for the hero, who revived in the breasts of his degraded countrymen

¹ Professor Creasy says the war broke out in 1743, but was terminated in 1746 by a treaty which made little change in the old arrangements fixed under Murád IV.

³ Fraser's *History of Nádir Sháh* (1742).

a sense of their former fame, and restored Persia to her independence as a nation."

During the reign of Nádír an attempt was made to establish a British Caspian trade with Persia. The names of Jonas Hanway and John Elton were honourably connected with this undertaking; and the former has left most valuable records of the time and country.

From Nádír Sháh to the Kajár Dynasty.—After the death of Nádír Sháh something like anarchy prevailed for thirteen years in the greater part of Persia as it existed under Sháh 'Abbás. No sooner had the crime become known than Ahmad Khán, chief of the Abdáli Afghans, marched off rapidly with his men to Kandahar and took possession of that city and a certain amount of treasure. The chief of the Bakhtiáris, Rashid, also with treasure, fled to the mountains, from which his people had been drawn prior to the Indian expedition; and the conspirators who had done the murderous deed invited 'Alí, a nephew of the deceased monarch, to ascend the vacant throne. By the action of Ahmad Abdáli, Afghanistan was at once lost to the Persian crown, for this leader was strong enough to found an independent kingdom. The Bakhtiári encouraged his brother, 'Alí Mardan, to compete for the succession to Nádír; and the nominee of the disaffected party hastened from Sístan to Mashhad to take advantage of his nomination. The prince was welcomed by his subjects; he told them that the murder of his uncle was due to his own instigation, and, in order to conciliate them towards him in a practical manner, remitted the revenues of the current year and all extraordinary taxes for the two years following.

Taking the title of 'Adíl Sháh, or the "just" king, he commenced his reign by putting to death the two princes Ríza Kúlí and Násr Ulláh, as well as all relatives who could, in his estimation, be considered his competitors, with the exception of Sháh Rukh, son of Ríza Kúlí, whom he spared in case a lineal descendant of Nádír should at any time be required by the people. His calculations proved, however, no wiser than beneficent. He had not removed all dangerous members of the royal house, nor had he gauged the temper of the times or people. 'Adíl Sháh was soon dethroned by his own brother, Ibráhm, and he in his turn was defeated by the adherents of Sháh Rukh, who made their leader king.

This young prince had a better and more legitimate title than that of the grandson of Nádír, whose usurpation was too recent an occurrence to have eradicated and supplanted a comparatively ancient dynasty of national kings. He was also grandson, on the mother's side, of the Safawí Sháh Husáin. Amiable, generous, and liberal-minded, and of prepossessing exterior, he proved to be a popular prince. But his friends and supporters had done well to have left him in honourable obscurity; for he was neither of an age nor character to rule over a people led hither and thither by turbulent and disaffected chiefs, ever divided by the conflicting interests of personal ambition. No sooner had his claim to succession been admitted than his authority was subverted. Sa'íd Muhammad, son of Mirza Dáúd, a chief mulla at Mashhad, whose mother was the reputed daughter of Sulaiman, collecting a body of men, and assuming the name of his maternal grandfather, declared himself king, and imprisoned and blinded Sháh Rukh. Yúsuf 'Alí, the general commanding the royal troops, came to the rescue, defeated and slew Sulaiman, and replaced his master on the throne, reserving to himself the protectorship or regency. A new combination of chiefs, of which Jí'afir the Kurd and Mir 'Alam the Arabian are the principal names handed down, brought about the death of Yúsuf 'Alí and the second imprisonment of Sháh Rukh. These events were followed by a quarrel terminating in the supremacy of the Arab. At this jun-

ture Ahmad Sháh Abdáli reappeared in Persian Khurásan from Herat; he attacked and took possession of Mashhad, slew Mir 'Alam, and, pledging the local chiefs to support the blinded prince in retaining the kingdom of his grandfather, he returned to Afghanistan. But thenceforward this unfortunate young man was a mere shadow of royalty, and his purely local power and prestige had no further influence whatever on Persia as a country.

The land was partitioned among several distinguished persons, who had of old been biding their opportunities, or were born of the occasion. Foremost among these was Muhammad Hasan Khán, hereditary chief of those Kajárs who were established in the south-east corner of the Caspian. His father, Fath 'Alí Khán, after sheltering Sháh Tahmásp II. at his home in Astrábad, and long acting as one of his most loyal supporters, had been put to death by Nádír, who had appointed a successor to his chiefdom from the "Yukári" or "upper" Kajárs, instead of from his own, the "Ashágha," or "lower." Muhammad, with his brother, had fled to the Túrkmans, by whose aid he had attempted the recovery of Astrábad, but had not succeeded in regaining a permanent footing there until Nádír had been removed. On the murder of the tyrant he had raised the standard of independence, successfully resisted Ahmad Sháh and his Afghans, who sought to check his progress in the interests of Sháh Rukh, and eventually brought under his own sway the valuable provinces of Gílan, Mazandaran, and Astrábad,²—quite a little kingdom in itself. In the large important province of Adarbáijan, Azad Khán, one of Nádír's generals, had established a separate government; and 'Alí Mardan, brother of the Bakhtiári chief, took forcible possession of Ispahan, empowering Sháh Rukh's governor, Abú 'l-Fath Khán, to act for the new master instead of the old.

Had 'Alí Mardan declared himself an independent ruler he would have been by far the most important of the three persons named. But such usurpation at the old Safawí capital would have been too flagrant an act for general assent; so he put forward Isma'íl, a nephew of Sháh Husáin, as the representative of sovereignty, and himself as one of his two ministers,—the other being Karím Khán, a young chief of the Zend Kurds. Sháh Isma'íl, it need scarcely be said, was a mere nominal king, and possessed no real authority; but the ministers were strong men in their way, and the Zend especially promised to be useful in his generation, for he had many high and excellent qualities. After a time 'Alí Mardan was assassinated, and Karím Khán became the sole living power at Ispahan. The story of the period is thus told by Watson.

"The three rivals, Karím, Azad, and Muhammad Hasan, pro-Struggle ceeded to settle, by means of the sword, the question as to which of them was to be the sole master of Persia. A three-sided war then three ensued, in the course of which each of the combatants in turn rivals seemed at one time sure to be the final conqueror. Karím, when he had arranged matters at Ispahan, marched to the borders of Mazandarán, where the governor of that province was ready to meet him. After a closely-contested battle victory remained with Muhammad Hasan; who, however, was unable to follow up the foe, as he had to return in order to encounter Azad. That leader had invaded Gílan, but, on the news reaching him of the victory which the governor of Mazandarán had gained, he thought it prudent to retrace his steps to Sultaniyah. Karím roused his shattered forces at Tehrán, and retired to Ispahan to prepare for a second campaign. When he again took the field it was not to measure himself once more with the Kajár chief, but to put down the pretensions of Azad. The wary Afghan, however, shut himself up in Kazvín, a position from which he was enabled to inflict much injury on the army of Karím, while his own troops remained unharmed

¹ There were three branches of the Kajár tribe, i.e., the Suddás, Túngkút, and Jakáiyar. The last, according to Watson, became settled in Iran and Turan, and seem at first to have given their name to all the tribe.

² Watson. Malcolm says that Gílan was under one of its own chiefs, Híddáiyat Khán.

behind the walls of the town. Karīm retired a second time to Ispahan, and in the following spring advanced again to meet Azad. A pitched battle took place between them, in which the army of Karīm was defeated. He retreated to the capital, closely pressed by the foe. Thence he continued his way to Shiráz, but Azad was still upon his traces. He then threw himself upon the mercy of the Arabs of the Garmsir, or hot country, near the Persian Gulf, to whom the name of the Afghans was hateful, and who rose in a body to turn upon Azad. Karīm, by their aid, once more repaired his losses and advanced on Ispahan, while Muhammad Hasan with fifty thousand men was coming from the opposite direction, ready to encounter either the Afghan or the Zend. The Afghan did not await his coming, but retired to his government of Tabriz.

"The Zend issued from Ispahan, and was a second time defeated in a pitched battle by the Kajar. Karīm took refuge behind the walls of Shiráz, and all the efforts of the enemy to dislodge him were ineffectual. Muhammad Hasan Khan in the following year turned his attention to Adarbajian. Azad was no longer in a position to oppose him in the field, and he in turn became master of every place of importance in the province, while Azad had to seek assistance in vain—first from the Pasha of Baghdad, and then from his former enemy, the Tsar of Georgia. Next year the conquering Kajar returned to Shiráz to make an end of the only rival who now stood in his way. On his side were 80,000 men, commanded by a general who had twice defeated the Zend chief on an equal field. Karīm was still obliged to take shelter in Shiráz, and to employ artifice in order to supply the place of the force in which he was deficient. Nor were his efforts in this respect unattended with success: seduced by his gold, many of the troops of the Kajar began to desert their banners. In the meantime the neighbourhood of Shiráz was laid waste, so as to destroy the source from which Muhammad Hasan drew his provisions; by degrees his army vanished, and he had finally to retreat with rapidity to Ispahan with the few men that remained to him. Finding his position there to be untenable, he retreated still further to the country of his own tribe, while his rival advanced to Ispahan, where he received the submission of nearly all the chief cities of Persia. The ablest of Karīm's officers, Shaikh 'Ali, was sent in pursuit of the Kajar chief. The fidelity of the commander to whom that chieftain had confided the care of the pass leading into Mazandarán, was corrupted; and, as no further retreat was open to him, he found himself under the necessity of fighting. The combat which ensued resulted in his complete defeat, although he presented to his followers an example of the most determined valour. While attempting to effect his escape he was recognized by the chief of the other branch of the Kajar tribe, who had deserted his cause, and who had a blood-feud with him, in pursuance of which he now put him to death.

Karīm
Khán.

"For nineteen years after this event Karīm Khan ruled with the title of wakīl, or regent, over the whole of Persia, excepting the province of Khurāsán. He made Shiráz the seat of his government, and by means of his brothers put down every attempt which was made to subvert his authority. The rule of the great Zend chief was just and mild, and he is on the whole, considering his education and the circumstances under which he was placed, one of the most faultless characters to be met with in Persian history."

Karīm Khán died at his capital and favourite residence in 1779 in the twentieth year of his reign, and, it is said, in the eightieth of his age. He built the great bazaar of Shiráz, otherwise embellishing and improving the city, had a tomb constructed over the remains of Háfiz, and repaired the "túrbat" at the grave of Sa'dí, outside the walls. He encouraged commerce and agriculture, gave much attention to the state of affairs along the shores of the Persian Gulf, and carefully studied the welfare of the Armenian community settled in his dominions. In his time the British factory was removed from Gombroon to Bushahr (Bushire). It would be pleasant, if space allowed, to repeat the anecdotes creditable to his memory; for it is unusual to find so worthy a figure in Oriental annals.

On Karīm's death a new period of anarchy supervened. His brother, Zaki, a cruel and vindictive chief, and withal a pardoned rebel—for, when governor of Ispahan, he had revolted against Karīm—assumed the government. At the same time he proclaimed Abú 'l-Fath Khán, second son of the deceased monarch, and his brother Muhammad 'Alí, joint-successors to the throne. The seizure of the citadel at Shiráz by the adherents of the former, among whom were the more influential of the Zends, may have induced him to

adopt this measure as one of prudent conciliation. But the garrison held out, and, to avoid a protracted siege, he had recourse to treachery. The suspicious nobles were solemnly adjured to trust themselves to his keeping, under promise of forgiveness. They believed his professions, tendered their submission, and were cruelly butchered. Zaki did not long enjoy the fruits of his perfidious dealing. The death of Karīm Khán had raised two formidable adversaries to mar his peace, who could not fail to bring on a dénouement of some kind seriously affecting his interests.

Agha Muhammad, son of Muhammad Hasan, the Kajár chief of Astrábád, a prisoner at large in Shiráz, was in the environs of that city awaiting intelligence of the old king's decease, and, hearing it, instantly escaped to Mazandaran, there to gather his tribesmen together and put himself in a condition to compete for the crown of Persia. Taken prisoner by Nádir and barbarously mutilated by 'Adíl Sháh, he had afterwards found means to rejoin his people, but had surrendered himself to Karīm Khán when his father was killed in battle. On the other hand, Sádik, brother to Zaki, who had won considerable and deserved repute by the capture of Basrah from the Turkish governor, abandoned his hold of the conquered town on hearing of the death of Karīm, and appeared with his army before Shiráz. To provide against the intended action of the first, Zaki detached his nephew, 'Alí Murád, at the head of his best troops to proceed with all speed to the north; and, as to the second, the seizure of such families of Sádik's followers as were then within the walls of the town, and other violent measures, struck such dismay into the hearts of the besieging soldiers that they dispersed and abandoned their leader to his fate. From Karman, however, where he found an asylum, the latter addressed an urgent appeal for assistance to 'Alí Murád. This chief, encamped at Tehran when the communication reached him, submitted the matter to his men, who decided against Zaki, but put forward their own captain as the only master they would acknowledge. 'Alí Murád, leaving the pursuit of Agha Muhammad, then returned to Ispahan, where he was received with satisfaction, on the declaration that his one object was to restore to his lawful inheritance the eldest son of Karīm Khán, whom Zaki had set aside in favour of a younger brother. The sequel is full of dramatic interest. Zaki, enraged at his nephew's desertion, marched out of Shiráz towards Ispahan. On his way he came to the town of Yazdikhast,—a singular place, steep and rugged, something like a section, or three upper stories, of the old town of Edinburgh set upon a natural foundation of crumbling stone. It comes upon the traveller as an abrupt elevation in a dreary vale, and the surrounding scenery savours of the weird and romantic. Here he demanded a sum of money from the inhabitants, claiming it as part of secreted revenue; the demand was refused, and eighteen of the head men were thrown down the precipice beneath his window; a "sáiyid," or holy man, was the next victim, and his wife and daughter were to be given over to the soldiery, when a suddenly-formed conspiracy took effect, and Zaki's own life was taken in retribution for his guilt (1779).

When intelligence of these events reached Karman, Sádik Khán hastened to Shiráz, proclaimed himself king in place of Abú 'l-Fath Khán, whom he declared incompetent to reign owing to dissipation and indolence, and put out the eyes of the young prince. He despatched his son Jí'afir to assume the government of Ispahan, and watch the movements of 'Alí Murád, who appears to have been then absent from that city; and he gave a younger son, 'Alí Naki, command of an army in the field. A campaign ensued with success from time to time on either side, but ending in the capture of Shiráz and assumption of sovereignty by 'Alí Murád, who caused Sádik Khán to be put to death.

From this period up to the accession of Agha Muhammad Khán the summarized history of Markham will supply the principal facts required.

'Ali Murád reigned over Persia until 1785, and carried on a successful war with Agha Muhammad in Mazandaran, defeating him in several engagements, and occupying Tehran and Sari. He died on his way from the former place to Ispahan, and was succeeded by Jí'afir, son of Sádík,¹ who reigned at Shiráz, assisted in the government by an able but unprincipled "kalántar," or head magistrate, named Hajji Ibráhím. This ruler was poisoned by the agency of conspirators, one of whom, Sáiyid Murád, succeeded to the throne. Hajji Ibráhím, however, contriving to maintain the loyalty of the citizens towards the Zend reigning family, the usurper was killed, and Lutf 'Alí Khán, son of Jí'afir, proclaimed king. He had hastened to Shiráz on hearing of his father's death and received a warm welcome from the inhabitants. Hajji Ibráhím became his chief adviser, and a new minister was found for him in Mirza Husáin Shirázi. At the time of his accession Lutf 'Alí Khán was only in his twentieth year, very handsome, tall, graceful, and an excellent horseman. To his fearless bravery and indomitable perseverance he united the nobler virtues of generosity and magnanimity. He formed many enduring friendships; and, though false-hearted traitors forsook him in the hour of adversity, others loyally stood by him to the last. While differing widely in character, he was a worthy successor of Karím Khán, the great founder of the Zend dynasty. Lutf 'Alí Khán had not been many months on the throne when Agha Muhammad advanced to attack him, and invested the city of Shiráz, but retreated soon afterwards to Tehran, which he had made the capital of his dominions. The young king then enjoyed a short period of peace. Afterwards, in the year 1790, he collected his forces and marched against the Kajárs, in the direction of Ispahan. But Hajji Ibráhím had been intriguing against his kind young sovereign, to whose family he owed everything, not only with his officers and soldiers but also with Agha Muhammad, the chief of the Kajárs, and arch-enemy of the Zends. Lutf 'Alí Khán was suddenly deserted by the whole of his army, except seventy faithful followers; and when he retreated to Shiráz he found the gates closed against him by Hajji Ibráhím, who held the city for the Kajár chief. Thence falling back upon Bushahr, he found that the shahk of that town had also betrayed him. Surrounded by treason on every side, basely deserted alike by his dearest friends and by those who had been raised from the dust by his family, yet, still undaunted by the black clouds that gathered round him, with his little band he boldly attacked and routed the chief of Bushahr and blockaded the city of Shiráz. His unconquerable valour gained him many followers, and he defeated an army sent against him by the Kajárs in 1792.

Agha Muhammad then advanced in person against his gallant young rival. He encamped with an army of 30,000 men on the plain of Mardasht, near Shiráz. Lutf 'Alí Khán, in the dead of night, suddenly attacked the camp of his enemy with only a few hundred followers. The Kajárs were completely routed and thrown into confusion; but Agha Muhammad, with extraordinary presence of mind, remained in his tent, and at the first appearance of dawn his "muazzin," or public crier, was ordered to call the faithful to morning prayer as usual. Astonished at this, the few Zend cavaliers, thinking that the whole army of Kajárs had returned, fled with precipitation, leaving the field in possession of Agha Muhammad. The successful Kajár then entered Shiráz, and promoted the traitor Hajji Ibráhím to be his wazír. Lutf 'Alí Khán took refuge with the hospitable chief of Tabas in the heart of Khurásan, where he succeeded in collecting a few followers; but, advancing into Fárs, he was again defeated, and forced to take refuge at Kandahar.

In 1794, however, the undaunted prince once more crossed the Persian frontier, determined to make a last effort, and either regain his throne or die in the attempt. He occupied the city of Karman, then a flourishing commercial town, half-way between the Persian Gulf and the province of Khurásan. It had a very fine bazaar and was well fortified. Agha Muhammad besieged it with a large army in 1795, and, after a stout resistance, the gates were opened through treachery. For three hours the gallant young warrior fought in the streets with determined valour, but in vain. When he saw that all hope was gone he spurred his faithful horse against the ranks of the enemy and, with only three followers, fought his way through the Kajár host and escaped to Bam-Narmashir, the most eastern district of the province of Karman on the borders of Sístan.

Furious at the escape of his rival, the savage conqueror ordered a general massacre; 20,000 women and children were sold into slavery, and 70,000 eyes of the inhabitants of Karman were brought to Agha Muhammad on a platter. The monster counted them with the point of his dagger, then, turning to his minister, he exclaimed, "If one had been wanting I would have made up the

number with your own eyes." Karman has never fully recovered from the effects of this fiend's atrocities.

Lutf 'Alí Khán took refuge in the town of Bam; but the governor of Narmashir, anxious to propitiate the conqueror, basely surrounded him as he was mounting his faithful horse Kúran to seek a more secure asylum. The young prince fought bravely; but, being badly wounded and overpowered by numbers, he was secured and sent to the camp of the Kajár chief. The spot where he was seized at Bam, when mounting his horse, was marked by a pyramid, formed, by order of his revengeful enemy, of the skulls of the most faithful of his adherents. The most hideous indignities and atrocities were committed upon his person by the cruel Kajár, in whose breast not one spark of generous or humane feeling had ever found a place. Finally, the last reigning prince of the house of Zend was sent to Tehran and murdered, when only in his twenty-sixth year. Every member of his family and every friend was ordered to be massacred by Agha Muhammad; and the successful but guilty miscreant thus founded the dynasty of the Kajárs at the price of all the best and noblest blood of Iran.

The Zend is said to be a branch of the Lak tribe, dating from the time of the Kaianian kings, and claims to have been charged with the care of the *Zend-Avesta* by Zoroaster himself.² The tree attached to Markham's chapter on the dynasty contains the names of eight members of the family only, i.e., four brothers, one of whom had a son, grandson, and great-grandson, and one a son. Four of the eight were murdered, one was blinded, and one cruelly mutilated. In one case a brother murdered a brother, in another an uncle blinded his nephew.

Kajár Dynasty.—Agha Muhammad was undoubtedly one of the most cruel and vindictive despots that ever disgraced a throne. But he was not without care for the honour of his empire in the eyes of Europe and the outer world, and his early career in Mazandaran gave him a deeply-rooted mistrust of Russia, with the officers of which power he was in constant contact. The following story, told by Forster,³ and varied by a later writer, is characteristic. A party of Russians having obtained permission to build a "counting-house" at Ashraf, in the bay of that name, erected instead a fort with eighteen guns. Agha Muhammad, learning the particulars, visited the spot, expressed great pleasure at the work done, invited the officers to dine with him, imprisoned them, and only spared their lives when they had removed the whole of the cannon and razed the fort to the ground. As this occurrence must have taken place about 1782, when he was engaged in family feuds, and the sovereign power was vested in the hands of 'Alí Murád, it may be received as an illustration not only of his patriotism but of the independent action he was ever ready to exercise when opportunity offered.

Forster was travelling homeward by the southern shores of the Caspian in January 1784, and from him we gather many interesting details of the locality and period. He calls Agha Muhammad chief of Mazandaran, as also of Astrábad and "some districts situate in Khurasan," and describes his tribe, the Kajár, to be, like the Indian Rajput, usually devoted to the profession of arms. Whatever hold his father may have had on Gilán, it is certain that this province was not then in the son's possession, for his brother, Jí'afir Kúli, governor of Balfrush (Balfroosh), had made a recent incursion into it and driven Hidáiyat Khán, its ruler, from Rasht to Enzali, and Agha Muhammad was himself meditating another attack on the same quarter. The latter's palace was at Sari, then a small and partly fortified town, thickly inhabited, and with a plentifully-supplied market. As "the most powerful chief in Persia" since the death of Karím Khán, the Russians were seeking to put their yoke upon him, and he was naturally averse to the infliction. It is not clear, however, from the context

² Markham. Morier says of Karím Khán's family, "It was a low branch of an obscure tribe in Kurdistan."

³ *Journey from Bengal to England* (1793), vol. ii. p. 201; see also Markham, pp. 341, 342.

¹ A five days' usurpation of Bakir Khán, governor of Ispahan, is not taken into account.

what Forster means when he writes that Agha Muhammad is "the only Persian chief bordering on the Caspian Sea whom the empire of Russia has yet made tributary, or rendered subservient to its policy."

As Agha Muhammad's power increased, his dislike and jealousy of the Muscovite assumed a more practical shape. His victory over Lutf 'Alī was immediately followed by an expedition into Georgia. After the death of Nādir the wālī or prime ruler of that country had looked around him for the safest and surest means of shaking off the offensive yoke of Persia; and in course of time an opportunity had offered of a promising kind. In 1783, when the strength of the Persian monarchy was concentrated upon Ispahan and Shīrāz, the Georgian czar Heraclius entered into an agreement with the empress Catherine by which all connexion with the shāh was disavowed, and a quasi-vassalage to Russia substituted,—the said empire extending her ægis of protection over her new ally. Agha Muhammad now demanded that Heraclius should return to his position of tributary and vassal to Persia, and, as his demand was rejected, prepared for war. Dividing an army of 60,000 men into three corps, he sent one of these into Daghistān, another was to attack Erivan, and with the third he himself laid siege to Shishah in the province of Karabagh. The stubborn resistance offered at the last-named place caused him to leave there a small investing force only, and to move on with the remainder of his soldiers to join the *corps d'armée* at Erivan. Here, again, the difficulties presented caused him to repeat the same process and to effect a junction with his first corps at Ganja, the modern Elisabetsopol. At this place he encountered the Georgian army under Heraclius, defeated it, and marched upon Tiflis, which he pillaged, massacring and enslaving¹ the inhabitants. Then he returned triumphant to Tehran, where (or at Ardabil on the way) he was publicly crowned shāh of Persia. Erivan surrendered, but Shishah continued to hold out. These proceedings caused Russia to enter the field. Darband was taken possession of by Imhoff, Bākū and Shumakhi were occupied, and Gilan was threatened. The death of the empress, however, caused the issue of an order to retire, and Darband and Bākū remained the only trophies of the campaign.

In the meantime Agha Muhammad's attention had been called away to the east. Khurāsān could hardly be called an integral part of the shāh's kingdom so long as it was under even the nominal rule of the blind grandson of Nādir. But the eastern division of the province and its outlying parts were actually in the hands of the Afghans, and Mashhad was not Persian in 1796 in the sense that Delhi was British at the outbreak of the Indian mutiny. Shāh Rukh held his position, such as it was, rather under Ahmad Shāh and his successors in Afghanistan than under any other sovereign power. Agha Muhammad determined to restore the whole province to Persia, and, after a brief residence in Tehran on his return from the Georgian expedition, he set out for Mashhad. It is important to note that on the occasion of his coronation he had girded on the sabre consecrated at the tomb of the founder of the Safawīs,—thus openly pledging himself to support the Shī'ah faith.

But there had been continual dissatisfaction in the capital of Khurāsān, and there had been constant inroads upon it from without, which the powerless royal puppet was unable to prevent. His popularity was real, but wholly wanting in political vigour. It never seemed to have effect outside the limited sphere of personal sympathy and regard. Owing to the frequent revolutions in the

holy city the generals of Timur Shāh, king of the Afghans, had made three expeditions on Shāh Rukh's behalf. Mashhad had been taken and retaken as though he were not a resident in it, much less its *de jure* king. Moreover, his two sons Nādir Mirza and Wālī Nī'amat had been long waging, one with the other, a predatory war, and the former was practically in 1796 the actual ruler of the place. Three years before Timur had died, and his third son, Zaman Shāh, by the intrigues of an influential sardār, Paiyanda Khān, had been proclaimed his successor at Kabul.

Agha Muhammad's entry into Mashhad was effected without a struggle on the part of those in possession. The Kājār shāh walked on foot to the tomb of Imām Rīza, before which he knelt and kissed the ground in token of devotion, and was recognized as a Shī'ah of Shī'ahs. Shāh Rukh submissively followed in his train. Then began the last act of the local tragedy. The blind king's gradual revelation, under horrible torture, of the place of concealment of his several jewels and treasures, and his deportation and death (of the injuries thus received, at Damaghan, *en route* to Mazandaran), must be classed among the darkest records of Oriental history.

From Mashhad Agha Muhammad sent an envoy to Zaman Shāh, asking for the cession of Balkh, and explaining his invasion of Khurāsān; but the Afghan monarch was too perplexed with the troubles in his own country and his own insecure position to do more than send an unmeaning reply. It is not shown what was the understood boundary between the two countries at this particular period; but Watson states that on the shāh's departure he had received the submission of the whole of Khurāsān, and left in Mashhad a garrison of 12,000 men.

Agha Muhammad had now fairly established his capital at Tehran. On his return thither in September 1796 he dismissed his troops for the winter, directing their re-assembly in the following spring. The re-invasion by Russia of the provinces and districts he had recently wrested from her west of the Caspian had made great progress, but the circumstance does not seem to have changed his plans for the army. Olivier, who had in those days come to the Persian court on a commercial and political mission from the French republic, and whose book is quoted by Watson, expressed his surprise to the prime minister that, while his majesty thought it necessary to strangle some twenty-seven Russian sailors sent in as prisoners, he took no immediate measures to check the Muscovite forces in the field. The reply was that there was no hurry in the matter. Although, when the spring arrived and the shāh led his forces to the Arras, the Russians had, it is true, retreated, yet territory had been regained by them as far south as the Talish. Agha Muhammad had now arrived at the close of his career. He was enabled, with some difficulty, to get his troops across the river, and take possession of Shishah, which had given them so much trouble a year or two before. There, in camp, he was murdered (1797) by his own personal attendants,—men who, singularly enough, were under sentence of death, but allowed to be at large. He was then fifty-seven years of age, and had ruled over part of Persia for more than eighteen years,—over the kingdom generally for about three years, and from his coronation for about one year only.

The brutal treatment he had experienced in boyhood under the orders of 'Adil Shāh, Nādir's wretched nephew, and the opprobrious name of "eunuch" which attached to him, and with which he was taunted by his enemies, no doubt contributed to embitter his nature. His vindictiveness and inhumanity were notorious, and exemplified at almost every period of his life. On the other hand, his contempt of luxury and frugality of diet, his avoidance

¹ Lady Sheil says (1849): "I saw a few of these unhappy captives, who all had to embrace Mahomedanism, and many of whom had risen to the highest stations, just as the Circassian slaves in Constantinople."

of hyperbole and dislike of excessive ceremony, his protection to commerce and consideration for his soldiers, the reluctance with which he assumed the crown almost at the close of his reign, his positive refusal to wear any royal headgear but the small circular pearl-adorned diadem in which he is commonly represented by the native painter,—all these would have been praiseworthy in another man; but the fearful weight of evil on the other side of the scales made them of comparatively small consideration, and on his death the memory of his atrocious tyranny alone survived. Those who have seen his portrait once will recognize the face wherever presented. "Beardless, and shrivelled," writes Sir John Malcolm, "it resembled that of an aged and wrinkled woman, and the expression of his countenance, at no time pleasant, was horrible when clouded, as it very often was, with indignation. He was sensible of this, and could not bear that any one should look at him."

Agha Muhammad had made up his mind that he should be succeeded by his nephew Fath 'Alī Shāh, son of his full brother, Husāin Kūlī Khān, and governor of Fārs, a young prince with whom he had always been on good terms, and to whom he had proved himself exceptionally well disposed. There was a short interval of confusion after the murder. The remains of the sovereign were exposed to insult, the army was disturbed, the recently-captured fort on the left bank of the Arras was abandoned; but the wisdom and resolution of the minister, Hajji Ibrahim, and of Mirza Muhammad Khān Kajār, a high functionary, prevailed to secure order and acceptance of the duly-appointed heir. The first, proclaiming his own allegiance, put himself at the head of a large body of troops and marched towards the capital. The second closed the gates of Tehran to all comers until Fath 'Alī Shāh came himself from Shirāz. Though instantly proclaimed on arrival, the new monarch was not crowned until the spring of the following year (1798).

The so-called rebellions which followed were many, but not of any magnitude: Such as belong to local history are three in number, *i.e.*, that of Sādik Khān Shakākī, the general whose possession of the crown jewels enabled him, after the defeat of his army at Kazvīn, to secure his personal safety and obtain a government; of Husāin Kūlī Khān, the shāh's brother, which was compromised by the mother's intervention; and of Muhammad, son of Zaki Khān, Zend, who was defeated on more than one occasion in battle, and fled into Turkish territory. There may have been other names mixed up with these, but of aiders and abettors rather than principals. Later, Sādik Khān, having again incurred the royal displeasure, was seized, confined, and mercilessly bricked up in his dungeon to die of starvation.

Another adversary presented himself in the person of Nādir Mirza, son of Shāh Rukh, who, when Agha Muhammad appeared before Mashhad, had taken refuge with the Afghans. This prince, hearing of the death of his father's destroyer, gathered around him a military force and made a show of independence. Fath 'Alī sent to warn him of the consequences of his act, but without the desired effect. Finally, he advanced into Khurāsān with an army which appears to have met with no opposition save at Nishāpūr and Tūrbat, both of which places were taken, and when it reached Mashhad Nādir Mirza tendered his submission, which was accepted. Peace having been further cemented by an alliance between a Kajār general and the prince's daughter, the shāh returned to Tehran.

Now that the narrative of Persian kings has been brought up to the period of the consolidation of the Kajār dynasty and commencement of the 19th century, there remains but to summarize the principal events in the reigns of Fath 'Alī Shāh, and his immediate successors, Muhammad Shāh and Nāsrū 'd-Dīn Shāh.

Fath 'Alī Shāh came to the throne at about thirty-two years

of age, and died at sixty-eight, after a reign of thirty-six years. The period was an eventful one. It was that of George III., George IV., and William IV. in England, of Napoleon I. from first consul to emperor, of the restoration of the Bourbon kings and the interposition of the house of Orleans, in France. The sons of Paul, Alexander and Nicholas, were emperors of Russia; and, except for the last few years of Salim II., the second Mahmūd ruled over the Turkish dominions. No other European nations had any direct concern with Persia. In Afghanistan it was the epoch of the revolution which broke up its short-lived unity as a kingdom. The struggles of Mahmūd Shāh and Shuj'au 'l-Mulk enabled them to be quasi-sovereigns for a time; but Kabul was divided from Kandahar, and Kandahar from Herat, and the work of Ahmad Abdālī was all undone. Among the governors-general of India in those days are the distinguished names of Wellesley, Cornwallis, Hastings, and William Bentinck.

Persia's great aim was to recover in the north-west, as in the north-east of her empire, the geographical limits obtained for her by the Sāfawī kings; and this was no easy matter when she had to contend with a strong European power whose territorial limits touched her own. Fath 'Alī Shāh undertook, at the onset of his reign, a contest with Russia on the western side of the Caspian, which became constant and harassing warfare. Georgia was, clearly, not to revert to a Muhammadan suzerain. In 1800 its czar, George, son and successor of Heraclius, notwithstanding his former professions of allegiance to the shāh, renounced his crown in favour of the Russian emperor. His brother Alexander indignantly repudiated the act and resisted its fulfilment, but he was defeated by General Lazeroff on the banks of the Lora. Persia then re-entered the field. Among the more notable occurrences which followed were a three days' battle, fought near Etchmiadzin near Erivan, between the crown prince, 'Abbās Mirza, and General Zizianoff, in which the Persians suffered much from the enemy's artillery, but would not admit they were defeated; unsuccessful attempts on the part of the Russian commander to get possession of Erivan; and a surprise, in camp, of the shāh's forces, which caused them to disperse, and necessitated the king's own presence with reinforcements. On the latter occasion the shāh is credited with gallantly swimming his horse across the Arras, and setting an example of energy and valour. In the following year 'Abbās Mirza advanced upon Shishah, the chief of which place and of the Karabagh, though an old foe to Agha Muhammad, had declared for Russia; much fighting ensued, and Erivan was formally taken possession of in the name of the shāh. The Russians, moreover, made a futile attempt on Gilan by landing troops at Enzali, which returned to Bākū, where Zizianoff fell a victim to the treachery of the Persian governor. Somewhat later Ibrahim Khalil of Shishah, repenting of his Russophilism, determined to deliver up the Muscovite garrison at that place, but his plans were betrayed, and he and his relatives put to death. Reprisals and engagements followed with varied success; and the crown prince of Persia, after a demonstration in Shirwan, returned to Tabriz. He had practically made no progress; yet Russia, in securing possession of Darband, Bākū, Shirwan, Sheki, Ganja, the Talish, and Moghan, was probably indebted to gold as well as to the force of arms. At the same time Persia would not listen to the overtures of peace made to her by the governor-general who had succeeded Zizianoff.

Relations had now commenced with England and British India. A certain Mahdi 'Alī Khān had landed at Bushahr, entrusted by the governor of Bombay with a letter to the shāh. His mission had reference to the politics of Afghanistan, and appears to have been fairly successful; but he was followed shortly by an English envoy from the governor-general, Captain Malcolm of the Madras army. He had not only to talk about the Afghans but about the French also, and the trade of the Persian Gulf. The results were a political and commercial treaty, and a return mission to India from Fath 'Alī Shāh. To him France next sent her message. In 1801 an American merchant from Baghdād had appeared as the bearer of credentials from Napoleon, but his mission was mistrusted and came to nothing. Some five years afterwards Jaubert, after detention and imprisonment on the road, arrived at Tehran and went back to Europe with a duly-accredited Persian ambassador, who concluded a treaty with the French emperor at Finkenstein. On the return of the Persian diplomatist, a mission of many officers under General Gardanne to instruct and drill the local army was sent from France to Persia. Hence arose the counter-mission of Sir Harford Jones from the British Government, which, on arrival at Bombay in April 1808, found that it had been anticipated by a previously-sent mission from the governor-general of India, under Malcolm again, then holding the rank of brigadier-general.

The home mission, however, proceeded to Bushahr, and Malcolm a return thence to India, from pressure of circumstances, enabled Sir Harford to move on and reach the capital in February 1809. A few days before his entry General Gardanne had been dismissed, as the peace of Tilsit debarred France from aiding the shāh against Russia. However open to criticism may have been the after-conduct of the British diplomatist, his diplomacy was so far successful that he

concluded a treaty with Persia the month after his arrival at the capital; but the Government of India were not content to leave matters in his hands: notwithstanding the anomaly of a double mission, Malcolm was in 1810 again despatched as their own particular envoy. He brought with him Captains Lindsay and Christie to assist the Persians in the war, and presented the shah with some serviceable field-pieces; but there was little occasion for the exercise of his diplomatic ability save in his non-official intercourse with the people, and here he availed himself of it to the great advantage of himself and his country.¹ He was welcomed by the shah in camp at Ujani, and took leave a month afterwards to return *via* Baghdad and Basrah to India. The next year Sir Harford Jones was relieved as envoy by Sir Gore Ouseley.

Meanwhile hostilities had been resumed with Russia: the crown prince vainly attempted to penetrate Georgia; and one or two engagements ensued with more or less assertion of success on either side. In 1812 the British envoy used his good offices for the restoration of peace between the belligerents, and a Russian officer of high rank was sent to the Persian camp to propose the appointment of deputies. But there was no possibility of agreement, and the endeavour failed. To add to the Persian difficulty, it so happened that in July of this year a treaty was concluded between England and Russia "for re-establishing the relations of amity and good understanding between the two kingdoms respectively"; and this circumstance caused the envoy to direct that British officers should take no further part in Russo-Persian military operations. Christie and Lindsay, however, resolved to remain at their own risk, and advanced with the Persian army to the Arras. On the 31st October the force was surprised by an attack of the enemy, and retreated; the next night they were again attacked and routed at Aslandüz. Christie fell bravely fighting at the head of his brigade; Lindsay saved two of his nine guns; but neither of the two Englishmen was responsible for the want of proper disposition of the troops which mainly caused the disaster. Lankuran was taken by Persia, but retaken by Russia during the next three months; and on the 13th October 1813, through Sir Gore Ouseley's intervention, the treaty of Gulistan put an end to the war. Persia formally ceded Georgia and the seven provinces before named, with Karabagh.

On the death of the emperor Alexander in December 1825 Prince Menschikoff was sent to Tehran to settle a dispute which had arisen between the two Governments regarding the prescribed frontier. But, as the claim of Persia to a particular district then occupied by Russia could not be admitted, the special envoy was given his *congé*, and war was recommenced. The chief of Talish struck the first blow, and drove the enemy from Lankuran. The Persians then carried all before them; and the hereditary chiefs of Shirwan, Sheki, and Bakü returned from exile to co-operate with the shah's general in the south. In the course of three weeks the only advanced post held by the governor-general of the Caucasus was the obstinate little fortress of Shishah. But before long all was again changed. Hearing that a Russian force of some 9000 men was concentrated at Tiflis, Muhammad Mirza, son of the crown prince, advanced to meet them on the banks of the Zezam. He was defeated; and his father, seeking to repair the loss, was routed more seriously still at Ganja. The shah made great efforts to renew the war; but divisions took place in his son's camp, not conducive to successful operations, and new proposals of peace were made. Ardabil, and even Tabriz, had been threatened, and, although the threat had been rather signified than expressed, the presence of Russian troops south of the Arras was calculated to strike terror in Adarbsijan. But Russia demanded Erivan and Nakhichevan (Nakhichevan) as well as the cost of the war, and in 1827 the campaign was reopened. Briefly, after successive gains and losses, not only Erivan was taken from Persia but Tabriz also, and finally, through the intervention of Sir John Macdonald, the English envoy, a new treaty was concluded at Turkmanchái, laying down the boundary between Russia and Persia very much as it has been formed in 1884. Among the hard conditions for the latter country were the cession in perpetuity of the khanates of Erivan and Nakhichevan, the inability to have an armed vessel in the Caspian, and the payment of a war indemnity of some £3,000,000.

After Russia, the neighbouring state next in importance to the wellbeing of Persia was Turkey, with whom she was united on the west by a common line of frontier. Fath 'Ali Shah was fortunate in having had but one war with the sultan during his whole reign, and that one of no duration. Salim had not scrupled, it is true, in 1804 and 1805, to allow the Russians to make free use of the south-eastern coasts of the Black Sea, to facilitate operations against the shah's troops; and there had been a passage of arms between the king's eldest son, Muhammad 'Ali Mirza, and Sulaiman Pasha, son-in-law of the governor-general of Baghdad, which is locally credited as a battle won by the former. But there was no open rupture between the two sovereigns until 1821, when the frontier disputes and com-

¹ The "wakilu'l-mulk," governor of Karman, told Colonel Goldsmid, when his guest in 1856, that "his father had" been Sir John Malcolm's *Mikmandar*. There never was such a man as 'Malcolm Sahib.' Not only was he generous on the part of his government, but with his own money also" (*Telegraph and Travel*, p. 585).

plaints of Persian travellers, merchants, and pilgrims culminated in a declaration of war. This made 'Abbás Mirza at once seize upon the fortified places of Toprak Kalah and Ak Sarai within the limits of the Ottoman empire, and, overcoming the insufficient force sent against him, he was further enabled to extend his inroads to Mush, Bitlis, and other known localities. The Turkish Government retaliated by a counter-invasion of the Persian frontier on the south. At that time the pasha of Baghdad was in command of the troops. He was defeated by Muhammad 'Ali Mirza, then prince-governor of Karmanshah, who drove his adversary back towards his capital and advanced to its immediate environs. Being attacked with cholera, however, the Persian commander recrossed the frontier, but only to succumb under the disease in the pass of Kirind. In the sequel a kind of desultory warfare appears to have been prosecuted on the Persian side of Kurdistan, and the shah himself came down with an army to Hamadan. Cholera broke out in the royal camp and caused the troops to disperse.

In the north the progress of 'Abbás Mirza was stopped at Baiyazid by a like deadly visitation; and a suspension of hostilities was agreed upon for the winter season. At the expiration of four months the sardar of Erivan took possession of a Turkish military station on the road to Arzum (Erzeroum), and the crown prince marched upon that city at the head of 30,000 men. The Ottoman army which met him is said to have numbered some 52,000; but victory was on the side of their opponents. Whether the result was owing to the defection of 15,000 Kurds or not the evidence adduced is insufficient to decide. In the English records of the period it is stated that "the defeat of the Turks was complete; the greater part of their army fled in disorder from the field, abandoning all their tents and baggage, and fourteen pieces of artillery." It is added: "the prince royal followed up his successes, and advanced within two days' march of Arzum, but the cholera morbus is said to have again broken out in his army, and in such a manner as effectually to arrest its further advance."²

Profiting from this victory, 'Abbás Mirza repeated an offer of peace before made without avail to the pasha of Arzum; and, in order to conciliate him more effectually, he retired within the old limits of the dominions of the shah, his father. But more troubles arose at Baghdad, and other reasons intervened to protract negotiations for a year and a half. At length, in July 1823, the treaty of Arzum closed the war between Turkey and Persia. It may be remarked that this document is sensible and business-like, and provides especially against a recurrence of the proved causes of war, such as interference in one another's frontier districts, extorting taxes from Persian travellers or pilgrims, disrespect to the ladies of the royal harem and other ladies of rank proceeding to Mecca or Karbala (Kerbela), irregular levies of custom-duties, non-punishment of Kurdish depredators transgressing the boundary, and the like. Fath 'Ali Shah in it is styled "King of kings, the Sultan son of a Sultan—the Conqueror," and Mahmud II. is "Protector of the Faith, Guardian of the Holy Cities, Ruler by Sea and Land, the Sultan son of a Sultan—the Conqueror."

With respect to the eastern boundaries of his kingdom, Fath 'Ali Shah was fortunate in having to deal with a less dangerous neighbour than the Muscovite of persistent policy and the Turk of precarious friendship. The Afghan was neither a contemptible foe nor a sure ally, but he was not tainted with that fictitious civilization of semi-Oriental people which makes duplicity the essence of diplomatic intercourse. He had seen too little of Europeans to imitate them in their worst and weakest points; and, though equal to the Persian in physical force and prowess, he was his inferior in worldly knowledge and experience. Quite as dishonest as his neighbours and more treacherous than most, he had not the polished ingenuity to conceal his dishonesty and double-dealing. Moreover, the family divisions among the ruling houses of Afghanistan grew from day to day more destructive to that patriotism and sense of nationality which Ahmad Shah had held out to his countrymen as the sole specifics for becoming a strong people.

The revolt of Nádír Mirza had, as before explained, drawn the shah's attention to Khurásan in the early part of his reign; but, although quiet had for the moment been restored at Mashhad by the presence of the royal camp, fresh grounds of complaint were urged against the rash but powerless prince, and recourse was had to extreme measures. Charged with the murder of a holy sayyid, his hands were cut off and his tongue was plucked out, as part of the horrible punishment inflicted on him.

It does not appear that Nádír Mirza's cause was ever seriously espoused by the Afghans, nor that Fath 'Ali Shah's claim to Mashhad, as belonging to the Persian crown, was actively resisted. But the large province of Khurásan, of which Mashhad was the capital, and which included Darahgáz and Kelat-i-Nádír in the north and Káiyán in the south, had never been other than a nominal dependency of the crown since the death of Nádír; and in the autumn of 1830

² *Annual Register*, "History of Europe" (1822). There is a note in connexion with the text from which these extracts are taken, on the state of Anglo-Persian relations and the predominance of Russian influence at Tehran, well worthy the reader's perusal.

the shâh, under Russian advice, assembled a large force to bring into subjection all turbulent and refractory chiefs on the east of his kingdom. Yazd and Karman were the first points of attack; Khurâsan was afterwards entered by Semnan, or the main road from Tehran. The expedition, led by 'Abbâs Mirza, involved some hard fighting and much loss of life. A considerable extent of ground was traversed; several forts and places were captured, among them Kabushan and Sakahs; and it may be concluded that the objects contemplated were more or less attained. An English officer, Colonel Shee, commanded what was called the "British detachment" which accompanied the prince. Thus far as regards Yazd, Karman, and Khurâsan. It was otherwise with Herat.

Hajji Firûzu 'd-Din, son of Timûr Shâh, reigned undisturbed in that city from 1800 to 1816. Since Fath 'Ali Shâh's accession he and his brother Mahmûd had been, as it were, under Persian protection; and, when the king retraced his steps homeward after his expedition to Mashhad, at the commencement of the century, it is supposed that he did so at the request of an ambassador from Zaman Shâh of Kabul. Persia claimed the principality of Herat as part of the empire of Nâdir, but her pretensions had been satisfied by payments of tribute or evasive replies. Now, however, that she marched her army against the place, Firûzu 'd-Din called in the aid of his brother Mahmûd Shâh of Kabul, who sent to him the famous wazir, Fath Khân Bârakzâi. The latter, intriguing on his own account, got possession of the town and citadel; he then sallied forth, engaged and defeated the Persian forces, and forced them to retire into their own country. There are various accounts of this action, and the Persian story is that the Afghans were defeated; but no one disputes the result, *i.e.*, the retreat of the invading army. In 1824, on a solicitation from Mustafâ Khân, who had got temporary hold of Herat, more troops were despatched thither, but, by the use of money or bribes, their departure was purchased. Some eight or nine years afterwards 'Abbâs Mirza, when at the head of his army in Mashhad, invited Yar Muhammad Khân of Herat to discuss a settlement of differences between the two Governments. The meeting was unproductive of good. Again the Persian troops advanced to Herat itself under the command of Muhammad Mirza, son of 'Abbâs; but the news of his father's death caused the commander to break up his camp and return to Mashhad.

Sir Gore Ouseley returned to England in 1814, in which year Mr Ellis, assisted by Mr Morier—whose "Hajji Baba" is the un-failing proof of his ability and deep knowledge of Persian character—negotiated on the part of Great Britain the treaty of Tehran. England was to provide troops or a subsidy in the event of unprovoked invasion, while Persia was to attack the Afghans should they invade India. Captain Willock succeeded Mr Morier as chargé d'affaires in 1815, and since that period Great Britain has always been represented at the Persian court. It was in Fath 'Ali Shâh's reign that Henry Martyn was in Persia, and completed his able translation of the New Testament into the language of that country. He had met Malcolm and Mackintosh at Bombay, and Sir John had recommended him to Sir Gore Ouseley, to whose mission he officiated as chaplain prior to departure from Shirâz in 1812. Martyn died at Tokat in Asia Minor, on his homeward journey. Little more remains to be here narrated of the days of Fath 'Ali Shâh. Among the remarkable occurrences may be noted the murder at Tehran in 1828 of M. Grebayaïoff, the Russian envoy, whose conduct in forcibly retaining two women of Erivan provoked the interference of the mullas and people. To repair the evil consequences of this act a conciliatory embassy, consisting of a young son of the crown prince and some high officers of the state, was despatched to St Petersburg. Shortly afterwards the alliance with Russia was strengthened, and that with England slackened in proportion. There were reasons why this should be the outcome of the previous situation, some of which will be self-evident to the reader of blue-books, while others will remain mere matters of opinion.

As an Oriental despot Fath 'Ali Shâh was neither cruel nor unjust, but acts of cruelty and injustice were committed under his sanction. The treatment of Nâdir Mirza has been mentioned. That of the old minister, Hajji Ibrâhîm, was perhaps more barbarous still. His fondness for sport and his literary tastes gave him the capacity of uniting his conversation to visitors of different kinds; but the love of money was a drawback to the exercise of his sympathies, and the loss of territory to Russia, involving as it did loss of revenue, was not calculated to arouse any strong sentiment of friendship towards the czar's European allies. Morier's description of the king's person was thus given in 1809.

"He is a man of pleasing manners and an agreeable countenance, with an aquiline nose, large eyes, and very arched eyebrows. His face is obscured by an immense beard and mustachios, which are kept very black; and it is only when he talks and smiles that his mouth is discovered. His voice has once been fine, and is still harmonious, though now hollow, and obviously that of a man who has led a free life. . . . He was seated on a species of throne called the *takht-i-tâs*, or the throne of the peacock, which is raised 3 feet from the ground, and appears an oblong square of 8 feet broad and 12 long. We could see the bust only of his majesty, as the rest of his body was hidden by an elevated railing, the upper work of the throne, at the corners of which were placed several ornaments of vases and toys. The back is much raised; on

each side are two square pillars, on which are perched birds, probably intended for peacocks, studded with precious stones of every description, and holding each a ruby in their beak. The highest part of the throne is composed of an oval ornament of jewelry, from which emanate a great number of diamond rays."

One passage may be added as not only significant of the individual monarch but also of the national character.

"When the audience was finished, the king desired one of his ministers to inquire from J'âfir 'Ali Khân (the English Agent) what the foreigners said of him, and whether they praised and admired his appearance."

Fath 'Ali Shâh had a numerous family. Agreeably to the Persian custom, asserted by his predecessors, of nominating the heir-apparent from the sons of the sovereign without restriction to seniority, he had passed over the eldest, Muhammad 'Ali, in favour of a junior, 'Abbâs; but, as the nominee died in the lifetime of his father, the old king had proclaimed Muhammad Mirza, the son of 'Abbâs, and his own grandson, to be his successor. Why a younger son had been originally selected, to the prejudice of his elder brother, is differently stated by different writers. The true reason was probably the superior rank of his mother. Markham's estimate of the character of the crown prince, based upon conflicting evidence, but apparently correct, is that "he possessed enlightened views," was "desirous of improving the condition of his country," yet "was deficient in talent, rather weak-minded, and loved flattery."

It is worthy of remark that the selection of Muhammad Mirza was made with the express concurrence of the British and Russian Governments, communicated to their respective representatives at the shâh's court, and the British minister at St Petersburg was instructed to express to the Government of the czar the gratification of his own Government at finding that the two powers were "acting with regard to the affairs of Persia in the same spirit," and were "equally animated by a sincere desire to maintain not only the internal tranquillity but also the independence and integrity of Persia."

Muhammad Shâh was twenty-eight years old when he came to Muhammad the throne in 1834. He died at the age of forty-two, after a reign mad of about thirteen and a half years. His accession was not publicly Shâh notified for some months after his grandfather's death, for it was necessary to clear the way of all competitors, and there were two on this occasion,—one 'Ali Mirza, governor of Tehran, who actually assumed a royal title, and one Hasan 'Ali Mirza, governor of Shirâz. Owing to the steps taken by the British envoy, Sir John Campbell, assisted by Colonel Bethune, at the head of a considerable force, supplied with artillery, the opposition of the first was neutralized, and Muhammad Shâh, entering Tehran on 2d January, was proclaimed king on the 31st of the same month. It cost more time and trouble to bring the second to book. Hasan 'Ali, "farmân-farmâ," or commander-in-chief, and his brother and abettor, had an army at their disposal in Fârs. Sir Henry Lindsay Bethune marched his soldiers to Ispahan to be ready to meet them. An engagement which took place near Kumîshâh, on the road between Ispahan and Shirâz, having been successful, the English commander pushed on to the latter town, where the two rebel princes were seized and imprisoned. Forwarded under escort to Tehran, they were, according to Watson, ordered to be sent on thence as state prisoners to Ardabil, but the farmân-farmâ died on the way, and his brother was blinded before incarceration. Markham, however, states that both 'Ali Mirza and Hasan 'Ali were allowed to retire with a small pension, and that no atrocities stained the beginning of the reign of Muhammad Shâh. It is presumed that the fate of the prime minister, or "kâim-makâm," who was strangled in prison, was no more than an ordinary execution of the law. This event, and the prevalence of plague and cholera at Tehran marked somewhat gloomily the new monarch's first year.

The selection of a premier was one of the first weighty questions for solution. A member of the royal family, the "asafu 'd-daulah" governor of Khurâsan, left his government to urge his candidature for the post. The king's choice, however, fell on Hajji Mirza Aghâsi, a native of Erivan, who in former years, as tutor to the sons of 'Abbâs Mirza, had gained a certain reputation for learning and a smattering of the occult sciences, but whose qualifications for statesmanship were craftiness and suspicion. Such a counsellor was hardly fitted for Muhammad Shâh, whose natural bigotry could scarcely fail to accept the short-sighted policy which the minister would be sure to advocate. As might have been anticipated, the hajji fell into the hands of Russia, represented by Count Simonich, who urged him to a fresh expedition into Khurâsan and the siege of Herat. There was no doubt a plausible pretext for both proposals. The chiefs, reduced to temporary submission by 'Abbâs Mirza, had again revolted; and Shâh Kanran, supported by his wazir, Yar Muhammad, had broken those engagements and pledged on the strength of which Fath 'Ali Shâh had withdrawn his troops. In addition to these causes of offence he had appropriated the province of Sistan, over which Persia had long professed to hold the rights of suzerainty. But the king's ambition was to go farther than retaliation or chastisement. He refused to acknowledge any right to separate government whatever on the part of the Afghans.

¹ Correspondence relating to Persia and Afghanistan, London, 1839.

1836-1848. and Kandahar and Ghazni were to be recovered, as belonging to the empire of the Safawi dynasty. The advice of the British envoy was dissuasive in this respect, and therefore distasteful.

Sir John Campbell, in less than a year after the sovereign's installation, went home, and was succeeded as British envoy by Mr Henry Ellis. The change in *personnel* signified also a transfer of superintendence of the Persian legation, which passed from the Government in India to the authorities in England. In 1836, on the return home of Mr Ellis, Mr M'Neill became chargé d'affaires.

About this time the arrangements for the expedition were matured. It was to commence with a campaign against the Türkmans,—Herat being its later destination. The king would command in person, and the army would be formidable in numbers and war material. Such counter-proposals as Mr Ellis had suggested for consideration, in his earnest endeavours to divert the shah from his purpose, had been politely put aside, and the counsels of the war-party had prevailed. Should the main operations designed be successful, and Herat fall to Persia, it was impossible to foretell the result; and the case was now more than ever complicated by the action of the Bārakzai chiefs of Kandahar, who had sent a mission to Tehran to offer assistance against their Sádúzai rival at Herat. Fresh provocation had, moreover, been given to the shah's Government by the rash and incapable Kamran.

About the close of the summer the force moved from Tehran. The royal camp was near Astrábad in November 1836. Food was scarce; barley sold for ten times the usual price, and wheat was not procurable for any money. The troops were dissatisfied, and, being kept without pay and on short rations, took to plundering. There had been operations on the banks of the Gurgan, and the Türkmans had been driven from one of their strongholds; but little or no progress had been made in the subjection of these marauders, and the Heratis had sent word that all they could do was to pay tribute, and, if that were insufficient, the shah had better march to Herat. A military council was held at Shahrud, when it was decided to return to the capital and set out again in the spring. Accordingly the troops dispersed, and the sovereign's presence at Tehran was taken advantage of by the British minister to renew his attempts in the cause of peace. But remonstrances were vain, and, although on the present occasion Count Simonich ostensibly aided Mr M'Neill, no argument was of any avail to divert the monarch from his purpose. He again set out in the summer, and, invading the Herat territory in November 1837, began the siege on the 23d of that month.

Siege of
Herat.

Not until September in the following year did the Persian army withdraw from before the walls of the city; and then the movement only took place on the action of the British Government. Ordinary pressure and argument had failed. It had become necessary to use strong language, and to resort to strong measures, the purport of which could not be mistaken. Mr M'Neill, who had joined the Persian camp on 6th April, left it again on 7th June. He had in this interval done all in his power to effect a reasonable agreement between the contending parties by personal communication with Afghans in Herat as well as with the shah and his minister; but both in this respect and in the matter of a commercial treaty with England, then under negotiation, his efforts had been met with evasion and latent hostility, and this last feeling had been notably evinced in the seizure and violent treatment of a messenger bearing an official communication from a foreign Government to the British minister at Tehran. The Russian envoy, who had appeared among the tents of the besieging army almost simultaneously with his English colleague, no sooner found himself alone in his diplomacy than he resumed his aggressive counsels, and little more than a fortnight had elapsed since Mr M'Neill's departure when a vigorous assault, planned, it is asserted, by Count Simonich himself, was made upon Herat. The Persians attacked at five points, at one of which they would in all likelihood have been successful had not the Afghans been aided by Eldred Pottinger, a young Englishman, who with the science of an artillery officer combined a courage and determination which inevitably influenced his subordinates. Through his exertions the assailants were beaten back, as they were also independently at the other points noted. Still the garrison was disheartened; and, had not Colonel Stoddart's arrival on 11th August to threaten the shah with British intervention put a stop to further action, there is no knowing what mischief might have resulted from the incompetence and intrigues of Kamran and his advisers. As it happened, Colonel Stoddart's firm attitude and refusal to allow any but British mediators to decide the pending dispute won the day; and that officer was able to report that on 9th September Muhammad Sháh had "mounted his horse" and gone from before the walls of the beleaguered city.

The siege of Herat was the great event in the reign of Muhammad Sháh. It lasted for nearly ten months; and the story of its progress is a strange record of a desultory campaign in which intrigue and conspiracy were the continuously working agencies, while military action was spasmodic. The British expedition in support of Sháh Shuj'a, which may be called its natural consequence, involves a question foreign to the present narrative. Persia's con-

nexion with Afghanistan can only be partial, and confined to Herat, Kabul, Kandahar, or one section of the country only. A united Afghanistan would always be distasteful to her.

The remainder of the king's reign was marked by new difficulties with the British Government; the rebellion of Agha Khán Mahláti, otherwise known as the chief of the Assassins; a new rupture with Turkey; the banishment of the asafu 'd-daulah, governor of Khurásan, followed by the insurrection and defeat of his son; and the rise of the sect of the Bábis. The first of these only calls for any detailed account.

In the demands of the British Government was included the cession by Persia of places such as Ghurian, Farah, and Sabzáwár, which had been taken during the war from the Afghans, as well as reparation for the violence offered to the courier of the British legation. The shah, in ill-humour at his fruitless expedition to Herat, deferred compliance with these requisitions, and indeed sought to evade them altogether. M'Neill gave a certain time for decision, at the end of which, no satisfactory reply having reached him, he broke off diplomatic relations, ordered the British officers lent to the shah to proceed towards Baghdád *en route* to India, and retired to Arzrum with the members of his mission. On the Persian side, charges were made against M'Neill, and a special envoy, sent to England to support them, was instructed to represent the so-called injuries which British diplomatic action had inflicted on the shah. An endeavour was at the same time made to interest the cabinets of Europe in influencing the British Government on behalf of Persia. The envoy managed to obtain an interview with the minister of foreign affairs in London, who, in July 1839, supplied him with a statement, fuller than before, of all English demands upon his country. Considerable delay ensued, but the outcome of the whole proceedings was not only acceptance but fulfilment of all the engagements contracted. In the meantime the island of Karak had been taken possession of by an expedition from India.

On 11th October 1841 a new mission arrived at Tehran from London, under Mr (now Sir) John M'Neill, to renew diplomatic relations. It was most cordially received by the shah, and it need scarcely be added that, as one of its immediate results, Karak was evacuated by the British-Indian troops.

There had been a long diplomatic correspondence in Europe on the proceedings of Count Simonich and other Russian officers at Herat. Among the papers is a very important letter from Count Nesselrode to Count Pozzo di Borgo in which Russia declares herself to be the first to counsel the shah to acquiesce in the demand made upon him, because she found "justice on the side of England" and "wrong on the side of Persia." She withdrew her agent from Kandahar and would "not have with the Afghans any relations but those of commerce, and in no wise any political interests." She recalled to the English cabinet her wishes before expressed.

"To re-establish promptly the relations of friendship between the courts of London and of Tehran; to put an end to the hostile measures adopted in the Persian Gulf; to abstain from disturbing the tranquillity of the people of the centre of Asia by nourishing their animosities; to be contented with competing in industry in those vast countries, but not to engage there in a struggle for political influence; to respect the independence of the intermediate countries which separate the her own British territory. Such, it was emphatically stated, was "the system which England and Russia have a common interest invariably to pursue, in order to prevent the possibility of a conflict between these two great powers, which, that they may continue friends, require to remain each within its own limits, and not to advance against each other in the centre of Asia."¹

Agha Khán's rebellion was fostered by the defection to his cause of a large portion of the force sent against him; but he yielded at last to the local authorities of Karman and fled the province and country. He afterwards resided many years at Bombay, where, while maintaining among natives a quasi-spiritual character, he is better known among Europeans for his doings on the turf.

The quarrel with Turkey, though specific in the case of individual actors, was generally about frontier relations and transgressions of the border. Eventually the matter was referred to an Anglo-Russian commission, of which Colonel Williams (since Sir Fenwick Williams of Kars) was president. A massacre of Persians at Karbela might have seriously complicated the dispute, but, after a first burst of indignation and call for vengeance, an expression of the regret of the Ottoman Government was accepted as a sufficient apology for the occurrence.

The rebellion of the asafu 'd-daulah, maternal uncle of the shah, was punished by exile, while his son, after giving trouble to his opponents, and once gaining a victory over them, took shelter with the Türkmans.

Sa'id Muhammad 'Alí, founder of the Bábis, was born at Shíráz about 1810.² Adopting a life of seclusion, and practising a kind of exaggerated Súfism, he followed for some time the calling of a dervish, and when at Kázimain near Baghdád he openly asserted his pretensions as a prophet. The Turkish authorities

¹ Correspondence relating to Persia and Afghanistan, London, 1839. The annexation of Sind and the Panjab will, it is presumed, be given as excuses for the partial absorption of Turkestan. But the cases are in no way analogous. The occupation by Russia of the Persian island of Ashuráda in the south-east corner of the Caspian followed the British reverses in Kabul of 1841.

² Lady Sheil. Gobineau says 1824.

would have put him to death, but the Persian consul, claiming him as a subject, saved his life, and sent him to his native place. Thenceforward his career is strange and adventurous, and even when he himself had been committed to prison his agents were employed in promulgating his doctrine, with sufficient success to occasion the issue of a decree making it a capital crime to profess the tenets of Bábism. More will be said on the subject shortly.

Before closing the reign of Muhammad Sháh note should be taken of a prohibition to import African slaves into Persia, and a commercial treaty with England,—recorded by Watson as gratifying achievements of the period by British diplomatists. The French missions in which occur the names of MM. de Lavalette and de Sartiges were notable in their way, but somewhat barren of results.

In the autumn of 1848 the sháh was seized with the malady, or combination of maladies, which caused his death. Gout and erysipelas had, it is said,¹ ruined his constitution, and he died at his palace in Shamiran on 4th September. He was buried at Kúm, where is situated the shrine of Fátima, daughter of Imám Riza, by the side of his grandfather, Fath 'Alí, and other kings of Persia. In person he is described as short and fat, with an aquiline nose and agreeable countenance.²

On the occasion of his father's death, Násrú 'd-Din Mirza, who had been proclaimed wálí 'ahd, or heir-apparent, some years before, was absent at Tabriz, the headquarters of his province of Adarbáijan. Colonel Farrant, then chargé d'affaires on the part of the British Government, in the absence of Colonel Sheil, who had succeeded Sir John McNeill, had, in anticipation of the sháh's decease and consequent trouble, sent a messenger to summon him instantly to Tehran. The British officer, moreover, associated himself with Prince Dolgorouki, the representative of Russia, to secure the young prince's accession; and there was no doubt in the minds of the wiser lookers-on that, if the two diplomatists were really of one mind in the matter, they would attain their end in spite of all obstacles.

They did so after a time, and with the aid of the queen-mother, who, as president of the council, showed much judgment and capacity in conciliating adverse parties. But the six or seven weeks which passed between the death of the one king and the coronation of the other proved a disturbed interval, and full of stirring incident. The old minister, Hajji Mirza Aghási, incurred the displeasure of the influential part of the community by shutting himself up in the royal palace with 1200 followers, and had to take refuge in the sanctuary of Sháh 'Abdu'l-'Azim near Tehran. On the other hand Mirza Agha Khán, a partisan of the asafu 'd-daulah, and himself an ex-minister of war, whom the hajji had caused to be banished, was welcomed back to the capital. At Ispahan, Shiráz, and Karman serious riots took place, which were with difficulty suppressed. While revolution prevailed in the city, robbery was rife in the province of Yazd; and from Kazvin the son of 'Alí Mirza, otherwise called the "zillu 's-sultan," the prince-governor of Tehran, who disputed the succession of Muhammad Sháh, came forth to contest the crown with his cousin, the heir-apparent. The last-named incident soon came to an inglorious termination for its hero. But a more serious revolt was in full force at Mashhad when, on the 20th of October 1848, the young sháh entered his capital and was crowned at midnight king of Persia.

The chief events in the long reign of the present sháh, Násrú 'd-Din, may be reviewed under four heads: (1) the insurrection in Khurásan, (2) the insurrection of the Bábis, (3) the fall of the amírú 'n-nizám, and (4) the war with England.

It has been stated that the asafu 'd-daulah was a competitor with Hajji Mirza Aghási for the post of premier in the cabinet of Muhammad Sháh, that he was afterwards, in the same reign, exiled for rising in rebellion, and that his son, the salár, took shelter with the Türkmen. Some four months prior to the late king's decease the latter chief had reappeared in arms against his authority; he had gained possession of Mashhad itself, driving the prince-governor, Ilaniza Mirza, into the citadel; and so firm was his attitude that Yar Muhammad of Herat, who had come to help the Government officials, had retired after a fruitless co-operation, drawing away the prince-governor also. The salár now defied Murád Mirza, Násrú 'd-Din's uncle, who was besieging the city; he found secret means of obtaining money and supplies; and, by occasionally repelling an assault or effecting a skilful sortie, he kept up a prestige of power, which, added to his personal popularity, commanded the sympathy and good wishes of the multitude. In April 1850, after a siege of more than eighteen months, fortune turned against the bold insurgent, and negotiations were opened between the citizens and besiegers for the surrender of the town and citadel. Treachery may have had to do with the result, for when the sháh's troops entered the holy city the salár sought refuge in the mosque of Imám Riza, and was forcibly expelled. He and his brother were seized and put to death, the instrument used being, according to Watson, "the bowstring of Eastern story." The conqueror of Mashhad, Murád Mirza, became afterwards himself the prince-governor of Khurásan.

¹ Watson.

² Markham.

Lady Shen has written a graphic account of the death of Sa'id Muhammad Alí. After repeated arrests and warnings to no purpose the spread of his doctrines had become so rapid among all classes that it was thought necessary to remove him by the severest punishment of the law. He was conveyed to Tabriz, and brought out in the great square for execution.

"A company of soldiers was ordered to despatch Báb by a volley. When the smoke had cleared away Báb had disappeared from sight. It had so happened that none of the balls had touched him, and, prompted by an impulse to preserve his life, he rushed from the spot. Had Báb possessed sufficient presence of mind to have fled to the bazar . . . he would in all probability have succeeded in effecting his escape. A miracle palpable to all Tabriz would have been performed, and a new creed would have been established. But he turned in the opposite direction, and hid himself in the guard-room, where he was immediately discovered, brought out, and shot. His body was thrown into the ditch of the town, where it was devoured by the half-wild dogs which abound outside a Persian city. Báb possessed a mild and benignant countenance, his manners were composed and dignified, his eloquence was impressive, and he wrote rapidly and well."

Later on she wrote—

"This year (1850) seven Bábis were executed at Tehrán for an alleged conspiracy against the life of the prime minister. Their fate excited general sympathy, for every one knew that no criminal act had been committed, and suspected the accusation to be a pretence. . . . Previously to decapitation they received an offer of pardon, on the condition of reciting the *kalama* (or Muhammadan creed). . . . It was rejected, and these visionaries died steadfast in their faith. . . . In Zanjan the insurrection, or the religious movement, as the Bábis termed it, broke out with violence. This city is only 200 miles from Tehrán, midway to Tabriz. At its head was a mulla of repute and renown, who, with his associates, retired into an angle of the city, which they strengthened as best they could. For several months they defended themselves with unconquerable resolution against a large force in infantry and guns, sent against them from Tehrán. It was their readiness to meet death that made the Bábis so formidable to their assailants. From street to street, from house to house, from cellar to cellar, they fought without flinching. All were killed at their posts, excepting a few who were afterwards bayoneted by the troops in cold blood."

In the summer of 1852 his majesty was attacked, while riding in the vicinity of Tehrán, by four men, one of whom fired a pistol and slightly wounded him. This man was killed, and two others were captured by the royal attendants; the fourth jumped down a well. The existence of a conspiracy was then discovered, in which some forty persons were implicated; and ten of the conspirators (one a young woman) were put to death,—some under cruel torture. A short reign of terror then ensued which is well illustrated in the following extract from Watson's *History*.

"The prime minister . . . was fearful of drawing down upon himself and his family the vengeance of the followers of the Báb; and, in order that others might be implicated in these executions, he hit upon the device of assigning a criminal to each department of the state; the several ministers of the Sháh being thus compelled to act as executioners. The minister for foreign affairs, the minister of finance, the son of the prime minister, the adjutant-general of the army, and the master of the mint, each fired the first shot, or made the first cut with a sabre, at the culprits assigned to their several departments, respectively. The artillery, the infantry, the camel-artillery, and the cavalry, each had a victim.³ . . . But the result of all this slaughter was, as might have been expected, to create a feeling of sympathy for the Bábis, whose crime was lost sight of in the punishment which had overtaken them. They met their fate with the utmost firmness, and none of them cared to accept the life which was offered to them on the simple condition of reciting the Muslim creed. While the lighted candles were burning the flesh of one follower of the Báb, he was urged by the chief magistrate of Tehrán to curse the Báb and live. He would not renounce the Báb; but he cursed the magistrate who tempted him to do so, he cursed the Sháh, and even cursed the prophet Muhammad, his spirit rising superior to the agony of his torture."

The movement, however, was not only felt in Tehrán and Zanjan but also in Mazandaran, Fars, Karman, and Tabriz; and, in spite of the fearful punishments with which the professors of the doctrine have been visited, the complete extinction of Bábism by fire and sword is a consummation hardly to be act within the range of human probability.

Mirza Taki, the amírú 'n-nizám (vulgarly amír nizám), or commander-in-chief, was a good specimen of the self-made man of Mirza Persia. He was the son of a cook of Bahrám Mirza, Muhammad Taki Sháh's brother, and he had filled high and important offices of state and amassed much wealth when he was made by the young sháh Násrú 'd-Din, on his accession, both his brother-in-law and his prime minister. The choice was an admirable one; he was honest, hard-working, and liberal according to his lights; and the services of a loyal and capable adviser were secured for the new régime. For the rebellion in Khurásan and all emergencies that occurred during his three years' tenure of office, he was the same active and intelligent mentor that he had been when associated with the prince in his government of Adarbáijan. Unfortunately, he did not boast the confidence of the queen-mother; and this circumstance greatly strengthened the hands of those enemies whom an honest minister must ever raise around him in a corrupt Oriental state. For a time the sháh closed his eyes to the accusations and insinuations breathed against him; but at last he fell under the evil influence of designing counsellors, and acts which should have redounded to the minister's credit became the charges on which he lost his office and his life. He was credited with an intention to grasp in his own hands the royal power; his influence over the army was

³ "Even the Sháh's admirable French physician, the late lamented Dr Cloquet, was invited to show his loyalty by following the example of the rest of the court. He excused himself, and pleasantly said that he killed too many men professionally to permit him to increase their number by any voluntary homicide on his part" (Lady Sheil).

cited as a cause of danger; and on the night of 13th November 1851 he was summoned to the palace and informed that he was no longer premier. Mirza Agha Khān, the "itīmādu 'd-daulah," was named to succeed him, and had been accordingly raised to the dignity of "sadr 'azim." As the hostile faction pressed the necessity of the ex-minister's removal from the capital, he was offered the choice of the government of Fārs, Ispahan, or Kūm. He declined all; but, through the mediation of Colonel Sheil, he was afterwards offered and accepted Kashan. It is not probable that Mirza Taki, once fallen from his high estate, would have long survived, or rather would have been long suffered by his rivals or foes to survive, this crisis in his career. For intriguers and charlatans he was too real a character to be harmless, and means would have doubtless been devised to get rid of him altogether. As it happened, opportunity was taken of an ill-timed if well-meant interference on his behalf of the Russian legation, and the shāh's ire was aroused more than ever against him.

"Once having got him out of the way," writes Major Evan Smith from information gathered on the scene of the tragedy he is recounting, "his enemies had full play, and, forty days after his banishment, prevailed upon the king to issue orders for his execution. . . . The executioners arrived at Fin, and, seeing the ex-minister, told him that they had been sent by the shah to ask after his health. Mirza Taki Khān at once saw that his fate was sealed; he merely asked that, instead of having his throat cut, he might be allowed to die in his own way. The request was granted; he went into the hammām, where the king's barber opened the two principal arteries in each arm, and he quietly sat there and bled to death."¹

Rupture
with
England.

When England was engaged in the Crimean War of 1854-55 her alliance with a Muhammadan power in no way added to her popularity or strengthened her position in Persia. The Sunni Turk was almost a greater enemy to his neighbour the Shī'ah than the formidable Muscovite, who had curtailed him of so large a section of his territory west of the Caspian. Hence during the war Persia coquetted with Russia as to a possible secret alliance, rather than with France or England. Moreover, since Sir John McNeill's arrival in Tehran in 1841, formally to repair the breach with Muhammad Shāh, there had been little differences, demands, and explanations, which were portentous of a storm in the future; and these symptoms had culminated in 1856, the year of the peace with Russia. As to Afghanistan, the wazīr Yar Muhammad had in 1842, when the British troops were perishing in the passes, or otherwise in the midst of dangers, caused Kamran to be suffocated in his prison. Since that event he had himself reigned supreme in Herat, and, dying in 1851, was succeeded by his son Sa'id Muhammad. This chief soon entered upon a series of intrigues in the Persian interests, and, among other acts offensive to Great Britain, suffered one 'Abbās Kūli, who had, under guise of friendship, betrayed the cause of the salār at Mashhad, to occupy the citadel of Herat, and again place a detachment of the shāh's troops in Ghurian. Colonel Sheil remonstrated, and obtained a new engagement of non-interference with Herat from the Persian Government, as well as the recall of 'Abbās Kūli. In September 1855 Muhammad Yūsuf Sādūzāi seized upon Herat, putting Sa'id Muhammad to death with some of his followers who were supposed accomplices in the murder of his uncle Kamran.

About this time Kohan Dil Khān, one of the chiefs of Kandahar, died, and Dost Muhammad of Kabul annexed the city to his territory. Some relations of the deceased chief made their escape to Tehran, and the shāh, listening to their complaint, directed the prince-governor of Mashhad to march across to the eastern frontier and occupy Herat, declaring that an invasion of Persia was imminent. Such was the situation when the Hon. Mr Murray was fulfilling his second year of duty at the legation in Tehran. He had relieved Mr Taylour Thomson, Colonel Sheil's *locum tenens*, at a time when relations were somewhat strained, and coolness and want of confidence were daily becoming more apparent between the British representative and the court to which he was accredited. The following passage is from a recently-published work treating of the place and period.²

"At the end of 1855, our relations with the court of Tehran were anything but satisfactory. Even the outward semblance of civility towards the English representative was disregarded, and, in like manner, the veneer of courtesy was wanting in the official communications bearing the sign-manual of the Shah or his responsible minister. So great was the tension of ill-feeling occasioned, that our envoy withdrew to Baghdad, declining to resume the functions of his office until ample apology had been made, by certain persons named, for certain offences charged, after a manner detailed by himself. A crisis such as this may, it is true, be brought about in Persia by ourselves, through defective diplomacy and ignorance of the native character, ways, prejudices, and, to some extent, language; but it may also arise from many other causes—among others, a wilful pre-determination on the part of the local government. Once instructed to give offence to strangers and provoke a rupture, Persia is a wonderful adept in fulfilling his instructions; and will prove as capable in bawling insult and inouendo as in the more complex and refined game of compliment and cajolery. In the present instance, there was in the attitude of Persia evidence of wilfulness and an exhibition of more than ordinary temper; for not only were the Shah's own words full of insult, but his expressions were supplemented by deeds. Finally, by sending a large military expedition under his royal uncle, Prince Murād Mirza, to take possession of Herat, he showed his contempt of treaties, and aimed a blow at England's Eastern policy in the most accepsive part.

"This occurred in December, the same month in which the British envoy quitted Teheran. In the first week of 1856, negotiations were opened at Constantinople, when the Persian chargé d'affaires in that city related his version of the quarrel to our well-known ambassador there. Discussion was prolonged for some months in 1856, during which an 'ultimatum' from Lord Clarendon had been put forward without avail; and in October, a plenipotentiary named Farrukh Khān arrived at the Porte with the Shah's instructions to settle the whole matter in dispute. But although this personage went so far as to sign a declaration that Herat should immediately be evacuated by the troops of his sovereign, other engagements were required from him which he could not undertake, and the attempt at a settlement failed. Lord Stratford presented a new 'ultimatum' on November 22d; but it was then too late to avert an outbreak. The news that Herat had been captured on October 29th, and that three proclamations declaring war against Persia had been issued by the governor-general of India on November 1st, soon reached Constantinople, and Farrukh Khān's occupation was, for the moment, gone."

In less than three weeks after issue by the governor-general of India of the proclamation of war with Persia the Sind division of the field force left Karachi (Kurrachee). On 13th January following the Bombay Government orders notified the formation of a second division under Lieutenant-General Sir James Outram. Before the general arrived the island of Karak and part of Bushahr had both been occupied, and the fort of Rishir had been attacked and carried. After the general's arrival the march upon Barazjūn and the engagement at Khushab—two places on the road to Shirāz—and the operations at Muhamrah and the Kārin river decided the campaign in favour of England. On 5th April, at Muhamrah, Sir James Outram received the news that the treaty of peace had been signed in Paris, where Lord Cowley and Farrukh Khān had conducted the negotiations. The stipulations regarding Herat were much as before; but there were to be apologies made to the mission for past insolence and rudeness, and the slave trade was to be suppressed in the Persian Gulf.

With the exception of a small force retained at Bushahr under General John Jacob for the three months assigned for execution of the ratifications and giving effect to certain stipulations of the treaty with regard to Afghanistan, the British troops returned to India, where their presence was greatly needed, owing to the outbreak of the mutiny. The envoy retraced his steps from Baghdad to Tehran, to receive the excuses of the shāh's minister. Before Mr Murray's arrival, however, an act of so-called retaliation, but savouring rather of sheer revenge, had been perpetrated, which could not have commended itself to the mind of an English diplomatist on the spot. One of the articles of the treaty of peace provided for the release of all prisoners taken by the Persians at Herat. Among these was the ex-ruler Muhammad Yūsuf, who, having resisted the besieging army, had been brought captive to Tehran. The provision of mercy was in his case tantamount to a sentence of savage death, for the relatives of Sa'id Muhammad (whom he had slain in return for the murder of his uncle Shāh Kamran) awaited his release literally to hew him to pieces in front of the Kasri Kajār, a royal palace about 5 miles from the walls of the capital. When Colonel Taylor and the officers deputed with him to certify the evacuation of Herat by the Persian soldiers reached their destination, they were received by a newly-appointed governor, Sultan Ahmad Khān, better known as Sultan Jān, nephew and son-in-law of the amir Dost Muhammad. It is unnecessary to refer to other then the political reasons of the war. They soon ceased to interest the minds of even European residents in Persia; and the war became a thing of the past. Mr Murray was succeeded in 1859 by Sir Henry Rawlinson as British envoy. No more popular nomination could have been made than that of this justly-distinguished Oriental statesman; but he barely remained a year at the work. Retiring at his own request, he was succeeded by Mr Charles Alison, whose marvellous acquaintance with Turks and their language had rendered him an invaluable secretary at Constantinople.

It now only remains to mention those incidents which have engaged the attention of the British Government, or in which British officers have had to play a part. Such are the establishment of a telegraph, the settlement of the Perso-Baluch, and the arbitration on the Perso-Afghan frontier. The proceedings of Russia in the countries east of the Caspian and bordering on the Oxus have, moreover, a bearing more or less direct on the interests of Great Britain, with especial reference to her Indian empire.

The question of constructing a telegraph in Persia as a link in the overland line to connect England with India was broached in Tehran by Colonel Patrick Stewart and Captain Champain, officers of engineers, in 1862, and an agreement on the subject concluded by Mr Edward Eastwick, when chargé d'affaires, at the close of that year. Three years later a more formal convention, including a second wire, was signed by Mr Alison and the Persian foreign minister; meantime the work had been actively carried on, and communication opened on the one side between Bushahr and Karachi and the Makran coast by cable, and on the other between Bushahr and Baghdad via Tehran. The untrustworthy character of the line through Asiatic Turkey caused a subsequent change of direction; and an alternative line—the Indo-European—from London to Tehran, through Russia and along the eastern shores of the Black Sea, was constructed, and has worked well since 1872.

¹ *Eastern Persia*, vol. i. p. 156. The palace of Fin, near Kashan, was the residence of the amir nizam.

² James Outram: a Biography, vol. ii., London, 1880.

in conjunction with the Persian land telegraph system and the Bushahr-Karachi line.¹

The Sistan mission, under Major-General (afterwards Sir Fredric) Goldsmid, left England in August 1870, and reached Tehran on 3d October. Thence it proceeded to Isfahan, from which city it moved to Baluchistan, instead of seeking its original destination. Difficulties had arisen both in arranging the preliminaries to arbitration and owing to the disordered state of Afghanistan, and it was therefore deemed advisable to commence operations by settling a frontier dispute between Persia and the Kelat state. Unfortunately, the obstructions thrown in the way of this settlement by the Persian commissioner, the untoward appearance at Bampur of an unexpected body of Kelatis, and the absence of definite instructions marred the fulfilment of the programme sketched out; but a line of boundary was proposed, which has since been accepted by the litigants, and which, except perhaps in the case of a small district on the north, has, it is believed, been generally respected. In the following year the same mission, accompanied by the same Persian commissioner, proceeded to Sistan, where it remained for more than five weeks, prosecuting its inquiries, until joined by another mission from India, under Major-General (afterwards Sir Richard) Pollock, accompanying the Afghan commissioner. Complications then ensued by the determined refusal of the two native officials to meet in conference; and the arbitrator had no course available but to take advantage of the notes already obtained on the spot, and return with them to Tehran, there to deliver his decision. This was done on 19th August 1872. The contending parties appealed to the British secretary of state for foreign affairs, as provided by previous understanding; but the decision held good, and was eventually accepted on both sides (see above, p. 619).

The Russo-Persian boundary question of 1881 might have been considered to belong to history, but has been treated elsewhere. It is, however, a strictly pacific arrangement, and has nothing in common with the treaties of Gulistan or Turkmanchái.

Mr Alison died at Tebran in April 1872. Mr Ranald Thomson, whose experience of Persia is of thirty-five years' duration, then

became chargé d'affaires, and held the post until relieved by his brother, Mr (since Sir) Tylour Thomson from Chili. On the retirement of the latter in April 1879, Mr (since Sir Ranald) Thomson succeeded as envoy. During the later years of the reign of Násru'd-Din several Englishmen have distinguished themselves as explorers in the north-east. Among them the names of O'Donovan, Napier, Baker, Gill, Clayton, and Stewart will be readily remembered. Colonels Bateman-Champain, Murdoch Smith, Sir Oliver St John, Beresford Lovett, and the late Major Pierson, all engineer officers connected with the telegraph, have made their mark in the country. Násru'd-Din Sháh, unlike his predecessors, has paid two visits to Europe,—one in 1873 and one in 1879. On the first occasion only he extended his journey to England, and was then attended by his "sadr 'azim," or prime minister, the late Mirza Husáin Khán, an able and enlightened adviser, withal a Grand Cross of the Star of India. His second visit was to Russia, Germany, France, and Austria, but he did not cross the Channel. Among the sháh's latest projects are the possession of a little fleet in the Persian Gulf, and of some vessels on the Kárin. In 1884 it was stated that a thousand-ton steamer (the "Persepolis") and a smaller one for river navigation were actually in course of construction. The route by the Kárin was to be opened, and a carriageable road constructed from Shústar to Tehran, via Dizful, Khuramabad, Búrjird, Sultanabad, and Kúm. Orders had been given for building two tugs to pull native craft up the Kárin. The arrangements for the road, transport, and administration from Muhamrah to Tehran were confided to General Houtum Schindler, the inspector-general of Persian telegraphs.²

The works which have been mainly followed and quoted in the above historical sketch are Sir John Malcolm's *History of Persia*; the more modern histories by Robert Grant Watson and Clements Markham; the *Travels of Venetians in Persia*, edited by Lord Stanley of Alderley, printed for the Hakluyt Society (1873); and the *History of the late Revolutions in Persia*, taken from the memoirs of Father Krusinski, procurator of the Jesuits at Isfahán (1738). Those which have contributed information in a minor degree are Lady Sheik's *Diary in Persia*; Erskine's *Bábár*; Chardin's *Travels*, annotated by Langléa; Professor Creasy's *History of the Ottoman Turks*; Ferrier's *History of the Afghans*; *Telegraph and Travel* (1874); and others mentioned in the footnotes. (F. J. G.)

PART III.—LANGUAGE AND LITERATURE.

SECTION I.—PERSIAN (IRANIAN) LANGUAGES.

Under the name of Persian is included the whole of that great family of languages occupying a field nearly coincident with the modern Iran, of which true Persian is simply the western division. It is therefore common and more correct to speak of the Iranian family. The original native name of the race which spoke these tongues was Arian. King Darius is called on an inscription "a Persian, son of a Persian, an Arian of Arian race"; and the followers of the Zoroastrian religion in their earliest records never give themselves any other title but *Airyavó dangharó*, that is to say, "Arian races." The province of the Iranian language is bounded on the west by the Semitic, on the north and north-east by the Ural-altaic or Turanian, and on the south-east by the kindred language of India.

The Iranian family of languages is one of the seven great branches of the Indo-European stem, and was first recognized as such by Sir William Jones and Friedrich Schlegel. Whatever uncertainty still remains as to the exact relationship between all the several branches of the Indo-European family, it is at least certain that Indian and Persian belong together more closely than the rest, and that they continued to develop side by side for a long period after the other branches had been already severed from the parent stem.

The common characteristics of all Iranian languages, which distinguish them especially from Sanskrit, are as follows.

(1) Change of the original *s* into the spirant *h*. Thus—

| Sanskrit. | Zend. | Old Persian. | New Persian. |
|----------------|--------|--------------|--------------|
| eindhu (Indus) | hiadu | hindo | hind |
| sarva (all) | haurva | haruva | har |
| sama (whole) | hama | hama | ham |
| santi (sunt) | henti | haotly | hend. |

(2) Change of the original aspirates *gh*, *dh*, *bh* (= *χ*, *θ*, *φ*) into the corresponding medials—

| Sanskrit. | Zend. | Old Persian. | New Persian. |
|---------------|--------|--------------|--------------|
| bhūmi (earth) | būmi | būmi | hum |
| dhīta (θερός) | dāta | dāta | dād |
| gharma (heat) | garēma | garma | garm. |

(3) *k*, *t*, *p* before a consonant are changed into the aspirants *kh*, *th*, *f*—

| Sanskrit. | Zend. | Old Persian. | New Persian. |
|------------------|---------|--------------|----------------|
| prathama (first) | fratema | frataina | fradum (Paraf) |
| kratu (insight) | khrateu | | khirad. |

(4) The development of soft sibilants—

¹ The Indo-European Telegraph Company have now (1884), on rather more than 450 miles of wire, from Julfa on the Aras to Tehran, in what is called the "Maintenance Department," six stations with fifteen employes; the "commercial" stations, with twenty employes, are at Tabriz and Tehran only. The Persian telegraph system, under British officers, has fourteen stations in all, the chief being at Tehran, Isfahan, Shiráz, and Bushahr. The official staff numbers between thirty-five and forty. The number of paid words passing through these lines has steadily increased from 305,485 in 1877 to 1,177,412 in 1883. The average time taken by a message from London to Calcutta via Tehran varies from one and a half to two and a half hours.

| Sanskrit. | Zend. | Old Persian. | New Persian. |
|---------------------------|--------------|--------------|--------------|
| Asuró Medhás ³ | Ahuró Mazdáo | Auramazdá | Ormuzd |
| bāhu (arm) | bāzu | | bāzu |
| hima (hiems) | zima | | zim. |

Our knowledge of the Iranian languages in older periods is too fragmentary to allow of our giving a complete account of this family and of its special historical development. It will be sufficient here to distinguish the main types of the older and the more recent periods. From antiquity we have sufficient knowledge of two dialects, the first belonging to eastern Iran, the second to western.

1. *Zend*, or *Old Bactrian*.—Neither of these two titles is well chosen. The name *Old Bactrian* suggests that the language was limited to the small district of Bactria, or at least that it was spoken there,—which is, at the most, only a hypothesis. *Zend*, again (originally *dzaintish*), is not the name of a language, as Anquetil Duperron supposed, but means "interpretation" or "explanation," and is especially applied to the mediæval Pahlavi translation of the *Avesta*. Our "*Zend-Avesta*" does not mean the *Avesta* in the *Zend* language, but is an incorrect transcription of the original expression "*Avisták va zand*," i.e., "the holy text (*Avesta*) together with the translation." But, since we still lack sure data to fix the home of this language with any certainty, the convenient name of *Zend* has become generally established in Europe, and may be provisionally retained. But the home of the *Zend* language was certainly in eastern Iran; all attempts to seek it farther west—e.g., in Media⁴—must be regarded as failures.

Zend is the language of the so-called *Avesta*,⁵ the holy book of the Persians, containing the oldest documents of the religion of Zoroaster. Besides this important monument, which is about twice as large as the *Iliad* and *Odyssey* put together, we only possess very scanty relics of the *Zend* language in mediæval glosses and scattered quotations in Pahlavi books. These remains, however, suffice to give a complete insight into the structure of the language. Not only amongst Iranian languages but amongst all the languages of the Indo-European group, *Zend* takes one of the very highest places in

² In the transcription of proper names in Part II. an endeavour to render the pronunciation current in Persia has caused the modification of the more conventional, and perhaps the more strictly correct, mode elsewhere followed in this work. On this principle it is that the *e* is replaced by *i* and *a*, and the *o* by *u*, as in Makran for Mekran, Rigan for Regan, Khurásan for Khorásan, &c. In Arabic words, however, the *w* is not exchanged for *v*, nor is the *s* necessarily used for the *ش*, except where the repetition of *s* would be confusing, as in *sáiyid*. As a general rule the system of spelling Indian words, accepted for official correspondence, has been applied to the transliteration of Persian. When a final *a* is not accented it represents *ah*, as *kára* for *kdrah*, and so forth.

³ Name of the supreme god of the Persians.

⁴ Cp. I. Darmasteter, *Études Iraniques*, i. 10 (Paris, 1883).

⁵ As was said above, this, and not *Zend-Avesta*, is the correct title for the original text of the Persian Bible. The origin of the word is doubtful, and we cannot point to it before the time of the Sassanians. Perhaps it means "announcement," "revelation."

importance for the comparative philologist. In age it almost rivals Sanskrit; in primitiveness it surpasses that language in many points; it is inferior only in respect of its less extensive literature, and because it has not been made the subject of systematic grammatical treatment. The age of Zend must be examined in connexion with the age of the *Avesta*. In its present form the *Avesta* is not the work of a single author or of any one age, but embraces collections produced during a long period. The view which became current through Anquetil Duperron, that the *Avesta* is throughout the work of Zoroaster (in Zend, *Zarathushtra*), the founder of the religion, has long been abandoned as untenable. But the opposite view, which is now frequently accepted, that not a single word in the book can lay claim to the authorship of Zoroaster, also appears on closer study too sweeping. In the *Avesta* two stages of the language are plainly distinguishable, for which the supposition of local dialectic variation is not sufficient explanation, but which appear rather to be an older and a younger stage in the development of the same language. The older is represented in but a small part of the whole work, the so-called *Gāthās* or songs. These songs form the true kernel of the book *Yasna*¹; they must have been in existence long before all the other parts of the *Avesta*, throughout the whole of which allusions to them occur. These *gāthās* are what they claim to be, and what they are honoured in the whole *Avesta* as being,—the actual productions of the prophet himself or of his time. They bear in themselves irrefutable proofs of their authenticity, bringing us face to face not with the Zoroaster of the legends but with a real person, announcing a new doctrine and way of salvation, no supernatural Being assured of victory, as he is represented in later times, but a mere man, often himself despairing of his final success, and struggling not with spirits and demons but with human conflicts of every sort, in the midst of a society of fellow-believers which was yet feeble and in its earliest infancy. It is almost impossible that a much later period could have produced such unpretentious and almost depreciatory representations of the deeds and personality of the prophet; certainly nothing of the kind is found outside the *gāthās*. If, then, the *gāthās* reach back to the time of Zoroaster, and he himself, according to the most probable estimate, lived as early as the 14th century B.C., the oldest component parts of the *Avesta* are hardly inferior in age to the oldest Vedic hymns. The *gāthās* are still extremely rough in style and expression; the language is richer in forms than the more recent Zend; and the vocabulary shows important differences. The predominance of the long vowels is a marked characteristic, the constant appearance of a long final vowel contrasting with the preference for a final short in the later speech.

| Sanskrit. | Gāthā. | Later Zend. |
|-------------|--------|-------------|
| abhi (near) | abi | aiwi |
| izā (work) | izā | izha. |

The clearest evidence of the extreme age of the language of the *gāthās* is its striking resemblance to the oldest Sanskrit, the language of the Vedic poems. The *gāthā* language (much more than the later Zend) and the language of the *Vedas* have a close resemblance, exceeding that of any two Romanic languages; they seem hardly more than two dialects of one tongue. Whole atrophes of the *gāthās* can be turned into good old Sanskrit by the application of certain phonetic laws; for example—

"mat yao padaish yā frasritā izhayāo
pairijasā mazdā ustāpazastō
apivā ashā aredrāyācā nemanghā
at vāo vanghēsh mananghō hunaretātā."

becomes in Sanskrit—

"mana vah padāih yā praçrutā ihāyā
parigachāi medha uttēnabastah
āt va rtena radhrasyaca namasā
āt vō vasor manasah sūrtayā."

The language of the other parts of the *Avesta* is more modern, but not all of one date, so that we can follow the gradual decline of Zend in the *Avesta* itself. The later the date of a text, the simpler is the grammar, the more lax the use of the cases. We have no chronological points by which to fix the date when Zend ceased to be a living language; no part of the *Avesta* can well be put later than the 5th or 4th century A.C. Persian tradition at least regards the collection and arrangement of the holy texts as completed before Alexander's time. At that period they are said to have been already written out on dressed cowhides and preserved in the state archives at Persepolis.

The followers of Zoroaster soon ceased to understand Zend. For this reason all that time had spared of the *Avesta* was translated into Middle Persian or PAHLAVI (q.v.) under the Sasanians. This translation, though still regarded as canonical by the Parsis, shows a very imperfect knowledge of the original language. Its value for modern philology has been the subject of much needless contro-

versy amongst European scholars. It is only a secondary means towards the comprehension of the ancient text, and must be used with discrimination. A logical system of comparative exegesis, aided by constant reference to Sanskrit, its nearest ally, and to the other Iranian dialects, is the best means of recovering the lost sense of the Zend texts.

The phonetic system of Zend consists of simple signs which express the different shades of sound in the language with great precision. In the vowel-system a notable feature is the presence of the short vowels *e* and *o*, which are not found in Sanskrit and Old Persian; thus the Sanskrit *santi*, Old Persian *hantiy*, becomes *henti* in Zend. The use of the vowels is complicated by a tendency to combinations of vowels and to epenthesis, i.e., the transposition of weak vowels into the next syllable; e.g., Sanskrit *bharati*, Zend *baraiti* (he carries); Old Persian *margu*, Zend *mōruva* (Merv); Sanskrit *rinakti*, Zend *irinakhti*. Triphthongs are not uncommon; e.g., Sanskrit *aqvibhyas* (dative plural of *aqva*, a horse) is in Zend *aspāitibyo*; Sanskrit *kṛnoti* (he does), Zend *kernaoti*. Zend has also a great tendency to insert irrational vowels, especially near liquids; owing to this the words seem rather inflated; e.g., *sarya* (on the left) becomes in Zend *hāvaya*; *bhrājati* (it glitters), Zend *barzaiti*; *gnā* (year), Zend *gend*. In the consonantal system we are struck by the abundance of sibilants (*s* and *sh*, in three forms of modification, *z* and *zh*) and nasals (five in number), and by the complete absence of *l*. A characteristic phonetic change is that of *rt* into *sh*; e.g., Zend *asha* for Sanskrit *ṛta*, Old Persian *arta* (in *Artaxerxes*); *fravashi* for Pahlavi *fravardin*, New Persian *ferver* (the spirits of the dead). The verb displays a like abundance of primary forms with Sanskrit, but the conjugation by periphrasis is only slightly developed. The noun has the same eight cases as in Sanskrit. In the *gāthās* there is a special ablative, limited, as in Sanskrit, to the "a" stems, whilst in later Zend the ablative is extended to all the stems indifferently.

We do not know in what character Zend was written before the time of Alexander. From the Sasanian period we find an alphabetic and very legible character in use, derived from Sasanian Pahlavi, and closely resembling the younger Pahlavi found in books. The oldest known manuscripts are of the 14th century A.D.³

Although the existence of the Zend language was known to the Oxford scholar Hyde, the Frenchman Anquetil Duperron, who went to the East Indies in 1755 to visit the Parsi priests, was the first to draw the attention of the learned world to the subject. Scientific study of Zend texts began with E. Burnouf, and has since then made rapid strides, especially since the *Vedas* have opened to us a knowledge of the oldest Sanskrit.

2. *Old Persian*.—This is the language of the ancient Persians Old Persian properly so called,⁴ in all probability the mother-tongue of Middle Persian of the Pahlavi texts, and of New Persian. We know Old Persian from the rock-inscriptions of the Achæmenians, now fully deciphered. Most of them, and these the longest, date from the time of Darius (Old Persian, *Dārayavaush*); but we have specimens as late as Artaxerxes Ochus. In the latest inscriptions the language is already much degraded; but on the whole it is almost as antique as Zend, with which it has many points in common. For instance, if we take a sentence from an inscription of Darius, as—

"Auramazdā hya imām būmim adā hya avam asmanam adā hya martiyam adā hya siyātūm adā martiyahyā hya Dārayavaum khshāyathiyam akunaush eivam paruvām khshāyathiyam,"

it would be in Zend—

"Ahurō mazdāo yō imām būmim adāt yō aom asmanem adāt yō mashīm adāt yō shāitūm adāt masyahyē yō dārayavohūm khshaētem akernaotō ōyūm pouruām khshaētem."⁵

The phonetic system in Old Persian is much simpler than in Zend; we reckon twenty-four letters in all. The short vowels *e*, *o* are wanting; in their place the old "a" sound still appears as in Sanskrit, e.g., Zend *bagen*, Old Persian *bagam*, Sanskrit *bhagam*; Old Persian *hamarana*, Zend *hamarena*, Sanskrit *samarana*. As regards consonants, it is noticeable that the older *z* (soft *s*) still preserved in Zend passes into *d*,—a rule that still holds in New Persian; compare—

| Sanskrit. | Zend. | Old Persian. | New Persian |
|--------------|-------|--------------|-------------|
| hasta (hand) | zasta | dasta | dast |
| jayas (sea) | zrayō | daraya | daryā |
| aham (I) | azem | adam | |

Also Old Persian has no special *l*. Final consonants are almost entirely wanting. In this respect Old Persian goes much farther than the kindred idioms, e.g., Old Persian *abara*, Sanskrit *abharat*, Zend *abarāt*, *ἐφερε*; nominative *baga*, root-form *baga-s*, Sanskrit

³ Grammar by Spiegel (Leipsic, 1867); Dictionary by Justi (Leipsic, 1864); edition of the *Avesta* by Westergaard (Copenhagen, 1852), translation into German by Spiegel (Leipsic, 1852), and into English by Darmesteter (Oxford, 1880) in the *Sacred Books of the East*.

⁴ And perhaps of the Medes. Although we have no record of the Median language, we cannot regard it as differing to any great extent from the Persian. The Medes and Persians were two closely-connected races. There is nothing to justify us in looking for the true Median language either in the cuneiform writings of the second class or in Zend.

⁵ Ormuzd, who created this earth and that heaven, who created man and man's dwelling-place, who made Darius king, the one and only king of mankind.

¹ The *Avesta* is divided into three parts: (1) *Yasna*, with an appendix, *Visparad*, a collection of prayers and forms for divine service; (2) *Vendidad*, containing directions for purification and the penal code of the ancient Persians; (3) *Khordah-Avesta*, or the Small *Avesta*, containing the *Yashts*, the contents of which are for the most part mythological, with shorter prayers for private devotion.

² "With verses of my making, which now are heard, and with prayerful hands, I come before thee, Mazda, and with the sincere humility of the upright man and with the believer's song of praise."

bugas. The differences in declension between Old Persian and Zend are unimportant.

Old Persian inscriptions are written in the cuneiform character of the simplest form, known as the "first class." Most of the inscriptions have besides two translations into the more complicated kinds of cuneiform character of two other languages of the Persian empire. One of these is the Assyrian; the real nature of the second is still a mystery. The interpretation of the Persian cuneiform, the character and dialect of which were equally unknown, was begun by Grotefend, who was followed by Burnouf, Rawlinson, and Oppert. The ancient Persian inscriptions have been collected in a Latin translation with grammar and glossaries by Spiegel (Leipsic, 1862). The other ancient tongues and dialects of this family are known only by name; we read of peculiar idioms in Sogdiana, Zabulistan, Herat, &c. It is doubtful whether the languages of the Scythians, the Lycians, and the Lydians, of which hardly anything remains, were Iranian or not.

After the fall of the Achemenians there is a period of five centuries, from which no document of the Persian language has come down to us.

Under the Arsacids Persian nationality rapidly declined; all that remains to us from that period—namely, the inscriptions on coins—is in the Greek tongue. Only towards the end of the Parthian dynasty and after the rise of the Sasanians, under whom the national traditions were again cultivated in Persia, do we recover the lost traces of the Persian language in the Pahlavi inscriptions and literature.

3. *Middle Persian*.—The singular phenomena presented by Pahlavi writing have been discussed in a separate article (see PAHLAVI). The language which it disguises rather than expresses—Middle Persian, as we may call it—presents many changes as compared with the Old Persian of the Achemenians. The abundant grammatical forms of the ancient language are much reduced in number; the case-ending is lost; the noun has only two inflexions, the singular and the plural; the cases are expressed by prepositions,—e.g., *rûbân* (the soul), nom. and acc. sing., plur. *rûbânân*, dat. *val* or *avo rûbân*, abl. *min* or *az rûbân*. Even distinctive forms for gender are entirely abandoned, e.g., the pronoun *avo* signifies "he," "she," "it." In the verb compound forms predominate. In this respect Middle Persian is almost exactly similar to New Persian.

4. *New Persian*.—The last step in the development of the language is New Persian, represented in its oldest form by Firdausi. In grammatical forms it is still poorer than Middle Persian; except English, no Indo-European language has so few inflexions, but this is made up for by the subtle development of the syntax. The structure of New Persian has hardly altered at all since the *Shâhnâmâ*; but the original purism of Firdausi, who made every effort to keep the language free from Semitic admixture, could not long be maintained. Arabic literature and speech exercised so powerful an influence on New Persian, especially on the written language, that it could not withstand the admission of an immense number of Semitic words. There is no Arabic word which would be refused acceptance in good Persian. But, nevertheless, New Persian has remained a language of genuine Iranian stock.

Among the changes of the sound system in New Persian, as contrasted with earlier periods, especially with Old Persian, the first that claims mention is the change of the tenues *k*, *t*, *p*, *c*, into *g*, *d*, *b*, *z*. Thus we have—

| Old Persian or Zend. | Pahlavi. | New Persian. |
|----------------------|----------|--------------|
| mahrka (death) | mark | marz |
| Thraetona | Fritûn | Farîdân |
| âp (water) | âp | âb |
| hvatô (self) | khôd | khôd |
| raucab (day) | rôj | rûz |
| haca | aj | az. |

A series of consonants often disappear in the spirant; thus—

| Old Persian or Zend. | Pahlavi. | New Persian. |
|------------------------|----------|--------------|
| kanfa (mountain) | kof | kôh |
| gâthu (place). Z. gâtu | gâs | gâh |
| cahware (four) | | châr |
| bandaka (slave) | bandak | bandah |
| spâda (army) | | alpâh |
| dadami (I give) | | diham. |

Old *d* and *dh* frequently become *y*—

| Old Persian or Zend. | Pahlavi. | New Persian. |
|------------------------|----------|--------------|
| madhu (wine) | | mal |
| baodhō (consciousness) | bôd | bol |
| pâdha (foot) | | pâl |
| kadhâ (wheat) | | kâl. |

Old *y* often appears as *j*: Zend *yâma* (glass), New Persian *jâm*; *yavan* (a youth), New Persian *yavân*. Two consonants are not allowed to stand together at the beginning of a word; hence vowels are frequently inserted or prefixed, e.g., New Persian *sitâdan* or *istâdan* (to stand), root *stâ*; *birâdar* (brother), Zend and Pahlavi *brâtar*.¹

Amongst modern languages and dialects other than Persian which must be also assigned to the Iranian family may be mentioned—

1. *Kurdish*, a language nearly akin to New Persian, with which it has important characteristics in common. It is chiefly distinguished from it by a marked tendency to shorten words at all costs, e.g., Kurd. *berâ* (brother) = New Persian *birâdar*; Kurd. *dân* (I give) = New Persian *diham*; Kurd. *spt* (white) = New Persian *sipêd*.

2. *Baluch*, the language of Baluchistan, also very closely akin to New Persian, but especially distinguished from it in that all the old spirants are changed into explosives, e.g., Baluch *vâb* (sleep) = Zend *hvaafna*; Baluch *kap* (slime) = Zend *kafa*, New Persian *kaf*; Baluch *hapt* (seven) = New Persian *haft*.

3. *Ossetic*, true Iranian, in spite of its resemblance in sound to the Georgian.²

4. *Afghan*, which has certainly been increasingly influenced by the neighbouring Indian languages in inflexion, syntax, and vocabulary, but is still at bottom a pure Iranian language, not merely intermediate between Iranian and Indian.

The position of *Armenian* alone remains doubtful. Some scholars attribute it to the Iranian family, others prefer to regard it as a separate and independent member of the Indo-European group. Many words that at first sight seem to prove its Iranian origin are only adopted from the Persian.³ (K. G.)

SECTION II.—MODERN PERSIAN LITERATURE.

Persian historians are greatly at variance about the origin of their national poetry. Most of them go back to the 5th Christian century and ascribe to one of the Sasanian kings, Bahramgûr or Bahram V. (420-439), the invention of metre and rhyme; others mention as author of the first Persian poem a certain Abulhafz of Soghd, near Samarkand. In point of fact, there is no doubt that the later Sasanian rulers fostered the literary spirit of their nation (see PAHLAVI). Pahlavi books, however, fall outside of the present subject, which is the literature of the idiom which shaped itself out of the older Persian speech by slight modifications and a steadily increasing mixture of Arabic words and phrases in the 9th and 10th centuries of our era, and which in all essential respects has remained the same for the last thousand years. The national spirit of Iran, although smothered and stifled by the Arab conquest, could not be entirely annihilated. The system of centralization was at no time very strong in the extensive dominions of the Omayyad and Abbâsid dynasties; and the more their power and influence decayed the more they lost their hold on Persia, especially since the native element began to aspire to governorships and to take the political management into its own hand. The death of Hârun al-Rashîd in the beginning of the 9th century, which marks the commencement of the decline of the caliphate, was at the same time the starting-point of movements for national independence and a national literature in the Iranian dominion, and the common cradle of the two was in the province of Khorâsân, between the Oxus and Jaxartes. In Merv, a Khorâsânian town, a certain 'Abbâs composed in 809 A.D. (193 A.H.), according to the oldest biographical writer of Persia, Mûhammed 'Aufi, the first real poem in modern Persian, in honour of the 'Abbâsid prince Ma'mûn, Hârun al-Rashîd's son, who had himself a strong predilection for Persia, his mother's native country, and was, moreover, thoroughly imbued with the freethinking spirit of his age. Soon after this, in 820 (205 A.H.), Tâhir, who aided Ma'mûn to wrest the caliphate from his brother Amîn, succeeded in establishing the first semi-independent Persian dynasty in Khorâsân, which was overthrown in 872 (259 A.H.) by the family of the Saffârids, founded by Ya'qûb b. Laith, originally a brazier in Sîstân or Zabulistân.

The development of Persian poetry under these first native dynasties was slow. Arabic language and literature had gained too firm a footing to be supplanted at once

¹ Grammars of New Persian, by Lumsden (Calcutta, 1820), Chodzko (Paris, 1852), Vullera (Giessen, 1870). For the New Persian dialects see Fr. Müller, in the *Sitzungsber. der Wien. Akad.*, vols. lxxvii, lxxviii.

² Compare Hubachmann, in Kuhn's *Zeitschrift*, xxiv. 396.

Minstrels
of 10th
century.

by a new literary idiom still in its infancy; nevertheless the few poets who arose under the Tāhirids and Šaffārids show already the germs of the characteristic tendency of all later Persian literature, which aims at amalgamating the enforced spirit of Islamism with their own Aryan feelings, and reconciling the strict deism of the Mohammedan religion with their inborn loftier and more or less pantheistic ideas; and we can easily trace in the few fragmentary verses of men like Hanzalah, Hakīm Fīrūz, and Abū Salīk those principal forms of poetry now used in common by all Mohammedan nations—the forms of the *kašīda* (the encomiastic, elegiac, or satirical poem), the *ghazal* or ode (a love-ditty, wine-song, or religious hymn), the *rubāʿī* or quatrain (our epigram, for which the Persians invented a new metre in addition to those adopted from the Arabs), and the *mathnawī* or double-rhymed poem (the legitimate form for epic and didactic poetry). The first who wrote such a *mathnawī* was Abū Shukūr of Balkh, the oldest literary representative of the third dynasty of Khorāsān, the Sāmānids, who had been able in the course of time to dethrone the Šaffārids, and to secure the government of Persia, nominally still under the supremacy of the caliphs in Baghdād, but in fact with full sovereignty. The undisputed reign of this family dates from the accession of Amīr Naṣr II. (913-942; 301-331 A.H.), who, more than any of his predecessors, patronized arts and sciences in his dominions. The most accomplished minstrels of his time were Mohammed Farāldādī; Abū ʿAbbās of Bokhārā, a writer of very tender verses; Abū ʿMuzaḥfar Naṣr of Nīshāpūr; Abū ʿAbdallāh Mohammed of Junaid, equally renowned for his Arabic and Persian poetry; Maʿnawī, full of original thoughts and spiritual subtleties; Khusrawānī, from whom even Firdausī condescended to borrow quotations; Abū ʿl-Ḥasan Shahīd of Balkh, the first who made a *dīwān* or alphabetical collection of his lyrics; and Master Rūdagī, the first classic genius of Persia, who impressed upon every form of lyric and didactic poetry its peculiar stamp and individual character (see Rūdagī). His graceful and captivating style was imitated by Hakīm Khabbāz, a great baker, poet, and quack; Abū Shuʿaib Šālīḥ of Herāt, who left a spirited little song in honour of a young Christian maiden; Raunakī of Bokhārā; Abū ʿl-Faṭḥ of Bust, who was also a good Arabic poet; the amīr Abū ʿl-Ḥasan ʿAlī Alagāṭchī, who handled the pen as skilfully as the sword; ʿUmārah of Merv, a famous astronomer; and Kisāʿī, a native of the same town, a man of stern and ascetic manners, who sang in melodious rhythm the praise of ʿAlī and the twelve imāms. All these poets flourished under the patronage of the Sāmānīd princes, who also fostered the growing desire of their nation for historical and antiquarian researches, for exegetical and medical studies. Manṣūr I., the grandson of Rūdagī's patron, ordered (963; 352 A.H.) his wazīr Balʿamī to translate the famous universal history of Ṭabarī (224-310 A.H.) from Arabic into Persian; and this *Taʾrīkh-i-Ṭabarī*, the oldest prose work in modern Persian, is not merely remarkable from a philological point of view, it is also the classic model of an easy and simple style. The same prince employed the most learned among the ulemā of Transoxiana for a translation of Ṭabarī's second great work, the *Tafsīr*, or commentary on the Koran, and accepted the dedication of the first Persian book on medicine, a pharmacopœia by the physician Abū Manṣūr Muwaffaq b. ʿAlī of Herāt (edited by Seligmann, Vienna, 1859), which forms a kind of connecting link between Greek and Indian medicine. It was soon after further developed by the great Avicenna (died 1037; 428 A.H.), himself a Persian by birth, and author of pretty wine-songs, moral maxims, psychological tracts, and a manual of philosophic science, the *Dānishnāma-i-ʿAlāʾī*, in his native tongue.

A still greater impulse was given, both to the patriotic feelings and the national poetry of the Persians, by Manṣūr's son and successor, Prince Nūh II., who ascended the throne in 976 (365 A.H.). Full of enthusiasm for the glorious past of the old Iranian kingdom, he charged his court poet Daḳīqī, who openly professed in his ghazals the Zoroastrian creed, to turn the Parsī collection of the venerable legends and traditions of the heroic ages of Iran, the *Khodāʾināma*, or "Book of Kings" (which had been translated from the Pahlavī under the Šaffārid Yaʿqūb b. Laith), into Persian verse. Shortly after commencing this work Daḳīqī was murdered in the prime of life; and the fall of the minstrel was soon followed by that of the Sāmānīd dynasty itself, which was supplanted by the younger and more vigorous house of Sabuktagīn, the founder of the Ghaznawids, who had rapidly risen from the rank of a common Turkish soldier to that of an independent ruler of Ghazna (Ghazni, Ghuznee) and all the surrounding countries, including a considerable portion of India. But Daḳīqī's great enterprise was not abandoned; a stronger hand, a higher genius, was to continue and to complete it, and this genius was found in Firdausī (940-1020; 328-411 A.H.), with whom we enter the golden age of the national epopee in Persia (see FIRDŪSĪ). In 1011, after thirty-five years of unremitting labour, he accomplished his gigantic task, and wrote the last distichs of the immortal *Shāhnāma*, that "glorious monument of Eastern genius and learning," as Sir W. Jones calls it, "which, if ever it should be generally understood in its original language, will contest the merit of invention with Homer itself." And, although it was not he, the unrivalled master of epic art, but his old friend and patron, the less-renowned ʿUnṣurī, who officiated as "king of poets" in the court of Maḥmūd of Ghazna (998-1030; 388-421 A.H.), who had continued his father Sabuktagīn's conquests, and founded an empire extending from the Caucasus to Bengal and from Bokhārā and Kashgar to the Indian Ocean, he was nevertheless the central sun round which all the minor stars revolved, those four hundred poets who formed the famous "Round Table" in the sultan's magnificent palace. Firdausī's fame eclipsed that of all his contemporaries (however well founded their claim upon literary renown),—men like ʿUnṣurī, Farrukhī, Asjadī, Ghadāʾirī, Minūṭchehrī, and others, whose eloquent praises of Maḥmūd have come down to us in very scarce copies, and even that of his own teacher Asadī, who survived his great pupil, and established a reputation of his own by introducing into Persian literature the novel form of the *munāzarah* or strife-poem, the equivalent of the Provençal *tenson* and the English *estuf* or *joust*. The *Shāhnāma*, from the very moment of its appearance, exercised such an irresistible fascination upon all minds that there was soon a keen competition among the younger poets as to who should produce the most successful imitation of that classic model; and this competition has gone on under different forms through all the following centuries, even to the most recent times. First of all, the old popular traditions, so far as they had not yet been exhausted by Firdausī, were ransacked for new epic themes, and a regular cycle of national epopees gathered round the *Book of Kings*, drawn almost exclusively from the archives of the princes of Sīstān, the family of Firdausī's greatest hero, Rustam. The first and most ambitious of these competitors seems to have been Asadī's own son, ʿAlī b. Aḥmad al-Asadī, the author of the oldest Persian glossary, who completed in 1066 (458 A.H.), in upwards of 9000 distichs, the *Garshāspnāma*, or marvellous story of the warlike feats and love-adventures of Garshāsp, one of Rustam's ancestors. The heroic deeds of Rustam's grandfather were celebrated in the *Sāmānāma*, which almost equals the *Shāhnāma* in length; those of Rustam's two sons, in the *Jahāngīrnāma* and the *Farā-*

Imitations
of the
Shāhnāma

murznama; those of his daughter, an amazon, in the Brunhild style of the German Nibelunge, in the *Bānū Gushāspnāma*; those of his grandson, in the *Barsūnāma*; those of his great-grandson, in the *Shahriyār-nāma* (ascribed to Mukhtārī and dedicated to Mas'ūd Shāh, who is probably identical with Mas'ūd b. Ibrāhīm, Sultan Mahmūd's great-grandson, 1088-1114; 481-508 A.H.); and the wonderful exploits of a son of Isfandiyār, another hero of the *Shāhnāma*, in the *Bahmannāma*.

When at last these old Iranian sources were almost entirely exhausted, the difficulty was met in various but equally ingenious ways. Where some slight historical records of the heroic age—no matter how doubtful their authenticity—were still obtainable, poetical imagination seized upon them at once, and filled the wide gaps by its own powerful invention; where no traditions at all were forthcoming, fiction pure and simple asserted its indisputable right; and thus the national epopee gave way to the epic story, and—substituting prose for verse—to the novel and the fairy tale. Models of the former class are the various *Iskandarnāmas*, or "Books of Alexander the Great," the oldest and most original of which is that of Nizāmī (completed about 1202; 599 A.H.); the latter begins with the *Kitāb-i-Samak 'Iyār*, a novel in three volumes (about 1189; 585 A.H.), and reaches its climax in the *Būstān-i-Khayāl*, or "Garden of Imagination," a prose romance of fifteen large volumes, by Mohammed Taqī Khayāl, written between 1742 and 1756 (1155 and 1169 A.H.). Many aspirants to poetical fame, however, were not satisfied with either of these expedients: they boldly struck out a new path and explored hitherto unknown regions, and here again a twofold tendency manifested itself. Some writers, both in prose and verse, turned from the exhausted fields of the national glory of Persia to the comparatively original soil of Arabian traditions, and chose their subjects from the chivalrous times of their own Bedouin conquerors, or even from the Jewish legends of the Koran. Of this description are the *Anbiyānāma*, or history of the pre-Mohammedan prophets, by Hasanī Shabistārī 'Ayānī (before the 8th century of the Hijra); Ibn Husām's *Khāwārnāma* (1427; 830 A.H.), or the deeds of 'Alī; Bādhil's *Hamla-i-Haidarī*, which was completed by Najaf (1723; 1135 A.H.), or the life of Mohammed and the first four caliphs; Kāzīm's *Farahnāma-i-Fātima*, the book of joy of Fātima, Mohammed's daughter (1737; 1150 A.H.),—all four in the epic metre of the *Shāhnāma*; and the prose stories of *Hātīm Ta'ī*, the famous model of liberality and generosity in pre-Islamic times; of *Amir Hamzah*, the uncle of Mohammed; and of the *Mujizāt-i-Mūsawī*, or the miraculous deeds of Moses, by Mu'in-almiskīn (died about 1501; 907 A.H.).

Quite a different turn was taken by the ambition of another class of imitators of Firdausī, especially during the last four centuries of the Hijra, who tried to create a new heroic epopee by celebrating in rhythm and rhyme stirring events of recent date. The gigantic figure of Timūr inspired Hātīfī (died 1521; 927 A.H.) with his *Timūrnāma*; the stormy epoch of the first Safawī rulers, who succeeded at last in reuniting for some time the various provinces of the old Persian realm into one great monarchy, furnished Kāsimī (died after 1560; 967 A.H.) with the materials of his *Shāhnāma*, a poetical history of Shāh Isma'īl and Shāh Tahmāsp. Another *Shāhnāma*, celebrating Shāh 'Abbās the Great, was written by Kamālī of Sabzawār; and even the cruelties of Nādir Shāh were duly chronicled in a pompous epic style in 'Ishratī's *Shāhnāma-i-Nādirī* (1749; 1162 A.H.). But all these poems are surpassed in length by the 33,000 distichs of the *Shāhīnshāhnāma* by the poet-laureate of the late Feth 'Alī Shāh of Persia, and the 40,000 distichs of the *Georgenāma*, a poetical history of India from its discovery by the Portuguese to the conquest

of Poona by the English in 1817. In India especially this kind of epic versification has flourished since the beginning of Humāyūn's reign (1530-1556); the court-poets of the great Mogul emperors of Delhi, as well as of all the minor dynasties, vied with one another in glorifying the exploits of their respective sovereigns, as is sufficiently proved by the *Zafarnāma-i-Shāhjahānī* by Kudsī (died 1646; 1056 A.H.); the *Shāhīnshāhnāma* by Tālib Kalīm (died 1651; 1061 A.H.), another panegyrist of Shāh Jahān; Atashī's *Adilnāma*, in honour of Shāh Mohammed 'Adil of Bijāpūr, who ascended the throne in 1629 (1039 A.H.); the *Tawārīkh-i-Kulī Kutbshāh*, a metrical history of the Kutbshāhs of Golkonda; and many more, down to the *Fathnāma-i-Tipū Sultān* by Ghulām Hasan (1784; 1189 A.H.).

But the national epopee, with both its legitimate and its illegitimate offspring, was not the only bequest the great Firdausī left to his nation. This rich genius gave also the first impulse to the higher development of those other branches of poetical art which were to flourish in the following ages—particularly to *romantic*, *didactic*, and *mystic poetry*; and even his own age produced powerful co-operators in these three most conspicuous departments of Persian literature. *Romantic fiction*, which achieved its highest triumph in Nizāmī of Ganja's (1141-1203; 535-599 A.H.) brilliant pictures of the struggles and passions in the human heart (see Nizāmī, vol. xvii. pp. 521, 522), sent forth its first tender shoots in the numerous love-stories of the *Shāhnāma*, the most fascinating of which is that of Zāl and Rūdabeh, and developed almost into full bloom in Firdausī's second great mathnawī *Yūsuf u Zalikhā*, which the aged poet wrote after his flight from Ghazna, and dedicated to the reigning caliph of Baghdād, Alkādir-billāh. It represents the oldest poetical treatment of the Biblical story of Joseph, which has proved so attractive to the epic poets of Persia, among others to 'Anīak of Bokhārā (died 1149), who was the first after Firdausī to write a *Yūsuf u Zalikhā* (which can be read in two different metres), to Jāmī (died 1492), Manjī Kāsim Khān, Humāyūn's amīr (died 1571), Nāzīm of Herāt (died 1670), and Shaukat, the governor of Shīrāz under Feth 'Alī Shāh. Perhaps prior in date to Firdausī's *Yūsuf* was his patron 'Unsūrī's romance *Wāmīk u Adhrā*, a popular Iranian legend of great antiquity, which had been first written in verse under the Tāhirid dynasty. This favourite story was treated again by Faslī Jurjānī (in the course of the same 5th century of the Hijra), and by many modern poets,—as Damīrī, who died under the Safawī Shāh Mohammed (1577-1586; 985-994 A.H.), Nāmī, the historiographer of the Zand dynasty, and Husāin of Shīrāz under Feth 'Alī Shāh, the last two flourishing towards the beginning of the present century. Another love-story of similar antiquity, which had originally been written in Pahlavī, formed the basis of Fakhr-uddīn As'ad Jurjānī's *Wīs u Rāmīn*, which was composed in Isfahān (Ispahān) about 1048 (440 A.H.),—a poem remarkable not only for its high artistic value but also for its close resemblance to one of the epic masterpieces of mediæval German literature, Gottfried von Strasburg's *Tristan und Isolde*.

The last-named Persian poet was apparently one of the earliest eulogists of the Seljūks, and it was under this Turkish dynasty, which soon became a formidable rival both of the Ghaznawids and of the Arabian caliphs of Baghdād, that lyrical romanticism—that is, panegyrical and satirical poetry—rose to the highest pitch. What Firdausī, in his exalted descriptions of royal power and dignity, and the court-poets of Sultan Mahmūd, in their unbounded praise of the great sovereign and protector of arts, had commenced, what other encomiasts under Mahmūd's successors—for instance, Abū 'l-Faraj Rūnī of Lahore and Mas'ūd b. Sa'd b. Salmān (under Sultan

Ibrāhīm, 1059-1088)—had successfully continued, reached its perfection in the famous group of panegyrists who gathered in the first half of the 6th century of the Hijra round the throne of Sultan Sanjar, and partly also round that of his great antagonist, Atsiz, shāh of Khwārizm. This group included Adīb Šābir, who was drowned by order of the prince in the Oxus about 1145 (540 A.H.), and his pupil Jauharī, the goldsmith of Bokhārā; Amīr Mu'izzī, the king of poets at Sanjar's court, killed by a stray arrow in 1147 (542 A.H.); Rashīd Watwāt (the Swallow), who died in 1172 (568 A.H.), and left, besides his *kašidas*, a valuable treatise on poetry (*Ḥodā'ik-essīhr*) and a metrical translation of the sentences of 'Alī; 'Abd-alwāsī Jabālī, who sang at first, like his contemporary Hasan Ghaznawī (died 1169; 565 A.H.), the praise of the Ghaznawid shāh Bahram, but afterwards bestowed his eulogies upon Sanjar, the conqueror of Ghazna; and Aḥmad-uddīn Anwārī, the most celebrated *kašida*-writer of the whole Persian literature. Anwārī (died between 1191 and 1196; 587 and 592 A.H.), who in early life had pursued scientific studies in the madrasah of Tūs and who ranked among the foremost astronomers of his time, owes his renown as much to the inexhaustible store of poetical similes and epitheta ornantia which he showered upon Sanjar and other royal and princely personages as to his cutting sarcasms, which he was careful enough to direct, not against special individuals, but against whole classes of society and the cruel wrongs worked by an inexorable fate,—thus disregarding the more manly example of Firdausī, whose bold attack upon Sultan Mahmūd for having cheated him out of the well-earned reward for his epopee is the oldest and, at the same time, most finished specimen of personal satire. This legitimate branch of high art, however, soon degenerated either into the lower forms of parody and travesty—for which, for instance, a whole group of Transoxanian writers, Sūzanī of Samarkand (died 1174; 569 A.H.) and his contemporaries, Abū 'Alī Shatranjī of the same town, Lāmi' of Bokhārā, and others gained a certain literary reputation—or into mere comic pieces and jocular poems like the "Pleasantries" (*Ḥalīyyāt*) and the humorous stories of the "Mouse and Cat" and the "Stone-cutter" (*Sangtarash*) by 'Ubaid Zākānī (died 1370; 772 A.H.). Anwārī's greatest rival was Khāḳānī (died 1199; 595 A.H.), the son of a carpenter in Shīrwān, and panegyrist of the shāhs of Shīrwān, usually called the Pindar of the East on account of the difficult and enigmatic style of his verses. Oriental critics, of course, greatly admire the obscure allusions, far-fetched puns, and other eccentricities with which the otherwise energetic and harmonious language, both of his laudatory odes and of his satires, is loaded; to European taste only the shorter epigrams and the double-rhymed poem *Tuhfat-ul-irākain*, in which Khāḳānī describes his journey to Mecca and back, give full satisfaction. Among his numerous contemporaries and followers may be noticed Muḥjir-uddīn Balaḳānī (died 1198; 594 A.H.), Ṣāḥir Fāryābī (died 1202; 598 A.H.), and Athīr Akhsikātī (died 1211; 608 A.H.),—all three panegyrists of the atābegs of Adharbaijān (Azerbaijan), and especially of Sultan Kizil Arslan—Kamāl-uddīn Isfahānī, tortured to death by the Moguls in 1237 (635 A.H.), who sang, like his father Jamāl-uddīn, the praise of the governors of Isfahān, and gained, on account of his fertile imagination, the honorary epithet of the "creator of fine thoughts" (Khallāk-ulma'ānī); and Saif-uddīn Isfarangī (died 1267; 666 A.H.), a favourite of the shāhs of Khwārizm.

Fruitful as the 6th and 7th centuries of the Hijra were in panegyrics, their literary fame did not rest upon these alone; they attained an equally high standard in two other branches of poetry, the didactic and the mystic, which after a short period of separate existence entered into a close and henceforth indissoluble union. The origin of

both can again be traced to Firdausī and his time. In the ethical reflexions, wise maxims, and moral exhortations scattered throughout the *Shāhnāma* the didactic element is plainly visible, and equally plain in it are the traces of that mystical tendency which was soon to pervade almost all the literary productions of Persian genius. Šūfīc pantheism, which tends to reconcile philosophy with revealed religion, and centres in the doctrine of the universality and absolute unity of God, who is diffused through every particle of the visible and invisible world, and to whom the human soul during her temporary exile in the prison-house of the body strives to get back through progressive stages till she is purified enough to be again absorbed in Him, is already hinted at in the numerous verses of the "Book of Kings" in which the poet cries out against the vanity of all earthly joys and pleasures, and expresses a passionate desire for a better home, for a reunion with the Godhead. But the most characteristic passage of the epopee is the mysterious disappearance of Shāh Kaikhosrau, who suddenly, when at the height of earthly fame and splendour, renounces the world in utter disgust, and, carried away by his fervent longing for an abode of everlasting tranquillity, vanishes for ever from the midst of his companions. The first Persian who devoted poetry exclusively to the illustration of Šūfīc doctrines was Firdausī's contemporary, the renowned poet sheikh Abū Saīd b. Abū 'l-Khair of Mahna in Khorāsān (968-1049; 357-440 A.H.), the founder of that specific form of the ruba'ī which gives the most concise expression to religious and philosophic aphorisms,—a form which was further developed by the great freethinker 'OMAR B. KHAYYĀM (q.v.), and Afdal-uddīn Kāshī (died 1307; 707 A.H.). The year of Abū Saīd's death is most likely the same which gave to the world the first great didactic mathnawī, the *Rūshanā'ināma*, or "Book of Enlightenment," by NĀSIR B. KHOSRAU (q.v.), a poem full of sound moral and ethical maxims with slightly mystical tendencies. About twenty-five years later the first theoretical handbook of Šūfism in Persian was composed by 'Alī b. 'Uthmān al-jullābī al-hujwīrī in the *Kashf-ulmahjūb*, which treats of the various schools of Šūfīs, their teachings and observances. A great saint of the same period, Sheikh 'Abdallāh Anṣārī of Herāt (1006-1089; 396-481 A.H.), assisted in spreading the pantheistic movement by his *Munājāt* or invocations to God, by several prose tracts, and by an important collection of biographies of eminent Šūfīs, based on an older Arabic compilation, and serving in its turn as groundwork for Jāmī's excellent *Nafahāt-aluns* (completed in 1478; 883 A.H.). He thus paved the way for the publication of one of the earliest text-books of the whole sect, the *Ḥadīqāt-ulḥaḳīqat*, or "Garden of Truth" (1130; 525 A.H.), by Ḥakīm Sanā'ī of Ghazna, to whom all the later Šūfīc poets refer as their unrivalled master in spiritual knowledge. In this extensive mathnawī in ten cantos, as well as in his smaller poetical productions, he skilfully blended the purely didactic element, which is enhanced by pleasant stories and anecdotes, with the chief tenets of higher theosophy,—an example which has been strictly adhered to by all the following Šūfīc poets, who only differ in so far as they give preponderance either to the ethical or to the mystical side of their writings. As the most uncompromising Šūfīs appear the greatest pantheistic writer of all ages, Jelāl-uddīn Rūmī (1207-1273; 604-672 A.H.; see Rūmī), and his scarcely less renowned predecessor Farīd-uddīn 'Aṭṭār, who was slain by the Moguls at the age of 114 lunar years in 1230 (627 A.H.). This prolific writer, originally a druggist ('aṭṭār) in Nīshāpūr, after having renounced all worldly affairs and performed the pilgrimage to Mecca, devoted himself to a stern ascetic life, and to the composition of Šūfīc works, partly in prose, as in his valuable "Biography of eminent Mystic Divines," but mostly in the form of math-

nawís (upwards of twenty in number), among which the *Pandnáma*, or "Book of Counsels," and the *Mantik-ut-tair*, or the "Speeches of Birds," occupy the first rank. In the latter, an allegorical poem, interspersed with moral tales and pious contemplations, the final absorption of the Súfí in the deity is most ingeniously illustrated, and the seven valleys through which the birds travel on their way to the fabulous phoenix or sîmurg (literally thirty birds), and in which all except thirty succumb, are the seven stations of the mystic road that leads from earthly troubles into the much-coveted Faná or Nirvána.

In strong contrast to these advanced Súfís stands the greatest moral teacher of Persia, Sheikh Sa'dí of Shíráz (died about 110 lunar years old in 1292; 691 A.H.; see SA'DÍ), whose two best known works, the *Bústán*, or "Fruit-garden," and the *Gulistán*, or "Rose-garden," owe their great popularity both in the East and the West to the purity of their spiritual thoughts, their sparkling wit, charming style, and the very moderate use of mystic theories. However, both have found comparatively few imitations,—the former in the *Dastúr-náma* of Nizá'í of Kóbistán (died 1320; 720 A.H.), in the *Dah Báb*, or "Ten Letters," of Kátibí (died 1434; 838 A.H.), and in the *Gulzár* of Hairatí (murdered 1554; 961 A.H.); the latter in Mu'in-uddín Juwainí's *Nigáristán* (1335; 735 A.H.) and Jámí's *Baháristán*, or "Spring-garden" (1487; 892 A.H.); whereas an innumerable host of purely Súfíc compositions followed in the wake of Saná'í's, 'Attár's, and Jelál-uddín Rúmí's mathnawís. They consist partly of mere expositions of doctrines with or without illustrations by tales and anecdotes, partly of complete Súfíc allegories, often disfigured by the wildest eccentricities. It will suffice to name a few of the most conspicuous in each class. To the former belong the *Lamátát*, or "Sparks," of Iráki (died between 1287 and 1309; 686 and 709 A.H.), the *Zád-ul-musáfirín*, or "Store of the Wayfarers," by Husainí (died 1318; 718 A.H.), the *Gulshan-i-Ráz*, or "Rose-bed of Mystery," by Mahmúd Shabistari (died 1320; 720 A.H.), the *Jám-i-Jam*, or "Cup of Jamshid," by Auhadí (died 1338; 738 A.H.), the *Anís-ul-'Arifín*, or "Friend of the Mystics," by Kásim-i-Anwár (died 1434; 837 A.H.), and others; to the latter 'Assár's *Míhr u Mushtarí*, or "Sun and Jupiter" (1376; 778 A.H.), 'Arifí's *Gú-i-Chaugán*, or "The Ball and the Bat" (1438; 842 A.H.), *Husn u Dil*, or "Beauty and Heart," by Fattáhi of Nishápúr (died 1448; 852 A.H.), *Sham' u Parwána*, or "The Candle and the Moth," by Ahlí of Shíráz (1489; 894 A.H.), *Sháh u Gadá*, or "King and Dervish," by Hilálí (put to death 1532; 939 A.H.), Babá-uddín 'Ámil's (died 1621; 1030 A.H.) *Nán u Halwá*, or "Bread and Sweets," *Shír u Shakar*, or "Milk and Sugar," and many more.

During all these periods of literary activity, lyric poetry, pure and simple—i.e., the ghazal, in its legitimate form—had by no means been neglected; almost all the renowned poets since the time of Rúdagí had sung in endless strains the pleasures of love and wine, the beauties of nature, and the almighty power of the Creator; but, however rich the ghazals of Sa'dí in lofty thoughts and pious feelings, however sublime the hymns of Jelál-uddín Rúmí, it was left to the incomparable genius of Háfíz (died 1389; 791 A.H.; see HAFÍZ) to give to the world the most perfect models of lyric composition; and the lines he had laid down were more or less strictly followed by all the ghazal-writers of the 9th and 10th centuries of the Hijra,—by Salmán of Sáwa (died about 1377; 779 A.H.), who excelled besides in *qasída* and mathnawí; Kamál Khujandí, Háfíz's friend, and protégé of Sultan Husain (776-784 A.H.); Mohammed Shírin Maghribí (died at Tabriz in 1406; 809 A.H.), an intimate friend of Kamál; Ní'mat-ulláh Walí (died 1431; 834 A.H.), the founder of a special religious order; Kásim-i-

Anwár (see above); Amír Sháhí (died 1453; 857 A.H.), of the princely family of the Sarbadárs of Sabzawár; Banná'í (died 1512; 918 A.H.), who also wrote a romantic poem, *Bahrám u Bihrúz*; Bába Fighání of Shíráz (died 1519; 925 A.H.), usually called the "Little Háfíz"; Nargisí (died 1531; 938 A.H.); Lisání (died 1534; 941 A.H.), who himself was imitated by Damírf of Isfahán, Muhtasham Káshí, and Wahshí Báfkí (all three died in the last decade of the 10th century of the Hijra); Ahlí of Shíráz (died 1535; 942 A.H.), author of the *Síhr-i-Halál*, or "Lawful Witchcraft," which, like Kátibí's (died 1434; 838 A.H.) *Majma'-ulbahrain*, or the "Confluence of the Two Seas," can be read in two different metres; Nau'í (died 1610; 1019 A.H.), who wrote the charming romance of a Hindu princess who burned herself in Akbar's reign with her deceased husband on the funeral pile, styled *Súz u Gudáz*, or "Burning and Melting," &c. Among the immediate predecessors of Háfíz in the 8th century of the Hijra, in which also Ibn Yámín, the great *kit'ah*-writer,¹ flourished, the highest fame was gained by the two poets of Delhi, Amír Hasan and Amír Khosrau. The latter, who died in 1325 (725 A.H.), two years before his friend Hasan, occupies the foremost place among all the Persian poets of India by the richness of his imagination, his graphic style, and the historical interest attached to his writings. Five extensive *diwáns* testify to his versatility in all branches of lyric poetry, and nine large mathnawís to his mastership in the epic line. Four of the latter are poetical accounts of contemporary events during the reigns of the emperors of Delhi, 'Alá-uddín Mohammad Sháh Khiljí (1296-1311), his predecessor Firúz Sháh, and his successor Kutb-uddín Mubárek Sháh,—the *Miftáh-ul-futúh*, or "Key of Mysteries," the *Kirán-ussa'dáin*, or "The Conjunction of the Two Lucky Planets," the *Nuh Sipihr*, or "Nine Spheres," and the love-story of *Khidrkhán u Duwalráni*. His other five mathnawís formed the first attempt ever made to imitate Nizámí's famous *Khamsah*, or five romantic epopees, and this attempt turned out so well that henceforth almost all epic poets wrote quintuples of a similar description. Khwájú Kirmání (died 1352; 753 A.H.) was the next aspirant to Nizámí's fame, with five mathnawís, among which *Humái u Humáyún* is the most popular, but he had to yield the palm to 'Abd-urrahmán Jámí (1414-1492; 817-898 A.H.), the last classic poet of Persia, in whose genius were summed up, as it were, all the best qualities of his great predecessors, and who combined, in a manner, the moral tone of Sa'dí with the lofty aspirations of Jelál-uddín Rúmí, and the graceful ease of Háfíz's style with the deep pathos of Nizámí, to whose *Khamsah* he wrote the most successful counterpart (see his *Yásuf u Zalikhá* mentioned above). Equally renowned are his numerous prose works, mostly on Súfíc topics, and his three *diwáns*. Many poets followed in Jámí's footsteps, first of all his nephew Hátifí (see above), and either wrote whole *khamsahs* or imitated at least one or other of Nizámí's epopees; thus we have a *Lailá u Majnún*, for instance, by Maktabí (1490), Hilálí (see above), and Rúh-ulamín (died 1637). But their efforts could not stop the growing corruption of taste, and it was only at the court of the Mogul emperors, particularly of the great Akbar (1556-1605), who revived Sultan Mahmúd's "round table," that Persian literature still enjoyed some kind of "Indian summer" in poets like Ghazálí of Mashhad or Meshed (died 1572); 'Urí of Shíráz (died 1591), who wrote spirited *qasidas*, and, like his contemporaries Wahshí and Kautharí, a mathnawí, *Farhád u Shírin*; and Faídí (died 1595), the author of the romantic poem, *Nal u Daman*, who also imparted new life into the rubá'í. In Persia proper

¹ A *kit'ah* or *mukatta'ah* is a poem containing moral reflexions and differs from the *qasída* and ghazal only by the absence of a *matla'* or initial distich.

only Zulálí, whose clever romance of "Sultan Mahmúd and his favourite Ayáz" (1592) is widely read in the East, Sá'ib (died 1677), who is commonly called the creator of a new style in lyric poetry, and, among the most modern, Hátif of Isfahán, the singer of sweet and tasteful odes (died about 1785), deserve a passing notice.

But we cannot conclude our brief survey of the national literature of Persia without calling attention to the rise of quite a novel form of Iranian poetry, the *drama*, which has only sprung up in the beginning of the present century. Like the Greek drama and the Mysteries of the European Middle Ages, it is the offspring of a purely religious ceremony, which for centuries has been performed annually during the first ten days of the month Moharrem,—the recital of mournful lamentations in memory of the tragic fate of the house of the caliph 'Alí, the hero of the Shi'itic Persians. Most of these passion-plays deal with the slaughter of 'Alí's son Hosain and his family in the battle of Kerbelá. But lately this narrow range of dramatic subjects has been considerably widened; Biblical stories and even Christian legends have been brought upon the Persian stage; and there is a fair prospect of a further development of this most interesting and important movement.

In the various departments of general Persian literature, not touched upon in the foregoing pages, the same wonderful activity has prevailed as in the realm of poetry and fiction, since the first books on history and medicine appeared under the Sámánids (see above). The most important section is that of historical works, which, although deficient in sound criticism and often spoiled by a highly artificial style, supply us with most valuable materials for our own research, especially when they relate contemporary events in which the authors took part either as political agents or as mere eye-witnesses. Quite unique in this respect are the numerous histories of India, from the first invasion of Sultan Mahmúd of Ghazna to the English conquest, and even to the first decades of the present century, most of which have been described and partly translated in the eight volumes of Elliot's *History of India* (1867-78). Persian writers have given us, besides, an immense variety of universal histories of the world, with many curious and noteworthy data (see, among others, Mirkhond's and Khwándamír's works under MÍRKHOND, vol. xvi. p. 499); histories of Mohammed and the first caliphs, partly translated from Arabic originals, which have been lost; detailed accounts of all the Persian dynasties, from the Ghaznavids to the still reigning Kajars, of Jenghiz Khán and the Moguls (in Juwainí's and Wassáf's elaborate *Taríkh's*), and of Timúr and his successors (see an account of the *Zafarnáma* under PETIS DE LA CROIX); histories of sects and creeds, especially the famous *Dabistán*, or "School of Manners" (translated by Troyer, Paris, 1843); and many local chronicles of Iran and Túrán. Next in importance to history rank geography, cosmography, and travels (for instance, the *Nuzhat-ul-kulúb*, by Hamdalláh Mustaufí, who died in 1349, and the translations of Istakhrí's and Kazwíní's

Arabic works), and the various *tadhkiras* or biographies of Súfis and poets, with selections in prose and verse, from the oldest of 'Aufi (about 1220) to the last and largest of all, the *Makhzan-ulgharâib*, or "Treasure of Marvellous Matters" (completed 1803), which contains biographies and specimens of more than 3000 poets. We pass over the well-stocked sections of philosophy, ethics, and politics, of theology, law, and Sáfism, of mathematics and astronomy, of medicine (the oldest thesaurus of which is the "Treasure of the sháh of Khwárizm," 1110), of Arabic, Persian, and Turkish grammar and lexicography, and only cast a parting glance at the rich collections of old Indian folk-lore and fables preserved in the Persian versions of *Kalilah & Dimnah* (see RÚDAGÍ), of the *Sindbádnáma*, the *Tútúdnáma*, or "Tales of a Parrot," and others, and at the translations of standard works of Sanskrit literature, the epéques of the *Rámáyana* and *Mahábhárata*, the *Bhagavad-Gítá*, the *Yoga-Vasishtha*, and numerous *Puránas* and *Upanishads*, for which we are mostly indebted to the emperor Akbar's indefatigable zeal.

A complete history of Persian literature is still a desideratum. Hammer's *Schöne Redekünste Persiens*, Vienna, 1818, is altogether unsatisfactory and obsolete. Concise sketches of Persian poetry are contained in Ouseley's *Biographical Notices*; in Flügel's article in Ersch and Gruber's *Allgemeine Encyclopädie* (1842); in Bland's papers in the *Journal of the Roy. Asiatic Society*, vol. vii. p. 345 sq. and vol. ix. p. 122 sq.; and in Barbier de Meynard's *Poésie en Perse*, Paris, 1877. Real mines of information are the catalogues of Sprenger, Calcutta, 1854; Morley, London, 1854; Flügel, 3 vols., Vienna, 1865; and Rieu, 3 vols., London, 1879-83. For the first five centuries of the Hijra compare Ethé's editions and metrical translations of "Rúdagí's Vorläufer und Zeitgenossen," in *Morgenländische Forschungen*, Leipsic, 1875; of Kisá'i's songs, Firdausí's lyrics, and Abú Sa'id b. Abú 'l-Khair's rubá'is, in *Sitzungsberichte der bayr. Akademie* (1872, p. 275 sq.; 1873, p. 622 sq.; 1874, p. 133 sq.; 1875, p. 145 sq.; and 1878, p. 38 sq.); of Avicenna's Persian poems, in *Göttinger Nachrichten*, 1875, p. 555 sq.; and of Asadí and his munázarát, in "Persische Tenzonen," *Verhandlungen des 5ten Orientalisten-Congresses*, Berlin, 1882, part ii., first half, p. 48 sq.; Zotenberg's *Chronique de Tabari*, Paris, 1867-74; Jurjání's *Wís u Rámin*, edited in the *Bibl. Indica*, 1864 (translated into German by Graf in *Z. D. M. G.*, xxiii. 375 sq.); and Kasimírski's *Spécimen du dráma de Menouchchéri*, Versailles, 1876. On Khákání, see Khanykoff's "Mémoire," in *Journal Asiatique*, 6th series, vol. iv. p. 137 sq. and v. p. 296 sq., and Salemann's edition of his rubá'is, with Russian transl., Petersburg, 1875; on Firdá'uddin 'Attár, Sacy's edition of the *Panádnáma*, Paris, 1819, and Garcin de Tassy's *Mantik-ut-tair*, Paris, 1857; on the *Gulshan-i-ráz*, E. H. Whinfield's edition, London, 1880; and on Amir Khosrau's mathnawis, the abstracts given in Elliot's *History of India*, vol. iii. p. 524 sq. German translations of Ibn Yamin were published by Schlechta-Wssehrd, *Bruchstücke*, Vienna, 1852; of Jámi's minor poems, by Rosenzweig, Vienna, 1840; by Rückert, in *Zeitschrift für die Kunde des Morgenlandes*, vols. v. and vi., and *Zeitschrift der D. Morgenl. Gesellsch.*, vols. ii., iv., v., vi., xxiv., xxv., and xxix.; and by Wickerhauser, Leipsic, 1855, and Vienna, 1858; German translation of *Yusuf u Zalikhá*, by Rosenzweig, Vienna, 1824, English by Griffith, London, 1881; French translation of *Lailá u Majnún*, by Chézy, Paris, 1805, German by Hartmann, Leipsic, 1807; Hilálí's "König und Derwisch," by Ethé, in *Morgenländ. Stud.*, Leipsic, 1870, p. 197 sq. On the Persian drama, compare Gobineau's *Religions et Philosophies de l'Asie centrale*, Paris, 1866; Chodzko's *Théâtre persan*, new ed., Paris, 1878; and Ethé, "Persische Pensionspiele," in *Morgenländ. Stud.*, p. 174 sq. (H. E.)

PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUC DE (1808-1872), the most devoted servant of Napoleon III., who with the duc de Morny and Marshal Saint-Arnaud formed the triumvirate which established the second empire, was born at Saint-Germain L'Espinas (Loire) on 11th January 1808. He came of a good family, but not a noble one, and, as his father had been killed at the battle of Salamanca in 1812, he was brought up by an uncle, who sent him to be educated at the college of Limoges. He entered the 3d Hussars in 1825, the cavalry school at Saumur in 1826, and became *maréchal des logis* in the 4th Hussars in 1828. He was at this time a Legitimist, but was soon made a Republican by his captain, and he helped to persuade his regiment to assist in the insurrection of 1830. For this service he expected great rewards, but got none, and was eventually dismissed from the army for insubordination in 1831. Finding himself without resources, he took to journalism, and assisted in editing the *Temps*, and in 1833, by which time he had become a profound Bonapartist, he issued a solitary number of a new journal, the *Occident français*, in which he proclaimed his political creed. This number was sent to Queen Hortense at Arenenberg, and when M. Fialin followed it in person, calling himself the *vicomte de Persigny*, he met with a warm reception, and soon became indispensable to Louis Napoleon. He had two qualities which gave him ascendancy over the young prince, fidelity and audacity. He it was who planned the attempt on Strasburg in 1836, and that on Boulogne in 1840. For his share in the last escapade he was sentenced to imprisonment in a fortress for twenty years, which was commuted into detention at Versailles, where he wrote a curious book to prove that the Pyramids were built to keep the Nile from silting up. When the Revolution of 1848 broke out he laboured indefatigably for the Bonapartist cause, securing the election of Louis Napoleon to the Constituent Assembly in June and in September 1848, and to the presidency in December 1848. His own prosperity was now secured; he was made *aide-de-camp* to the prince president, and elected to the Legislative Assembly in May 1849 for the department of the Loire. He then became one of the secret plotters of the coup d'état, and was at first designed for the office of minister of the interior, but a man of more capacity, De Morny, was chosen for this post, and Persigny only accompanied Colonel Espinas to take possession of the hall of the assembly. On securing the throne Napoleon III. hastened to reward his most faithful personal adherent. Persigny became minister of the interior in the place of De Morny in January 1852, and a senator in December 1852. He resigned office in 1854 and became ambassador in London, with but one short interval (1858-59), from May 1855 to November 1860, when he again became minister of the interior. His second tenure of office lasted till June 1863, when he resigned in disgust at the influence which M. Rouher was attaining over the mind of the emperor, and was made duc de Persigny in September 1863. As a minister he showed very little capacity, and throughout the years of his political influence he never seemed to understand, like De Morny, the real bases of the existence of the second empire. He, however, from dislike of Rouher, supported Ollivier in 1869, and defended the plébiscite, and when the empire fell in 1870 escaped to England. He did not long survive the overthrow of the idea which he had so strenuously supported, and died at Nice on 11th January 1872. Fialin de Persigny was certainly only an adventurer, but he had one merit, which the other founders of the second empire did not possess, fidelity to his master.

For Persigny's life, see a most eulogistic Biography by Delaroze *Le duc de Persigny et les doctrines de l'empire*, 1865; a short Biography in Mirecourt's *Portraits contemporains* (1868); and Cas-

telle's *Portraits politiques et historiques* (1859). His own curious book, *De la destination et de l'utilité permanente des Pyramides d'Égypte et de Nubie*, was published in 1845, and he wrote various political pamphlets, of which the most interesting relates to the Strasburg attempt, *Relation de l'entreprise du prince Napoléon Louis* (Lond. 1837). For his political career under the empire, see Taxile Delord's *Histoire du second empire* (1868-75).

PERSIMMON, the name given to the fruits of *Diospyros virginiana* in the United States. The tree which bears them belongs to the order *Ebenaceæ*, and has oval entire leaves, and monœcious flowers on short stalks. In the male flowers, which are numerous, the stamens are sixteen in number, arranged in pairs, and with the anthers opening by slits. The female flowers are solitary, with traces of stamens, and have a glabrous ovary with one ovule in each of the eight cells,—the ovary being surmounted by four styles, which are hairy at the base. The fruit-stalk is very short, bearing a subglobose fruit an inch or rather more in diameter, of an orange-yellow colour, and with a sweetish astringent pulp. It is surrounded at the base by the persistent calyx-lobes, which increase in size as the fruit ripens. The astringency renders the fruit somewhat unpalatable, but, after it has been subjected to the action of frost, or has become partially rotted or "bletted" like a medlar, its flavour is improved. In some of the southern States the fruit is said to be kneaded with bran, made into cakes, and baked. From the cakes a fermented liquor is made with the aid of yeast. The tree is cultivated in England, but rarely if ever ripens its fruit, and in the States it is said not to ripen north of New Jersey.

The Chinese and Japanese cultivate another species, the *Diospyros Kaki*, of which there exist numerous ill-defined varieties, which, according to Mr Hiern in his exhaustive monograph of the *Ebenaceæ*, all belong to one species. The fruits are larger than those of the American kind, variable in shape, but have similar properties. Some varieties have been introduced into Great Britain, and have produced their fruits in orchard-houses. The fruit is in appearance something like that of the apricot, but very astringent to the taste. After "bletting," however, it becomes sweet and agreeable. Some specimens analysed by Dr Voelcker for the scientific committee of the Royal Horticultural Society contained, roughly, 84 per cent. of water, 2½ per cent. of tannic acid, and 9·8 of sugar, pectin, &c., with small quantities of woody, albuminoid, and mineral matters.

PERSIUS (A. PERSIUS FLACCUS) stands third in order of time of those recognized by the Romans as their four greatest satirists. These represent four distinct periods of the national development—the revolutionary era of the Gracchi, the years immediately preceding the establishment of the monarchy, the first years of the reign of Nero, the age of Domitian and the dawning of the better era which followed on the accession of Nerva. Their relative value consists in the truth, freedom, and power with which they expressed the better spirit of their time, commented on its vices and follies, and described the actual personages, the prevailing types of character, and the fashions and pursuits—the "*quicquid agunt homines*"—by which it was marked. Of these four representatives of the most distinctly national branch of Roman literature—Lucilius, Horace, Persius, and Juvenal—Persius is the least important. He is indeed inferior to none of them in the purity and sincerity with which he expresses the best spirit of his age; but he was inferior in literary originality and vigour to Lucilius, in literary art to Horace and Juvenal,—less powerful in his denunciation of evil than Lucilius and Juvenal, less searching in his criticism than Horace,—less true to life in his delineation of men and manners than the two earlier satirists, less powerful in his effects than the latest among them. This inferiority is to be ascribed partly to the circumstances of his age. Its literature was more artificial, and also more opposed to the true principles of art, than that of any other stage in the development of Roman letters. The generation which succeeded the Augustan age—the generation which lived

under Tiberius, Gaius, and Claudius—had not the genius to originate a literature of its own nor the sense of security which would enable it to perpetuate the literary accomplishment of the preceding age. No period between the Ciceronian era and the reign of Hadrian was so unproductive. The accession of the young emperor, in whom were ultimately realized the worst vices of the tyrant along with the most despicable weaknesses of the *litterateur* and *artiste*—"scenicus ille" is the term of contempt applied to him in Tacitus—gave a fresh impulse to that fashion of verse-making which Horace remarked as almost universal among his educated contemporaries, and which was stimulated by the rhetorical education of the day. But the writers of the Neronian age had neither the genius nor the true sense of art which distinguished the Ciceronian and Augustan ages, nor had they acquired the cultivated appreciation and good taste of the later Flavian era, nor were they animated by that sense of recovered freedom of speech and thought which gave to Roman literature its two last great representatives. The writing of the Neronian age was, for the most part, a crude and ambitious effort to produce sensational effects by rhetorical emphasis. Of its representatives four can still be read with a certain though by no means an unmixed pleasure,—Seneca, Lucan, Petronius, and Persius. Of these Persius had least of the true literary gift. He had neither the smooth and fluent elegance of Seneca, the "ingenium amœnum et auribus illius temporis accommodatum" attributed to him by Tacitus, nor the rhetorical passion of Lucan, nor the cynical realism and power of representation which enabled Petronius to originate a new form of literature. Persius could not have become a satirist of the type of Petronius or of Martial: he could not have treated human degradation in a spirit of cynical sympathy or of amused tolerance. On the other hand earnest satire directed against its legitimate objects, the emperor and his favourites, could not at such a time express itself openly. "Pone Tigellinum" is an expressive reminder that it was safer to write sickly sentimentalism about "Phyllis and Hypsipyle" than to assume the rôle of Lucilius.

But apart from the influence of his time and the natural limitations of his genius, the personal circumstances of Persius were unfavourable to success in the branch of literature to which he devoted himself. The shortness of his life and the retirement in which it was spent, his studious tastes, his delicate health, and that which is most admirable in him, his exceptional moral purity, all contributed to keep him ignorant of that world which it is the business of a satirist to know. Lucilius, Horace, Petronius, Martial, Juvenal, were all men of the world, who knew the life of their day by close personal contact with it, and had no need to imagine it through the medium of impressions received from literature, or situations invented as themes for rhetorical exercises. Some aspects of his time, such as the outward signs of literary affectation and effeminacy, did come within the range of Persius's observation, and these he describes with no want of the pungency, "*Italum acetum*," characteristic of his race. But from any intimate knowledge, even through the medium of conversation, of the vices and vulgarities from which Petronius lifts the curtain he was debarred by the purity alike of his moral instincts and of his taste. Thus his satire, while able to lash "the sickly morals" of his time ("*pallentes radere mores*") in fervid generalities, cannot perform the more important function of probing them through living examples.

But Roman satire had another function besides the representation and criticism of men and manners. More than any other branch of literature it was the expression of the writer's own nature and convictions. The frank sincerity with which these were expressed was a great cause

of the personal hold which Lucilius had on his readers; it is still one of the secrets of the personal charm of Horace. The sympathy with which Persius was read in the early days of Christianity and the enthusiasm which many readers have felt for him in modern times are mainly due to the impression of character which he produces. But he is to be regarded further, not as an isolated specimen of purity in an impure age, but as an important witness of that undercurrent of moral and spiritual sentiment which gathered force as a protest against the corruption and tyranny of the first century of the empire. The consciousness of moral evil which became intensified during that period is very apparent when we compare the spirit of Cicero and Horace, men in their own day seriously concerned with questions of conduct, with that of Tacitus and Juvenal. This great inward change was stimulated and directed by the teaching of Stoicism; and it was in the reign of Nero that Stoicism gained its chief ascendancy over educated men, and supplanted among the adherents of the republic the fashionable Epicureanism of the days of Lucretius and Horace. Of the Stoical spirit of that time, represented also by Seneca and Lucan, Persius is the purest representative. His chief claim to consideration is, not that he is a great poet, satirist, or humorist, or even an agreeable writer, but that he is one of the earliest, and, amongst classical writers, one of the most sincere preachers of a pure personal morality based on a spiritual conception of religion.

The impression of him produced by his writings is confirmed by the accounts transmitted of his life, for which we are indebted to the contemporary grammarian, Valerius Probus of Berytus. Written when the impression left by him was fresh on the memory of his friends, it may be accepted as trustworthy in regard both of outward facts and of the sentiments which he inspired.

Well born and well connected, and the inheritor of a good estate, Persius lived the uneventful life of a student, and was chiefly remarkable for his affection for his friends, his teachers, and his family. He was a native of Etruria, a district which contributed less than any other in Italy to the literary distinction of Rome. And it is noticeable that, while Persius has all the characteristic moral fervour of the more serious Roman writers, he shows less, compared with those who have an important place in the national literature, of that sensuous vivacity and susceptibility to beauty in art and nature with which the purely Italian race was preeminently endowed. He was born at Volaterræ in the year 34 A.D., and received his early education there. His father died when he was six years of age, and his mother, Fulvia Sisennia, whose latter name by its termination is indicative of an Etruscan stock, married a second time and was soon again left a widow. In one of the satires he speaks of the eagerness with which his father used to bring his friends to listen to his recitation of the dying speech of Cato. It is not likely that at the age of six he could have been so far advanced in his rhetorical education, and perhaps, though he uses the word "*pater*," this reminiscence, which is told not without satirical colouring, may be a testimony to the interest which his stepfather took in watching his progress. The nature of the lesson—"morigeri verba Catonis"—is suggestive of an early direction towards Stoicism given in his teaching; but by what he tells us of his way of shirking his lessons and of his healthy preference of play to work, he seems to have done what he could to escape the doom of becoming a precocious prodigy. He was taken at the age of twelve to Rome, and continued his education under the two most famous grammarians and rhetoricians of the day, Remmius Palaemon and Virginius Flavius. The decisive influence of his life was his friendship with the Stoic philosopher, Annaeus Cornutus, whose

pupil he became on assuming the "toga virilis" at the age of sixteen. To the charm of this man's conversation and teaching Persius attributes his escape from the temptations to a life of pleasure, to which youths of good position and fortune were exposed at Rome. Besides his friendship with Cornutus, he enjoyed during ten years of his life the intimate friendship of Thrasea Pætus, the noblest specimen of Stoicism which the Roman world produced in the first century of the empire. This intimacy was probably due, in the first place, to the relationship of Persius to the younger Arria, the wife of Thrasea. Though a much younger man, he gained so completely the affection of Thrasea that he often went with him as the companion of his travels. The knowledge that he was an intimate member of the circle of Thrasea and Helvidius gives an additional interest to the opinions of Persius on literature and conduct, and also to the indications of his attitude towards the reigning power. He was introduced also to Seneca, but was not much attracted by his genius. The influence of Thrasea may have had something to do with this want of sympathy. The true Stoic, who "kept as holidays the birthdays of the two Brutuses and of Cassius," was not likely to have been among the admirers of the apologist for parricide.¹

He was also intimate with some of the younger poets of the time, especially with Cæsius Bassus, to whom he addresses his sixth satire. He was acquainted with his younger and more famous contemporary, Lucan, who is said, with the generous impulses which seemed to have been mixed with the fatal weaknesses of his character, to have been carried away by great enthusiasm when he first heard Persius reciting some of his verses. His biographer tells us that the impulse to writing satire was derived from reading a book of Lucilius. He was evidently a diligent student both of him and of Horace. He himself justifies his adoption of this mode of writing by his natural tendency to satiric criticism,—"*sum petulanti splene cacinno*." But his satire shows as little of the humorous amusement in contemplating the comedy of life, which is one of the motives of the satire of Horace, as of the fierce indignation which the tragic spectacle of its crimes produced in Juvenal. We should rather be inclined to conclude that, as his Stoicism was a protest against the vices and tyranny of the time, so his adoption of that masculine national form of literature which took its subjects from the actual experience of Roman life was a protest against the effeminate style and exotic themes which were then fashionable with the social class to which he belonged.

There is no trace in his writings of any participation in the active interests of public or professional life. More than any other Roman writer, except perhaps Lucretius, he chose the "*secretum iter et fallentis semita vitæ*" (the flowery path that winds by stealth). But his life, if apparently much happier, was not enriched by the fulness of contemplative interest and of delight in nature which lightened up the gloom of the older poet. His latest satire, addressed to his friend Cæsius Bassus, is written from the port of Luna on the Gulf of Genoa; but, while celebrating the mildness of its winter climate, grateful to him as an invalid, he is silent about the charm of its natural beauty. He died at the age of twenty-eight, on one of his own estates on the Via Appia, within eight miles of Rome. His satires were revised by Cornutus, and edited at his own request by Cæsius Bassus. The former is said to have altered into a vague generality an expression reflecting on the poetical gifts of Nero, a subject as dangerous to deal with as his vices and tyranny. Dying in the

year 62 A.D., Persius did not witness the worst crimes of that reign, and escaped the fate which awaited Seneca, Lucan, and Thrasea.

His character is thus summed up by his biographer. "He was of a most gentle disposition, of maidenly modesty; handsome in person, and marked by exemplary affection towards his mother, sister, and aunt. He lived soberly and chaste." The characteristic of "*virginalis pudicitia*" it is natural to associate with the pure family atmosphere in which he lived, and the existence of cultivated women who could exercise such an influence is a warning not to judge Roman society, even in its worst time, altogether from the representation of Juvenal. The letters of Pliny amply confirm the belief that the world was not all so bad as it appears in that representation. The tone of the biographer as well as his explicit statements attest the warm affection which Persius inspired in his lifetime. Mere asceticism unaccompanied by other graces of character cannot account for this sentiment of affection; and the Roman world had a keen eye to detect insincere professions of austerity. But, while there are many signs of inexperience of life and much forced and artificial writing in Persius, there is in the expression of his deepest convictions an unmistakable ring of genuineness. He seems to love virtue without effort, because his nature finds in the love and practice of virtue the secret of happiness. There is also in the personal addresses to his friends, as in that to Macrinus, a tone of genial sympathy with the innocent enjoyments of life. In the expression of affection for those whom he loved no ancient writer is so cordial and single-minded, except one, as much separated from him by the licence of his life as by the force of his genius, who also died in early youth, the ardent true-hearted poet of Verona.

Persius is said to have written slowly and seldom, and, though he seems to have composed, probably before he devoted himself to satire, a tragedy on a Roman subject, on account in verse of some of his travels, and some lines on the elder Arria (none of which were ever given to the world), the only result of his literary activity is the short book of six satires which we now possess. The contrast between the small amount of his contributions to literature and the reputation which he enjoyed is noticed by two ancient writers, who indicate their appreciation of his value, Quintilian and Martial. The satires are not only fewer in number than those of Horace and Juvenal, but they are for the most part shorter. Only one of them, the first, fulfils the proper function of satire by representing any phase of the life of the time and pointing its moral. It exposes by personal sketches and representative imitations the fashionable taste in poetry, and marks its connexion with the luxury and effeminacy of the age. The satire was believed in ancient times to be aimed at the emperor; and this is confirmed, not only by the tradition of the substitution by Cornutus of the vague generality "*quis non*" for the pointed "*Mida rex*," but also by the parody "*Torva Mimaloneis implerunt cornua bonis*," &c., which is in keeping with the account we have in Tacitus and other writers of the style of the emperor's compositions. In an ego abounding in informers it would have been dangerous to have published or even to have read before a circle of friends a more direct comment; but the attitude of Persius towards the absolute ruler of the day may be inferred from other references in the satires, as from the passage iii. 35, beginning "*Magne pater divum*"; and again at iv. 20, in the words, "*Ast ego Dinomaches*," we may suspect a protest against the degradation of the Roman world in submitting to be governed by the son of Agrippina. Even in the abstinence from one single word of compliment to the ruling power we enjoy an agreeable contrast to the time-serving of Seneca and the adulation of Lucan.

While the first satire is, like most of those of Lucilius, Horace, and Juvenal, essentially representative, and has its motive in the desire to paint in satiric colours a prevailing fashion and some of the actual personages or types of character of the day, all the rest are essentially didactic and have their motive in the desire to enforce and illustrate some lesson of morality or tenet of Stoicism. The second is an admirable sermon on prayer, and illustrates by examples that union of worldliness and covetousness with religious faith and practice which has not been absolutely confined to Paganism. The third is aimed at the exposure and correction of the weakness of character which, in spite of good resolutions, succumbs to the attacks of sloth and pleasure. The fourth, suggested by the first *Alcibiades* of Plato, though perhaps also written with covert reference to one whose "Greek levity" may have prompted him to

¹ Cf. "*Ergo non iam Nero, culus immunitas omnium questus antebat, sed Seneca adverso rumore erat, quod oratione tali confessionem scripsisset*" (Tac., *Ann.*, xiv. 11).

pose as a Roman Alcibiades, is directed against the arrogant claims of a sensual youth to deal, on the ground of his hereditary distinction, with affairs of state and to govern men. The fifth, the most elaborate of all, illustrates the Stoical doctrine of the difference between true and false freedom, and shows the power of avarice, luxury, the passion of love, ambition, and superstition to make men slaves. It is the same subject as that which Horace treats in the third satire of the second book; but it is treated with neither the irony nor the direct knowledge of life which Horace applies to it. The last satire is chiefly devoted to a subject which played a large part in the satire of Horace and Lucilius,—the proper use of money. In all these latter pieces the subjects are the common-places of satire and moral disquisition, illustrated rather by new versions of old characters than by pictures of the living men and women of the day. Though he expresses admiration for the spirit of Lucilius and the old comedy, he seems to keep clear of all personality and detraction. He professes "*ingenuo culpam defigere ludo*," and, whatever may be thought of his humour, he at least always writes in the spirit of a gentleman. So far as there is real contact with life in his satires, it is with the vanity and weakness of the class to which he himself belonged that he shows familiarity. Other sketches, however, show original observation, as that of the provincial ædile, of the brawny centurion who laughs at all philosophers, and, the most elaborate of all, that of the man torn asunder by his avarice and his love of luxury, who shrinks from the hard roughing of a sea-voyage, to which he is prompted by his cupidity (i. 129, ii. 76-87, v. 141-160).

In point of form he aims at reproducing the dialogue of the old "*satura*," to which Horace finally adhered. But for the dramatic vivacity of ordinary speech he substitutes the curt questions and answers of Stoical disquisition. This is a great source of the obscurity of his writing. Some of his satires take the form of a familiar epistle, but in them also there is a large intermixture of dialogue. In style, while he protests against other modes of affectation, he cannot escape the perverse fashion of forced and exaggerated expression. While disclaiming imaginative inspiration and avoiding poetical ornament, he falls into the opposite extreme of excessive realism, and disguises his plain meaning under contortions of metaphor, taken from the forge, the potter's wheel, the carpenter's rule, the baker's oven, &c. He is fond, too, of the realism of physical expression to denote states of mind and feeling, such as "*fibra*," "*pulpa*," "*gluto*," &c.; and this tendency, combined perhaps with the wish to imitate Lucilius, has led him occasionally to disfigure the purity of his pages with unnecessary coarseness. It is only rarely, and when he is at his best, that we are not conscious of a constant strain to express his meaning with unnecessary emphasis. Though single phrases of forcible condensation can be quoted from him, yet almost every period and paragraph seems to have been made harsh and obscure with the purpose of arresting attention. In the pictures which he draws from life, as in that of the reciting poet in the first satire, he strives by minuteness and exaggeration of detail to produce a strong sensational impression; and this is still more observable in those numerous cases where he distorts and caricatures the temperate and truthful effects of Horace's sketches. No Latin writer is less natural. His works have engaged the industry of many commentators both in ancient and modern times. None could claim less the praise which Martial claims for his own, of "*pleasing grammarians without needing the aid of their interpretation*."

It is not, accordingly, among writers but among moralists that he holds a high place. Among the professors of Stoicism some were better writers, others were greater men; no one was purer in all his instincts, more sincere in all his nature, or inspired with a more genuine enthusiasm for virtue. It is when he gives expression to this enthusiasm and to his single-hearted affection for his friends that he is able for a few lines to write with simple force and with impassioned earnestness. Such lines as these—

"Compositum ius fasque animæ, sanctosque recessus
Mentis, et incoctum generoso pectus honesto" (ii. 73, 74);

"Quid sumus et quidnam victuri gignimur . . .
... quem te deus esse

Jussit et humana qua parte locatus es in re" (iii. 66-72), &c.;

are in a strain more in accordance with the best modern ideas of man's highest duty and his true position in the world than anything to be found in the other satirists of Rome. The aim of Lucilius was to make men good citizens. He judged their life by the standard of public virtue and utility. The aim of Horace's satire was to make men happier in themselves and more agreeable in their intercourse with one another. He judged them by the standard of good sense, good feeling, and good manners. The aim of Juvenal—so far as it was sincere—was to raise human life from the degradation into which it had fallen. The standard by which he judged the men of his day was that of the manliness and dignity realized in the best ages of the republic. The aim of Persius was to make men live in accordance with the dictates of a pure conscience. His standard was that ideal of human conduct which has arisen out of the aspirations and convictions of an enlightened theism.

The best recent editions of Persius are those of O. Jahn and of Professor Conington. The edition of Mr. Pretor is also to be named. All of these contain, in their introductions, important contributions to the critical estimate of Persius. An excellent account of his life, character, and writings is to be found in Martha's *Les Moralistes Romains*, and an interesting, though somewhat disparaging, criticism of him as a writer is contained in Nisard's *Poètes Latins de la Décadence*. (W. Y. S.)

PERSONAL ESTATE. Strictly speaking, the term ESTATE (*q.v.*) is confined in English law to the extent of interest which can exist in real property. But "personal estate" is a term often conveniently, if not accurately, applied to all property that is not real property. The division of property into real and personal represents in a great measure the division into immovable and movable incidentally recognized in Roman law and generally adopted since. "The only natural classification of the objects of enjoyment, the only classification which corresponds with an essential difference in the subject-matter, is that which divides them into moveables and immoveables" (Maine, *Ancient Law*, ch. viii.). "Things personal," according to Blackstone, "are goods, money, and all other moveables which may attend the owner's person wherever he thinks proper to go" (*Comm.*, vol. ii. p. 16). This identification of things personal with movables, though logical in theory, does not, as will be seen, perfectly express the English law, owing to the somewhat anomalous position of chattels real. In England real property is supposed to be superior in dignity to personal property, which was originally of little importance from a legal point of view. This view is the result of feudal ideas, and had no place in the Roman system, in which immovables and movables were dealt with as far as possible in the same manner, and descended according to the same rules. The law of personal property has developed more rapidly and freely than that of real property, as it is of more modern growth and has not been affected by the notion of tenure. The main differences between real and personal property which still exist in England are these. (1) In real property there can be nothing more than limited ownership (see ESTATE); there can be no estate properly so called in personal property, and it may be held in complete ownership. There is nothing corresponding to an estate-tail in personal property; words which in real property would create an estate-tail will give an absolute interest in personalty. A life-interest may, however, be given in personalty, except in articles *quæ ipso usu consumuntur*. Limitations of personal property, equally with those of real property, fall within the rule against perpetuities. (See REAL ESTATE.) (2) Personal property is not subject to various incidents of real property, such as rent, dower, or escheat. (3) On the death of the owner intestate real property descends to the heir; personal property is divided according to the Statute of Distributions. (4) Real property as a general rule must be transferred by deed; personal property does not need so solemn a mode of transfer. (5) Contracts relating to real property must be in writing by the Statute of Frauds, 29 Car. II. c. 3, s. 4; contracts relating to personal property need only be in writing when it is expressly so provided by statute, as, for instance, in the cases falling under s. 17 of the Statute of Frauds. (6) A will of lands need not be proved, but a will of personalty or of personal and real property together must be proved in order to give a title to those claiming under it. (7) Devises of real estate fall as a rule within the Mortmain Act, 9 Geo. II. c. 36 (see CHARITIES, CORPORATION); bequests of personal property, other than chattels real, are not within the Act. (8) Mortgages of real property need not generally be registered; mortgages of personal property for the most part require registration under the Bills of Sale Acts (see PLEDGE; and BILL OF SALE, vol. iii. p. 674).

Personal estate is divided in English law into *chattels*

real and chattels personal; the latter are again divided into *choses in possession* and *choses in action*. Chattels real are personal interests in real estate, which, though they are annexed to land, still descend in the same manner as personal estate. Blackstone speaks of them as being "of a mongrel amphibious nature." Examples are a term of years, the next presentation to a benefice, an estate *pur autre vie*, and money due upon a mortgage. Under the head of chattels personal fall all kinds of property other than real estate and chattels real. In cases of bequest to a charity the terms pure and impure or mixed personality are often used. The latter class is almost coterminous with chattels real. It falls as a rule within the Mortmain Act. A chose in action denotes the right of recovery by legal proceedings of that which, when recovered, becomes a chose in possession. Choses in action were before the Judicature Acts either legal, as debts (whether arising from contract or tort), recoverable in a court of law, or equitable, as legacies (residuary personal estate of a deceased person), or money in the funds. A legal chose in action was not assignable. A consequence of this view was that until 1875 (subject to one or two statutory exceptions, such as actions on policies of insurance) an action on an assigned chose in action must have been brought at law in the name of the assignor, though the sum recovered belonged in equity to the assignee, and in equity he might have sued in his own name, making the assignor a party as co-plaintiff or as defendant. The Judicature Acts have made the distinction drawn between legal and equitable choses in action of no importance. The Judicature Act, 1873, 36 and 37 Vict. c. 66, s. 25, (6), enacts that the legal right to a debt or other legal chose in action may be passed by absolute assignment in writing under the hand of the assignor. The old law as to the reduction into possession by a husband of his wife's choses in action (see HUSBAND AND WIFE) seems to have been practically rendered obsolete by the Married Women's Property Act, 1882. Blackstone, who is followed by Mr Joshua Williams (*Law of Personal Property*), recognizes a further division of *incorporeal personal property*, standing between choses in action and choses in possession, and including personal annuities, stocks and shares, patents, and copyrights.

Interest in personal property may be either absolute or qualified. The latter case is illustrated by animals *feræ naturæ*, in which property is only coextensive with detention. Personal estate may be acquired by occupancy (including the *accessio, commixtio, and confusio* of Roman law), by invention, as patent and copyright, or by transfer, either by the act of the law (as in bankruptcy, judgment, and intestacy), or by the act of the party (as in gift, contract, and will).

There are several cases in which, by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property *prima facie* real which is treated as personal is an estate *pur autre vie*, which, since 14 Geo. II. c. 20, s. 9 (now replaced by 1 Vict. c. 26, s. 6), is distributable as personal estate in the absence of a special occupant. Examples of property *prima facie* personal which is treated as real are FIXTURES (*q.v.*), heirlooms, such as deeds and family portraits, and shares in some of the older companies, as the New River Company, which are real estate by statute. In ordinary cases shares in companies are personal estate, unless the shareholders have individually some interest in the land as land.

The terms *heritable* and *movable* of Scotch law to a great extent

correspond with the real and personal of English law. The main points of difference are these. (1) Leases are heritable as to the succession to the lessee, unless the destination expressly exclude heirs, but are movable as to the fise. (2) Money due on mortgages and securities on land is personality in England. At common law in Scotland debts secured on heritable property are themselves heritable. But by 31 and 32 Vict. c. 101, s. 117, heritable securities are movable as far as regards the succession of the creditor, unless executors are expressly excluded. They still, however, remain heritable *quoad fiscum*, as between husband and wife, in computing legitim, and as far as regards the succession of the debtor. (3) Up to 1868 the heir of heritage succeeded to certain movable goods called heirship movables, which bore a strong likeness to the heirlooms of English law. This right of the heir was abolished by 31 and 32 Vict. c. 101, s. 160. (4) Annuities, as having *tractum futuri temporis*, are heritable, and an obligation to pay them falls upon the heir of the deceased (Watson, *Law Dict.*, s.v. "Annuities").

The law in the United States agrees in most respects with that of England. Heirlooms are unknown, one reason being, no doubt, that the importance of title-deeds is much less than it is in England, owing to the operation of the Registration Acts. Long terms in some States have annexed to them the properties of freehold estates. Thus in Massachusetts, if the original term be a hundred or more years, it is deemed a fee as long as fifty years remain unexpired (*Mass. Gen. Stat.*, c. 90, § 20). In the same State estates *pur autre vie* descend like real property (*Gen. Stat.*, c. 91, § 1). In New York and New Jersey an estate *pur autre vie* is deemed a freehold only during the life of the grantee; after his death it becomes a chattel real. In other States the heir has a *scintilla* of interest as special occupant (Kent, *Comm.*, vol. iv. p. 27). In some States railway rolling-stock is considered as purely personal, in others it has been held to be a fixture, and so to partake of the nature of real property. Shares in some of the early American corporations were, like New River shares in England, made real estate by statute, as in the case of the Cape Sable Company in Maryland (Schouler, *Law of Personal Property*, vol. i. p. 619). In Louisiana animals employed in husbandry are, and slaves were, regarded as immovables. Pews in churches are generally real property, but in some States they are made personal property by statute, *e.g.*, in Massachusetts (*Gen. Stat.*, c. 30, § 38). The assignment of choses in action is generally permitted, and is in most States regulated by statute. The circuit court has no jurisdiction in the case of an assigned chose in action unless a suit might have been prosecuted in that court if no assignment had been made (*Revised Stat. of U. S.*, tit. xiii. § 629). (J. W. +)

PERSPECTIVE. See PROJECTION.

PERTH, an inland county of Scotland, is situated almost in the centre of the country between 56° 4' and 56° 57' N. lat., and between 3° 4' and 4° 50' W. long. The larger part of its border-line is formed of natural boundaries, the Grampians separating it on the west and north from Argyll, Inverness, and Aberdeen, while the Ochils and the Firth of Tay in the south-east divide it from Kinross, Clackmannan, and Fife. In the south the river Forth forms a large portion of the boundary with Stirling, but the boundary with Forfar in the north-east is almost at no point defined either by rivers or mountains. The county is of an irregular circular form, the diameter being about 70 miles. A small portion in the south-east is separated from the main portion at the junction of Clackmannan and Fife, and another small portion is surrounded by Stirlingshire. Perthshire is the fourth largest county in Scotland, the total area being 1,617,808 acres, or 2528 square miles. Situated on the Highland border, Perthshire embraces characteristics scarcely combined in any other county of Scotland, and it excels them all in the picturesqueness and multimiform variety of its scenery. The finest passes into the Highlands are Killiecrankie, Leny, and the Trossachs. With hardly any exception the rivers and streams flow east and south and reach the ocean either by the Forth or the Tay. They generally issue from large elongated lochs formed by depressions at the foot of the mountains. The Erich in the extreme north-west unites Loch Erich and Loch Rannoch; and from the latter flows the Tummel, which, after passing through Loch Tummel and forming a series of rapids and falls, joins the Tay. The Tay, which rises on the borders of Argyllshire, passes through Loch Dochart and Loch Tay and in its course

of rather over 100 miles receives nearly the whole drainage of the county, discharging a larger volume of water to the sea than any other river in Great Britain; its principal tributaries are the Tummel at Logierait, the Bran near Dunkeld, the Isla near Kinclaven (after its junction with the Ercht), the Almond near Perth, and the Earn from Loch Earn, at the borders of Fifeshire. The Forth from Loch Ard skirts the southern boundary of the county, and receives the Teith from Lochs Katrine, Achray, Vennacher, Voil, and Lubnaig, the Goodie Water from Loch Menteith, and the Allan, which rises in the Ochil Hills. Loch Ercht, partly in Inverness-shire, and Loch Tay are each more than 14 miles in length, Loch Rannoch is 9 miles long, Lochs Earn and Katrine are 7 each, and Lochs Vennacher, Lubnaig, and Voil each between 5 and 3. There are an immense number of small lochs varying in length from .1 to 3 miles, among which may be mentioned Garry, Tummel, Lows, Lyon, Dochart, Freuchie, Ard, and Menteith. The lochs and rivers abound in salmon and varieties of trout; and scarcely any of the streams have been perceptibly injured by the pollution of manufactures. About four-fifths of the surface of the county, chiefly in the west and north-west, is occupied by the Grampians, or encroached on by their ridges or by isolated summits, among the highest of the chain in Perthshire being Ben Lawers (3984 feet), north of Loch Tay; Ben More (3843) and Stobinnain (3821), south of Loch Dochart; Ben-y-Gloe (3690), and other peaks, near Glen Tilt; Schiehallion (3547), south of Loch Rannoch; and Ben Voirlich (3180), south of Loch Earn. The Ochils, occupying a considerable area in the south-east, attain in many cases a height of over 2000 feet, and the Sidlaws, practically a continuation of the Ochils running into Forfarshire, reach a height of about 1500 feet. The lowland districts consist chiefly of the straths and river-valleys, as Strath-tay; Strathmore, extending into Forfarshire; Strathearn, stretching across the county from west to east, and bounded on the south by the Ochils; the district of Menteith between the Teith and the Forth; and the Carse of Gowrie between the Sidlaws and the Firth of Tay.

Geology and Minerals.—As regards its geology Perthshire consists of two distinct areas, that differ from each other entirely in the rocks of which they are composed and consequently in their scenery. The larger of these regions comprises the mountainous ground and occupies the northern and by much the larger part of the county. The rocks in this region belong to the series of crystalline schists, and include varieties of gneiss, mica-schist, clay-slate, hornblende-rock, &c., with important bands of quartzite, quartz-schist, and limestone. These rocks are arranged in approximately parallel folds, the axes of which range in a general sense from south-west to north-east, the same groups of strata being repeated again and again by successive plications. The quartzites from their durability and whiteness form specially marked zones across the county, as in the ranges of Schiehallion and Ben-y-Gloe. The limestones also from their persistence afford excellent horizons for interpreting the geological structure. A notable band of them runs along the valley of Loch Tay, plunging under Ben Lawers and rising up again in Glen Lyon, whence it continues across Strath Tummel into Glen Tilt. These various crystalline rocks are believed to be prolongations of the schistose series that overlies the Lower Silurian rocks of Sutherland; but they have not yet yielded fossils. They are here and there pierced by masses of granite, porphyry, or other eruptive rocks.

The southern (or more correctly south-eastern) limit of the mountain ground is defined by a line drawn from the foot of Loch Lomond by Aberfoyle, Pass of Leny, Comrie,

a little below Dunkeld, and Bridge of Cally, to Lintrathen. On the southern side of this line the ground presents distinctively lowland scenery. It is occupied by the Lower Old Sandstone with its included conglomerates, flagstones, and volcanic rocks. A remarkable dislocation, which nearly coincides with the line just traced, separates the younger series of formations from the older rocks of the mountains. But here and there on the north side of the fracture, in bay-like hollows of the hills, the massive conglomerates of the Old Red Sandstone can be seen resting upon the upturned edges of the schists. These conglomerates with their associated strata appear to have been laid down in a large lake or inland sea which lay across central Scotland and northern Ireland, and was tenanted by the peculiar Old Red Sandstone fishes (*Cephalaspis*, &c.). A long line of active volcanoes extended through this lake. Their sites are still traceable in the Ochil and Sidlaw Hills. See GEOLOGY, vol. x. p. 343 *sq.* Much of the lower ground is covered with the clays, gravels, and sands left by the ice-sheets and glaciers that once occupied the surface. Raised beaches marking recent upheaval of the land are seen in the Firth of Tay. The larger rivers present a succession of three or more alluvial terraces. Copper ore is found in the southern Ochils and coal at their base. Ironstone is wrought at Culross. Lead and other metals are found sparingly in the neighbourhood of Tyndrum, Ben Ledi, and Glen Lyon. Roofing slates are quarried at Birnam. In many valleys there are large deposits of peat.

Agriculture.—The climate and soil of Perthshire present greater varieties than in any other county of Scotland. In the higher western regions it is very moist; and long stretches of exposed uplands alternate with finely-sheltered valleys. The arable land is chiefly in the drier eastern districts. For the most part the soil is sharp and fertile. The county, agriculturally, may be classed in four divisions: deer-forests, chiefly the wilder mountain districts; grazing and pasture lands on the hills, embracing about four-fifths of the total area; light soils in the lower undulating districts, including the north portion of Menteith and the upper portion of the principal river-valleys, specially suited for oats, barley, turnips, and potatoes; clay and carse land, chiefly in the Carse of Gowrie, which extends to about 100,000 acres, in the Carse of Stirling north of the Forth and in the lower part of Strathearn below and above Bridge of Earn. The Carse of Gowrie has as its basis the boulder clay, above which rests the blue clay proper, or peat, or the carse clay,—a mixture of sand and clay, ranging from the finest clay soil to poor whitish "end clay." The best heavy carse land is very rich and productive, but requires to be thoroughly wrought, limed, and manured. The district is well adapted for wheat, although the area sown is decreasing. A considerable area is occupied by orchards, the light quick soil on Tayside and in the upper districts of Menteith being admirably adapted for apples.

Between 1875 and 1880 the number of holdings decreased from 5296 to 5123, although their area increased from 831,890 to 344,728 acres. Of the holdings 179 in 1880 were above 300 acres in extent, 1033 between 100 and 300 acres, 786 between 50 and 100 acres, and 3125 did not exceed 50 acres each. There are a large number of small holdings in the Highland valleys and in the neighbourhood of the villages and small towns. According to the agricultural returns for 1883 there were 344,240 acres, or only a little less than a fifth of the total area, under cultivation, 103,050 acres being under corn crops, 50,799 acres green crops, 100,631 rotation grasses, 87,064 permanent pasture, and 2696 fallow. Of the corn crops, 70,424 acres were under oats, 22,770 acres barley and bere, 6238 wheat, and 3087 beans; and of the green crops, 31,059 acres were under turnips and swedes and 18,611 under potatoes. The number of horses was 13,651, of which 10,524, chiefly Clydesdales, were used solely for agricultural purposes. Cattle numbered 73,097, of which 18,755 were cows and heifers in milk or in calf. Although dairy-farming is not in itself an important industry, a large number of cows are generally kept on the lowland farms. The cows are principally Ayrshires, but the West

Highland or Kyloe breed of cattle is common in the straths and lower grounds adjoining the Highlands. Sheep in 1883 numbered 696,640. All the pasturage in the Grampians, not in deer-forests, is occupied by sheep, and there are also large sheep-runs on the Ochils. The blackfaced are principally kept in the Grampians, but there are also a large number of Cheviots, and in the lower grounds South Downs and Leicesters are common. In 1812 there were 203,880 acres under wood, of which 61,164 were planted and 142,716 natural. The area under woods in 1884 was 94,563 acres, in addition to which 424 acres were under orchards, 535 acres market-gardens, and 113 acres nurseries. In Breadalbane and Menteith there are still extensive remains of the old forest.

According to the latest return (1872-73) the land was divided among 5787 proprietors, possessing 1,612,001 acres at an annual value of £259,365, or about 11s. 10d. an acre. Of the proprietors 4680, or nearly four-fifths, possessed less than one acre each. The following possessed upwards of 20,000 acres each, viz., duke of Athole, 194,640; earl of Breadalbane, 193,504; Baroness Willoughby d'Eresby, 76,837; trustees of marquis of Breadalbane, 40,662; earl of Moray, 40,553; Hon. Lady Menzies, 35,500; Sir A. D. Drummond Stewart, 33,274; trustees of R. Stewart Menzies, 33,000; Sir Robert Menzies, 32,784; duke of Montrose, 32,294; earl of Mansfield, 31,197; D. R. Williamson, 29,494; C. H. Drummond Moray, 24,980; Mrs Mary Stuart Robertson, 24,000; W. M. Macdonald, 22,600; David Carnegie, 22,205; and Lieutenant-Colonel Farquharson, 20,056.

Manufactures.—The manufacture of coarser linen fabrics is largely carried on in the towns and villages, and there are a considerable number of flour-mills. Cotton-works exist at Deanston and Stanley; hand-loom weaving is carried on at Auchterarder, Dunblane, Doune, Crieff, and elsewhere, and in several places the manufacture of shawls, blankets, and other fabrics. For the industries of the city of Perth see below.

Railways.—The lowland districts of the county are intersected by branches of the principal railway lines of Scotland, supplying convenient communication between all the principal towns; and by the Highland and Oban railways, supplemented by coaches and steamers on the larger lochs, the finest scenery in the county has been rendered easy of access.

Administration and Population.—Anciently the county was divided into the hereditary jurisdictions of Athole in the north, Balquhider in the south-west, Breadalbane in the west, Gowrie in the east, Menteith in the south, Perth in the south-east, Rannoch in the north-west, and Stormont and Strathern in the middle. These jurisdictions were abolished by the Act of 1748, and in 1795 an Act was passed dividing the county for administrative purposes into the ten districts of Auchterarder, Blairgowrie, Carse of Gowrie, Crieff, Culross, Coupar-Angus, Dunblane, Dunkeld, Perth, and Weem. The sheriffdom is divided into an eastern and a western district, the seat of the one being Perth and of the other Dunblane. The county is represented in parliament by one member, the city of Perth by one member, and Culross is included in the Stirling district of burghs. Perthshire embraces eighty-one parishes, and contains three ancient cities, Perth, formerly the capital of Scotland, and Dunkeld and Dunblane, formerly the seats of bishoprics, as was also Abernethy. The royal burghs are Perth (27,207) and Culross (380); and Auchterarder, Abernethy, and Dunblane formerly held this rank. The police burghs are Abernethy (906), Alyth (2377), Blairgowrie (4537), Callander (1622), Coupar-Angus (partly in Forfarshire), Crieff (4469), Dunblane (2186), Perth (26,951), and Rattray (2538). The population of the county in 1831 was 142,166, which by 1851 had diminished to 138,660, and by 1871 to 127,768; but in 1881 it had increased to 129,007, of whom 61,552 were males and 67,455 females. The increase has been wholly in the town population, from 44,250 (in 1871) to 49,642 (in 1881), there being a decrease in the village population from 23,321 to 22,349, and in the rural from 60,197 to 57,016. The number of persons speaking Gaelic was 14,505, or more than one-ninth of the total population.

History and Antiquities.—In the 2d century the district was divided, according to Ptolemy, among three tribes. The Damnonii inhabited Menteith, Strathern, and Forthryfe (including the western part of Fife), and had three principal oppida—Alauna, at the junction of the Allan and Forth, guarding the entrance to the Highlands from the south; Lindum, at Ardoch; and Victoria, at Loch Orr in Fife. The Venicones inhabited part of Fife and the adjoining district of Perthshire, with the town of Orrea, probably Abernethy, at the junction of the Earn and Tay, the nearest Roman station to which was at Ardgrie. The Vacomagi skirted the Highland region, and had the towns of Tamea in Inchtuthil (an island in the Tay), where remains still exist, and Banatia, at Buchanty on the Almond, where there was a strong Roman station. In 83 A.D. Agricola explored the country beyond the Forth, and in the following year probably carried his legions to the foot of the Grampians. At Mons Graupius or Granpius, whose site is not ascertained, but which is, according to the most probable conjecture (Mr Skene's), in the district of Stormont in Perthshire, amongst the outliers of

the Grampians near Meikleour, where the Cleavers Dyke and Buzzard Dykes perhaps mark the camps of Agricola and Galgacus, and the Hill of Blair the scene of battle, the Romans (according to their own accounts) defeated the tribes of Caledonia with great slaughter; but they deemed it imprudent to pursue the victory. Perthshire was accordingly left in the possession of its native tribes till its invasion by Severus in 207. The Roman road of Severus passed by Alauna to Lindum at Ardoch, where there are extensive remains of a Roman station, and thence by Strageath near Auchterarder, Dalgin Ross near Comrie, where there were prominent remains a century ago, and Buchanty, where one branch passed eastwards to the coast, and the other turned northwards over the Grampians.

As Severus renewed the wall of Antoninus, he does not appear to have retained possession of the county north of the Forth and the Clyde. Perthshire was included in the kingdom of the Southern Picts, who had their capital first at Abernethy and afterwards at Forteviot. On the burning of Forteviot by the Northmen in the 8th century the seat of the Government was changed to Scone, which continued to be the capital of Albany, the chief royal residence in Scotland, and the place where its kings were crowned, though circumstances led to James II., James III., and Mary being crowned elsewhere. But, as Perth increased in population, it became the seat of the parliament, and the favourite residence of the kings, until it was succeeded by Edinburgh in the reign of James II. In the early history of the county fall the defeat of the Danes at Luncarty in the 10th century and of Macbeth by Earl Siward at Dunsinane in 1054. To its later history, apart from incidents connected with the city of Perth, belong the removal of the coronation stone from Scone to Westminster by Edward I.; the battle of Dupplin, where Edward Baliol defeated the earl of Mar; the rout of the troops of General Mackay at Killiecrankie by the Highlanders under Dundee, 17th July 1689; and the indecisive battle at Sheriffmuir, 13th November 1715, between the adherents of the Pretender under the earl of Mar and the forces of the Government under Argyll. Apart from the camp at Ardoch Roman remains are not important. Of hill-forts the most remarkable is that on Dunsinane Hill. Among other relics of an early period are a ship-barrow of the vikings on the Hill of Rattray; weems in the parishes of Monzie, Alyth, and Bendoehy; the witchstone near Cairnbeddie, where Macbeth is said to have met the witches,—probably a sepulchral memorial of some old battlefield; another stone in Meikle parish called Macbeth's Stone; a group of standing stones near Pitlochrie; and a number of sculptured stones at Meikle.

Abernethy, originally founded by the Pictish king Nertan in the 5th century, and refounded by St Columba in the 6th, succeeded Iona as the seat of the primacy of Scotland, afterwards transferred to St Andrews. The round tower in the churchyard, resembling those in Ireland, is supposed to have been built in the time of Kenneth Macalpine. The Culdees had monastic churches at Dunblane, Dunkeld, Abernethy, and Mithill. DUNBLANE (q.v.) and DUNKELD (q.v.) were subsequently erected into bishoprics. The Canons Regular had an abbey at Scone, founded in 1124 and burned in 1559, its site being now occupied by a modern mansion; a priory at Loch Tay, 1114; a priory at Inchafray, 1200; a priory at Strathfillan, 1314; and a priory at Abernethy, 1273. The Dominicans had a convent at Perth, 1231, where there was also a Carthusian monastery, 1429, and a Greyfriars monastery, 1460. Culross abbey, of which the tower and the Gothic choir still remain, was founded by the Cistercians in 1217, and there was also an abbey of Cistercian nuns at St Leonards, Perth, founded in 1296. A Carmelite convent was founded at Tulliallan in 1267. There were collegiate churches at Methven and Tullibardine. Of the old castles of the chiefs mention may be made of Elcho Castle on the Tay, 4 miles south of Perth; Blair Castle, garrisoned by Montrose in 1644, stormed by Cromwell in 1653, occupied by Claverhouse in 1689, dismantled in 1690, and restored in 1870; Castle Huntly, built in 1452 by Lord Grey, master of the household to James II.; the ruins of Castle Dhu, near Moulin, once a stronghold of the Campbell family; the ruins of Finlaurig Castle, Killin, the cradle of the Breadalbane family; Cluny Castle, on the island in the loch of the same name between Dunkeld and Blairgowrie; and Doune Castle, on the Teith, a picturesque ruin of very old date, rebuilt by Murdoch, duke of Albany. Among modern mansions the principal are Keir House, the seat of the late Sir W. Stirling-Maxwell; Blair Drummond House, the seat of the Drummonds; Blair Castle, duke of Athole; Taymouth Castle, earl of Breadalbane; Doune Lodge, earl of Moray; Dupplin Castle, earl of Kinnoull; Scone Palace, earl of Mansfield; Glenaeles, earl of Camperdown; Strathallan Castle, Viscount Strathallan; and Drummond Castle, Baroness Willoughby d'Eresby.

PERTH, an ancient city, a royal and parliamentary burgh, and the chief town of the above county, is beautifully situated at the foot of Kinnoull Hill, chiefly on the west bank of the Tay, about 40 miles north of Edinburgh and about 20 west of Dundee. It is substantially built

of stone, and contains a number of good public buildings, while the lower slopes of Kinnoul Hill are studded with villas embosomed in woods. To the north and south of the town along the banks of the Tay are the extensive meadows of the North and South Inches. The Tay is crossed by a stone bridge for carriage traffic, erected in 1771 and widened in 1869, and by a stone and iron railway bridge with a footway. Notwithstanding its importance in early times, the city now retains almost no relics of antiquity. The religious houses were razed by the mob after John Knox preached his famous sermon in St John's church against the idolatries of Rome. The Dominican or Blackfriars monastery, founded by Alexander II in 1231 and a residence of the Scottish kings, occupied a site near the west end of the present bridge; the site of the Carthusian monastery, founded by James I. in 1429, and where he and his queen, and Margaret queen of James IV., were buried, has since 1750 been occupied by the hospital founded by James VI.; Greyfriars monastery, founded in 1460, stood on the present Greyfriars churchyard; and a little west of the town was a house of the Carmelites or Whitefriars, founded in 1260. The parliament house, where the ancient parliaments of Scotland were held, was cleared away in 1818, and was succeeded by the Freemasons' Hall; Earl Gowrie's palace, founded in 1520, was removed in 1805 to make way for the county buildings; the Spey tower near the Spey gate, a mural fortress long used as a prison, was taken down about fifty years ago. The cross, erected in 1668 in place of that demolished by Cromwell, was removed in 1807. The old church of St John is said to have been founded in the 5th century; the transept and nave of the existing structure date from the early part of the 13th century and the choir in its present state from the 15th; the building is now divided into an east, a middle, and a west church. Among other public edifices the principal are the county buildings (erected 1819-20 at a cost of £32,000, and enlarged in 1866), the general prison for Scotland (originally erected in 1812 as a depot for French prisoners, remodelled as a convict prison in 1840, and enlarged in 1858 and 1881), the city and county jail (1819), the military barracks (1793-94), the public seminaries (1807), Marshall Museum and Library (1823), Murray's Royal Lunatic Asylum (1827), the infirmary (1836), the general railway station (1848), the new public hall (1881), the Boys' and Girls' Religious Society hall (1881), the new municipal buildings (1881),—a fine range in the Tudor style, cost £13,000.

Some of the most extensive bleach-fields in the kingdom are in the immediate neighbourhood of Perth on the banks of the Tay and the Almond. Perth itself has manufactories of gauge glasses, muslins, ginghams, imitation India shawls and scarfs, union goods, and boots and shoes; and there are rope-works, coach-building yards, iron-foundries, breweries, and distilleries. The Tay has valuable salmon fisheries. The navigation of the river is considerably obstructed by sand. In 1834 an Act was obtained for constructing a harbour and docks and enlarging the quays, which were further extended in 1856. In 1840 Perth was made an independent port; vessels of 200 tons can unload at its quays. The number of vessels

in cargo and in ballast that entered the port in 1883 was 124 of 9767 tons, that cleared 124 of 9731 tons. The principal imports are Baltic timber, coal, salt, and manure, and the exports corn.

Plan of Perth.

potatoes, timber, and slates. The population of the parliamentary burgh in 1851 was 23,835; this had increased by 1861 to 25,250, and by 1881 to 28,949, of whom 13,453 were males and 15,496 females.

History.—Perth is stated to have been anciently called Bertha, and to have been situated at the junction of the Almond and Tay, whence it was removed to its present site after an inundation in 1210. In any case the church of St John was founded long before this; and a variety of Roman remains seem to indicate that there was a Roman station on the present site of the city. The obscurity of its early history is accounted for by the fact that its records were removed by Edward I. Perth is stated to have been a burgh as early as 1106. The charter granted it by James VI. makes mention also of another granted by David I., and the charter of King David was renewed by William the Lion, by whom Perth was created a royal burgh. It was fortified by the last-named king in 1210 and again by Edward I. in 1298. It was attacked without success by Robert Bruce in 1306, but in 1311 he succeeded in scaling its walls one dark night. It was captured by Edward III. in 1335 and retaken by the Scots in 1339. The earl of Cornwall is stated by Fordun to have been stabbed in 1336 by his brother Edward III. before the great altar in the parish church of St John. In 1396 a famous combat took place on the North Inch, between Clan Chattan and Clan Kay, which has been made familiar to English readers by Sir W. Scott in his *Fair Maid of Perth*. The Blackfriars monastery, where the kings then resided, was the scene in 1437 of the murder of James I. by Walter, earl of Athole, and Gowrie House in 1600 of a mysterious conspiracy against James VI. Perth succeeded Scone as the capital of Scotland, but after the murder of James I. the parliament and courts were transferred to Edinburgh, which was declared the capital in 1482. The city was visited by the plague in 1512, 1585-87, 1608, and 1645, by the cholera in 1832, and by inundations in 1210, 1621, 1740, 1773, and 1814. It was taken by Montrose in 1644, capitulated to Cromwell in 1651, and was occupied by Dundee in 1689; it was recovered by Argyll from the adherents of the Pretender in 1715, and was occupied by Prince Charles Edward in 1745. The famous articles of Perth were agreed to at a meeting of the General Assembly in the parish church of St John, 25th August 1618.

Scott, *Statistical Account of the Town and Parish of Perth*, 1796; Maidment, *The Chronicle of Perth from 1210 to 1668*, 1831; Penney, *Traditions of Perth*, 1836; Lawson, *The Book of Perth*, 1847; Peacock, *Perth, its Annals and Archives*, 1849.

PERTH, a city of Australia, capital of the colony of Western Australia, is picturesquely situated on the Swan

river, 31° 57' 10" S. lat., 115° 52' 20" E. long., 12 miles above Freemantle and 1700 west-north-west of Melbourne. The streets are wide and regular, and the houses are built chiefly of brick and stone. It is the seat of an Anglican and of a Roman Catholic bishop. In addition to the cathedrals the principal buildings are the town-hall, built entirely by convict labour, the mechanics' institute, the governor's palace, and the high school. Perth was founded in 1829, received a municipal constitution in 1856, and was created a city in 1880. In the same year railway communication was opened up by means of the Eastern Railway. The population of the city, including the military, in 1871 was 5007, and in 1881 it was 5044.

PERTHES, FRIEDRICH CHRISTOPH (1772-1843), German publisher, was born at Rudolstadt on 21st April 1772. At the age of fifteen he became an apprentice in the service of Böhme, a bookseller in Leipsic, with whom he remained about six years. In Hamburg, where he settled in 1793 as an assistant to the bookseller Hoffmann, he started in 1796 a bookselling business of his own, in developing which he soon gave evidence of remarkable tact, energy, and intelligence. In 1798 he entered into partnership with his brother-in-law, J. H. Besser, with whose aid he rapidly succeeded in forming an establishment which commanded universal confidence and respect. By his marriage with a daughter of the poet Matthias Claudius (in 1797) he was brought into intimate relation with a group of Protestant writers, who, although of a liberal tendency, retained a strong belief in the essential doctrines of Christianity; and they exercised a powerful influence on the growth of his religious opinions. This, however, did not prevent him from being on friendly terms with a number of eminent Roman Catholic authors. Perthes was an ardent patriot; and during the period of Napoleon's supremacy he distinguished himself by his steady resistance to French pretensions. His zeal for the national cause led him to issue (in 1810-11) *Das Deutsche Museum*, to which many of the foremost publicists in Germany contributed. For some time the French made it impossible for him to live in Hamburg; and when, in 1814, he returned, he found that his business had greatly fallen off and that it would have to be thoroughly reorganized. In 1821, his first wife having died, he left Hamburg, transferring his business there to his partner, and went to Gotha, where he established what ultimately became one of the first publishing houses in Germany. Among other important works issued by him may be named the *Theologische Studien und Kritiken* and the *Geschichte der europäischen Staaten*, the latter conducted in the first instance by Heeren and Ukert, afterwards by Giesebrecht. Perthes died at Gotha on 18th May 1843.

Of the three sons of Perthes, the youngest, A. H. T. Perthes, succeeded him as a publisher. The elder sons became authors of some eminence, and one of them, C. T. Perthes, wrote an excellent biography of his father, *Friedrich Perthes' Leben*. In 1785 a publishing house was founded in Gotha by the uncle of F. C. Perthes, J. C. Justus Perthes, whose son Wilhelm became distinguished as publisher of works relating to geography. Bernhard Wilhelm,

Wilhelm's son, who succeeded to the business in 1853 and died in 1857, greatly extended its operations. In 1854 he established a geographical institute, and the *Mittheilungen aus Justus Perthes' geographischem Institut*, conducted by A. Petermann, soon gained a European reputation. This house issues the *Almanach de Gotha*, and has published the maps and writings of many of the most eminent German geographers and travellers.

PERTINAX, HELVIUS, Roman emperor, was the son of a charcoal-burner, and was born in 126 A.D. in Liguria, or at Villa Martis among the Apennines. From being a teacher of grammar he rose through many important offices, both civil and military, to the consulate, which he held twice. Chosen on 31st December 192 to succeed the murdered Commodus, he was himself assassinated in a mutiny of the soldiers after a reign of eighty-six days.

PERTZ, GEORG HEINRICH (1795-1876), editor of the *Monumenta Germaniæ Historica*, was born at Hanover on 28th March 1795. From 1813 to 1818 he studied at Göttingen, chiefly under Heeren. His graduation thesis, published in 1819, on the history of the Merovingian mayors of the palace, attracted the attention of Baron Stein, by whom he was engaged in 1820 to edit the Carolingian chronicles of the newly-founded Historical Society of Germany. In search of materials for this purpose, Pertz made a prolonged tour through Germany and Italy, and on his return in 1823 he received at the instance of Stein the principal charge of the entire work of the society, which was to be the publication, under the title of *Monumenta Germaniæ Historica*, of accurate texts of all the more important historical writers on German affairs down to the year 1500, as well as of laws, imperial and regal archives, and other valuable documents, such as letters, falling within this period. In the discharge of this, the principal task of his life, Pertz made frequent journeys of exploration to the leading libraries and public record offices of Europe, publishing notes on the results of his explorations in the *Archiv der Gesellsch. f. Deutsche Geschichtskunde* (1824-72). In 1823 he had been made secretary of the archives, and in 1827 principal keeper of the royal library at Hanover; from 1832 to 1837 he edited the *Hannoversche Zeitung*, and more than once sat as a representative in the Hanoverian Second Chamber. In 1842 he was called as chief librarian to Berlin, where he shortly afterwards was made a privy councillor and a member of the Academy of Sciences. Failing health and strength led to the resignation of all his appointments in 1874, and on 7th October 1876 he died at Munich while attending the sittings of the historical commission.

The *Monumenta*, with which the name of Pertz is so closely associated, began to appear in 1826, and at the date of his resignation 24 volumes ("Scriptores," "Loges," "Diplomata") had appeared. The work, which for the first time made possible the existence of the modern school of scientific historians of medieval Germany, continues to be carried on under Waitz, Wattenbach, Dümmler, and others. In connexion with the *Monumenta* Pertz also published *Scriptores rerum Germanicarum in usum Scholarum*; among his other literary labours may be mentioned an edition of the *Gesammelte Werke* of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn vom Stein*, 6 vols., 1849-55; also, in an abridged form, *Aus Stein's Leben*, 2 vols., 1856).

P E R U

PERU has, in different periods, included areas of territory of varying extent. The empire of the Incas and the Spanish viceroyalty were not conterminous with the modern republic nor with each other. In the present article the sections relating to physical geography and the moral and material condition of the people will be confined to the limits of the republic, while in the historical section there will necessarily be references to events which took place beyond the existing limits of the country.

Extent.—The republic of Peru is situated between the equator and the Tropic of Capricorn, yet, owing to the differences of elevation, it includes regions with every variety of climate. It lies between the parallels of 3° 21' S. and 19° 10' S. and between 68° and 81° 20' 45" W. long., and has an area of about 480,000 square miles.¹ The

¹ Before the war with Chili the southern limit of Peru was to 22° 23' S. lat., the coast-line measured 1400 miles, and the area was 504,000 square miles (see p. 679 below).

length along the Pacific coast is 1240 miles, while the width ranges from 300 to 400 miles.

Boundaries.—The republic is bounded on the W. by the Pacific Ocean, on the E. by Brazil and Bolivia, on the N. by Ecuador, and on the S. by Chili. The northern boundary commences at the village of Tumbes, near the southern shore of the Gulf of Guayaquil, whence it passes southwards to the river Macara, a tributary of the Chira, which falls into the Pacific. It takes the course of the Macara to its source in the cordillera of Ayavaca; it crosses the Andes to Lake Chalgua and then runs east to the Putumayo River on the 70th degree of longitude, which it follows to the Brazilian town of Tabatinga, on the Marañon. The Marañon then forms the boundary until the first Brazilian town is reached at Tabatinga. The frontier with Brazil was determined by the treaty of San Ildefonso in 1777. A treaty dated 23d October 1851 further settled the boundary, which was fixed by the commissioners who explored the Javari in 1866 and 1871. It follows the course of the Javari from the point where it falls into the Amazon, in $4^{\circ} 13' 21''$ S., up to a point near its source in $7^{\circ} 1' 17''$ S.; from this it forms a straight line to a point in $6^{\circ} 52' 15''$ S. on the left bank of the Madeira, being half the distance between the mouth of the Mamoré and that of the Madeira. This is the point where the frontiers of Peru, Brazil, and Bolivia meet. The Peru-Bolivian frontier, within the basin of the Amazon, has not been accurately defined. It follows the Madeira to the mouth of the Mamoré, then the Beni and its tributary the Madidi to the junction of the latter with a stream called the Pablo-bamba, ascending the ravine of the Pablo-bamba to the source of that stream in the eastern Andes. The line then crosses the Andes in a straight line southwards to the village of Conima on the shore of Lake Titicaca. Thence it passes across the lake in another straight line to the isthmus of Yunguyo, and thence to the mouth of the Desaguadero. From the Desaguadero the frontier takes a south-south-west direction to the source of the river Mauri, and then, until the recent war with Chili, it ran south along the watershed of the Maritime Cordillera to the source of the river Loa, which falls into the Pacific. The southern boundary separating the Peruvian province of Tarapaca from the Bolivian province of Atacama was formed by the ravine of Dnende, south of the Loa, to the coast of the Pacific in $22^{\circ} 23'$ S. near Tocapilla. This part of the frontier was carefully delineated in 1628, and the boundary marks are recorded in a document which is still extant. But the Chilians conquered and in 1884 annexed the Peruvian province of Tarapaca.

Physical Geography.—Peru is divided longitudinally into three well-defined regions, the coast, the sierra, and the montaña. The coast, extending from the base of the Maritime Cordillera to the Pacific Ocean, consists of a sandy desert crossed at intervals by rivers, along the banks of which there are fertile valleys. The sierra is the region of the Andes, and is about 250 miles in width. It contains stupendous chains of mountains, elevated plains and table-lands, warm and fertile valleys, and ravines. The montaña is the region of tropical forests within the valley of the Amazon, and skirts the eastern slopes of the Andes.

The coast has been upraised from the ocean at no very distant geological epoch, and is still nearly as destitute of vegetation as the African Sahara. It is, however, watered by fifty streams which cross the desert at intervals. Half of these have their origin in the summits of the Andes, and run with a permanent supply of water into the ocean. The others, rising in the outer range, which does not reach the snow-line and receives less moisture, carry a volume of water to the sea during the rainy season, but for the rest of the year are nearly dry. The absence of rain here is caused by the action of the lofty uplands of

the Andes on the trade-wind. The south-east trade-wind blows obliquely across the Atlantic Ocean until it reaches Brazil. By this time it is heavily laden with vapour, which it continues to bear along across the continent, depositing it and supplying the sources of the Amazons and La Plata. Finally, the trade-wind arrives at the snow-capped Andes, and here the last particle of moisture is wrung from it that the very low temperature can extract. Coming to the summit of that range, it rushes down as a cool and dry wind on the Pacific slopes beyond. Meeting with no evaporating surface, and with no temperature colder than that to which it is subjected on the mountain-tops, this wind reaches the ocean before it becomes charged with fresh moisture. The constantly prevailing wind on the Peruvian coast is from the south. From November to April there are usually constant dryness, a clear sky, and considerable, though by no means oppressive, heat. From June to September the sky is obscured for weeks together by fog, which is often accompanied by drizzling rain called "garua." In 1877 the maximum temperature at Lima was $78\frac{1}{2}^{\circ}$ Fahr. in February and the minimum $61\frac{1}{2}^{\circ}$ Fahr. in July. At the time when it is hottest and driest on the coast it is raining heavily in the Andes, and the rivers are full. When the rivers are at their lowest, the "garua" prevails on the coast. The climate of various parts of the coast is, however, modified by local circumstances.

The deserts between the river-valleys vary in extent, the largest being upwards of 70 miles across. On their western margin steep cliffs generally rise from the sea, above which is the "tablazo" or plateau, in some places slightly undulating, in others with ridges of considerable height rising out of it, the whole apparently quite bare of vegetation. The surface is generally hard, but in many places there are great accumulations of drifting sea-sand. The sand usually forms isolated hillocks, called "medanos," of a half-moon shape, having their convex sides towards the trade-wind. They are from 10 to 20 feet high, with an acute crest, the inner side perpendicular, the outer with a steep slope. Sometimes, especially at early dawn, there is a musical noise in the desert, like the sound of distant drums, which is caused by the eddying of grains of sand in the heated atmosphere, on the crests of the "medanos." Apparently the deserts are destitute of all vegetation; yet three kinds of herbs exist, which bury themselves deep in the earth, and survive long periods of drought. One is an amaranthaceous plant, whose stems ramify through the sand-hills; the other two are a *Martynia* and an *Aniseia*, which maintain a subterranean existence during many years, and only produce leafy stems in those rare seasons when sufficient moisture penetrates to the roots. In a few hollows which are reached by moisture the trees of the desert find support, the "algarrobo" (*Prosopis horrida*), a low tree of very scraggy growth, the "vichaya" (*Capparis crotonoides*), and "zapote del perro" (*Colicodendrum scabridum*), mere shrubs. Far away towards the first ascents to the Andes a tall branched cactus is met with, and there are *Salicornias* and *Salsolas* near the coast. But, when the mists set in, the low hills near the coast bordering the deserts, which are called "lomas," undergo a change as if by magic. A blooming vegetation of wild flowers for a short time covers the barren hills. Near Lima one of the low ranges is brightened by the beautiful yellow lily called "amancaes" (*Ismene Amancaes*). The other flowers of the "lomas" are the "papita de San Juan" (*Begonia geraniifolia*), with red petals contrasting with the white inner sides, valerians, the beautiful *Bomarea ovata*, several species of *Oralis*, *Solanum*, and crucifers. But this carpet of flowers is very partially distributed and lasts but a short time. Generally the deserts present a desolate aspect, with no sign of a living creature or of vegetation. Only in the very loftiest

regions of the air the majestic condor or the turkey buzzard may be seen floating lazily; perhaps a lizard will dart across the path; and occasionally a distant line of mules or a solitary horseman seems to shimmer weirdly in the refraction on the distant horizon."

The valleys form a marvellous contrast to the surrounding desert. A great mass of pale-green foliage is usually composed of the "algarrobo" trees, while the course of the river is marked by lines or groups of palms, by fine old willows (*Salix humboldtiana*), fruit-gardens, and fields of cotton, maize, sugar, and lucerne. In some valleys there are expanses of sugar-cane, in others cotton, whilst in others vineyards and olive-yards predominate. The woods of "algarrobo" are used for pasture, cattle and horses greedily enjoying the pendulous yellow pods.

For purposes of description the coast-region of Peru may be divided into six sections, commencing from the north:—(1) the Piura region; (2) the Lambayeque and Truxillo section; (3) the Santa valleys; (4) the section from Lima to Nasca; (5) the Arequipa and Tacna section; (6) Tarapaca.

(1) The great desert-region of Piura extends for nearly 200 miles from the Gulf of Guayaquil to the borders of the Morrope valley, and is traversed by three rivers—the Tumbes, Chira, and Piura, the two former receiving their waters from the inner cordillera and breaking through the outer range. It is here that the coast of South America extends farthest to the westward until it reaches Capes Blanco and Paríña, and then turns southward to the Bay of Payta. The climate of Piura is modified by the lower latitude, and also by the vicinity of the forests of Guayaquil. Fog and "garua" are much less frequent than in the coast-region farther south, while positive rain sometimes falls. At intervals of about ten years there are occasional heavy showers of rain from February to April.

(2) The second section of the coast-region includes the valleys of the Morrope, the Chiclayo, and Lambayeque, the Saña, the Jequetepeque, the Chicama, Moche, Viru, and Chao. With the intervening deserts this section extends over 200 miles. All these valleys, except Morrope and Chao, are watered by rivers which have their sources far in the recesses of the mountains, and which furnish an abundant supply in the season when irrigation is needed.

(3) The third section, also extending for 200 miles, contains the valleys of Santa, Nepeña, Casma, Huarney, Fortaleza, Pativilca, Supé, and Huaura. The river Santa, which rises in the lake of Conococha, 12,907 feet above the sea, and has an entire length of 180 miles, is remarkable for its long course between the outer and central ranges of the Andes, in a trough known as the "Callejon de Huaylas," 100 miles in length. It then breaks through in a deep gorge, and reaches the sea after a course of 35 miles over the coast-belt, and after fertilizing a rich valley. The Santa and Nepeña valleys are separated by a desert 8 leagues in width, on the shores of which there is a good anchorage in the bay of Ferrol, where the port of Chimbote is to be the terminus of a projected railway. The Nepeña, Casma, Huarney, Fortaleza, and Supé rivers rise on the slope of an outer range called the Cordillera Negra, and are consequently dry during the great part of the year. Wells are dug in their beds, and the fertility of the valleys is thus maintained. The Pativilca (or Barranca) river and the Huaura break through the outer range from their distant sources in the snowy cordillera, and have a perennial supply of water. There are 9 leagues of desert between the Nepeña and Casma, 16 between the Casma and Huarney, and 18 between the Huarney and Fortaleza. The latter desert, much of which is loose sand, is called the "Pampa de Mata Cavallos," from the number of exhausted animals which die there. Between the Supé and Pativilca is the desert called the "Pampa del Medio Mundo."

(4) The next coast-section extends for over 300 miles from Chanay to Nasca, and includes the rivers of Chanay or Lacha, of Carabayllo, Rimac, Lurin, Mala, Cañete, Chincha, Pisco or Chunchanga, Yca, and Rio Grande. Here the maritime range approaches the ocean, leaving a narrower strip of coast, but the fertile valleys are closer and more numerous. Those of Carabayllo and Rimac are connected, and the view from the Bay of Callao extends over a vast expanse of fertile plain bounded by the Andes, with the white towers of Lima in a setting of verdure. Lurin and Mala are smaller valleys, but the great vale of Cañete is one green sheet of sugar-cane; and narrow strips of desert separate it from the fertile plain of Chincha, and Chincha from the famous vineyards of Pisco. The valleys of Yca, Palpa, San Xavier, and Nasca are rich and fertile, though they do not extend to the sea; but between Nasca and Acari there is a desert 60 miles in width. (5) The Arequipa and Tacna section extends over 350 miles, and comprises the valleys of Acari, Atequipa, Atico, Ocoña, Majes or Camana, Quilca, with the interior valley of Arequipa, Tambo, Ylo or Moquegua, Ite or Locumba, Sama, Tacna, and Azapa or Arica. Here the Maritime Cordillera recedes, and the important valley of Arequipa, though

on its western slope, is 7000 feet above the sea, and 90 miles from the coast. Most of the rivers here have their sources in the central range, and are well supplied with water. The coast-valleys through which they flow, especially those of Majes and Locumba, are famous for their vineyards, and in the valley of Tambo there are extensive olive plantations. (6) The most southern coast-section is that of Tarapaca, extending between the cordillera and the Pacific, in a narrow strip from the ravine of Camarones, south of Arica, to the former southern frontier of Peru. Only two rivers reach the sea in Tarapaca, the Tiliviche in the north of the province, and the Loa in the extreme south. The other streams are lost in the desert soon after they issue from their ravines in the Andes. The reason of this is that in Tarapaca there is an arid range of hills parallel with the sea-shore, which is about 30 miles in width, and covered with sand and saline substances. Between this coast-range and the Andes is the great plateau called the "Pampa de Tamarugal," from 3000 to 3500 feet above the sea, which is about 30 miles wide, and extends the whole length of Tarapaca. This plateau is covered with sand, and contains vast deposits of nitrate of soda. Here and there a few "tamarugas" or acacia trees are met with, which give their name to the region.

The coast of Peru has few protected anchorages, and the headlands are generally abrupt and lofty. These and the few islands are frequented by myriads of sea-birds, whence come the guano-deposits, the retention of ammonia and other fertilizing properties being due to the absence of rain. The islets off the coast are all barren and rocky.

The most northern is Foca, in 5° 13' 30" S., near the coast to the south of Payta. The islands of Lobos de Tierra and Lobos de Afuera (2), in 6° 27' 45" S. and 6° 56' 45" S. respectively, are off the desert of Sechura, and contain deposits of guano. The two Afuera islands are 60 and 36 miles from the coast at the port of San José. The islets of Macabi, in 7° 49' 20" S., also have guano-deposits, now nearly exhausted. The two islets of Guañape, surrounded by many rocks, in 8° 34' S., contain rich deposits. Chao rises 450 feet above the sea, off the coast, in 8° 46' 30" S. Corcobado is in 8° 57' S. La Viuda is off the port of Casma, in 9° 23' 30" S.; and Tortuga is 2 miles distant to the north. Santa Islet lies off the bay of Cosca, in 9° 1' 40", and the three high rocks of Ferrol in 9° 8' 30" S. Farther south there is the group of islets and rocks called Huaura, in 11° 27' S., the chief of which are El Pelado, Tambillo, Chiquitana, Bravo, Quitacalzones, and Mazorque. The Horniglas are in 11° 4' S. and 11° 58', and the Pescadores in 11° 47' S. The island of San Lorenzo, in 12° 4' S., is a lofty mass, 4½ miles long by 1 broad, forming the Bay of Callao; its highest point is 1050 feet. Off its south-east end lies a small but lofty islet called Fronton, and to the south-west are the Palomitas Rocks. Horadada Islet, with a hole through it, is to the south of Callao Point. Off the valley of Lurin are the Pachacamac Islands, the most northern and largest being half a mile long. The next, called San Francisco, is like a sugar-loaf, perfectly rounded at the top. The others are mere rocks. Asia Island is farther south, 17 miles north-west of Cerro Azul, and about a mile in circuit. Pisco Bay contains San Gallan Island, high, with a bold cliff outline, 2½ miles long by 1 broad, the Ballista Islets, and farther north the three famous Chincha Islands, whose vast guano-deposits are now exhausted. South of the entrance to Pisco Bay is Zarate Island, and farther south the white level islet of Santa Rosa. The Infiernillo rock is quite black, about 50 feet high, in the form of a sugar-loaf, a mile west of the Point of Santa Maria, which is near the mouth of the Yca river. Alacran is a small islet off the lofty "morro" of Arica. A low island protects the anchorage of Iquique on the coast of Tarapaca, and farther south are the three islets of Patillos in 20° 46' 20" S., and the Pajaros, with guano-deposita, in 22° 6' 4" S. All these rocks and islets are barren and uninhabitable, mere outworks of the desert headlands.

The more common sea-birds, which haunt the islets and headlands in countless myriads, are the *Sula variegata* of guano-bird, a large gull called the *Larus modestus*, the *Pelecanus thuyus*, and the *Sterna Yca*, a beautiful tern with curved white feathers on each side of the head. The rarest of all the gulls is also found on the Peruvian coast, namely, the *Xema furcatum*.¹ The immense flocks of birds, as they fly along the coast, appear like clouds, and one after another is incessantly seen to plunge from a height into the sea to devour the fishes, which they find in extraordinary numbers. The guano-deposits are in layers from 40 to 50 feet thick, of a greyish-brown colour outside, and more and more solid from the surface downwards, owing to the gradual deposit of strata and evaporation of fluid par-

¹ The third known example was shot in Paracas Bay, near Pisco, by Captain Markham, in 1881.

ticles. Sea-lions (*Otaria forsteri*) are common on the rocky islands and promontories. These large creatures frequent particular islets for the purpose of breathing their last, the wounded or aged being helped there by their companions.

The Maritime Cordillera, overhanging the Peruvian coast, contains a long line of volcanic mountains, most of them inactive, but their presence is probably connected with the frequent and severe earthquakes, especially in the southern section of the coast. Since the year 1570 there have been seventy violently destructive earthquakes recorded on the west coast of South America, but the register is of course incomplete in its earlier part. The most terrible was that of 1745, which destroyed Callao. There had been subterranean noises for some days previously; the first shock was at 10.30 p.m. on 28th October, and there were 220 shocks in the following twenty-four hours. The town was overwhelmed by a vast wave, which rose 80 feet; and the shocks continued until the following February. On 13th August 1868 an earthquake nearly destroyed Arequipa, and great waves rolled in upon the ports of Arica and Iquique. On 9th May 1877 nearly all the southern ports were overwhelmed. These fearful catastrophes are in greatest force where there are volcanoes, whether active or extinct, in the vicinity. That of 1877 had its origin in the volcanic mountains near the frontier of Peru and Bolivia, and spent its chief fury near its centre of origin, gradually working itself out as it went north. Usually the line of disturbance is meridional and along the coast, but in some instances the line takes a seaward direction at an angle with the mountain-chains.

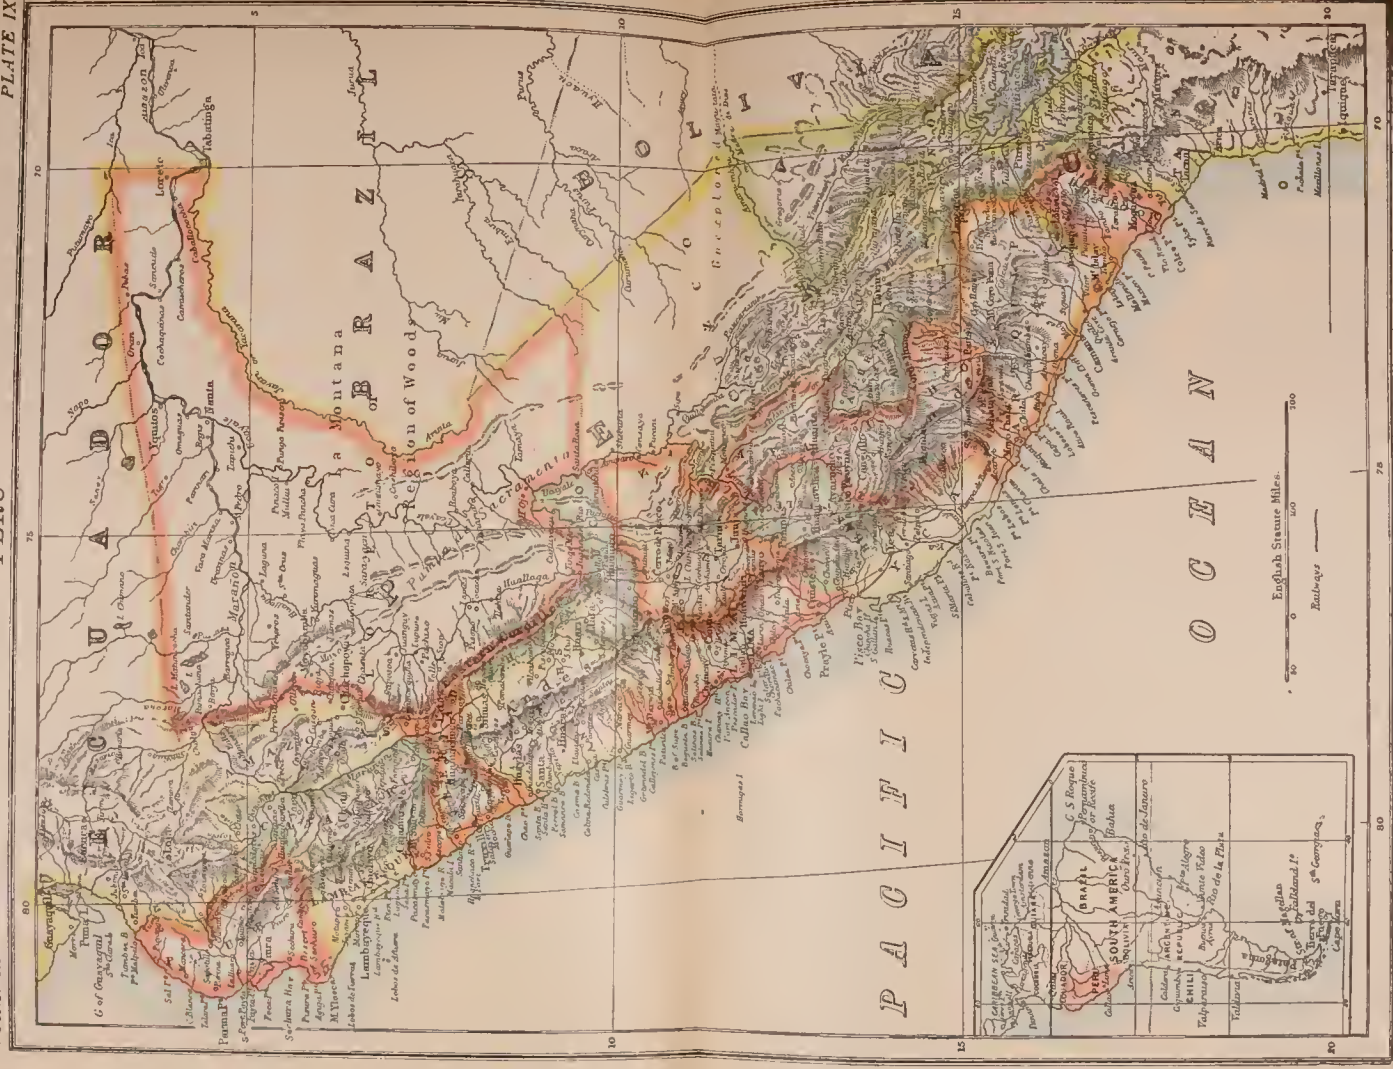

The most important part of Peru is the region of the cordilleras of the Andes divided into "puna" or lofty uninhabited wilderness, and "sierra" or inhabitable mountain slopes and valleys. This great mountain-system, running south-east to north-west with the line of the coast, consists of three chains or cordilleras. The two chains which run parallel, and near each other on the western side, are of identical origin, and have been separated by the action of water during many centuries. On these chains are the volcanoes and many thermal springs. The narrow space between them is for the most part, but not always, a cold and lofty region known as the "puna," containing alpine lakes,—the sources of the coast-rivers. The great eastern chain, rising from the basin of the Amazon and forming the inner wall of the system, is of distinct origin. These three chains are called the Maritime Cordillera, the Central Cordillera, and the Andes. Paz Soldan and other Peruvian geographers give the name of Andes, *par excellence*, to the eastern cordillera.

The Peruvian Maritime Cordillera contains a regular chain of volcanic peaks overlooking the coast-region of Tarapaca, which attain a height of 16,000 to 18,000 feet. Chief among them are the snowy peak of Lirima over the ravine of Tarapaca, the volcano of Isluga overhanging Camiña, the unmeasured peak of Sehama, and Tacora near the Bolivian frontier. In rear of Moquegua there is a group of volcanic peaks, clustering round those of Ubinas and Huaynaputina. A great eruption of Huaynaputina commenced on 15th February 1600 and continued until the 28th. An incessant rain of fine white sand was poured over the surrounding country for a distance of 40 miles, accompanied by a mighty subterranean roaring sound. But generally these volcanoes are quiescent. Farther north the Misti volcano rises over the city of Arequipa in a perfect cone to a height of over 18,000 feet, and near its base are the hot sulphur and iron springs of Yura. As the maritime chain advances northward it fully maintains its elevation. The peak of Sarasara, in Parinacochas (Ayacucho), is 19,500 feet above the sea, and in the mountains above Lima the passes attain a height of more

than 15,000. In latitude 10° S. the maritime chain separates into two branches, which run parallel to each other for 100 miles, enclosing the remarkable ravine or Callejon de Huaylas,—the eastern or main branch being known as the Cordillera Nevada and the western as the Cordillera Negra. On the Nevada the peak of Huascan reaches a height of 22,000 feet, according to the trigonometrical measurement of the railway engineer Hindle. The Huandoy peak, above Carhuaz, reaches to 21,088 feet; the Hualcan peak, overhanging the town of Yungay, is 19,945 feet high; and most of the peaks in this part of the chain reach a height of 19,000 feet. During the rainy season, from October to May, the sky is generally clear at dawn, and the magnificent snowy peaks, with sharply-defined outlines, stand out in lovely contrast to the deep-blue background. But as the day advances the clouds collect, and the whole is shrouded in a dense veil. In most parts of the Peruvian Andes the line of perpetual snow is at 16,400 feet above the sea; but on the Cordillera Nevada, above the Callejon de Huaylas, it sinks to 15,400 feet. This greater cold is obviously caused by the intervention of the Cordillera Negra, which intercepts the warmth from the coast. As this lower chain does not reach the snow-line, the streams rising from it are very scantily supplied with water, while the Santa, Pativilca, and other coast-rivers which break through it from sources in the snowy chain have a greater volume from the melted snows. At the point where the river Santa breaks through the Cordillera Negra that range begins to subside, while the Maritime Cordillera continues as one chain to and beyond the frontier of Ecuador.

The Central Cordillera is the true water-parting of the system. No river, except the Marañon, breaks through it either to the east or west, while more than twenty coast-streams rise on its slopes and force their way through the maritime chain. The Central Cordillera consists mainly of crystalline and volcanic rocks, on each side of which are aqueous, in great part Jurassic, strata thrown up almost vertically. In 14° 30' S. lat. the central chain is connected with the Eastern Andes by the transverse mountain-knot of Vilcañota, the peak of that name being 17,500 feet above the sea. The great inland basin of Lake Titicaca is thus formed. The central chain continues to run parallel with the Maritime Cordillera until, at Cerro Pasco, another transverse knot connects it with the Andes in 10° 30' S. lat. It then continues northward, separating the basins of the Marañon and Huallaga; and at the northern frontier of Peru it is at length broken through by the Marañon flowing to the eastward.

The Eastern Andes is a magnificent range in the southern part of Peru, of Silurian formation, with talcose and clay slates, many quartz veins, and eruptions of granitic rocks. Mr Forbes says that the peaks of Illimani (21,470 feet) and Illimani (21,040 feet) in Bolivia are Silurian and fossiliferous to their summits. The eastern range is cut through by six rivers in Peru, namely, the Marañon and Huallaga, the Perene, Mantaro, Apurimac, Vilcamayu, and Paucartambo, the last five being tributaries of the Ucayali. The range of the Andes in south Peru has a high plateau to the west and the vast plains of the Amazonian basin to the east. The whole range is highly auriferous, and the thickness of the strata is not less than 10,000 feet. It is nowhere disturbed by volcanic eruptions, except at the very edge of the formation near Lake Titicaca, and in this respect it differs essentially from the Maritime Cordillera. To the eastward numerous spurs extend for varying distances into the great plain of the Amazons. It is here that the majestic beauty of the Andean scenery is fully realized: masses of dark mountains rise for thousands of feet, with their bases washed by foaming torrents and their

summits terminating in sharp peaks or serrated ridges; the lower slopes are covered with dense vegetation; and everywhere there is flowing water in cascades or rushing torrents, the condensed moisture of the trade-winds hurrying back to the Atlantic. The Andes lose their majestic height to the northward; and beyond Cerro Pasco the eastern chain sinks into a lower range between the Hualлага and Ucayali. But throughout the length of Peru the three ranges are clearly defined.

For purposes of description the sierra of Peru may be conveniently divided into four sections, each embracing portions of all three ranges. The first, from the north, comprises the upper basins of the Marañon and the Hualлага, and is 350 miles long by 100 broad. The second extends from the Knot of Cerro Pasco to Ayacucho, about 200 miles, including the Lake of Chinchay-cocha and the basin of the river Xauxa. The third or Cuzco section extends 250 miles to the Knot of Vilcañota with the basins of the Pampas, Apurimac, Vilcamayu, and Paucartambo. The fourth is the basin of Lake Titicaca, about 150 miles in length and breadth.

The Lake of Chinchay-cocha, in the second section, is 36 miles long by 7 miles broad, and 13,000 feet above the sea. Its marshy banks are overgrown with reeds and inhabited by numerous waterfowl. From this lake the river Xauxa flows southwards through a populous valley for 150 miles before entering the forests. Lake Titicaca, in the fourth or most southern section, is about 80 miles long by 40 broad, the frontier of Bolivia passing across it diagonally. It is 12,545 feet above the sea by the railroad-levels. The drainage is carried off southwards by the river Desaguadero to the great swampy Lake of Anlagas in the south of Bolivia, while it is fed by streams from the Andes and the Central Cordillera. The largest is the Ramiz, formed by the two streams of Pucara and Azangaro, both coming from the Knot of Vilcañota to the north. The Suchiz, formed by the Cavanilla and Lampa streams, falls into the lake on the north-west side, as well as the Yllpa and Ylave. Much of the water flows out by the Desaguadero, but a great proportion is taken up by evaporation in the dry season from April to September. The waters are gradually receding under the combined influence of evaporation and the sediment brought down by the rivers. The deepest part of the lake is on the Bolivian side; in other parts it is very shoaly, and along the shore there are many acres of tall reeds. The principal islands are Titicaca and Coati (at the south end near the peninsula of Copacabana), Campanaria (9 miles from the east shore), Soto, and Esteves. There are two other lakes in the Collao, as the elevated region round Titicaca is called. Lake Arapa, a few miles from the northern shore of Titicaca, is 30 miles in circumference. Lake Umayo is on higher ground to the westward. The lake in Peru which is third in size is that of Parinacochas on the coast watershed, near the foot of the snowy peak of Sarasara. It is 12 miles long by 6 broad, but has never been visited and described by any modern traveller. The smaller alpine lakes, often forming the sources of rivers, are numerous.

The great rivers of the sierra are the Marañon, rising in the Lake of Lauricocha and flowing northward in a deep gorge between the Maritime and Central Cordilleras for 350 miles, when it forces its way through the mountains at the famous Pongo de Mauseriche and enters the Amazonian plain. The Hualлага rises north of Cerro Pasco, and, passing Huanuco, flows northwards on the other side of the Central Cordillera for 300 miles. It breaks through the range at the Pongo de Chasuta and falls into the Marañon. The other great rivers are tributaries of the Ucayali. The Pozuzu, flowing eastward from the Knot of Cerro Pasco, joins the Pachitea, which is the most northern important affluent of the Ucayali. The Xauxa, becoming afterwards the Mantaro, receives the drainage of Xauxa, Huancavelica, and Ayacucho. The southern valleys of this part of the sierra furnish streams which form the main rivers of Pampas, Pachachaca, and Apurimac. These, uniting with the Mantaro, form the Ene, and the Ene and Perene (which drains the province of Tambo) form the Tambo. The classic river of Vilcamayu rises on the Knot of Vilcañota, flows north through a lovely valley, receives the Yanatilde and Paucartambo on its right bank, and, uniting with the Tambo, forms the Ucayali. Most of these main streams flow through profound gorges in a tropical climate, while the upper slopes yield products of the temperate zone, and the plateaus above are cold and bleak, affording only pasture and the hardiest cereals.

The great variety of elevation within the sierra produces vegetation belonging to every zone. There is a tropical flora in the deep gorges, higher up a sub-tropical, then a temperate, then a sub-arctic flora. In ascending from the coast-valleys there is first an arid range, where the great-branched cacti rear themselves up among the rocks. Farther inland, where the rains are more plentiful, is the native home of the potato. Here also are other plants with edible roots—the "oca" (*Oxalis tuberosa*), "ulluca" (*Ullucus tuberosus*), "massua" (*Tropaeolum tuberosum*), and "learcó" *Polym-*

nia sonchifolia). Among the first wild shrubs and trees that are met with are the "chilca" (*Baccharis Feuilleti*), with a pretty yellow flower, the *Mutisia acuminata*, with beautiful red and orange flowers, several species of *Senecio*, calceolarias, the *Schinus Molle*, with its graceful branches and bunches of red berries, and at higher elevations the "lambras" (*Alnus acuminata*), the "saucó" (*Sambucus peruviana*), the "queñuar" (*Buddleia incana*), and the *Polylepis racemosa*. The *Buddleia*, locally called "oliva silvestre," flourishes at a height of 12,000 feet round the shores of Lake Titicaca. The temperate valleys of the sierra yield fruits of many kinds. Those indigenous to the country are the delicious "chirimoyas," "paltas" or alligator pears, the "paccay," a species of *Inga*, the "lucma," and the "granadilla" or fruit of the passion-flower. Vineyards and sugar-cane yield crops in the warmer ravines; the sub-tropical valleys are famous for splendid crops of maize; wheat and barley thrive on the mountain slopes; and at heights from 7000 to 13,000 feet there are crops of "quinua" (*Chenopodium Quinoa*). In the loftiest regions the pasture chiefly consists of a coarse grass (*Stipa Ychu*), of which the llamas eat the upper blades while the sheep browse on the tender shoots beneath. There are also two kinds of shrubby plants, a thorny *Composita* called "ccanlli" and another called "tola," which is a resinous *Baccharis*, and is used for fuel.

The animals which specially belong to the Peruvian Andes are the domestic llamas and alpacas and the wild vicuñas. There are deer, called "taruco" (*Cervus antiscensis*), the "viscacha," a large rodent, a species of fox called "atoc"; and the "puma" (*Felis concolor*) and "ucumari" or black bear with a white muzzle, when driven by hunger, wander into the loftier regions. The largest bird is the condor, and there is another bird of the vulture tribe, with a black and white wing feather, formerly used by the Yncas in their head-dress, called the "coraquenque" or "alcamari." The "pito" is a brown speckled creeper which flutters about the rocks. There is a little bird, the size of a starling, with brown back striped with black, and white breast, which the Indians call "ynca-hualpa"; it utters a monotonous sound at each hour of the night. A partridge called "yutu" frequents the long grass. On the lakes there is a very handsome goose, with white body and dark-green wings shading into violet, called "huachua," two kinds of ibis, a large gull (*Larus serranus*), frequenting the alpine lakes in flocks, flamingoes called "parihuana," ducks, and water-hens. Many pretty little finches fly about the maize-fields and fruit-gardens, and a little green parakeet is met with as high as 12,000 feet above the sea.

The third division of Peru is the region of the tropical forests, at the base of the Andes, and within the basin of the Amazons. It is traversed by great navigable rivers. The Marañon, having burst through the defile of the Pongo de Mauseriche, and the Hualлага through that of Chasuta, enter the forests and unite after separate courses of about 600 and 400 miles, the united flood then flowing eastward to the Brazilian frontier. After 150 miles it is joined by the Ucayali, a great navigable river with a course of 600 miles. The country between the Hualлага and the Ucayali, traversed by the eastern cordillera, is called the Pampa del Sacramento. The forests drained by the Marañon, Hualлага, and Ucayali form the northern portion of the Peruvian montaña. The southern half of the montaña is watered by streams flowing from the Eastern Andes, which go to form the river Madre de Dios or Amaru-mayu, the principal branch of the river Beni, which falls into the Madeira. The region of the Peruvian montaña, which is 800 miles long from the Marañon to the Bolivian frontier, is naturally divided into two sections, the sub-tropical forests in the ravines and on the eastern slopes of the Andes and the dense tropical forests in the Amazonian plain. The sub-tropical section is important from the value of its products, and interesting from the grandeur and beauty of its scenery. Long spurs run off from the Andes, gradually decreasing in elevation, and it is sometimes a distance of 60 or 80 miles before they finally subside into the vast forest-covered plains of the Amazon basin. Numerous rivers flow through the valleys between these spurs, which are the native home of the quinine-yielding chinchona trees. The most valuable species, called *C. Caldasaya*, is found in the forests of Carabaya in south Peru and in those of Bolivia. The species between Carabaya and the head-waters of the Hualлага yield very little of the febrifuge alkaloid. But the forests of Huanuco and

Huamalis abound in species yielding the grey bark of commerce, which is rich in chinchonine, an alkaloid efficacious as a febrifuge, though inferior to quinine. With the chinchona trees grow many kinds of *Melastomaceæ*, especially the *Lasiandra*, with masses of purple flowers, tree-ferns, and palms. In the warm valleys there are large plantations of coca (*Erythroxylon Coca*), or *Coca* (see vol. vi. p. 684), the annual produce of which is stated at 15,000,000 lb. The other products of these warm valleys are most excellent coffee, cocoa, sugar, tropical fruits of all kinds, and gold in great abundance. In the vast untrodden forests farther east there are timber trees of many kinds, incense trees, a great wealth of india-rubber trees of the *Hevea* genus, numerous varieties of beautiful palms, sarsaparilla, vanilla, ipecacuanha, and copaiba. The abundant and varied fauna is the same as that of the Brazilian forests.

Population.—The earliest reliable enumeration of the people of Peru was made in 1793, when there were 617,700 Indians, 241,225 mestizos (Indian and white), 136,311 Spaniards, 40,337 negro slaves, and 41,404 mulattos, giving a total of 1,076,977 souls, without counting the wild Indians of the montaña. The ecclesiastics numbered 5496, including 1260 nuns. This tells a sad story of depopulation since the fall of the Yncas, to which the abandoned terraces on the mountain-sides, once highly cultivated, bear silent testimony. In 1862 the population was officially estimated at 2,487,716. The latest census was taken in 1876 with much care. The result was 2,673,075 souls (males 1,352,151, females 1,320,924); of these 57 per cent. were Indians, 23 per cent. mestizos, and 20 per cent. of Spanish descent, negroes, Chinese, and foreigners; so that Peru is still the country of the Ynca people.

Political divisions.

Political Divisions.—The empire of the Yncas was divided into four main divisions, Chinchay-suyu to the north of Cuzco, Anti-suyu to the east, Colla-suyu to the south, and Cunti-suyu to the west, the whole empire being called Ttahuantin-suyu, or the four governments. Each was ruled by a viceroy, under whom were the "huaranca-camayocs," or officers ruling over thousands, and inferior officers, in regular order, over 500, 100, 50, and 10 men. All disorders and irregularities were checked by the periodical visits of the "tucuyricocs" or inspectors. The Spanish conquest threw this complicated system out of gear. In 1569 the governor, Lope Garcia de Castro, divided Peru into "corregimientos" under officers named "corregidores," of whom there were 77, each in direct communication with the Government at Lima. An important administrative reform was made in 1784, when Peru was divided into 7 "intendencias," each under an officer called an "intendente." These "intendencias" included about 6 of the old "corregimientos," which were called "partidos," under officers named "sub-delegados." Thus the number of officers reporting direct to Lima was reduced from 77 to 7, a great improvement. The republic adopted the same system, calling the "intendencias" "departments" under a prefect, and the "partidos" "provinces" under a sub-prefect. Peru is divided into 18 departments, 2 littoral provinces, and what is called the constitutional province of Callao. The departments contain 95 provinces. The Government recognizes 65 cities, 70 towns, 1337 smaller towns, 641 villages, 40 hamlets on the sea-coast, and 600 in the rural districts. The departments (going from north to south) are:—

| Coast. | Sierra. | Montaña. |
|-------------|---------------|----------------------|
| Piura. | Caxamarca. | Amazonas and Loreto. |
| Lambayeque. | Huanuco. | |
| Libertad. | Junin. | |
| Ancachs. | Huancavelica. | |
| Lima. | Ayacucho. | |
| Yca. | Apurimac. | |
| Arequipa. | Cuzco. | |
| Moquegua. | Puno. | |
| Tacna. | | |

Towns and Seaports.—The principal towns on the coast, except Payta, Callao, and Arica, are always some distance from the seashore. San Miguel de Piura, founded by Pizarro in 1532, is on the river of the same name. The towns in all parts of Peru are built on the same plan where the ground will allow of it, in squares or "quadras," with the streets at right angles, and a quadrangular open space or "plaza," one side being occupied by the principal church, near the centre. The church usually has an ornamental façade in the Renaissance style, with two towers. The houses on the coast are flat-roofed, with folding doors to the street, leading to a court or "patio," with rooms opening on it. Piura is a town of this class. Farther south are the cities of Lambayeque, Chiclayo, and Saña. Truxillo, founded by Pizarro in 1535, is of more importance. It is of oval shape, and was surrounded by walls with fifteen bastions, built in 1686, which have recently been demolished. Besides the cathedral, seat of a bishopric founded in 1609, there are three churches, and formerly four monasteries and a Jesuit college. Truxillo is the most important city north of Lima.

To the north of Lima there are five principal ports and thirteen smaller ones. Payta has a good anchorage and exports the cotton of the Chira and Piura valleys, the anchorages of Tumbes to the north and Sechura to the south being subsidiary to it. Pimentel is the port for the valleys of Lambayeque and Chiclayo, and Eten for that of Ferreñafe, the older port of San José having been abandoned as more dangerous. Pacasmayo, also, a precarious anchorage, is the port which taps the rich valley of Jequetepeque. Farther south Malabrigo is the port for the valley of Chicama. Huanchaco was formerly the port for Truxillo, but Salaverry, a few miles to the south, has been substituted as affording a safer anchorage. Santiago de Chao and Gualañe in the Viru district are lesser ports, the latter being resorted to by ships loading with guano at the adjacent islands. Chimbote, in the bay of Ferrol, has a good anchorage, and is important as the principal outlet for the Santa valley and the department of Ancachs. Farther south are the lesser ports of Santa, Samanco, Casma, Huarmey, Supé, Huacho, Chancay, and Ancon.

Lima, the capital (see vol. xiv. p. 644), according to the census of 1876, had a population of 100,046, of whom 33,020 were of European descent, 23,010 half-castes, 19,630 Indians, 15,378 foreigners, and 9008 negroes. South of Lima are the cities of Chinchay and Yca, with the principal seaport of Pisco, whence the wines and spirits of the adjacent valleys are exported. The small ports of Cerro Azul and Tambo Mora export the sugars of the Cañete and Chinchay valleys. Farther south the exposed port of Chala, with a bad anchorage, is used for the valley of Acari and the province of Parinacochas in the mountains. South-east of Yca are the charming agricultural towns of Palpa and Nasca. AREQUIPA (see vol. ii. p. 484), the most important coast-city south of Lima, was founded by Pizarro in 1536. South of Arequipa is the littoral province of Moquegua, with a pleasant town, the centre of a vine-growing industry. The cities of Tacna, Arica, and Iquique are in the Chilean province of Tarapaca. The ports of Arequipa were formerly Quilca, then Islay, and now Mollendo. Ylo and Pacocha, in the same bay, are the ports of Moquegua; Saña, under the lofty headland of the same name, is a port where landing is impossible except in "balsas," and it is little used. Arica was a very important port before the Chilean invasion, as through it passed all the trade to Bolivia. Iquique and Pisagua are the chief ports of Tarapaca, the others being Junin, Mexillones, Molle, Chucumata, Patillos.

In the sierra there is the same regularity in intention in laying out the plan of the towns, but it is often interfered

with by the irregularity of the ground. High-pitched red tiled roofs take the place of the flat roofs of the coast. The upper stories often recede, leaving wide corridors under the overhanging eaves, and in the "plazas" there are frequently covered arcades. Fruit-gardens and fields waving with lucerne and barley encircle the towns, and there is almost always a background of mountain-ranges. The principal interior towns in the north of Peru are Caxamarca, Huaraz, Huanuco, Cerro Pasco, the centre of the great silver-mining industry, 13,200 feet above the sea, Tarma, and Xauxa. Huancavelica owed its existence to the famous quicksilver mine. Ayacucho, formerly Guamanga, founded by Pizarro in 1539, is a charming abode amidst lovely scenery. Between Ayacucho and Cuzco are the pleasant towns of Andahuaylas and Abancay. Cuzco (see vol. vi. p. 744), the centre of Peru, the old capital of the Incas, lies at the foot of the famous hill of Sacsahuaman. South of Cuzco are many delightful places in the vale of Vilcamayu, and the towns in the Collao, the chief being Puno on the shore of Lake Titicaca.

Commerce.—The resources of Peru consist of its mineral wealth, its flocks, yielding valuable wool, its crops, and the products of its virgin-forests. Silver-mines extend along the whole length of the cordilleras from Hualgayoc to Puno. The mines are worked here and there, the great centre of this industry being at Cerro Pasco, where 1,427,592 ounces of silver were produced in 1877. The value of the silver exported from Peru in that year was £575,000, of copper £330,000; of gold there is no return. The exportation of guano from the Chincha Islands began in 1846 and continued until 1872. Between 1853 and 1872 there were 8,000,000 tons shipped from these islands. The deposits on the Guañape Islands were first worked in 1869, and from that year to 1871 as many as 838,833 tons were shipped,—460,000 tons remaining. On the three Macabi Islands there were 400,000 tons of guano in 1872, and large deposits on the Lobos Islands. But the most important discoveries of guano-deposits, since the exhaustion of the Chincha Islands, have been on the coast of Tarapaca. In 1876 the quantity at Pabellon de Pica was calculated at 350,000 tons, at Punta de Lobos 200,000 tons, at Huanillos 1,000,000 tons (buried under huge boulders of rock), at Chipana 250,000 tons. The total quantity of guano on islands north of Lima may be 600,000 tons, and on the coast of Tarapaca 1,800,000 tons.

Since 1830 nitrate of soda has been exported from the southern parts of Peru, the deposits being found on the western side of the Pampa de Tamarugal in Tarapaca. This region contains sufficient nitrate for the supply of Europe for ages. From 1830 to 1850 the export from Iquique amounted to 239,860 tons; in 1875 the annual export reached its maximum (326,869 tons).

The sugar cultivation in the coast-valleys is a great source of wealth. In 1877 the yield was estimated at 85,000 tons, valued at £1,360,000; of this quantity 63,370 tons went to Great Britain. Cotton, an indigenous product of the coast-valleys, is next in importance to sugar, the estates being worked with intelligence and a due outlay of capital. The cultivation of the vine is also a profitable industry,—a well-known spirit and excellent wine being made in the valleys of Pisco and Yca, and in the districts of Majes and Moquegua. Rice-crops are raised at Ferreñafe; olives are grown largely in the Tambo valley; and the silk-worm and cochineal insect have been successfully cultivated. In the sierra large quantities of wheat, barley, and potatoes are raised, and millions of pounds of alpaca and sheep's-wool are exported. From the forests of the montaña come chinchona bark, coca, coffee of the finest quality, cocoa, india-rubber, and some medicinal roots.

Communication.—Several railroads have been constructed of late years to connect the coast-towns and valleys with their seaports. That from Payta to Piura, contracted for in 1872, is 63 miles long; one from the port of Pimentel to Chiclayo and Lambayeque has a length of 45 miles. There are 50 miles of railway from Eten to Ferreñafe, 33 from Pacasmayo to Magdalena, 25 from Malabrigo to Ascope and the Chicama valley, 85 from Salaverry to Truxillo, 172 from Chimbote to Huaraz (only 52 finished). Several short lines radiate from Lima. A line from Pisco to Yca is 43 miles long, from Mollendo to Arequipa 107, from Ylo to Moquegua 63 miles, from Arica to Tacna 39 miles; and there are railroads in Tarapaca connecting the nitrate-works with the ports of Pisagua, Iquique, and Patillos. At Cerro Pasco a short line, begun in 1860, connects the silver-mines with the town. A railroad was commenced in 1870, from Callao and Lima, across the western and central cordilleras to Oroya, 12,178 feet above the sea in the valley of Xauxa, a distance of 136 miles. It ascends the valley of the Rimac, rising nearly 5000 feet in the first 46 miles. It then threads intricate gorges of the Andes, along the edges of precipices and over deep chasms. It

tunnels the Andes at a height of 15,615 feet. There are sixty-three tunnels, and the bridge of Verrugas spans a chasin 580 feet wide, resting on three piers, the centre one being 252 feet high, made of hollow wrought-iron. This great work is completed (1884), as far as Chicla, a distance of 86½ miles. Another railroad across the Andes connects Arequipa with Puno on the shores of Lake Titicaca. The summit is crossed in a cutting only 6 feet deep, 14,660 feet above the sea. The first locomotive reached Puno on 1st January 1874. The line is 232 miles long, and is to be prolonged to Cuzco. The cost of the Oroya line has been £4,625,887, and of the Arequipa and Puno line £4,346,659.

Two steamers were launched on Lake Titicaca in March 1874, which carry the traffic from Bolivia to Puno. Extensive harbour-works have been completed at Callao since 1870; and iron piers have been constructed at other ports. Steam communication connects the Peruvian ports on the Huallaga and Marañon with the Brazilian line at Tabatinga.

Education and Literature.—Universities and colleges were founded in Peru very soon after the conquest, and there was intellectual progress both among the Indians and the families of Spanish descent. The university of San Marcos at Lima is the most ancient in the New World, having been created by order of Charles V. in 1551. The college of San Carlos was founded in 1770, and the school of medicine in 1792. At Cuzco the university of San Antonio Abad was founded in 1598, and the college of San Geronimo at Arequipa in 1616. Since the independence there has been very considerable intellectual and educational progress in the country. There is a university of the first rank at Lima, 5 lesser universities, 33 colleges for boys and 18 for girls, 1578 schools for boys and 729 for girls, besides private schools. The most prolific author in Spanish times was Dr Pedro de Peralta y Barnuevo, author of an epic poem called *Lima Fundada* and many other works. Towards the latter end of the last century scientific studies began to receive attention in Peru. M. Godin, a member of the French commission for measuring an arc of the meridian near Quito, became professor of mathematics at San Marcos in 1750; and the botanical expeditions sent out from Spain gave further zest to scientific research. Dr Gabriel Moreno (died 1809), a native of Huamantanga in the Maritime Cordillera, studied under Dr Jussieu, and became an eminent botanist. Don Hipolito Unanue, born at Arica in 1755, wrote an important work on the climate of Lima and contributed to the *Mercurio Peruano*. This periodical was commenced in 1791 at Lima, the contributors forming a society called "Amantes del Pais," and it was completed in eleven volumes. It contains many valuable articles on history, topography, botany, mining, commerce, and statistics. An ephemeris and guide to Peru was commenced by the learned geographer Dr Cosme Bueno, and continued by Dr Unanue, who brought out his guides at Lima from 1793 to 1798. In 1794 a nautical school was founded at Lima, with Andres Baleato as instructor and Pedro Alvarez as teacher of the use of instruments. Baleato also constructed a map of Peru. A list of Peruvian authors in viceregal times occupies a long chapter in the life of St Toribio¹ by Montalvo; and the bibliographical labours of the Peruvian Leon Pinelo are still invaluable to Spanish students.

The topographical labours of Cosme Bueno and Unanue were ably continued at Lima by Admiral Don Eduardo Carrasco, who compiled annual guides of Peru from 1820. But the most eminent Peruvian geographer is Dr Don Mariano Felipe Paz Soldan, whose *Geografia del Peru* appeared in 1862. His still more important work, the *Diccionario geografico estadistico del Peru* (1877), is a gazetteer on a most complete scale, displaying an immense amount of labour, research, and literary skill. In 1868 appeared his first volume of the *Historia del Peru Independiente*, and two others have since been published. The earlier history of Peru has been written in three volumes by Sebastian Lorente; Mariano Rivero has ably discussed its antiquities; and Manuel Fuentes has edited six interesting volumes of memoirs written by Spanish viceroys. But the most valuable and important historical work by a modern Peruvian is undoubtedly General Mendiburn's *Diccionario Historico-Biografico del Peru*, a monument of patient and conscientious research, combined with critical discernment of a high order, which has certainly secured for its accomplished author a permanent place in the history of literature. As laborious historical students, Don José Toribio Polo, the author of an ecclesiastical history of Peruvian dioceses, and Don Enrique Torres Saldamando, the historian of the Jesuits in Peru, have great merit. Among good local annalists may be mentioned Juan Gilberto Valdivia, who has written a history of Arequipa, and Pio Benigno Mesa, the author of the *Annals of Cuzco*.

The leading Peruvian authors on constitutional and legal subjects are Dr José Santistevan, who has published volumes on civil and criminal law; Luis Felipe Villaran, author of a work on con-

¹ The city of Lima produced two saints, the archbishop St Toribio, who flourished from 1578 to 1600, and Santa Rosa, the patron saint of the city of the kings (1586-1616), whose festival is celebrated on 26th August.

stitutional right; Dr Francisco Garcia Calderon (late president of Peru), author of a dictionary of Peruvian legislation in two volumes; Dr Francisco Xavier Mariategui, one of the fathers of Peruvian independence; and Dr Francisco de Paula Vivil (died 1875), orator and statesman as well as author, whose work *Defensa de los Gobiernos* is a noble and enlightened statement of the case for civil governments against the pretensions of the court of Rome. Manuel A. Fuentes, an able statistician and the author of the *Estadística de Lima*, has also written a manual of parliamentary practice.

On the whole, Peruvian literature since the independence has attained to highest merit in the walks of poetry and romance. The Guayaquil author Olmedo, who wrote the famous ode on the victory of Junin, and the Limenians Felipe Pardo and Manuel Segura are names well known wherever the Spanish language is spoken. Pardo, as well as Segura, wrote in a satirical vein. Both died between 1860 and 1870. The comedies of Segura on the customs of Lima society, entitled *Un Paseo a Amancaes* and *La Saya y Manto*, have no equal in the dramatic literature of Spanish America and few in that of modern Spain. From 1848 date the first poetical efforts of Arnaldo Marquez, Manuel Nicolas Corpancho, Adolfo Garcia, Clemente Althaus, Pedro Paz Soldan (better known under his *nom de plume* of "Juan de Arona"), Carlos Augusto Salaverry, a son of the ill-fated general, Luis Benjamin Cisneros, Trinidad Fernandez, Constantino Carrasco, Narciso Arestegui, José Antonio Lavalle, Ricardo Palma, and Numa Pompilio Llona. Marquez is undoubtedly the most correct in diction and the most richly endowed with imaginative sentiment among Peruvian poets of the present generation. Corpancho was a dramatist of the romantic school and author of a bright little volume of poems entitled *Brevés*. He perished in a shipwreck off the coast of Mexico when barely thirty years old. Adolfo Garcia is the poet of most robust and vigorous thought, and he has written much, but only one volume of his select poems has been published (Havre, 1870). Among other productions of great merit this book contains a sonnet to Bolivar, which is one of the most beautiful that has appeared from the muse of Peru. Althaus (d. 1880) was a poet, imaginative, tender, elegant, and very careful as regards rhythm and diction. Paz Soldan, a good classical scholar, has published three volumes of poems. Salaverry is one of Peru's best lyrical poets; and the novels of Cisneros, entitled *Julia* and *Edgardo*, have secured him a lasting reputation. Fernandez and Carrasco were two poets of merit who died very young. The principal work of Carrasco was his metrical version of the Quichua drama of *Ollantay*. Lavalle and Arestegui are chiefly known as novelists. Palma has published three books of poetry, entitled *Armonías*, *Verbos y Gerundios*, and *Pasionarias*. Since 1870 he has devoted his great literary powers to writing the historical traditions of Peru in prose, of which six volumes have already appeared. They display great research, and are written in a graceful and agreeable style. Palma is a member of the Spanish Academy, a distinction shared, among Peruvian poets, with Felipe Pardo. The collected poems of Llona have recently been published; his *Canto de la Vida* is highly spoken of for its depth of thought and elegance of diction.

Peruvians have not neglected their early history and the study of the literature and language of the Yncas. Several have followed in the footsteps of Rivero. José Sebastian Barranca, the naturalist and antiquary, and Gavino Pacheco Zagarra, a native of Cuzco, have published translations of the ancient Ynca drama of *Ollantay*.

Among Peruvian naturalists since the independence the most distinguished have been Rivero, the geologist and mineralogist, and his friend and colleague Nicolas de Pierola, author of *Memorial de Ciencias Naturales*. Dr Cayetano Heredia, rector of the college of medicine in Lima from 1845 to his death in 1861, was an ardent patron of medical science. His successor, Dr Miguel de los Rios, has followed in his footsteps; and since 1856 many valuable contributions have been published by Peruvian physicians in the *Gaceta Médica de Lima*.

The most prominent publicists of Peru have been Mariategui, Vivil, Reynaldo and Cesario Chacaltana, Ricardo Heredia, José Basimiro Ulloa, Toribio Pacheco, and Luciano Cisneros.

The Peruvian priesthood, though justly accused of tyranny in their relations with the Indians in early times, and of immorality in many instances, can point to numerous learned and upright prelates, to devoted parish priests, to noble-minded teachers and ardent patriots, in their body. Founded in 1541, and raised to archiepiscopal rank in 1545, the see of Lima has been ruled by twenty-three prelates. The first was a Dominican friar, Dr Geronimo de Loaysa (1542-1575), who was more a politician than a priest. But the second, Dr Toribio Mogrovejo (1581-1606), devoted himself to the welfare of his flock, and died in the odour of sanctity, being finally canonized as St Toribio. Since the independence, Archbishop Luna Pizarro has added lustre to the see by his learning and ability. The bishopric of Cuzco was founded by Pope Paul III. in 1537, and has had twenty-seven prelates. Among them, Dr Gorrichategui (1771-76) was an excellent Quichua scholar and preacher and a devoted friend of the oppressed Indians; Dr Moscoso y Peralta (1777-89) was a prelate of consummate virtue and learning. The

bishoprics of Arequipa, Guamanga (Ayacucho), and Truxillo were created in 1609. The missionary bishopric of Maynas or Chachapoyas was founded in 1802, those of Huanuco and Puno in recent times. The Jesuits were once very powerful and wealthy in Peru, and both Jesuits and Franciscans, while working at their calling as missionaries, achieved much valuable geographical work on the rivers and in the forests of the montaña. Since the independence the religious orders have been gradually suppressed, yet monks as well as priests were in the front rank in advocating the cause of liberty. The ecclesiastical seminary at Lima, founded by St Toribio in 1601, was removed to part of the monastery of San Francisco in 1859, where it still flourishes, and where youths intended for holy orders are educated. The priests occupy a very important position in the social system, and much of the teaching is in their hands. Such men as Luna Pizarro and Vivil have performed their duties in a singularly faithful and enlightened spirit. Unfortunately there is still deplorable laxity among parish priests, though there are many noble exceptions.

Inhabitants.—The early inhabitants of Peru originally consisted of several distinct nations, subdivided into many tribes, which were eventually combined in the empire of the Yncas. The principal race was that of the imperial Yncas themselves, inhabiting the two central sections of the sierra, from the Knot of Cerro Pasco to that of Vilcañota, a distance of 380 miles. Here nature has worked on her grandest and most imposing scale. The scenery is magnificent, the products of every zone are collected in the valleys and on the mountain-sides; but the difficulties in the way of advancing civilization, caused by the obstacles of nature, are such as to tax man's ingenuity to the utmost. A country like this was well adapted for the cradle of an imperial race. Six nations originally peopled this central mountain-region—the Yncas in the valley of the Vilcamayu and surrounding plateaus, the Canas round the sources of the Apurimac, the Quichuas along the upper courses of the Pachachaca and the Apurimac, the Chancas, a very warlike people, from Guamanga to the Apurimac, the Huancas in the valley of the Xauxa, and the Rucanas round the summits and on the slopes of the Maritime Cordillera. These six nations were divided into "ayllus" or tribes, the most distinct of which were the still famous Morochucos and Yquichanos, brave mountaineers of the Chanca nation. There are reasons for believing that these nations once spoke different languages, especially the Chancas, but, excepting a few words imbedded in the general language of the Yncas, they are now lost.

In the basin of Lake Titicaca there was another race, anciently called Colla, but now better known as Aymara. Their language survives, and, though closely allied grammatically, the vocabulary differs from that of the Yncas. Within the Colla region, but differing from the rest of the inhabitants both in language and physical appearance, there was a savage tribe called Urus, inhabiting the reed-beds and islands in the southern part of Lake Titicaca. In the region north of the Knot of Cerro Pasco comprising the basin of the Marañon there were many warlike tribes speaking a language which the Yncas called Chinchaysuyu. The most important of these tribes were the Conchucos, Huamachucos, and Ayahuucas far to the north.

The Peruvian coast appears originally to have been inhabited by a diminutive race of fishermen called Changos, a gentle and hospitable people, never exceeding 5 feet in height, with flat noses. They fished in boats made of inflated seal-skins, lived in seal-skin huts, and slept on heaps of dried seaweed. Vestiges of this early race may be traced in the far south, as well as at Eten, Morrope, and Catacaos in the north. The later and more civilized coast-people were a very different and an extremely interesting race. They appear to have formed distinct communities in the different valleys each under a chief, of whom the most civilized and powerful was the Chimú, who ruled over the five valleys of Pativilca, Huarmey, Santa, Viru, and Moche, where Truxillo now stands. The subjects of this prince made great advances in civilization, and his vast palaces near Truxillo now form extensive ruins. The irrigation works of this coast-people were most elaborate; every acre of cultivable ground was brought under cultivation, and water was conveyed at high levels from great distances. The Yncas called these people Yncas, but they have entirely passed away, giving place to the negroes and Chinese labourers who now swarm in the coast-valleys. There is no dictionary of the Ynca language, but there is a grammar and a short list of words written in 1644, before it had entirely ceased to be spoken.

The Ynca or Quichua tribes of the Andes of Peru average a height of 5 feet to 5 feet 6 inches. They are of slender build, but with well-knit muscular frames, and are capable of enduring great fatigue. Their complexions are of a fresh olive-colour, skin very smooth and soft, beardless, hair straight and black, the nose aquiline. They are good cultivators, and excel as shepherds by reason of their patience and kindness to animals. They are naturally gentle, most affectionate to their families, with an intense love of home; but at the same time they are enduring and brave. The Aymaras are more thick-set than the Yncas, and their chief phy-

sical peculiarity is that the thigh, instead of being longer, is rather shorter than the leg. The whole build is admirably adapted for mountain-climbing.

The policy of the Yncas was to enforce the use of their language, called by the earliest Spanish grammarian "Quichua," among all the conquered tribes. Hence its very general use throughout the mountainous part of Peru, the only differences being the survival of words in some of the districts from the language or dialect that was superseded. Quichua was the language of a people far advanced in civilization; it was assiduously cultivated by learned men for several centuries; not only songs but elaborate dramas and rituals were composed in it; and it is still the language of the majority of the people of Peru. Aymara, which is a closely-allied tongue, is spoken along the shores of Lake Titicaca.

The wild Indians of the montaña, except a few tribes on the skirts of the Andes, do not belong to the Peruvian family. They are part of the great Tupi group of nations, and belong to the region of the Amazons. On the banks of the Huallaga are the Cocomas, Cholones, Panos, and Motilonos; and on the Ucayali the wild tribes of the Cashibos, Capahuanas, Remos, Amajuacas, and Mayorunas. The Conibos, Pirros, Sencis, Setebos, and Shipibos are peaceful traders. The Antis or Campas form a large and important tribe on the upper course of the Ucayali, with probably a large share of Ynca blood in their veins. The savage Indians on the tributaries of the Beni are called Chunchos. It is, however, to another family of the American race that the tribes of the Amazons mainly belong.

History.—Cyclopean ruins of vast edifices, apparently never completed, exist at Tiahuanaco near the southern shore of Lake Titicaca. Remains of a similar character are found at Huaraz in the north of Peru, and at Cuzco, Ollantay-tambo, and Huinaque between Huaraz and Tiahuanaco. These works appear to have been erected by powerful sovereigns with unlimited command of labour, possibly with the object of giving employment to subjugated people, while feeding the vanity or pleasing the taste of the conqueror. Their unfinished state seems to indicate the break-up of the Government which conceived them and which must have held sway over the whole of Peru, and the occurrence of Aymara words, especially in the names of places over the whole area, points to an Aymara origin for this lost and prehistoric empire. It is certain that for ages afterwards the country was again broken up into many separate nations and tribes. Then the most civilized and most powerful people, the Yncas of Cuzco and the Vilcamayu, began slowly to build up and cement together a later and more civilized empire. This great work, which probably occupied five centuries, was just completed when the Spaniards discovered Peru. The history of Ynca civilization has yet to be written. Our knowledge even of the Spanish writers who collected information at the time of the conquest is still very incomplete. Much that is essential for a correct appreciation of this interesting subject is still inedited and in manuscript. But, to comprehend it, a knowledge is also necessary of the people, of their country and languages. Without such qualifications for the task, the numerous traditions, customs, and beliefs cannot be understood nor assigned to the particular epochs and nationalities to which each belonged. With our existing imperfect knowledge the subject cannot be adequately treated without a detailed and critical examination of conflicting evidence which would be foreign to the purpose of the present article.

The great Ynca Huayna Capac died in 1527, the year when Pizarro first appeared on the coast. His consolidated empire extended from the river Ancasmayu north of Quito to the river Maule in the south of Chili. The Yncas had an elaborate system of state-worship, with a ritual, and frequently recurring festivals. History and tradition were preserved by the bards, and dramas were enacted before the sovereign and his court. Roads with post-houses at intervals were made over the wildest mountain-ranges and the bleakest deserts for hundreds of miles. A well-considered system of land-tenure and of colonization provided for the wants of all classes of the people. The administrative details of government were minutely and carefully organized, and accurate statistics were kept by means of the "quipus" or system of knots. The edifices displayed marvellous building skill, and their workmanship is unsurpassed. The world has nothing to show, in the way of stone-cutting and fitting, to equal the skill and accuracy displayed in the Ynca structures of Cuzco. As workers in metals and as potters they displayed infinite variety of design, though not of a high order, while as cultivators and engineers they in all respects excelled their European conquerors.

The story of the conquest has been told by Prescott and Helps, who give ample references to original authorities; it will be sufficient here to enumerate the dates of the leading events. On 10th March 1526 the contract for the conquest of Peru was signed by Almagro and Luque, Gaspar de Espinosa supplying the funds. In 1527 Francisco Pizarro, after enduring fearful hardships, first reached the coast of Peru at Tumbez. In the following year he went to Spain, and on 26th July 1529 the capitulation with the crown for the conquest of Peru was executed. Pizarro sailed from

San Lucar with his brothers in January 1530, and landed at Tumbez in 1532. The civil war between Huascar and Atahualpa, the sons of Huayna Capac, had been fought out in the meanwhile, and the victorious Atahualpa was at Caxamarca on his way from Quito to Cuzco. On 15th November 1532 Francisco Pizarro with his little army entered Caxamarca and in February 1533 his colleague Almagro arrived with reinforcements. The murder of the Ynca Atahualpa was perpetrated on 29th August 1533, and on 15th November Pizarro entered Cuzco. He allowed the rightful heir to the empire, Manco the legitimate son of Huayna Capac, to be solemnly crowned on 24th March 1534. Almagro then undertook an expedition to Chili, and Pizarro founded the city of Lima on 18th January 1535. In the following year the Yncas made a brave attempt to expel the invaders, and closely besieged the Spaniards in Cuzco during February and March. But Almagro, returning from Chili, raised the siege on 18th April 1537. Immediately afterwards the dispute arose between the Pizarros and Almagro as to the limits of their respective jurisdictions. An interview took place at Mala, on the sea-coast, on 13th November 1537, which led to no result, and Almagro was finally defeated in the battle of Las Salinas near Cuzco on 26th April 1538. His execution followed. His adherents recognized his young half-caste son, a gallant and noble youth generally known as Almagro the Lad, as his successor. Bitterly discontented, they conspired at Lima and assassinated Pizarro on 26th June 1541. Meanwhile Vaca de Castro had been sent out by the emperor, and on hearing of the murder of Pizarro he assumed the title of governor of Peru. On 16th September 1542 he defeated the army of Almagro the Lad in the battle of Chupas near Guamanga. The ill-fated boy was beheaded at Cuzco.

Charles V. enacted the code known as the "New Laws" in 1542. "Encomiendas," or grants of estates on which the inhabitants were bound to pay tribute and give personal service to the grantee, were to pass to the crown on the death of the actual holder; a fixed sum was to be assessed as tribute; and forced personal service was forbidden. Blasco Nunez de Vela was sent out, as first viceroy of Peru, to enforce the "New Laws." Their promulgation aroused a storm among the conquerors. Gonzalo Pizarro rose in rebellion, and entered Lima on 28th October 1544. The viceroy fled to Quito, but was followed, defeated, and killed at the battle of Anaquito on 18th January 1546. The "New Laws" were weakly revoked, and Pedro de la Gasca, as first president of the Audiencia (court of justice) of Peru, was sent out to restore order. He arrived in 1547, and on 8th April 1548 he routed the followers of Gonzalo Pizarro on the plain of Xaquixaguana near Cuzco. Gonzalo was executed on the field. La Gasca made a redistribution of "encomiendas" to the loyal conquerors, which caused great discontent, and left Peru before his scheme was made public in January 1550. On 23d September 1551 Don Antonio de Mendoza arrived as second viceroy, but died at Lima in the following July. The country was then ruled by the judges of the Audiencia, and a formidable insurrection broke out, headed by Francisco Hernandez Giron, with the object of maintaining the right of the conquerors to exact forced service from the Indians. In May 1554 Giron defeated the army of the judges at Chuquinga, but he was hopelessly routed at Pacara on 11th October 1554, captured, and on 7th December executed at Lima. Don Andres Hurtado de Mendoza, marquis of Cañete, entered Lima as third viceroy of Peru on 6th July 1555, and ruled with an iron hand for six years. He at length brought the turbulent conquerors to their knees. All the leaders in former disturbances were put on board a ship at Callao and sent to Spain. Corregidores, or governors of districts, were ordered to try summarily and execute every turbulent person within their jurisdictions. All unemployed persons were sent on distant expeditions, and moderate "encomiendas" were granted to a few deserving officers. The previous anarchy was thus completely stamped out. At the same time the viceroy wisely came to an agreement with Sayri Tupac, the son and successor of the Ynca Manco, and granted him a pension. He took great care to supply the natives with priests of good conduct, and promoted measures for the establishment of schools and the foundation of towns in the different provinces. The cultivation of wheat, vines, and olives, and European domestic animals were introduced. The next viceroy was the Conde de Nieva (1561-64). His successor, the licentiate Lope Garcia de Castro, who only had the title of governor, ruled from 1564 to 1569. From this time there was a succession of viceroys until 1824. The viceroys were chief magistrates, but they were not supreme. In legal matters they had to consult the Audiencia of judges, in finance the Tribunal de Cuentas, in other branches of administration the Juntas de Gobierno and de Guerra.

Don Francisco de Toledo, the second son of the count of Oropesa, entered Lima as viceroy on 26th November 1569. Fearing that the little court of the Ynca Tupac Amaru (who had succeeded his brother Sayri Tupac) might become a formidable focus of rebellion, he sent troops to seize the young prince, and unjustly beheaded the last of the Yncas in the square of Cuzco in the year 1571. After a minute personal inspection of every province in Peru, he, with the experienced aid of the learned P'olo de Ondegardo

and the judge Matienza, established the system under which the native population of Peru was ruled for the two succeeding centuries; and future viceroys referred to him as the great master of statesmanship who was their guide, and to his ordinances as their acknowledged text-book. His *Libro de Tasos* fixed the tribute to be paid by the Indians, exempting all men under eighteen and over fifty. He found it necessary, in order to secure efficient government, to revert in some measure to the system of the Yncas. The people were to be directly governed by their native chiefs, whose duty was to collect the tribute and exercise magisterial functions. The chiefs or "curacas" had subordinate native officials under them called "pichca-pachacas" over 500 men, and "pachacas" over 100 men. The office of curaca (or "cacique") was made hereditary, and its possessor enjoyed several privileges. Many curacas were descended from the imperial family of the Yncas, or from great nobles of the Yncarial court. In addition to the tribute, which was in accordance with native usage, there was the "mita," or forced labour in mines, farms, and manufactories. Toledo enacted that one-seventh of the male population of a village should be subject to conscription for this service, but they were to be paid, and were not to be taken beyond a specified distance from their homes.

In their legislation the Spanish kings and viceroys showed a desire to protect the people from tyranny, but they were unable to prevent the rapacity and lawlessness of distant officials. The country was depopulated by the illegal methods of enforcing the mita, and an air of sadness and desolation spread over the land. Toledo was succeeded in 1581 by Don Martín Henriquez, who died at Lima two years afterwards. The subsequent history of the viceroyalty is well worthy of detailed attention by students of history in all countries possessing a colonial empire. The Spanish colonies suffered from the strict system of monopoly and protection, which was only slightly relaxed by the later Bourbon kings, and from the arbitrary proceedings of the Inquisition. Between 1581 and 1776 as many as fifty-nine heretics were burned at Lima, and there were twenty-nine "autos," but the Inquisition affected Europeans rather than natives, for the Indians, as catechumens, were exempted from its terrors. The curacas sorrowfully watched the gradual extinction of their people by the operation of the mita, protesting from time to time against the exactions and cruelty of the Spaniards. At length a descendant of the Yncas, who assumed the name of Tupac Amaru, rose in rebellion in 1780. The insurrection lasted until July 1783, and the cruel executions which followed its suppression failed to daunt the people. The death of Tupac Amaru shook the power of Spain and made it totter to its fall. From that time both Indians and Peruvians of Spanish descent began to think for themselves, and to entertain ideas of liberty and progress. Tupac Amaru was followed by Dr Pedro José Chavez de la Rosa, the Spanish bishop of Arequipa, and Dr Toribio Rodríguez de Mendoza, rector of the university of San Carlos at Lima, whose pupils, among whom were the future republican statesmen Dra Luna Pizarro and Vivil, became ardent advocates of reform. When, on 3d August 1814, Mateo García Pumacagua, a Peruvian chief, raised the cry of independence at Cuzco, he was joined by many Peruvians of Spanish descent, but was defeated in the battle of Umachiri (12th March 1815), taken, and executed. At the same time the youthful and enthusiastic poet Melgar suffered death in the cause of his country.

Peru was the centre of Spanish power, and the viceroy had his military strength concentrated at Lima. Consequently the more distant provinces, such as Chili and Buenos Ayres, were able to throw off the yoke first. But the destruction of the viceroy's power was essential to their continued independent existence. The conquest of the Peruvian coast must always depend on the command of the sea. A fleet of armed ships was fitted out at Valparaíso in Chili, under the command of Lord Cochrane and officered by Englishmen. It conveyed an army of Argentine troops, with some Chilians, under the command of the Argentine general San Martín, which landed on the coast of Peru in September 1820. San Martín was enthusiastically received, and the independence of Peru was proclaimed at Lima on his entrance, after the viceroy had withdrawn (28th July 1821). On 20th September 1822 San Martín resigned the protectorate, with which he had been invested, saying that the "presence of a fortunate soldier is dangerous to a newly-constituted state," and on the same day the first congress of Peru became the sovereign power of the state. After a short period of government by a committee of three, the congress elected Don José de la Riva Agüero to be first president of Peru on 26th February 1823. He displayed great energy and capacity as an administrator, but the aid of the Colombians under Bolívar was sought, and the native ruler was unwisely deposed. Bolívar arrived at Lima on 1st September 1823, and began to organize an army to attack the Spanish viceroy in the interior. On 6th August 1824 the cavalry action of Junín was fought with the Spanish general Canterac near the shores of the lake of Chinchay-cocha. It was won by a gallant charge of the Peruvians under Colonel Suárez at the critical moment. Soon afterwards Bolívar left the army to proceed to the coast, and the final battle of Ayacucho (9th December 1824)

with the viceroy and the whole Spanish power was fought by his second in command, General Sucre. The Spaniards were completely defeated. The viceroy and all his officers were taken prisoners, and Spanish power in Peru came to an end.

General Bolívar now showed that he was actuated by personal ambition; he intrigued to impose a constitution on Peru, with himself as president for life. He failed, and left the country on 3d September 1826, followed by all the Colombian troops in March 1827. General Lamar, who commanded the Peruvians at Ayacucho, was elected president of Peru on 24th August 1827, but was deposed, after waging a brief but disastrous war with Colombia, on 7th June 1829. General Gamarra, who had been in the Spanish service, and was chief of the staff in the patriot army at Ayacucho, was elected third president on 31st August 1829.

For fifteen years, from 1829 to 1844, Peru was painfully feeling her way to a right use of independence. The officers who fought at Ayacucho, and to whom the country felt natural gratitude, were all-powerful, and they had not learned to settle political differences in any other way than by the sword. From 1837 to 1839 there was a lawless and unprincipled intervention on the part of Chili which increased the confusion. Three men, during that period of probation, won a prominent place in their country's history, Generals Gamarra, Salaverry, and Santa Cruz. Gamarra, born at Cuzco in 1785, never accommodated himself to constitutional usages; too often he made his own will the law; but he attached to himself many loyal and devoted friends, and, with all his faults, which were mainly faults of ignorance, he loved his country and sought its welfare according to his lights. Salaverry was a very different character. Born at Lima in 1806, of pure Basque descent, he joined the patriot army before he was fifteen and displayed his audacious valour in many a hard-fought battle. Feeling strongly the necessity that Peru had for repose, and the guilt of civil dissension, he wrote patriotic poems which became very popular. Yet he too could only see a remedy in violence. He seized the supreme power, and perished by an iniquitous sentence on 18th February 1836.¹ Andres Santa Cruz was an Indian statesman. His mother was a lady of high rank, of the family of the Yncas, and he was very proud of his descent. Unsuccessful as a general in the field, he nevertheless possessed remarkable administrative ability and for nearly three years (1836-39) realized his lifelong dream of a Peru-Bolivian confederation.² But Peruvian history is not confined to the hostilities of these military rulers. Three constitutions were framed, in 1828, 1833, and 1839. There were lawyers, statesmen, and orators who could defend the rights and liberties of the people. On 7th November 1832 Dr Vivil, the deputy for Tacna, rose in his place in congress and denounced the unconstitutional acts of President Gamarra in a memorable speech of great eloquence. Nor should a much humbler name ever be omitted in writing the history of republican Peru. Juan Ríos, a private soldier, was sentry at the door of congress when Gamarra illegally sent his troops to disperse the members. He defended his post against two companies, and fell mortally wounded.

In 1844 General Ramon Castilla restored peace to Peru, and was elected constitutional president on 20th April 1845. Ten years of peace and increasing prosperity followed. In 1849 the regular payment of the interest of the public debt was commenced, steam communication was established along the Pacific coast, and a railroad was made from Lima to Callao. After a regular term of office of six years of peace and moral and material progress Castilla resigned, and General Echenique was elected president. But the proceedings of Echenique's government in connexion with the consolidation of the internal debt were disapproved by the nation, and, after hostilities which lasted for six months, Castilla returned to power in January 1855. From December 1856 to March 1858 he had to contend with and subdue a local insurrection headed by General Vivanco, but, with these two exceptions, there was peace in Peru from 1844 to 1879, a period of thirty-five years. The existing constitution was framed in 1856, and revised by a commission in 1860. Slavery and the Indian tribute were abolished; by its provisions the president is elected for four years, and there are two vice-presidents. The congress consists of a senate and chamber of deputies. The senators are elected by departments and the deputies by the people, every 30,000 inhabitants having a representative. When congress is not sitting there is a permanent commission of the legislature, elected at the end of each session, and consisting of seven senators and eight deputies. The chamber of deputies may accuse the president of infractions of the constitution and the senate passes judgment. The president appoints the prefects of departments and sub-prefects of provinces; the prefects nominate the governors of districts. In each province there is a judge; a superior court of justice sits at the capital of each department; and there is

¹ The romance of his life has been admirably written by Manuel Bilbao (1st ed., Lima, 1853; 2d ed., Buenos Ayres, 1867).

² The succession of presidents and supreme chiefs of Peru from 1829 to 1844 was as follows:—1829-33, Agustín Gamarra; 1834-35, Luis José Orbegoso; 1835-36, Felipe Santiago Salaverry; 1836-39, Andres Santa Cruz; 1839-41, Agustín Gamarra; 1841-44, Manuel Menéndez.

Bibliography.—The history of Yuca civilization is to be found in works contemporaneous with the conquest or written in the succeeding century, in the native literature, and in the modern descriptions of ruins and other remains. The highest authority is Pedro de Cieza de Leon, whose *Chronicle*, which bears the stamp of impartiality, accuracy, and intelligence, was written within twenty years of the conquest (Eg. fr. of parts i. and ii. by the Hakluyt Society, 1864, 1883). The valuable writings of the learned lawyer Polo de Ondegardo, which discuss the polity and administrative rule of the Yucas, have been edited in Spanish, and one of his interesting reports has been translated and issued by the Hakluyt Society. Cristoval de Molina, the priest of the hospital founded by the Hakluyt Society. Cristoval de Molina, the priest of the hospital of Cuzco, has described the rites, ceremonies, and ritual of the Yucas in great detail; he wrote in 1580, but his manuscript was not translated and issued (by the Hakluyt Society) until 1878. It has since been ably edited in Spanish at Madrid. Miguel Balboa, who was in the country from 1566 to 1589, wrote an excellent historical work, which is translated into French in the series of N. Ternaux Compans. The *Natural History of the Indies*, by the Jesuit José de

¹ The succession of presidents of Peru, since the establishment of peace by Castilla in 1844, has been as follows:—1845-51, Ramon Castilla; 1851-55, José Rufino Echenique; 1855-62, Ramon Castilla; 1862-65, Miguel San Román (died 3d April 1863); 1863-65, José Pezet (vice-president); 1865-68, Mariano Ignacio Prado;

Island, and Pacific Railroad, and is connected by a tramway (1 mile) with La Salle, the terminus of the Illinois and Michigan Canal. Flour-mills, a plough-factory, and zinc-works are among the chief industrial establishments; coal-

works are among the chief industrial establishments:
1868-72, José Balta; 1872-76, Manuel Pardo; 1876-79, Mariano
Ignacio Prado; 1879-81, Nicolás de Pirola (supreme chief); 1881
(12th March), Francisco García Calderón; 1883 (20th October),
General Iglesias.

mining is largely prosecuted in the vicinity; and 125,000 tons of ice are yearly despatched to the southern markets. The population was 3132 in 1860 and 4632 in 1880 (township, 5053).

PERUGIA, a city of Italy, the chief town of the province of Perugia (formerly Umbria), lies 1550 feet above the sea on a beautiful and green-clad hill, which affords a magnificent view over a wide sweep of the Apennines and the great Umbrian plain through which the Tiber flows. The railway station at the foot of the ascent, more than a mile from the city-gate, is $48\frac{1}{2}$ miles south-east of Arezzo and 128 miles north of Rome. The walls, which follow a very irregular ground-plan, have a circuit of 8300 yards, and the length from Sant' Angelo in the north-west to Porta San Costanzo in the south-east is 2500 yards. Of the forty-two towers which could be counted in the 14th century only three or four—the Torre degli Scalzi, &c.—remain; but away from the line of the present enceinte there are several relics of the ancient Etruscan and Roman fortifications, notably the so-called arch of Augustus, a magnificent gateway in the Piazza Grimana, with the ancient inscription AVGVSTA PERVSTA on the archivolt and a beautiful Renaissance loggia boldly crowning one of its towers. The Cittadella Paolina—a great fortress erected by Paul III. on a site previously occupied by ten churches, two monasteries, the palaces of the Baglioni, and a number of private houses—was destroyed by the citizens in 1848, and its place has been partly taken by a substantial block of public offices (the museum, &c.). In modern Perugia the great centre of interest is the Piazza del Duomo at the north end of the Corso. On one side stands the cathedral of San Lorenzo, a Gothic structure of the 14th and 15th centuries, in the plan of a Latin cross, on the other side is the Palazzo Pubblico, presenting a fine Gothic façade of the first half of the 14th century with the figures of the Perugian griffin and the Guelph lion above the outside stair; and in the centre rises the great marble fountain constructed about 1277 by Bevinante, Frate Alberto (both Perugians), and Boninsegna (a Venetian), and adorned by statues and statuettes sculptured by Niccolò and Giovanni Pisano. The cathedral contains the burial-place of the three popes, Innocent III., Urban IV., and Martin IV., and a reputed relic of great celebrity in Italy—the Virgin's wedding-ring; and at the north-west corner, in the Piazza del Papa, is a sitting statue¹ of Pope Julius III. by Vincenzo Danti, erected about 1555 by the people of Perugia in gratitude for the restoration of their civic privileges. On the decoration of the Sala del Cambio or old exchange, contiguous to the Palazzo Pubblico, PERUGINO (*q.v.*) put forth the full force of his genius. Most of the movable paintings for which Perugia is famous have since 1863 been collected in the Pinacoteca Vannucci, established in the same Monte Morcino monastery of the Olivetans which now accommodates the university; besides a considerable number of pieces by Perugino, there are specimens of Pinturicchio, Niccolò Alunno, Bonfigli, &c. This centralization has somewhat impaired the interest of several of the churches; but others remain with undiminished wealth. San Domenico, a Gothic edifice originally designed by Giovanni Pisano, but rebuilt in 1632, contains that artist's magnificent monument of Pope Benedict XI., and in its east front a beautiful stained-glass window by Bartolommeo da Perugia. San Pietro de' Casinensi (outside the Porta Romana) is a basilica with a triple nave, founded in the beginning of the 11th century by Vinciole, and remarkable for its conspicuous spire, its granite and marble columns, its walnut stall-work designed by Raphael, and its numerous pictures (by Perugino, Parmigiano, Raphael, &c.). The Chiesa Nuova (formerly San Giovanni

Rotondo) possesses the tombs of Baldassare Ferri, the Perugian musician, and Vermiglioli, the leading Perugian antiquary. The university, which is not one of the "royal universities," though it dates from 1307 and has faculties of law, science, and medicine, numbers only seventy-nine students (1881-82). Other educational and benevolent institutions are a botanical garden, a meteorological observatory, a commercial library founded in 1582 by Prospero Podiani,² the Santa Margherita lunatic asylum, and the hospital of Santa Maria. Woollens, silks, wax candles, and liqueurs are manufactured on a small scale. The population of the city was 16,708 in 1871, and 17,395 in 1881, that of the commune 49,503 and 51,354 respectively.

A notice of ancient Perugia (Perusia) has been given under ETRURIA, vol. viii. p. 635. After the disasters of the Perugian war (41 B.C.) the city was rebuilt by Augustus and took the title Augusta; and at a later date it became a regular colony, *Colonia Flavia*. Its recovery from the Goths by Belisarius in 537, its protracted siege and sack by Totila (549), its restoration to the Eastern empire by Narses in 552, and its long occupation by the Lombards are the main points in the history of Perugia previous to the 9th century. At that time, with the consent of Charles the Great and Louis the Pious, it passed under the supremacy of the popes; but for many centuries the papal authority existed rather in name than in reality, and the city continued to maintain an independent and enterprising life, warring against its enemies and subduing many of the neighbouring lands and cities,—Foligno, Assisi, Spoleto, Montepulciano, &c. It remained true for the most part to the Guelphs. On various occasions the popes found a personal asylum within its walls, and it was the meeting-place of the conclaves which elected Honorius II. (1124), Honorius IV. (1285), Celestine V. (1294), and Clement V. (1305). But Perugia had no mind simply to subserve the papal interests. At the time of Rienzi's unfortunate enterprise it sent ten ambassadors to pay him honour; and, when papal legates sought to coerce it by foreign soldiery, or to exact contributions, they met with vigorous resistance. In the 15th century the real power, after passing from despot to despot, was at last concentrated in the Baglioni family, who, though they had no legal position as rulers or magistrates, defied all other authority, and filled the streets of the city with their broils and butcheries. Gian Paolo Baglioni was lured to Rome in 1520, and beheaded by Leo X.; and in 1534 Rodolfo, who had slain a papal legate, was defeated by Pier Luigi Farnese, and the city, captured and plundered by his soldiery, was deprived of its privileges and given over to the "worse tyranny of priests and bastards." In 1797 Perugia was occupied by the French; in 1832, 1838, and 1854 it was visited by earthquakes; in May 1849 it was seized by the Austrians; and, after a futile insurrection in 1859, it was finally united, along with the delegation, to Piedmont in 1860.

See B. Rossi Scotti, *Guida di Perugia*; Bonazzi, *Storia di Perugia* (1875 &c.); J. A. Symonds, *Sketches in Greece and Italy* (1874).

PERUGINO, PIETRO (1446-1524), whose correct family name was VANNUCCI, one of the most advanced Italian painters immediately preceding the era of Leonardo da Vinci and Raphael, was born in 1446 at Città della Pieve in Umbria, and belongs to the Umbrian school of painting. The name of Perugino came to him from Perugia, the chief city of the neighbourhood. Pietro was one of several children born to Cristoforo Vannucci, a member of a respectable family settled at Città della Pieve. Though respectable, they seem to have been poor, or else, for some reason or other, to have left Pietro uncared for at the opening of his career. Before he had completed his ninth year the boy was articled to a master, a painter at Perugia. Who this may have been is very uncertain; the painter is spoken of as wholly mediocre, but sympathetic for the great things in his art. Benedetto Bonfigli is generally surmised; if he is rejected as being above mediocrity, either Fiorenzo di Lorenzo or Niccolò da Foligno may possibly have been the man. Pietro painted a little at Arezzo; thence he went to the headquarters of art, Florence, and frequented the famous Brancacci Chapel in the church of the Carmine. It appears to be sufficiently established that he studied in the atelier of Andrea del Verrocchio, where Leonardo da Vinci was also a pupil. He may have learned perspective, in which he particularly

¹ See Hawthorne's description in the *Marble Faun*.

² See the curious history in *The Fortnightly Review*, 1866.

excelled for that period of art, from Pietro della Francesca. The date of this first Florentine sojourn is by no means settled; some authorities incline to make it as early as 1470, while others, with perhaps better reason, postpone it till 1479. Pietro at this time was extremely poor, and his prospects of rising in his art, save by the exercise of incessant diligence day and night, were altogether dim; he had no bed, but slept on a chest or trunk for many months, and, bent upon making his way, resolutely denied himself every creature-comfort.

Gradually Perugino rose into notice, and in the course of some years he became extremely famous not only throughout all Italy but even beyond her bounds. He was one of the earliest Italian painters to practise oil-painting, in which he evinced a depth and smoothness of tint which elicited much remark; he transcended his epoch in giving softness to form and a graceful spaciousness to landscape-distances, and in perspective he applied the novel rule of two centres of vision. The Florentine school advanced in amenity under his influence. Some of his early works were extensive frescos for the Ingesati fathers in their convent, which was destroyed not many years afterwards in the course of the siege of Florence; he produced for them also many cartoons, which they executed with brilliant effect in stained glass. Though greedy for gain, his integrity was proof against temptation; and an amusing anecdote has survived of how the prior of the Ingesati doled out to him the costly colour of ultramarine, and how Perugino, constantly washing his brushes, obtained a surreptitious hoard of the pigment, which he finally restored to the prior to shame his stingy suspiciousness. Another (and possibly apocryphal) anecdote, to show that he was not incapable of rising superior to all sordid considerations, is that he painted some excellent frescos for the oratory annexed to S. Maria de' Bianchi and would only accept an omelette as a gratuity. A third anecdote (but it belongs to a late period of his life) is that, as he would trust no one, he was accustomed to carry his money about with him in travelling after he had received a payment, and on one occasion was robbed and had a narrow escape of his life; eventually, however, the bulk of the money was recovered. A good specimen of his early style, in tempera, is the circular picture in the Louvre of the Virgin and Child enthroned between Saints.

Perugino returned from Florence to Perugia, and thence, towards 1483, he went to Rome. The painting of that part of the Sistine Chapel which is now immortalized by Michelangelo's Last Judgment was assigned to him by the pope; he covered it with frescos of the Assumption, the Nativity, and Moses in the Bulrushes. These works were ruthlessly destroyed to make a space for his successor's more colossal genius, but other works by Perugino still remain in the Sistine Chapel,—Moses and Zipporah (often attributed to Signorelli), the Baptism of Christ, and Christ giving the keys to Peter. This last work is more especially noted, and may be taken as a typical example both of Perugino's merits and of his characteristic defects,—such as formal symmetry of composition, set attitudes, and affectation in the design of the extremities. Pinturicchio accompanied the greater Umbrian to Rome, and was made his partner, receiving a third of the profits; he may probably have done some of the Zipporah subject.

Pietro, now aged forty, must have left Rome after the completion of the Sistine paintings in 1486, and in the autumn of that year he was in Florence. Here he figures by no means advantageously in a criminal court. In July 1487 he and another Perugian painter named Aulista di Angelo were convicted, on their own confession, of having in December waylaid with staves some one (the name does not appear) in the street near S. Pietro

Maggiore. Perugino limited himself, in intention, to assault and battery, but Aulista had made up his mind for murder. The minor and more illustrious culprit was fined ten gold florins, and the major one exiled for life. The next recorded incident in his career is also not wholly honourable to Perugino,—that of his undertaking but not fulfilling a contract to paint in Orvieto; as the commission fell through we need not pursue the details.

Between 1486 and 1499 Perugino resided chiefly in Florence, making one journey to Rome and several to Perugia. He had a regular shop in Florence, received a great number of commissions, with proportionate gain and fame, and continued developing his practice as an oil-painter, his system of superposed layers of colour being essentially the same as that of the Van Eycks. One of his most celebrated pictures, the *Pietà* in the Pitti Gallery, belongs to the year 1495. From about 1498 he became increasingly keen after money, frequently repeating his groups from picture to picture, and leaving much of his work to journeymen. In 1499 the guild of the Cambio (money-changers or bankers) of Perugia asked him to undertake the decoration of their audience-hall, and he accepted the invitation. This extensive scheme of work, which may have been finished within the year 1500, comprised the painting of the vault with the seven planets and the signs of the zodiac (Perugino doing the designs and his pupils most probably the executive work), and the representation on the walls of two sacred subjects—the Nativity and Transfiguration—the Eternal Father, the four Virtues of Justice, Prudence, Temperance, and Fortitude, Cato as the emblem of wisdom, and (in life-size) numerous figures of classic worthies, prophets, and sibyls. On the mid-pilaster of the hall Perugino placed his own portrait in bust-form. It is probable that Raphael, who in boyhood, towards 1496, had been placed by his uncles under the tuition of Perugino, bore a hand in the work of the vaulting; but, besides Raphael, the master had many and distinguished scholars acting as his assistants. The Transfiguration in this series has often been spoken of as the latest work of eminent excellence produced by Perugino, and from about 1500 he declined in a marked degree; this, however, is not to be accepted as true without some qualification, as we shall see in the sequel. It may have been about this time (though some accounts date the event a few years later) that Vannucci married a young and beautiful wife, the object of his fond affection; he loved to see her handsomely dressed, and would often deck her out with his own hands. He was made one of the priors of Perugia in 1501.

While Perugino, though by no means stationary or unprogressive as an executive artist, was working contentedly upon the old lines, and carrying out, almost to their highest point of actual or potential development, the ancient conceptions of subject-matter, treatment, style, and form, a mighty wave of new art flooded Florence with its rush and Italy with its rumour. Michelangelo, twenty-five years of age in 1500, following after and distancing Leonardo da Vinci, was opening men's eyes and minds to possibilities of achievement as yet unsurmised. Vannucci in Perugia heard Buonarroti bruited abroad, and was impatient to see with his own eyes what the stir was all about. In 1504 he allowed his apprentices and assistants to disperse, and he returned to Florence. It was not in the nature of things that he should simply swell the chorus of praise. Though not openly detracting, he viewed with jealousy and some grudging the advances made by Michelangelo; and Michelangelo on his part replied, with the intolerance which pertains to superiority, to the faint praise or covert dispraise of his senior and junior in the art. On one occasion, in company, he told Perugino to

his face that he was "a bungler in art" (*goffo nell' arte*). This was not to be borne, and Vannucci brought, with equal indiscretion and ill success, an action for defamation of character. Put on his mettle by this mortifying transaction, he determined to show what he could do, and he produced the chef-d'œuvre of the Madonna and Saints for the Certosa of Pavia. The constituent parts of this noble work have now been sundered. The only portion which remains in the Certosa is a figure of God the Father with cherubim. An Annunciation has disappeared from cognizance, three compartments—the Virgin adoring the infant Christ, St Michael, and St Raphael with Tobias—are among the choicer treasures of the London National Gallery. The current story that Raphael bore a hand in the work is not likely to be true. This was succeeded in 1505 by an Assumption, in the Cappella dei Rabatta, in the church of the Servi in Florence. The painting may have been executed chiefly by a pupil, and was at any rate a failure: it was much decried; Perugino lost his scholars; and towards 1506 he once more and finally abandoned Florence, going to Perugia, and thence in a year or two to Rome.

Pope Julius II. had summoned Perugino to paint the Stanza in the Vatican, now called that of the Incendio del Borgo; but he soon preferred a younger competitor, that very Raphael who had been trained by the aged master of Perugia; and Vannucci, after painting the ceiling with figures of God the Father in different glories, in five medallion-subjects, found his occupation gone; he retired from Rome, and was once more in Perugia from 1512. Among his latest works one of the best is the extensive altar-piece (painted between 1512 and 1517) of S. Agostino in Perugia; the component parts of it are now dispersed in various galleries.

Perugino's last frescos were painted for the monastery of S. Agnese in Perugia, and in 1522 for the church of Castello di Fontignano hard by. Both series have disappeared from their places, the second being now in the South Kensington Museum. He was still at Fontignano in 1524 when the plague broke out, and he died. He was buried in unconsecrated ground in a field, the precise spot now unknown. The reason for so obscure and unwonted a mode of burial has been discussed, and religious scepticism on the painter's own part has been assigned as the cause; the fact, however, appears to be that, on the sudden and widespread outbreak of the plague, the panic-struck local authorities ordered that all victims of the disorder should be at once interred without any waiting for religious rites. This leads us to speak of Perugino's opinions on religion. Vasari is our chief, but not our sole, authority for saying that Vannucci had very little religion, and was an open and obdurate disbeliever in the immortality of the soul. Gasparo Celio, a painter of the 16th century, cites Niccolò delle Pomarance (whose wife was related to Perugino's wife) as averring that the aged master on his deathbed rejected the last sacraments, and refused to confess, saying he was curious to know the final fate of an unconfessed soul, and *therefore* he was buried in unconsecrated ground. For a reader of the present day it is easier than it was for Vasari to suppose that Perugino may have been a materialist, and yet just as good and laudable a man as his orthodox Catholic neighbours or brother-artists; still there is a sort of shocking discrepancy between the quality of his art, in which all is throughout Christian, Catholic, devotional, and even pietistic, and the character of an anti-Christian contemner of the doctrine of immortality. It is difficult to reconcile this discrepancy, and certainly not a little difficult also to suppose that Vasari was totally mistaken in his assertion; he was born twelve years before Perugino's death, and must have talked

with scores of people to whom the Umbrian painter had been well known. We have to remark that Perugino in 1494 painted his own portrait, now in the Uffizi Gallery of Florence, and into this he introduced a scroll lettered "Timete Deum." That an open disbeliever should inscribe himself with "Timete Deum" seems odd, one's first impression is either that he cannot have been a disbeliever or else that he must have been a hypocrite as well, which, however, is still inconsistent with Vasari's account of the facts. It is possible, after all, that a man might fear God and yet have no confidence in immortality, or in many of the things which seemed in 1494 to be essentials of religion. The portrait in question shows a plump face, with small dark eyes, a short but well-cut nose, and sensuous lips, the neck is thick, the hair bushy and frizzled, and the general air imposing. The later portrait in the Cambio of Perugia shows the same face with traces of added years. Perugino died possessed of considerable property, leaving three sons.

The character of Perugino's art is, as we have just said, throughout religious, although, in some instances already indicated, he strayed outside the circle of Christian history and tradition. His art is reserved, self-contained, not demonstrative, yet conspicuously marked by a tendency to posing and balance, and to little artifices wherein the graceful merges in the affected. He had a particular mastery over abstracted purism of expression; this appears constantly in his works, and, while it carries the finer of them to a genuinely ideal elevation, it leaves upon many a mincing and mawkish taint which it is not easy to view without some impatience. Perugino did not recruit his strength from study of the antique; his drawing, though frequently solid and able, is unequal, and there is a certain littleness of style in his forms, especially (with rare exceptions) the nude. His technical attainment was exceptional, and in colour he may be regarded as standing first in his generation in central Italy if we except Francia. Perugino does not leave upon us the impression of personal greatness; he does not seem to have had struggling within him a profounder message to convey than he succeeded in conveying. There is neither massiveness of thought, nor novel initiative, nor glowing intensity, though there is some fervour of inspiration. Still, within his own province, he is a rare and excellent master.

Among the very numerous works of Perugino a few not already named require mention. Towards 1501 he produced the picture of the marriage of Joseph and the Virgin Mary (the "Sposalizio") now in the museum of Caen; this served indisputably as the original, to a great extent, of the still more famous Sposalizio which was painted by Raphael in 1504, and which forms a leading attraction of the Brera Gallery in Milan. A vastly finer work of Perugino's than his Sposalizio is the Ascension of Christ, which, painted a little earlier for S. Pietro of Perugia, has for years past been in the museum of Lyons; the other portions of the same altar-piece are dispersed in other galleries. In the chapel of the Disciplinati of Città della Pieve is an Adoration of the Magi, a square of 21 feet containing about thirty life-sized figures; this was executed, with scarcely credible celerity, from the 1st to the 25th March (or thereabouts) in 1505, and must no doubt be in great part the work of Vannucci's pupils. In 1507, when the master's work had for years been in a course of decline and his performances were generally weak, he produced, nevertheless, one of his best pictures—the Virgin between St Jerome and St Francis, now in the Palazzo Penna. In S. Onofrio of Florence is a much-lauded and much-debated fresco of the Last Supper, a careful and bloodily correct but not inspired work; it has been ascribed to Perugino by some connoisseurs, by others to Raphael; it may more probably be by some different pupil of the Umbrian master.

Our account of Perugino follows in its main lines that given by Crowe and Cavalcaselle in their *History of Painting in Italy*, vol. iii. Vasari is, as usual, by far the most graphic narrator, but lax in his facts (though not so much so as in several other instances). Other leading authorities are Orsini, *Vita, &c.*, di Pietro Perugino e de' suoi Scolari, 1804, and Mezzanotte *Vita, &c.*, di Pietro Vannucci, 1836. (W. M. R.)

PERUVIAN BARK. See CINCHONA and QUININE.

PERUZZI, BALDASSARE (1481-1536), architect and painter of the Roman school, was born at Ancajano, in the diocese of Volterra, and passed his early life at Siena, where his father resided. While quite young Peruzzi went to Rome, and there studied architecture and painting; in the latter he was at first a follower of Perugino. The choir-frescos in San Onofrio on the Janiculan Hill, usually attributed to Pinturicchio, are by his hand. One of the first works which brought renown to the young architect was the villa on the banks of the Tiber in Rome now

known as the Farnesina, originally built for the Sienese Agostino Chigi, a wealthy banker. This villa, like all Peruzzi's works, is remarkable for its graceful design and the delicacy of its detail. It is best known for the frescos painted there by Raphael and his pupils to illustrate the stories of Psyche and Galatea. One of the *loggie* has frescos by Peruzzi's own hand,—the story of Medusa, a work of considerable decorative beauty. On account of his success in this building Peruzzi was appointed by Leo X. in 1520 architect to St Peter's at a salary of 250 scudi, a handsome sum for that time; his design for its completion was not, however, carried out. During the sack of Rome in 1527 Peruzzi was taken prisoner, and barely escaped with his life, on condition of his painting the portrait of Constable de Bourbon, who had been killed during the siege (see Vasari). From Rome he escaped to his native city Siena, where he was made city architect, and designed fortifications for its defence, a great part of which still exist. Soon afterwards he returned to Rome, where he made designs for a palace for the Orsini family, and built the palaces Massimi and Vidoni, as well as others in the south of Italy. He died in 1536, and was buried by the side of Raphael in the Pantheon.

Peruzzi was an eager student of mathematics and the science of perspective; he was also a fair classical scholar, and was much influenced by the treatise of Vitruvius. Like many of the great artists of his time, he was remarkable for the varied extent of his knowledge and skill. A most able architect, a fair painter, and a scientific engineer, he also practised minor arts, such as stucco-work in relief, sgraffito, and the decorative painted arabesques which the influence of Raphael did so much to bring into use. His best existing works in fresco are in the Castel di Belcaro and the church of Fontegiusta in Siena. For Siena cathedral he also designed a magnificent wooden organ-case, painted and gilt, rich with carved arabesques in friezes and pilasters; he also designed the high altar and the Cappella del Battista.

His chief pupil was the architect Serlio, who, in his work on architecture, gratefully acknowledges the great debt he owed to Peruzzi's instruction. The English National Gallery possesses an interesting drawing by his hand (No. 167). The subject is the Adoration of the Magi, and it is of special value, because the heads of the three kings are portraits of Michelangelo, Raphael, and Titian. The Uffizi and the library at Siena contain a number of Peruzzi's designs and drawings, many of which are now of priceless value to the student of Roman antiquities, as they show ancient buildings which have been destroyed since the 16th century.

Vasari, *Vita di Baldassare Peruzzi* (Milanesi's ed., vol. iv. p. 489, 1882); Milizia, *Memorie degli Architetti* (1781, vol. i. pp. 210-215); Della Valle, *Lettere Sanesi* (1782-86); Gaye, *Carteggio inedito d'Artisti* (1839-40); Lauzi, *Storia Pittorica* (1804); and Platner, *Beschreibung der Stadt Rom* (1830-42).

PERVIGILIUM. See VIGIL.

PERVIGILIUM VENERIS, the Vigil of Venus, a short Latin poem, in praise of spring as the season of love and flowers. Written professedly in early spring on the eve of a three-nights' festival (Vigil) in honour of Venus (probably April 1-3), it describes in warm and poetical language the annual awakening of the vegetable and animal world in spring through the all-pervading influence of the foam-born goddess, whose birth and connexion with Rome and the Cæsars are also touched upon. The joyous tone which runs through the poem passes suddenly at the close into one of lyric sadness: "The nightingale is singing, but I am silent. When comes my spring?" It consists of ninety-three verses in trochaic tetrameter catalectic and is divided into strophes of unequal length by the refrain, "Cras amet qui nunquam amavit; quique amavit

cras amet." The author, date, and place of composition are unknown. Formerly it was ascribed to Catullus, but from its late Latinity, approximating in some points to Italian,¹ it can hardly have been earlier, and was probably later, than the latter half of the 2d century A.D. It is certainly earlier than Fulgentius (about 480-550 A.D.), who imitated it. The references to Hybla and Etna (or Enna), from which some have thought that the poem is Sicilian, need be no more than poetical allusions to Sicily as the flowery land. Virgil's description of spring (*Georg.*, ii. 323-342) is imitated somewhat closely; compare especially verse 62 with Virgil's 327; again, v. 85 is a copy of *Aeneid*, xi. 458. This seems to disprove Bernhardt's conjecture that the poem is a translation from the Greek. From its exuberant rhetoric Orelli ascribes it to an African poet of the 3d or 4th century A.D. Bücheler places it between Florus and Nemesianus, i.e., in the 2d or 3d century A.D. Wernsdorf suggested as its author Annius Florus in the time of Hadrian; Heidtmann conjectured Appuleius; Baehrens refers it to Tiberianus, a poet of the 4th century. But there are not data enough to determine the authorship.

The *Pervigilium* is preserved in the Paris MSS. 10318 (*Codex Salmasianus*) and 8071 (*Codex Thuanus* or *Pithocanus*); the former (the better of the two) belongs to the 7th or beginning of the 8th century, the latter to the 9th or beginning of the 10th. They differ too much to have been copied from the same original. The age of the MSS. refutes the theory, sometimes broached, that the poem is modern. The first edition was published by Lipsius at Antwerp in 1611; and there are modern editions by Wernsdorf (*Portæ Latini Minores*, vol. iii.), Orelli (1832), Bücheler (1859), Baehrens (1877). There are translations into English verse by Thomas Stanley (1651) and Parnell, into prose by W. K. Kelly; a French translation by Sanadon; a German one by Kirchner.

PESARO, a city and seaport of Italy, the capital of the province of Pesaro and Urbino, lies on the coast of the Adriatic 36 miles north of Ancona and 20½ south of Rimini on the right bank of the Foglia, the ancient Pisaurus. The ground on which it is built is only from 10 to 40 feet above the sea, but it is surrounded by hills,—on the east by Monte Ardizio, on the west by Monte Accio or San Bartolo, which derives one of its names from the Roman dramatist L. Attius, born and buried on the spot. The city walls, which were strengthened by bastions and moat and made a circuit of about a mile, were in 1830 transformed into a public promenade. Besides the ancient cathedral of the Annunciation (restored since 1860) the more conspicuous buildings are the prefecture (a palace originally erected by the Sforza, and restored by Francesco Maria della Rovere), the seminary, the Rossini theatre (opened in 1818), the fortress or Rocca Costanziana (built by Costanzo Sforza in 1474), the harbour-fort (due to Napoleon I.), and the large lunatic asylum. Rossini, who was a native of Pesaro, left all his fortune to found a musical lyceum in the city, and his statue by Marochetti (1864) stands near the railway station. The Olivieri library (established by the antiquary of that name, author of *Marmora Pisarenisia*, &c.) contains about 14,000 volumes, MSS. of Tasso's, &c., various antiquities, and a fine collection of majolica from the old Urbino manufactory. Among the industries of Pesaro are the growing, spinning, and weaving of silk, tanning, iron-founding, and the manufacture of glass and pottery. The harbour is of no great importance, and the aggregate burden of the 437 vessels entering or clearing in 1883 was less than 12,000 tons. The population of the city and port in 1870 was 11,952 and in 1880 12,913; that of the commune 19,691 and 20,909 in the same years.

The ancient Pisaurum in the territory of the Galli Senones became a Roman colony in 184 B.C. and soon grew to be a flourish-

¹ Thus *de* is very frequently used like Italian *di*; *totus* (v. 22) instead of *omnes*, Ital. *tutti*; and *mane* (*ib.*) in the sense of "to-morrow," Ital. *domani*.

ing town. It was recruited with a body of military colonists by Mark Anthony, and after the disastrous earthquake of 31 B.C. received another accession from Augustus and took the title *Colonia Julia Felix*. Destroyed by Vitiges the Goth, it was restored and strengthened by Pelisarius, and afterwards along with Ancona, Fano, Sinigaglia, and Rimini formed the Pentapolis Maritima. In the course of the 13th century Pesaro was sometimes under the government of the popes, sometimes under that of the emperors; but the Malatesta family, which first took root in the city about 1285, gradually became the real masters of the place. In 1445 they sold their rights to Francesco Sforza; and in 1512, through the influence of Julius II., the Sforza were supplanted by his nephew Francesco Maria, duke of Urbino. Leo X. took the city away from Francesco and gave it to Lorenzo de' Medici; but on Lorenzo's death Francesco was restored and Pesaro became the ordinary residence of the dukes of Urbino till the death of Francesco Maria II. in 1631, when it reverted to the States of the Church. It has formed part of the present kingdom of Italy since 1860. Terenzio Mamiani della Rovere, poet and statesman, was born at Pesaro in 1800.

PESHAWAR,¹ or PESHAWUR, a district in the lieutenant-governorship of the Punjab, with an area of 2504 square miles, situated in the extreme north-western corner of British India, between 33° 50' and 34° 30' N. lat. and 71° 30' and 72° 50' E. long. Except on the south-east, where the Indus flows, it is encircled by mountains, and is bounded on the N. by the Mohmand, Utman Khel, and other hills, E. by the Indus, S. by the Khatak and Afridi Hills, and W. by the Khyber Mountains. It forms an important part of the frontier of the Punjab, being crossed by the great route from India to Cabul. The only hills of any consequence in the district are the Khatak Hills, a continuation of the Afridi Hills, which are themselves a spur of the great Sufed Koh range. The plain consists of alluvial deposits of silt and gravel, and throughout the whole valley its surface is studded with water-worn shingle or boulders. The district presents, especially in its western and central portions, an appearance of great beauty: it is covered with luxuriant vegetation, which is relieved by the meanderings of the numerous canals and set off by its bare stony surroundings and the far distant snowy peaks. Its rivers, all tributaries of the Indus, are the Cabul, Swat, Bara, Budni, and Ludnai. The district is naturally fertile and well watered, and the valley is entirely drained by the Cabul river. The temperature ranges from a minimum of 17° in February to a maximum of 137° in July. The average rainfall is about 14 inches.

According to the census of 1881 the population was 592,674, of whom 329,524 were males and 263,150 females. The people are mostly Afghans and almost entirely of the Moslem religion, no less than 546,117 being Mohammedans, while Hindus numbered only 39,321, Christians 4088, Sikhs 3103, and others 45. The largest tribe in the district is that of the Pathans, of whom in 1881 there were 276,656. The Moslem portion of the population is occupied chiefly in agriculture and the rearing of cattle, while the Hindus are engaged in trade as bankers, merchants, and shopkeepers. The prevailing languages are the Urdu and Pushtu.

Out of the total area of 2504 square miles 1414 are cultivated and 470 are returned as cultivable. The chief products are wheat, barley, maize, millet. Peshawar also produces some of the finest rice in the world, known as "Bara rice," named after the river by which the ground yielding it is irrigated. Since the district came into British possession its trade has increased considerably. The principal foreign markets with which it deals are Cabul and Bokhara; the imports from the former are chiefly silk, nuts and fruits, skins, timber, dyes, and spices, and from the latter gold bullion and gold thread, which go principally to Bombay. The exports consist mainly of piece goods, tea, fancy wares, sugar, salt, and spices. The chief manufactures are Peshawar scarves, celebrated throughout India for their fine texture and tasteful colouring, leather goods, cutlery, the preparation of snuff, and a great deal of broadcloth. The gross revenue of the district in 1882-83 was £95,931, of which the land revenue contributed £68,201.

Peshawar in 1881 had five towns with a population exceeding 5000, namely Peshawar (see below); Nowshera, 12,963; Tangi, 9037; Maira Parang, 8874; and Charsadda, 8363.

¹ The division of this name comprises the three districts of Peshawar, Kohat, and Hazara, with an area of 8381 square miles. In 1881 it had a population of 1,181,289—males 649,509, females 531,780. By religion 719,095 were Moslems, 68,992 Hindus. 6724 Sikhs, 4390 Christians, and 88 others.

History.—The first authentic record of the tribes seated about Peshawar is in the time of Mahmud. What little is heard of them before then points to their being a bold and independent race. Buddhism was introduced into the district in the reign of Asoka, 263 B.C., and one of his rock edicts still exists. From the time of Sabuktigin, governor of Khorasan, in 978 A.D., who took possession of the country up to the Indus, Peshawar became the scene of fierce contests. Mahmud, his son, was the first Moslem conqueror of Hindustan, and succeeded in converting the Pathans to the Mohammedan faith; and this tribe remained true to him in all his subsequent engagements with the infidels. The last decisive battle of Mahmud with the Hindus was fought on the plains of Chach in Rawal Pindi, where he totally defeated Anang Pal, the last champion of the Hindu creed and nationality in the north. For a century and more after Mahmud's death (1028) Peshawar continued to be a province of Ghazni; and under his numerous successors it acquired great importance, becoming the centre of their dominions, which were extended to Lahore. Timur's invasion of India at the close of the 13th century did not disturb the district or the tribes about it, but a century later the Khakhai Pathans, a body of roaming adventurers, invaded the district in three main clans—the Yusufai, Giganis, and Muhammadzai—and obtained permission from the Dilazaks, who then held it, to settle on a portion of their waste lands. Quarrelling with the Dilazaks, they routed them and swept them into the neighbouring district of Hazara. The Giganis then settled in the fertile strip of land about the confluence of the Swat and the Cabul; the Muhammadzai took Hashtnagar, and the Yusufai the remainder of the country north of the Cabul river. For some time these tribes remained unmolested, but in 1519 Babar, fifteen years after his capture of Cabul, allied himself with the injured Dilazaks and subdued the Afghans of Peshawar. After his death in 1530 the country was the scene of constant feuds, which ended in the Dilazaks being completely ousted. The year 1553 marks the last immigration of Afghans into the district. In 1587 Akbar came to the throne. During the next three reigns the valley rendered an unwilling allegiance to the central authority, and in the reign of Aurangzeb the Pathans succeeded in freeing themselves from Mogul supremacy. In 1738 Nadir Shah held possession of the district, and under the succeeding Durani dynasty it was often the residence of the Cabul court. On the death of Timur Shah in 1793 the throne was left to be contended for by his sons, whose adventurous enterprises and varied fortunes form a romantic page in Oriental history. In 1818 the Sikhs advanced into the valley and overran the whole district to the foot of the hills; and the country continued to be ravaged by them until it at last fell into their hands, when they ruled it with their usual severity. In 1848 the district became an integral portion of British India, and, except for its connexion with the mutiny in 1857, there is little else of importance to notice.

PESHAWAR, chief town in the above district, situated in 34° 2' N. lat. and 71° 37' E. long., is about 14 miles east of the Khyber Pass, and distant from Lahore 276 miles and from Cabul 190 miles. Its population in 1881 was 79,982 (50,322 males, 29,660 females). It is built on a plain 1068 feet above the sea, and is surrounded by a mud wall 10 feet high. Among the chief buildings of the town are the Ghor Khatri, originally a Buddhist monastery, afterwards rebuilt as a Hindu temple, and now used as a serai. Peshawar is commanded by a mud-fort to the north-west, built on the ruins of Bala Hissar; and it is well watered, and said to be one of the best-drained cities in the Punjab.

PESSIMISM is a word of very modern coinage, employed to denote a mode of looking at and estimating the world, and especially human life, which is antithetical to the estimate designated by the term (a much older one) "Optimism." Both terms have a general as well as a special application. In their non-technical usage they denote a composite and ill-defined attitude of mind which gives preponderating importance to the good or to the evil, to the joys or to the sorrows, respectively, in the course of experience. The optimist sees everything in *coulour de rose*; the pessimist always turns up the seamy side of things. But in their special and technical employment, optimism and pessimism denote specific theories elaborated by philosophers,—the former to show that the world is the work of an author of infinite goodness and wisdom, and is, all things considered, conducive to the happiness of its sentient life; the latter, that existence, when summed up, has an

enormous surplus of pain over pleasure, and that man in particular, recognizing this fact, can find real good only by abnegation and self-sacrifice. As a speculative theory optimism is chiefly associated with the *Théodicée* of Leibnitz (1710), while pessimism is the work of Schopenhauer (*Die Welt als Wille und Vorstellung*, 1st ed. 1819) and Von Hartmann (*Philosophie des Unbewussten*, 1st ed. 1869). In either case, however, the modern doctrines have their predecessors. The Stoics and the Neoplatonists were earlier labourers in the cause of optimism, in their attempt to exhibit the adaptations in nature for the welfare of its supreme product man. And in the metaphysical dogmas of Brahmanism, as well as in the practical philosophy of the Buddhists, the creed of the modern pessimist, that the world is vanity and life only sorrow, is found preluded with startling sameness of tone.

Though later as a philosophical creed in the European world, pessimism is far earlier than optimism as a mood of feeling in mankind at large. The ordinary human being, so long as he is engrossed with action and identified with his immediate present, is neither optimist nor pessimist. But in proportion as reflexion awakens—as the fullness of life and vigour of will give place to the exhaustion of age or to brooding thoughtfulness—there comes a sense of doubt as to the value of the aims on which energy is spent and as to the issue of the struggle with nature. It is failure that excites meditation: the obvious disproportion between desire and attainment impresses the poet and thinker, as they scan the page of human life, with the predominant darkness of the record. The complaint is heard from every land and in every language that the days of man are few and evil, that the best lot of all is not to be born at all, and next in order is the fate of those cut off by early death. Even the great king himself (says Socrates in the *Apology*, xxxii.), far less any private man, as he reviews the course of his past life, cannot point to any better or happier time than a night of dreamless sleep; and Byron bids us—

"Count o'er the joys thine hours have seen,
Count o'er thy days from anguish free,
And know, whatever thou hast been,
'Tis something better not to be."

In a religious form this pessimism appears as a belief that man is a creature at the mercy of more potent agents, to whom his wishes and fears are of slight importance. Called into existence by instrumentalities over which he has no control, he is involved in a lifelong conflict with forces, natural and supernatural, which work out their inevitable issues with utter indifference to his weal or woe. The wheels of the universe are deaf to the cry of human hearts. There is a hopeless sense of inequality in the struggle between the petty self-centred will of man and the capricious and irresistible forces of nature.

This natural and instinctive pessimism is contemporaneous with the non-theistic religions of the world,—with all the forms of nature-worship, from the grossest and most trivial polytheism to the abstrusest schemes of naturalistic pantheism. In such a state of belief man tries to obtain relief from the burden of troubles in various ways. There is first of all the vulgar method of adulation and sacrifice. The powers of the unknown which lie ready to thwart the plans of man, and which he conceives in the likeness of beings with vaster forces but with passions and susceptibilities like his own, may be bribed by gifts or placated by flattery. Hence the common practices of superstitious worship. A second means of escape from the burden of life is given by what may be called Epicureanism. While not denying the divine, it explains away the gods of popular religion, and at the same time rejects the attempt to transform the idea of necessary connexion from a principle for

the explanation of phenomena into a controuling agency at the summit of the universe. Within the limits fixed by his natural conditions it represents man as free to work out his own welfare without interference from superior powers. But it is forced to admit that the happiness which man can obtain is after all only negative,—all pleasure is but the withdrawal of pain, and the utmost range of pleasure lies in varying the methods of such deliverance. Epicureanism is pessimistic; but it is an egoistic pessimism which is content to aim at the maximum of painlessness for the individual, and which ignores the metaphysics of universal pain and of universal relief from that pain.

The third method of relief from the troubles of existence has a closer analogy with the pessimism of modern times. It is the Buddhism of the East. Buddhism, whatever be the uncertainty attaching to its founder's personal story, is to all intents a shoot which has been cut off from the main tree of Brahmanism. Its theory rests on the metaphysics of the Brahmanical schools; its scheme of life is one out of the many phases of Hindu asceticism. Buddhism left the parent stock of Hindu religion at a time when the metaphysicians had carried up the polytheism of their country into a unified pantheism, when the philosophy of the Upanishads had worked up the comparatively rude theology of the Vedic hymns into a compact doctrine. The fundamental dogma presented by this system is the contrast between the true self or permanent reality of the world and the changes and plurality of the phenomenal scene in which men live or seem to live. On the one hand is Brahma, or Átman: from one side, the universe, the All, and everything,—from another, the true self, the Ego, the absolute, whose name is the No, No, because no words can describe him, the very reality of reality. On the other hand is the world of growth and decay, of sorrow and death,—the world, as it was subsequently called, of illusion, *Máyá*, where the semblance of firm reality is deceitfully assumed by the phantoms of creation. And as in the universe, so is the contrast in the human soul. There is the unredeemed soul, which desire and action (the will *in posse* and *in esse*) hold fast in the bonds of changeable existence, in the mutations of metempsychosis; there is also the redeemed soul, which by ascetic virtues, by renunciation of domestic ties, by the continued practice of self-denial and mortification, has found its way from the world of illusory semblances to its true and abiding self.

It is on some such conception of the world, in which over against Brahma in his eternal quiet there stands man suffering and yearning for relief, that Buddhism ultimately reposes. But, while the speculative theories of the Brahmins put in the foreground the august mystery of the All-one, Buddha starts from the other side of the picture, from the actual experience of life. The four truths of Buddhism, which are the foundation of its religious creed and the recurring burden of its teachings, leave the metaphysical basis out of sight. All life is sorrow, says the first: birth, age, disease, death, is sorrow; and the cause of this sorrow, adds the second truth, is the thirst which leads from birth to birth,—the thirst for pleasures, for existence, for power. The third is, that sorrow can only be removed by the complete annihilation of desire; and the fourth prescribes the means of word and act forming the eight parts of the way which frees from sorrow. The practical need is everything; the theoretical basis, the Brahma, which the orthodox schools presented as the sole reality, is so completely lost sight of that the modern critics are at variance with each other as to how far the goal of Buddhist endeavour can be described as anything positive. That all life is pain is the one perpetual refrain of Buddhism. The search for pleasure is vain and ends in increased misery. But the true Buddhist does not allow the per-

ception of this fact to cause, still less to perpetuate, a feeling of melancholy. It only urges him to have compassion on his suffering brothers, and to look forward joyously to the goal of release which he has set before himself.

For further details reference may be made to the article on BUDDHISM. It is enough to say here that the chief point of Buddhist theory is to see in all apparent being only a process of becoming: events happen, nothing is; the only permanence can be but the law of their occurrence. The cosmic philosophy of Buddha is like that of Heraclitus. "All things flow; nothing abides"; only this flux of everything serves to emphasize the fact that the happiness of man is thereby rendered vain. The end which Buddha seeks is the redemption of man from this toilsome world of birth and death. It is not absorption in the unity of Brahma, not felicity in a higher and better world. It is, to cast off the conditions which trammel existence, the consciousness which leads to desire and action, the body and all its appurtenances; it is, to attain death in life, to have so mortified flesh and spirit that the individual can no longer be in the ordinary sense said to exist. He has attained, when so perfected, what is called Nirvāna, "the land of peace where transitoriness finds rest."

Religious
recon-
ciliation.

Before discussing the development of this pessimistic ethics in modern days, it remains to notice a fourth issue from the evil that is in the world. This view of life and of the universe is specially connected with Hebrew monotheism and its later developments in Mohammedan as well as Christian doctrine under the potent stimulus of Greek philosophy. It is in the belief of a moral God—a good and wise creator and governor of the universe—that the optimistic problem and theory finds its chief origin. When the idea of God has been purged of its naturalism and identified with the ideal of wisdom, goodness, and justice, there soon arises for thinking minds the necessity of a "théodicée,"—a justification of providence. Can the evil and misery found upon earth, the disproportion between merit and recompense, be explained on the hypothesis of a wise and beneficent ruler in heaven? One of the most familiar and typical instances of such a feeling is given by the book of Job. In the later times of Israel, when the vigour of creative faith was undermined by a critical spirit, born of bitter fates and foreign influences, voices were heard, like those of the writer of Ecclesiastes, giving utterance to pessimistic doubt. The story of Job is another and more edifying presentation of the same theme. How, it is asked, can the misfortunes of the just man be harmonized with the idea of a righteous God? Is suffering the penalty of sin, and must virtue be always paid its wages in pleasure?

The difficulty, it is evident, arises with the perception of the antagonism between the natural and the moral, and implies a desire to bridge over the gulf between them. With the gradually deepening conviction that the central principle of the universe is a moral principle, the need is felt for explaining the immorality (so to speak) of the natural laws, for reconciling the unconditional imperative of the word of duty with the indifference to right and wrong displayed in the facts of life. Sometimes we are referred for answer to another world, which shall compensate for the mistakes of the present. At other times it is suggested that physical evil has the function of a moral discipline, that suffering teaches nobility, that misfortunes are blessings in disguise.

The optimism of Leibnitz is of a different cast, and goes more boldly to face the real difficulty of the situation. It argues against the common estimate of moral and physical evil, and seeks to reduce them both to little more than privations of good,—to mere absence of good, to a defect rather than a blemish, to what is called metaphysical evil.

The world, it is admitted, is far from perfect, but it is as good as it could be made if all the good which it contains was to be realized. Like everything else, it is not free from the defects of its qualities. It is, we may be sure, the best of possible worlds. But this is far from saying that it is a good world. Ignorant as we are of the limits of what is possible, it is not for us to say that the quality of the best, under the given circumstances, is at all distinguishable from what is really very bad. The defence of theism which Leibnitz thus undertook against the sceptical suggestions of Bayle is only the common argument that the work must be judged as a whole, that it is unfair to pronounce judgment on an isolated event or thing apart from the question how it is affected by its interdependence. But, unfortunately, in the case before us, in the problem of the universe, we do not know the whole, and can only grope our way tentatively from point to point, feebly endeavouring to forecast the plan of the total structure.

But Leibnitz goes farther than this assertion of interconnexion or adaptation. It is the ultimate assumption of his argument that the forces of the universe are in the hands of a perfectly wise intelligence, that, as in man there is a rational power of initiation and guidance, so in the world as a macrocosm there is a primal reason which governs its movements and co-ordinates them to a desirable end. The actual phases of existence only carry out in palpable shape and successive or simultaneous manifestations an ideal or rational plan, which is their original and sufficient reason. The world at large is somewhat of a machine, or a congeries of machines, which run down according to their own internal and innate conditions of existence; but these machines are wound up by one supreme machinist, who has predetermined the aim and object of their combined movements. Thus the doctrine of the pre-established harmony, while on the one hand it is an apotheosis of logic by the emphasis it lays on the necessary causal interdependence of the several partial movements, is on the other hand, by its principle of sufficient reason—the *principe du meilleur* or *de convenance*—a doctrine of teleology, whereby an ideal principle of design interpolates the contingent and subordinates necessity to freedom. The world is not a mere group of causes and effects governed by the logic of contradiction and identity; over and above the necessitarian logic is a mind which looks behind and before, and combines all events, not recklessly or necessarily, but in the hands of reciprocal subservience to the greatest good of which they admit.

In this argument Leibnitz is open to the criticism of Kant, that he has passed from a legitimate conception presiding over the synthesis of phenomena to the illegitimate idea of a self-subsistent and personal principle, which, far from being a mere ideal of complete synthesis, itself creates and predetermines that synthesis. To the logical scientist the phenomena are merely connected by a formal unity; to the theist like Leibnitz this unity is identified with a cosmical mind, an intelligent power which regulates the evolution of things and subordinates them all to the fulfilment of its original plan. Leibnitz thus manipulates two ideas, the logical and the religious, as if they were interchangeable, though in reality they lie in different planes. The reason which at one time is treated as an abstract principle of self-consistency is at another time clothed in the concrete mental life associated with it under its human aspects. Mere reason, says Aristotle, can initiate no change; it neither chooses nor commands, but simply asserts. But human reason is always in the long-run wrapped up with some aim, is always (in the technical sense) practical, and only for moments of abstraction ever merely theoretical. Thus the reason in the universe was

spoken of as God, and conceived anthropomorphically after the pattern of human personality.

The optimism of Leibnitz found its well-sounding but somewhat misleading phrase that all is for the best in this best of possible worlds bitterly satirized in Voltaire's *Candide*, and painfully commented upon by the earthquake of Lisbon. But the real object of the Frenchman's wit was the baser optimism of the age which sheltered its vulgar features under the mask of the Leibnitian *Théodicée*. An easy-going generation had settled down in the pleasing faith that their barns were filled with good things for many years, and that they might eat, drink, and be merry. The creed found in England a prophet of solemn pomp in Pope, whose *Essay on Man* has fixed in pregnant lines the main half-truths of the Leibnitian theory, which the poet had probably learned from Bolingbroke. The same optimism appears in Shaftesbury ("Tis good which is predominant"), and shows its presence in Paley. Some opposition to the current eudæmonism is found in the well-weighed and all but sceptical judgments pronounced by Butler, as well as in the cynical pessimism that tried to raise its voice in Mandeville. But the great instance against the comfortable view of life is the striking passage which Hume in his *Dialogues concerning Natural Religion* has put in the mouth of Demea, beginning "The whole earth, believe me, Philo, is cursed and polluted. A perpetual war is kindled amongst all living creatures," &c.

In Germany, under the head of Natural Theology, the ordinary optimism flourished amain. The whole range of creation was ransacked to show how well man had been provided for by God. The poetry of Brockes (the translator of Pope) is full of the theme,—the laudation of the many gifts we owe to Providence, of the multifarious uses to which each animal and plant can be put. It is an anthropocentric optimism which thus makes man's welfare the main end of the creation, and which, above all, finds that welfare in what we eat and drink and wherewithal we are clothed. The good which Leibnitz had spoken of was understood as material prosperity, comfort, happiness. God's goodness was measured by the amount of worldly well-being which He bestows upon us.

The great Kant, as late as 1759, when he printed a short sketch *On Optimism*, was still inclined to keep terms with this base caricature of a great theory, and spoke with full agreement of that theory itself. But here as elsewhere Hume's influence was potent upon him, and in a paper published in 1791 (*On the Failure of all Philosophical Attempts in Theodicy*) he had altered his tone. Our intelligence, he argues, is absolutely powerless to discover the proportion in which the world, at least as known to us in experience, stands to the supreme wisdom. And to the grounds adduced to prove that the pleasures of life far exceed its pains his reply is: take a man of sound mind, who has lived long enough and thought enough on the value of life to be able to form a judgment on the subject, and ask him whether he would like to play out the game of life once more (not on the same terms, but) on any terms he pleases, be it only in this terrestrial world of ours, and not in fairy land. In one direction indeed Kant may be called optimist (or at least meliorist),—in his belief in the ample possibilities of moral and political improvement, and in his enthusiastic hopes for the cessation of some chief causes of human misery.

But in one way Kant had laid the axe to the chief root of optimism. That root is the utilitarian or eudæmonistic theory of conduct,—the theory which seeks to explain morality away into a sort of magnified selfishness, and regards the authority of moral rules as due to their origin in counsels of prudence. The moral law, said Kant, is the one clear utterance of the Absolute. And the lesson

thus taught bore fruit. At first indeed idealism with its optimistic interpretations returned. The double-faced dictum of Hegel, that the real is the rational and the rational the real, was often understood to justify the principle that, whatever is, is right. The net of Hegelian thought seemed to grasp everything; everything fell as it were naturally into its place, and seemed to be justified by the symmetry of its position in the logical evolution. For in idealism we find the true home of optimism. The world as experienced in sense and feeling is full of discords and defects, and the more we abstract each part of the whole into its "beggary elements," the greater seems the weakness and the triviality. But, when we rise in thought to the contemplation of the unity and order, these real discords pale before the spectacle of ideal harmony. The formal symmetry carries the day. The corpse may be hideous and yet the theory of the anatomist has its beauty. The sorrows of the hero do not make impossible the pleasure of the spectator in the drama. Just as the hardships long ago endured are sweet to remembrance, so the individual sufferings are lost in the conception of the universal ends they subserve. The real pain is compatible with a formal pleasure; reason can find commendable and good what is torment to flesh and blood.

But, while the life-work of Hegel had been to show that at bottom the principle of being and the principle of thought were the same, that nature and history were the incarnations of reason, the succeeding philosophy of Schopenhauer reverted to the distinction of Kant, which it emphasized, between thought and existence. Schopenhauer dethroned reason and claimed to have discovered the real root of that being which we know as an idea. This root of existence is what he called Will. The source of the reality which we cognize—the secret essence which is objectified in the forms of the universe as it presents itself to our conceptions—is Will. By this Will he meant a blind but irresistible effort to exist, a craving of inextinguishable strength towards life and objective being, an unconscious lusting after the pleasure of manifesting itself as something acting here and now. It is something less than Will, as we know will, and yet something more than force. Under every known kind of actions and phenomena in space-and-time—phenomena, known by their reciprocal relations—there is an unknown but felt something, an endless, aimless, limitless struggle to be upraised into the light of existence. This ultimate basis of will-force we must assume as the fact presupposed by all specific causal explanations. But in its generic basis the Will has no definite aim; it is the will to be everything in general and nothing in particular,—the will to be, to do, to act. End or purpose supervenes only with the rise of consciousness. Intelligence comes forward at first as a mere organ in the service of the Will; it is only a means for the preservation of the individual and the species. It is observable first in the animal, where the purely instinctive stimuli fail to procure sufficient material for subsistence, where the food has to be selected, and the motions of the animal are accordingly dependent on motives, i.e., on conceptions of objects to be attained. It is this need which occasions the development of the brain; with the brain intelligence rises upon the scene; and thus the world now comes to see itself, not in its reality, but in its phenomenal objectification, as the realm of causes and effects in the element of space and time. This conscious knowledge, which at first consists merely in momentary and individual perceptions, attains higher powers, as abstract and general reason, by the aid of speech.

Now intelligence, which originally came with the formation of brain-tissue as a mere tool of the Will in the more complex forms of its objectification, may rise at length, according to Schopenhauer, to be the liberator of the

Schopenhauer's Will, the primary reality.

human race from the restless tyrant which works in them now, as it erewhile brought them to the birth. For, firstly, knowledge in its own character emancipates; it lets its possessor know that he suffers and why he suffers. Such is the first prerogative of reason. But, secondly, in the occasional intervals when the storm of Will is laid to rest, the mind, instead of striving in the interests of practical intelligence to detect the causal relations of things, can concentrate itself exclusively on a single isolated object. A transformation is thus accomplished whereby the object, ceasing to be a mere particular, becomes the type-idea, the eternal form, the generic and adequate embodiment of Will in a special grade; while, on the other hand, the individual who has become absorbed in such contemplation is no longer a mere individual, but has become the "will-less, painless, timeless subject of knowledge." It is this power of rising above the prosaic requirements which science gratifies, of seeing the permanent and one reality in the dependent and disunited phenomena of the particulars, which what we call Art imitates by production. The artist produces the eternal types which the blind Will only realizes in many imperfect and particular adumbrations; he conquers nature by fixing in a single image the traits which constitute the true and permanent meaning confusedly presented by her in many exemplars. For the mind which can see that idea in the natural forms, or which beholds it in the works of art, for him who contemplates without reference to the Will, "the wheel of Ixion stands still; freed from the prison-house of blind desire, he enjoys the sabbath of æsthetic beatitude."

Schopenhauer's ethics.

But the relief obtained in art is only for blessed moments. Perennial consolation can be found only in the ethical life, and in an ethics of asceticism and self-sacrifice. True life begins only when we have learnt that happiness is impossible by means of gratifying the cravings of desire. Each satisfaction of the will is only a starting-point for fresh effort; the achievement of the desired object suggests a new want. "Alles Leben ist Leiden." At every point desires are thwarted; even when they gain their end the satisfaction is merely negative. The weary Titan of humanity knows no repose; his feeble pleasures are drops in a sea of pain. Thus the central principle of pessimism asserts that in the order of nature, *i.e.*, so long as the will to live remains unbroken, happiness in the true sense is impossible. Life as life necessarily involves misery. No doubt the man of the world may turn round and declare that notwithstanding this he means to gather the rose without the thorn. Undismayed by the analysis of the consequences involved in will, he affirms the will to life. Adopting the principles of the Cyrenaic hedonists, he closes his eyes to far-reaching eventualities and lives in the moment; he turns life in every portion into art; he revels in the inspiring sense of action without care for past obligations and future anxieties. It is otherwise with the man who has surveyed all the issues of things, who looks at the net result of life as a whole and in all individuals. For him it is a duty to deny and abjure this will to life. He must, in other words, renounce the works of egoism and of injustice. He must see through the illusion of the *principium individuationis*, must recognize that his very self, his will, is identical in essence with every creature, even with the suffering. When he has done this, and is in love and sympathy with all around him, "the veil of Maya" has for him become transparent. In every way he proceeds (over and above cultivating in active love compassion for others) to deny the exercise of the will to life in his individual case, in his own body. He will, above all, according to Schopenhauer, perpetually keep the vow of chastity; he will by fasting and penance so mortify his body that the will to life shall be utterly broken in him.

"And," adds Schopenhauer (§ 67), "I think I may assume that along with the highest manifestation of will the feeble counterpart of it in the animal kingdom would also disappear." Man, by ascetic mortification of the will, and by sanctity of beneficence, becomes the redeemer even of the rest of the animated creation.

The contrast between nature and grace, between the physical and the moral, the life of the flesh and the life of the spirit, stands out in these outlines as the central doctrine of pessimism. It is in essentials the same doctrine which was preached by Buddha, which is put into the mouth of Socrates in the *Phædo* (philosophy is a rehearsal of death: *μελέτημα θανάτου*); it is the doctrine which stands indelible in the early archives of Christianity, and was proclaimed as the better and more excellent way by myriads of the noblest Christian teachers for more than ten centuries of the church. The pessimistic ethics of Schopenhauer casts aside the feeble compromises by which it is alternately asserted that morality makes for happiness and happiness is morality; it rejects the postulates by which Kant tried to lighten for human nature the burden of imperative duty; it goes behind the social sanctions which see in good conduct acts subservient to the good of a human community. In pessimistic ethics—and the pessimism of Schopenhauer has essentially an ethical aim—we have the wreck left on the wastes of time by Hegelianism. Hegelianism had taught, or seemed to teach, that God was in the beginning by Himself as a Logos, or self-evolving idea, which uttered itself in the unconscious forms of nature, till in the conscious spirit of man He gradually realized Himself in moral and intellectual life, in art and religion. Schopenhauer stripped this cycle of its first period. There was no idea, no logical machinery, at the basis of things; nature began out of a blind impulse; and it was only in man's intelligence that the vague longing of the heaving world knew itself to be. But that intelligence has for its supreme aim—not, as in Hegel, to enter into and carry on the great process which is the absolute, but—to deny its creator and annihilate the principle of being. The world of Will, in its process of objectification, has thus given birth to a child which in the fulness of time will destroy the womb that bore it.

It will be apparent that in Schopenhauer's system we can distinguish two parts,—the first, the doctrine of the positivity of pain, and that life is always and only pain; the second, the ethical condemnation of the principle of such a world, and the method for correcting the evil which it had introduced. In the latter lies his chief and characteristic achievement,—in what we may call his metaphysics of ethics. Man by morality (ascetical morality) is to be the redeemer of the world. In this conviction Schopenhauer shows himself the descendant of the metaphysical systems of the past, which find in man the key to the mystery of the universe. It is a strange and a weary way of redemption which he delineates; the cross is heavier than humanity seems able to bear. Yet the suggestion to deliver ourselves shows that the old belief in human spontaneity, in the primacy of the moral principle, in the possibility of noble deeds and of a victory over egoism, was still vigorous in his mind. Another pessimism neglects this ethical element altogether. To this ignoble pessimism man is in truth only an animal like the rest, and the distinction on which he prides himself—his moral nature—is but a confused and illusory product of simpler animal experiences. He has knowledge of wider range, it is true; but knowledge is powerless to change his nature. His acts in every case are necessarily determined; his fancied freedom is found on examination to be no whit more spontaneous than the fall of the unsupported stone. The necessitarianism of evolution did away with the independ-

ent existence of morality, and reduced it to conventional stereotyping of natural symbols, with forgetfulness and misinterpretation of their meaning and applications.

To an age so minded the consolations of pessimism sounded faint and unreal. They had lost the old *ποῦ στῶ*, the optimistic creed that man was the undisputed head of creation. They saw themselves no longer a select race, favorites of God, but as engaged in the struggle for life with thousands of other species. The rôle of saviour of the world was not for them. And so, turning a deaf ear to the high words of Schopenhauer, they sought easier consolations in the common and casual pursuits and pleasures in the world; they determined to make the best of this vale of tears,—even in Pandemonium there might be shady spots and cool retreats. A few spirits who had drunk more deeply at the wells of suffering, and who were alike without the mental energy of Schopenhauer and the comfortable inconstancy of the mass of men, could not rise beyond the ever-present sense of the emptiness and infelicity of life. There are many such types in literature; but perhaps no more perfect expression has been given to the strange abysmal melancholy of a withered life than by the Italian poet-scholar Leopardi. At one time dallying lovingly with the idea of death, at another finding only deception and illusion in love, liberty, progress, and all human ideals, and almost always with irony, bitterness, and hopelessness living in the sense of an inexorable destiny, a malign nature, which calmly motions man to destruction, Leopardi presents pessimism in its naked terrors. For him there are no consolations, either base or noble. Man is at the mercy of a pitiless nature; he must endure a thousand deaths daily. This mood of Leopardi's, however he himself protested against the suggestion, was unquestionably to a main extent due to the tremendous disproportion in which his mental and æsthetic nature stood to the circumstances of his life, and not a little to the general political condition of his country.

When the first edition of Schopenhauer's great work appeared in 1819 it did not attract much immediate attention. Pessimism was in the air: the Romantic school in Germany, and especially Heine and Lenau, Byron in England, and Chateaubriand in France,—not to mention many other names,—all in their several ways gave expression to the "Weltschmerz." Yet it was not till 1844 that a second and much enlarged edition of the work appeared, followed by a third in 1859. By this time the doctrines of Schopenhauer had found many enthusiastic followers, and a flood of literary works poured from the press in criticism or support of them. With the year 1866 the title "Pessimism" began to show itself in books which discuss his views. And in 1869 appeared the *Philosophy of the Unconscious*, by E. von Hartmann. The popularity of this work was enormous. In the ten years which elapsed between its publication and that of Hartmann's next systematic work (*The Phenomenology of the Moral Consciousness*) it had run through eight editions. The lesser works of Hartmann, his articles in reviews, the pamphlets by friends and opponents during the last fifteen years, are truly named legion. The question "Is life worth living?" has become a question of the day, to which the problems of socialism, liberalism, and religion contribute their quota. The novels of Turgeneff and Sacher-Masoch are full of the ideas of Schopenhauer's pessimism.

Hartmann's first work was written when its author was twenty-five. It bears traces of the paradox and exaggeration which sometimes go with youthful talent, and occasionally pays the tribute of imitation to the naturalistic pruriency and sensationalism of the contemporary novel. The style is cumbersome and pretentious. And yet its popularity proves that its author has the faculty of directing

with no unskilful or incompetent hand the vague and incoherent tendencies of the cultivated masses. The world which has lost hold of, and perhaps broken with, the faith of its fathers is on the look-out for a "Weltanschauung"; it wants to know the metaphysical inferences to be gathered from the recent advances of scientific theory. Not merely had Darwinism, as may be seen from the character of Hæckel's *Natural History of Creation*, caught the public ear more widely in Germany than in England, but the deductions from its principles had been carried to far greater lengths. Amid the decay of distinctively Christian beliefs, and even of theism, the doctrine of pessimism attracted a sort of religious fervour. The prevalent sense of dissatisfaction and baffled endeavour was met by a theory that the principle of the universe was radically perverse, and could not be amended. And, if it be urged that it is difficult to believe in the genuineness of a pessimism when its professors take their ease and mirthfully jeer the stranger who expected to find people not clad in soft raiment nor dwelling in kings' houses, it may be replied that pessimism is not the only temporizing creed. The moral indignation (*Entrüstungs-Pessimismus*) of a Carlyle or a Juvenal, which pours its vials of scorn on the selfish meanness of mankind, and the churchly exhibition of the sores and frailties of human flesh and blood in which books like the *De Contemptu Mundi* of Innocent III. revel, alike overshoot their mark and leave the world unconvinced of its nothingness.

It is out of place here to enter into any lengthened exposition of Hartmann's metaphysics. This world, according to him, is the work of an Unconscious, a being which is at once will and intelligence,—a will urging to be and to do somewhat and an intelligence which adapts means to ends. But the will is only instinct, and the intelligence is the unconscious reason which guides the somnambulist or the clairvoyant. Thus there is wisdom in the frame of the world, but the original resolution to exist was the work of a blind will. Reason did not prompt the initial act, yet at every movement towards existence an unconscious reason effectively correlates the elements into united action. The various individuals seem indeed to be acting of themselves: they pursue aims of their own; but they are only puppets in the hand of nature, the unconscious intelligence and will. Apparently, there are many agents, each in some degree independent; really, there is only one source of action, the union of will and idea in instinctive adaptation and unwitting design.

With man at length consciousness awakes, and the possibility is laid for a new relation between the two elements in the universal principle. Knowledge, however, is not an end in itself; it is not enough to know the process of the world. The consciousness which is generated at length by the unconscious reason out of the workings of will has its function marked out for it beforehand by its unconscious author. Its final purpose is to revoke the effects of that irrational step by which the unconscious will in its eagerness to exist dragged the idea with it in its service. The hour of vengeance may come some day. The intelligence which has become conscious in man may at length induce his will to take the backward step, to retire into non-existence even as it erewhile rose into existence. In that day when the force of will has been mainly accumulated in the province where intelligence prevails, it is probable that a successful act of suppression of the will to life on the part of human reason would entail the utter prostration and annihilation of the will to life throughout the universe. By the act of its intelligent portion, in which the major part both of the cosmic will and intelligence has been gradually accumulated, the world, as a whole, will commit suicide.

But Hartmann is not merely a metaphysician: he proposes to supply inductive proof for his prepositions. The question of the preponderance of pleasure or pain in the world is to be worked out by observation of facts and summation of figures. So far differing from Schopenhauer, he admits the positivity of pleasure, but maintains nevertheless that pleasure and pain are representable by quantities of the same denomination, prefaced respectively by the *plus* or *minus* sign. When the accounts of debt and credit are drawn out, it appears that the balance is enormously on the side of pain. To him who has once perceived the surplus of pain it is an obvious duty to extinguish the source whence sprang the unmitigated evil. Yet mankind in the past has shrunk from the acceptance of this conclusion, and sought refuge in three successive illusions: (1) the naive illusion of the natural mind that happiness is to be found in this present world; (2) the illusion that happiness, though a failure here, will be realized in the world beyond the grave; (3) the illusion which puts its hopes on the amelioration of humanity in the future history of the world. One after another these illusions are shown to be vanity. A little taste of pleasure, amid the insipidity and bitterness of life, is snatched by a select few from the consolations of art and science. But at last, as wisdom grows and the hopeless monotony of grief is more acutely felt by the race, humanity will rise up boldly to the last great act of despairing suicide, and reduce the unconscious to its primeval nullity.

If we pass from this grandiose drama of the birth and destruction of the universe to consider the ethical doctrine which Hartmann supposes himself to base upon his metaphysical theory, we find ourselves on safer ground. For, apart from the method by which he reaches it, his moral principle is not very different from the general view on such subjects. The basis of morality in his theory is the relation of the individual consciousness to the Absolute in which consists its true being. It is in this ultimate identity of the individual with the All-one—not merely in the preservation of his phenomenal welfare, or of the welfare of the society he belongs to, or the furtherance of some one ideal good—that the obligation to be moral is to be sought. On the other hand, there is nowhere in the universe a surplus of pleasure; and therefore the moral agent cannot either here or elsewhere look for happiness in a positive sense as the reward of his virtue. Egoism of every range—from the more materialistic to the more religious pleasures—is incompatible with genuine virtue. The aim of morality is the redemption of the whole world from the evil into which its initial act has plunged it. And in this act of redemption—the result of which will not be joy, but rest, the quietude of the universe—man by his intelligence and will is the main worker, the fellow-worker of the Absolute; it is by him that God works out the redemption of himself and of the universe. “Real existence,” so closes the *Phenomenology of the Moral Consciousness*, “is the incarnation of the God-head; the world-process is the story of the Passion of the God who has become flesh, and at the same time the way to the redemption of Him who is crucified in the flesh; but morality is the co-operation towards shortening this way of suffering and redemption.”

It would be vain to criticize in detail these speculations, out of which a few principal points have been adduced, and which, besides being in themselves vague, are pliable in the hands of their author. But a few remarks may be made on some main issues involved in the dispute. It may be admitted in the first place that the doctrine of the origin of existence in an a-logical principle is but an extravagant way of stating that the intelligence when it awakes to consciousness finds itself in presence of another world of

nature and custom which seems irrational and antagonistic—a world which is outside of us and seems to mock our puny individual efforts for its improvement. Secondly, it may be admitted that there is no evidence for the thesis that the world was intended to suit the convenience of man, or of any species whatever. As a matter of fact, there is abundance of misery in the world. But, quite apart from the reducibility of the amount by the application of intelligent means, it seems certain that no attempt to draw up a balance-sheet of absolute cosmic misery or happiness is ever likely to be successful. It is as irrational to pronounce this to be the worst of all possible worlds as the best. The superlatives employed in the terms “optimism” and “pessimism” betray a passionate estimate of things. Life, one has said, would be tolerable but for its pleasures. Even those who, like Leopardi, have declared themselves in love with death, show, by still electing to live, that life has something not measurable by pleasures, yet chosen even amid mental tortures and extreme ill-health. As Aristotle said long ago, we are not unbiassed judges *in re* Pleasure *v.* Pain. Thirdly, if it were worth while, it might be urged that the main terms of the pessimists are extremely vague. The “Will” and the “Unconscious” cannot be tied down to a definite meaning without losing their power; the contrast between the positivity and negativity of pleasure and pain shows an ignorance of logic; and, above all, the habit of transferring the terms of religion to express what are supposed to be analogous ideas in pessimistic metaphysics is misleading.

The pessimistic theories of modern times are in part a commendable protest against the common compromises which slur over the antithesis between the moral and the natural. They show tolerably conclusively that the world is not a felicitic institution, and that he who makes happiness the aim of his life is on the wrong tack. But, when they proceed to dogmatize that existence has a root of bitterness and life is a burden of pain, they fall into the common error of exaggerating a statement relatively true into an absolute principle. You cannot tell if life is worth living, so long as life is held to be the sum or difference of pains and pleasures. If pains and pleasures were only and always such, the argument might be admitted; if they were permanent real entities, not liable to be transformed into each other, not constantly associated in the same act, it might be possible to treat them as ultimate and irreversible standards for our estimate of life and the guidance of our conduct. If pleasure and pain are unequally and unfairly distributed, it is probable that this is a fault which human agency can cure to an unspeakable degree, quite without the desperate remedy of self-torture or cosmic suicide. If pessimism can teach the world that the highest reward of virtue is self-respect, and that there is no pleasure available anywhere to bribe us to be good, it has done well. It has also done well if it points out the barriers to happiness in this world, so long as these barriers prevent true life and can be removed by wise methods. But in the meanwhile, till the burden of existence has become universally unbearable, it may be well to remember that we shall be as likely to benefit the Absolute by doing our work well as by macerating ourselves, and that the sum of existence is a big thing, of which it were rash to predicate either that it is altogether and supremely good or altogether and supremely bad.

The works on pessimism have been numerous lately. Most of them, however, deal with it mainly in connexion with the two German philosophers, and of these several treat exclusively of the special metaphysical and psychological theories. For Buddhism, see *Buddhism*, vol. iv. p. 424 *sq.*, and also Oldenberg's *Buddha* (1881), since translated into English. An account of Schopenhauer was given by R. Adamson in *Mind* for 1876, and in Miss Zimmern's *Life of Schopenhauer* (1876); the first account of Hart-

includes the new houses of parliament, the academy, the exchange, the redoute, a large structure in a mixed Romanesque and Moorish style, erected for balls and other social purposes, the Greek church, the parish church, the old town-house, the extensive custom-house at the lower end of the quays, and several fine hotels and insurance offices. In the Radial Strasse are the new opera-house, the academy of music, the exhibition building, and the national drawing-school. The largest building in Pesth is the so-called New Building, in the Leopoldstadt, erected by Joseph II., and covering as much ground as an ordinary London square. It is at present used as artillery barracks; and the Carl's Barracks in the inner town, also used for housing troops, are little inferior in size. Another large military establishment is the Ludoviceum, or officers' college, at the south-east end of the town. The remaining buildings remarkable for their size or interest are the new town-house, the post-office, the national museum, the theatres (of which there are about half a dozen), and the palaces of several of the Hungarian magnates. To the south-east of the town lie the new slaughter-houses, which are admirably fitted up, and, with the adjacent cattle-market, cover nearly 30 acres of ground.

The artistic and scientific culture of Pesth, and indeed of Hungary, finds its most conspicuous outward expression in the academy of sciences and the national museum, two large and handsome modern buildings. The academy, founded for the encouragement of the study of the Hungarian language and the various sciences, possesses a library of 100,000 volumes, and harbours the national picture gallery, a good collection of 700 to 800 works, formed by Prince Eszterházy, and purchased for £130,000. The national museum contains extensive collections of antiquities, natural history, and ethnology, a gallery of mediocre paintings, and a library of 150,000 printed volumes and 12,000 documents. Pesth also possesses numerous societies for the cultivation of science and art, most of which, however, limit their usefulness by publishing their proceedings in the Magyar tongue alone. The university of Pesth, the only one in Hungary proper, was established at Tyrnau in 1635, removed to Buda in 1777, and transferred to Pesth in 1783. It is attended by upwards of 2000 students, and possesses the usual medical and scientific collections, an admirable chemical laboratory, a botanic garden, and a library of 120,000 volumes. Pesth also contains a Protestant theological college and a rabbinical institute. The second place among the educational establishments of the town is taken by the Polytechnic Institute, with its three faculties of applied chemistry, engineering and architecture, and mechanics; it is attended by about 1000 students. The other schools comprise six gymnasia, six normal seminaries, and a large number of special and elementary schools, in spite of which 32 per cent. of the adult population were unable to read or write in 1880. The charitable institutions of the city are on a liberal scale. Characteristic of Budapest is the large number of its public baths, the most interesting of which are at Buda.

In commerce and industry Budapest is by far the most important town in Hungary, and in the former, if not also in the latter, it is second to Vienna alone in the Austrian-Hungarian monarchy. The chief articles of manufacture are machinery, railway plant, carriages, gold and silver wares, chemicals, cutlery, starch, tobacco, and the usual articles produced in large towns for home consumption. The great staple of trade is grain, of which about 4½ million bushels are brought into the town annually. One-fourth of this amount merely passes through Pesth, while most of the remainder is ground into flour and exported in this form. Other important articles of commerce are wine, wool,

cattle, timber, hides, honey, wax, and "slivovitz," an inferior spirit made from plums. The imports, so far as they do not belong to the transit trade, consist chiefly of manufactured articles and colonial produce. The four annual fairs, formerly attended by many thousand customers, have now lost much of their importance. The swine market of Steinbruch is the largest in Hungary, about half a million animals being annually disposed of. The trade of Pesth is in great part carried on by the Danube, the navigation of which has increased enormously since the introduction of steamboats in 1830; but the town is also connected by railway with all the chief places of Austria and Hungary.

The largest and most popular of the public gardens and promenades in Pesth itself is the Stadtwaldchen on the north-east side, with its pleasant lake and trees. A still more delightful resort, however, is the Margaret Island, a long narrow island in the Danube, laid out in the style of an English park, with fine trees, velvety turf, and a group of villas and bath-houses.

Few European towns have grown so rapidly as Pesth during the present century, and probably none has witnessed such a thorough transformation in the last twenty years. In 1780 Pesth was still a badly-built town of the third rank, with only 13,500 inhabitants, and it was not till 1799 that its population (29,000) surpassed that of Buda (24,000). By 1840, however, Buda had added but 14,000 souls to its population, while that of Pesth had more than doubled; and of the joint population of 270,000 in 1869 fully 200,000 fell to the share of Pesth. In 1880 the population of Budapest was 370,767 souls, including a garrison of 10,000 men, showing an increase since 1869 of 32 per cent., and since 1800 of an average of 6 per cent. per annum. Of this total 198,746 were returned as having Hungarian for their mother-tongue, 119,902 as Germans, and 21,581 as Slovaks. Divided according to religious sects, we find 242,981 Roman Catholics, 70,879 Jews, 42,254 Protestants, and 3014 members of the Greek Church. Of these the Jews show the greatest relative increase since 1869 (56 per cent.) and the Roman Catholics the least. Of the gross increase of population in Hungary between 1869 and 1880 no less than two-thirds are due to Budapest alone, which in the same interval rose from the twenty-third to the fifteenth place among the towns of Europe. About 25 per cent. of the population are supported by trade and industry, 20 per cent. are engaged in service, and 4 per cent. belong to the professional and official classes. Nearly 50 per cent., including women and children, are returned as belonging to the non-working classes, but less than 1 per cent. are described as living on their capital or property. In spite of the large proportion of one-storied houses, the ratio of inhabitants to each dwelling-house is somewhat high (33, as compared with 8 in London, 35 in Paris, and 59 in Vienna).

As Paris is sometimes said to be France, so may Pesth with almost greater truth be said to be Hungary. Its composite population is a faithful reflexion of the heterogeneous elements in the empire of the Hapsburgs, and the trade and industry of Hungary are centralized at Pesth in a way that can scarcely be affirmed of any other European capital. In virtue of its museum and academy it is also the scientific centre of Hungary, and nine-tenths of all books in the Magyar tongue are published here. The average rate per head of imperial taxation is five or six times as great in Pesth as in the rest of Hungary. The recent patriotic movement in favour of Magyarizing all institutions has found its strongest development in Pesth, where the German names have all been removed from the streets and buildings. It is found, too, that the children of German parents born in Pesth easily become Magyarized, while a survey of Hungary at large during the last sixty years shows a relative increase of barely 1 per cent. in the Hungarian as opposed to the German tongue. The inhabitants are good-natured, hospitable, and fond of luxury and display. The upper classes are much addicted to sports of all kinds, and cultivate horse-racing, fox-hunting, and rowing with energy and success. Almost the only popular festival of importance is that of St Stephen on the 20th August, when thousands of people flock to inspect the relics of that saint in the palace-church of Buda.

History.—The origin of Pesth proper is obscure, but the name, apparently derived from the old Slavonic "pestj," a stove (like Ofen, the German name of Buda), seems to point to an early Slavonic settlement. The Romans never gained a foothold on this side of the river, though Aquincum, on the site of old Buda, is believed, from the extant remains, to have contained about 80,000 inhabitants. When it first appears in history Pesth was essentially a German settlement, and a chronicler of the 13th century describes it as "Villa Teutonica ditissima." Christianity was introduced early in the 11th century. In 1241 Pesth was destroyed by the Tatars, after whose departure in 1244 it was created a royal free

city by Bela IV., and repopled with colonists of various nationalities. The succeeding period seems to have been one of considerable prosperity, though Pesth was completely eclipsed by the sister-town of Buda with its fortress and palace. In 1526 Pesth was taken and pillaged by the Turks, and from 1541 to 1686 Buda was the seat of a Turkish pasha. Pesth in the meantime entirely lost its importance, and on the departure of the Turks was left little more than a heap of ruins. Its favourable situation and the renewal of former privileges helped it to revive, and in 1723 it became the seat of the highest Hungarian officials. Maria Theresa and Joseph II. did much to increase its importance, but the rapid growth which enabled it completely to outstrip Buda belongs entirely to the 19th century. A signal proof of its vitality was given in 1838 by the speed and ease with which it recovered from a disastrous inundation that destroyed 3000 houses. In 1848 Pesth became the seat of the revolutionary diet, but in the following year the insurgents had to retire before the Austrians under Windischgrätz. A little later the Austrians had to retire in their turn, leaving a garrison in the fortress of Buda, and, while the Hungarians endeavoured to capture this position, General Hentzi retaliated by bombarding Pesth, doing great damage to the town. The inhabitants to the number of 80,000 took refuge in the Stadtwaldchen. Between 1867 and 1873 Pesth is said to have doubled in size, and during the last four or five years the building activity has been little if at all inferior.

(J. F. M.)

PETAU, DENYS (1583-1652), better known in some departments of literature under the Latin form of his name as DIONYSIUS PETAVIUS, a highly-distinguished Catholic theologian and one of the most learned men of the 17th century, was born on 21st August 1583 at Orleans, where his father was a well-to-do merchant with some literary culture. Petau received his early education at Orleans, but finished his university course in Paris, where, after graduating in arts, he attended theological lectures at the Sorbonne. By Isaac Casaubon, who had perceived his abilities, he was introduced to the MS. treasures of the Bibliothèque Royale; and, at the suggestion of that scholar, he began to work for the edition of Synesius which he afterwards published. In 1603, before he had completed his twentieth year, he received a teaching appointment in the faculty of philosophy at the university of Bourges; here his leisure hours were devoted to his editorial labours and to a systematic study of the ancient philosophers and mathematicians. Having come under the influence of the learned Jesuit Fronton le Duc, he was induced to resign his post at Bourges in order that he might join the Society of Jesus, and in June 1605 he entered upon his novitiate at Nancy. After an interval of four years, he taught rhetoric successively at Rheims, La Flèche, and Paris, taking the four vows of the order at the last-named place in 1618; from 1621 to 1644 he was professor of positive theology in the college of the order. On account of growing infirmities and to secure leisure for his great work, to be mentioned below, he then retired from teaching duties, but retained the librarianship in the Collège de Clermont until his death, which took place on 11th December 1652.

The list of Petau's literary labours bears witness to an extraordinary and many-sided activity, and includes several works which still enjoy the recognition of scholars. He edited Synesius (1611, 2d ed. 1631, 3d ed. 1633), Themistius (1613), Julian (1630), the *Breviarium* of Nicephorus (1616), and Epiphanius (1622); his *Animadversiones* on the last-named have been reprinted by Dindorf, as a still unexhausted mine of valuable material, in the fifth vol. of his *Epiphani Opera* (1859). Carrying on and improving on the chronological labours of Scaliger, he published in two folio volumes an *Opus de doctrina temporum* (1627; frequently reprinted), followed in 1630 by *Uranologion s. systema variorum aethorum qui de sphaera ac sideribus eorumque motibus graece commentati sunt* and *Variorum dissertationum ad Uranologion libri VIII.* Of the first-mentioned of these he made an abridgment, entitled *Rationarium temporum*, which passed through numerous editions, was translated into English and French, and in a recent reprint has been brought down to the year 1849. In theology proper Petau's first appearance was polemical, and quite in the manner of that time,—a pseudonymous criticism on the recently-published com-

mentary of Salmasius on Tertullian's *De Pallio* (Antonii Kerkoetii *Aremorici animadversionum liber*, 1622). The controversy was continued in a series of replies and rejoinders, and was renewed in connexion with other publications of his distinguished antagonist. In particular, some references to the church doctrine as to the authority of bishops made by Salmasius in his *De fanore trapezite* was the occasion of Petau's *Dissertationum ecclesiasticarum libri duo, in quibus de episcoporum dignitate et potestate deque aliis ecclesiasticis dogmatibus disputatur* (1641) and also of his *De ecclesiastica hierarchia libri V.* (1641). Petau also had his share in the Jansenist controversy, and has the honour of being twice mentioned as a Jesuit authority in the *Provinciales*. His first appearance in the dispute was against Arnauld's *De la fréquente communion*, which he met with a treatise, *De la pénitence publique et de la préparation à la communion* (1643); his subsequent works, viewed in the light of the struggle then at its height, explain themselves by their titles (*De lege et gratia libri II.* (1648), *De Tridentini concilii interpretatione et S. Augustini doctrina* (1649), *De adjutorio sine quo non est adjutorio quo* (1651)). In his great but unfinished work, *De theologicis dogmatibus* (5 vols. fol., 1644-50), he deals with the doctrine of God, the Trinity, Creation, and the Incarnation; his design had been to complete it by an exhaustive treatment of the sacraments and of the Christian graces and virtues. Its scope, which was to free theology from the subtleties of scholasticism and to rest the science on the simple and firm basis of Scripture, the councils, and the fathers, is well enough explained by his own avowal, "nova quaerant alii, nil nisi prisca peto." The work is a treasury of well-digested learning, and justly entitles its author to the praise of Muratori, who speaks of him as "the restorer of dogmatic theology." By some of his fellow-Jesuits he was supposed to have been too ready to recognize the Jansenism of Augustine, and in various quarters his declaration that many of the ante-Nicene fathers were less orthodox than the decrees of the first council has been made a matter of reproach. But in these charges the impartial critic will recognize only proof of his candour. Petau, it may be added, was a rigid ascetic, and in particular is said to have indulged in the discipline of self-flagellation to a degree that injured his health.

PETER. Simon Peter was "an apostle of Jesus Christ" (1 Peter i. 1). His two names are both found in two forms: of the one the full form is Symeon (Συμεών), Σymeōn, which is found in the speech of James, Acts xv. 14, and in most MSS. of 2 Peter i. 1, the shorter and more usual form being Simon; the other is found both in its Greek form Peter (Πέτρος) and in the Græcized form Cephas (Κηφᾶς) of the Aramaic Kepha (כִּפְאָ). Simon is the name by which he is always addressed by Jesus Christ; Peter is that by which he is most commonly spoken of in the Synoptic Gospels, the Acts of the Apostles, and subsequent ecclesiastical literature; the combined name, Simon Peter, is found once in St Matthew, once in St Luke, and frequently in St John; sometimes Peter is expressly stated to be a surname (Matt. iv. 18, x. 2; Acts x. 5, 18, 32, xi. 13); St Paul, in 1 Cor. and in Gal. i. 18, ii. 11, 14 (according to the chief uncial MSS., except D), uses Cephas, but in Gal. ii. 7, 8, he uses Peter.¹ The name of his father is also found in two forms, John (Ἰωάννης, Iōānēs, in most MSS. of John i. 42, xxi. 15, 16) and Jonas (Ἰωνᾶς, Matt. xvi. 17, and cod. A in John). In John i. 44 he is said to have been of Bethsaida, which was possibly the place of his birth; but it appears from Mark i. 29 (= Matt. viii. 14; Luke iv. 38) that he and his brother Andrew had a house together at Capernaum. With the same brother, and with James and John as partners, he was engaged in what was probably the thriving business of a fisherman on the Lake of Genesaret; and from the fact that he went back to his business after the resurrection it has been inferred that, at least up to that time, he had never wholly left it. That he was married is clear from the mention of his wife's mother

¹ Throughout the New Testament the Peshito-Syriac uses Cephas where the Greek has Peter, and there is no reasonable doubt of the identity of the two names; but Clement of Alexandria, in a fragment preserved by Eusebius, *H. E.*, i. 12, 3, and the so-called "Two Ways" (Harnack, *Lehre der zwölf Apostel*, p. 225, and Hilgenfeld, *Nov. Test. extra Canonem receptum*, fasc. iv. p. 111) take them to refer to different persons, probably from an unwillingness to believe that Gal. ii. 11 really referred to Peter.

(Mark i. 30 and parallels) and that his wife accompanied him when he finally left his home to preach the gospel is implied by St Paul (1 Cor. ix. 5); there is an early tradition, which is not inconsistent with probability, that she also suffered martyrdom, and that Peter called out to her as she was being led away, "O wife, remember the Lord!"¹ The statement that he had children² is probably only an inference from the fact of his having been married; the alleged name of his daughter, Petronilla, is as suspicious as the story of his having cured her of the palsy³; and the majority of commentators take the expression "Mark, my son," in 1 Peter v. 13, to refer only to spiritual kinship.

Of the beginning of his discipleship there are two accounts which have sometimes (by Baur, Keim, Holtzmann, and others), though without sufficient reason, been supposed to be inconsistent with each other.

(1) According to St John, he was brought to Jesus by his brother Andrew, who had been a follower of John the Baptist, but who, after the Baptist's testimony, recognized in Jesus the promised Messiah (John i. 40-42). The fact that he was then not at Capernaum but in the Jordan valley, where John was baptizing, seems to indicate that he, like his brother, had been attracted by John's preaching. It is not stated that he at once became one of those who followed Jesus, and there is consequently room for the supposition that he returned home; and the statement that it was upon the occasion of this first meeting that he received his distinctive surname, Cephas or Peter, is not inconsistent with Mark iii. 16, Luke vi. 14, which mention the fact rather than the occasion, or with Matthew xvi. 18, which gives to an existing name a new application.

(2) According to St Matthew and St Mark, it was at the beginning of the Galilean ministry, that Jesus called Simon and Andrew to become "fishers of men" (Matt. iv. 18-20; Mark i. 16-18). The manner of the call seems to imply a previous acquaintance, and is consequently not out of harmony with that of St John. It is less easy to determine whether the account in Luke v. 1-11 refers to the same or to a different incident; Schleiermacher, Neander, Bleek, and others treat it as the fuller and more accurate account; Ewald, Weiss, Keim, and others regard the miraculous draught of fishes as a reminiscence of a later tradition, and probably identical with John xxi. 5-11.

From the time of his call Peter has a place in most of the important events of the Gospel narrative. It was to his house in Capernaum that Jesus went as if to a home (Matt. viii. 14; Mark i. 14, 33; Luke iv. 38), and it is consequently sometimes spoken of as simply "the house" (Matt. ix. 28, xiii. 1, 36, xvii. 25). He formed, with his two former partners, James and John, an apostolic triumvirate, which was admitted when all others were excluded, and to whom, with Andrew, was committed the great prophecy of the last days (Mark xiii. 3). The most important incident which is recorded of him between his call and the crucifixion is that which happened at Cæsarea Philippi (Matt. xvi. 13-23; Mark viii. 27-33; Luke ix. 18-22; probably recorded in substance, though in a different form, in John vi. 66-69). The incident links itself closely with the history which had immediately preceded it. The expectation which the Galilean peasantry had begun to form of Jesus had been disappointed; the miracles of healing and feeding had not been followed by the assumption of the national leadership; many of the disciples had begun to drift away, and those who were looking for the Messiah saw in Him only "one of the prophets." Those who

remained were tested by a direct question; whether the form of the question was that of the Synoptists, "Whom say ye that I am?" or that of St John, "Will ye also go away?" it was Peter who answered for the rest, in words which have an equivalent meaning, whether they were in the form "Thou art the Christ," or in the form "Lord, to whom shall we go? Thou hast the words of eternal life." The further detail which St Matthew gives, xvi. 17-19, has sometimes been thought to be a later addition, reflecting a fact of subsequent ecclesiastical history; but its absence from St Mark does not seem to be an adequate ground for rejecting it, and its substance is found in Justin Martyr (*Tryph.*, c. 100). Round the words which St Matthew records many controversies have raged; nor does it seem possible, with existing means of investigation, to fix to the sentence "upon this rock I will build My church" a meaning that will be beyond dispute. Whatever may be its precise meaning, it seems at any rate to be in harmony with other passages of the Synoptic Gospels, which indicate, not only that Peter was foremost among the apostles by virtue of natural force of character, but that he was also their ordinary leader and representative: the most important passage is Matt. x. 2, where the expression "the first," which is applied to him, cannot be restricted to mere priority of enumeration in the list. It is possible that his colleagues James and John, or their more ambitious mother, endeavoured to dispute this position with him (Matt. xx. 20, 21; Mark x. 35-37), and it has been contended (Baur, Strauss, Holtzmann) that in the Fourth Gospel John holds the place which the Synoptists assign to Peter; but even if this contention were admitted it would merely afford one more argument to show that the priority of rank was limited by natural affection as well as by the law of equality among the Christian brotherhood (Matt. xxiii. 8-11; Mark ix. 33-35; Luke xxii. 24-27). But, although Peter was foremost in expressing the confident belief of the disciples that Jesus was the Messiah, it seems clear that in his conception of the Messiah he did not rise above the current ideas of his countrymen. "He that should come" was to be a national deliverer. This conception appears on two occasions especially—when Jesus first told the disciples of His coming sufferings, "Peter took Him and began to rebuke Him," and received the answer, "Get thee behind Me, Satan," as though this attitude of the disciples were a new temptation (Matt. xvi. 21-23; Mark viii. 31-33); and, when Jesus was actually in the power of His enemies, and no "legions of angels" appeared either to rescue or to enthrone Him, Peter's natural hopefulness gave way to complete despondency, and he more than once "denied that he knew Him."

In the earliest account of the resurrection (that of St Paul, 1 Cor. xv. 5) it is mentioned that Jesus appeared to Peter before and separately from the twelve; and the last chapter of the Fourth Gospel gives him an especial prominence: it adds one more example of the impulsive energy of his character (ver. 7); it portrays more vividly than any other passage in the Gospels the depth of his attachment to his Master (vers. 15-17); and it forecasts the manner of his death (vers. 18, 19). His prominence in the early community at Jerusalem is proved by the testimony of St Paul; for it was to visit "Cephas" that he made his first journey to Jerusalem after his conversion, and fourteen years afterwards, though James and John as well as Cephas "were reputed to be pillars," it was the latter who stood out above the rest as the special preacher of "the gospel of the uncircumcision" (Gal. i. 18, ii. 7-10). These facts undoubtedly confirm the general picture of the relations of Peter to the early church which is drawn in the Acts of the Apostles; at the same time no part of the New Testament has been more strongly attacked by modern

¹ Clem. Alex., *Strom.*, vii. 10, v. 869, quoted by Eusebius, *H. E.*, iii. 30, 2.

² Clem. Alex., *Strom.*, iii. 6, p. 535, quoted by Eusebius, *ibid.*

³ St Augustine, *c. Adimant. Manich.*, c. 17, vol. viii. 139, ed. Ben.

writers than the first twelve chapters of that book, in which the "Acts of Peter" are contained. The attack has been made (Baur, Schwegler, Overbeck, Zeller, and others) partly on the speeches and partly on the narrative. (1) It is alleged that the Petrine speeches form no exception to the general uniformity of phraseology and style which characterizes the Acts, and that they ignore the marked differences in the conception of Christianity between Peter and Paul. It must be admitted that the coincidences are such as to render it probable that the author of the Acts dealt freely with his materials, but at the same time the peculiarities are sufficiently numerous to support the view that these speeches contain a true representation of the primitive teaching.¹ (2) The narrative passages which have been most keenly contested are those which relate to Simon of Samaria and to Cornelius. It is alleged that the account of the former is the mere reflex of the later legends in which the name of Simon Magus was substituted for that of St Paul as the representative of false Christianity, and it is said of the latter that it is a mere attempt to claim for Peter the opening of the door to the Gentiles which was the special honour of Paul, and that it cannot be reconciled with the division of labour between the apostle of the circumcision and the apostle of the uncircumcision which is spoken of in the Epistle to the Galatians.² At the great crisis of early Christianity which is known as the conference or council of Jerusalem Peter advocated (according to the Acts), or accepted (according to Paul), the policy of conciliation. Afterwards he went to Antioch, where Paul had preceded him, and there he carried out his acceptance of Gentile Christianity to the further point of eating at the common meals at which Gentiles were present. For this step the members of the original community at Jerusalem were not prepared; and, when a deputation from them came to Antioch, Peter "drew back and separated himself" (Gal. ii. 12). Thereupon followed an argument and a remonstrance on the part of Paul which has been fruitful of results to both ancient and modern Christianity. Peter was "withstood to the face" because of (1) inconsistency, (2) practical calumny of Christ, (3) transgression of the law, (4) making void the gift of God (Gal. ii. 14-21). It is altogether too much to assume that this remonstrance led to a permanent alienation of the two apostles from one another; it is more probable that with a character such as Peter's, which had more energy than steadiness of resolution, it may even have been effectual. But it is upon the assumption of such an alienation that the Jewish party in the ancient church pictured Peter as the champion and hero of the faith, and Paul as its vanquished opponent, and also that in modern times the Tübingen school have endeavoured to reconstruct not only early church history but also the New Testament.

This incident at Antioch is the last that is certainly known of Peter. The prophecy recorded in John xxi. 18, 19, is in harmony with early tradition in pointing to a violent death. But of the time and place of that death we know nothing with even approximate probability. The only historical mention of him for more than a hundred years afterwards is in Clement of Rome (*Ep.*, i. 5, 4), who sets before the Corinthians the example of "Peter, who through zeal undertook not one or two but numerous labours, and so having borne witness went to the place

that was due to him." It is sometimes supposed that an indication of the place in which he "bore witness" or "suffered martyrdom" is afforded by the phrase "among us," i.e., among the Romans, in the next chapter; but this, though possible, is quite uncertain. Outside this statement, which if it were more definite would be conclusive, there is only the doubtful interpretation of "Babylon" in 1 Peter v. 13 as meaning "Rome," and the echo of a vague tradition in the apocryphal *Petri et Pauli Prædicatio*.³ The testimony of the "presbyter" who is quoted by Papias in reference to Peter's connexion with Mark (Euseb., *H. E.*, iii. 39, 15) says nothing of the place at which they were together, and the coupling of the names of Peter and Paul by Ignatius (*Ad Roman.*, c. 4) would not, even if the early date of Ignatius were established, afford a solid argument that "in their death they were not divided." But from the beginning of the last quarter of the 2d century the testimony to the presence and death of Peter at Rome is almost uniform; the tradition, whatever may have been its foundation in fact, had firmly established itself. Dionysius of Corinth (Euseb., *H. E.*, ii. 25, 8) says that Peter and Paul founded the church at Corinth together and then proceeded to Italy. Irenæus (*Adv. Hæres.*, iii. 1) speaks of Peter and Paul as having together founded the church at Rome; the Muratorian Fragment (not earlier than the end of the 2d century) refers to the "passion of Peter" i.e., his martyrdom; the presbyter Gaius (Euseb., *H. E.*, ii. 25, 7, early in the 3d century) says that he saw the *τροπαία* (whatever that may mean) of the two apostles Peter and Paul at Rome; in Tertullian (*e.g.*, *Scorp.*, c. 15; *De Præscr.*, c. 24 and 36) the tradition is fairly established, and no later Latin father expresses any doubt of it.

But, besides the fact that there is an interval of more than a hundred years between what must have been, in the ordinary course of nature even if not through violence, the approximate time of Peter's death and the first certain tradition of the place and manner of it, there are two other important considerations which render the ordinary patristic statements doubtful. (1) One stream of tradition, for the existence of which it is difficult to account if the other tradition had been uniform, represents Peter as having worked at Antioch, in Asia Minor, in Babylonia, and in the "country of the barbarians" on the northern shores of the Black Sea. This is in harmony with the geographical details of the first of the two epistles which bear his name. That epistle is addressed to the "elect who are sojourners of the dispersion in Pontus, Galatia, Cappadocia, Asia, and Bithynia," and the "Babylon" from which it is obviously written (v. 13) is best understood not as a cryptographic expression for Rome, but, like the other geographical names of the epistles of the New Testament, in a literal sense. All this, no doubt, is not inconsistent with the supposition that Peter went to Rome towards the end of his life, but it seems to exclude the theory that he made a lengthened stay there and was the founder of the Roman Church. (2) The other consideration is that the presence of Peter at Rome is almost inextricably bound up with a story of whose legendary character there can be little doubt, that of the Simon Magus of the *Clementines*.⁴ Under the name of Simon Magus the conservative Jewish Christians, who could never forgive the admission of the Gentiles to be "fellow-heirs" with the "children of the promise," seem to have represented Paul⁵; and, throwing

¹ The question of the relation of their language to the rest of the Acts and to the Petrine epistles is discussed in detail with various results by several writers, *e.g.*, Mayerhoff and Weiss in the works mentioned below, and more fully Kähler in *Studien u. Kritiken* for 1873, p. 492 *sq.*

² The details of the discussion will be found in most recent books which deal with the Acts; on the negative side the most convenient book for English readers is the translation of Zeller's *Contents and Origin of the Acts of the Apostles*, 1875.

³ Hilgenfeld, *Nov. Test. extra Can. rec.*, fasc. iv. p. 57.

⁴ Uhlhorn, *Die Homilien u. Recognitionen des Clemens Romanus*, Göttingen, 1852, makes an unsuccessful attempt to show that the two stories may be separated.

⁵ For the detailed proofs of this reference may be made to Baur, *Church History*, E. T., vol. i. p. 91; Zeller, *The Acts of the Apostles*, E. T., vol. i. p. 250; and Hilgenfeld, in his *Zeitschrift f. wissenschaftl. Theologie*, 1868, p. 367.

back into the 1st century, and into the personal relations between the two apostles, the violent controversies between the catholic and the Jewish parties which came to a head in the 2d century, they framed a romance of which Peter was the hero, and in which, under the mask of Simon Magus, Paul played the part of the "false apostle." The romance in its original form has perished; its substance is partly preserved and partly recast in the Clementine *Homilies* and *Recognitions*, of which the former exist in their original Greek, the latter in an incomplete Latin translation. In course of time the original identity of Paul with Simon Magus was forgotten, and in the later forms of the legend (see the *Acts of Peter and Paul* below) Peter and Paul are joined together in the combat with the pretender. But in almost all later patristic accounts of Peter Simon Magus has an important place; he is said to have gone to Rome in the time of Claudius, and Peter is said to have at once followed him in 42 A.D.; hence, as Peter lived until the Neronian persecution in 67 there was room for an episcopate of twenty-five years. This last tradition can hardly be reconciled with the facts mentioned in the New Testament of his presence at Jerusalem and at Antioch (Acts xv.; Gal. ii.); but Lipsius has endeavoured to show, not only that single points in the story must be given up, but that the whole tradition of the presence of Peter at Rome is a fiction which grew out of the Judæo-Christian attack upon Paul.

The probabilities of the case are evenly balanced; on the one hand it is difficult to account for the complete silence as to Peter in the Pauline epistles, and it is impossible with those epistles in sight to regard Peter as the founder of the Roman community, on the other hand, it is difficult to suppose that so large a body of tradition had no foundation in fact; such a supposition, besides its general improbability, would assume that the extreme form of Judæo-Christianity which the *Clementines* reflect had a much greater influence over the conceptions of the 2d century than the evidence warrants.¹

¹ The question whether Peter was ever at Rome has been so much discussed that the following list of the chief treatises and articles on either side will be convenient for reference; it is not exhaustive. The question was at first discussed as one between Protestants and Catholics. The earliest treatise on the Protestant side is probably that of Ulrich Vehlen (Velenus) in his *Demonstratio contra Romani papæ primatus signum*, 1520, reprinted by M. Flacius Illyricus in his *Refutatio invecivæ Bruni contra centurias historiæ ecclesiasticæ*, p. 86; it was answered at the time by Bishop Fisher of Rochester in his *Convulsio calumniarum Aldrichi Veleni*, reprinted in his works, ed. Würzburg, 1597, p. 1299. The most complete account of the older arguments on the Lutheran side is that of Spanheim, *Dissertatio de fidei professione Petri Apostoli in urbem Romam deque non una traditionis origine*, 1679, reprinted in his works, Leyden ed., 1703, vol. ii. p. 331. In modern times the question has been discussed chiefly on literary grounds and without reference to its bearing on the Roman controversy. It was first stated on the negative side by Baur in the *Tübinger Zeitschrift für Theologie*, 1831, p. 136, and in his *Paulus*, E. T., vol. i. p. 223. His most important follower has been Lipsius, whose two works, the *Chronologie der römischen Bischöfe*, Kiel, 1869, and *Die Quellen der römischen Petrus-Sage*, Kiel, 1872, are of great value apart from the results which they endeavour to establish; he also deals with the question more concisely in the *Jahrb. f. deutsche Theol.*, 1876, p. 561. On the same side are Mayerhoff, *Historisch-kritische Einleitung in die petrinischen Schriften*, Hamburg, 1835; Gundert, in the *Jahrb. f. deutsche Theol.*, 1869, p. 306; Holtzman, s.v. "Petrus," in Schenkel's *Bibellexicon*; Hausrath, *Nüliche Zeitgeschichte*, vol. iii. p. 344; Zeller, in the *Deutsche Rundschau*, 1875, p. 215 (reprinted in his *Vorträge u. Abhandlungen*, 2te Samml., 1877), and in the *Z. f. wissensch. Theol.*, 1876, p. 31. The truth of the early tradition has been maintained in opposition to these writers by Credner, *Einleitung in das N. T.*, 1836, p. 628; Olshausen, *Römerbr.*, 1840, p. 40; Wieseler, *Chronologie des apost. Zeitalters*, 1848, p. 552; Ewald, *Gesch. des Volkes Israel*, vol. vi. p. 616; Hilgenfeld, in his *Z. f. wissensch. Theol.*, 1872 p. 372, 1876 p. 57 (in answer to the article of Zeller in the same number mentioned above), 1877 p. 436 (in answer to the article of Lipsius mentioned above); Delitzsch, in *Stud. und Krit.*, 1874, p. 213; Renan, *L'Antechrist*, p. 186, and appendix; Seyerlen, *Entstehung*

It would be inappropriate to enter in the present article into the causes and consequences of the enormous influence which the belief that Peter founded and presided over the first Christian community at Rome has exercised upon Christianity. It was no doubt natural, considering that influence, that curiosity should be largely exercised as to the details of his life and death at Rome, and that legends of respectable antiquity should express themselves in visible memorials. Modern Rome contains many such memorials. The chapel of S. Pietro in Carcere preserves the tradition that he was imprisoned in the Tullianum, and that a spring of water issued from the ground that he might baptize his gaolers. The churches of S. Prassede and S. Pudenziana preserve the tradition that much of the later part of his life at Rome was spent in the house of Pudens on the Viminal Hill. The latest localization of a legend has built a church outside the old Porta Capena to mark the spot where, when he was fleeing from persecution, he met his Master going into Rome. "Lord, whither goest Thou?" (Domine, quo vadis?) was his question. "I go to Rome to be crucified again" was his Master's answer.² Besides these visible memorials of Petrine legends there are four annual feasts. (1) On 29th June is celebrated the Feast of St Peter and St Paul. The day is supposed to be that of their martyrdom; it is in reality that of the reburial of their supposed remains in 253, which is recorded in the *Kalendarium Liberianum* of 354 (printed by Mommsen in the *Abhandlungen der königl. sächs. Gesellschaft, phil.-hist. Classe*, 1850, p. 362). Those of Peter were then reburied "ad catacumbas," i.e., in the cemetery of St Sebastian on the Appian Way; they were afterwards said to have been transferred to the basilica which Constantine erected on the Vatican. (2) On 22d February is celebrated a feast in commemoration of Peter as bishop of Antioch (*Festum Cathedræ Petri Antiochenæ*), which also is mentioned as early as the *Kalendarium Liberianum*. (3) On 18th January has been celebrated since the 8th century a feast in commemoration of his bishopric of Rome. (4) On 1st August has been celebrated since the 9th century a feast in commemoration of his imprisonment (*Festum S. Petri ad Vincula*), but whether of that by Herod which is mentioned in Acts xii., or of that by Nero, is uncertain.

Besides the two canonical epistles (see PETER, EPISTLES OF) the following works have either been (erroneously) attributed to him or bear closely upon his history.

1 *The Gospel according to Peter*.—Eusebius (*H. E.*, vi. 12, 2-6) mentions that the public use of this Gospel was at one time allowed, but afterwards disallowed on the ground of its Docetism, by Serapion, the successor of Theophilus in the bishopric of Antioch (191-213). It is mentioned by Origen (*Hom. in Matt.*, x. 17, vol. iii. p. 462), by Jerome (*De Vir. Illustr.*, c. 1), and by Theodoret (*Hæret. Fab.*, ii. 2). Hilgenfeld (*Nov. Test. extra canon. rec.*, fasc. iv. p. 39) thinks that it held a middle place between the *Gospel according to the Hebrews* and the *Gospel of the Ebionites*. No certain fragments of it remain.

2 *The Preaching of Peter* (Πέτρον κήρυγμα); and

3 *The Journeys of Peter* (Πέτρον περιόδοι).—These two works are mentioned together in the *Epistle to James* which is prefixed to the Clementine *Recognitions*; the former appears to have been Judæo-Christian; the latter was an attack on Paul under the guise of Simon Magus. Both works underlie the Clementine *Recognitions* and *Homilies*; the patristic references to them will be found in Hilgenfeld, l.c., p. 52, and *Einleitung*, pp. 42, 155, 580, 613.

4 *The Preaching of Peter and Paul*.—This, in distinction from the preceding, belongs to the period at which Pauline and Petrine tendencies had become combined. The fragments of it and references to it are collected by Hilgenfeld, l.c., p. 56.

5 *The Acts of Peter and Paul*.—The history of this work is obscure; in its present form (as printed by Tischendorf, *Acta Apostolorum Apocrypha*, pp. 1-39) it is probably a late recasting of an earlier work or works. Of such earlier work or works there are traces which are collected by Hilgenfeld, l.c., p. 66; in addition to these it has been thought that the *Martyrium Petri et Pauli* of Symeon Metaphrastes contains part of the original *Acts of Peter*; but the section of the great work of Lipsius, *Die apok. Apostelgesch. u. Apostelleg.*, which will probably unravel the present literary difficulties of these *Acts* has not yet (1884) appeared.

6 *The Apocalypse of Peter*.—This is mentioned as a dendero-canonical book in the Muratorian Fragment, by Clement of Alexandria (ap. Euseb., *H. E.*, vi. 14, 1), and by Eusebius (*H. E.*, iii. 25, 4). Methodius of Tyre placed it "among the inspired Scriptures" (*Sympos.*, ii. 6), and Sozomen (*H. E.*, vii. 19) says that in some churches of Palestine it was publicly read once a year. A few short

und erste Schicksale der Christengemeinde zu Rom, 1874, p. 51; Schmid, *Petrus in Rom*, Lucerne, 1879 (which is a convenient summary of earlier literature and arguments rather than an independent contribution to the subject); Langen, *Geschichte der römischen Kirche*, 1881, p. 40; Sieffert, in Herzog-Plitt, *R. E.*, s.v. "Petrus."

² The story is first found in a sermon sometimes attributed to St Ambrose and printed in some editions of his works, e.g., ed. Paris, 1603, vol. v. p. 100.

fragments of it are collected by Grabe, *Spicil.*, i. 74, and by Hilgenfeld, *l.c.*, p. 71. (The work under the same title which was partly translated by Jacobus de Vitriaco in the 13th century, and of which some MSS. still remain, *e.g.*, an Arabic translation in the Bodleian library—*MSS. Arab. Christ.*, xlviii.—is a much later composition.)

7. *Epistle of Peter to James*.—This is prefixed to the Clementine *Homilies* (ed. Lagarde, p. 1); according to Photius (*Biblioth.*, cod. 42, 113) there was a similar letter, which is now lost, prefixed to the *Recognitions*. Its character and literary value are the same as those of the *Clementines* in general.

8. *The Teaching of Simon Cephas in Rome*.—This treatise exists in Syriac, and was first published and translated by Cureton, *Ancient Syriac Documents*, 1864, p. 35 (since by B. P. Pratten, in the Ante-Nicene Library, vol. xx.). (E. HA.)

PETER, EPISTLES OF. 1 *Peter*.—The first of the two canonical epistles which bear the name of St Peter is addressed "to the elect who are sojourners of the dispersion in Pontus, Galatia, Cappadocia, Asia, and Bithynia." Most commentators in both ancient and modern times (*e.g.*, of the former, Athanasius, Jerome, Epiphanius; of the latter, Lange, Weiss, and Beyschlag) have interpreted this phrase to refer primarily to Jewish Christians. But this interpretation creates a difficulty. The countries named were countries in which St Paul and his companions had been especially active, and in which they had formed many communities, chiefly from the Gentile population. If therefore "the sojourners of the dispersion" be understood to refer to Jews, it becomes necessary to suppose the existence side by side in the same countries of two sets of communities, Pauline and Petrine, and further to suppose either (with Weiss) that the latter were already in existence when Paul preached, or (with the majority of writers) that Peter followed Paul upon his own ground. Both these suppositions are improbable, and it is preferable to understand the phrase of the "children of God that are scattered abroad" whether Jews or Gentiles. That some of the latter were included in it seems clear from i. 21, ii. 10, which imply that before they were Christians they knew not God, and from iii. 6, which implies that their wives had only now become daughters of Abraham.

The epistle was evidently written at a time when the Christians of Asia Minor were both calumniated (ii. 12, iii. 16, iv. 4, 14) and persecuted (i. 6, 7, iii. 14-17, iv. 12-19). It exhorts those to whom it was addressed not only to bear their trials patiently, and even to rejoice inasmuch as they were "partakers of the sufferings of Christ" (iv. 13), but also to give no occasion to the hostile world which surrounded them to reproach them as evil-doers (ii. 12, 15, iv. 14, 15), and it specializes this exhortation to well-doing by addressing separately servants (ii. 18-25), wives (iii. 1-6), and husbands (iii. 7). This fact that Christianity had come to be persecuted, and also the fact, which is manifested in its whole tone, that Christians were in danger of retrograding, show that the epistle cannot be placed in the earlier part of the apostolic age. The time of the Neronian persecution is the earliest that will satisfy the required conditions; and some (*e.g.*, Schwegler, Baur, Hilgenfeld) have thought that even this is too early for those conditions, and that it must be referred to the time of Trajan. It may, however, be said in reference to this latter view that the words of Tacitus in regard to the Christians under Nero, if they be not merely a reflexion from his own time, exactly suit the circumstances to which this epistle refers; "*quos per flagitia inuisos vulgus Christianos appellabat*" (*Ann.*, xv. 44).

Like most documents of the apostolic age, it deals less with doctrine than with practice. But, though the doctrine is incidental, it is clear; taken in connexion with the Petrine speeches in the Acts of the Apostles, with which it is on the whole in harmony, it probably gives a faithful transcript of the original apostolic teaching. The Messiah

of whom the prophets had spoken had been revealed (i. 10-12); He had come to suffer (i. 11) for sins (ii. 24, iii. 18), and by His sufferings He had rescued the elect from their former evil life (i. 18-20) and brought them to God (iii. 18), and in His conduct under suffering left an example for them to follow (ii. 21-23). Belief in God who raised Him from the dead on the one hand is a purification of the soul and an obedience to the truth, and on the other it results in love of the brethren (i. 22); it constitutes a bond of brotherhood, like that which had existed between the children of Abraham, and made the elect, what the Jews had failed to be, "a royal priesthood, a holy nation" (ii. 9, from Exod. xix. 6). But the fulfilment of the promise is not for this world; Christians are "strangers and travellers" (ii. 11); the end of all things is at hand (iv. 7), and that is the revelation of the glory of the Messiah in which those who believe in Him will be partakers (iv. 13, v. 1).

The picture of the Christian communities which the epistle presents is of the simplest, and is in entire harmony with the general facts of the apostolic and sub-apostolic age. The organization was that of the Jewish synedria; the "elders" were as shepherds of the flock, exercising over the younger members the control of a simple discipline. The ministering to the wants of those who needed help was the common and personal duty of all who had wherewith to minister (iv. 10), and a special class of officers for the purpose was not yet needed. It is evident that "liberty of prophesying" prevailed; the only injunction on the point is, "if any man speak, let him speak as the oracles of God" (iv. 11).

The coincidences of thought and expression between some passages of this epistle and some passages in the epistle of James and in both the disputed and undisputed epistles of St Paul have given rise to much discussion. The chief coincidences are the following:—(1) between 1 Peter and James, i. 6, 7, and i. 2, 3, i. 12 and i. 25, i. 22 and iv. 8, ii. 1 and i. 21, iv. 8 and v. 20, v. 5, 9, and iv. 6, 7, v. 6 and iv. 10; (2) between 1 Peter and Romans, i. 14 and xii. 2, ii. 5 and xii. 1, ii. 6-10 and ix. 32, ii. 13 and xiii. 1, iii. 9 and xii. 17, iii. 22 and viii. 34, iv. 3, 7, and xiii. 11, 12, iv. 9 and xiii. 13, iv. 10 and xii. 6; (3) between 1 Peter and Ephesians, i. 1 *sq.* and i. 3 *sq.*, i. 14 and ii. 3, ii. 18 and vi. 5, iii. 1 and v. 22, iii. 22 and i. 20, v. 5 and v. 21. Of these coincidences several explanations have been given. Weiss (*Die petrinische Lehrbegriffe*, 1855, and *Biblical Theology of the New Testament*, E. T., vol. i. p. 167) holds that this epistle preceded the other epistles and gave rise to the expressions which they contain. The Tübingen school hold that the contrary is the case, and that it represents either a late and weakened form of Paulinism (Baur, Zeller, Pfleiderer), or an attempt to mediate between the Pauline and Petrine parties by clothing the doctrines of the latter in the phraseology of the former (Schwegler). Others (notably Mayerhoff, *Einleitung in die petr. Schriften*, 1835) consider that there is no copying on either the one side or the other, but that all the coincidences of expression come from a common stock of apostolic teaching.

The epistle was used by Papias and is possibly referred to by Polycarp, and it is expressly quoted by Irenæus and Tertullian; it is not mentioned in the Muratorian Fragment, but it is translated in the Peshito version, and is included by Eusebius among the admitted books (*homologoumena*). Its genuineness was generally admitted until the present century; and some of its peculiarities have been accounted for by the hypothesis of its having been originally written in Aramaic, and translated, or possibly amplified, by Mark or Silvanus. On the other hand there are some who hold that the attacks upon it by Schwegler, Baur, Pfleiderer, Holtzmann, and others have been stronger than the defence of it.

2 *Peter*.—The second epistle is addressed to a wider circle than the first, *i.e.*, to Christians in general. Its aim is mainly polemical; it is directed partly against a tendency towards libertinism, which was growing up and which took for one of its supports the Pauline doctrine of Christian freedom (ii. 1, iii. 16), and partly against the reaction which had set in against the earlier eschatology (iii. 3, 4). It protests in powerful language against the separation of Christianity from holy living, maintaining that Christianity without holy living is worse than no Christianity at

all (c. ii.); and it reasserts the reality of the Second Coming, resting it upon the reality of the supernatural evidence of the First Coming (i. 16-18).

The correspondence between this epistle, especially c. ii., and that of Jude is too strong to be a mere coincidence. It was at one time supposed to be the original which Jude imitated (so Semler and Michaelis, and more recently Luthardt and Hofmann), but the preponderance of opinion in modern times is in favour of the opposite view (not only by those who question the authenticity of this epistle but by some also of those who maintain it, e.g., Weiss). A leading argument in favour of the latter hypothesis is that 2 Peter ii. 13-17 is an amplification (and some maintain also a misapplication) of Jude 11, 12, and that 2 Peter ii. 11 requires Jude 9 for its explanation. An equally well-marked correspondence has recently been pointed out between this epistle and Josephus, and the balance of probability is in favour of the priority of the latter.¹

The differences of style which distinguish the second from the first epistle have been noted since the time of Jerome (*De Vir. Illustr.*, c. 1, and *Epist. ad Hedib.*, c. 11). They are sometimes explained on the ground of the epistles having had different purposes, or having been written at different times; they are more commonly used as indications of a difference of authorship; and, although the argument from differences of style in comparatively short documents cannot be held to be decisive where the external evidence in their favour is strong, such is not the case with this epistle. The external evidence for it is singularly weak; there are no certain traces of it earlier than the 3d century, when Origen (ap. Euseb., *H. E.*, vi. 25), who is the first to mention it, also mentions that it was questioned. It is not included in either the Muratorian Fragment or the Peshito-Syriac (though it is in the later Philoxenian). Eusebius (*H. E.*, iii. 3) ranks it among the disputed books (*antilegomena*), and Jerome, although he included it in his translation (which fact probably accounts for its general acceptance in the Western churches), mentions that many rejected it. These doubts of early writers, which were revived by Erasmus and Calvin, have been shared by a large proportion of those who have written on the book in modern times; at the same time it cannot be said that there is a consensus of opinion against it.

The best editions of both the epistles are those in the commentaries of De Wette and Meyer, as revised the former by Brückner and the latter by Huther (this has been translated, with the rest of Meyer's *Commentary*, into English); there is a convenient short English commentary by Dean Plumptre in the *Cambridge Bible for Schools*. For the doctrinal and other questions which arise out of the two epistles reference may be made, in addition to the works mentioned in the course of the article, to Weiss, "Die petrinische Frage," in *Stud. u. Krit.*, 1865, p. 619; Grimm, "Das Problem d. ersten Petrusbr.," *ibid.*, 1872, p. 657; Schmid, *New Testament Theology*, translated in Clark's Foreign Theological Library; Messner, *Die Lehre der Apostel*, 1856; Farrar, *Early Days of Christianity*, vol. i. pp. 121, 174; and Sieffert, s.v. "Petrus," in Herzog-Plitt's *Real-Encyclopädie*, 2d ed. vol. xi. (E. H.A.)

PETER OF BLOIS, otherwise known as PETRUS BLESSENSIS, a writer of the 12th century, was born at Blois in France about the year 1120. He studied theology at Paris, where one of his teachers was John of Salisbury, who exercised a considerable influence over him; he afterwards resided for some time as a student of law at Bologna. He was then appointed preceptor to William II. of Sicily, and in 1167 made keeper of the privy seal (sigillifer); political occurrences, however, compelled his return in the following year to France, whence he was invited into England by Henry II., who made him his private secretary. About 1176 he withdrew from court and entered the household of Richard, archbishop of Canterbury, whose chancellor he became.

¹ Abbott, in the *Expositor*, 1882, p. 49, and Farrar, *The Early Days of Christianity*, vol. i. p. 190.

This office he also held under Baldwin, Richard's successor, by whom he was sent to Rome in 1187 to support his cause in the controversy with the monks of Canterbury. Peter died about 1200.

His writings, which cover all the fields of intellectual activity then accessible, show him to have been one of the most widely and deeply learned men of his age. They include a number of allegorizing sermons and edifying tracts, a hortatory address, *De Ierosolymitana peregrinatione acceleranda*, a discourse *Contra perfidiam Judæorum*, and, most interesting for its bearing on the political and ecclesiastical history of his time, a collection of 183 letters to Henry II., as well as to various popes, prelates, and scholars, including his old master John of Salisbury. The best edition of his works is that of Pierre de Goussaiville, Paris, 1667, fol.

PETER THE HERMIT, the apostle of the first crusade, was born of good family, it is supposed, in the diocese of Amiens about the year 1050. His early history is obscure, but he appears to have seen some military service under the counts of Boulogne before his withdrawal from the world as a hermit. His crusading zeal originated in a pilgrimage he made to the Holy Sepulchre shortly before 1094, in which year he began to preach in the transalpine countries the immediate deliverance of Jerusalem from the infidel (see CRUSADES, vol. vi. p. 623 sq.). After the failure of the expedition headed by him in 1096, he founded and became first prior of the abbey of Neufmoustier at Huy in the diocese of Liège, where he died on 7th July 1115.

PETER I., ALEXEIEVICH, surnamed THE GREAT (1672-1725), czar of Russia, was born at Moscow on 11th June 1672. His mother, Natalia Narishkina, was the second wife of the czar Alexis. He was taught reading and writing, and the limited range of subjects which then constituted education in Russia, by the deacon Nikita Zotoff. He came to the throne in the year 1682, on the death of his elder brother Feodore; there was another brother, Ivan, who was six years his senior, but he was weak both in body and mind. Feodore therefore had wished Peter to succeed him, but Sophia, his sister, a woman of strong character and great ambition, was desirous that Ivan should rule, so that she might be proclaimed regent and in reality exercise the sovereignty. She therefore fomented a revolt of the "streltzi," or native militia, and the result was a compromise, whereby Ivan and Peter were to reign jointly. On the death of Ivan in 1696 Peter became sole ruler, and punished Sophia by incarcerating her for life in the Devichi monastery, where she died in 1704.

With the aid of Lefort, a Swiss adventurer, and other foreigners, Peter commenced his remarkable reforms, for which see RUSSIA. Here nothing more than a brief summary of the leading events of his life is given. In the year 1696 he besieged and took Azoff, his great object being to give Russia a seaboard. In 1697 he made his first Continental tour, on which occasion he worked at the dockyards of Zaandam and Deptford. On leaving England he took with him many ingenious men who wished to try their fortunes in a new country,—among them Perry the engineer, who has left us an interesting account of Russia at that time. From England Peter went to Vienna, where he studied the tactics of the imperial army, then enjoying a great reputation throughout Europe, and was meditating a visit to Italy when he heard of a revolt of the streltzi, fomented by the partisans of the old régime, in consequence of which he hurried back to Moscow, and on his arrival punished the rebels with the greatest severity.

In the year 1700 he joined Poland and Denmark against Sweden. Although defeated at Narva the same year, he pursued his plans unremittently, and in 1709 won the battle of Poltava, after which Charles, the Swedish king, became a fugitive in Turkey. In 1703 the foundations of St Petersburg were laid. Peter had married in 1689

Eudoxia Lopukhin, but had divorced her in 1696; she bore him a son, Alexis. In 1711 he took as his second wife Martha Skavronska, whom he caused to be baptized in the Greek Church under the name of Catherine. In this year took place Peter's unsuccessful campaign in Turkey, which ended with the loss of Azoff. The well-known story of his being rescued by Catherine when on the point of being obliged to surrender to the enemy has been shown to be of very doubtful authority. In 1713 Peter had made himself master of a considerable strip of the Swedish coast. In 1716 he went on another European tour in the company of his wife; on this occasion he visited, among other places, Amsterdam, Copenhagen, and Paris. During his absence his son Alexis, who had been a constant source of trouble to him, became more rebellious and estranged from his father. He was openly leagued with the reactionary party in Russia, who looked forward to his assistance in reversing the policy of Peter, as soon as he should succeed to the throne. Peter on his return in 1718 forced his son to renounce all claim to the sovereignty. Alexis was afterwards tried for high treason and sentenced to death; soon it was given out that he had died suddenly. The fate of this wretched young man has only been ascertained in modern times; it seems tolerably clear that he sank under repeated inflictions of torture. His death is a dark stain upon the character of Peter. On 10th September 1721 the peace of Nystad was concluded, by which Sweden ceded Livonia, Esthonia, Ingria, Carelia, Viborg, and the adjacent islands to Russia. In 1724 Peter went to inspect the works on Lake Ládoga, and further weakened his constitution, which had long been in an unhealthy state on account of the continual excitement and arduous labours of his life. The czar died on 28th January 1725.

The character of Peter exhibits a strange congeries of opposed qualities. According to some he "knouted" Russia into civilization; others see in him the true "father of his country" and the founder of Russian greatness. In spite of his errors, no one will deny that he was a man of great genius; his was the "fiery soul that, working out its way," exhausted prematurely a vigorous physical organization. Although frequently cruel, on many occasions he showed humanity and tenderness, and even in his most violent fits of temper was amenable to advice, as he evinced in enduring the rebukes of Prince James Dolgoruki. All Russia seems but the monument of this strange colossal man. He added six provinces to her dominions, gave her an outlet upon two seas, a regular army trained in European tactics in lieu of the disorderly militia previously existing, a fleet, and a naval academy, and, besides these, galleries of painting and sculpture and libraries. The title of "Great" cannot justly be refused to such a man.

PETER II., ALEXIEVICH (1715-1730), son of Alexis and grandson of Peter the Great, was born at St Petersburg in 1715, and ascended the throne in 1727. He was under the guardianship of Menshikoff, to whose daughter Mary he was betrothed. The faction of the Menshikoffs was overthrown, however, by the Dolgorukis, to a daughter of whose house the czar was now to be married. All these political plans were rudely broken by the death of Peter in January 1730. During his short reign this youth showed reactionary tendencies, and it seemed as if the capital of Russia was again to be transferred to Moscow. The young czar was buried in the cathedral of the Archangel in that city.

PETER III., FEODOROVICH (1728-1762), was son of Anna, daughter of Peter the Great, who had married the duke of Holstein. He was born at Kiel in 1728, his real names being Karl Peter Ulrich; he went to Russia in 1742 on being named heir to the throne. In 1745 he married Sophia Augusta, princess of Anhalt-Zerbst, who,

on entering the Greek Church, took the name of Catherine. They lived very unhappily together. In January 1762 the czarina Elizabeth died and Peter succeeded her. He soon became unpopular on account of his fondness for the Prussians and the introduction of German regulations in the army. His wife took advantage of his unpopularity and caused herself to be crowned empress, July 1762. Peter showed great want of energy, and only attempted to stem the insurrection when it was too late. He was removed to Ropsha in the government of St Petersburg, and, after having been forced to sign a renunciation of all rights to the throne, was strangled by Orloff and others. He was first buried in the Alexandro-Neveski monastery, but his remains were removed in 1796 by Paul to the Petropavlovski church.

PETERBOROUGH, a city and municipal and parliamentary borough, chiefly in Northamptonshire, but partly in Huntingdenshire, is situated on the river Nene, 76 miles north of London by the Great Northern Railway. The town is also a station on the London and North-Western, the Great Eastern, and the Midland systems. It is built chiefly along the river on the north side, the streets being straight and wide, and containing many good houses. The first bridge over the Nene at Peterborough was erected in 1140, the present bridge in 1872. The cathedral of St Peter is the third church that has occupied the site; the first, founded by Peada, king of the Mercians, in 656, was entirely destroyed by the Danes in 870, and the second, founded by King Edgar in 971, was accidentally burnt in 1116. The present building, founded in the following year, was, inclusive of the west front, 120 years in building, being consecrated on 4th October 1237. It is one of the three Norman cathedrals in England, and, though scarcely entitled to a place among cathedrals of the first rank, possesses special features rendering it second almost to none in point of architectural interest. It embraces in all eight periods of construction, and in no other building can the transition be better studied through the various grades of Norman to Early English, while the later addition is an admirable example of Perpendicular. The edifice proceeded as usual from east to west, and, while an increase in elegance and elaboration is observable in the later parts, the character of the earlier buildings has been so carefully kept in mind that no sense of incongruity is produced. A series of uniform Decorated windows were added throughout the church in the 14th century, and the effect has been rather to enhance than detract from the unity of design. The choir, Early Norman, was founded on 12th March 1117 (or 7th March 1118) by John de Sez, and dedicated in 1140 or 1143; the aisles of both transepts and the whole of the south transept were built by Martin de Bec, 1140-55; the remaining portions of the transepts and the central tower, of three stories, were completed by William de Waterville, 1155-75; the nave, Late Norman, was completed by Abbot Benedict, 1177-93, who added a beautiful painted roof of wood; the western transepts, Transition Norman, were the work of Abbot Andrew, 1193-1200; the western front, with its magnificent triple arch, the unique feature of the building, and one of the finest specimens of Early English extant, must have been built between 1200 and 1250; but there exists no record of its construction. The lady chapel, built parallel with the choir by William Parys, prior, was consecrated in 1290; the bell-tower was erected by Abbot Richard between 1260 and 1274; the south-west spire, the pinnacles of the flanking tower of the west portal, and the enlargement of the windows of the nave and aisles were the work of Henry de Morcot in the beginning of the 14th century; the new building or eastern chapel in the Perpendicular style, begun in 1438, was not completed till 1528. In 1541 the

church was converted into a cathedral, the abbot being made the first bishop. The extreme length of the building is 471 feet, and of the nave 211 feet, the breadth of the west front being 156, the height of the central tower, as reconstructed in the 14th century, was 150, that of the spires and tower of the west front is 156 feet. In 1643 the building was defaced by the soldiers of Cromwell, who destroyed nearly all the brasses and monuments, burnt the ancient records, levelled the altar and screen, defaced the windows, and demolished the cloisters. To obtain materials for repairs the lady chapel was taken down. In the latter part of the 18th century the church was repaved. In 1831 a new throne, stalls, and choir-screen were erected and other restorations completed. On account of the insecure state of the central tower in 1883, it was taken down; but it is now (1884) being rebuilt. Catherine of Aragon was interred in the cathedral in 1536, and Mary queen of Scots in 1587, but the body of the Scottish queen was removed to Westminster Abbey in 1612. Of the monastic buildings there are some interesting remains. The cathedral is approached by a Norman gateway, above which is the chapel of St Nicholas, built by Abbot Benedict, and now used as the music school, and on the left the chapel of St Thomas a Becket, built by Abbot Ashton in the 15th century, and now used as the grammar-school. The gateway to the bishop's palace, formerly the abbot's house, was built by Abbot Godfrey de Croyland in 1319, and the deanery gate by Abbot Kirtton in 1515. One of the canonry houses is formed partly from a hall of the 13th century. To the north of the cathedral is Touthill, said to have been erected for the defence of the monastery.

Peterborough is included for civil purposes in the parish of St John the Baptist, but for ecclesiastical purposes it is divided into four, the additional parishes being St Mary's Boogate (1857), St Mark's (1858), and St Paul's (1869). The old parish church of St John originally stood to the east of the cathedral, but was rebuilt on its present site in the centre of the city (1401-7) in the Perpendicular style. It consists of chancel, nave, aisles, and an embattled tower adorned with pinnacles. The educational establishments include the Henry VIII. grammar or chapter school; the St Peter's training college for schoolmasters for the dioceses of Peterborough, Ely, and Lincoln, erected from designs of Sir Gilbert Scott (1864), and attended by forty-six pupils; the practising school attached to the training college, attended by 250 boys; and Deacons and Ireland's charity school, established in 1721 for the clothing and educating of twenty poor boys, but lately reorganized. The principal public buildings are the market-house (1671), used as a town-hall, the corn exchange (1848) in the Italian style, the liberty jail and house of correction in the Norman style (erected in 1848 and enlarged in 1855 and 1870), the assembly rooms (1853), and the county court and probate office (1873). A cattle-market, 5 acres in extent, was opened in 1867. The benevolent institutions include the dispensary and infirmary, several almshouses, and the union workhouse. The modern prosperity and rapid growth of the town are chiefly due to the trade caused by the junction of so many railway lines. Adjoining the town are extensive works and sheds connected with the Great Northern and Midland Railways. Important cattle-markets and fairs are held, and there is a large transit of meat and cattle to London and elsewhere. An extensive trade in corn, coal, and timber is also carried on. The principal manufacture is that of agricultural implements. The entire parliamentary city of Peterborough has an area of 6558 acres (of which 6310 are in Northamptonshire), with a population of 22,394 (of whom 20,123 are in Northamptonshire). The population of the municipal borough (area, 1818 acres) in 1871 was 16,310, and in 1881 it was 21,228. Since 1841 it has more than trebled.

The ancient name of Peterborough was *Medeshamstede*. The foundation of the great Benedictine abbey of St Peter was laid in 655 by Oswy, king of Northumbria, and Peada, the first Christian king of Mercia. It was the first of the Benedictine abbeys in Gyrwa land (Fenland). In 870 it was plundered by the Danes, after which it remained desolate till 966, when it was restored to its former splendour by Athwold, bishop of Winchester. From that time the town was called a borough, being probably then surrounded by walls; and under Abbot Leofric, nephew of Earl Leofric of Mercia, the abbey became one of the wealthiest in England. In 1169 it was plundered by Hereward. Since the first of Edward IV. the borough has returned two members to parliament. Until 1874 the city was included in the liberty or

soke of Peterborough, the government of which was vested in the lord paramount, the *custos rotulorum*, and magistrates appointed by the crown, with powers equal to those of judges of assize, a high bailiff of the city was appointed by the dean and chapter as lords of the manor, who acted as returning officer till the incorporation of the city in 1874. Peterborough is divided into three wards; for municipal and sanitary purposes it is governed by a mayor, six aldermen, and eighteen councillors, but for magisterial and sessional purposes is still included in the liberty of Peterborough.

Gunton, *History of the Church of Peterborough*, 1688; Britton, *History and Antiquities of the Abbey and Cathedral Church of Peterborough*, 1828; Paley, *Remarks on the Architecture of Peterborough Cathedral*, 1849; Sweeting, *Notes on Peterborough Cathedral*, 1869.

PETERBOROUGH AND MONMOUTH, CHARLES MORDAUNT, EARL OF (c. 1658-1735), a man whose whole life was passed in the turmoil of excitement, was born about 1658. His father, John Mordaunt, was created Baron Mordaunt of Reigate, Surrey, in 1659; his mother was Elizabeth, the daughter and sole heiress of Thomas Cary, the second son of Robert Cary, earl of Monmouth. He entered upon a long career of warfare when only about sixteen years of age by joining Sir John Narborough's fleet in the Mediterranean, and won his first distinction in arms in Cloudesley Shovel's destruction of the dev's fleet under the very guns of Tripoli. On two subsequent occasions—the first in September 1678, the second in June 1680—he embarked in expeditions for the relief of Tangier, but the adventure met with little success, and that troublesome possession was soon after abandoned. His father died 5th June 1675, and Charles Mordaunt succeeded to the peerage. On his return from the second expedition to Tangier he plunged into active political life as a zealous Whig and an unswerving opponent of the duke of York. But his continued hostility to James II. forced him to retire to Holland, when he proposed to William of Orange to invade England. The disposition of the cold and cautious William had little in common with the fierce and turbulent English peer. His plan was rejected, though the prudent prince of Orange deemed it judicious to retain his fiery adherent by his side. When William sailed to Torbay his friend accompanied him, and when the Dutch prince was safely established on the throne of England honours without stint were showered upon Lord Mordaunt. He was sworn of the privy council 14th February 1689, made a lord of the bedchamber in the same month, created lord-lieutenant of Northamptonshire shortly after, and in April of the same year appointed first lord of the treasury and advanced in the peerage to be earl of Monmouth. In less than a year he was out of the treasury, but he still remained by the person of his monarch. He was with William in his dangerous passage to Holland in January 1691; and in June 1692, when crossing from England to the same country, he narrowly escaped shipwreck. Although the English king had refused his consent to a bill for triennial parliaments in the previous session, Lord Monmouth did not shrink from reintroducing it in December 1693. This led to a disagreement with the court, though the final breach did not take place until January 1697, when Monmouth was accused of complicity in Sir John Fenwick's conspiracy and of the use of "undutiful words" towards the king. He was committed to the Tower, staying in confinement until April 1697, and deprived of his employments. Some consolation for these troubles came to him in June of the same year, when he succeeded to the earldom of Peterborough. The four years after his release from the Tower were mainly passed in retirement at Parson's Green, Fulham, at a house long since pulled down, but famous for its "extraordinary good rooms" and its spacious gardens. At the close of William's reign Lord Peterborough emerged from his suburban retreat for a time to take part in the prosecution of Lord Somers, and on the accession of Anne he plunged into political life again with avidity. His first act was to draw down on himself in February 1702 the

censure of the House of Commons for the part which he took in the attempt to secure the return of his nominee for the borough of Malmesbury. In the same year he was appointed governor of Jamaica, but he never visited the island over which he ruled, preferring to remain in a part of the world where he could play a more active part in the government of affairs. Through the fear of the ministry that his restless spirit would drive him into opposition to its measures if he stayed at home, he was appointed early in 1705 to command an expedition of English and Dutch troops in Spain. He was created sole commander of the land-forces and joint-commander with Sir Cloudesley Shovel of the fleet, and at the same time was reinstated a member of the privy council. His first exploit was to seize Denia in Valencia; then, with all the impetuosity of his character, he urged upon the Austrian claimant to the throne the expediency of dashing for Madrid, less than 250 miles distant, only to find that he was overruled by his colleagues in council. After this repulse he sailed for Barcelona (August 1705) and commenced to besiege that town. For three weeks the siege languished, until, by a sudden night-attack on 14th September, Peterborough seized the outworks of Montjuich, and three nights later captured the citadel itself. On 14th October the city was his. This was his greatest feat, and in this enterprise he showed, what was usually wanting in his character, both tact and conciliation. After this victory Catalonia declared for the Austrian prince, and Peterborough advanced into Valencia with the object of reducing it to subjection. By threats, cajolements, intrigues, and plots he obtained possession of its chief towns, but the prince for whom he was fighting allowed himself to be surrounded in Barcelona. Peterborough's advice, that Charles should travel by sea to Lisbon and march against Madrid with the allied force of 25,000 men, was disregarded, and the English commander with his little body of 2000 foot and 600 horse then advanced towards Barcelona, which was besieged by a greatly superior force of the enemy. The city was on the point of being captured, when Peterborough, warned of the approach of the English fleet—it is said that the signal of its arrival was a blank sheet of paper—put off in an open boat, and, after journeying to and fro, met with his country's vessels. On 8th May he brought the leading ships into the port of Barcelona, and three days later the French beat a retreat. Again did the English commander urge upon the Austrian claimant of the Spanish throne the expediency of immediately advancing to Madrid, and again was the advice rejected, although the capital was occupied by the allied forces under Galway and Das Minas. Charles remained at Barcelona for some weeks, and when at last he did move towards Madrid it was by a route which Peterborough disapproved of. When difficulties beset Charles on his way the earl joined him, but he soon retired to Valencia in disgust, and then left the country to raise money at Genoa. In a short time he returned to Spain once more, but during his absence the prospects of the allied forces had passed from bad to worse. The leaders of the army differed in their views, and Lord Peterborough quitted the country for ever (March 1707).

On his return to England he allied himself with the Tories, and received his reward in being contrasted, much to his advantage, with the Whig victor of Blenheim and Malplaquet. The differences between the three peers, Peterborough, Galway, and Tyrwaley, who had served in Spain, formed the subject of angry debates in the Lords, when the majority declared for Peterborough; after some fiery speeches the resolution that he had performed many great and eminent services was carried, and votes of thanks were passed to him without any division. His new friends were not desirous of detaining him long on English soil,

and they sent him on a mission where he characteristically engaged the ministry in pledges of which they disapproved. His resentment at this disagreement was softened by the command of a cavalry regiment, and by his appointment as a Knight of the Garter. A few months before the close of Queen Anne's reign (November 1713) he was despatched as ambassador-extraordinary to the king of Sicily, but was recalled by the Whigs as soon as they obtained the reins of power. With the accession of George I. Lord Peterborough's influence was gone. Hatred of Marlborough became the ruling passion of his mind. His last twenty years of life were passed with the recollection of disappointed hopes and with the continual presence of disease. Worn out with suffering, he died at Lisbon, 25th October 1735. His remains were brought to England and buried at Turvey in Bedfordshire, 21st November.

Lord Peterborough was short in stature and spare in habit of body. His activity knew no bounds. He was said to have seen more kings and postilions than any man in Europe, and the whole point of Swift's lines on "Mordanto" consisted in a description of the speed with which he hastened from capital to capital. Nature had bestowed many gifts upon him, but had denied him more. He was eloquent in debate and intrepid in war, but his influence in the senate was ruined through his inconsistency, and his vigour in the field was wasted through his want of union with his colleagues. He could do nothing like other men. His first wife, Carey, daughter of Sir Alexander Fraser of Mearns, died 13th May 1709, and was buried at Turvey 20th May. Some years later he married Anastasia Robinson, a dramatic singer of great beauty and sweetness of disposition; but she was unrecognized as his wife, and lived apart from him at her mother's house at Parson's Green. Nor was it until a few months before his death that she was introduced to society as the countess of Peterborough. (W. P. C.)

PETERHEAD, a seaport, market town, burgh of barony, and parliamentary burgh of Aberdeenshire, Scotland, is situated on a rocky peninsula on the North Sea, about 30 miles north-north-east of Aberdeen and 2 north of Buchan Ness. It has railway communication by a section of the Great North of Scotland line, opened in 1862. The town is built of the red granite of the district. At the extremity of the peninsula is the insular suburb of Keith-Inch. Among the principal buildings are the town-hall (1788), with a granite spire 125 feet high, the music hall, and the court-house. The reading society (1808) possesses a library with upwards of 5000 volumes, and the mechanics' institute one with about 1000 volumes. The Arbuthnot Museum contains natural history specimens, a collection of coins, and objects of antiquarian interest. In front of the town-hall is a statue to Field-Marshal Keith (1696-1758), presented to the burgh by William I. of Prussia in 1868. A market cross was erected in 1832 when the town was created a parliamentary burgh. Peterhead at an early period had an extensive trade with the ports of the Baltic, the Levant, and America. Formerly it was a bonding sub-port to Aberdeen, but was made independent in 1832. The north and south harbours lie between the town and Keith-Inch, and the isthmus dividing them is pierced by a canal, which is crossed by an iron swing-bridge. In the north harbour are two graving-docks. A new harbour was completed in 1878, and the south harbour has been deepened and enlarged. The south bay is to be converted into a national harbour of refuge. The Arctic seal and whale fishing, which in 1802 was prosecuted by only one vessel, employed in 1857 as many as 32 vessels, but since that time it has declined somewhat. The herring fishing, in which the port has long held a leading position (631 boats in 1883), was begun in 1818 by a joint-stock company. The general trade is of considerable importance. The chief exports are herrings (£180,000 in 1883), granite, cattle, and agricultural produce. In 1883 the number of vessels that entered the port with cargoes and in ballast was 864 of 87,839 tons, the number that cleared 840 of 86,318 tons. The town possesses ship and boat building

yards, saw-mills, an iron-foundry, cooperages, agricultural implement works, woollen manufactories, breweries, and a distillery. In the neighbourhood there are extensive granite and polishing works. The limits of the police burgh and the parliamentary burgh are identical, with a population in 1871 of 8536 and in 1881 of 10,922.

The town and lands of Peterhead belonged anciently to the abbey of Deer, built by William Cumming, earl of Buchan, in the 13th century. When the abbey was erected into a temporal lordship in the family of Keith, the superiority of the town fell to the earl marischal, with whom it continued till the forfeiture of the earldom in 1715. The town and lands were purchased in 1720 by a fishing company in England, and on their failure by the Merchant Maiden Hospital of Edinburgh for £3000, who are still the superiors of the town. Peterhead was made a burgh of barony in 1593 by George Keith, fourth earl marischal of Scotland. It was the scene of the landing of the Pretender, 25th December 1715. Peterhead is included in the Elgin district of burghs.

PETERHOF, a town of European Russia, in the government of St Petersburg, and 18 miles west of the capital, on the south coast of the Gulf of Finland, has grown up round the palace built by Peter the Great in 1711, was constituted a district town in 1848, and has increased its population from 7647 in 1866 to 14,298 in 1881. It is almost exclusively a residential town, but is garrisoned by a cavalry regiment and has the military schools lodged in its barracks for six weeks in the summer. The palace, which is still occupied by the imperial family during part of the summer, has undergone alterations and additions, but retains a distinct Petrine stamp. It is built on a height 60 feet above the sea. The gardens, which owe their magnificence to Alexander I. and Nicholas I., are laid out in the Versailles style, with elaborate water-works. From the "Marly" summer-house Peter I. loved to watch his fleet beneath the Cronstadt batteries, and in that of "Mon-plaisir" he died. It was at Peterhof that the empress Alexandra used to celebrate her birthday by fêtes at which more than 100,000 persons were present. Peterhof is connected with Oranienbaum on the west and with Strelma on the east by an uninterrupted series of gardens and villas.

PETERS, or PETER, HUGH (1598-1660), a man whose name has for three centuries been rarely mentioned except in terms of infamy, was the son of Thomas Dyckwoode *alias* Peters, by Martha, daughter of John Treffry of Fowey, Cornwall, and was baptized in Fowey parish church 29th June 1598. His parents were in good circumstances, and they sent him to Trinity College, Cambridge, where he took the degree of B.A. in 1616 and M.A. in 1622. About the latter date he was licensed by Dr George Montaigne, bishop of London, to the lectureship at St Sepulchre's, London, but his first definite post in the church was at Rotterdam (1623-32); as colleague of William Ames, whom he much admired, and who died "in his bosom." In October 1635 he emigrated to Boston in New England, and in the following year became the minister of the first church at Salem in Massachusetts. His abilities soon gave him a prominent place in all the civil and ecclesiastical affairs of the colony, and in 1641 his reputation was so great that he was sent to England as the best guardian of the colony's interests at home. His shrewd judgment, his ready wit, and his zeal for the cause of the Parliament endeared him to the army and its leaders; he accompanied Fairfax and Cromwell on their campaigns, and described their achievements in numerous letters to the House of Commons. To the adherents of the vanquished cause Hugh Peters always lent his good offices. He was desirous that Laud should be banished, and not executed. It was through his influence that Juxon was permitted to attend Charles after his condemnation, and his acts of kindness to some of the Royalist clergy are mentioned in Walker's *Sufferings of the Clergy*. Through the favour of the Pro-

sector he filled several important offices. He was one of the twenty-one persons appointed to consider the abuses of the national laws; he was a judge for granting probates of wills, and a trier for licensing candidates to the ministry. At the Restoration he was seized and imprisoned in the Tower of London, where he composed his affecting tract, "A Dying Father's Last Legacy to an Only Child." His trial as a regicide took place on 13th October 1660, and he was, of course, condemned to death. Four days later he was drawn on a sledge to Charing Cross and there hanged and quartered, his head being set on a pole on London Bridge. Hugh Peters suffered his cruel death without any sign of wavering. For many years after his death the grossest charges against his memory were circulated in catchpenny pamphlets by his enemies, and his name was held up to general execration; but it is clear that these accusations are but the creation of party malice. He was twice married; his first wife was Elizabeth, said to have been the daughter of Thomas Cooke of Pebmarsh, Essex, and the widow of Edmund Read, who died at Wickford in the same county November 1623. She died about 1640, and he subsequently married Deliverance Sheffield, the mother of his only child, Elizabeth Peters. The writings of Hugh Peters and the publications, in print and manuscript, relating to his life are described in the *Bibliotheca Cornubiensis*. He pleaded, in opposition to Prynne and others, for the admission of the Jews into England. The chief blot on his fame is his advocacy of the burning of the records.

PETERSBURG, a city and port of entry of the United States, in Dinwiddie county, Virginia, lies 22 miles south of Richmond on the south side of the Appomattox river, which is navigable for large vessels from the James river up to the falls opposite the city, and for flat boats 107 miles above the falls to Farmville. Petersburg is an important railway junction, manufactures tobacco, cotton goods, and iron wares, and carries on a very extensive shipping trade in the export of tobacco, cotton, flour, and peanuts (groundnuts). Its public buildings comprise a court-house, a custom-house, and post-office, two markets, and a theatre; there are two public libraries and two public parks, Central and West End. The population was 14,010 in 1850, 18,266 in 1860, 18,950 (10,185 coloured) in 1870, and 21,656 in 1880.

Petersburg was laid out at the same time with Richmond (1733) by Colonel William Byrd, on the site of an Indian village destroyed in 1576. It was first incorporated in 1748. During the Revolutionary War it was twice the headquarters of the British under General William Phillips, who died while in possession of the town in 1781. The bravery of the Petersburg volunteers on the Canadian frontier in 1812 procured it the title of Cockade City of the south. The terrible siege of Petersburg, lasting from June 1864 to 3d April 1865, was the final scene of the Civil War.

PETERWARDEIN (Hungarian *Petervárad*, Servian *Petrovaradin*), a town and strong fortress of Hungary, is situated on a promontory formed by a loop of the Danube, 45 miles to the north-west of Belgrade. It is connected with Neusatz on the opposite bank by a bridge of boats 800 feet long. The fortifications consist of the upper fortress, on a lofty serpentine rock rising abruptly from the plain on three sides, and of the lower fortress at the northern base of the rock. The latter includes the town, which contains (1880) 3603 inhabitants, engaged in wine-growing, agriculture, and the manufacture of liqueurs (*rosoglio*) and vinegar. The two fortresses can accommodate a garrison of 10,000 men. The arsenal contains interesting trophies of the Turkish wars.

Peterwardein, the "Gibraltar of Hungary," is believed to represent the Roman *Acumincum*, and received its present name from Peter the Hermit, who here marshalled the levies of the first crusade. It was captured by the Turks in 1526 and retained by them for 160 years. In 1716 it witnessed a signal defeat inflicted

on the Turks by Prince Eugene. During the revolutionary struggles of 1848-49 the fortress was held by the insurgents for a short time.

PÉTION DE VILLENEUVE, JÉRÔME (1753-1794), was the son of a procureur at Chartres, where he was born in 1753. He himself became an avocat in his native place in 1778, and at once began to try to make a name in literature. His first printed work was an essay, *Sur les Moyens de prévenir l'Infanticide*, which failed to gain the prize for which it was composed, but pleased Brissot so much that he printed it in vol. vii. of his *Bibliothèque philosophique des Législateurs*. Pétion's next works, *Les Lois Civiles*, and *Essai sur le Mariage*, in which he advocated the marriage of priests, confirmed his position as a bold reformer, and when the elections to the States-General took place in 1789 he was elected a deputy to the Tiers État for Chartres. Both in the assembly of the Tiers État and in the Constituent Assembly Pétion showed himself a radical leader. He supported Mirabeau on 23d June, attacked the queen on 5th October, and was elected president on 4th December 1790. On 21st June 1791 he was chosen one of three commissioners appointed to bring back the king from Varennes. After the last meeting of the assembly on 30th September 1791 Robespierre and Pétion were made the popular heroes and were crowned by the populace with civic crowns. Pétion received a still further proof of the affection of the Parisians for himself on 14th November 1791, when he was elected second mayor of Paris in succession to Bailly. In his mayoralty he exhibited clearly his republican tendency and his hatred of the old monarchy, especially on 20th June 1792, when he allowed the mob to overrun the Tuileries and insult the royal family. For neglecting to protect the Tuileries he was suspended from his functions by the Directory of the department of the Seine, but the leaders of the Legislative Assembly felt that Pétion's cause was theirs, and rescinded the suspension on 13th July. On 3d August, at the head of the municipality of Paris, Pétion demanded the dethronement of the king, and on 10th August, while the monarchy was falling with the Tuileries, he patiently underwent a form of detention in his own mairie. He was still mayor of Paris when the massacres of September in the prisons took place, and must bear the blame of not having endeavoured to interfere. He was elected to the Convention for Eure-et-Loir, and became its first president. Manuel then had the folly to propose that the president of the Assembly should have the same authority as the president of the United States; his proposition was at once rejected, but Pétion got the nickname of "Roi Pétion," which contributed to his fall. His jealousy of Robespierre allied him to the Girondin party, as did also his assiduous attention at Madame Roland's salon. With the Girondins he voted for the king's death and for the appeal to the people, as one of them he was elected to the first committee of general defence in March 1793, as their representative he attacked Robespierre on 12th April, and it is no matter of wonder, therefore, that his name was among those of the twenty-two Girondin deputies proscribed on 2d June. Pétion was one of those who escaped to Caen and raised the standard of provincial insurrection against the Convention; and when the Norman rising failed he fled with Guadet, Buzot, Barbaroux, Salle, and Louvet to the Gironde, and hid in a grotto at St Émilien. At last, but a month before Robespierre's fall in June 1794, the escaped deputies felt themselves tracked down, and deserted the grotto; Louvet found his way to Paris, Salle and Guadet to Bordeaux, where they were soon taken; Barbaroux committed suicide; and the bodies of Pétion and Buzot were found in a field, half-eaten by wolves.

For Pétion's published works, see the edition of his *Œuvres*, 3 vols., 1792; for his life, see the ridiculous eulogy in J. J. Regnault-Warin's *Vie de Pétion*, 1792, and *Mémoires inédits de Pétion et*

Mémoires de Buzot et de Barbaroux, with an introduction by C. A. Dauban, 1866; and for his last days and death, see C. Vatel, *Charlotte Corday et les Girondins*, 3 vols., 1872.

PETIS DE LA CROIX, FRANÇOIS (c. 1653-1713), the best representative of Oriental learning in France during the last decades of the 17th century and the beginning of the 18th century, was born in Paris about 1653. He was son of the Arabic interpreter of the French court, and inherited this office at his father's death in 1695, afterwards transmitting it to his own son, Alexandre Louis Marie. At an early age he was sent by Colbert to the East; during the ten years he spent in Syria, Persia, and Turkey he mastered Arabic, Persian, and Turkish, and also collected rich materials for future writings.¹ He found, besides, opportunity to equip himself for those diplomatic missions which the French Government entrusted to him soon after his return to Paris in 1680. Having served a short time as secretary to the French ambassador in Morocco, he accompanied as interpreter the French forces sent against Algiers, and greatly contributed to the satisfactory settlement of the treaty of peace between the two countries, which was drawn up by himself in Turkish and ratified in 1684. In a similar capacity he conducted the negotiations with Tunis and Tripoli in 1685 and those with Morocco in 1687; and the zeal, tact, and linguistic knowledge he manifested in these and other transactions with Eastern courts were at last rewarded in 1692 by his appointment to the Arabic chair in the Collège Royal de France, which he filled until his death in 1713.

He published *Contes Turcs*, Paris, 1707, and *Les Mille et un Jours*, 5 vols., Paris, 1710-12, and proved his acquaintance with the Armenian and Ethiopic languages (a powerful impulse to the study of the latter having been given just at that time by the masterly works of Hieb Ludolf) in his *Armenian Dictionary* and his *Account of Ethiopia*. But the lasting monument of his literary fame, the one standard work that has outlived many generations and still keeps a distinct merit of its own, is his excellent French version of Sharaf-uddin 'Alī Yazdī's *Zafarnāma*, or *History of Timūr* (completed 828 A.H.; 1425 A.D.), which was given to the world nine years after his death, 1722 (4 vols., Paris; translated into English by J. Darby, London, 1723). This work, renowned throughout the East as a model of elegant style, and one of the rare specimens of a fairly critical history Persia can boast of, was compiled under the auspices of Mirzā Ibrāhīm Sultān, the son of Shāh Rukh and grandson of the great Timūr himself. This prince collected all the official records of Timūr's reign, both in Turkish and Persian, collated and revised them, and had then an accurate text drawn up by his secretaries, which was turned by Sharaf-uddin into elegant and refined language and revised by Ibrāhīm Sultān himself (see Rien's *Cat. Persian MSS. in the Brit. Mus.*, i. p. 173 sq.). The only error committed by Petis de la Croix in his otherwise very correct translation is that he erroneously ascribed the important share which Ibrāhīm Sultān had in the *Zafarnāma* to Timūr himself.

PETITION is an application for redress by a person aggrieved to an authority capable of relieving him. It may be made in the United Kingdom to the crown or its delegate, or to one of the houses of parliament.

The right of petitioning the crown was recognized indirectly as early as Magna Charta in the famous clause, *Nulli vendemus, nulli negabimus aut differemus, rectum aut justitiam*, and directly at various periods later, e.g., in the articles of the Commons assented to by Henry IV., by which the king was to assign two days in the week for petitions, it being an honourable and necessary thing that his lieges who desired to petition him should be heard (*Rot. Parl.*, 8 Hen. IV., p. 585). The case of the seven bishops in 1688 confirmed the right, and finally the Bill of Rights in 1689 declared "that it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal." Petitions to the crown appear to have been at first for the redress of

¹ Many of these—as the account of Jerusalem, *Modern and Ancient*, the *Travels through Syria and Persia*, the *Antiquities and Monuments of Egypt*, the translations of Pseudo-Wāqidī's *Conquest of Syria* and of Hāji Khalfā's *Dictionary*, and the *History of the Ottoman Empire*—still remain in manuscript.

private and local grievances, or for remedies beyond those possessed by the courts. As equity grew into a system, petitions of this kind tended to become superseded by bills in chancery (see CHANCERY). Statutes were originally drawn up by the judges at the close of the session of parliament from the petitions of the Commons and the answers of the crown. In the drawing up of the statutes frauds were at times committed, the judges not always reciting correctly the tenor of the petition or answer. To obviate this danger complete statutes in the form of bills began to be introduced into parliament in the reign of Henry VI. The crown could accept or reject them, but could not alter them (see Hallam, *Middle Ages*, ch. viii. pt. 3). A relic of the old form of the statute founded upon petition still remains in the preamble of Appropriation Acts and other statutes creating a charge upon the public revenue. It runs thus: "We, your majesty's most dutiful and loyal subjects, the Commons of the United Kingdom . . . do most humbly beseech your majesty that it may be enacted; and be it enacted, &c.," from this point following the enacting words common to all statutes. Petitions to the crown from the House of Commons in other matters now usually take the form of addresses. The crown may refer petitions presented to it to be adjudicated upon by a delegated authority. This is the course pursued in the case of peerage claims, which are referred to the House of Lords, and by that House to the committee for privileges, and in the case of petitions to the crown in council, with which the judicial committee in most cases deals (see below); or the crown may delegate the power of receiving petitions in the first instance. Examples of petitions to the delegated authority are those addressed to a court of justice or those addressed to the home secretary for the pardon or mitigation of punishment of a convicted criminal. Petitions to the houses of legislature seem to have been later in origin than petitions to the crown. The political importance of petitioning dates from about the reign of Charles I. The development of the practice of petitioning had proceeded so far in the reign of Charles II. as to lead to the passing of 13 Car. II. c. 5 against tumultuous petitioning. This is still law, though it has ceased to be enforced. It provides that no petition or address shall be presented to the king or either house of parliament by more than ten persons; nor shall any one procure above twenty persons to consent or set their hands to any petition for alteration of matters established by law in church or state, unless with the previous order of three justices of the county, or the major part of the grand jury. Up to 1688 petitions usually dealt only with some specific grievance; from that time dates the present practice of petitioning with regard to general measures of public policy. Since 1833 more than 700,000 petitions on public matters have been presented to the House of Commons. Petitions to the crown need not apparently be in any particular form, but no doubt they would not be received if couched in unbecoming language. Petitions to the Houses of Lords and Commons must be framed in a prescribed form. They must be properly superscribed, and must conclude with a prayer. They must be in writing (in the Commons), must contain none but genuine signatures, and must be free from disrespectful language or imputations upon any tribunal or constituted authority. They must be presented by a member of the House, except petitions to the House of Commons from the corporation of London, which may be presented at the bar by the sheriffs, and from the corporation of Dublin, which may be presented by the lord mayor. Though a petition is made to the House, in practice petitions to the Commons are referred to the committee on public petitions, under whose directions they are classified and analysed. In the Lords receivers and triers of petitions

are still appointed, though their functions have long been obsolete. Petitions may be sent free by post to members of either house, provided they fulfil certain conditions as to weight, &c. (see May, *Parliamentary Practice*, ch. xix.)

In the United States the right of petition is secured by Art. 1 of the Amended Constitution, which enacts that "Congress shall make no law abridging . . . the right of the people peaceably to assemble and to petition the Government for a redress of grievances."

Petitions to a Court of Justice.—Strictly speaking these are no doubt an indirect mode of petitioning the crown, for in the theory of English law the crown is the fountain of justice. But it is more convenient to treat them separately, as they now form a part of the practice of the courts. Appeals to the House of Lords and the privy council are prosecuted by petition of appeal. The House of Lords has now no original jurisdiction in judicial matters; the original jurisdiction of the privy council in such matters is confined to petitions under certain statutes, such as the Endowed Schools Acts 1867 and 1873, the Public Schools Act 1868, the Universities Act 1877, and the Patents Act 1883. In most cases the petitions are referred to the judicial committee of the privy council. Petitions may be addressed to the lord chancellor in a few instances, such as the sealing of patents and the removal of coroners and county court judges. The most important use of petitions in England is in the Chancery Division of the High Court of Justice. They may be presented either as interlocutory proceedings in the course of an action, or as original proceedings where no litigation exists,—a petition being generally a more cheap and speedy form of remedy than an action. Petitions in the course of an action are usually presented to the court in which the action is brought. Examples of original petitions are those under the Lands Clauses Acts, the Trustee Acts, the Companies Acts. In a few cases they may be brought by way of appeal, e.g., under the Charitable Trusts Act 1860. Petitions are also modes of procedure in other courts with jurisdiction in equity, as the chancery courts of the county palatine of Lancaster and the county courts, in the latter only in certain cases falling within the County Courts Act 1865, 28 and 29 Vict. c. 99, s. 1 (5) and (6). They are used to initiate proceedings in bankruptcy and divorce, but are almost unknown in the Queen's Bench Division; the only case of procedure by petition in that division seems to be the petition to sue *in forma pauperis*. Evidence in support of a petition is usually given by affidavit.

In Scotland petitions in the Court of Session are either original or in a pending action. Original petitions are presented to one of the divisions of the inner house, unless they are included in any of the matters mentioned in 20 and 21 Vict. c. 56, s. 4, when they are brought before the junior lord ordinary, or unless, by special statutory provision, they may be brought before any lord ordinary, as in the case of petitions under the Conjugal Rights Act 1861, or the Trusts Act 1867. In the sheriff court actions are commenced by petition (39 and 40 Vict. c. 70, s. 6). A *petition and complaint* is a process of a quasi-criminal nature by which certain matters of extraordinary jurisdiction are brought under the notice of the Court of Session. It lies against magistrates and officers of the law for breach of duty, against parties guilty of contempt of court, &c. The concurrence of the lord advocate is necessary to a petition and complaint. A *reclaiming petition*, obsolete in the Court of Session, is a form of process of appeal in the sheriff court. See 39 and 40 Vict. c. 70, ss. 28, 30.

In the United States petitions can be presented to the courts under much the same circumstances as in England. "It is a general rule in such cases that an affidavit should be made that the facts therein contained are true as far as

known to the petitioner, and that those facts which he states as knowing from others he believes to be true" (Bouvier, *Law Dict.*).

Election Petition.—The article ELECTIONS must now be read subject to the Parliamentary Elections Act 1879 and the Judicature Act 1881. By the Act of 1879 the trial of an election petition is conducted before two judges instead of one, as before. If the judges differ in opinion as to whether the member petitioned against is duly elected or not, he is deemed to be duly elected. The Act of 1881 provides for the annual appointment of three judges of the Queen's Bench Division for the trial of election petitions, and makes the judgment of the High Court of Justice in election cases final unless leave be given to appeal to the Court of Appeal. No appeal lies to the House of Lords, nor can any judge who is a peer sit on the trial of an election petition.

Petition of Right is a term confined to English law. It is used in two senses. (1) It denotes the statute 3 Car. I. c. 1, a parliamentary declaration of the liberties of the people. (See ENGLAND, vol. viii. p. 345.) (2) It denotes a mode of prosecuting a claim against the crown by a subject. This remedy is said to owe its origin to Edward I. It lies as a rule for obtaining possession of real or personal property, or for breach of contract, not for breach of public duty, as failure to perform treaty obligations, or for trespass, or for negligence of crown servants. The remedy where the crown is in possession of property of the suppliant, and the title of the crown appears by record, as by inquest of office, is a somewhat different one, called *monstrans de droit*. The procedure on a petition of right is either at common law or by statute. At common law the petition suggests such a right as controverts the title of the crown, and the crown indorses upon the petition *Soit droit fait al partie*. Thereupon a commission is issued to inquire into the truth of the suggestion. After the return to the commission, the attorney-general pleads or demurs, and the merits are then determined as in actions between subject and subject. If the right be determined against the crown, judgment of *ousterlemain* or *amoveas manus* is given in favour of the suppliant. The Petitions of Right Act 1860 (23 and 24 Vict. c. 34, extended to Ireland by 36 and 37 Vict. c. 69) preserves to the suppliant his right to proceed at common law, but gives an alternative remedy. In proceedings under the statute the petition is left with the secretary of state for the home department for her majesty's consideration. She, if she think fit, grants her fiat that right be done, whereupon the fiat is served upon the solicitor to the treasury, and a statement of defence is put in on behalf of the crown. The proceedings are thenceforth assimilated as far as possible to those in an ordinary action. A judgment in favour of the suppliant is equivalent to a judgment of *amoveas manus*. Costs are payable to and by the crown. A petition of right is tried in the Chancery or Queen's Bench Division, unless the subject-matter of the petition arises out of the exercise of belligerent right on behalf of the crown, or would be cognizable in a prize court if the matter were in dispute between private persons. In either of these cases the suppliant may at his option intitle his petition in the Admiralty Division (27 and 28 Vict. c. 25, s. 52). (J. W. F.)

PETRA (ἡ Πέτρα, in ecclesiastical writers also αἱ Πέτραι), the capital city of the NABATEANS (q.v.), and the great centre of their caravan trade, is described by Strabo (xvi. p. 779) as lying in a level place, well supplied with water for horticulture and other uses, but encircled by a girdle of rocks, abrupt towards the outer side. The surrounding country was barren, especially towards Judæa; the distance from Jericho was three to four days' journey, and from Phœnicum on the Red Sea coast five (see plate VI., vol. vii.). Accord-
