{ No. 52.

ANNUAL REPORT

OF THE

COMMISSIONER OF PATENTS

FOR

THE YEAR 1868.

VOLUME II.

WASHINGTON.
GOVERNMENT PRINTING OFFICE.
1870.

IN THE HOUSE OF REPRESENTATIVES,

April 9, 1869.

Resolved by the House of Representatives, (the Senate concurring,) That there be printed thirty thousand extra copies of the next Report of the Commissioner of Patents, of which seventeen thousand shall be for the use of the House, eight thousand for the use of the Senate, and five thousand for the use of the Commissioner of Patents.

Attest:

EDW. MCPHERSON, *Clerk.*

IN SENATE OF THE UNITED STATES,

December 9, 1869.

Resolved, That the Senate agree to the resolution of the House of Representatives relative to printing the Report of the Commissioner of Patents.

Attest:

GEO. C. GORHAM, *Secretary.*

DESCRIPTIONS.

DESCRIPTIONS AND CLAIMS OF PATENTS

ISSUED IN THE YEAR 1868.

ILLUSTRATED WITH ENGRAVINGS.

VOLUME II.

77,433.—MOSES ADSIT, Forest, N. Y.—*Draught Attachment.*—May 5, 1868.—The doubletree pin is at the front side of the doubletree. The clevises are attached to bars sliding at the rear side of the doubletree and secured by a pin to the holding strap and tongue, so that when either horse walks ahead of the other the clevis to which it is attached is made to approach the fulcrum pin.

Claim.—The plates *b b*, sliding in grooves upon the top and bottom of the doubletree B in front of the band D, said plates *b* secured together at their ends and centers by the bolts *c e*, which slide in the slots *d f* of the doubletree, all constructed and arranged to operate as herein described for the purpose specified.

77,434.—D. E. AIKEN and A. A. AIKEN, Adrian, Mich.—*Splint Plane.*—May 5, 1868.—The thickness of the slat is regulated by the spring tongue at the end of the wedge, the tongue being adjusted by a set screw at the point. The plane is intended for making blind slats, each one pushing the preceding one out.

Claim.—The wedge C of the plane provided with a longitudinal groove in its under side, in which is secured one end of the spring E, whose free end is adjusted to regulate the thickness of the slat to be cut by the screw G passing through the wedge, all constructed, arranged, and operating as described for the purpose specified.

77,435.—C. ALBERT, Harrisville, Ohio.—*Sheep Holder.*—May 5, 1868.—The feet of the animal are secured to the toggles at the branching arms of the standards. The standards may be swaged to either side and set by a ratchet wheel and pawls.

Claim.—The adjustable standards E, arms F, in combination with the socket stays D and rollers C, in the manner as and for the purpose set forth.

77,436.—DAVID ALDRICH, New York, N. Y., assignor to PHELAN & COLLENDER, same place.—*Cue Trimmer.*—May 5, 1868.—The end of the cue is inserted in the hollow hand-piece, and the carriage which reciprocates at the end thereof carries the trimming knife, and is actuated by a spring lever.

Claim.—1. The hollow hand-piece and cue-holder, with its table or slide-holder, *b*, in combination with a reciprocating carriage, provided with a cutter, substantially as and for the purposes set forth.

2. The employment, in combination with the hollow cue-holder and hand-piece, of a reciprocating cutter carriage and the driving lever D, the whole arranged to operate in the manner and for the purpose substantially as described.

3. The removable cutter *g*, in combination with the cutter carriage and table *b*, substantially as and for the purpose described.

77,437.—ALBERT F. ALLEN, Providence, R. I.—*Thimble Puller.*—May 5, 1868.—The expansible jaws are made to engage the thimble, the surrounding sleeve acts as a fulcrum against the end of the tube, and the mandrel and thimble are drawn forward by

a nut screwing upon the mandrel and bearing against the sleeve.

Claim.—The combination of the expansible catches or jaws E E E, or their equivalent, the expanding wedge F, the sleeve M, and the screw mandrel H, and nut P, constructed substantially as described for the purpose set forth.

77,438.—OLIVER E. ALLEN, New York, N. Y.—*Car Spring.*—May 5, 1868.—The circumference of the cylindrical block of rubber is wound with yarn and the whole placed within an inverted cylindrical cup whose lower edge incloses and slides vertically upon a plunger upon which the block is placed.

Claim.—1. A spool for a car or other spring, composed of an India-rubber center, surrounded by woolen yarn or other exterior elastic covering, substantially as described.

2. A car spring, composed of vulcanized rubber, and wound around by woolen yarn or other exterior elastic covering, and placed and used in a metallic case or exterior, substantially as herein described.

77,439.—SOLOMON ANDERSON, West Burlington, N. Y.—*Saw.*—May 5, 1868.—The holes pass obliquely through the plate, forming cutting edges on both sides of the hole.

Claim.—The perforations *c'* in the saw plate A, having upper and lower cutting edges, *d e*, and used either with or without the cutting edges *f g* of the holes *b*, substantially as and for the purpose set forth.

77,440.—CHARLES BANGE, St. Louis, Mo.—*Clothes Drier.*—May 5, 1868.—The clothes being placed between the rack and the perforated side of the hanging cylinder are dried by the rotary motion of the latter.

Claim.—The fixed cylinder D, revolving perforated cylinder E, uprights 1, 2, 3, 4, &c., hoop *s*, chains *d d'*, and collar *e*, all in combination with the wheels H, K, *p b*, and F, and their respective shafts, when arranged in relation to each other and the framework of the machine, substantially as and for the purpose specified.

77,441.—ANDREW H. BIXLER, Carlisle, Pa.—*Open Ring.*—May 5, 1868.—Two open rings are pivoted together by an arm upon each, so that when they are turned into a parallel position a closed ring is formed.

Claim.—The elliptical parts A A and B B, joined by the hinge and pin C, and the trapezoid extension D, of the part A A, all constructed and combined in the manner and for the purpose herein set forth.

77,442.—J. D. BLAKE, Laconia, assignor to himself and J. A. SANBORN, Holderness, N. H.—*Soap Stand.*—May 5, 1868.—The stand is clamped upon the side of the tub by the depending lugs, and the soap dish is held upon the stand by the two fixed clips and the spring clip.

Claim.—The base plate A, provided with stationary clips B B, movable clip C, and clamp lugs

m m, together composing a soap stand, substantially as herein specified.

77,443.—ERNST BREDT, New York, N. Y.—*Button*.—May 5, 1868; antedated April 25, 1868.—The button shell is formed of a woven material, stiffened and pressed between dies, so that an ornamental shape is given thereto.

Claim.—A button shell, formed of stiffened woven or fibrous material, pressed up to the required shape between dies, as specified, in combination with a base or shank, substantially as set forth.

77,444.—WILLIS S. BRONSON, Hartford, Conn.—*Base Burning Stove*.—May 5, 1868.—The plate supporting the fire pot, and separating the ash pit from the combustion chamber, has air ports, with dampers, to limit the supply of air. The combustion chamber has a double top, through which air circulates. A circular series of flues extend from the combustion chamber to a circular chamber beneath the oven. A two-plated damper closes the feed openings to the reservoir in the plates at top and bottom of the circular flue chamber, and is drawn back when supplying fuel.

Claim.—1. The double ventilated top *c*, which covers the combustion chamber *b'*, and forms a support for the magazine or reservoir *d*, substantially as and for the purpose described.

2. In combination with the double ventilated plate *c*, and magazine *d*, the conducting tubes *f* and double movable damper, and dividing flue plates *g*, substantially as and for the purpose described.

3. The arrangement of the oven *k*, directly over and in combination with the double movable damper and dividing flue plates *g*, substantially as and for the purpose described.

4. The double movable damper and dividing flue plate *g* arranged in and forming the smoke and hot air flues *e e*, substantially as and for the purpose described.

77,445.—WILLIS S. BRONSON, Hartford, Conn.—*Fire Grate*.—May 5, 1868.—An oscillating grate turns on the perforated pivot on a stationary cross bar. The grate has tubular upward projections through which the air passes to the fire, and which serve by the oscillation of the grate to stir the same.

Claim.—1. The hollow stationary hub *b c*, constructed and arranged upon the supporting bar *a*, substantially as and for the purpose described.

2. The grate *f*, as constructed, in combination with said supporting bar *a*, substantially as and for the purpose described.

77,446.—DARIUS C. BROWN, Lowell, Mass.—*Harness Frame for Looms*.—May 5, 1868.—The object is to enable the harness frame, after the heddles have been supplied with warp, to be bent around the curved surface of the warp beam. For this purpose the end connection bars of the string bars are made of thin and elastic metal, or other material that may be bent to conform to the surface of the warp beam or roller.

Claim.—1. The improved harness or heddle frame, as made with elastic connection bars *C C*, substantially as and for the purpose specified.

2. The combination with the bars *A B* and brackets, and string bars supported in such brackets, of the elastic connection bars *C C*, substantially as herein shown and described.

77,447.—FREDERICK W. BROWN, Philadelphia, Pa.—*Device for Soldering the Lids of Cans*.—May 5, 1868; antedated April 21, 1868.—The plano-convex block is attached by a chain to the sharp pointed lever, and is heated when used for attaching the can lids, and the stick of solder is passed around its periphery in contact with the junction between the lid and can. When removing the lid the heated block is placed upon the same, which is then raised by the lever.

Claim.—The combination, substantially as described, of the block *A*, instrument *D*, and chain *C*, for the purpose specified.

77,448.—SILAS H. BROWN, Troy, N. Y.—*Stop Valve*.—May 5, 1868.—A movable brace lever is

hinged to, and operates in combination with the valve to shut the same, and keep it shut, until its opening movement commences, when the valve is relieved from the shutting pressure of the lever.

Claim.—1. In combination with a valve *B*, and its actuating stem *D*, a movable or sliding lever brace *C*, so attached to and operating with the valve that when said valve is closed said lever braces it tight on its seat, and when said valve is opened said lever moves with it, so as to leave an entirely unobstructed passage way within the pipe, in manner substantially as herein described, and for the purpose as set forth.

2. In combination with said valve *B*, its stem *D*, and sliding brace lever *C*, the grooves or shoulders *E E* of the valve chamber *A*, said grooves or shoulders being inclined relatively to the valve seat *H*, substantially as and for the purposes described.

3. The combination and arrangement of the valve *B*, its stem *D*, the sliding movable brace lever *C*, and the grooves or shoulders *E E*, when applied in manner substantially as described, and operating for the purposes as set forth.

77,449.—THEODORE BRUNO, Saginaw, Mich.—*Machine for Sawing Laths*.—May 5, 1868.—The fixed fence being used, a strip will be cut by each saw on the mandrel; but the depressible fence being used, a smaller number will be cut. The depressible fence, or guide, may be placed so low that the stuff will pass over it.

Claim.—The gauge *M*, working in the longitudinal slot in front of the guide *L*, and resting upon the spring *N*, operated by the lever *O*, whereby the number of strips to be cut from the board at one operation is regulated, as herein shown and described.

77,450.—LEWIS BURGER, Springfield, Ill., assignor to himself and ISAAC L. HAMBURGER, Albany, N. Y.—*Door Directory*.—May 5, 1868.—Within the box, to be attached to the outside of a door, is a series of rollers with inscriptions displayed through holes, and indicating absence, destination, &c. Hands may indicate time of return. A slate is ready to receive orders, &c.

Claim.—1. A door directory, consisting of a box, with perforated dial plate *A*, and of various rollers, aprons, and hands, to indicate time and date of return, and other notes, substantially as herein shown and described, the rollers, aprons, or hands only being adjustable, by means of a suitable key, as described.

2. The combined cover and slate *G*, when the same is arranged on a door indicator, substantially as herein shown and described.

3. The letter box *H*, card holder *I*, and pencil holder *J*, when arranged in combination with the door indicator, all made and operating substantially as and for the purpose herein shown and described.

77,451.—DANIEL BURNS, Bay City, Mich.—*Combined Low Water Detector and Safety Valve*.—May 5, 1868.—The falling of the float acts through a lever upon the beam of the safety valve, to cause the raising of the latter when the water falls below a safe level.

Claim.—The arrangement of the within described box *G*, filled as specified, with the levers *D I K*, the valves *A B*, the weight *T*, and the crocheted slide *E*, substantially as and for the purpose set forth.

77,452.—VICTOR H. BUSCHMANN, Baltimore, Md.—*Rack for Billiard Cue*.—May 5, 1868; antedated April 25, 1868.—Each of the retaining buttons of the respective receptacles of a cue rack is operated by a weighted lever to open the receptacle, and is closed by the weight of the cue when inserted.

Claim.—So constructing a billiard cue receptacle that the weight of the cue, when placed therein, shall close it, and when the cue is withdrawn the receptacle will open, and remain open, for the return of the cue.

77,453.—GEORGE CAHILL, New York, N. Y., assignor to ISAAC G. JOHNSON, J. F. HUNTER, and PETER P. KELLER, same place.—*Machine for Tapping and Drilling*.—May 5, 1868.—The head of the spindle has sockets for taps or drills radiating from it in a vertical plane, and the object is to cause the partial rotation of the head to bring another tap into

operation while the spindle is rotating. This is done pin by a forked lever, which first withdraws the stop and then causes the said rotary movement of the head.

Claim.—1. The combination of the collar C, friction band *c*, forked lever D, fingers *e e*, shoulder *a*, jointed arm E, or their respective equivalents, all constructed and arranged in the manner and for the purpose specified and set forth.

2. The system of levers G, cam H, and pin I, when constructed, combined, and applied to the forked spindle of a tapping machine, in the manner and for the purpose herein specified and set forth.

3. The forked lever D, movable collar C, slotted strap L, the lever arms K K, rods M M, arms N N, shaft O, disk P, all constructed and combined, and all applied to and used upon the forked spindle of a tapping machine, in the manner and for the purpose specified and set forth.

4. The improved tapping machine, consisting of the several parts hereinbefore specified, all constructed and arranged substantially as described.

77,454.—GEORGE CANDEE, Berlin Heights, Ohio.—*Feed Water Heater for Steam Generators.*—May 5, 1868.—The caloric current, after leaving the flues of the boiler, has a backward and forward course through a number of hexagonally-arranged cylindrical pipes surrounded by a water jacket, and connected by U-bends at their alternate ends. The feed water passes through the water jacket.

Claim.—Passing the feed water or air through successive chambers, (heated as described,) of a lower to a higher temperature, in the manner and for the purposes herein set forth and described.

77,455.—CHARLES P. CARTER, Poughkeepsie, N. Y.—*Implement for Sharpening Watch Wood.*—May 5, 1868.—The angular knife is set in an angle-faced block, which is attached to the bench, and used for sharpening the splints of soft wood used by watchmakers.

Claim.—The block *a*, knife *b*, and screw *c*, when arranged and combined to operate substantially the same as shown and described.

77,456.—JOHN B. CHRISTIAN, Mount Carroll, and JOHN GUNN, Salem Township, Ill.—*Railroad.*—May 5, 1868.—The railroad track has additional hollow rolled iron rails laid inside the usual rails, and the cars have one or more pairs of additional broad flanged wheels hanging immediately over the additional rails, and supporting the truck in case of accident.

Claim.—1. The construction and arrangement of a railroad track, composed of the hollow rolled iron rails A A, placed inside of the usual T-rails, substantially as and for the purposes set forth.

2. The construction and arrangement of railroad cars having two or more pairs of broad flanged wheels B B, substantially as and for the purpose specified.

3. The lever H H, in combination with the spiral springs O O, moving in the periphery of a circle, for the purpose substantially as set forth.

77,457.—JOHN C. CLIME, Philadelphia, Pa., assignor to himself and J. MOORE HENDRICKS, same place.—*Bedstead Fastener.*—May 5, 1868.—The attaching bolts are screwed into the rail and traverse the tenon block which rests in a mortise of the post. The bolt passes through the post and is secured by a nut.

Claim.—The device, consisting of the bolt C and tenon block D, in one piece, and screw cap E, in combination with the rails and parts of a bedstead, for fastening said rails and parts together.

77,458.—HENRY COLLINSON, Boston, assignor to himself and SAMUEL VANCE, South Boston, and SAMUEL VANCE, assignor to JAMES O. BOYLE, Boston, Mass.—*Grate Bar.*—May 5, 1868.—The air passages increase in diameter downward, and their bottoms slope outward and downward, both formations being intended to aid in discharge of ashes.

Claim.—1. A grate bar, as made, with its air passages extended entirely across it.

2. The arrangement of the transverse passages obliquely in the bar, in manner as specified.

3. The grate bar, as made, with air passages extending across it, and to increase in width from their upper to their lower parts, as specified.

77,459.—GEORGE CONRON, New York, N. Y.—*Water Closet.*—May 5, 1868.—The valve is covered with vulcanized rubber, and is held to its seat by the weight of water. When raised, the contents of the pan are discharged by the lower pipe. Excess of water above is carried off by the inverted U pipe. This pipe is prevented from acting as a siphon by an air pipe in its vertex.

Claim.—The valve chamber E, pipe B, pipe D, pan I, overflow pipe C, and valve A, all constructed and operating together, substantially as shown and described, and for the purpose set forth.

77,460.—A. L. CONVERSE, Springfield, Ill.—*Churn.*—May 5, 1868.—The churn has four vertical dashers turned by gear connection with a horizontal crank shaft.

Claim.—The outer gear wheels I, central gear wheels J K, beveled gear wheel L, plates G, bearings N, and shaft M, when arranged to operate upon the hinged rectangular central lid C, as herein shown and described.

77,461.—O. H. COOKE, Morrisville, Vt.—*Potato Washer.*—May 5, 1868.—Stepped in the perforated false bottom is a vertical shaft at whose lower end is a triangular cross bar.

Claim.—The combination of the perforated bottom B, with or without the metal ring around its periphery, with the sharp-edged float E, crank D, and wooden cross piece C, made and arranged and operating substantially as and for the purposes above set forth.

77,462.—ALPHEUS B. CORBY, Binghamton, N. Y.—*Churn.*—May 5, 1868.—The pallets are in the form of pawls, which engage the cogs of the spur wheel turned by the spring, and which are pivoted to the "cam" upon the pendulum shaft. The pallets are raised from the wheel by the movement of the guide blocks. The motion of the pendulum may be used to cause the movement of a vertically reciprocating rotary or oscillating churn dasher.

Claim.—1. The escapement apparatus, consisting of the pallets *v v'*, cam F, shafts *g G*, and guides *m n*, when used for the purposes described,

2. The arrangement and combination of said escapement apparatus with the spur wheels W W', drum R, ratchet wheel *t*, pinion *i*, weight T, pendulum P, and frame A B C D, substantially as and for the purpose set forth.

77,463.—LEWIS B. COVERT, New York, N. Y.—*Extension Step Ladder.*—May 5, 1868.—Both legs of the step ladder are extensible. The lower portion of the steps are two-part. A frame is fitted to slide between the said steps, and the frame carries swinging steps that can be turned down flat and held by keys, or turned up edgewise to pass between the two-part steps.

Claim.—1. A step ladder, formed with the two-part steps *b*, extension pieces *c*, and their steps, substantially as specified.

2. The swinging steps *h*, supported by the castings *g*, in the manner specified, in combination with extension step ladder aforesaid.

3. The extension legs *l o*, in combination with the extension step ladder, provided with the swinging steps, as and for the purposes set forth.

77,464.—JAMES P. DAVIS, Stiles, Wis.—*Mechanical Movement.*—May 5, 1868.—The adjustable friction bars have longitudinal reciprocation between the friction rollers, and are held between loosely-running pulleys that serve as guides. The movement of the piston is limited by a crank upon the fly-wheel shaft. The main shaft has a spur wheel engaging spur wheels upon the shafts of the friction pulleys, receiving motion from them alternately. The main shaft is connected by a belt with the fly-wheel shaft.

Claim.—1. The recessed friction pulleys D and racks *a*, operating substantially as shown and described, and for the purpose specified.

2. The gear wheels G G' H, substantially as shown and described, in combination with the friction pulleys D D, as and for the purpose set forth.

3. The pulley I, belt *h*, and fly wheel, substantially as shown and described, in combination with the recessed friction pulleys D and cross head F, for the purpose of accomplishing the more perfect working of the parts, all as set forth.

4. The cross head F, cogs *n*, friction racks *a*, substantially as shown and described, in combination with the friction pulleys D, all as and for the purpose set forth.

77,465.—EDWIN DAYTON, Meriden, Conn.—*Cement Water Pipe.*—May 5, 1868.—In jointing the ends of compound pipe which is made of cement and thin metal, the ends have respectively an inside and outside bevel given to them, and one being inserted into the other the joint is covered with a collar of cement which may be cased in a metallic shell.

Claim.—1. The short pipe E, of tapering shape, fitting into the adjoining ends of the pipes A B, to form a water-tight joint, and coated upon the inner and outer sides equally with cement, as herein shown and described.

2. The packing ring or band *a*, applied to the pipe sections, substantially as and for the purpose described.

77,466.—THOMAS H. DONOHUE, Washington, D. C.—*Chimney Cleaner.*—May 5, 1868.—The brushes are attached by toggles and collars to the shaft, and are expanded and contracted by slipping the movable collar on the stem. Each brush is attached to one member of the secondary toggle which connects the knee joints of the vertical toggles, which effect the expansion.

Claim.—1. The combination of the fixed and sliding collars B C and their connecting arms *a b* with the bars or segments *c*, pivoted together and supported on the shaft A, for operation together, substantially as set forth.

2. In combination with the bars or segments *c*, connected and supported as described, the braces *d* and sliding collar E, all arranged and operating substantially as described.

3. In combination with the adjustable expanding frame, constructed substantially as described, the detachable brushes F or scrapers G, as and for the purposes set forth.

77,467.—CLAUDE DUCREUX, New York, N. Y.—*Wagon Brake.*—May 5, 1868.—Improvement on his patent, January 1, 1867. Collars are placed upon the hubs, whose friction thereon is adjustable by screws. The brake lever, when braking the wagon, is moved to engage a lug upon the collar and prevent its rotation with the wheel, thereby checking or stopping the rotation of the same.

Claim.—The adjustable rings C C on the hubs of the wagon wheels, when provided with lugs *b b*, in combination with the oscillating bar D, having lugs *d*, all arranged and operating substantially as herein shown and described.

77,468.—MILTON ECKLEY, Olney, Ill.—*Machine for Cleaning Grain.*—May 5, 1868.—The grain is subjected to the action of the agitated riddle and the blast of air from the fan, and thence falls into the revolving screen, whose internal spiral flange delivers it at the end.

Claim.—1. The arrangement of the fans G, riddle K, and compound cylindrical screen D, substantially as described, for the purpose specified.

2. The construction and arrangement of the fans G, riddle K, spouts I J, compound cylindrical screen D, and shafts B F, substantially as described, for the purpose specified.

77,469.—FRANCIS ELLERSHAUSEN, Montreal, Canada East.—*Converting Cast Iron into Cast Steel and Malleable Iron.*—May 5, 1868.—The cast iron in a molten state is poured over surfaces containing oxygen and oxide of iron upon sheet iron plates.

Claim.—1. Converting cast or pig iron into cast steel or malleable iron, by bringing it in a liquid state in contact with hot or cold solid oxides, substantially as herein specified.

2. Bringing to an instantaneous uniform contact, at a sufficient heat, on a sufficiently large hot or cold surface of pure oxide, the carbon contained in molten cast iron, so as to cause a rapid, violent combustion of the carbon, substantially as described.

77,470.—JOHN ELLIS, New York, N. Y.—*Material for Purifying and Decoloring Petroleum.*—May 5, 1868.—The bones are calcined to a gray color and used as a filtering material. Navassa phosphate of lime, or other deposits containing phosphate of lime or phosphorus, may be kept at a red heat in contact with the air until sufficiently charred, and used in the same manner as the bone phosphate.

Claim.—1. The method of preparing bones, animal charcoal, Navassa phosphate of lime, and other phosphatic deposits, in the manner described in the foregoing specifications, as materials for filtering and bleaching petroleum and other fluids.

2. For the purpose of filtering and bleaching petroleum and all the fluids produced from it, including residuum and the heavier oil, after the lighter fluids have been separated from it, the use of pure phosphate of lime, and the commercial article, and also either and all, separately or combined, of the materials or substances which result from treating bones, animal charcoal, Navassa phosphate of lime, or other phosphatic deposits, in the manner described in the foregoing specifications.

77,471.—WILLIAM B. EMERY, Albany, N. Y.—*Machine for Threshing and Cleaning Grain.*—May 5, 1868.—The straw and grain pass from the threshing cylinder to an apron, and are then received upon an inclined elevator which raises and delivers them to a revolving beater. They then fall onto a slatted bed, and are then tossed by vibrating fingers before the final delivery off the end of the separator. The agitation of the separator and the shoe in different directions prevents extreme agitation of the machine itself. The adjustment of the bonnet by the outside lever directs the current of straw and grain issuing from the cylinder.

Claim.—1. Combining with a self cleaning threshing machine, (in which the shoe and the separator vibrate in opposite directions,) an endless straw elevator, having an apron between it and the threshing cylinder, arranged substantially as and for the purpose specified.

2. Deflecting the edge S of the apron upwards, substantially as and for the purpose specified.

3. The beater N, in combination with the elevator D and apron *b b*, substantially as specified, whether the shoe and the separator vibrate in opposite directions or in unison.

4. The lever Y of the bonnet, whereby the bonnet may be adjusted from the outside of the machine, substantially as and for the purpose specified.

77,472.—ISAAC FISHER, St. Louis, Mo.—*Vise.*—May 5, 1868.—The vise has adjustment in a horizontal and in a vertical plane.

Claim.—The improved vise A, the same having two axes or centers of adjustment, arranged substantially as described.

77,473.—W. A. FLANDERS, Shelby, Ohio.—*Bee Hive.*—May 5, 1868.—The foundation for the comb is formed of wood or other material coated with wax, which is impressed to give a good face for attachment for the comb. The foundation is traversed by a pipe to give passage for the bees.

Claim.—The honey-comb foundation B, when provided with a passage, *x*, and constructed substantially as and for the purposes herein specified.

77,474.—SIMEON B. FORBES, New Cumberland, W. Va.—*Double Shovel Cultivator.*—May 5, 1868.—The sole bar is pivoted to the standard, and its rear end is connected to the standard by an adjustable brace. The share is double winged, and the double mold board is removable.

Claim.—1. The combination of the sole D, double winged point E, and double mold board F, with each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the adjustable brace G with the curved rear parts of the beam A and with th

sole D, substantially as herein shown and described, and for the purpose set forth.

77,475.—WILLIAM H. FORKER, Meadville, Pa.—*Paint Brush.*—May 5, 1868.—The bristles are first thrust through the ring and the cap placed on it. The handle is then thrust up through the middle of the mass of bristles and secured by the nut, which screws upon the screw-threaded ferrule and draws the spreading ferrule within the socket.

Claim.—The solid wooden handle A, of full length, with its conical ferrule F, which, in combination with the nut C, operating on the cap D from above, holds all the parts firmly together, when constructed as and for the purpose set forth.

77,476.—MATTHEW H. FOSTER and HUBERT C. HART, Unionville, Conn.—*Nut Making Machine.*—May 5, 1868.—The blank is cut from the bar by a plunger cutter, operated by a cam on the shaft. A sliding bed conveys the blank from the cutter to the punch and die, as the button on the bed traverses in the cam groove of the wheel above it. The formers move at right angles to each other. One is actuated by projections on the face of the wheel, and the other by a lever on the bed and projections on the periphery of the wheel. The formers, in connection with stationary bars, form four square sides. The descending slide passes the blank into the concave die and the punch drives a hole through it.

Claim.—1. Sliding bed B, having button G and pivoted lever I thereon, with cam wheel F, provided with studs *k k'*, all constructed and arranged substantially as described.

2. Arranging the cams *a b c d e s s'* so as to operate the cutter *n*, slide *m*, and punch *p*, substantially as set forth.

3. The improved nut machine, consisting of mechanism constructed, combined, and arranged substantially as herein set forth.

77,477.—JAMES R. GILLETT, Westfield, Mass.—*Whip.*—May 5, 1868.—The core of the whip is covered by metallic foil to prevent the moisture affecting it.

Claim.—Interposing a metallic lining, B, between the core A and covering C of a whip, substantially as and for the purpose herein shown and described.

77,478.—O. T. GLEASON, Farmington, Me.—*Velocipede.*—May 5, 1868.—The supporting wheels are turned by friction wheels actuated by treadles. The machine lays its own track consisting of straight hinged sections.

Claim.—1. The combination of four traction wheels, each having a friction boss, A, with the friction driving wheels P, shaft J, double crank I I, and treadles H H, all substantially as shown and described, and for the purpose set forth.

2. The lever bearings L, rods N, and steering levers E, all constructed and operating together, substantially as shown and described, and for the purpose set forth.

77,479.—LYMAN B. GOODHUE, St. Louis, Mo.—*Furnace for Melting Glass.*—May 5, 1868.—The fixed pots extend from the furnace bottom (where they are perforated) either through the furnace top or through the shelf forming the bottom of the melting chamber into which the "batch" is placed. The material, as melted, runs down into the lower chamber through which the calorific current first passes from the furnace. Across the top of the lower chamber are stretched transverse, reverberatory arches to check the current, and deflect the heat upon the molten glass. The wall of the bottom and some distance up the sides is chambered to contain dry sand to prevent the escape of glass through any cracks forming in the fire clay.

Claim.—1. The shelf D of a furnace for melting glass, as shown and specified.

2. The combination of a furnace for melting glass with immovable pots, as specified.

3. The employment of reverberatory arches in a furnace for melting glass, arranged as specified.

4. The packing of a furnace for melting glass with sand, as specified.

5. A furnace for melting glass, when constructed substantially as shown and specified.

77,480.—JOHN GOURLAY, Escanaba, Mich.—*Portable Bath House.*—May 5, 1868.—The parts of the bath house are made detachable so that it can be moved from one apartment to another. The tank is suspended upon cords operated by a windlass, so that it can be lowered for filling and raised for a shower bath.

Claim.—The general combination and arrangement of the tank I, slides H H, pulleys K K, J, cord U, drum X, gate M, lever *n*, crank P, with house A B C D E F G, substantially as set forth.

77,481.—JOHN GRACIE and ROBERT H. BOYD, Pittsburg, Pa.—*Lamp Burner.*—May 5, 1868.—The lower end of the wick tube is covered by gauze or bent upward to prevent the descent of the wick below it and the burning out of the hydrocarbon to expose its lower end. The gas trap has small tubes which have a U bend, the ends communicating respectively with the globe and with the gas reservoir.

Claim.—1. A wick tube *m m'*, partially closed at its lower end by an indentation, *z*, or other equivalent device, substantially as and for the purposes above set forth.

2. An opening or openings leading from the globe or oil receptacle of a lamp to the inside of the burner, each opening being covered with wire gauze, finely-perforated plate, or provided with a gas trap, and arranged within the burner, substantially as and for the purposes described.

77,482.—HARRY S. GRIFFITHS, Brooklyn, N. Y.—*Suspension Ring.*—May 5, 1868.—The plate of the suspending ring has points which are forced through the card.

Claim.—The suspension ring for business cards, constructed and employed substantially as and for the purpose herein described.

77,483.—EDWARD H. HART, New York, N. Y.—*Fur Cuff.*—May 5, 1868.—The overlapping portion is secured to the other end by an elastic band which elongates as the cuff is drawn over the hand, and the overlapping end is then fastened down to the band of the cuff by another elastic band and a catch.

Claim.—A fur cuff, provided with a connecting elastic band, E, in combination with the elastic fastening band F, the whole arranged substantially as shown and described.

77,484.—ISAAC A. HEDGES and JOSEPH M. STORY, Cincinnati, Ohio, assignors to LANE & BODLEY, same place.—*Machine for Sawing Laths.*—May 5, 1868.—The feed rolls are journaled in vertically adjustable rods. The belt which drives the feed rolls passes around an idler pulley turning upon an arbor fixed to a weighted lever.

Claim.—1. The pivoted weighted lever L' and pulley I, in combination with the belt *e* and pulleys *f* upon the feed rolls, all arranged and operating as described, whereby the belt is tightened, and the feed rolls held in their bearings, as herein shown and described.

2. The journal boxes *j* for the shaft K, secured by pivots *k* in the holders *l*, having the vertical shafts *m*, which are adjusted higher or lower in the framing, as herein described, for the purpose specified.

77,485.—JOHN I. HERRICK, Milwaukee, Wis.—*Street Car.*—May 5, 1868; antedated April 28, 1868.—The wheels of the cars are mounted on runners when required. The runners are attached to the car bottom by swivel bolts and hooks, the latter engaging studs projecting from the inner sides of the runners.

Claim.—1. Runners D, constructed and connected substantially as and for the purposes set forth.

2. In combination with said runners, the attaching apparatus E, G, and H, and the hooks and supports, substantially as and for the purpose set forth.

3. Platform or bottom A, wheels B, and runners D, in combination substantially as and for the purpose set forth.

77,486.—REUBEN HOFFHEINS, Dover, Pa.—*Reaping Machine.*—May 5, 1868; antedated April 22, 1868.—The cutting apparatus is hinged to a frame which is articulated on the axle. The rake axis and

reel post are upon the shoe, and the rake and reel preserve their relation to the cutter and platform during vertical oscillations of the latter. A prolongation of the rake head passes through a pivoted bar which is oscillated by a crank on the driving wheel axle. The rake is thereby swept along the platform, lifted, carried forward in an elevated position, and then dropped to its work again.

Claim.—1. A "forward cut" harvesting machine which has its finger beam or cutting apparatus hinged to a frame, which articulates on the axle of the driving wheels, without materially affecting the position of the draught frame and tongue, and to which finger beam is attached a platform carrying a circularly-moving sweep rake, said harvesting machine also having a device for adjusting the cutting apparatus, and a seat for the driver, such seat being in such relation to the adjusting device that the driver can raise and lower the cutting apparatus, platform, and rake while the machine is in operation, and while he is seated, substantially as set forth.

2. The combination of a forward cut hinged cutting apparatus, a frame articulating on the main axle, a quadrant platform, a sweep rake, and a reel moving in harmony with the platform and cutting apparatus, a driver's seat on the draught frame, and a device for raising and lowering the cutting apparatus, platform, rake, and reel while the machine is in motion, and while the driver is seated, substantially as set forth.

3. A circularly-moving sweep rake, a hinged platform of quadrant form, and a hinged finger beam, all connected together and moving in harmony with one another, as the platform and finger beam are caused to rise and fall by the undulations of the ground, in combination with a draught frame of a "forward cut" harvester, which has two supporting wheels applied on a single axle, and which also has a frame and tongue hinged so as to articulate independently of the frame to which the finger beam is hinged, and which articulates on the said axle, substantially as set forth.

77,487.—FRANCIS M. HOWARD and DANIEL W. AVERY, St. Paul, Ind.—*Ditching and Grading Machine.*—May 5, 1868.—The share is attached to the lower ends of the slotted, vertically adjustable side plates, and delivers the earth onto the endless carrier, which is driven by gearing from the ground wheels and delivers the dirt above the level of the ditch.

Claim.—1. The adjustable slotted guides *m*, in combination with the plow or enter *c*, substantially as and for the purposes set forth.

2. In combination with the above, and with the toothed wheel *g'* and shaft *G*, the jaws *a*, riveted to the belt *B* and the pivoted carrier beam *b*, all constructed, arranged, and operating as and for the purposes set forth.

77,488.—FRANK E. HOWE, New York, N. Y., and LINDSAY I. HOWE, Boston, Mass.—*Combined Coal Hopper and Platform Scale.*—May 5, 1868.—The weighing hopper is supported by a weighing apparatus, and it has an opening bottom to discharge the contents.

Claim.—The arrangement of the hopper *F*, in the frame *E*, supported upon the scale platform *D*, when such hopper is adapted to discharge the coal into the hopper *I*, passing directly through the scale platform *D*, as herein shown and described.

77,489.—JARVIS HOWE, Milford, Mass.—*Boo Form.*—May 5, 1868.—The wooden "leg" and "foot" parts of the tree are made in separate pieces, with the grain running longitudinally, and attached together by a bent piece of metal. The direction of the crimping screw is changed, by changing that of the socket into which it screws, by drawing it out slightly and changing the lug upon it to another notch in the plate. The socket is drawn inward by a spiral spring.

Claim.—1. As an article of manufacture, a boot form, having a metal edge, substantially as and for the purpose specified.

2. The combination of the parts *A*, *B*, and *C*, substantially as and for the purpose specified.

3. The thimble, when combined with a plate, hav-

ing lugs and the notches, substantially as and for the purpose specified.

4. As articles of manufacture, the parts *A* and *B*, when constructed and arranged for use on the part *C*, each substantially as described.

5. The arrangement of the piece *D* in the chamber, substantially as shown.

6. A boot form, the leg and foot parts of which are separate pieces, united together by a third piece, substantially as described and for the purpose specified.

77,490.—SIDNEY S. HURLBUT, Cordova, Ill.—*Grain Separator.*—May 5, 1868.—The grain passes over a number of sieves in one shoe, and is divided into three qualities, of which the good grain passes to one place and the refuse to another, while the mixture of the two is elevated and discharged into the hopper to be passed through again.

Claim.—1. The combination of the screening shoe, constructed and operating substantially as described, with an elevator, which leads back into the hopper, and with a cleaned grain discharge passage, substantially as described, and for the purpose set forth.

2. The employment of an elevator which will return that portion of the wheat which escapes from the screens in an unclean state back to the hopper to be re-screened, substantially as specified.

3. The combination of the screens *L*, *p*, and *r'*, the short screens *s* *t*, the cut-off *T*, and the gauge *V*, with means for conveying the clean wheat out of the machine, and also for conducting back to the first screen *L* the wheat which is mixed with foreign substances, substantially as described.

77,491.—JOEL C. JACKSON, Rochester, N. Y., and FREDERICK J. JACKSON, Danbury, Conn.—*Bedstead Fastening.*—May 5, 1868.—The rail has downturned pins which enter inclined mortises in the post. The pins have screw-threaded ends which pass longitudinally into the rails.

Claim.—The bedstead fastening, formed of the inclined hooks *c*, with their threaded shanks *c'*, screwed into the ends of the rail, as set forth, and entering corresponding holes in the posts, as specified.

77,492.—JASPER S. JEWETT, Ottawa, Ill.—*Fence Gate.*—May 5, 1868.—The uprights and rails are pivoted together, and the top bars are counterpoised and pivoted to the posts, and connected to a series of levers operated by cords over the center of the road, so that the gates can be swung upward and backward by drawing one of the cords.

Claim.—1. The two gates *C* *C*, the rods *I* *I*, the levers *J* *J*, the levers *M* *M*, the hollow casting *L*, the ropes *O* *O*, and the ropes *O'* *O'*, when combined with each other in a double fence gate, and constructed substantially as and for the purpose described in the foregoing specification.

2. The catches *Q* *Q*, the ropes or chains *S*, the tumblers *H* *H*, the springs *R* *R*, and the springs *U* *U*, when combined with each other in a double fence gate, and constructed substantially as and for the purpose described in the foregoing specification.

77,493.—ALBERT H. JOHNSON, Hartford, Conn.—*Bosom Pad.*—May 5, 1868.—The pads are supported on brass springs which are stepped in concavo-convex metallic plates, and serve to form an air space between the pad and the person.

Claim.—In combination with an inflated elastic bosom pad, the supporting springs *a* *a*, arranged as herein shown and described, and for the purposes specified.

77,494.—MARTHA JONES, Amelia County, Va.—*Corn Husker, Shelter, &c.*—May 5, 1868.—The corn is passed through a tube, which is cut away on one side, to allow the rotary serrated disk to act upon the corn. A rotary blower at the lower end of the tube carries off the chaff.

Claim.—1. A machine, so constructed as to be capable of husking the ears of maize or Indian corn, and, at the same operation, cutting up the husks, for the purposes set forth.

2. A machine, so constructed as to be capable of husking and shelling the ears of maize or Indian

corn, and, at the same operation, cutting up the husks, for the purposes set forth.

3. A machine, so constructed as to be capable of husking and cutting up the husks of maize or Indian corn, and, at the same operation, separating the cut husks from the ears, for the purposes set forth.

4. A machine, so constructed as to be capable of husking, shelling, and cutting up the husks of maize or Indian corn, and, at the same operation, separating the cut husks from the corn, for the purposes set forth.

5. The knives *c c*, arranged spirally on the wheel, in combination with the projections *b b*, substantially as described.

6. The knives *c c*, in combination with the projections *b b* for tearing and giving a rotary motion to the ear, and the projections *d d* for shelling the corn, substantially as described.

7. The knives *c c*, arranged spirally on the wheel, in combination with the projections *b b* and separator, substantially as described.

8. The knives *c c*, in combination with the projections *b b*, for husking, and projections *d d* for shelling, and separator, substantially as described.

9. The knives *c c*, arranged spirally and attached separately to the face of the wheel, as and for the purposes set forth.

10. The wheel B, provided with the projections *b b* and *d d*, and spirally-arranged knives, in combination with the spout *s* and separator, substantially as described.

77,495.—SAMUEL U. KING, Windsor, Vermont.—*Wood-Turning Lathe.*—May 5, 1868.—The centralizers are forced inward by the centrifugal action of the weights upon the levers, so that a stick being forced between the ends of the centralizers they will centralize upon it in relation to the cutters, which, as the stick is driven through, will round the same.

Claim.—The combination of the centralizers, their levers and centrifugal weights, with one or more cutters, and a wheel having tubular journals, or the equivalents thereof, the whole being arranged substantially in manner and so as to operate as and for the purpose hereinbefore described.

77,496.—HACK KRAFFT, Mulberry, Pa.—*Horse Hay Fork.*—May 5, 1868.—The rectangular frame is made to embrace the bale, and its pivoted ends turned up beneath the same. The pivoted ends are operated by connection to a single hand lever, which has an engaging catch, and the latter is freed by a cord to discharge the bale.

Claim.—1. The centrally arranged vibrating cross head *C'*, transverse connecting rods *m m*, rocking links *d d*, vertically sliding pivoted legs *c c*, and the forks *b b*, in combination with the frame *A A'*, the whole arranged and operated in the manner shown and described.

2. The latch lever *D* and pin *g* applied to the frame *A A'*, in combination with a lever *C C'* connected to vibrating points *b b*, substantially as described.

77,497.—JACOB LAGOWITZ, Newark, N. J.—*Traveling Bag.*—May 5, 1868.—The links to which the handles are hung have arms which lap past the lower jaw when the links are raised and hold the bag shut. The springs tend to hold the links in this position.

Claim.—1. An automatic device for closing traveling bags, consisting of the links or rings *a a*, to which the ends of the chain or strap handle *B* are secured, and which carry the arms *b b* that fit over the sides of the bag, substantially as herein shown and described.

2. The above, in combination with the spring *c*, made as set forth.

77,498.—SAMUEL LEATHER, Dalton, England.—*Loom for Weaving Garments.*—May 5, 1868.—The loom is for weaving double cloth, which is connected at certain parts, forming a series of under garments, which are cut apart subsequently. To accomplish this, cams are applied to the loom to operate on the stitching leaves of the heddles.

Claim.—1. The combination of the sliding cams *H*, shaft *b*, gear *G'*, and worm wheel *G*, with the needles *d*, and guide rods *c c*, for weaving the neces-

sary pattern, substantially as herein shown and described.

2. In combination with the above, the shaft *a*, screw worm *G*, and pinion *G'*, substantially as and for the purpose herein shown and described.

77,499.—J. D. and I. W. LEGG, Long Eddy, N. Y.—*Curtain Fixture.*—May 5, 1868.—The roller is journaled in plates, suspended on cords, which are coiled around spring pulleys. The roller is drawn downward by a cord, which is coiled around one end of the roller and coils up the shade as the roller is drawn down.

Claim.—1. Connecting the roller *B*, through the medium of tapes *c c*, to springs *C C*, secured to the upper part of the window frame, in connection with the hooks *l l* and loops *m m*, or other suitable fastening for securing or holding the lower end of the shade, and the cord *D* on the pulley *h* of the roller, all being arranged to operate substantially as and for the purpose set forth.

2. The clamp *E*, when used in connection with the cord *D* of the shade roller *B*, connected to the springs *C C*, substantially as and for the purpose specified.

77,500.—CHARLES MAHAN, Grand Island, Cal.—*Farm Wagon.*—May 5, 1868.—The four hounds and the sway bar are placed before the fore axle, and by removing the hind wheels and reach, a stiff tongue may be applied, and the fore wheels used to support a cart body. The sides and ends of the wagon body are removable, being held in position by spring catches at their upper sides, when in place.

Claim.—1. The frame, consisting of the cross pieces *J J'* and central rail *K*, as arranged, in combination with the box *I*, axletree *D*, wheels *C*, and reach *H*, in the manner and for the purpose substantially as set forth.

2. The sliding hook *A'*, when constructed in the manner and for the purpose specified.

3. The box *A*, when the sides of said box are provided with cleats *C'*, notches *b*, and spring catches *c*, in the manner and for the purpose set forth.

77,501.—JOSEPH T. MARTIN, New York, N. Y.—*Grapple for Sunken Vessels.*—May 5, 1868.—The grapple levers are adjustable longitudinally and vertically upon the beam, and are arranged so that the upward draught upon them causes their ends to bite into the side of the vessel.

Claim.—A marine grapple, consisting of a solid beam, *A*, to which the levers *C*, carrying the grappling jaws *B*, are pivoted, when said bars are adjustable toward or away from each other, on the beam *A*, and also up and down adjustable on the same, substantially as and for the purpose herein shown and described.

77,502.—CHARLES A. MAXFIELD, New York, N. Y.—*Machine for Forming Pasteboard Boxes.*—May 5, 1868; antedated April 23, 1868.—A series of folders are combined with a "former" in such manner that the sheet of material is folded against and wrapped around the former, the parts acting successively as the plunger is forced into a die containing these folders, and carries the paper or other material with it, delivering the same in the form of a folded box or box envelope.

Claim.—The former *c*, in combination with the folders 2 3 4 5, substantially as specified, so that the folding of a box or box envelope is effected by driving the previously cut sheet of material through between said folders, as set forth.

77,503.—JAMES MCCARTHY, New York, N. Y.—*Extension Pipe Coupling.*—May 5, 1868.—The coupling pieces are extended by means of their screw connection, so as to unite the ends of pipes at a greater or less distance apart.

Claim.—1. An extension pipe coupling, made by connecting the tubular pieces *A* and *B*, substantially in the manner set forth.

2. The above in combination with the jam-nut *C*, made as herein shown and described.

77,504.—O. P. McDONALD, Carbondale, Ill.—*Attachment for Pendulum Clocks.*—May 5, 1868.—By the unequal expansion and contraction of the

rods, incident to changes in temperature, the effective suspension point of the pendulum is made to move up and down to compensate for changes in the length of the pendulum rod.

Claim.—The combination of the rods A B, of different metals, having unequal expansibility, with the pendulum rod of a clock, substantially as and for the purpose specified.

77,505.—DAVID MCFARLAND, Worcester, Mass.—*Railroad Truck.*—May 5, 1868.—The portion of the axle between the wheels is covered by a cylindrical case.

Claim.—1. The combination, with the axle or journal of a set of ear wheels, of an axle protector or guard, substantially as and for the purposes set forth.

2. The combination, with the axle of a set of car wheels, of a tubular protector, for the purposes set forth.

3. The combination, with the axle of a set of car wheels, of a guard piece, E, or its equivalent, on each side of the journal or axle, for the purpose of preventing the deflection of the axle, in case of it breaking.

4. The combination, with the axle B and wheels A A, of the tube D, clamping pieces E E, and cross supporting pieces F F, substantially as and for the purposes set forth.

5. The combination, with the truck and wheels, of a wheel protector, shield, or cover H, substantially as and for the purposes set forth.

77,506.—WILLIAM C. MCGILL, Cincinnati, Ohio.—*Blacking Brush.*—May 5, 1868.—Box clamps are attached to the usual place of the dauber brush, and to the tops of the standards forming the clamp a rotary brush is journaled, which transfers the blacking from the box to the boot.

Claim.—1. In combination with the spreading brush, the cover, made and operating substantially as and for the purpose herein described.

2. The spring standards D D', serving the double purpose of journaling the said brush, and of holding while permitting the adjustment of the blacking box, operating substantially as herein shown and described, and for the purpose set forth.

77,507.—SHANNON MCGUFFIN, Rising Sun, Ind.—*Coffee and Tea Pot.*—May 5, 1868.—The strainer swings from the end of a rod and is brought in conjunction, when required, with the entrance to the spout, so as to arrest solid matters and grounds.

Claim.—Providing a coffee or tea pot, A, with a swinging and adjustable strainer, substantially as and for the purpose herein specified.

77,508.—ADAM McMULLEN and JOHN H. ROCK, Sterling, Ill.—*Harness.*—May 5, 1868.—The breast collar is supported as usual from the withers and at its rear ends receives the tug straps. Other forward attachments are made to the breast straps which are connected to the neck yoke or tongue.

Claim.—The tugs B D, brace C, straps H and F, and collar A, when the various parts are connected together and operating in the manner as herein set forth.

77,509.—ROBERT McMURRAY, Brooklyn, N. Y.—*Sand Screen.*—May 5, 1868.—The longitudinal wires rest as usual upon transverse bearing wires and are retained laterally by wires looped over each in turn and fastened to the sides of the frame.

Claim.—The combination, with the frame and straight vertical rods, of cross wires, formed with equidistant eyes or loops, through which the vertical rods pass, and by which they are retained laterally, all substantially as and for the purposes described.

77,510.—EDWARD MERCIER, Springfield, Mass., assignor to himself and HENRY W. BAILEY, same place.—*Railroad Switch.*—May 5, 1868.—The ends of the rails forming the switch track are placed about two inches laterally from the ends of the rails of the main track. One end of each switch rail is placed in the chair, and it is bent near the middle. To the inside of the switch rails are bolted the safety pieces, which have an incline, and a part operating as a

splice rail, and forming a continuation in a straight line of one side of the bent switch rail. The rails thus arranged are held by the switch bars and operated by the usual machinery. Long, stationary guides are made of common rail and arranged inside the switch rails and safety pieces. The said guides are somewhat longer, and about $\frac{1}{4}$ of an inch higher than the switch rails. Inside the guides, at one end, are flat plates on which the flanges of the wheels run.

Claim.—1. The combination of the fixed guides $f f'$ with the sliding safety pieces or inclines $a a'$, substantially in the manner described, and for the purpose specified.

2. The supporting plates $e e'$, arranged and combined with the fixed guides $f f'$ and sliding inclines or safety pieces $a a'$, substantially as described, and for the purpose specified.

77,511.—JAY C. MERRELL, Medina, N. Y.—*Wash Boiler.*—May 5, 1868.—In the lower part of the boiler is a horizontal longitudinal tube whose ends are closed by slides when the boiler is used in the ordinary way upon the stove. When otherwise used a grate and fire are placed in the tube and an additional section of tubing is attached at the end, a chimney leading from the auxiliary tube.

Claim.—The boiler A, provided with the tube B and slides C, and having the auxiliary tube D and grate F arranged for use in connection therewith, for the purpose of adapting the boiler to use either with or independent of the stove, substantially as described.

77,512.—ALBERT H. MERSHON, Philadelphia, Pa.—*Damper for Hot Air Furnace.*—May 5, 1868.—Improvement on his patent, May 29, 1866. To the chain which is attached to the furnace draught door is attached another chain which passes over two pulleys and is connected to a door opening into a flue communicating with the furnace flue. The former flue also communicates, through an opening closed at will by a damper, with the ash chamber. The arrangement is such that when the furnace draught door is opened the flue door is closed, and *vice versa*.

Claim.—The chain B, pulleys D D, door F, horizontal flue I, and damper M, when combined and constructed substantially as and for the purposes herein described.

77,513.—HENRY F. METZLER, New York, N. Y., assignor to himself and WILLIAM F. YOUNGS, Brooklyn, N. Y.—*Spring Horse.*—May 5, 1868.—Improvement on his invention patented February 21, 1865. The child is mounted on the oscillating seat and the foot rest adjustable as stirrups for the feet. The spring is connected to the screw rod by a yoke and tends to preserve the perpendicularity of the seat, returning it to the vertical when oscillated in either direction.

Claim.—1. The adjustable foot rest, vibrating with the horse, substantially as described.

2. The cross bars j and j' , to secure the ends of the spiral spring, and as a means of attaching the same to the screw i , and bracket E, substantially as described.

77,514.—CHARLES M. MILES and GEORGE W. REMSEN, Lincoln, Del.—*Lamp Burner.*—May 5, 1868.—The turret between the cap and the body of the burner has an opening through which a match may be entered. A slide closes it, moving in a cam track which opposes accidental disengagement. The reservoir may be filled through the larger holes of the supporting ring below the dead air chamber, while air is admitted to the reservoir through the smaller holes.

Claim.—1. The chamber H and annular slide I, having openings f , and outlets d , when said outlets d are protected by guard e , all constructed and arranged to operate in the manner and for the purpose set forth.

2. The combination, in a lamp burner, of the perforated turret D, provided with slide F, dead air chamber A, perforated chamber H, and annular slide I, when said chamber H is provided with outlets d , which are protected by a guard, e , all constructed, arranged, and operating as described, for the purpose specified.

3. The lamp burner, constructed as described, and

consisting of the cap E, wick tube B, perforated turret D, having slot *b*, perforated annular slide F I, having pins *a*, dead air chamber A, perforated chamber H *f*, having outlets *d*, guard *e*, and ring G, all constructed and arranged to operate as set forth.

77,515.—G. L. MILLER, Pontiac, Mich.—*Trace Hook*.—May 5, 1868.—The tang is screwed into the end of the whiffletree and the hook is flat and broad so as to require a certain presentation of the loop of the cock eye in hitching. The loop then draws upon the neck of the hook.

Claim.—The herein described trace hook, when constructed in the manner as set forth, as a new article of manufacture.

77,516.—SARAH P. P. MILLER, Beaver, Pa.—*Basket*.—May 5, 1868.—The braids or strands are sewed together and the basket stuffed to the required shape while receiving its outer coat of varnish.

Claim.—As a new article of manufacture, a cloth basket, made of strips of cloth braided or twisted together, and coated with varnish or sizing inside and out, to preserve the form and render it waterproof, substantially as described.

77,517.—ALBERT MOORE and A. D. HOWES, South Adams, Mass.—*Steam Globe Valve*.—May 5, 1868.—The pipes below communicate by ports with the chamber above, and the openings of the ports are valve seats for the poppet valves which are attached to a yoke above and are actuated by a screw stem.

Claim.—1. The shell, formed of the parts A A', with the valve chamber B', substantially as described.

2. The block D and the valves C C, in combination with the shell and valve stem B, when arranged substantially as shown and described.

77,518.—JOEL MOULTON, Boston, Mass.—*Manufacture of Elastic Rolls*.—May 5, 1868.—Improvement on his patent, No. 75,292, Mar. 10, 1866.—The strips of rubber and webbing are lapped over a strand of wire, which is then coiled on the mandrel, turning outward the edges of the covering strips.

Claim.—1. As a means of more securely fixing the body of an elastic roll to its shafts, the employment therewith of a metallic wire or string.

2. The mode, herein described, of applying the strands of fibrous material to a sheet, or between two sheets, of vulcanized rubber, essentially in manner and for the purpose as set forth.

77,519.—EDWIN A. PARKER, Horseheads, N. Y.—*Coal Stove*.—May 5, 1868.—Below the fire box of the stove and within the enlarged base are a series of channels which carry air to the fire chamber and the room respectively. The caloric current is carried from the upper part of the stove to the base, where they follow a circuitous course in contact with the plates of the chamber where air is warmed before entering the apartment.

Claim.—1. The arrangement of the annular chamber E around the tubular downward extension C of the fire box, said chamber communicating with the fire box, and with the atmosphere in the room, so that a supply of fresh air, entering it, may be caused to enter the fire box, and also the room, substantially as herein shown and described.

2. The chamber H, arranged in the bottom of the stove base B, and close above the floor, and communicating with the draught chamber E, as set forth, so that it will serve to distribute fresh warm air around the base of the stove, close above the floor, as specified.

3. The chambers E and H, when arranged as set forth, in combination with the chamber I, through which the products of combustion can be made to pass, so that thereby the fresh air passing through the chambers E and H will be warmed, substantially as herein shown and described.

4. The damper *k*, connecting the chambers E and I, for the purpose of allowing the introduction of fresh air from the draught chamber E to the smoke pipe J, substantially as herein shown and described, for the purpose of checking the draught.

5. The S-shaped partition L in the chamber I, in combination with the partition *a*, horizontal parti-

tion *f*, pipes K K, and smoke pipe J, as herein described, for the purpose specified.

77,520.—J. R. PERRY and D. W. PERRY, Wilkesbarre, Pa.—*Railroad Car Truck*.—May 5, 1868.—Each wheel has an axle with two bearings, in adjustable boxes. The outer box is pivoted and the inner one slides within a limited range so as to allow the wheel to play a little in turning curves. Rollers above the sliding box assist the motion.

Claim.—The combination of the sliding and pivoted boxes C D, upon each side of the wheels, friction rollers *e*, connecting bar E, attached to the axles upon each side of the car, and the oscillating bar F, as herein described for the purpose specified.

77,521.—WILLIAM H. PERIMMER, Lanesville, Ind.—*Measuring and Registering Grain*.—May 5, 1868.—The slide below the hopper is drawn back and held by a catch. When the measure is filled it depresses that end of the lever platform, disengaging the slide catch and closing the hopper slide. The rising end of the platform actuates a pawl and train of gearing which has the usual register consisting of dials and fingers.

Claim.—The tilting platform A, in combination with the scale beam E, the hopper B, and the recording apparatus of the dials, the whole constructed, arranged, and operating substantially as and for the purpose herein described.

77,522.—FREDERICK A. POTTER, North Providence, assignor to FALES, JENKS, AND SONS, Smithfield, R. I.—*Tool Holder*.—May 5, 1868.—The tool is made of a cylindrical bar of steel and is placed in an inclined socket at the end of the tool holder. The tool has a series of rounded notches in one side to receive the side of a tapering pin which is driven transversely and horizontally through the holder.

Claim.—The arrangement of the holder A, the tool bar B, and the holding pin *b*, with reference to each other, substantially as described for the purposes specified.

77,523.—D. R. PRINDLE, East Bethany, N. Y.—*Field Roller*.—May 5, 1868.—The roller is made in two sections and the axis is jointed at mid-length, playing vertically in a slot which prevents movement in the direction of draught independently of the frame. The outer journal sockets flare inward to allow the accommodating movement of the axis.

Claim.—1. The jointed axis or pivot *a b*, for two or more sections A B of a roller substantially as and for the purpose herein specified.

2. The vertically oblong or upright bearing *d*, between the sections of the roller, substantially as set forth.

3. The combination of the jointed axis or pivot, and the vertically slotted or oblong bearing, so as to produce a roller which will adapt itself up and down to the unevenness of the ground, but will be rigid in a horizontal direction, substantially as herein specified.

77,524.—JO. RAMSEY, Milford, Texas.—*Harvester*.—May 5, 1868.—The team is hitched to a tongue running backward from the frame and supported upon a wheel upon a pivoted post which may be turned by a horizontal lever. The cutter-bar is reciprocated by a lever whose lozenge-shaped head is actuated by the pins upon the peripheries of two disks which are fast upon the axle. The fingers have a round turn at the end forming a rounded eye to prevent elogging.

Claim.—1. The pin wheel J J, constructed of two light disks, with pins *i i* in their periphery, and with an endless bracing or staying wire *j*, passed diagonally from one disk to the other around the pins *i i*, in combination with the device G *h*, which drives the sickle of a harvester such as described, all substantially as described.

2. The guard fingers *g*, constructed as shown in Figs. 5 and 6, with a narrow, straight slot terminating in an elliptical or circular eye, for the purpose set forth.

77,525.—AMOS RANK, Salem, Ohio.—*Harvester*.—May 5, 1868.—The hinged finger-bar is adjusted at

different heights from the ground by a chain which is attached to the shoe and passes over a sheave to a grooved segment attached to a lever. The device is set by a ratchet and pawl.

Claim.—In combination with a vibrating lifting-lever K, and its pawl O, the construction of the ratchet plate J, with spaces *v* between the teeth *p* thereof, substantially as described.

77,526.—AMOS RANK, Salem, Ohio.—*Harvester.*—May 5, 1868.—An angular arm is pivoted to the reel post, and carries a grooved wheel, which, by means of a spring is pressed against the actuating chain of the reel to keep the same under proper tension during the movement of the post caused by inequalities of the ground. The reel post is adjustably attached to the inner grain divider so that the fore end of the divider may be adjusted higher according to the character of the grain.

Claim.—1. The combination, in a belt tightener, of the angular lever *m*, spring *l*, and the grooved wheel *k*, substantially as and for the purpose described.

2. Applying the inside divider P to a bracket T, upon the reel post H, and making this divider adjustable, substantially as described.

77,527.—OLIVER H. REED, Washington, D. C.—*Guide Gauge for Printing Presses.*—May 5, 1868.—The plate is inserted into the feed board of a "Hoe" press or attached by a screw to the guide bar of a "Gordon" press. A pin is hinged to this plate and may be folded down to make a smooth feed board, or may be raised into effective position.

Claim.—The use of a folding pin or side guide for paper upon a printing press, substantially as set forth.

77,528.—JOHN REIBER and JOHN SCHRADER, Bridgeport, Ill., assignors to themselves and W. M. LEWIS, same place.—*King-Bolt for Carriages.*—May 5, 1868.—The clip embraces the axle and has a socket which receives the jointed bolt on which the head block turns. A brace from beneath the axle is connected by a joint to the coupling bar so as to allow it to vibrate with the axle.

Claim.—1. The jointed bolt *d*, in combination with the clip B and head block *d*, substantially as and for the purpose shown and described.

2. The brace D, having joint *b*, in combination with the clip B, jointed king-bolt *d*, axle A, and coupling E, all substantially as and for the purpose shown and described.

77,529.—FREDERICK RICHARDSON, New Bedford, Mass.—*Boot Heel.*—May 5, 1868.—The center or wearing portion has flanges on each side to hold the filling and may be reversed when one side is worn.

Claim.—The reversible plate *e*, formed substantially as described, in combination with the flange *a* and the filling *d*, and applied to a boot or shoe heel, as set forth and specified.

77,530.—J. H. RICHARDSON, Chicago, Ill.—*Screw-Cutting Machine.*—May 5, 1868.—Combined with the cams of a die head is a slotted collar in which operates a stop by means of which the dies may be set to cut screws of different sizes and to open and shut uniformly by reversing the motion of the drive pulley. A friction band passes over the die head for checking its motion while the cams open the dies and loosen the screw.

Claim.—The combination of neck I, face plate C, cams *m n*, pulley F, friction band G, collar H, treadle Y, dies W, and die head D E U, the whole being constructed and arranged to operate substantially as herein specified.

77,531.—A. Q. ROSS, Cleves, Ohio.—*Carriage Step Screen.*—May 5, 1868.—The step screen is fastened to the bottom of the carriage by means of hinges just behind the step. When the door is closed the screen remains close against the bottom of the carriage and when the door is opened the screen falls down.

Claim.—The carriage step screen B, operated by means of bars and spring, or cord and pulleys, or by other equivalent manner, by means of the carriage door, substantially as and for the purposes above set forth.

77,532.—FRANK J. ROTH, Schenectady, N. Y.—*Piston Packing.*—May 5, 1868; antedated April 22, 1868.—The body of the piston consists of a spider, follower and inner ring, the sectional packing rings slipping on the latter and being held by a dowel pin and expanded by a spring and wedge against the inside of the cylinder. The side rings are fitted loosely over the inner ring and are forced by the steam against the face of the sectional ring.

Claim.—The side rings E E and packing rings D D, when combined substantially in the manner set forth.

77,533.—FRANK J. ROTH, Schenectady, N. Y.—*Piston Packing.*—May 5, 1868; antedated April 22, 1868.—The steam acts upon the cut ends of the packing ring and expands it to the inner surface of the cylinder, without entering the interior of the piston or under the packing rings. The hooks of the ring engage depressions in the break joints which are held in the rabbet of the central ring.

Claim.—The central ring *e*, break joints *f f*, and packing ring *d*, when combined, substantially in the manner herein set forth and described.

77,534.—FRANK J. ROTH, Schenectady, N. Y.—*Stuffing Box Packing.*—May 5, 1868; antedated April 22, 1868.—Steam is admitted to the rear end of the follower to pack the piston rod, driving the conical annulus upon the packing rings. Dirt or collected grease is blown out through a pipe provided with a cock.

Claim.—The employment of cock *g*, or its equivalent, when used in connection with stuffing box *a*, substantially as herein set forth and described.

77,535.—CASPER RUBBLES, Lowville, N. Y.—*Planter and Cultivator.*—May 5, 1868.—The flat, triangular, pointed shares are attached to the frame by jointed rods at their rears; in front they are suspended by chains which pass over rollers by which they are lifted when the lever is oscillated toward the rear. Cams on the wheels come in contact with the slide bar to reciprocate it transversely of the path of the machine to operate the seed-dropping slides in the tubes below the seed hoppers.

Claim.—1. The V-shaped shares H, applied to the machine through the medium of the rods or bars *c e*, which are connected by joints *d* to the rear bar of the frame A, and connected at their front ends by chains I to wheels or pulleys F on shaft E, substantially as shown and described.

2. The tubes K, provided with the slides *g g'*, attached to the levers L, which are connected to the reciprocating rod M, operated through the medium of the spring N, and the projections *i* on wheel O, substantially as set forth.

77,536.—MARK SAFFORD, Boston, Mass.—*Soap Holder.*—May 5, 1868.—The soap dish is clamped to a ledge or the edge of a board by means of a projection and a spring which form jaws.

Claim.—The combination, with the soap dish, and one or more projections or legs *e e* thereon, of a bolt or clamp, and spring for actuating the same, arranged and operating in connecting with the said legs, substantially in the manner and for the purposes shown and set forth.

77,537.—CHARLES SAFFRAY, M. D., New York, N. Y.—*Cement.*—May 5, 1868; antedated April 25, 1868.—Composed of boiled linseed oil, 1 gal.; and strained onion juice, $\frac{1}{2}$ lb.; boiled 3 hours, and mixed with boiled linseed oil, 9 galls.; river sand, 47 lbs.; oxide of calcium, 2 lbs.; oxide of iron, 1 lb.; protoxide of lead, 4 lbs.; and oil prepared as aforesaid, $\frac{1}{2}$ gall., are mixed as a mortar and applied.

Claim.—The preparation of oil, as above described, for making cements, and an improved cement made of the above-named materials, bound together by the chemical action upon them of the oil so prepared, said cement to be applied to the uses specified.

77,538.—OLIVER SALGEE, New York, N. Y.—*Pump Piston.*—May 5, 1868; antedated April 25, 1868.—The forked link has segments which bear in sockets on the upper part of the piston, and the

valve plays on its seat between them. The packing is wound around in a recess of the piston.

Claim.—The forked link *k*, in combination with the ring piston *m*, that is formed with sockets, receiving the joints *l* of said link *k*, and with the valve *o*, applied between the forked link, as and for the purposes set forth.

77,539.—H. SCHEVENELL and S. S. REMBERT, near Memphis, Tenn.—*Instrument for Treating Piles.*—May 5, 1868.—Vertical strips of copper are imbedded in the zinc cone and the moisture of the parts induces an electric action, adapted to allay inflammation.

Claim.—The electrode *A B*, composed of different metals *a a b*, substantially as shown and described, for the purpose set forth.

77,540.—EBENEZER SEAVER, Boston, Mass.—*Clothes Pin.*—May 5, 1868.—The pin has two jaws with beveled surfaces where the lips meet and with an interior space narrowing toward the hinge.

Claim.—The beveled contact surfaces of the parts *A* and *B*, as shown at Fig. 2, in combination with the teeth *C C'*, as and for the purpose specified.

77,541.—JOHN SHELDON, Chicago, Ill.—*Derrick.*—May 5, 1868.—Designed for field use in stacking hay, &c. It is a light frame for erection, and is collapsed together for transportation or storage. The standard supports the arm and its brace, and is itself stayed by struts which are anchored by clevises and stakes.

Claim.—The general combination and arrangement of standard *A*, arm *D*, braces *C* and *M*, with brace *S*, substantially as and for the purpose set forth.

77,542.—GERARD SICKELS, Boston, Mass.—*Water Meter.*—May 5, 1868.—The valve piston works vertically and is actuated by shifting the bearing of a prop attached to the under side of that piston. As the foot of the prop is moved to the center of its track, the piston is elevated; and after the said foot passes the center, the pressure of the water on the piston will force the foot of the post to the opposite end of the track, thus inclining it in the opposite direction and causing the upper end of the prop to push the valve in the opposite direction. The prop extends down into the cylinder so that it is operated by direct action of the bar connecting the pistons.

Claim.—1. Effecting the entire motion of the valve by shifting the bearings of the foot of the prop *o*, attached to the under side of the valve piston, substantially as set forth.

2. Extending the prop of the valve piston down into the cylinder, so that it can be operated upon by the direct motion of the cylinder piston.

3. The combination of the valve piston *k*, the movable prop *o*, and the connecting bar *d*, substantially as and for the purpose described. •

77,543.—WILLIAM S. SIMPSON, Berea, Ohio.—*Mop Wringer and Brush.*—May 5, 1868.—The implement has a scrubbing brush at the end and in the frame has a pair of wringing rollers between which the mop cloth is passed as occasion requires.

Claim.—The combination of the frame *A*, having arms *g*, brush *B*, rollers *D F*, levers *f*, adjustable spring bolt *h i*, and mop cloth *J*, all constructed and arranged as described, for the purpose specified.

77,544.—H. D. SMALLEY, New Baltimore, Ohio.—*Portable Fence.*—May 5, 1868.—The lower edges of the panels rest in the notched sills and they are laterally stayed by the brace whose notches abut against the upper panel on one side of the fence and against the next panel on the opposite side of the fence.

Claim.—The peculiar arrangement and combination of the panel *A² D²* with projecting rails *D²*, the panels *A D* with projecting rail *D*, and the braces *F* with notches *d* and *e*, the several parts being arranged in the manner and for the purpose specified.

77,545.—JOSEPHUS SONXEDCKER, Cincinnati, Ohio.—*Advertising Frame.*—May 5, 1868; antedated

April 28, 1868.—The frame is hinged on one side and has lock catches upon the opening side; several glazed frames display advertisements.

Claim.—The frame or cage *A B*, having grooved panels for the reception of advertising cards, and being adapted to be secured to each other and to a lamp or other post, substantially as set forth.

77,546.—JOHN STACKHOUSE, West Pittsburg, Pa.—*Polishing Machine.*—May 5, 1868.—The roll to be polished and straightened is passed between the rollers, which have similar rotation from a common motive wheel. After passing endways between the rollers the object drops into a receiving trough between the shafts communicating motion from the wheels to the rollers.

Claim.—1. The guide *H* for introducing the metal to be polished in a line parallel to the axial lines of the rollers *C C'*, the guides *I I* for holding said metal longitudinally between said rollers, and the guide *m* for receiving the polished metal in the line of its passage from between the rolls, as herein described, for the purpose specified.

2. The guides *H, I*, and *m*, in combination with the polishing rolls *C C'* and head blocks *A A'*, substantially as described, for the purpose specified.

77,547.—P. H. STARKE, Richmond, Va.—*Plow.*—May 5, 1868.—The plow has a double beam, the rear of each fork being connected to the back of the standard to which the share and mold board are bolted. A handle is attached to each portion of the beam.

Claim.—1. The double beams, Nos. 6 and 7, attached to the standard, as described, for the saving of power and prevention of choking.

2. The standard or frame pieces, No. 5, having no vertical connection with the beams, to which the other parts are attached, as described.

3. The point, No. 4, indented with a succession of points, in place of a share, each of its cutting parts presented nearly square to the front to prevent the plow from being wedged or pressed so hard against the land as to wear the land side, and cause considerable loss of power thereby.

77,548.—JOHN and JACOB STOCK, New York, N. Y.—*Barber's Chair.*—May 5, 1868.—The upper part of the back is hinged and is vertically adjustable by a rack and stop. A head rest is hinged to a bracket and is adjustable both in inclination and height.

Claim.—The movable back *D*, hinged to the stationary back *B* of a barber's chair, arranged with suitable mechanism to fix this movable back *D* in any desired position, in the manner and for the purpose substantially as set forth.

77,549.—DAVID STUART and LEWIS BRIDGE, Philadelphia, Pa., assignors to STUART, PETERSON, & Co., same place.—*Base Burning Stove.*—May 5, 1868.—Air is introduced into the stove at various parts, and after circulating and heating is discharged into an upper chamber, from which it is distributed to any points desired.

Claim.—1. The chamber *F*, between the fire pot and casing *G*, when the said chamber has, in front, openings for the admission of cold air, and communicates at the rear with openings for the passage of another current of cold air, all substantially as and for the purpose herein set forth.

2. The above in combination with the air chamber *K* at the rear of the fire chamber.

3. The plates *J* and *II*, between which is a passage, forming a communication between the lower crescent-shaped chamber *K* and upper chamber *Q*, as described.

4. The air opening *q*, communicating with the space between the plates *J* and *II*, as set forth.

5. The crescent-shaped air chamber *Q*, open in front for the passage of the products of combustion from within the space inclosed by the inner casing of the said chamber round to the rear of the same, as set forth.

6. Openings for admitting cold air at three different points to the within-described chambers or their equivalents, in which the air is heated, and by which

the heated air is delivered in one volume to a receiving chamber, T.

7. The coal reservoir S, suspended within but at a distance from the chamber Q, as set forth.

77,550.—CHARLES H. THURSTON, Marlboro, N. H.—*Attaching Knobs to Screws.*—May 5, 1868.—The two-ended gimlet screw is screwed into the knob, and secured therein by a pin which is driven into the knob beside the screw and follows a groove plowed through the thread.

Claim.—The construction of the attaching screws in a wooden knob, by the formation of a slotted screw and key, causing it to remain in place, substantially as herein shown and described.

77,551.—JOSEPH F. UMPLEBY, Albany, N. Y.—*Needle Book.*—May 5, 1868.—The sewing machine needles of various sizes are placed in different compartments of the book. A cushion and shield keep the needles in place. A gauge determines their sizes. Numbers and characters indicate their sizes and the appropriate threads for each.

Claim.—1. The needle book A A', constructed with cushion K e f, and with gauge plate g, substantially as and for the purpose described.

2. The gauge plate g h, applied to the needle book, as described.

3. Providing a needle book, constructed as shown and described, with the oil stone e, which is arranged to bear against the cushion when the book is closed, as set forth.

77,552.—JOHN H. VICKERS, Norwich, Conn., assignor to NORWICH LOCK COMPANY.—*Combined Knob Latch and Lock.*—May 5, 1868; antedated April 22, 1868.—Designed to be used as a latch lock or to fasten securely when required. The latch lever, as in the "Tyler" lock, patented August 16, 1865, is lowered out of contact with the bolt or raised to engage therewith, according to the requirements as stated above. Tumblers and a fence are so arranged as to oppose the motion of the latch lever in attempting to free the bolt, unless, by the introduction of the proper key, the tumblers are brought to the proper position by the key.

Claim.—The employment of one or more tumblers M, in combination with the latch lever D in the Tyler lock, and adapted to operate relatively to the key N and stop A', or their equivalents, substantially as and for the purpose herein specified.

77,553.—DANIEL F. WALLACE, Ripley, Ohio.—*Hemp Brake.*—May 5, 1868.—The beating bar is rounded on its working edge and attached by arms to the shaft, the intervening space being occupied by a board which forms it into a wing which is effective in blowing away the shives. The hemp is fed up to the beater by a spring board which moves in slots in the frame of the machine.

Claim.—The beating wings C, in combination with the rest D, operating in the inclined slots i, and provided with the springs E, when arranged substantially as described and shown.

77,554.—CHARLES E. WAREHAM, Port Washington, Wis.—*Rotary Scrubbing Machine.*—May 5, 1868; antedated April 23, 1868.—The box is mounted on wheels whose axle communicates a rotary motion to the circular brush through the intervention of the bevel gearing. A chamber in the box trickles water or suds in front of the brush.

Claim.—The arrangement of the box A, mounted on wheels B B, in combination with the bevel gear c c', for operating a rotary brush or mop, substantially as and for the purposes herein described.

77,555.—JOHN WEIDIG, Philadelphia, Pa., assignor to WILLIAM W. LYMAN, West Meriden, Conn.—*Fruit Jar.*—May 5, 1868.—The lid has a rim which is depressed upon a packing ring on the lip of the jar. The cover has inclines upon its upper surface, which, being rotated against the under side of the yoke, press the lid firmly on its seat.

Claim.—The combination of the stopper B, elevations and depressions d d, recess k, rim e, clamp e, fulcrum or centre h, packing and seat b b', notched ring g, substantially as and for the purpose described.

77,556.—MARCUS M. WELLS, Hartwick, N. Y.—*Grain Rake.*—May 5, 1868.—The tines are run beneath the swath, and when sufficient grain has been received the implement is turned up on its curved frame and the bent lever turned over the gavel and held down by the stirrup. The gavel is then bound.

Claim.—The jointed lever D, in combination with the curved tines A, cross bars C B, connection G, and handle E, as described.

77,557.—JOHN A. WHEELER, Freeborn, Minn.—*Windmill.*—May 5, 1868.—The sectional sails are hung in the frame of the wind wheel, supplementary arms being used in addition to the usual radial arms, to serve as supports for the sails and permit them to be pivoted at right angles to the radial arms and facilitate the adjustment.

Claim.—1. The false arms I I, secured by means of adjustable eye-bolts N N to the band rods G H, so that the sectional sails J J can be pivoted between the radial arms F F and the false arms I I, all arranged substantially as herein shown and described.

2. The rods K, eyes e, and lugs b, in combination with the sectional sails J J, false arms I I, eye-bolts N N, band rods G H, and radial arms F, all arranged and operating substantially as herein shown and described.

77,558.—NATHAN WHITTEN, Etna, Me.—*Car Coupling.*—May 5, 1868.—When the draw-head is forced back as the cars come in collision in making up the train, the draw bar acts upon a lever to thrust forward a plunger which drives out the link into coupling position.

Claim.—The combined lever F, bar F', and sweep E, secured to the draught bar B, to the car floor, and to the plunger rod D, for the purpose of giving a forward rectilinear and increased motion to the plunger C D when the draught bar is forced backward, all for the purposes and in the manner as shown and described.

77,559.—LEONARD WORCESTER and JOSEPH S. BROWN, Lowell, Mass.—*Fruit Jar.*—May 5, 1868.—The rubber disk is secured by a perforated top or ring so that the pressure may be regulated within the can.

Claim.—The elastic cover A and the perforated disk or washer B, applied to the mouth or opening of a fruit or preserve jar, in the manner and for the purpose substantially as described.

77,560.—ABRAM WRIGHT and GEORGE F. WRIGHT, Clinton, Mass.—*Toy Safe with Puzzle Lock.*—May 5, 1868.—The toy resembles a safe, and requires peculiar changes of position to enable the bolt to be withdrawn. In the present case, the safe is to be upset to let the little bolt fall out of the door bolt, and then, by turning the safe on the hinge side, the door bolt itself retires and the door is free to open.

Claim.—The application of a puzzle lock, when constructed as herein shown and described, or any other mechanical device which will produce the same result, to miniature or toy safes, substantially as and for the purpose herein set forth.

77,561.—RUFUS WRIGHT, Brooklyn, N. Y.—*Cherry Stoner.*—May 5, 1868.—The cherries are fed from a spout to the pockets of the intermittingly revolving wheel, which is turned 90° as the lever rises. The descent of the lever carries the needles through the cherry, forcing out the stone, which is discharged below, the succulent flesh dropping from the hole at a subsequent part of the revolution of the wheel. The band prevents the passage of more than one cherry. The pendant limits the stroke of the lever.

Claim.—1. The intermittingly rotating feed wheel C, when operated by the lever B, or other device, which carries the stone-ejecting needles G, substantially as and for the purpose set forth.

2. The pendant projection or guard e, attached to the needle bar or lever B, in connection with the intermittingly rotating feed wheel C, for the purpose specified.

3. The yoke or band K, attached to the hopper I, in connection with the feed wheel C, arranged to

operate substantially as and for the purpose set forth.

4. The spiral plate D, ratchet E, pawl F, and lever B, or its equivalent, for operating the wheel C, all arranged substantially as and for the purpose specified.

77,562.—PETER C. YOST, Hamilton, Ill.—*Corn Harvester.*—May 5, 1868.—The knife is mounted on a cross beam on the sled, the stalks being guided to the knife by two bars. A cradle in the rear of the cutting apparatus catches the stalks. When the apron is full it is tilted up and emptied upon the sled.

Claim.—1. The form and configuration of the knife C, as applied to a carriage or sled for reaping, substantially as described.

2. The slotted adjustable beam B, carrying the knife C and hooks D d, substantially as and for the purposes described.

3. The apron E, to catch the corn or grass, as applied to a carriage or sled for reaping or mowing, substantially as described.

77,563.—ALONZO W. ADAMS, New York, N. Y.—*Construction of Meter Safe.*—May 5, 1868.—The door is recessed into the wall of the meter, and has a number of arrow-headed bolts which are engaged by spring catches, so that the door plate cannot be removed without violence; thus indicating any tampering with the meter.

Claim.—A safe, of cast or wrought metal, provided with an opening M, arranged as described, and a door or side, which, when closed, becomes permanently locked, by means of the devices hereinabove described, or their equivalents, so that the safe cannot be opened except by violence, the whole being adapted to enclose and protect a meter, as and for the purpose set forth.

77,564.—JOHN ADAMS, Pontiac, Mich.—*Gate.*—May 5, 1868.—The slats are pivoted in the vertical bars so that the outer end of the gate may be raised to pass obstructions or make an opening for small stock; in this position the gate is held by oblique braces whose notches engage a pin on the top slat. When the gate is thrown wide open the braces are disconnected and the outer end drops to the ground.

Claim.—1. The bar h, when used in combination with a gate, for the purpose of automatically detaching the teeth of the brace D, and thereby dropping the front end of said gate, as herein fully set forth.

2. The combination of the bar K, provided with a catch or pin x, with the lever L, when both are arranged as and for the purpose specified.

3. The arrangement of the brace D, catch g, bars h and K, lever L, and a farm gate, the several parts being constructed and operating substantially as and for the purpose set forth.

77,565.—CHARLES P. ALSING, New York, N. Y.—*Asphalt Pavement.*—May 5, 1868.—Distilled coal tar, 20, and crude coal tar, 10 parts, are melted and the following added thereto: Portland cement, 10; granite crushed to coarse sand, 5; glass crushed to same coarseness, 5; gravel, 50 parts; the whole is well mixed. Upon three inches of coarse gravel is placed a melted mixture of distilled coal tar, 20, and crude coal tar, 10 parts, mingled intimately with gravel, 75 parts, and over this a layer of the composition first mentioned.

Claim.—An improved pavement, formed of the ingredients, and prepared and applied in substantially the proportions and manner herein described and set forth.

77,566.—EUGENE ATWOOD, Mansfield, Conn.—*Spindle.*—May 5, 1868.—The low, outer position of the whirr avoids lateral strain upon the spindle by the tension of the band on the whirr and affords access for the introduction of a self-lubricating device to the bolster within the sleeve.

Claim.—The combination, with the spindle A proper, of the head or cap B, tube or sleeve C, and whirr D, made separate and distinct from each other, and fitted and secured together for joint operation, substantially as shown and described.

77,567.—LORING J. BAKER, Machias, assignor to SAMUEL D. LEAVITT, ARCHIBALD McNICHOL, and

FRANK FOWLER, Portland, Me.—*Lamp Chimney Cleaner.*—May 5, 1868.—The washing pads are forced outward by sliding forward the sleeve upon the handle.

Claim.—The toggle-joint levers b b b b, operated by the sliding sleeve c, upon the rod or shaft d, substantially as and for the purpose as described.

77,568.—WILLIAM W. BALL, Edinburg, Ind.—*Metal Hub.*—May 5, 1868.—Flanges are cast with the hub which lie upon each side of the spokes and are drawn thereto by rivets or bolts.

Claim.—The annular flanges B B, made tapering from the hub to their edges, and cast of one piece with the hub, in such a manner as to form springs that are contractible, and made to firmly secure the spokes by the bolts C, as specified.

77,569.—JOHN S. BARDEN, Providence, R. I., assignor to UNION STEAM VALVE COMPANY, Mass.—*Slide Valve for Steam Engines.*—May 5, 1868.—The tapered valve is arranged so that its lower face will be at right angles with a line drawn from its center to the axial line of the cylinder. The upper parts are in a false top of sufficient depth only to contain a thin film of steam to equalize the pressure upon the two parts.

Claim.—1. The arrangement of the valve B, constructed as described, in respect to the three bearing surfaces, as and for the purpose set forth.

2. The passages f, so arranged as to connect and communicate between the recesses e' and the passages a a, as and for the purpose described.

77,570.—T. E. BATTERSON, Rochester, N. Y.—*Fruit Jar.*—May 5, 1868.—Loosely attached to the jar is a wire clamp capable of end motion so as to adapt it to the holding lugs if the cover be not placed centrally. The central coil allows a certain degree of spring.

Claim.—The combination with the cover B, of the wire clamp C, resting loosely in bearings e, so as to have a free turning and longitudinal movement, the whole arranged as described, and operating in the manner and for the purpose specified.

77,571.—HENRY JAMES BECKWITH, Chicopee, Mass.—*Machine for Cleaning Feathers.*—May 5, 1868.—The feathers are placed in the space between the interior steam-heating cylinder and an inclosing wooden case. The metallic cylinder is surrounded by a coiled steam pipe which is perforated to allow mingling of the steam with the feathers. The whole is supported on tubular gudgeons through which the steam passes and upon which the device rotates.

Claim.—1. The new combination of the head pieces H I I secured on the flange t t, in connection with the box A B C D, and the slide valve v, and the steam pipe P S S S S, arranged to operate together substantially as described.

2. The use of the head piece L M N, combined with the branch tubes X X, and the "heater" E E, and the waste pipe O, arranged to operate together substantially as described.

77,572.—EUGENE BEGGS, San Francisco, Cal.—*Gas Governor.*—May 5, 1868.—A thin, metallic diaphragm is connected with a valve by a series of levers to cause a regular supply to the burners. By means of a weight upon one of the levers, operated by a rod passing through a stuffing box from the outside, the pressure is regulated for the greatest number of burners to be used, while the valve and diaphragm regulate the amount for any less number.

Claim.—1. In a gas governor, the metallic or other diaphragm B, and the levers G and I, together with the valve M, the whole constructed and operated substantially as and for the purpose herein described.

2. The regulating weight S, moving upon the lever G and the sliding rod T, operating substantially as and for the purpose herein described.

3. The equalizing lever e, with the weights g, for increasing the weights on the diaphragm, and to overcome friction when the valve is opening, substantially as described.

77,573.—JOHN BLAKEY, Liverpool, and HOWARD BUSBY FOX, Oxtou, England, assignors to them—

selves and JAMES TURNER HALL.—*Collar and Cuff*.—May 5, 1868.—The paper is slid into place between the outer border and inner lining of silk or other material.

Claim.—A frame or holder A, of leather, silk, or other similar flexible and durable material, when combined with an inclosed detachable leaf or slip of paper, calico, or other similar delicate material or fabric C, to form an article of wearing apparel, substantially as herein set forth.

77,574.—CHARLES D. BLINN, Port Huron, Mich.—*Flexible Harrow*.—May 5, 1868.—The bars are connected by links with rectangular rods which pass around the bars at one end and are linked together at the other. One end of the rear bar is connected to the next one by a rigid link.

Claim.—1. The double links C, when operated in connection with the bars A, in the position herein described.

2. The solid link D, in connection with the above-mentioned parts, when constructed and operating substantially as and for the purposes herein set forth.

77,575.—HENRY BOWERS, Albany, N. Y.—*Draft and Shaft Tug*.—May 5, 1868.—The shaft depends from the saddle piece and has a fixed and a movable jaw which are clasped upon the shaft and secured by a turn key.

Claim.—1. The shaft clasp B, substantially as shown and described.

2. The tug A, substantially as shown and for the purpose set forth.

3. The combination of shaft tug A with saddle F, breast collar G, and shaft C, substantially as and for the purpose set forth.

77,576.—JOHN BRADLEY, Baltimore, Md., assignor to DAVID L. BARTLETT and HORACE W. ROBINS, same place.—*Boiler for Heating Purposes*.—May 5, 1868.—A number of cast metal chambers are placed together so as to allow a passage of air between each two of them over their faces. They have numerous transverse tubular openings allowing the passage of air from side to side. A portion of these sectional chambers are designed to form a fire chamber, with return flues through which the caloric current passes from rear to front and back again, and the remainder form a water back through which the flame and heated currents pass from front to rear and back again and finally to the smoke stack at the rear. The chambers contain water and are tightly clamped and steam-jointed together.

Claim.—1. Two or more sectional cast metal water or steam chambers, intersected by transverse air tubes or passages, and inclosing or encompassing a central fire space, in combination with two or more similar chambers, formed without such fire space, when all of said chambers are connected by continuous direct water and steam channels, and intersected by transverse smoke flues, and are also separated by intermediate air spaces, the whole being arranged and made to operate substantially in the manner and for the purpose herein set forth.

2. The formation and arrangement of continuous smoke and hot air flues, in and through a sectional heating boiler and radiator, by means of tubular openings in the several sections, fitting and connecting with each other, substantially in the manner and for the purpose herein set forth.

77,577.—WILLIAM BRAIDWOOD, Mount Vernon, N. Y.—*Printing Press*.—May 5, 1868.—The card drop projects upward from the rock shaft which has its bearing on the arms of the platen below the frisket shaft. On the right hand end of the rock shaft is a right-angled arm which extends both forward and backward, the forward portion being weighted to keep the card drop against the platen, and its rear portion having a horizontal pin projecting sideways and coming beneath the weighted tappet lever whose rear end is acted on by the cam formed on the periphery of the adjacent wheel. An additional inking roller is placed in contact with the usual roller to increase the inking surface.

Claim.—1. The arrangement and combination, with the card drop P, of the cam U, lever S, and weighted arm R, substantially as described.

2. The supplementary roller E, lying on roller D, and so arranged therewith that their peripheries on the side toward the roller frame F are in the same vertical tangential line, in combination with the vertically moving roller frame F, substantially as described and shown.

77,578.—CHARLES BREASTED, Chicago, Ill.—*Barrel Sifter*.—May 5, 1868.—The ashes are carried by the inclined chute to the upper part of the inclined sieve, and the cinders being thrown out, the ashes drop through into the vessel below.

Claim.—An ash sifter or screener, consisting of the box A, provided with the concave inclined slide C and laterally moving frame D, having the inclined screen E and mouth *b* attached, and protected by the cover *c*, all constructed and arranged to operate substantially as herein described.

77,579.—E. H. BUCKLAND, Springfield, Mass.—*Watch Case Spring*.—May 5, 1868.—The tongue which throws back the cap is placed upon one end of the spring and the catch stud near the other, a single spring thus lying more than half around the groove of the case and answering a double purpose.

Claim.—1. The spring A, formed of one piece, and reaching over half the circumference of the case, and forming both catch and throw-up at each end respectively, substantially as and for the purpose shown.

2. The stud E, with the catch *d* formed upon it, substantially as and for the purpose shown.

77,580.—E. H. BUCKLAND, Springfield, Mass.—*Spring for Watch Cases*.—May 5, 1868.—The catch is formed upon a curved piece which is placed between the rim of the case and the spring and is operated by the push pin. The device is intended for application to a common watch case.

Claim.—The independent catch D, formed upon the strip C, in combination with the spring B and push pin A, substantially as herein described.

77,581.—ESEK BUSSEY, Troy, N. Y.—*Oven*.—May 5, 1868.—Hinged shelves are placed in the supplementary ovens which may be folded up to the sides when the whole capacity of the oven is required for one article.

Claim.—1. In combination with an oven attached to stoves, hinging or pivoting therein a division or rack plate K, so that it may, when not used, be folded therein close to the oven side, in manner substantially as and for the purpose set forth.

2. In combination with a stove, a drum oven, having a slotted or open back or side, and arranged or placed directly beside and against the exterior wall or shell of the combustion or fire chamber of said stove, in manner substantially as and for the purpose herein set forth.

3. In combination with a drum oven, having an open back or side, and placed against the shell or plate of a stove, the employment therein of a series of slats or plates L L, arranged in manner substantially as and for the purposes herein described.

77,582.—WILLIAM CARR, Yellow Springs, Ohio.—*Burglar Trap*.—May 5, 1868.—The burglar falls between the trap doors, and his weight upon the hanging false bottom keeps them closed.

Claim.—1. A burglar trap, consisting of the chamber A, trap door or doors C C', rods L L', and suspended platform K, the whole being arranged to operate substantially as herein described and set forth.

2. The combination and arrangement, substantially as described, of the chambers A, *a a'*, partitions B B', trap doors C C', platform K, and rods L L', together with the shafts D D', and their accessories, E E', *e e'*, F F', *f f'*, G G', H H', I I', and J J', for the object explained.

77,583.—SETH E. CLAPP, Cambridge, Mass., assignor to himself and JOHN J. RIDGEWAY.—*Biscuit Cutter*.—May 5, 1868.—The rotating cutter has three circular openings whose sides form knives. It may have concentric tubes which remove a central plug from each biscuit.

Claim.—As a new article of manufacture, the bis-

cut cutter, either with or without the center piece D D' D'', substantially as described and for the purpose set forth.

77,584.—GEORGE PEMBERTON CLARKE, New York, and MARMONT B. EDSON, Brooklyn, N. Y.—*Register for Steam Engines.*—May 5, 1868.—The chart printed to indicate time and pressure, by vertical and horizontal lines respectively, is stretched upon a cylinder rotated by the engine and a marker on a steam pressure gauge is made to indicate the pressure at all times during the twelve hours. A reverse movement of the engine makes a retrograde line on the chart. The failure to reach an hour line at the time indicated denotes too slow a speed of the engine.

Claim.—1. The semicircular recess G, in combination with the pins H H and roller F, substantially as and for the purpose set forth.

2. The construction and application of the spring pad P Q, in combination with the recess G, pins H H, and roller F, substantially as described.

3. The construction and application of the movable journal box L, for the purpose set forth.

4. The application of the square piston rod W, in combination with the pencil holder, for the purpose herein shown and described.

5. The application of the hour wheel I², in combination with the crooked lever I, substantially as herein described and set forth.

6. The production of the delineations on the charts O, Fig. 10, by the combined action of the motion of the engine and the direct pressure of the steam from the boiler, and the action of the clock movement, the conjoint action of these several agencies producing the desired result, substantially as and for the purpose set forth.

77,585.—GREVILLE E. CLARKE, Racine, Wis.—*Skein and Box for Axles.*—May 5, 1868.—The skein has a depression on its lower side to hold anti-friction metal and is held on the spindle of the axle by a bolt which lies in a groove in said spindle and is secured to a bracket beneath the axle.

Claim.—The skein B, having a recess on its under part filled with box metal, C, and provided with a groove, *x*, and tongue, and used in combination with the box D, as constructed, and the rod E connected through the axle, as specified, all constructed and used substantially as set forth.

77,586.—JOSHUA R. CLARKE, Cohoes, N. Y.—*Waste Gate.*—May 5, 1868.—When the loose piston in the stationary cylinder is weighted by overflow water it descends and raises the cylinder suspended to the other end of the walking beam. This allows a discharge at that point which ceases as soon as the overflow no longer depresses the loose piston in the other cylinder.

Claim.—The water gate B, constructed substantially as described, in combination with and connected to a follower or piston, M, moving in an open cylinder or well, C, substantially as shown.

77,587.—LEVI H. COLBORN, Chicago, Ill.—*Bag Fastener.*—May 5, 1868.—The chain is drawn through the central hole in the plate until it is sufficiently tight and it is then slipped into the slot when a cross link rests in a cross notch.

Claim.—The combination, with the tie chain A, of the lock plate B, having a hole, D, and notch, E, with cross notch E', all constructed substantially as and for the purpose herein set forth.

77,588.—JAMES P. COLLINS, Troy, N. Y.—*Water Wheel.*—May 5, 1868.—The metallic surfaces are coated with vitreous enamel to prevent oxidation and friction.

Claim.—A water wheel, in whole or in part coated or enamelled with a silicious or vitreous substance, when having a metallic surface or surfaces, so as to prevent oxidation, and to reduce and lessen the friction of the water upon such parts or surfaces of such water wheel as and while the water is passing into and through such wheel, so as to give it rotating motion, for the purposes and in the manner substantially as herein contained, set forth and described.

77,589.—WILLIAM F. CONVERSE, Harrison, Ohio.—*Portable Fence.*—May 5, 1868.—The panels are held together by double-hooked bars and the connection made rigid by wedge-shaped keys inserted between the panels from the upper side. The wedges are barbed, or are headed at the small end to prevent displacement.

Claim.—1. The headed wedge-form key D, constructed and applied, substantially as and for the purpose set forth.

2. The paired hooks B B', in the described combination with two contiguous panels.

77,590.—WILLIAM H. CONWAY, Harrison, assignor to himself and J. H. J. RUTTER, Baltimore, Md.—*Steering Apparatus.*—May 5, 1868.—The side rudders are hung beneath the guards upon each side and are let down by a chain to assist in turning the boat.

Claim.—A side rudder for steamboats, when hinged to the under side of the guards, in such a manner that when not in use it can be drawn up out of the water, substantially as and for the purpose set forth.

77,591.—JOHN CORSON, Washington, D. C.—*Collecting Gold, Silver, and other Metals from their Ores.*—May 5, 1868.—The rollers in the glass-bottomed, insulated tank are tired alternately by different metals, and the slime contains acid or salt so that an electric current may be established to aid in the collection of the ore. The amalgamator has a rotating cylinder through whose tubular journals a stream of water is passed. The contents of the amalgamator is then discharged into cisterns whose length runs east and west, and which have end plates connected by a wire outside the cisterns. After settling in the cisterns the mass may be returned to the amalgamator.

Claim.—1. The mode herein described of collecting gold, silver, and copper from their ores, by the action of independent currents of electricity, in crystallizing the metals in an insulated pan.

2. The amalgamating process, with mercury or any other suitable substance, in an insulated pan or barrel, or other amalgamator.

3. The mode herein described of forming and applying the battery in the pan, or any other, substantially equivalent.

4. The mode of the amalgamation of gold and silver with mercury in an insulated vessel, pan, barrel, or any other substantially equivalent.

5. The stationary battery in the cisterns, in the form described, or any other substantially equivalent.

6. Using, for the purposes herein named, the aforesaid machinery and appliances, or any other, substantially the same, in which the same principle is used or involved.

77,592.—JOSEPH C. COULT, San Francisco, Cal.—*Furnace and Condenser for Collecting Quicksilver.*—May 5, 1868.—Improvement on his former patents. The pans for working fine dust ores are placed in the air chambers. The divisions between the fire chamber and air chamber and between the latter and the vapor chamber are made of grating. The vapor passes through perforated plates within the condenser, the pipes being made of such metal as admits of coating with quicksilver.

Claim.—1. The arrangement of the pans *d' d' d'* in the ore chambers C C, instead of the vapor chamber D.

2. The arrangement of the grating *d d*, placed on the inside of the ore chambers C C, to be used with or without the water linings *f f*, as may be desired, as and for the purposes set forth.

3. The arrangement of making or lining the inside of the condensing opening or pipes H H H with copper, silver, or other material that can be coated with quicksilver, as and for the purposes set forth.

4. The arrangement of placing in any part of the condensing openings H H H, leading from the furnace to the final escape into the open air, a series of punched copper, silver, or plate made of other material, that will or can be coated with quicksilver, for the purpose of amalgamating the fumes of mercury thereto, and saving all that would otherwise escape, as and for the purposes set forth.

77,593.—SAMUEL F. COVINGTON, Cincinnati, Ohio.—*Register for Railroad Fare.*—May 5, 1868.—The perforated metallic check is inserted into the glass-topped case and retained by the pin projecting upward from the spring bottom and precluding the removal of the check without the key.

Claim.—1. In combination with the seat of a railroad car, a box, so constructed that it may receive check plates, showing the names of the station to and from which the passenger has paid his fare, and so arranged that the plates can only be withdrawn by unlocking the box, substantially as and for the purpose set forth.

2. The combination of the box B, false bottom D, glass plate F, pins G, and check plates H, substantially as set forth.

3. In combination with the arm A and box B, the lock plate C, arranged to operate substantially as and for the purpose set forth.

77,594.—FRANK E. DARROW, Bristol, Conn., assignor to the DARROW MANUFACTURING COMPANY, same place.—*Spittoon.*—May 5, 1868.—The hide is prepared according to a process patented to him May 1, 1866, and the pieces forming the cup and cover respectively are swaged to form.

Claim.—The use or employment of raw hide in the manufacture of spittoons.

77,595.—NATHAN DEWEY and GEORGE W. FOSDICK, Dowagiac, Mich.—*Water Wheel.*—May 5, 1868.—The direct impact of the water is received upon the angular buckets, and the water then falls upon the curved buckets, whose forward edges are flush with the top of the wheel and whose rear edges incline downwardly from the inner shell of the wheel to the lower edge of the outer shell.

Claim.—The wheel A, composed of the rims B C and their buckets D and G, the buckets D being curved and inclined from the upper portion of the inner rim to the lower portion of the outer rim, all constructed and operating substantially as specified.

77,596.—DAVID DICK, Coming, N. Y.—*Wood Turning Lathe.*—May 5, 1868.—The device relates to means for actuating the rock shaft and sliding bar of one of the lathe heads which act respectively to operate the two slides of the tools by which the bobbin is formed; also to the mechanism to release the finished spool and to feed the sticks to the lathe.

Claim.—1. The weighted lever D, provided with the slotted arm F, in which the end of the lever G works, said lever adapted to operate the curved arm H, as herein described, whereby the tool heads and spindle are operated simultaneously, as and for the purpose specified.

2. The weighted lever I, attached to the rock shaft C, and provided with the segment arm K fitting in the spindle B, all operating as described for the purpose specified.

77,597.—FREDERICK BERNARD DOERING, London, England.—*Rock Drilling Machine.*—May 5, 1868; patented in England January 7, 1867.—In combination with the ordinary cylinder in which the piston actuating the boring tool works, is a small distributing cylinder; and combined with the distributing cylinder is a valve cylinder, and two other cylinders, the piston rods of which are connected to pawls which act upon the ratchet wheels for effecting the rotary motion of the piston and tool, and the advance motion of the engine.

Claim.—1. The combination of the following elements or parts, viz: first, an ordinary cylinder, provided with a piston and piston rod, suitable for supporting a boring tool; second, a distributing cylinder, provided with ports and pistons, actuated from the rod of the ordinary cylinder, the combination being substantially as described.

2. The combination of the following elements or parts, viz: first, an ordinary cylinder, provided with a piston and rod suitable for supporting a boring tool; second, a distributing cylinder, provided with ports and pistons, actuated from the rod of the ordinary cylinder; third, a cylinder actuating a pawl, the combination being substantially as set forth.

3. The combination of the following elements or parts, viz: first, an ordinary cylinder, provided with

a piston and piston rod suitable for supporting a boring tool; second, a distributing cylinder, provided with ports and pistons, actuated from the rod of the ordinary cylinder; third, a cylinder actuating a pawl, the combination being substantially as set forth.

4. The combination of these elements or parts, viz: first, an ordinary cylinder, provided with a piston and rod suitable for supporting a boring tool; second, a distributing cylinder, provided with ports and pistons, actuated from the rod of the ordinary cylinder; third, two cylinders, actuating each a pawl, the one to revolve the tool, the other to advance the boring tool toward its work, the combination being substantially as described.

77,598.—WILLIAM M. DOTY, New York, N. Y.—*Clothes Pin.*—May 5, 1868.—The spring hook holds the line against the stock.

Claim.—1. A clothes pin, composed of a stock, hook, and spring, combined, as herein specified, the hook having a play at right angles, or transverse to the stock, in the manner described.

2. The arrangement of the hook and stock, so that the former shall pass through the body of the stock or be supported upon the exterior of the same, as and for the purpose herein set forth.

77,599.—GEORGE A. EDWARDS, Centralia, Ill.—*Straw Cutter.*—May 5, 1868.—The feeding rake is connected by a cord to the head of the knife slide and is actuated thereby. The fore end of the box rests upon a spring and it has movement under pressure of the upper knife to bring the hay in contact with the V-shaped lower knife which is fixed to the frames.

Claim.—The arrangement of the pivoted box B upon the coil spring *h* and its shaft K, having rakes *r r*, that are operated by the lever *l* and cord *m*, and used in combination with the sliding head F, inclined knife I, and the angular knife C, on the frame A, all constructed and used as specified.

77,600.—LEVI D. FARWELL, Lancaster, and ARTEMUS W. GODDARD, Clinton, Mass.—*Fruit Paver.*—May 5, 1868; antedated April 25, 1868.—The cam strikes the foot when the rind is removed and raises the slide to automatically raise the fruit from the fork.

Claim.—The slide *a*, the lever *h*, and the foot *g* with cam *e*, or any other mechanical device, substantially as and for the purpose specified.

77,601.—JOHN E. FINLEY, Memphis, Tenn.—*Churn.*—May 5, 1868.—The vertical rotating churn-dasher has an inner rod attached to one dasher, and the other dasher is upon a sleeve having opposite rotation. The dasher's wings are spiral sectors.

Claim.—The combination of the flanged wheels H H, thimble G, key I, tube E, rod D, frame J, drive wheel A, and cog wheels B C, arranged and operated substantially as described.

77,602.—GEORGE P. FLOYD, Quincy, Mass.—*Railroad Track Cleaner.*—May 5, 1868.—The nozzles communicate by pipes with the steam drum, and throw a jet of steam upon the track to clear it of ice, snow, or small obstructions.

Claim.—The nozzles K, attached to the pipes D, when constructed and operating substantially as and for the purpose set forth.

77,603.—JOHN F. FORD, Boston, Mass.—*Window Safety Guard.*—May 5, 1868; antedated April 23, 1868.—Intended to be attached to the jambs of a window to prevent children from falling out. The side pieces have spurs which enter the jambs and sockets to receive the rounds, which have right and left-handed screws at their respective ends.

Claim.—1. As my invention, the window guard, as composed of the bars A B C D, arranged and connected by screws, and having spurs, substantially as described.

2. The combination and arrangement of the springs *d d* in the sockets of the middle projections of the bars A B, with such bars and their spurs, and the bars C D applied to the bars A B, substantially as specified.

77,604.—ROYAL CLARK GRANT, Middleport, Ohio.—*Nail Machine*.—May 5, 1868.—The cutting jaws rotate continuously, and the nail plate is fed by gravity. The cutters are arranged in concentric circles on the upper surface of the cylinder. The nail plate is held in a grooved bar which has a sliding motion upon radial arms above the cylinder, and is fed alternately to the cutters in the respective series, the cutters being inclined in opposite directions to cut the nails, heads and points, alternately. The nail blank is supported in a vertically sliding rest, a cam advances the header to operate on the nails of one series, and exterior inclines operate the header of the outer series. The nail clamp is operated by a toggle and a follower rod which is moved by traversing upon cams below.

Claim.—1. The horizontally rotating cylinder B, provided with a series of cutters and headers, in combination with clamp *h*, all constructed and arranged to operate substantially as described.

2. In combination with a series of cutters *a*, arranged as described, the laterally reciprocating plate holder *g*, arranged in such relation to the rotating cylinder as to present the nail plate alternately to the two circles of cutters, as set forth.

3. The combination of the clamp *h* and the sliding rest *d* with the headers *r* and *w*, when arranged to operate substantially as described.

77,605.—ELIJAH H. GRAY, Winchester, Ill.—*Clothes Line Hook*.—May 5, 1868.—The hook bar engages an eye in the post, and has a sheave for the cord to pass over, and a ratchet cam to hold the same.

Claim.—The hook A, provided with jaws *b b*, in combination with cam lever *d*, spring *g*, and pulley C, all arranged substantially as set forth.

77,606.—JONATHAN P. GROSVENOR, Lowell, Mass.—*Sawing Machine*.—May 5, 1868.—The saw shaft is journaled in a frame sliding between inclined guides secured to the main frame. A connecting rod is hinged near its center to the rocking rest frame, to adjust the said rest in either a vertical or inclined position, by a screw passing through a slot in the connecting rod and into the tail. The swinging rest, when wanted to hold the stuff, is swung upward on to the top of the table and adjusted to the desired angle.

Claim.—1. The frame A, carrying the saw arbor S, sliding in the inclined guide frame B, shaft C, screw *x*, and bevel gear C C, all constructed and arranged to operate in the manner substantially as described.

2. The employment of the connecting rod *a*, combined with the rocking rest *b*, and the tail *g* thereof, constructed and operating in the manner and for the purposes substantially as described.

3. The reversible rest *h*, combined with the pivoted bar *k*, projection *n*, notch *e*, slide table D, spring *m*, or its equivalent, all constructed and operating substantially as described.

77,607.—JOHN A. HAHN and CHARLES VOGLER, De Graff, Ohio.—*Shoemaker's Bench*.—May 5, 1868.—One end of the bench has a sewing clamp operated by a cam, and the other end has a pegging clamp whose toe and heel rests are drawn together by a screw. A strap lies over the hollow.

Claim.—1. The clamp C, when constructed with the vertically adjustable jaw *e*, the vertically and laterally movable jaw *e'*, the spring *s*, and the combination of the cam lever D, rod E, and treadle F, for the purpose of operating it, the whole being constructed, arranged, and operating in the manner described.

2. The combination and arrangement, on a shoemaker's bench, of the clamp C, constructed and operating as above described, and the apparatus, consisting of the plate I, blocks M and N, screw O, strap *r*, and treadle T, all constructed and operating in the manner and for the purposes set forth.

77,608.—JOSEPH HALE, Somerville, and WILLIAM HALL, Brookline, Mass.—*Rein Shackle*.—May 5, 1868.—The eye is swiveled to a socket, into which the arm of the buckle ring is placed and held by the spring catch, which also acts the part of a tongue for the buckle.

Claim.—As a new article of manufacture, a rein

shackle, made substantially as described, as and for the purposes set forth.

77,609.—ALONZO J. HALL, Derry, N. H.—*Water Wheel*.—May 5, 1868.—The water is conducted through the four arms of the inner reacting wheel, and is discharged against the buckets of the outer wheel, the jets of water from each arm impinging against two buckets at once. Each of the discharging apertures is governed by a pendulum regulator, which determines the area of water opening by the speed of rotation.

Claim.—1. The apertures *e* and circular groove in flange O, in combination with the chambers C and hub of the outer wheel B, when arranged to operate in the manner and for the purpose specified.

2. The valve B, in combination with the weight W and gate T, substantially as and for the purpose specified.

77,610.—EDWIN A. HALL, Sugar Branch, Ind.—*Floor Clamp*.—May 5, 1868.—The joist is gripped between two inclined legs of the clamp and the boards forced up by the cam, operated by the reversible lever. The lever projects over the joists when putting on the first few boards, and is afterward reversed to be operated from the floor.

Claim.—The arrangement of dog A B B' *a*, eccentric cam C, and reversible lever E *e e'*, substantially as set forth.

77,611.—WALTER HASLAM, New Britain, Conn.—*Seaming Machine*.—May 5, 1868.—The cloth holding plate is attached to the table of the machine by brackets and a thumb-screw, so as to admit of easy attachment and removal. The loops are placed upon the points of the plate before it is set in the machine, so that with a number of plates a machine may be kept running more constantly than when the plate is irremovable from the table.

Claim.—The combination, with the brackets *e* and stop *g*, of the slotted plate *d*, provided with its loop-holding points, and a thumb-screw, for the ready tightening and releasing of the plate, substantially as and for the purpose set forth.

77,612.—SAMUEL B. HOPKINS and EDWARD H. ANDERSON, Easton, assignors to themselves and J. M. SATTERFIELD, Baltimore, Md.—*Vapor Burner*.—May 5, 1868.—Improvement on their patent, April 3, 1860.—Four holes are used instead of two holes and slit of the former burner. A transverse, coneave plate is used in addition to the coneave plate used in the previous case.

Claim.—The burner above described, having the central cone A pierced with four holes *a a' a'* at the points specified, when used in combination with a plate B, bent up at the ends, and having ears *c c* projecting upward from its sides, substantially as and for the purpose described.

77,613.—BENJAMIN HORN, Sergeantsville, N. J.—*Mileage Register*.—May 5, 1868.—Intended especially for ascertaining distances traveled in hired carriages. The registering machinery strikes a bell and pierks a mark in a paper at the end of every mile traveled. A pin on the hub actuates the train of machinery.

Claim.—1. The spring crank or pin B¹, carried on the hub B, and adapted to act on the wheel D, so as to yield when necessary and avoid fracture, substantially as and for the purpose herein specified.

2. The ringing mechanism P Q, arranged to operate in combination with mechanism for receiving motion from the wheel of a carriage, and thus indicating to the ear each mile or other unit of distance traveled, substantially as and for the purpose herein specified.

3. In combination with mechanism, substantially as herein described, for receiving motion from the rotation of the wheel of a carriage, the striker R, operated by such mechanism at uniform distances traveled, and arranged to mark on a surface uniformly traversed across its path, substantially as and for the purpose herein specified.

4. In a mileage register, having provision for striking a bell, or marking on a moving surface, by a blow, as described, so forming and arranging the elastic parts P R, or either of them, that, while allowing for

a reasonable amount of backing without derangement, fraudulent turning of the carriage wheel backward will break or permanently set one or both of the striking parts, substantially as and for the purpose herein specified.

77,614.—WILLIAM W. HORTON, Providence, R. I.—*Lamp Burner*.—May 5, 1868.—The chimney holder can be removed from the burner with the chimney which rests upon the studs.

Claim.—1. The chimney supporter D, consisting of the ring, with its studs *g* and perforations or air-holes, arranged as specified.

2. The combination, as well as the arrangement, of the guard E, the perforated annuli C and F, and the flange *k*, with the body A and wick tube of the burner.

77,615.—THEODORE P. HOWELL and CHARLES P. OLIVER, Newark, N. J.—*Frame for Stretching Hides and Leather*.—May 5, 1868.—Improvement on their patent, August 6, 1867. One end of an arm is pivoted to one of the outside upright posts, and its other end is pivoted to an arm which is pivoted to the main sliding bar. The device forms a toggle to specially stretch the shoulder part of the hide.

Claim.—The arms A and B, constructed, combined, and operating substantially as and for the purposes specified.

77,616.—HORACE S. HOXIE, Adrian, Mich.—*Plow Colter*.—May 5, 1868.—The colter is attached by a shackle to the beam and has brace plates by which the share and mold board are attached. Bolts secure the parts together.

Claim.—1. In combination with the colter A, the braces *a*, *b*, and D, mold board B, tenon *h*, all constructed in the manner set forth and described.

2. The combination of the mold board B and colter A, when both are made in one piece, or welded together in the manner set forth and described.

77,617.—LEAVITT HUNT, Weathersfield, Vt.—*Sulky Plow*.—May 5, 1868.—The plow beam is pivoted to a draw bar which is hinged to the axle and is vertically adjusted by a bent lever which is connected to the draw bar and the frame, and set by a rack bar and stud. The clevis is connected by chains vertically to the draw bar and horizontally to the doubletree.

Claim.—1. The hinged beam D, and the plow beam E, provided with and connected by the oval axle *e*, and the chain *i*, or its equivalent, substantially as described and set forth.

2. The combination of the iron lever *l* with the bar *k* and the beam D, substantially as and for the purposes set forth.

3. Providing the beam E and the pole C with the slots S and *d*, to act in conjunction, thereby giving the plow some longitudinal play, when the beam E is connected to the whiffletree or bolt *t*, by the chain F, or its equivalent, substantially as described and for the purposes specified.

77,618.—A. G. HUNTER, Flint, Wales.—*Manufacture of Zinc*.—May 5, 1868.—The zinc ore, after suitable preliminary treatment, and mixture with carbon, is placed in a reverberatory furnace and kept from contact with all oxygen except that passing through the grate bars. The heated gases are condensed, and the metal runs into suitable recesses.

Claim.—The process of extracting zinc from its ores by the direct application of heat to the said ores, without the use of crucibles or retorts to contain the said ores, the heated gases and flame being, previously to their contact with the zinc, carefully deprived of free oxygen, and the subsequent condensation of the zinc vapor to the metallic state, all substantially as herein described.

77,619.—W. H. JACKSON, Brooklyn, N. Y., and GEORGE MERRILL, Newburyport, Mass., assignors to MERRIMACK LOOM COMPANY, Boston, Mass.—*Loom*.—May 5, 1868.—The weft thread is carried by a needle through the shed and is interlocked by a shuttle thread, returning to its normal position before the shed changes. The needle is passed through the under part of the shed near the reeds so as to

preserve it from contact with the warps. The needle then receives a swinging movement that passes its end around a standing shuttle or bobbin, the needle returning through the shed near the point of weaving so that the lay has to move the weft thread but a short distance.

Claim.—1. The mechanism, substantially such as described, for operating a weft-carrying needle, so that its point shall pass through the wider part of the shed, and return near the point of weaving, substantially as and for the purpose set forth.

2. A loom having a weft-carrying needle, arranged and operated substantially as described, so as to pass its eye through the shed obliquely, or near the beater, when the latter is thrown back, then around a stationary bobbin, located at the opposite edge of the shed, and thence back through the shed to the place of starting, substantially as set forth.

3. The combination of the shuttle holder *y*, the reciprocating fingers 21 and 22, bobbin *x*, and the weft-carrying needle, when said parts are constructed and arranged for joint operation with the mechanism of a loom, substantially as is herein described.

77,620.—MELVIN JINCKS, Dansville, N. Y.—*Lamp Burner*.—May 5, 1868.—The cone has a series of holes through which the spring catches pass from the base to secure the cone to the said base plate. The chimney is held by three radially adjustable catches.

Claim.—1. The sliding springs or holders *b b*, for the purpose of adjusting the same to different sizes of chimneys, substantially as described.

2. In combination with the above, the burner A, cone B, spring clips *c e e*, and flange or knob *h*, when all are constructed and arranged substantially in the manner and for the purpose set forth.

77,621.—DAVID A. JONES, Springfield, Mass.—*Combined Tweezers, Watch Key, &c.*—May 5, 1868; antedated April 22, 1868.—A socket of the tweezers receives the instrument which has a watch key at one end and an ear spoon at the other. The instrument is reversible in the socket.

Claim.—The combination of the tweezers A A', ear spoon *f*, and watch key *g*, arranged and constructed substantially as and for the purpose shown.

77,622.—P. W. KING, Lowville, N. Y.—*Animal Trap*.—May 5, 1868.—The top has a tilting platform which gravitates to a horizontal position and is secured by a spring catch beneath. The catch is sprung by a bait hook attached to a lever above the top.

Claim.—The combination of the members C, E, F, G, H, and J, for the purposes intended.

77,623.—JACOB KLEIN, Williamsburg, N. Y.—*Permutation Lock*.—May 5, 1868.—The bolt has an irregularly-shaped opening which surrounds the shaft of the turning knob, and is moved out and in by an arm upon the shaft by turning the knob 90°. The bolt has at top a recess into which the forward end of the tumbler enters when the bolt is thrown back. The bolt can only occupy the position to enter the recess when the arm of the tumbler enters the recesses of the combination wheels which are properly disposed.

Claim.—1. The oscillating hinged ward *e e*, as constructed, in combination with the catch or arm *d*, operating with the disk E F and bolt D, by means of the acute angle lugs *f f'*, on the shaft of the knob B, substantially as herein described.

2. The double-acting spring P P, the brake keys *q q*, operating reversely against the ring plate M, for holding it in position, when set to a given number, as set forth.

77,624.—AUGUST KOCH, Baltimore, Md.—*Cooler and Refrigerator*.—May 5, 1868.—The ice is placed in a perforated, removable tray and the water drops upon the upper part of the lid of a refrigerating chamber, and is carried to the annular water chamber surrounding the same. The air from the refrigerating chamber is allowed horizontal exit between the upper and lower portions of the lid.

Claim.—The combination of a detachable scive or

perforated ice pan, L, with the upper part of a ventilated water cooler, A, and with a ventilated refrigerating box or vessel, E, placed centrally therein beneath said pan, and surrounded by a water space F, all substantially as and for the purpose herein set forth.

77,625.—E. F. LACY and D. K. WOODBURY, Danville, Ill.—*Hame*.—May 5, 1868.—On the outside of the hame is a strap which forms a guide for the upper extension piece of the hame when it is slipped up or down to adapt it to the size of the collar. It is fastened at its adjustment by a set screw.

Claim.—The adjustable metallic plate C, provided with L-shaped ears *x x*, which project beyond and under the stationary plate B, and work in vertical grooves in the wooden hames A, all constructed, arranged, and operating as set forth.

77,626.—JAMES LAMB, Aurora, Ind.—*Shaft Coupling*.—May 5, 1868.—The clip is in two parts which are drawn together by a bolt which also expands the conical bushing into the socket of the thill iron to prevent rattling.

Claim.—The movable taper *d* and movable socket *e*, secured between the arms C C, and used in combination with the straight bolt E, thill F, and clips B B, substantially as set forth.

77,627.—PETER F. LAWSHE, Rochester, Minn.—*Self Sealing Burial Case*.—May 5, 1868.—A groove in the upper surface of the flange of the lower section contains a rubber packing, upon which the flat, under surface of the flange of the upper section is imposed.

Claim.—1. A self-sealing burial case, constructed and arranged to operate substantially as described.

2. A metallic burial case, constructed substantially as herein described, and provided with the rubber packing, as and for the purpose set forth.

77,628.—LLEWELLYN D. LOTHROP, Dover, N. H.—*Fishing Tackle*.—May 5, 1868.—The swivel is slotted for attachment of the cord to which the hook is secured. The knot of the cord is passed through the enlarged part of the slot and the cord is drawn down into the narrow part.

Claim.—The swivel, as made with the eye *c* and the slot *d* arranged in it, substantially as and for the purpose hereinbefore specified.

77,629.—ALMON D. MANLEY, Washington, Mich., assignor to himself and LEWIS H. CANTINE.—*Hoisting and Transferring Pulley*.—May 5, 1868.—The carriage traverses on the track rope so as to transfer the load, when lifted, to the place where it is to be dumped. A collar on the hoisting rope strikes a projection and locks the lifting pulley, when the carriage commences to traverse. After moving the required distance a bar on the carriage strikes a stop on the track rope and releases the hoisting rope so that the load may be lowered.

Claim.—The arrangement of the block B, drum K, pulley R, and lever L, in combination with the car D, and its pulleys, levers N and *j*, sliding bar *g*, pulley P, and cords E C F, adjustable collar H, and weight *w*, the various parts being constructed and operating substantially as set forth.

77,630.—DAVID A. MANUEL, Napa City, Cal.—*Side Hill Plow*.—May 5, 1868.—The share and mold board are respectively triangular pieces, hinged to the vertical axes on the sole plate, and capable of swinging round so as to occupy their station on either side of the beam, to form a right or left hand plow. One swings in front of the standard, and the other in the rear of it, and the parts are locked in either position by a draw bolt.

Claim.—1. Dividing the plow, between the share and mold board F and J, and hinging the two parts to the land side and standards, so that by swinging them to the right or left, and joining the two said parts, they will form a perfect plow, substantially as described.

2. Construction of the land side A, wider in front than at the heel, so that the line of draught will incline towards the land, substantially as described.

77,631.—WILLIAM C. MARQUIS, Burgettstown, Pa.—*Rat Trap*.—May 5, 1868.—At the top of the spout is a hinged platform, whose axis is prolonged and bent downward outside, where it has an adjustable weight. A rat reaching at the bait and stepping upon the platform is precipitated down the spout into the water chamber below.

Claim.—The tilting platform F, when hung on a bent rod *g*, in combination with the pendulous weight *h* and spout C, the several parts being constructed and used as and for the purpose specified.

77,632.—DANIEL S. MARVIN, Watertown, N. Y.—*Knife and Fork Scourer*.—May 5, 1868.—The knives are placed in pairs back to back and the clamp brought down upon the handles. The blades are then cleaned by a transverse reciprocation of a cork block with brick dust as a polishing material.

Claim.—The combination of the adjustable slat C with the bars A and B, rods and coil springs *b b*, as and for the purposes set forth.

77,633.—WALTER K. MARVIN, New York, N. Y.—*Safety Door Key Guard*.—May 5, 1868.—A swinging plate is hinged to the door, beneath the lock, and when elevated a sliding piece is made to protrude through the bow of the key handle to prevent the key from being turned by an outsider.

Claim.—The combination of the plate A with a slide or tongue, mounted in or upon said plate, and a spring to hold said tongue in position, substantially in the manner described, the whole constituting a key-fastening device, hinged to the door or other part where the key is located, so as to operate in connection with the said key, substantially as and for the purposes shown and specified.

77,634.—NATHAN F. MATHEWSON, Barrington, R. I.—*Mowing Machine*.—May 5, 1868.—The spring pawl moves longitudinally and engages a ratchet upon the side of a wheel turned by a lever, and whose peripheral groove is occupied by a chain connected to the finger bar to raise the same. The fore end of the shoe is turned up and passes around a bar of the V-shaped strap attached to the platform, and serves to support the finger bar in its movements. The pitman is connected to the wrist pin by an open-ended strap, through whose key slots a wedge-formed key is passed, and the outer ends of the strap are held by a bolt, by which the strap may be tightened upon the key to take up lost motion.

Claim.—1. The spring pawl 3, when combined and arranged with the pedal 5, the spring strap 6, the wedge key 4, and ratchet wheel 1, substantially as described and for the purposes specified.

2. The curved elongation of the shoe *m*, in combination with the strap *o*, for the purposes specified.

3. The rods *z z*, when used in connection with the wheel *x*, the rods W, the chucks *u*, and the gears E, for the purposes specified.

4. The double wedge key P, when performing the double office of journal box and key.

77,635.—S. T. MCDUGALL, Brooklyn, N. Y.—*Gas Heater*.—May 5, 1868.—The case has a vertical partition dividing it into a boiling recess upon one side and into a recess containing ovens upon the other. The roasting oven has a burner at its top, which is perforated on the lower side, and casts the heat downward onto the contents of the oven. The waste heat circulates in the flues around the upper oven, which may otherwise be heated singly by two small burners.

Claim.—1. The ironing apparatus, constructed and operating substantially as shown, in combination with the case or cabinet A.

2. The auxiliary chamber R, combined with the ovens Q and S, when the same shall be constructed and combined substantially as shown, for the purposes set forth.

3. The air supply pipe O, in combination with the downward burner I, constructed and operating substantially as and for the purposes specified.

77,636.—DUSTIN F. MELLEEN, Manchester, N. H.—*Apparatus for Distilling Pine Wood*.—May 5, 1868.—The wood is placed in perforated cylinders

which are mounted on trucks and contain about half a cord. Two of these cylinders are run upon a track into a cylinder heated by furnaces upon each side and by surrounding flues. Beneath the cylinder is the cylindrical pitch basin to receive the resin, pitch, and tar, and beneath the basin is a furnace to heat the same. The basin is cooled when desired by the passage of water through a surrounding water jacket. The turpentine or pyroligneous acid escapes into a condenser, from which it is drawn into a mixing chamber, to be mingled with deodorizers or other chemicals. The turpentine or pyroligneous acid, as the case may be, is drawn from the mixing cylinder and distilled.

Claim.—1. In combination with the cylindrical retort A and the furnaces B, the segmental flues *b* and *b*¹, with the upper and lower main flues B² and B³, constructed and arranged substantially as and for the purpose set forth.

2. In combination with a retort for the destructive distillation of resinous wood the pitch basin C, with water space under the same for conveying a current of cold water to modify the heat of the pitch basin, substantially as described.

3. In combination with the cylindrical retort A and wood-holding perforated cylinders A', or their equivalents, the pitch basins C, located within the main cylinder A, substantially as described.

4. In combination with the retort A a water pipe or pipes, so arranged as to convey a current of water into and through said retort, to prevent the pitch from being vaporized therein.

5. In combination with the retort A and pitch tank C', or their equivalents, a cock or gate, or the equivalent thereof, between the retort and the pitch tank, for the purpose of closing the connection between them while the wood is being charred, substantially as and for the purpose set forth.

6. In combination with the still and furnace the annular fire chamber *j*', the annular flue L', with connecting flues *l*, constructed and arranged substantially as and for the purpose set forth.

7. In combination with the annular fire chamber *j*' the fire flues or tubes L, passing from the furnace, through the still, to said annular fire chamber, substantially as described.

8. In combination with the rotating agitator the cog wheel *g* and pinion *g*', or equivalent gearing, inclosed in the cylinder E, substantially as and for the purpose described.

77,637.—FRANK MILLER, Indianola, Ill.—*Bolt Cutter.*—May 5, 1868.—The lips on the respective jaws are brought together as the movable handle is oscillated. On the axis of the latter is a cam, which moves within a loop on the stock of the movable jaw, to cause the lip on the latter to approach to or recede from the other lip.

Claim.—The tool herein described, when its several parts are constructed and arranged substantially as and for the purposes set forth.

77,638.—G. L. MILLER, De Witt, N. Y.—*Window Curtain Fixture.*—May 5, 1868.—At the ends of the rollers are swivel rings which run upon guide rods at each side of the window when the blind is lowered from above so as to admit light from the upper portion of the window.

Claim.—The guide rods *g* and swivels *f*, in combination with the vertically adjustable roller A, as and for the purpose set forth.

77,639.—WILLIAM R. MILLS, Hartford, Mich.—*Mop Wringer.*—May 5, 1868.—The sleeve is secured to the mop staff, and carries two bevel wheels turned by a hand crank, and causing the rotation of a shaft which has an eye at the lower end through which the end of the mop is passed.

Claim.—The combination of the sleeve B, the crank and shaft C, the bevel gear wheels D and E, the hangers G, the head J, when arranged with the mop handle A, the head I, and the web H, when constructed and operating substantially as and for the purpose herein described.

77,640.—JAMES F. MORSE, Montgomery, Ill.—*Extension Ladder.*—May 5, 1868.—The upper section slides within the lower one, and is operated by

cords passing around pulleys and taken up on a windlass at the top of the upper section.

Claim.—In combination with the members A B of the ladder, the arrangement of the pulleys E, cords *m m*, shaft D, and gearing F G, whereby the operator can raise and lower the upper member of the ladder when standing upon the same, substantially as specified and shown.

77,641.—SAMUEL K. MORSE, Commerce, Mich.—*Hay Raker and Loader.*—May 5, 1868.—The machine is to be trailed behind a wagon, raking up the hay in its route, elevating it by the teeth on the endless band and discharging it into the wagon. The belt frame is pivoted to the frame of the carriage and its inclination is adjusted by segmental, slotted bars and set screws.

Claim.—The slotted semicircular plates H H, and curved standards *f f*, by means of which the belt frame is adjusted to any desired elevation, as described.

77,642.—PETER MOUGEY, Marshallville, Ohio.—*Railway Cattle Guard.*—May 5, 1868.—The gate is attached to a shaft which is rotated by the weight of cattle approaching on the platform so as to erect the gate. Its normal position is flat and offers no obstruction to the passing train.

Claim.—The peculiar arrangement and combination of the platforms D D D, rock shaft F, with arms H H and I, connecting rod J, arm K, and gate L N, the several parts being arranged substantially in the manner and for the purpose herein specified.

77,643.—WILLIAM A. MUNN, Milwaukee, Wis.—*Blank for Bodies of Sheet Metal Tea and Coffee Pots.*—May 5, 1868.—The ornamental blanks for the sides of tea pots, &c., are cut and stamped as an article for sale to manufacturers of those articles, as the breasts, lids, bottoms, and handles have previously been.

Claim.—As a new article of manufacture, tin blanks to form the bodies of tea and coffee pots and similar articles, when stamped or pressed with fancy and ornamental designs, substantially as herein described.

77,644.—D. B. NELSON and MORGAN DYER, Elmira, N. Y.—*Scraper.*—May 5, 1868.—The bowl-shaped scraper has a removable point and is secured by curved braces to the beam. The downward, rear projection of the beam is also attached to the bowl. A lever above the beam assists in upsetting.

Claim.—The combination of the bowl A, movable point B, beam C, braces *c c*, and lever E, all arranged and operated as and for the purpose specified.

77,645.—DANIEL M. NIXON, Danville, Ill.—*Hame.*—May 5, 1868.—Studs project from the inside of the staple and the face of the sliding plate, and hold the loop of the hame tug at such height as may be desired. The tug may be shifted by sliding the plate and readjusting the loop.

Claim.—Constructing hames with a staple, D, and sliding plate F, having opposite projections E E', said parts being arranged to adjustably attach the trace, substantially as described.

77,646.—EDWARD NORTON, Boston, Mass.—*Machine for Grinding File Blanks.*—May 5, 1868.—The grindstones are journaled to pendulous hangers, and the weight of the stones tends to carry them away from the frame supporting the blanks. The stones are drawn inward toward the said frame by chains passing over pulleys and connected to a hand lever. The blanks are clamped in the frame in a vertical position, and have vertical and lateral reciprocation to bring all parts under action of the stone, without furrowing the same. The motion of the hangers, and consequent form given to the blanks, is regulated by a pattern upon the frame.

Claim.—1. The employment of a pendulous or oscillating hanger or stand, in combination with the axis of a grinding stone, arranged parallel to its own axis of oscillation, or equivalent device, substantially as described.

2. The arrangement of the oscillating grindstone stand or hanger, with an inclination from its sup-

porting and oscillation axis toward the work to be ground, so that the weight of the stone and hanger may be employed to effect all movements of the stone in the opposite direction, substantially as shown.

3. In combination with the inclined arrangement of frame for moving the stone in one direction, the arrangement of a weight, *c*, or spring, to move it in the opposite direction, substantially as set forth.

4. The frame *i*, or its equivalent, operating substantially as and for the purposes set forth.

5. The employment of the adjustable connecting rod *l*, in combination with the crank *m* and the carriage *k*, and operating substantially as and for the purpose set forth.

77,647.—JAMES M. OSGOOD, Somerville, Mass.—*Machine for Casting Eyelets.*—May 5, 1868.—In the periphery of a rotating cylinder are recesses fitted with sliding tubes that surround fixed, cylindrical pins, thus forming circular spaces for the reception of the molten metal which is forced from the recesses above. The sliding tubes are reciprocated by cross bars and cam grooves. The heads are finished by a second cylinder, studded with headers, which are brought into correspondence with the projecting ends of the partly formed eyelets.

Claim.—1. Making eyelets from cast metal, by the means substantially as described.

2. The fixed pins or rods *d*, in combination with the sliding tubes *f*, as and for the purpose set forth.

3. The combination of the fixed pins or rods *d*, the sliding tubes *f*, and the cylinder *B*, as described.

4. The combination of the cross bars *c*, the sliding tubes *f*, and the cam plates or disks *C C'*, as and for the purpose specified.

5. The cylinder *G*, provided with the projections *y*, as and for the purpose set forth.

6. The chamber *i*, formed in the plate *H*, in combination with the cylinder *B*, as described.

7. A cast metal eyelet, constructed by the means substantially as above described.

77,648.—JOHN H. PARK, White House, N. J.—*Bag Holder.*—May 5, 1868; antedated April 24, 1868.—The levers are attached to a block which is adjusted to the required height upon a notched post. The spreader levers are placed inside the hem of the bag and are distended by springs.

Claim.—The metallic levers *D D*, pivoted as described, and forming a hoop at the forward end, when provided with rack bar *e*, and used in connection with the block *B*, with its springs *a a*, all constructed and operating in the manner and for the purposes set forth.

77,649.—CHARLES and EDMUND PARKER, Meriden, Conn., assignors to CHARLES PARKER, same place.—*Coffee Mill.*—May 5, 1868.—The runner is supported at its upper end by the side pieces which extend up into the hopper which rests below the lugs. The side pieces have an open space directly from the hopper into the runner. The vertical part of the runner has ribs or teeth, and upon the inside of the side pieces are teeth cut across their face which act as breakers previous to grinding.

Claim.—1. Attaching the stationary grinding bed *a* on to the top board *b* by means of lugs *e*, in combination with the rim *d*, or a part thereof, the lugs entering above and the rim below the top *b*, or *vice versa*, substantially as set forth.

2. Forming a cracker within the hopper, by extending the side pieces or supports *g* up into the hopper, and so as to form open spaces directly from and within the hopper to the runner, between the said supports *g*, and when the said supports are inclined to the runner as described, and the under and inside of the supports *g* provided with teeth, so as to operate in the manner specified.

77,650.—JOHN E. PARKER, Meriden, Conn.—*Reversible Knob Latch.*—May 5, 1868.—Pressure on a knob disengages the face plate of the lock and allows it to be swung out so that the knob may be turned for a right or left hand door.

Claim.—Hinging the face plate to the lock case, so as to be turned therefrom, substantially in the manner and for the purpose herein set forth and described.

77,651.—GEORGE F. PERKINS and S. F. GIBBS, Holyoke, Mass.—*Door Fastener.*—May 5, 1868; antedated April 28, 1868.—The toothed bar is inserted between the door and the jamb, the tooth penetrating the latter. The cap is screwed against the door to keep it from opening. The case, when not thus used, may contain matches.

Claim.—A combined adjustable door fastener and match safe, consisting of the case *B*, cover *A*, and bar *C*, the whole constructed and operating substantially as described.

77,652.—HIRAM PRESTON, Orfordville, Wis.—*Gauge for Weather-Boarding.*—May 5, 1868.—The slide is adjusted on the stock to determine the width of board exposed to the weather. The tongue is slipped beneath the last nailed board and the claw at the lower end is driven in. The slide affords a rest for the board to be nailed on. The scribe piece is adjusted so as to make a mark on the end of the board by which to saw.

Claim.—1. The plate *B*, and screw *i*, as also the spring *h*, in combination with the bar *A*, substantially as described, and for the purposes set forth.

2. The scribe *D*, with the slotted arm *m* and pin *p*, constructed to operate in connection with the bar *A*, substantially as and for the purposes specified.

77,653.—GEORGE W. PRUYNE, Mexico, N. Y.—*Channeling Tool.*—May 5, 1868.—The knife and its wedge block slip into a slot in the stock and are held in position by the threaded end of the tool shank, whose other end is driven into the handle.

Claim.—1. The slide *B*, so constructed as to serve the double purpose of holding the knife and forming a shoulder or guide for the tool, in connection with the part *A*, substantially as described and set forth.

2. The handle *C*, forming a set screw, and acting in combination with the part *A* and slide *B*, substantially as described, and for the purposes specified.

77,654.—JAMES RANEY, Newcastle, Pa., assignor to himself, LEANDER, and BOSTIC RANEY.—*Elevating Flour, Feed, Grain, &c.*—May 5, 1868.—The meal from the stones passes into a chamber below, entering near the eye of the fan shaft, and the fan elevates it by a spout to an upper chamber where the flour settles, and whence the surplus air passes by a chute to the eye of the millstone.

Claim.—The arrangement of the fan *F*, spout *G*, and chamber *H*, with the spouts *I, K*, and *D*, as and for the purposes herein set forth.

77,655.—JOHN S. RANKIN, Detroit, Mich.—*Fall Leaf Table.*—May 5, 1868.—The leaf is hinged to a piece which slides beneath the top and has an inclined brace which retreats as its end is lifted from a catch pin in the lowering of the leaf.

Claim.—1. The slides *C*, in connection with the screws *D*, the plates *H*, the slots *G*, and the hinges *F*, and the spiral springs *N*, when operating substantially as and for the purposes described.

2. The combination of the above-named parts with the arm *I*, hinge *J*, guide *K*, pin *L*, spring *M*, leaf *A*, top *B*, and side rail *E*, when arranged and operating substantially as and for the purposes herein set forth.

77,656.—CHARLES F. RAVN, Milwaukee, Wis.—*Wagon Skein.*—May 5, 1868.—The spindle of the axle-tree has a tapering bolt inserted axially into its end and secured by a transverse pin. The cast-metal skein is retained by a nut screwing on to the end of the bolt, and the wheel is secured by a linchpin passing through a cap, and diametrically through the spindle and bolt.

Claim.—Skein *B*, center-iron *D*, bolt *E*, linchpin *F*, nut *G*, and cap *H*, in combination, substantially as and for the purpose described.

77,657.—JAMES H. REISINGER, Vinton, Ohio.—*Animal Trap.*—May 5, 1868.—The track way through the trap has a hinged door at each side and a gravitating platform in the middle. The rat stepping on the latter depresses it and the doors close. Escaping to the next chamber the platform rises, lowers the doors, and the trap is set.

Claim.—The trap *A*, having the pivoted platform

B, of shape described, doors C C, blocks D, rods d' , bait hook E, arranged as described, passage way G, gates I I', and rod J, the whole being constructed and operated substantially as described.

77,658.—CHRISTIAN RICH, Marshallville, Ohio.—*Farm Gate*.—May 5, 1868.—The gate has a segment gear on its hinging post and is moved by a rack bar which is controlled by levers up and down the road. A bar above the rack bar operates the latch by depressing its rear end.

Claim.—The peculiar arrangement and combination of the gate G I H, gate post B, gate latch K, wheel R, latch plate D, sliding bar E, rack and pinion M N, levers F F, and lever posts A A, the several parts being arranged and combined in the manner and for the purposes specified.

77,659.—HARRISON ROWE, Marietta, Pa.—*Fagot for Railroad Rails*.—May 5, 1868.—The top and bottom plates are wider than the intermediate filling which consists of two pairs of old rails, cut to length, laid on their sides, their threads in contact, with two B-plates between the pairs and one on top and bottom of the filling and next to the exterior plates.

Claim.—The manner of making and applying my wider top and bottom plates, A E, in combination with the intermediate filling B C D, when made into a pile or fagot for being rolled into rails for railroads, substantially in the manner specified.

77,660.—DAVID SARVER and ROBERT COONS, Greensburg, Pa.—*Corn Harvester*.—May 5, 1868.—The machine cuts one row at a time, the knife coming in contact with the stalks while the revolving reel and the guide bar direct them when cut to the cradle where they form a gavel transverse to the path of the machine. When sufficient has collected the driver oscillates the hand lever and the cradle tips out its load while a bar arrests the falling stalks during the momentary incapacity of the cradle to receive them.

Claim.—1. A cut-off, N, having an endwise movement parallel to the path of the machine, substantially as set forth.

2. The combination, substantially as set forth, with a tilting platform, of a cut-off, vibrating endwise at a right angle to the axis of the platform, and parallel to the path of the machine.

3. The combination, substantially as set forth, with a tilting platform and a cut-off, of a guide or deflector, supported at the grain end only.

4. The combination and arrangement, as set forth, with the reel, revolving on a vertical axis, of the tilting platform.

5. The combination, substantially as set forth, of a laterally projecting cutting apparatus, a reel, revolving on a vertical axis, a guide, a cut-off, and a tilting platform.

6. The combination, substantially as set forth, of the main frame and supplementary frame with the roller arm F and bracket F', for the purposes set forth.

77,661.—JOHN SCHATZ, New Haven, Conn.—*Reed Organ Bellows*.—May 5, 1868.—The bellows act on the vacuum principle instead of the plenum. Collapsing chambers are used in connection with the operating bellows to increase the capacity and assure regularity and steadiness of draft.

Claim.—The arrangement of the two chambers I and K, or either of them, upon one side of a fixed partition, B, in combination with the chamber H and bellows F and G upon the other side of the said partition, and all of the said partitions connecting with the passage A, and constructed so as to operate together, in the manner and for the purpose herein set forth.

77,662.—STEPHEN SCOTTON, Richmond, Ind.—*Tree Box*.—May 5, 1868.—The metallic hoop which encircles the tree consists of bars whose notches or catches hold the boards. Bars protrude from two of the sides to hold the tree in a central position.

Claim.—1. A band or belt, constructed of the various sections A, B, and C, formed substantially as described, and for the purposes set forth.

2. The braces E, in combination with the band, substantially as and for the purposes specified.

77,663.—I. D. SEELEY, Hudson, Wis.—*Wash Boiler*.—May 5, 1868.—The side plates form chambers within each side of the boiler, and the boiling water from beneath the grated false bottom is turned aside by the inclined deflecting plates and is driven up the side chambers, discharging from the holes near the top of the plates.

Claim.—In a washing boiler, the combination of the plates B, forming vertical compartments, the transverse and diagonally placed plates B², forming a continuous flange in extension of said plates B, and the perforated plate C, placed above the flanges B², substantially as and for the purpose set forth.

77,664.—HENRY SILAUDEMAN, Decatur, Ill.—*Beer Cooler*.—May 5, 1868.—The beer trickles over the corrugated sides of the pyramidal cooler and is received in the trough beneath. The cooler is filled with a constant supply of water, which it discharges into the water jacket of the pan, from whence it passes off.

Claim.—1. The pyramidal cooler C, when the same is formed of either plain or corrugated sides C' C', and the whole is so constructed and arranged as to leave an open chamber for the reception of water, substantially as described.

2. The independent base trough A, when the same is constructed and arranged substantially as described, and for the purpose specified.

3. The pyramidal cooler C, when the same is formed of either plain or corrugated sides C' C', and the whole is so constructed and arranged as to leave an open chamber for the reception of water, in combination with the base trough, when the whole is constructed and arranged substantially as described, and for the purpose specified.

77,665.—GEORGE SLATER, London, England, assignor to GEORGE WASHINGTON BELDING, same place.—*Sewing Machine*.—May 5, 1868.—One of the two vibrating shafts has an arm to operate the shuttle carrier and the other a cam to operate the feed bar. These shafts are operated by separate eccentrics on the driving shaft, and the one operating the shuttle is made tubular from end to end, the other shaft being passed through it.

Claim.—A simple rocking shaft, K, and an encircling, tubular rocking shaft, J, combined with each other, and respectively, at one end, with a cam, Y, operating the feed plate X, and lever N, operating the shuttle carrier O, and at the other, with the eccentrics G H, upon the driving shaft of a sewing machine, all substantially in the manner and for the purpose herein set forth.

77,666.—JONATHAN SMEAD, East Wallingford, assignor to himself and THOMAS STEWARD, Clarendon, Vt.—*Automatic Feeder for Evaporators*.—May 5, 1868.—The valves which admit the liquid to the pans are operated by buoyant vessels which float in the pans below, and their action is to maintain a uniform height of liquid in the pans. The easings around the floats are to prevent their being affected by the ebullition of the liquid. In the larger pan, besides its special duty, the float governs the admission of liquid to the reservoir whence the other pans are supplied, an arrangement being superadded by which excess or lack in the said pans is made to work an auxiliary device to correct the inequality.

Claim.—1. The perforated easings, arranged within the pans, in relation with the floats operating the sap or liquid-supplying mechanism, substantially as and for the purpose specified.

2. The arrangement of the chamber E, the ease F, valve c, with its stem d, and bent lever D, in relation with each other, and with the stem b of the float C^{*}, the pipe f, and the reservoir pipe G, substantially as and for the purpose set forth.

3. The valves m, arranged upon the stems i of the floats J, and in relation with the funnel-shaped mouth piece g, surrounding the orifices c' of the reservoir pipe G, substantially as and for the purpose specified.

4. The elastic diaphragm e, arranged in the end of the ease F, and in relation with the valve stem d.

operated by the float C* and the pipe *f*, substantially as and for the purpose specified.

77,667.—AMOR SMITH, Cincinnati, Ohio.—*Fertilizer*.—May 5, 1868.—The dry cracklings after extraction of the grease are pulverized and mixed with phosphates as a manure.

Claim.—As a new article of manufacture, cracklings, reduced to a powder, for use in combination with phosphates as a fertilizer.

77,668.—WILLIAM C. SMITH, Warrensburg, Mo.—*Sugar Evaporator*.—May 5, 1868.—Improvement on his patent, June 11, 1867. The furnace is adapted for a battery of pans at varying heights and the dampers determine the course of the caloric current so as to direct upon such pans as may be necessary, or directly to the chimney. The air is admitted at side openings, and after being warmed by traversing sinuous courses, enters the fire box below the grate.

Claim.—1. The air-heating chambers B¹ B², when combined with the fire box B, in the manner and for the purpose herein set forth and described.

2. The dampers or slides D D¹ D², when arranged and operated as and for the purpose shown and described.

77,669.—DANIEL E. SOMES, Washington, D. C.—*Cooling Air and Liquids, and Making Ice*.—May 5, 1868.—Refrigerating is induced by the use of atomized fluid. Carbonic acid is drawn or forced into a partial vacuum and then compressed into a receiver to be used in a vacuum for cooling purposes. The heat rendered sensible by condensation is conducted away by cold water.

Claim.—1. Atomizing liquid over and over in a chamber or vessel, without removing it from said chamber or vessel, substantially as and for the purpose set forth.

2. Atomizing liquid in a vacuum, or partial vacuum, over and over again, without removing it from said vacuum or partial vacuum.

3. Generating and using gas, substantially in the manner and for the purpose set forth.

4. A small portable cooler, constructed and operated substantially as set forth, as an article of manufacture.

5. The atomizers and chamber, in combination with the pump or its equivalent, substantially as described.

6. The atomizers and chamber, in combination with pipes or channels, and means for conducting away heat, substantially as described.

7. The atomizers and chamber, the receiver, the pump, and means for cooling or freezing, substantially as described.

8. The atomizers and chamber, the gas generator, and pump or its equivalent.

9. The atomizers and chamber, the gas generator and receiver, the pipes, and means for cooling, substantially as described.

10. The atomizers and chamber, the pump or its equivalent, and the gases, air, or liquids, substantially as set forth.

11. Means for regulating the supply of gas, air, or liquids, in combination with the atomizers and chamber, substantially as set forth.

12. The chamber and apartments with non-conducting substances, and double or multiple walls, substantially as and for the purpose set forth.

77,670.—ODED SPENCER, Jacksonsburg, Ohio.—*Steam Generator*.—May 5, 1868.—The boilers are placed in parallel position in the furnace, and are connected by tubes above and below the water line. The furnace bottom is undulating, and the boiler and tubes are enveloped by the caloric current.

Claim.—The combination and arrangement of the boilers and tubes with the furnace E, whereby the entire surface of the boilers A and tubes B C is subjected to the action of the heat, substantially as and for the purpose specified.

77,671.—JACOB SPRINGER, Lancaster, Pa., assignor to himself, A. C. FLINN, and H. B. MCNEAL, same place.—*Apparatus for Rectifying Spirits*.—May 5, 1868.—The tub has three chambers and means for heating the "singlings" before charging the

lower chambers, so as not to check the continuous process of evaporation incident to the use of a single-chambered vessel. The upper chamber receives the low wines, and they are heated by the steam in the middle chamber. The chambers are charged successively from the upper one, and provision is made for avoiding collapse and for carrying off vapor.

Claim.—The construction and arrangement of the doubling tub, with its three chambers D E F, copper or metallic heating dome H, or its equivalent, in combination with the pipes 5, 6, 11, and 12, arranged substantially in the manner and for the purpose specified.

77,672.—EDWARD STAHLBRODT, Rochester, N. Y.—*Lathe Rest*.—May 5, 1868.—The slot in the apron permits the carriage to be moved either way, to a distance bounded by the length of the slot, without opening the shear knot. This affords a means of readjustment of a cutting tool to its work of cutting screws after having been removed for grinding.

Claim.—The combination of slotted apron B, knot *g*, screw *d*, plate *f*, and tool carriage A, when constructed and arranged substantially as described.

77,673.—JOHN H. STARCK, Milwaukee, Wis.—*Glazing and Coloring Tobacco Pipes*.—May 5, 1868.—The pipes, after baking, are dipped in a solution made by mixing water, 3 pints; milk, 3 pints; and gelatine, 1 oz., dissolved in a quart of water. After drying, two coats of shellac dissolved in alcohol are applied, and the pipes supported over a heated plate until the proper color is produced, ranging from yellow to deep brown. If preferred, one coat of shellac and one of dye solution may be applied.

Claim.—1. The process of glazing tobacco pipes by the use of milk, gelatine, water, and shellac, substantially as described.

2. The process of glazing tobacco pipes by the use of the whites of eggs and gum shellac, substantially as described.

3. The process of coloring tobacco pipes by the use of the dye-wood solution, substantially as described.

77,674.—EDWARD STOCKTON and WILLIAM O. ST. JOHN, Folsom, Cal.—*Apparatus for Producing Motive Power*.—May 5, 1868.—Intended as a power for driving fan mills, pumps, churns, grindstones, &c., and operated by the power of springs and weights, which are wound up for the turning of the shafts.

Claim.—1. The combination and arrangement of the springs I I, weights P P, and gears J J, said gears being so connected with their respective shafts that they remain stationary while the shafts are turned to wind up the springs and weights.

2. The ratchet wheels L L, for connecting the gears with the shafts, in combination with the couplings E E, substantially as and for the purposes described.

77,675.—OLE O. STORLE, North Cape, assignor to himself and ISAAC N. MASON, Milwaukee, Wis.—*Harvester Rake*.—May 5, 1868.—The gavels are dropped at the side of the harvester. The rake is dropped at the commencement of its stroke, and is moved athwart the platform by an endless chain, delivering the gavel on to the tilter and pressing it against the arms of a shaft at the point of delivery. The depression of the tilter and elevation of the arms are effected by contact of a pin on the rake carriage with levers on the shafts of the dumping apparatus, and the gavel being dropped, the parts are restored to position, and the elevated rake is carried back to the initial point, ready for another stroke.

Claim.—1. Tilter I, levers M and N, rake frame F, and pin O, in combination, substantially as described.

2. Rake B, chain C, spur wheels D and D, and rake frame F, and lever G, in combination, substantially as and for the purpose described.

3. Rake B, tilter I, shaft K, rake frame F, lever G, levers M and N, and pin O, in combination, substantially as and for the purpose described.

77,676.—G. L. SWETT, Leominster, Mass.—*Shelf Rest*.—May 5, 1868.—The post has a series of notches, and the hub of the shelf, being loose upon the post, catches on the shoulders when deflected from a position concentric with the axis of the post.

Claim.—The standard or shelf rest B, when the

same consists of a series of truncated cones, the larger base of each being upward, when the same is combined with and used for supporting adjustable shelves, substantially as described and for the purpose set forth.

77,677.—HUGH TAGART, Jacksontown, Ohio.—*Cattle Guard for Railroads.*—May 5, 1868.—The vertical bars which form the guard are attached to a horizontal shaft, beneath which is a weight, which causes the bars to maintain an upright position, except when depressed by the passing train.

Claim.—The combination of the case A, shaft H, and weight B with the shaft C, provided with a series of vertical rods D D, when constructed substantially as described and operated as and for the purpose specified.

77,678.—R. M. THOMPSON, Coshocton, Ohio.—*Lifting Jack.*—May 5, 1868.—The bar is raised by the hand to the required height, and the pin passed through it and the notch of the rack bar. Being placed below the axle, the lever is depressed, and the stirrup iron falls into position on the base piece and maintains the load. The stirrup is withdrawn by pulling on the rod to lower the load.

Claim.—1. The lever C and standard B, in combination with stirrup iron G, substantially as described.

2. The base A, standard B, lever C, guard piece D, rod E, box F, and stirrup iron G, the whole being combined and arranged substantially as described.

77,679.—S. H. TIFT, Morrisville, Vt.—*Potato Washer.*—May 5, 1868.—The roots are washed by agitation in an interior perforated vessel which stands upon legs in the tub.

Claim.—The arrangement of the vessel B, provided with perforations *x x* and legs *h h*, with the arms C C, agitator D, and outside vessel A, the several parts being constructed and operated substantially as and for the purpose specified.

77,680.—SAMUEL TOOMEY, Wilmot, Ohio.—*Constructing Carriage Wheels.*—May 5, 1868.—In the setting of the rim on the tire some room for shrinkage is allowed between the rim and the shoulders of some of the spokes.

Claim.—The method of constructing bent rim carriage wheels, with the ends of the rim abutting together, and with spaces between the rim and the shoulders of the spokes, before putting on the tire, and then closing the rim and spoke shoulders together by the shrinking on of the tire, substantially as and for the purpose herein specified.

77,681.—ROBERT W. TOWLE, Searsport, Me.—*Handle for Smoothing Irons.*—May 5, 1868.—The forward end of the handle has a tenon which enters a mortise in the forward standard, and the rear end is held in the slotted standard by a latch piece which engages a notch in the post, and from which it is removed by a trigger on the handle when it is designed to disconnect the latter.

Claim.—The combination of the handle *a*, spring *c*, lever *d*, connecting rod *e*, uprights *g* and *j*, with the iron *b*, constructed and operating substantially as described and for the purpose specified.

77,682.—G. W. TUCKER, Elba Township, Ill.—*Gate.*—May 5, 1868.—The weight of the gate is supported upon a socket joint forming a hinge, and upon a roller on which the gate traverses as it swings 90° in opening. The hooks on the gate post keep it from leaving its hinge.

Claim.—The ball E, socket D, hooks F, and roller G, in combination with the gate A, for the purpose substantially as herein set forth.

77,683.—STEPHEN USTICK, Philadelphia, Pa., assignor to himself and GEORGE L. MILLER, same place.—*Pea Sheller.*—May 5, 1868.—A handful of unshelled peas are thrown into the hopper, and the lower ones fall between the strips and slide down the incline, being presented endwise to the rollers which draw in the pod and shell out the peas.

Claim.—1. The combination and arrangement of the longitudinal strips *e* with the hopper E, substan-

tially in the manner above described and for the purposes specified.

2. The combination of the roller B with the hopper E, when said roller has annular depressions *i* which coincide with the spaces *f*, substantially as and for the purpose set forth.

77,684.—HENRY VATTER, Lawrence, Mass.—*Return Flue Stove Pipe.*—May 5, 1868.—The pipe has a vertical, central partition, at the lower end of which is a damper. In one position of the latter the caloric current is forced to make the upward and return circuit before reaching the chimney, and in the other position the current has direct course to the chimney.

Claim.—1. A return flue stove pipe, constructed and arranged for operation as and for the purpose substantially as described.

2. The damper C, constructed as described, in combination with the partition A and the pipe, for the purpose and substantially as described.

77,685.—W. J. WALKER, Brooklyn, N. Y.—*Acid Powder as a Substitute for Yeast.*—May 5, 1868.—Commercial muriatic acid, 3 lbs., is mixed with water, 3 lbs., and the mixture thoroughly mingled with dry farinaceous substance and pulverized.

Claim.—1. Producing a powder, which is an admirable substitute for yeast, by combining with a dry farinaceous substance a certain quantity of hydrochloric (commercial muriatic) acid, when the same is prepared substantially as described and for the purpose specified.

2. Mixing with a powder, composed of a dry farinaceous substance and muriatic acid, a certain quantity of argal, cream of tartar, or other like acid powder, substantially as is described and for the purpose specified.

3. The mixing the powder with an alkaline carbonate, in such proportions, with flour or meal, as to make a self-raising flour or meal, for the purpose of bread, pastry, &c., substantially as described.

77,686.—BARTHOLOMEW and PETER WALTHER, New York, N. Y.—*Hitching Post.*—May 5, 1868.—The hitching chain is fast to a ball which rises and falls in the hollow iron post. Water entering at the slot above runs out at an opening below.

Claim.—A hollow hitching post, A, covered by a perforated metallic cap, and provided with inclined water-escape channels at the bottom of its cavity B, substantially as and for the purpose described.

77,687.—WALTER WARD, Mount Holly, N. J.—*Shaft Attachment to Wagons.*—May 5, 1868.—The pintle of the thill iron is held in two closed sockets, on sectional interlocking plates which slip up together laterally, and are held by screws or rivets.

Claim.—A carriage shaft, or thill connection or coupling, made of the pieces A, B, C, D, interlocked or breaking joint with each other, and firmly united, so that the shaft or thills cannot become detached, substantially as herein described and represented.

77,688.—ERASTUS D. WESTON, Taunton, Mass.—*Cooking Stove.*—May 5, 1868.—Passing in beneath the front overhang of the stove top the air courses beneath the top plate, dives behind the oven and passes thereinto. From thence it reaches the fire chamber, passes over the oven, dives down corner flues, along the sides at the bottom, reverts along the middle of the bottom and ascends the middle flue at the back.

Claim.—1. The arrangement of the air-heating flue G, the fireplace A, the smoke flue K, the oven E, and the air flue or flues M, provided with one or more openings, I, to lead air into the oven, as set forth.

2. The arrangement of one or more openings, J, with the flue G, the fireplace A, the oven E, one or more openings I, the flue or flues M, and the air flue G.

3. The arrangement of the air flue G, and its induction openings H, so as to extend over and in front of the front plate of the fireplace, as represented.

4. The arrangement of the air flues G M, the oven E, the fireplace A, the smoke flue K, and flues F, underneath and in rear of the oven, the oven being

provided with the air induction and eduction openings I J, as set forth.

77,689.—GEORGE H. WHITE, Huntington, N. Y.—*Preventing and Curing Crib Biting in Horses.*—May 5, 1868.—A prominent part of the manger is so arranged that when the horse bites the same he is struck upon the jaw by a bar connected to levers which are actuated by depression of the said part of the manger.

Claim.—The device herein shown, attached to the manger or any place where the horse may be fastened, and to operate by the motion caused by the biting of the horse, substantially as and for the purpose herein shown.

77,690.—PETER WHITE, St. Louis, Mo.—*Check Valve.*—May 5, 1868; antedated April 22, 1868.—The poppet valve has a long stem and has two faces so that it may be reversed and either side used. The parts are arranged to be detached for this purpose and the upper tube and lower socket form guides for the valve stem.

Claim.—1. The combination of the shaft K, thumb screw I, shaft N, valve A, valve seat B, socket P, and cylinder E, substantially as herein set forth.

2. The arrangement of the valve A and seat B, as herein set forth and described.

77,691.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester.*—May 5, 1868.—The drag bar is secured to the front end of the frame, passes beneath the latter, divides, bends outward, and reaches the shoe in two places. The coupling arm holds the shoe at the proper lateral distance from the machine. The lever is used to elevate the coupling apparatus. The brace is bolted to the coupling arm and passes through the head of the standard on the shoe. The object is to regulate the height of the shoe from the ground. The drop latch is pivoted to the shoe and its duty is to fall behind the heel of the cutter bar and keep it from running out of its seat when the bar is folded up for transportation.

Claim.—1. The shell main frame A, cast in single piece, with a recess fitted to receive the gearing, and another recess, L, to serve as a receptacle for tools, in connection with the cover or platform M, likewise cast in a single piece, so as to inclose the gearing and cover the tool box with the same piece, substantially as set forth.

2. The drag bar R, constructed and attached to the frame and shoe in the manner described, in connection with the brace Y and the standard Z and coupling arm U, as set forth.

3. The lever W, attached and operating as set forth.

4. The drop latch *v*, constructed and located as described.

77,692.—E. R. WHITNY, Plattsburg, N. Y.—*Dumping Sled.*—May 5, 1868.—The box is hinged to the rear bolster so as to tip and dump the contents when the bed is run back. This is done by removing a catch, when the draft of the team on the tongue draws upon a rope and runs the box to the rear.

Claim.—1. The sliding bars B, when used in combination with a cord, F, for the purpose of elevating the front part of a body, D, of a sled or wagon, and operated as and for the purpose specified.

2. Operating a dumping body, D, by means of the same team which draws the same, without detaching and reattaching said team, substantially as and for the purpose specified.

3. The arrangement of the posts C, pulleys *h* and *j*, with the cords F, when operated by means of sliding bars B, as and for the purpose herein set forth.

77,693.—GEORGE WIGGINS, Ortonville, Mich., assignor to himself, CHARLES HERRINGTON, and HIRAM MAXFIELD, same place.—*Sheep Shearing Table.*—May 5, 1868.—The table top has a double incline, and has straps to fasten the sheep; one around the girth, either one of the three at one end of the table for the head, and the sliding bar, with transversely sliding blocks, for the hind legs. This bar is drawn taut by the cord and windlass, secured by ratchet and pawl.

Claim.—The sliding bar C, in conjunction with the slots D, grooves E, the sliding fastening blocks G' and G'', the strap I, shaft J, crank K, ratchet L, and pawl M, when arranged and operating substantially as and for the purposes specified.

77,694.—JULIUS WILCKE, Newark, N. J.—*Pump.*—May 5, 1868.—The cylinder of the double acting pump communicates at its ends with the ends of a valve cylinder in which is an intermittently moving, tubular valve, reciprocated by the pressure of the fluid in the main cylinder, upon the middle diaphragm of the valve. The latter has on each side of the partition ports, which act in conjunction with openings in the side of the chamber in which it reciprocates, to induct or educt the fluid.

Claim.—1. The combination with the pump barrel A, having within it a reciprocating piston and valve cylinder or chamber C, connected with the pump barrel by end passages, *a a'*, of a loose or independent valve, F, constructed with an intermediate diaphragm, *e*, and separate suction and delivery ports controlling separate suction and delivery ports or passages in the valve chamber, as the valve is shot by the pressure of the fluid at the commencement of the return stroke of the piston, substantially as specified.

2. The intermittently reciprocating valve F, with its dividing diaphragm *e*, and side inlets and outlets, controlling suction and delivery ports in the valve cylinder by the pressure of the fluid in the discharge stroke of the piston, as specified, when said valve is of tubular or cylindrical form, and made with splits or divisions, H, to give to it an elastic character, essentially as shown and described.

77,695.—SIMON WING, Boston, assignor to himself and ELI F. SOUTHWARD, East Boston, Mass.—*Hanging Signs or Banners.*—May 5, 1868.—The wind has passage through the suspended sign, which is therefore less agitated, rendering its inscriptions more legible and its material more lasting.

Claim.—Making the ground of signs or banners of an open work or net work of twine, thread, silk, cord, wire, or other material that will allow the free passage of air, substantially in the manner and for the purpose set forth.

77,696.—JAMES F. WINCHELL, Springfield, Ohio, assignor to himself, L. A. SIMONS, and G. C. STEELE.—*Corn Harvester.*—May 5, 1868.—The machine cuts one row at a time. Guides direct the stalks to the pair of rotary cutters, one of which is serrated. The stalks are fed and directed by the reel, and their butts are carried towards the rear and received upon the platform, the tops falling against a bar, which is removed by the driver when sufficient has accumulated. When released, the swinging arm retreats, its rear end being guided by a slot in a cam; and when the load has fallen, the counter-weight comes into play, returning by a peculiar motion which prevents interference with the cut stalks. During this return motion the rear of the swinging arm is governed by another slot in the cam, into which it is guided by a spring.

Claim.—1. The swinging lever or rest I, in combination with the cam K, or its equivalent, for imparting to it the movements, substantially as described.

2. The corrugated roller G, arranged in rear of the cutters, for delivering the stalks to the platform, substantially as set forth.

3. The combination of the roller G and the platform H, substantially as set forth.

4. Providing the groove *a'* in the cam K with the projection *e''*, for holding the lever I in position, until operated by driver, as set forth.

5. The combination of the lever I, connected by the arm *a* to rock shaft J, with the weighted arm *m*, or its equivalent, for automatically returning the lever to its position, substantially as set forth.

77,697.—TORWALD WINTER, Boston, Mass.—*Chair and Lounge.*—May 5, 1868.—The end of the lounge is formed by a chair seat, which is capable of revolution on an axis so as to present the back in any required direction.

Claim.—1. The combination and arrangement of

the rotary chair seat and back and the lounge frame, substantially as shown and described.

2. Combining with a rotary chair seat rollers *k*, supporting the seat upon a bed piece *h*, and enabling the chair to be rotated upon said bed piece, substantially as described.

77,698.—CHRISTIAN WOLF, Danville, Ill.—*Horse Collar*.—May 5, 1868.—The sides of the collar are provided with tug hooks and rein rings, and are secured by a yoke above and a fastening below. The latter consists of a ratchet and spring pawl.

Claim.—The arrangement of a wooden collar *A*, having the straps or plates *B F* and *H*, rein guide *E*, and hold back rings secured to it, as described, with the ratchet bar *K*, guide *I*, pawl *j*, and spring *h*, all the parts being constructed and used as and for the purpose specified.

77,699.—U. A. WOODBURY, Morrisville, Vt.—*Vegetable Washer*.—May 5, 1868.—The rotary dasher revolves in the slotted cage which is slipped into a bucket or tub of water.

Claim.—The combination of the slotted bucket *A E* with the revolving frame *a b b d*, as described, which can be used in any water vessel of suitable size, for the purposes specified.

77,700.—C. F. WOODRUFF, Newbern, Tenn.—*Spur Wheel*.—May 5, 1868.—The rim is made in two sections perpendicular to the axis; each section has dovetail notches which correspond in the allied sections, so that the double dovetailed shank of the key will hold the two together. The key shanks also engage with the dovetail ends of the spokes. Pins hold the teeth in the wheels.

Claim.—1. The rim of a spur wheel, as constructed and cast in sectional segments *A A'*, united and bound together by the double dovetail shanks *a a* of the cogs *B B*, in the manner herein described.

2. The double dovetail shanks *a a* of the cogs *B B*, in combination with the sectional segments *A A'*, constructed, arranged, and operating substantially as and for the purpose described.

3. The combination of the arms *C C*, the shanks *a a*, the pins *b b*, and the sectional segment rim, constructed, arranged, and operating substantially as and for the purpose described.

77,701.—WILLIAM YOUNGBLOOD, New York, N. Y.—*Horse Collar*.—May 5, 1868.—The collar has two tubular portions divided by a partition which is immediately beneath the hames and preserves the filling from being destroyed.

Claim.—As a new article of manufacture, an India-rubber horse collar of tubular form, when said collar is divided longitudinally by the thick India-rubber partition *a*, forming an increased bearing surface for the hames, as herein shown and described.

77,702.—HEINRICH A. ZOPFF, Milwaukee, Wis.—*Culinary Apparatus*.—May 5, 1868.—The steamer has a depression in the floor to catch and retain condensed steam and preserve the water below from contamination.

Claim.—The tight bottom on shell *D*, containing a recess *F* to catch the condensed steam and the raw, ill-tasting vegetable water, and prevent this liquid from falling into the water below, with cover *G* and strainer *H*, substantially as and for the purpose described.

77,703.—AUGUSTUS B. FELGEMAKER and SILAS L. DERRICK, Buffalo, N. Y.—*Portable Pipe Organ*.—May 5, 1868.—The front row of vertical pipes connect with the upper section of the wind chest, and the rear row of vertical pipes with the lower section. The valve openings for the bass notes connect with openings at one end of the valve chest by passages to the divisions alternately.

Claim.—A compound wind chest *D*, having two or more divisions *e¹ e²*, each division having distinct air passages to supply a distinct set, row, or rows of pipes, for the purpose and substantially as described.

77,704.—HERMAN MENGEL, Philadelphia, Pa.—*Instrument for Measuring and Laying out Garments*.—May 5, 1868.—The vertical and lateral scales

are graduated for obtaining the sizes and proportions of the figure, being adjusted to agree with the measures as taken in the usual manner. At the upper end are scales adapted to the width of the back and the height of the shoulder.

Claim.—In combination with an instrument having laterally and vertically adjustable scales *B B' C D E* the scales *n*, vertically adjustable in the instrument, for laying out, on cloth or other fabric, measures for upper garments, operating substantially as described.

77,705.—ANTONIO PELLETIER, Washington, D. C.—*Cement for Roofing, Artificial Stone, Coating Iron, Wood, &c.*—May 5, 1868.—The oxide of calcium, magnesium, or aluminium is mixed with the chloride of the same; or the oxichloride of zinc or other metals may be used. The cement is composed of moist woody fiber or hair, 8; sand, asbestos, or mica, 4; and oxide of zinc, 4 parts; these are powdered and mixed with chloride of zinc in solution, 30° to 35° Baumé, to render it plastic. Other proportions and equivalents may be used.

Claim.—1. The chlorides of the alkaline earths, true earths, and heavy metals, in combination with the corresponding oxides of these, for the purpose of producing insoluble oxichloride compounds, substantially as described and set forth.

2. In combination with the oxides and chlorides, organic substances, such as vegetable and animal fiber, glue, hair, shoddy, substantially as described and set forth.

3. In combination with oxichlorides and organic substances, finely divided granulated fibrous or pulverized mineral ingredients of any kind, substantially as set forth.

4. The above-mentioned composition, with or without the incorporation or external coating with silicate of soda, either by itself or ground together with mineral colors, substantially as described and set forth.

5. In combination with the cement composition, for preventing its too rapid solidification, solutions of starch, gum, dextrine, sugar, gelatine, borax, or sulphate of ammonia, substantially as described and set forth.

77,706.—HENRY ARDEN, Cincinnati, Ohio.—*Car Elevator*.—May 5, 1868.—The car is passed beneath the frame and the hooks of the vertically moving frames engaged beneath the sill. The chains attached to the frames are then drawn up by turning their pulley shafts by means of the arms upon them which are linked to a vertically raising bar. The latter may be actuated by a screw or other means.

Claim.—1. The combination of the frame *A*, shafts *C*, and arms *G* with the links *e* and rod *f*, substantially as and for the purpose set forth.

2. The shafts *C* and pulleys *D*, in combination with the ropes or chains *E* and beams *F*, or their equivalents, all as shown and described.

3. The combination of the beams *F* and lifting hooks *b*, or their equivalents, all as shown and described.

4. The combination of the arms *G*, shafts *C*, and pulleys *D*, all as shown and described, and for the purpose specified.

5. The combination of the shafts *C*, pulleys *D*, and ropes or chains *E*, all as shown and described, and for the purpose specified.

77,707.—D. S. BAKER, West Bloomfield, N. Y.—*Stove Grate*.—May 12, 1868.—The rotating grate rests upon a fixed one beneath. The fingers facilitate the shaking down of the ashes, and may be attached to the upper grate or to a ring which is suspended over the edge of the fire-pot.

Claim.—1. A rotating grate, *h*, having upright fingers, *m*, in combination with the lower grate *i*, constructed and operated in the manner substantially as shown and described, and for the purpose set forth.

2. The combination of the fingered ring *C*, with the fire-box *A*, fingered rotating grate *h*, and the under supporting grate *i*, constructed and operated in the manner substantially as shown and described, and for the purpose set forth.

3. The combination of a cylinder or fire-box, or its

equivalent, with a fingered ring or bar C, as shown and described, and for the purpose set forth.

4. The combination of rotating grate *o* with a fingered ring, *n*, constructed and operated in the manner as shown and described, and for the purpose set forth.

5. In combination with said parts, as just described, the fingered ring C, or its equivalent.

77,708.—MOSES and WILLIAM P. BALES, London, Ohio.—*Corn Harvester*.—May 12, 1868.—The horse walks between two rows and the wheels run outside of said rows which are leaned outward by the spreader plates, then pass to the rear of it and in contact with a curved rod which assists in holding them while they are cut. They then fall forward with the tassel toward the team, and are guided by the tops of the spreaders to a dumping platform in the middle of the machine. The oblique cutters are placed in frames which give a "draw" motion to the blades.

Claim.—1. The arrangement of gatherers E E', spreaders F F', curved bar I, and central platform O O', for the purpose set forth.

2. The oblique siekles J J', lips j j', oblique tongue N, and pivoted frames K K', combined and operating in the manner explained.

3. The pivoted platform O O', in the described combination with the discharging lever P, arranged and operating as set forth.

4. The curved guide or rod R, in the described combination, with the gatherers E E', spreaders F F', curved bar I, and platform O O', for the purpose specified.

77,709.—JOSEPH BECK, New York, N. Y.—*Automatic Fan*.—May 12, 1868; antedated April 25, 1868.—Wings upon the fan direct the current of air. The fan is operated by clockwork whose rotary motion is converted to oscillatory by connection of the crank to a lever which has a segmental cog-gear which acts upon a similar gear upon a lever to which the form is attached.

Claim.—1. The employment of the fan C, constructed with the protectors *b b* and *c c*, operated and for the purpose substantially as herein described.

2. The arrangement and combination of the clockwork G, the balance V with the crank W, the rod X, the arm Y, the axle γ , the gear Z Z, and the fan-shaft C, operated and for the purpose substantially as herein shown.

77,710.—BENJAMIN D. BEECHER, Plantsville, Conn., assignor to LUTHER BEECHER.—*Machine for Threading Bolts*.—May 12, 1868.—The blank is heated and inserted in the guide tube and passes between the screw-threaded pressure dies, first entering a circular opening between the dies, and having the seal rolled off between the embossed surfaces of the dies. The thread is formed by pressure of the dies which rotate in the same direction.

Claim.—1. Arranging the cutting threads on the surface of the dies, as herein described; that is to say, so that a portion of each of said die surfaces shall be left plain, for the purpose of gradually rounding the blank, as the operation of threading it progresses, and that the initial or commencing portions of the several cutting threads shall follow one another in succession, all substantially as set forth.

2. In combination with the threaded part of the die, the embossed surface *k k'*, substantially as and for the purpose set forth.

77,711.—N. A. BOYNTON, New York, assignor to himself and DANIEL E. PARIS, Troy, N. Y.—*Fender Ring for Heating Stoves*.—May 12, 1868.—An annular fender is placed around the base of the fire-pot.

Claim.—A fender ring, situated at or near the bottom of a fire-pot, with its outer edges turning upward, so that the ring and the pot shall form together an acute angle, with its point toward the base of the pot, substantially as and for the purposes described.

77,712.—JOSEPH BRAKELEY, Bordentown, N. J.—*Drier*.—May 12, 1868.—A condensing apparatus

is combined with the wood-drying kiln to form a partial vacuum therein.

Claim.—Combining, with a dry-kiln, both a condenser and an exhaust pump, substantially as and for the purpose set forth.

77,713.—DARIUS C. BROWN, Lowell, and JOHN ASHWORTH, North Andover, assignors to D. C. BROWN, Lowell, Mass.—*Machine for Making Wire Heddles for Loom Harnesses*.—May 12, 1868.—The wire is straightened during its passage into the machine; seized near its end and drawn into position to be presented to the doubling mechanism, which seizes it by the middle after it is cut from the coil, and draws it into the mechanism for twisting it; the legs are separated to allow the entrance of the device which aids in the formation of the eye of the heddle; another mechanism passes between the legs and aids the formation of the loop near the end of the wire, the other loop being formed by the mechanism which seizes the eye at the middle. Mechanisms put the two longer and the two shorter twists in the doubled wire. The loops are turned into positions with their planes at right angles to the eye. The surplus wire is cut off and discharged, and the heddle delivered from the machine.

Claim.—1. The combination or machinery for spreading the heddle-eye lengthwise, as described, and also the combination of machinery for spreading the heddle-eye lengthwise, as specified, with mechanism for forming such eye from wire, in manner substantially as explained, such mechanism for spreading the eye consisting of the fingers q^2 q^3 , and mechanism for operating them, as set forth.

2. The presser R, as constructed, and provided with mechanism for operating it, substantially as described.

3. The combination of such presser R (provided with mechanism for operating it, as described) with the eye-former P, made substantially as described, so as to form and spread the eye of the heddle as specified, and with the next adjacent twisters, T U, to form the twists of the eye, as explained.

4. The mechanism or combination for straightening the wire during its passage into the machine, the same consisting of the curved arm I, and its pins *m n*, and the slider K, and its pins *o o*, the whole being arranged and applied together and to the frame of the machine, substantially in manner and so as to operate as specified.

5. The arrangement of the latch lever k^1 and the cam m^1 with the wheel L, its notch l^1 , and the shaft N, such latch-lever k^1 being for estopping the wheel L, as set forth.

6. The combination as well as the arrangement of the nipping and cutting levers *w x*, and their operative mechanism, with the wheel L, such operative mechanism being the plate O, and its cams *z a^1*, and the springs b^1 c^1 , the stud d^1 , the latch e^1 , notches f^1 g^1 , the lever n^1 , stud o^1 , arm p^1 , and stud q^1 .

7. The combination for operating the dog S, or moving it lengthwise on the pinion q^2 , such consisting of the cam plate x^3 , and the studs y^3 z^3 of the gear a^3 , and in combination with the cam plate x^3 and its dog S, the spring bolt a^4 and the notches b^4 c^4 , arranged as explained.

8. The combination of the pinion p^5 , the curved rack q^5 , the lever r^5 , the cam s^5 , and the spring t^5 , or their equivalents, with the retractor t^1 , combined with mechanism for twisting wire, and having mechanism for operating such retractor in other respects, substantially as set forth.

9. The combination of the auxiliary twister V (provided with mechanism for operating it as described) with the two twisters T U, to operate together and with the retractor, and provided with mechanism for operating them, as specified.

10. The twister T, as composed of the head d^4 , the jaws or slides l^4 l^4 , the flanged wheel f^4 , the eamed lever or slider K^4 , the studs m^4 m^4 , and slots n^4 n^4 , the whole being arranged substantially as described.

11. The combination of the screws p^4 p^4 with the twister T, made substantially as described, the purpose of such screws being to adapt the twister to operate on wire of different sizes.

12. The application or arrangement of the slide jaw i^5 , the lever m^5 , and its spring n^5 , with the lever

d^5 , applied to the bar c^5 , as and for the purpose specified.

13. The combination and arrangement of the spring f^3 , or its equivalent, with the mechanism for making the heddle, such spring, when the heddle may be resting on the inner stationary jaw of the bar c^5 , being used to press the heddle down a little, as and for the purpose hereinbefore mentioned.

14. The combination of the discharger u^5 (provided with mechanism for operating it as described) with mechanism for making the heddle, as specified.

15. The conductor W , made substantially as described.

16. The combination for actuating the tongue v^1 of the retractor t^1 , in order to enable a heddle to be removed from the retractor, and the tongue to close upon the next succeeding piece of wire introduced into the retractor, such combination consisting of the slider w^1 , the spring x^1 , the lever m^2 , and the cam o^2 ; also their combination with the retractor and its tongue.

77,714.—CALEB CADWELL, Waukegan, Ill.—*Harvester*.—May 12, 1868.—A double lever is attached to the tongue and arranged with one or more notches, fitted to rest on the main shaft, to regulate the position of the cutter bar when in use or moving from place to place. A cam wheel is arranged to work in an oscillating frame which works in combination with a lever to give motion to the cutter bar. The motive lever is connected to the pitman with a double joint, to avoid cramping the motion of the pitman. The cutter bar is adjustable in inclination by levers, chains, and a catch.

Claim.—1. The double joint T , in combination with the motion lever R and pitman V , arranged to operate substantially as specified.

2. The combination of the oscillating frame Q , Q , cam wheel W , strap i , motion lever R , double joint T , and pitman V , all arranged as and for the purpose herein specified.

3. The lever a , attached to the tongue J , in combination with catch c , chain 23 , and rod 22 , arranged to raise the front of the harvester, as described.

4. The arrangement of the rods C , D , brace G , lever E , catch F , and shoe B' , for raising the cutter bar U , substantially as described.

77,715.—C. CHABOT, Philadelphia, Pa.—*Sewing Machine*.—May 12, 1868.—The looper sleeve has a spiral slot traversed by a pin projecting from the needle bar, so as to cause the oscillatory movement of the said sleeve when it is prevented from vertical movement by the latch. The latter is pivoted to the lower bracket; it enters a circumferential groove in the sleeve, and is held in either position by an angular headed spring bolt, which engages an angular projection upon the latch. The throat piece has two catches, one of which takes beneath the table plate, and the other passes into an aperture in the spring push piece. The latter serves to hold the throat piece down when governed by the spring, and to raise one end of it when thrust forward. The bobbin is placed upon its arbor pin, and is held thereon by the "embossed" spring, whose tension is regulated by its pivot screw, and which may be swung around to allow the introduction or removal of the bobbin.

Claim.—1. In combination with a removable and replaceable throat plate, a push piece that fastens, unfastens, raises, and holds up said plate, substantially as and for the purpose described.

2. In combination with the shuttle and its bobbin the spring i , when pivoted to swing laterally, and embossed at both of its ends, for holding and allowing the bobbin to be removed by the side movement of the spring, as also for regulating the tension of the bobbin thread by means of the set screw r , substantially as described.

3. In combination with the latch D the concealed spring bolt t , for holding said latch in either position—that is, open or shut—substantially as described.

77,716.—HENRY CHAMBERLAIN, Dayton, Wis.—*Store Window*.—May 12, 1868.—The window may be rotated to bring the outer side to the inside, for attachment and removal of the shutters, or for other purposes.

Claim.—The combination of the spring bar A , the perpendicular bars a , b , c and d , the plate C and D of a store window, when constructed and operated substantially as described and for the purpose set forth.

77,717.—EDWIN CHESTERMAN, Boston, Mass., assignor to himself and EDWIN A. EATON.—*Boot and Shoe*.—May 12, 1868.—Improvement on his patent, January 23, 1866.—Instead of interposing a separate stratum of material between the upper and lining, a single lining fabric is used, having a rough or woolly side, which is placed next to the upper, and a smooth side next to the foot.

Claim.—A boot or shoe, whether made of leather or other material, having a lining fabric, one of whose sides consists of a loose, shaggy, or woolly material, when such shaggy side is placed toward the upper or outside of the boot or shoe, for the purpose of securing warmth and ventilation, as specified.

77,718.—PAXSON COATS, Cincinnati, Ohio.—*Condenser for Spirit Stills*.—May 12, 1868.—At the lower end of the worm is a chamber, from which the liquid passes downward, while the uncondensed vapor passes upward through a vertical axial pipe.

Claim.—The worm B , having its lower end b terminating in the reservoir C , from which extend the pipes E and D , the one up and the other down, in combination with the vat A , when the same are constructed and arranged in the manner substantially as and for the purpose specified.

77,719.—MARCELLUS V. CUMMING, Winthrop, Me.—*Mowing Machine*.—May 12, 1868.—The engine is mounted upon a wheel carriage and operates both the wheels of the same and the cutting mechanism. The wheels of an additional truck are turned by chain gear, to cause additional friction upon the ground.

Claim.—1. The combination of a cutting apparatus, M , a wheeled carriage, and a steam engine applied to both, so as to put them in operation under circumstances and substantially in manner and for the purposes as hereinbefore explained.

2. The combination of an auxiliary wheel carriage, O , and mechanism as described, (viz., the chain R and wheels S , S') or its equivalent, for revolving its axle with the mowing machine, its wheel carriage, and a steam engine applied to both, so as to put them in operation, substantially as and for the purposes set forth.

77,720.—J. D. F. DAHL, Milwaukee, Wis.—*Bed Bottom*.—May 12, 1868.—The bed bottom has two frames, and the upper one has guide pins passing through the lower one. Cords from the bottom of each guide pin pass over a sheave, cross the ends transversely between the frames, and, passing under another sheave, are connected to the corner of the upper frame, so that the bed is always transversely level.

Claim.—The combination of the frame B , provided with the guide rods C and the frame A , with the springs D , cords G , and pulleys F , all constructed and arranged to operate as set forth.

77,721.—MARTIN A. DILLEY, Mendon, Mich.—*Hay Raker and Loader*.—May 12, 1868.—The derrick frame is attached to and runs on wheels alongside the wagon, the rake teeth collecting the hay as it advances. The driver, by means of a treadle, brings the clutch in gear with a winding drum and elevates the fork in the ways, when the shaft turns and causes the rake to dump its load into the wagon and return to its lower position, ready for duty.

Claim.—1. The hinged box e , e and universal joint j , in combination with the frame F , guide bar K , and winding drum H , the several parts being constructed and arranged substantially as and for the purpose herein specified.

2. The arrangement of the lever l , rod a , elbow lever t , and rod h with the arm m and lever M , for the purpose of automatically detaching the clutch j , as herein fully described, and for the purpose specified.

3. The shaft R , provided with the arms L , m , m and n , in combination with the cords b , c and d , and winding drum H , the several parts being constructed

and arranged for the purpose of elevating the hay fork described, substantially as herein set forth.

77,722.—FRANCIS ELLERSHAUSEN, Montreal, Canada.—*Furnace and Process for the Manufacture of Iron and Steel.*—May 12, 1868.—The two furnaces are separated by a bridge. One furnace has a central crucible, and heats the contents through the side of the same, and the other furnace gives a reverberatory heat to the top of the crucible. The crucible is filled through a hole in the arch above it, and is emptied through a tap-hole at its bottom. The crucible is chiefly intended for the conversion of cast-iron into steel by the admixture of wrought or malleable iron scraps. The contents may be puddled through a working hole in the top.

Claim.—1. The furnace, in its novel combination of two fire chambers *b* and *l*, separated by fire bridge *m*, as shown in the two modifications, one chamber being a crucible fire chamber, and the other a reverberatory fire chamber, both in connection with the crucible *i*, all working together, substantially in the manner and for the purpose described.

2. The process of smelting and refining metals in large quantities and in short time, by the employment of a large crucible with discharge hole.

3. The puddling of cast iron in a crucible placed in my furnace, and surrounded by fire, the product being cast-steel, substantially in the manner described.

77,723.—JOSEPH S. ELLIOTT, Philadelphia, Pa., assignor to himself and A. B. COOLEY, same place.—*Hasp Lock.*—May 12, 1868.—The hasp falls into place over the usual staple on the lower part of the trunk, for instance, and the staple is engaged by the hook, whose notched inner end is then locked by a spring bolt. The bolt may be withdrawn by pressure on a projecting pin, after the tumblers are properly adjusted by a push key introduced at an opening above.

Claim.—The bolt *D*, operated by a spring *f* and projecting pin *i'*, as described, and the tumblers *F* and *G*, secured within, and arranged to operate in connection with the said bolt and with each other, in the manner and for the purpose herein set forth.

77,724.—ALOIS ESCHENLOHR, Munich, Bavaria.—*Seamless Leather Strap and Tube.*—May 12, 1868.—The skin of the animal may be removed in a long spiral strap either passing around the body transversely or longitudinally, or the hide may be split along the belly and the back, and axially around the nose, the two sides connecting at the rump, and forming a hide of double the usual length; or the hide may be removed in a cylindrical form and subsequently cut into a spiral strap.

Claim.—1. The method of skinning the animal and cutting out the skin, as herein described, and illustrated in Fig. 1, sheet 1, of the accompanying drawings.

2. The method of skinning and cutting out the skin of the animal, so as to form endless belts or straps of great length, in the manner herein described, and illustrated in Fig. 2, sheet 1, and Figs. 1 and 3, sheet 2, of the accompanying drawings.

77,725.—JOHN LYON FIELD, Kensington, Great Britain.—*Candle.*—May 12, 1868.—The lower end of the candle has a side projection, which is so formed as to project into the space left between the candles in packing. It is intended to enable the use of the candles in sockets of various sizes.

Claim.—A candle, having one or more ribs or projections near its lower end, substantially as and for the purpose described.

77,726.—JOHN FINN, Decorah, Iowa.—*Pan Former.*—May 12, 1868; antedated April 24, 1868.—The edges of the blank are, one after another, placed in the narrow slot, and the longitudinal and transverse corners are formed by raising the hinged blocks. Recesses in the blocks allow space for the vertical corners.

Claim.—1. The recesses *E* and blocks *F*, as herein specified.

2. Extension block *D* and bolt and slot *J*, substantially as described.

3. Lever or cam *G*, for the purpose set forth.

77,727.—JOSEPH FIRMEINICH, Buffalo, N. Y.—*Manufacture of Vinegar.*—May 12, 1868.—The ground grain is macerated in water for 24 hours, and at a temperature of 150° to 160° F., and then passed through smooth mill-stones, (termed a squeezer.) The first grinding may be dispensed with. From the squeezer the material is passed through a sieve having wire gauze at top and silk cloth at bottom, and from this to a sieve composed of fine silk cloth. From the last sieve the material is conveyed to the filter, which consists of a number of slightly inclined troughs or gutters, upon the bottoms of which the starch is deposited. The starch is scooped up and introduced into a tub, where it is mixed with water to the consistence of cream. To this 2 per cent. of sulphuric acid is added, and the mass allowed to stand 12 hours, and then gradually added to an equal amount of boiling water having a like proportion of sulphuric acid. The whole is kept at a boiling temperature until converted into glueose sirup, which is ascertained by the mass becoming clear or by the iodine test. After standing and cooling, chalk is added at the rate of 6 per cent. to the starch, to neutralize the acid, and the mass is gradually drawn off. The mass is then fermented by yeast and converted into vinegar in the "acetic" generator.

Claim.—1. The process of making vinegar from grain and other starch-producing substances, as a whole, substantially as herein specified.

2. As part of the process of making vinegar, the injection of steam into the digesting mass of meal or grain, as in the vats *G* and *I*, substantially as herein set forth.

3. As part of the process of making vinegar, the soaking and digesting of grain without grinding, as in the vat *I*, substantially as herein described.

4. As part of the process of making vinegar, the subjection of the soaked meal or grain to the smooth squeezing mill *J*, substantially as herein specified.

5. As part of the process of making vinegar, the method of applying the sulphuric acid, first with cold water and then with boiling water, and the injection of steam into the latter while adding the starch, and until it is converted into glucose, substantially as herein specified.

6. As a part of the process, the method of conducting the vinous fermentation by successive additions of yeast, first weak and then strong, substantially as herein described.

7. The arrangement of the sieves *K* and *L*, substantially as and for the purpose herein set forth.

8. The gauge valve *m n*, for drawing off the clarified sirupy liquid, substantially as herein described.

9. The construction of the acetic generator, substantially as herein set forth.

77,728.—HENRY A. HALL, Boston, Mass.—*Ankle or Knee Guard.*—May 12, 1868.—The "feelers" are intended to prevent interference, or cutting of one leg with the other hoof. They are usually cast solid with the band, but in this improvement are made separate for subsequent attachment.

Claim.—As a new article of manufacture, an ankle or knee guard, in which the band or belt is provided with a series of independent and separate feelers of vulcanized rubber, constructed or formed in the manner herein shown and specified, so that each feeler shall be uniformly flexible in various directions.

77,729.—WILLIAM HALL, Dubuque, Iowa.—*Lightning Rod.*—May 12, 1868.—A coiled metallic strip forms the lightning conductor.

Claim.—A continuous convoluted cylinder, constructed of sheet metal, wherein the sheet of which it is composed shall extend more than once around the axis in forming the cylinder, whether the same shall be constructed over an iron wire or not, when the same is made substantially as and for the purposes herein set forth.

77,730.—ALEXANDER HAMAR, New York, N. Y.—*Iron Furnace.*—May 12, 1868.—As the calorific current leaves the furnace it is conducted into a mixing chamber under the oven, and mixed with steam or hydrogen, which escapes through rose jets. The gases then pass into a combustion chamber, and pass upward between the rectangular bed pipes of the hot-air pipes, coming in contact with the deflectors by

which the current is spread among the said pipes. From the air pipes the caloric current passes in contact with a coil to superheat the steam therein, which passes into a chamber containing charcoal and iron filings to generate hydrogen. A portion of the hydrogen passes into the mixing chamber aforesaid, and the remainder passes into the tuyeres. The steam pipe may pass within the blast pipe, to maintain the former at a high temperature.

Claim.—1. The method, herein described, of injecting steam, superheated steam, or hydrogen into the oven, to mingle with the gases and increase their heating effect on the hot-blast pipes.

2. The arrangement, in a large combustion chamber, of the hot-air pipes, as and for the purpose described.

3. The combination, substantially as set forth, of the hot-air pipes with the interposed deflectors *r*, for the purpose described.

4. The combination, substantially as set forth, of the mixing chamber, the combustion chamber, and the hot-air pipes.

5. The arrangement, as set forth, of the superheating pipes *f* in the combustion chamber and above the air pipes, for the purpose specified.

6. The arrangement of the steam pipe within the hot-blast pipe, to maintain the steam at a high temperature.

7. The arrangement of the steam and blast pipes in sets, at different levels, for the purpose specified.

77,731.—DAVID M. HEIKES, Franklin Township, Pa.—*Clover Separator and Huller.*—May 12, 1868.—The clover, after passing beneath the thrashing cylinder, is raised by an endless carrier to a riddle, through which the seed falls upon a carrier which takes it back to the huller, by which the seed is liberated from the hulls, to be separated by the fans and riddles.

Claim.—The combination of the breaking device *e f*, elevator *G*, riddle *H*, conveyer *J*, platform or board *I*, hulling device *k l*, sieves *M N Q*, fans *O P*, and delivering spout *R*, all arranged substantially as described.

77,732.—NICHOLAS HIEMENZ, Buffalo, N. Y.—*Beer Cooler.*—May 12, 1868.—Around the outside of the ice chamber is a continuous trough with a gradual descent. The beer follows this to the discharge pipe at bottom, and is cooled by contact with the sides of the cold chamber.

Claim.—A beer cooler, composed of an ice chamber *A*, having an open inclined trough *C*, formed upon the outside walls thereof, in the manner and for the purpose substantially as herein described.

77,733.—EDWARD R. HOLZER, Philadelphia, Pa.—*Scaffold.*—May 12, 1868.—The posts are of sections scarfed together, are secured by screw bolts, and have a ratchet upon one side, into which a pawl of the platform engages. The posts are hinged to a base.

Claim.—1. A scaffold, consisting of two or more posts, *A*, each hinged to a base, *B*, resting on the ground, and to each of which is secured an adjustable bracket, *C*, all substantially as described.

2. The grooves *e*, arranged in opposite sides of the post, for the reception of the bent ends of the plates on the brackets, as set forth.

77,734.—WILLIAM HOWARD, Watertown, N. Y.—*Cheese Vat.*—May 12, 1868.—The space between the outer and inner vats is filled with water, through which passes the flue from a fire chamber at one corner.

Claim.—1. The combination with outer and inner vats of a fire chamber and heat and smoke conducting pipes, arranged about the sides of and between the vats, as and for the purposes set forth.

2. The combination with the heat and smoke conducting pipes and vat of a damper, arranged as and for the purposes set forth.

77,735.—H. HUNT, Delavan, Wis.—*Gate.*—May 12, 1868.—The opening cords are attached to levers pivoted to the pulley, and their action is to draw back the hinge upright and raise the latch end before the cord acts upon the pulley to swing the

gate around into an open position upon the holding rest.

Claim.—1. The combination of the levers *RR*, pulley *O*, and cords *F*, arranged substantially as and for the purpose set forth.

2. The combination of pulley *O*, levers *RR*, pivots *I J*, and cap *P*, arranged to operate substantially as herein set forth.

77,736.—I. S. HYATT, Rockford, Ill.—*Tax Calculator.*—May 12, 1868.—A sheet is arranged according to the rate of taxation; a vertical row upon its left hand indicates the units and tens, as the case may be; and to the proper figure upon this row the sliding bar, having the hundreds marked upon it, is adjusted. The amount of tax is read from the sheet immediately over the hundred. Upward projections upon the bar cover the place of mills on the sheet.

Claim.—1. In combination with tax table *A*, constructed substantially as described, the sliding bar *B*, operating in the manner and for the purposes as set forth.

2. Providing the sliding bar *B* with the projections *b b*, as and for the purposes set forth.

3. Rendering the sliding bar *B* adjustable in a direction at right angles to the carrier *E* by means of a slot and set screw, or their equivalents, for the purpose substantially as set forth.

77,737.—ALVARADO JONES, Westford, Wis., assignor to self and A. A. SAGE, same place.—*Harrow Teeth.*—May 12, 1868.—A steel point is welded to a piece of gas-pipe, to form the tooth.

Claim.—The hollow body *B*, in combination with the steel point *A*, in the construction of a harrow-tooth, substantially as and for the purposes set forth, as a new manufacture.

77,738.—BLINN D. JOSLIN and REUBEN A. NEW-HALL, North Brownville, Mich.—*Bed Bottom.*—May 12, 1868.—The ends of the slats are suspended by links from the bedstead rails, and supported by coiled springs, which rest upon a metallic truss-strip beneath.

Claim.—1. The truss *D*, provided with supporting springs *3*, when attached to slat *C*, and operating substantially as and for the purposes described.

2. The combination of the trussed slats *C* with the rod *B* and hooks *J*, upon the double coil-spring *E*, for the purpose described.

77,739.—GEORGE G. KNOWLES, Wakefield, R. I.—*Hay Spreader.*—May 12, 1868.—The tedder reel is revolved by gearing from the cogged rims on the driving wheels. As each bar comes into its lower position, its teeth are held vertically, so as to catch the hay, and become horizontal as they reach their upper position, in order to discharge the hay. These motions are produced by the eccentrics and their plates, which turn the triangular plates upon the tooth-bars.

Claim.—The combination of the eccentric plates *r r r r* with the triangles *t t t t*, and bars *K V*, as and for the purpose herein described.

77,740.—FRANK F. LANDIS, Lancaster, Pa.—*Padlock.*—May 12, 1868; antedated May 7, 1868.—The lock snaps shut, and the bolt is held by a spring lever. The key pivot pin forms an arbor on which the guard cylinder turns, the walls of the said cylinder serving to cut off communication between the keyhole and the bolt. The jointed end of the winged tumbler engages between two lugs as the cylinder is turned, and a key-pin upon the key passes through a hole in the rectangularly-bent guard plate, and by acting upon the tumbler, retracts the hinged end from between the lugs; the cylinder is then turned forward until the said end has passed over the inclined side of the catch upon the spring lever, and, being reversed, it engages the straight side of the same, and draws back the bolt; the lock staple must then be drawn out, or it will be re-locked when the lever is allowed to spring back.

Claim.—1. The rounded right angled chamber or partition *I*, with its wall, *H*, thickened and perforated, in combination with the hinged and winged tumbler *G E F*, on its pivot *f*, with a cylinder, *J*,

revolving freely on the pin O, for the socket in the key, arranged, and operated in the manner specified.

3. In combination with said chamber, or partition I H, and tumbler G E F, the arrangement of the lever C, with its hook D, in connection with the spring-bolt B, by the pin *b*, when actuated in the manner and for the purpose set forth.

77,741.—GEORGE T. LAPE, Summit, N. Y.—*Bridge*.—May 12, 1868; antedated April 28, 1868.—The top plate of each voussoir is suitably curved to form a section of the upper shell of the arch, and its ends project transversely to opposite sides, so that joints are broken between the different plates. A center plate runs across the voussoir, and the latter has also a longitudinal rib, whose flanged bottom runs parallel to the top plate. The abutting ends of the voussoirs have dovetailed and rectangular interlocking tongues.

Claim.—1. The construction of sections or voussoirs, consisting of abutting ends, flanges, rib, and cross-plate, with tongues, grooves, and dovetails, all arranged substantially as and for the purposes specified.

2. The construction of bridges, arches, &c., by combining a series of sections or voussoirs, and securing them to each other, substantially as herein specified.

77,742.—WILLIAM H. LEACH, Uxbridge, Mass., assignor to self and BRADFORD STETSON, same place.—*Tool Post for Lathe or Planing Machines*.—May 12, 1868.—The tool socket has a universal joint, with limited play, so as to present the tool in the required direction. As the clamping screw is brought down upon the shank of the tool, it binds it upon the ring of the socket, and at the same time draws the segment of the sphere against its shell, and stiffens the post upon its foundation.

Claim.—The construction of a tool-post, for a lathe or other machine, with the joint A' B', in combination with the collar C and set screw F, substantially as and for the purpose set forth.

77,743.—SAMUEL N. LONG, South Chatham, assignor to himself and LINCOLN B. BEARSE, Barnstable, Mass.—*Caster for Furniture*.—May 12, 1868.—Anti-friction balls are interposed between the lower face of the sleeve flange, and the upper face of the caster carriage. Channels in each surface form tracks for the balls to travel in as the carriage rotates on its axis.

Claim.—The combination of the sleeve D with the spindle A, with the plate B, having the groove *c* and the opening *g*, all constructed, arranged, and operating as for the purposes described.

77,744.—ROBERT H. MARTIN, Staten Island, N. Y.—*Safety Hatch*.—May 12, 1868; antedated April 25, 1868.—To each hatchway is a vertical, sliding, counterpoised guard. A retractable spring bolt upon the platform, in passing upward, impinges upon a ratchet projection of the guard and elevates it, making a clear way from the platform to the floor. As the platform passes the floor the bolt is pushed backward by a rounded projection, and the guard descends. When the platform is descending, a bolt, similar to the aforesaid, engages a ratchet tooth upon the counterpoise weight and elevates the guard by carrying the weight downward.

Claim 1. The combination, with a hatchway-hoist to the several floors, or any of them, of a warehouse or other structure, of partially balanced or counterpoised safety guards, substantially as specified.

2. The combination, with rising and falling or opening and closing safety guards, to a hatchway on any or all of the floors of a building, of self-shooting bolts on the hoist, operating automatically to open the guards, both in the ascent and descent of the hoist, essentially as shown and described.

3. Providing the hoist with unshipping or backlocking gear to its self-shooting bolts, for operation, at pleasure, of the latter with any one or more of the safety guards without lifting the others on intermediate floors, or for running the hoist up and down the hatchway without stopping at or raising any of guards, substantially as herein set forth.

77,745.—THOMAS MARVIN, Cambridge, Mass.—*Attaching Door Knobs to Spindles*.—May 12, 1868.—Each end of the spindle passes into a socket in the knob, having a cylindrical surface, upon which the escutcheon fits. The escutcheon has a shoulder upon which fits a disk applied to the inner end of the knob. The disk is applied to the knob by turning a peripheral flange back and down upon the neck of the knob. The shank of the socket piece is square in section, and fits into the knob mortise. One end of the spindle is confined to its socket by a transverse pin, and the other pin is adjustable in its socket.

Claim.—The combination of the stationery escutcheons, the spindle, the spindle sockets, with the shoulder *h* and flange *i*, the disks and the knobs, when constructed, connected, and relatively arranged, substantially as described.

77,746.—WILLIAM MATHEWS, Troy Township, Ohio.—*Purifying Sorghum Juice*.—May 12, 1868.—The cisterns are charged with filtering material, and are temporarily set on each other and on legs, so as to discharge into each other in descending series.

Claim.—The improved filterer herein described, composed of the vessels *b c d*, or their equivalents, arranged and charged with filtering materials, substantially as described.

77,747.—GEORGE W. MILLER and JULIUS D. STEVENS, Scranton, Pa.—*Hub Fastening for Eccentrics*.—May 12, 1868.—Steel, wedge-shaped, tooth dies are placed between the hub and its shaft, and the latter are clamped together as the wedge piece between the dies is drawn outwardly, forcing the dies apart.

Claim.—The dies C C, and which are secured within the hub of the eccentric, and made to clamp the shaft, by means of a bolt with a tapering head, or other equivalent, as and for the purpose set forth.

77,748.—WILLIAM JOHNSTON MILLER, Gettysburg, Pa.—*Shutter Fastening*.—May 12, 1868.—The shutter catch is pivoted in the sill, and tips freely to lock the sash, but is opened from the inside by a pull bar, which rotates the cam and depresses the catch.

Claim.—The arrangement and combination, in a shutter-fastening, of the pull P, bent arm or trigger E, rod *j*, spring *i*, catch *b*, and plate *a*, with its projecting catch, operating in the manner as shown and described, and for the purpose set forth.

77,749.—HYPOLITE MONIER, Paris, France.—*Gas Burner*.—May 12, 1868.—The air has passage through the grooves of the corrugated and fluted glass cone or chimney rest. The tulip is slipped upon the tube beneath the chimney rest, and the air passes between the points of its notched top and the said rest.

Claim.—1. The combination, with a gas or other burner, such as herein described, of an internally fluted cone or chimney rest, of glass or other transparent material, surrounding the same, and a cap, R, or its equivalent, the whole being constructed and arranged as specified, so that air shall pass to the flame through the interior of the burner, between the burner and the cone, and between the cone and the chimney, as and for the purposes set forth.

2. The combination, with the burner, of the internally fluted glass cone and chimney seat, and the corrugated and fluted glass tulip applied to the said cone, in the manner and for the purposes shown and specified.

77,750.—HENRY MORGAN, Springfield, Mass.—*Clothes-line Holder*.—May 12, 1868.—The line is gripped between a pulley and a serrated cam, both of which are pivoted to the plate.

Claim.—The combination of the pulley A and cam B with the gear *c c*, when arranged upon a plate, C, substantially in the manner and for the purpose shown.

77,751.—BENJAMIN L. MOTT, Jr., Pawtucket, R. I.—*Cooking Stove*.—May 12, 1868.—When the soot drawer is in place, its arched top forms a partial division plate in the bottom of the flue, the smoke passing forward over the arched plate, and reverting

beneath it on its way to the rear descending flue. Vertical plates on the end of the drawer, and on the end of the arched plate, respectively, act in conjunction with the vertical rear plates of the stove to form the rear flues.

Claim.—1. The combination and arrangement of the arched plate H with the soot drawer G, so as to divide such drawer or the chamber E into two connected or return flues, as set forth, and be movable with the drawer.

2. The combination of the lip or flange *a* with the partition or arched plate H, or the same and the drawer G, to be applied to the chamber E and flues D F of the cover, as specified.

77,752.—GEORGE MURRAY, Jr., Cambridge, Mass.—*Meat Pounder and Ice Pick.*—May 12, 1868.—The implement has a face full of projections to pound meat, an edge for cutting, and one for scaling.

Claim.—As an article of manufacture, a combined meat pounder, cleaver, ice pick, fish scaler, &c., composed of a rectangular-shaped plate, of cast or malleable iron, A, one side of which is covered with pointed projections, while from the other side projects a handle, B, and having one edge, C, and end, D, sharpened, so to produce cutting edges, substantially as herein set forth.

77,753.—ESAU P. NEWMAN, New Albany, Ind.—*Churn.*—May 12, 1868.—The breakers are supported inside the churn by the circular wire springs, and are removable. The dasher has rotary reciprocation by a bevel wheel and segment rack actuated by a lever.

Claim.—The breakers J J J J and steel-wire springs K K, as used in connection with the paddles I I I I in churning butter.

77,754.—CHARLES NOETHLICH, Muscatine, Iowa.—*Wagon Lock.*—May 12, 1868.—The pawl has a bell-crank form, and is operated by a compound lever whose upper end, when the pawl is disengaged from the ratchet, lies parallel with the curved end of the main lever.

Claim.—The arrangement and construction of the angular lever G G', link F, and pivoted pawl D, in combination with the bevel-toothed rack A, and vibrating lever B B, the arrangement of the whole being such that the pivot *c* can be thrown to the right or left of the line *x x*, and when in one position the pawl will be firmly locked without the aid of an auxiliary stop, and when in the other position, the pawl will be unlocked, all substantially in the manner described and shown.

77,755.—JAMES OGDEN, Philadelphia, Pa.—*Oil Can.*—May 12, 1868.—The oil-discharging and the air-receiving tubes are closed by the backward rotation of the spout; when the latter is brought into position for pouring, the former tube is in connection with it, and the latter admits air from the outside.

Claim.—The combination and arrangement of a can, A, pipe, G, socket, B, having openings, *f* and *i*, and a plug, D, fitting the said socket, and having passages, *e m*, and a spout, E, all substantially as described.

77,756.—SAMUEL PERRY, Seaford, Del., assignor to himself, and JOHN L. COULBORN.—*Lifting Jack.*—May 12, 1868.—The lever is pivoted in the standard and lifts the rack bar by means of the swinging link. The rack is held at its elevated position by an upper link, and by blocks in the rear between it and the standard.

Claim.—The arrangement of the standard A, with its slotted arm C, through which passes the rack F, and to which is pivoted a loop, *d*, said rack being operated by the lever D passing through the standard, and kept in position by the bar E and block *c*, all constructed and used as specified.

77,757.—W. H. PHELPS, Boston, Mass.—*Suspensory Bandage.*—May 12, 1868.—A silk net supports the serotum which is slightly embraced by the elastic upper edge of the net. A narrow bandage is sewn to the net and follows the line of the septum of the serotum. Elastic bands pass over the hips and are buckled in the rear.

Claim.—A suspensory bandage constructed and adapted for being used substantially as described and shown.

77,758.—SAMUEL PITCHER, Barnstable, Mass.—*Medicine.*—May 12, 1868.—Mixture to be used as a cathartic. Composed of senna leaves, 20 lbs.; bicarbonate of soda, 2 oz.; essence of wintergreen, 5 lbs.; extract of taraxacum, 1 lb.; sugar, 50 lbs.; and water, 10 galls.

Claim.—1. The composition substantially as described, and for the purpose as explained.

2. The process hereinbefore described for compounding the ingredients of such composition, such process embracing the two operations of straining the liquor from the leaves, and subsequently obtaining, by pressure of them, one extract, not obtainable by simple infusion.

77,759.—WILLIAM W. POTTER, Buffalo, N. Y.—*Stencil Plate.*—May 12, 1868.—Each letter is on a plate whose edges are bent over, so that it can be slipped upon a slotted plate attached like a tongue to a larger slotted plate. The letters are readily changed to form different combinations.

Claim.—1. A slotted plate, A, attached to the stencil plate B at one end, while the other end is free, substantially as and for the purposes set forth.

2. The combination of the slotted plate A, stencil plate B, the C-formed letters sliding on plate B and the latch D, substantially as and for the purposes described.

77,760.—S. H. RHOADES, Clyde, Ohio, and WILLIAM CARROLL, Hillsdale, Mich.—*Horse Hay Fork.*—May 12, 1868.—The springs in the lower end of the stock tend to retract the prongs within the case. The springs in the upper part act upon the pawls which engage the notched shank to retain the prongs in their projecting or collapsed positions respectively.

Claim.—1. The springs *b'* in combination with prongs E, for the purpose specified.

2. The catches *a b* and springs *c d*, as constructed and arranged to operate in combination with the shaft C, for the purpose specified.

77,761.—CHARLES RICHMOND, Memphis, Tenn., assignor to GAINOR, STILES & Co, same place.—*Cotton Planter.*—May 12, 1868.—The furrow opener precedes, and a spur in its rear keeps open, the groove between the flanges of the cylinder containing the seed. Stirrers in the latter keep the seed from clogging and force it to the aperture. It is covered by a drag bar.

Claim.—The adjustable flanges, whereby they can be separated or closed at will, for the proper distribution of seed, the separators to keep the seed disunited, in order to distribute equally and regularly, together with the hollow journals, allowing the whole to revolve and adapt itself.

77,762.—JAMES RILEY, Detroit, Mich.—*Straw Cutter.*—May 12, 1868.—The cutters are upon a horizontal disk which turns beneath the mouth of the box. The feeder is journaled to a frame which may be slid out when cutting roots.

Claim.—The arrangement of the sliding frame C with feeder A', when used in combination with the revolving cutter D and hopper L, and operated in the manner substantially as and for the purposes herein set forth.

77,763.—EDWARD S. RITCHIE, Brookline, Mass.—*Paint for Liquid Compasses, &c.*—May 12, 1868.—The pigment (such as dry white lead) is reduced to proper consistence by mixture with albumen, and the mixture immediately applied to the compass card. The albumen is coagulated by a solution of lime, or by heat.

Claim.—The application to a compass card, or other article to be exposed to alcohol, or an alcoholic mixture, as set forth, a paint composed of one or more pigments and coagulating material, (such as albumen, for instance,) and then, or subsequently, effecting coagulation of the vehicle, the whole being substantially as and for the purpose above specified.

77,764.—ANDREW J. ROCK, Union Village, Va.—*Last and Shoe Holder.*—May 12, 1868.—The supporting posts slide in the foot piece and have a regulating screw. The jaws slide in a block and have a similar adjustment. The height of said block is regulated by a central, vertical screw.

Claim.—The arrangement and combination of the adjustable posts C, screws D, E, and K, blocks A and G, when adjusted and operated with the adjustable jaws J J, as herein described, and for the purposes set forth.

77,765.—STEPHEN W. ROOF, New York, N. Y.—*Frame for Neck Ties.*—May 12, 1868.—The frame has wings to pass behind the lappels of the shirt collar, and a band clasp in front by which the bow is attached.

Claim.—The combination of the frame A with the clasp, made detached, as shown at B, or hinged to said frame, as seen at C, when the frame A is made as shown, so that its ends, when in use, pass up under the outer ends of the turn-down collar, with which it is worn, so as to hold it in its place, all substantially as shown and described, and for the purpose specified.

77,766.—SAMUEL I. RUSSELL, Chicago, Ill.—*Sidewalk.*—May 12, 1868.—The wooden foundation forms the principal portion, and its upper surface has dove-tail projections which anchor the superjacent mastic or asphaltum which forms the upper portion of the walk.

Claim.—1. The construction and arrangement of sidewalks or other ways with framework or supports, or combined with and covered by a surface coating composed of coal-tar, and grooved, substantially as specified.

2. The construction and arrangement of the walk in sections, substantially as described.

77,767.—EILERT O. SCHARTAU, Philadelphia, Pa., assignor to FRANK S. JUDD and JOHN G. POWELL, same place.—*Lamp Wick.*—May 12, 1868; antedated April 28, 1868.—The wick, of ordinary character, is protected by a perforated metallic cap.

Claim.—A wire gauze or perforated metallic case, of any shape, fastened permanently to the top of a lamp wick, of any material, or so constructed as to be folded on it and detached at convenience, for the purpose of guarding the wick from the carbonizing effect of the flame, thereby producing a clearer light and a saving of wick and oil, as herein set forth.

77,768.—S. FRANKLIN SCHOONMAKER, New York, N. Y.—*Transporting and Storing Grain and other products.*—May 12, 1868; antedated April 25, 1868.—The closed metal-lined chamber is charged with grain, cotton, or other product, and an artificial atmosphere of nitrogen is then injected to prevent fermentation or generation of heat.

Claim.—1. A closed chamber or compartment, rendered impervious to air and gases by a metal lining, so applied as to permit the free expansion and contraction of the metal, substantially as and for the purpose specified.

2. In connection with a suitably inclosed chamber or compartment, nitrogen gas, when produced from the confined air, by the agency of a chemical compound and heat, without the production of carbonic-acid gas, substantially as and for the purpose described.

3. Providing an opening or inlet, in connection with an inclosed chamber, for the passage of exterior air, to maintain, in the process, an equilibrium of pressure within and without, for the purposes substantially as described.

77,769.—ANSON SEARLS, New York, N. Y.—*Shaft Coupling for Carriages.*—May 12, 1868.—The thill iron has a slot which slips over the clip bolt. A hook bolt passes through the clip iron, its lower end engaging beneath the clip bolt and its upper end having a nut, beneath which is a packing ring.

Claim.—1. The shaft hook A, with a recess, C, in the back part of it, and hole for bolt I as set forth.

2. The curved T-head bolt I, for the purposes described.

3. The combination of the bolt I, spring K, washer

J, and nut E, in combination with the hook A and pin B, substantially as described, and all for the purposes set forth.

77,770.—GEORGE A. SEAVER, New York, N. Y.—*Cotton Bale Tie.*—May 12, 1868.—The fastening is a single wire, one end being bent to hook over the other. By rotation backwardly the straight portion is so exposed that the loop of the last fastened end of the band may be slipped over it and be retained as the bale expands, bringing it into locking position.

Claim.—The construction of the tie or fastening, substantially as described.

77,771.—AMOS SHIPLEY and WILLIAM T. MERSEREAU, Newark, N. J.—*Instrument for Lighting Gas, &c.*—May 12, 1868.—A match is secured in the end of the stock and is ignited by drawing back the frame which carries the friction surface over the match, the latter projecting conveniently for lighting gas.

Claim.—In combination with a standard, a movable framework, supporting the corrugated lips, when the same shall be constructed and operate substantially as described, for the purposes set forth.

77,772.—SHERMEN E. SKILLING, Benton Harbor, Mich.—*Tube Well.*—May 12, 1868.—The lower section of the driven pipe is shod with a point and has a slot for entrance of water. A coil of iron inside acts as a strainer, and the distance between the coils is regulated by a nut on the end of the central bolt.

Claim.—The coil spring G, provided with the rod H, the collars E and I, and the nut J, within the pipe A, substantially as arranged, and for the purpose hereinbefore described.

77,773.—EDWARD C. SMITH and DAVID F. WILCOX, Greenville, N. Y.—*Dentistry.*—May 12, 1868.—To assist in withdrawing the impression from the mouth air is introduced between the plaster and the surface of the mouth. The tube passes through the body of the cup, and the head of the hollow spring pin is in contact with the palate. By pressing the pin the air communication is made.

Claim.—1. The introduction of air between the surface of the mouth and the material used in taking impressions for artificial bases for teeth by means of air tubes T t, valve rod V, and spring S, substantially as set forth.

2. In combination with the impression cup C, the tubes t T, valve rod V, and coil-spring s, when arranged and operating substantially as and for the purposes set forth.

77,774.—WILLIAM H. SMITH, New York, N. Y., assignor to himself and ISRAEL HECKER.—*Sinker for Fishing Lines.*—May 12, 1868.—The conoidal end pieces are attached by an axial bolt and as many interposed annular disks are added as may be necessary for the purpose.

Claim.—Making a sinker in two parts, and in such a manner that sections or disks may be added to or taken from it, for the purpose of increasing or diminishing its weight, substantially as herein set forth.

77,775.—LORENZO D. SNOOK, Barrington, N. Y.—*Hop Trellis.*—May 12, 1868.—The posts have hooks upon which the longitudinal and transverse horizontal poles are laid.

Claim.—The horizontal poles D and E, when supported at right angles upon the upper sections B of the stakes, as specified, by means of the hooks K, and used in combination with the sectional stakes A B, substantially as and for the purpose set forth.

77,776.—GEORGE W. SOUTHWICK and JOHN H. GILLETT, Scott, N. Y.—*Shingle Machine.*—May 12, 1868; antedated May 4, 1868.—The carriage is reciprocated in the plane of the saw by means of pinion and rack. The carriage has a sliding frame and head block on which the shingle blocks are seenred and by whose motion the feed of the block is effected. An oscillating lever operates the spring pawls which act upon the ratchets to feed the block. The movement is derived from a hand lever which gives an oscillation to the

ways on which the block slides so as to present the latter to be cut heads and points alternately.

Claim.—The arrangement of the bar N, with its grooves P P, through which pass the pins S S, said bar being operated by the lever q for oscillating the bar J through its arm K, substantially as and for the purposes specified.

77,777.—EDWARD SPAULDING, Brooklyn, N. Y.—*Process for Treating Wood.*—May 12, 1868.—The timber is subjected to great longitudinal pressure to condense the cellular structure.

Claim.—The method of treating wood herein described, consisting essentially in subjecting it to sufficient pressure to change and compact the structure, preparatory to the process of drying by artificial heat, substantially as set forth.

77,778.—THOMAS H. SPENCER, Providence, R. I., assignor to CHARLES L. SPENCER, same place.—*Construction of Blacking Boxes.*—May 12, 1868.—The connecting link is jointed to the handle and to the box; when fully closed, the handle lies on the lid. The oscillation of the handle raises the lid and when the latter is vertical the handle is in the plane of, and supports the box.

Claim.—A double hinge, when applied to a blacking box and cover, in connection with a handle, substantially as described, and for the purpose set forth.

77,779.—AUGUSTUS STANLEY, New Britain, Conn.—*Saw-Horse.*—May 12, 1868.—One section has two rounds and the other but one, and that forms the pivot; the former slips into the latter, when the parts are collapsed, but the rabbeted edges of the two sections interlock when the saw-buck is extended.

Claim.—The folding parts A A, B, C, notched or recessed across, and adapted to lock into each other, and be rigidly confined at the proper angle by the aid of the screw-brace D d', or its equivalent, substantially as and for the purpose herein specified.

77,780.—ALBERT I. THUNELL and JOHN M. HEDSTROM, Buffalo, N. Y.—*Rotary Steam Engine.*—May 12, 1868.—The induction port is in one end of the shell and communicates with a curved groove in the end of the piston hub, and the said groove communicates by a longitudinal duct with a circular groove at the other end of the hub, both grooves communicating with the steam space. The eduction port is through the periphery of the shell. The curved groove with which the induction port communicates is discontinued at one part to close the said port when the piston wing is passing beneath the hinged valve.

Claim.—1. The arrangement of the concentric steam grooves f f', passage or passages g, and blank n, when combined with the piston head B, and steam pipes E G, in the manner and for the purpose specified.

2. In combination with the wing D, the spring slide D', with right angled packing edge a, arranged and operating as herein set forth.

3. In combination with the valve C, the crank arm H, connecting bar I, rock lever K, and cam pin m the whole arranged and operating as herein set forth,

77,781.—JULES TUREL, Kendallville, Ind.—*Lettering Marble.*—May 12, 1868.—Letters are cut in the marble and a strip of metal placed upon the slab projecting perpendicularly therefrom in the direction of the width of the strip, and from the midheight of the letters. A plaster cast is then taken and the same being raised from the slab the projecting letters are dressed off it, and the metallic strip being removed the plaster is returned into position upon the slab and the lead is then poured through the gate made by the removal of the metallic strip, and the letters in the slab are filled, together with the divergent holding holes drilled in the bottoms of the letter recesses. The face of the marble and letters is then dressed down.

Claim.—The process, substantially as herein described, for applying metallic lettering to marble or other stone.

77,782.—JOHN J. WALDRON, East Durham, N. Y., assignor to himself, TIMOTHY G. PALMER, and

HENRY BROWN.—*King-bolt for Wagons.*—May 12, 1868.—A socket is formed in the plate which unites the perch and head block; the said socket receives the king-bolt and forms a brace for the same, presenting an extended surface.

Claim.—The socket l, projecting downward from the plate f, that unites the perch c and bolster or head block d, in combination with the king-bolt i, that enters, at its upper part, said socket l, and is retained by the nut o above said plate f, as and for the purposes specified.

77,783.—DAVID WALKER, Newark, N. J.—*Blotter.*—May 12, 1868.—A thin strip of metal adapted to be used as a ruler and paper cutter is attached to the side of the blotter by the same wire which confines the blotting paper to the holder.

Claim.—The strip of metal or hard substance a, constructed, adapted, and attached to the blotter, in the manner and for the purpose specified.

77,784.—RUSS B. WALKER, Claremont, N. H.—*Waxing Floors.*—May 12, 1868.—The composition is put on in powder and left to be worked in by the feet of dancers or others. It is composed of beeswax 20, paraffine 60, spermaceti 20, Prussian blue 2, and linseed oil 2 parts, melted together, and when nearly cold scented with oils of cinnamon, bergamot, and lavender.

Claim.—1. The combination of beeswax, spermaceti, and paraffine, or its equivalent, in such proportions that the whole may be reduced to powder, substantially as and for the purpose set forth.

2. The method or process herein described of waxing floors by sprinkling thereon a waxing material, when the same is in a dry and pulverized or powdered state.

77,785.—JAMES WEATHERS, Greensburg, Ind.—*Attaching Hubs to Axles.*—The thimble at the inner end of the spindle has a flange through whose lower end a bolt passes. The other end of the bolt has an eye traversed by a bolt which passes through the axle and serves also to secure the hounds.

Claim.—The thimble B and skein E, cast of one piece, the former provided with a flange, h, and secured to the axle A by means of the bolt f and rod g, all combined, arranged, and used substantially as specified.

77,786.—E. Z. WEBSTER, Louisville, Ky.—*Stove for Railroad Cars.*—May 12, 1868.—Valves admit air to the fire and to the heating chamber respectively, and regulate the supply to each. Rising in the furnace the air dives again, and the smoke and gases pass out by a central flue beneath the floor. The jacket around this flue conducts the heated air from the hot-air chamber of the stove to register openings in the car floor. A charging chamber, with a slide valve above and below, is the means of introducing coal without exposing the fire and permitting the escape of smoke into the car.

Claim.—1. The slides M and O, in combination with the hopper N, for supplying coal to the furnace, substantially as herein described.

2. The combination of the furnace A, casing H, valves I and G, smoke and hot-air flues D and K, slides M and O, and hopper N, for the purpose and substantially as herein specified.

77,787.—SAMUEL WEHRLY, San Francisco, Cal.—*Trunk Lid Supporter.*—May 12, 1868.—The metallic catch upon the lid engages a hole in the spring attached to the inside of the back of the trunk, and serves to prevent the lid from shutting, or undue opening.

Claim.—1. The spring B, having a hole, a, near its upper end, for the purpose of receiving the point D, substantially as described.

2. The catch E, having a point, D, formed by making a slot on its top, substantially as and for the purpose described.

77,788.—PATRICK WELCH, New York, N. Y.—*Frame for Neck Ties.*—May 12, 1868.—The middle of the frame, to which the bow is attached, is slotted, so that it can be entered from below and pressed upward behind the shirt button. An elastic loop, from

its lower portion, is then placed over the button to hold up the frame.

Claim.—The neck-tie frame, formed with a slot running from the upper part down the center of the body, for the purposes and as set forth.

77,789.—JOHN E. WILLIAMS and MICHAEL LEMON, Binghamton, N. Y.—*Churn Dasher.*—May 12, 1868.—The tubular staff has a double flap valve at bottom which admits air to a recess beneath the crucial dasher. The air passes from the recess through holes having radial exit through the ends of the dasher arms.

Claim.—The combination of the dasher A, center-hinged valve F, hollow shaft or dasher rod C, and oblique openings E E through the edges of the wings, all being constructed substantially as herein described and represented for the purpose set forth.

77,790.—JOHN I. WILLIAMS, Etna, Pa.—*Boiling and Puddling Furnace.*—May 12, 1868.—The hollow boshes form channels to conduct a supply of water, and obviate the use of "fixing" for protecting the sides of the said boshes which are exposed to the fire.

Claim.—1. The hollow cast-iron water-chill boxes *a a* of a puddling or boiling furnace, made with rounded back corners, and jambs *b* in front, substantially as and for the purpose hereinbefore described.

2. The use of hollow water boshes or boxes, connected with a water reservoir or tank, of suitable capacity to keep up a circulation of warm water, as well between heats as when the furnace is in operation, substantially as hereinbefore described.

77,791.—L. W. WOLFE, Jacksonville, Ill.—*Seat for Vehicles.*—May 12, 1868.—The sides and back are dovetailed into connecting, curved, metallic corners, to which the top props may be attached.

Claim.—The arrangement of the seat A with the hollow concavo-convex metallic corners B B, as herein described, all constructed and used substantially as set forth.

77,792.—GEORGE T. WOODBURY and THOMAS BURCH, Newark, N. J.—*Finishing Skins and Leather.*—May 12, 1868.—The indentations, similar to those in the grain of hog-skin, are engraved upon a soft steel cylinder, and the cylinder is then hardened. The pattern is transferred by pressure to a soft steel cylinder, which is subsequently hardened and used to impress the pattern upon leather.

Claim.—1. A metallic or other roller, provided with such marks, prominences, and depressions as will produce, when passed over leather, under pressure, an imitation hog-skin.

2. The means of producing an imitation of the dressed skin of a hog upon leather adapted thereto, by the use of a roller, prepared and employed substantially as described.

3. An imitation hog-skin, when produced by the use of a metallic or other roller, having engraved, indented, transferred, or otherwise prepared upon its circumference, such marks, depressions, and projections as will secure a representation of the marks left by the removal of bristles and otherwise, when pressed upon and revolved over leather, the whole substantially as described.

77,793.—HOWELL W. WRIGHT, Taunton, Mass., assignor to REED and BARTON, same place.—*Alloy for the Manufacture of Spoons and Forks.*—May 12, 1868.—Composed of nickel 1, and copper 3 parts.

Claim.—The within-described alloy, or composition of metals, or any other substantially the same, all as and for the purposes set forth.

77,794.—REUBEN ZIDER, El Paso, Ill.—*Railway Chair.*—May 12, 1868.—The rail is held between the two clamps which embrace its base flange, and are forced against the rail by the pressure against their inclined surfaces of the inclined sides of the cavity in the chair. The clamps are held down by pieces which are retained by spikes passing through them and entering notches in the clamps as they pass through the chairs. A wedge is driven between the clamps and beneath the rail, after the spikes are driven.

Claim.—The arrangement of the clamps B B and

key D with the chair A, the several parts being constructed substantially as described, thus forming an improved railroad chair.

77,795.—FEDERAL C. ADAMS, Cincinnati, Ohio.—*Cupola Furnace.*—May 12, 1868.—The peculiar form given to the cupola is to keep the stock up until melted. Above the cupola is a domed top which deflects the heat. The air blast becomes heated beneath the outer casing before passing through the tuyeres.

Claim.—1. The general shape of the interior of a cupola furnace, as described; that is to say, gradually contracted from the bottom to a point above the tuyeres, and thence gradually enlarged to the top, as shown.

2. The heating chamber A above the cupola, provided with openings B and door C, with the base-wall H projecting over the lining, substantially as shown.

3. The air-heating chamber F, under the wall H, and between the lining and the outer case, with the openings for the introduction and discharge of air, substantially as described.

4. The plate J in the chimney, with its smoke-passages, substantially as shown, and for the purpose described.

5. The outer case L, forming a blast-heating chamber N, surrounding the cupola, substantially as described.

6. The partitions O O¹ O² O³ in the blast-heating chamber N, substantially as and for the purposes described.

7. The space or chamber between the lining E e and the inner case, for the purpose of cooling the back of the lining, or heating the blast, substantially as described.

8. The eupola lining E e, composed of an iron plate or plates covered with fire clay or other non-conductor, as described.

9. Arranging the tuyeres in a cluster, as shown by P Q R S T.

10. The arrangement of tuyeres on an angular or spiral line, as shown by the combinations P Q R S or R S U V.

11. The tuyeres set at an angle to a radial line, as shown at W, for the purpose of creating a tangential or vertical blast, as described.

12. The arrangement of tuyeres, having the same size at the outlet, one above the other, in regular or irregular order, substantially as and for the purpose described.

13. The tuyeres Y Y projecting beyond the lining toward the center of the eupola, as described.

14. The employment, in a cupola furnace, of slotted tuyeres for the admission of the blast.

15. The slotted tuyeres constructed with the lower part of the outer end wider than the upper part, and projecting beyond the lining, substantially as shown.

16. The horizontal slotted tuyeres, constructed substantially as shown.

17. The upright center tuyere Z, surmounted by a cap, Z', whether introduced through the bottom or from the sides of the cupola, substantially as described.

18. So arranging the tuyeres of a eupola furnace, as to employ a greater number below than above, for the purposes described.

19. The upper row of tuyeres W W W, substantially as and for the purpose described.

20. The combination, in the same eupola furnace, of tuyeres of different shapes and sizes, and located above and below each other, substantially as set forth.

21. The inclined supports of the cap of the center tuyere Z, for the purpose of introducing the blast with a vertical motion, as described.

22. In a horizontal series of tuyeres applied to a cupola furnace, constructing the inlets of unequal size, as described.

23. In a series of tuyeres, placed one above the other, making some of them with the outer end of greater diameter than others, while the inner end remains of the same diameter, as described.

24. The horizontal line of tuyeres R³, R², P, T, S, S², and S³, increasing and diminishing, substantially as shown.

77,796.—ALONZO BENEDICT, Albany, N. Y.—*Carriage-Pole Tip*.—May 12, 1868.—The metallic tip has a socket to receive the end of the carriage pole, and an upwardly and forwardly curved horn for the ring of the neckyoke.

Claim.—A pole tip, A B, substantially as and for the purpose described.

77,797.—WILLIAM L. BLAISDELL, Port Byron, N. Y.—*Shaft for Vehicles*.—May 12, 1868.—The thill is connected to the cross-bar by a metallic shoe which gives bearing to a spring trace hook. The latter is drawn outward and turned when attaching the trace, a plate and spiral spring acting respectively to draw the hook inward and to turn it to the proper position when released.

Claim.—1. The hollow foot B, of iron or other metal, when arranged as described, for the purpose of uniting the shaft and cross-bar.

2. The combination of the hook D and shoe E with the springs *e* and F and foot B, all arranged and operating substantially as described, for the purpose set forth.

77,798.—ISAAC J. BOGERT, Fayette, assignor to himself and S. C. CROSBY, Manchester, Iowa.—*Stump Extractor*.—May 12, 1868.—The two lifting chains occupy the grooves upon the periphery of the windlass drum, which is operated by a pawl lever, and held by a catch pawl. The frame stands upon pivoted feet.

Claim.—1. The combination of the head block or frame A, inclined legs B and C, cylinder F, and toothed wheel G, with each other, substantially as herein shown and described, and for the purpose set forth.

2. In combination with the above, the feet N pivoted to the lower ends of the supports B, substantially as described, for the purpose specified.

3. The combination of the lever I and hooked pawl J with the toothed wheel G, substantially as herein shown and described, and for the purpose set forth.

77,799.—CHARLES L. BROWNE, Washington, D. C.—*Flame Aerator*.—May 12, 1868.—The crescent-shaped plate is attached to rings which are slipped upon the burner. The plate is formed by bending up a curved strip of metal so as to form a sharp edge beneath, and leave a groove above, along which the air passes into the flame.

Claim.—The wedged-shaped bar *a a a*, grooved on its periphery or exterior edge, and so placed on the burner that the ends or mouths of the groove are below the lowest point of combustion, substantially as and for the purposes herein described.

77,800.—EDWARD M. CARPENTER, Middletown, N. Y.—*Suspension Bridge*.—May 12, 1868.—The wedges are inserted in the openings between the upper parts of the nearly rectangular truss sections, and the bolts pass through the wedge blocks, and through the lower ends of the uprights.

Claim.—1. The construction and arrangement of the frame of a bridge, of separate sections, B B and B', in combination with the wedges F F, substantially as herein shown and described.

2. The wedges F F combined with the screw-rods *e* and nuts *g*, substantially as and for the purpose herein shown and described.

77,801.—DE LANCE COLE, Marshall, Ill.—*Extension for Tables*.—May 12, 1868.—To a common folding leaf, rectangular, table are applied two leaves which are connected thereto by dowel pins and bars, and whose outer ends are supported by legs whose heads slide between cleats beneath the said leaves.

Claim.—The combination of the extension leaf or leaves F, provided with legs H, dowel pins G, and supporting bars I, with the hinged leaf or leaves D and slotted side bars of the frame A of an ordinary table, substantially as herein shown and described and for the purpose set forth.

77,802.—JAMES W. DAVIDSON, Mount Auburn, Ill.—*Wheat Drill*.—May 12, 1868.—The runners or openers are pivoted at the fore end, and connected to each other and to a transverse bar at the rear end; and the forward end of the seat is supported by

legs resting upon said bar so that the driver, by his position upon the seat, regulates the depth at which the seed is dropped. Each opener is followed by a wheel which presses the seed down to the proper depth. The wheels serve to sustain the machine, and are placed upon two rotating axles to assist in turning.

Claim.—1. The seat K, when its forward end is supported upon the adjustable cross-bar C, carrying the seed tubes by the bars M, all arranged as described, for the purpose specified.

2. The adjustable shoes B, when provided with short vertical tubes at their rear ends to receive the flexible tubes D, said shoes being held in place and connected to each other by means of the cross-bar C secured to the short tubes, all arranged as described for the purpose specified.

77,803.—HENRY G. DAYTON, Maysville, Ky., assignor to RICHARD H. COLLINS, Cincinnati, Ohio.—*Tobacco Pipe*.—May 12, 1868.—The metallic case is bottomless, and receives the clay bowl secured therein by the metallic end of the stem.

Claim.—1. As a new article of manufacture, a bowl, D, with a perforated side, so that it can be inserted into the main bowl of a pipe.

2. A tobacco pipe, consisting of a bowl, A, without a bottom, and with a socket, B, of a removable bowl, D, which is held in place by means of the tube C, substantially as herein shown and described, and for the purpose set forth.

77,804.—LYMAN DERBY, New York, N. Y.—*Thill Fastener*.—May 12, 1868.—The thill iron passes vertically through the pivot pin, and is retained by a spring catch taking beneath the outside of the pin.

Claim.—1. The combination of the slotted bolt C with the ear-pieces B, whether attached to the clip A or jack plate, for securing the clip upon the axle, as sometimes used for the purposes hereinbefore set forth.

2. In combination with the slotted bolt C, the tenoned or wedge-shaped thill iron E, having an oblong hole, F, in it, substantially as hereinbefore set forth, and for the purposes described.

3. In combination with the tenon-shaped thill iron E, having a slot or hole, F, in it, the spring-latch G, substantially as described and for the purposes set forth.

77,805.—GUSTAVE DE VILLEPOIX, Abbeville, (Somme,) and JOSEPH FRANCOIS BONNATERRE, Paris, France.—*Liquid Extract from Vegetables*.—May 12, 1868.—A distillate of 7 gallons is made of the following: water, 16½ galls.; salt, 4 lbs.; turnip, 36 lbs.; leeks, 16 lbs.; onions, 1½ lbs.; celery, 6 lbs.; parsley, 1 lb.; cloves, 200; and 8 small tubers of garlic. The distillate is added to salt, 24 lbs.; and refined sugar, 16 lbs.

Claim.—1. As a new article of manufacture, the herein-described liquid extract of vegetables, as and for the purpose described.

2. The herein-described process for preparing the said liquid extract of vegetables, as and for the purpose described.

3. The combination with the said liquid extracts of vegetables, of a solution of salt and sugar, substantially as and for the purpose described.

77,806.—JEAN MAURICE DUFOURNET and LOUIS CLEMENDOT, Paris, France.—*Preserving the Wood of Coffins*.—May 12, 1868.—The wood of which the coffin is composed is coated with impervious, anti-septic composition, and the coffin is coated inside with paper that is coated inside and outside with metal.

Claim.—1. Rendering the wood indestructible by coating it over with any antiseptic matter.

2. Covering the coated wood with metallic sheets or suitably prepared papers so as to obtain perfect air and water-tight surfaces, substantially as and for the purpose herein specified.

77,807.—JOHN ELBERTSON, Kirksville, Mo.—*Corn Planter*.—May 12, 1868.—The seed roller is turned by a rack or strap connection with the vertically moving staff whose lower end acts to puncture the ground.

Claim.—1. The combination of the rack *e*, gear *e'*,

plate *i*, and roller C having one flat edge, substantially as and for the purposes set forth.

2. In combination with the parts above referred to, the slide D and tube A, when all said parts are constructed and arranged so as to operate together in the manner and for the purpose set forth.

77,808.—WILLIAM H. FISH, Jr., Searsdale, N. Y.—*Corn Planter.*—May 12, 1868.—The fore wheel is upon two vertically-adjustable arms. The seed slide is operated by a lever actuated by pins upon the side of the ground wheel. The seed drops into a short spout, which is closed at bottom by a valve that is actuated simultaneously with the slide, and allows the immediate fall of the corn brought to the spout by the previous movement of the slide.

Claim.—1. The valve *e* in the spout I, when arranged in connection with the seed slide H, so as to be operated therefrom, substantially in the manner as and for the purpose specified.

2. The fitting of the small front wheel D in an adjustable frame, E, secured to the front part of the frame A, in the manner substantially as and for the purpose set forth.

3. The combination of the two frames A E, when used in connection with a seed-dropping mechanism, substantially as shown and described.

77,809.—THOMAS FLINN, Brooklyn, N. Y.—*Water Indicator and Alarm.*—May 12, 1868.—The float is attached to the lower end of a vertical rod sliding in a cylindrical case upon the boiler, and, through medium of another rod, acts upon a bell-crank lever connected with a whistle valve to cause the whistle to sound whether the water be much too high or too low. The height of the water is seen through a transparent part of the case by the position of a pointer upon the rod.

Claim.—1. The arrangement of the rods E and F, connected so that the upper suspended rod F will only be operated by the lower floating rod, when the water in the boiler is at too high or too low a level, substantially as herein shown and described.

2. The rod F, when operated as described, in combination with the levers G H and with the valve B, all made and operating so that the valve will be opened both when the rod F is raised and when it is lowered, as set forth.

3. The above, in combination with the pin *f*, or other indicator on the floating rod E, whereby the apparatus is provided with an index, as set forth.

77,810.—WILLIAM S. FORD, Clinton, Ill.—*Bridle Bit.*—May 12, 1868.—Each end of the mouth piece is attached to a downwardly flaring tubular piece through which the ends of the cheek straps pass, twisting around 90° to bring the end into position for attachment of the rein.

Claim.—The tubes B B, when formed as described, in combination with the bit mouth A and cheek straps C C, as and for the purpose set forth.

77,811.—A. J. GOING, Clinton, La.—*Corn Planter.*—May 12, 1868.—The planter has a jumping cutter or colter enabling its use in rooty ground.

Claim.—The arrangement of the colter D, furrow opener E, and standard F, with the beam B, as herein described for the purpose specified.

77,812.—LEWIS GRISCOM, Mahanoy Plane, Pa.—*Lathe.*—May 12, 1868.—The cross-feed screw has a pulley upon which is coiled a band whose other end is attached to a bar fixed to the shears, so that the transverse feed shall bear proportion to the longitudinal feed, and be actuated thereby.

Claim.—For operating the cross-feed screw of a lathe, the combination of the feed-screw with the pulley E, band *b*, bar J, or its equivalent, all substantially as described.

77,813.—E. L. HAGAR, Empire City, Col.—*Chart Roller.*—May 12, 1868.—The case receives a number of roller charts which are drawn up by cords in a similar manner to a window shade.

Claim.—The chart-roller constructed as described, consisting of the case C, having the hinged lid H, and adapted to receive the chart rollers B, said chart passing through the curved opening E, their operat-

ing cords F passing through separate openings in front of the charts, as herein shown and described.

77,814.—WILLIAM P. HAMLIN, Exira, Iowa.—*Liniment.*—May 12, 1868.—Intended as an outward application for wounds and bruises. Composed of alcohol, 1 gall.; gum camphor, $\frac{1}{4}$ lb.; sugar of lead, $\frac{1}{4}$ lb.; water of ammonia, 1 lb.; spirits of turpentine, 1 quart; and water, 1 pint.

Claim.—A liniment, formed of the ingredients, in the proportions, and in the manner substantially as herein described.

77,815.—JOSEPH S. HOSKINS, Spring Hill, Mo.—*Hemp Breaking Machine.*—May 12, 1868.—In a main frame are set rollers, in the peripheries whereof are a number of sharp pins, similar to those in a hackle, and through these teeth the hemp is fed to adjustable swords. These are disposed in three series parallel to the feed rollers: one series rigidly stretched across the frame; another mounted upon a lifting frame, and, having a vertical reciprocation therewith, bringing the swords borne in the lifting frame upon and off the third series, which is mounted upon springs attached to the main frame.

Claim.—1. The lifting-frame F F', carrying the swords C, the swords D upon the frame A, and the swords E upon the springs G, secured at *g* to the frame, and passing beneath the rollers B, all constructed and operating as described for the purpose specified.

2. The lifting-frame F F', swords C D, yielding swords E, and springs G, in combination with the whipper Q, feed rollers B, pawl R, and oscillating bar P, substantially as described, for the purpose specified.

3. The whipper Q, substantially as above set forth and described.

4. The oscillating bars P, carrying the whipper Q in their forked extremities, in the manner and operating substantially as above set forth and described.

5. The pawl R, in combination with the ratchet T and oscillating bar P, operating substantially as above set forth and described.

77,816.—AUGUST W. HERR, Chicago, Ill.—*Fire Proof Safe.*—May 12, 1868.—The inner and outer boxes have a grooved joint between the lid and body of the box, and the space between them is packed with a non-conductor in which are placed water tubes to supply steam in case of fire.

Claim.—The fire-proof box, consisting of case A and box B, each constructed and arranged, and both combined as described, the spaces between the same being provided with water evaporators, arranged in the manner herein described, or in any other suitable manner, and filled with fine salt or other bad conductor of heat, substantially answering the purpose herein specified, all combined and operating substantially as herein shown and described, and for the purposes set forth.

77,817.—S. R. HIGGINS, Parma, Mich.—*Hay Raker and Loader.*—May 12, 1868.—The rake teeth have radial movement by their own weight and cam plates, and collect the hay which is compressed between rollers, and raised to the wagon between an endless carrier and a guard frame.

Claim.—1. The two rollers B H, in combination with the endless carrier D, guard F, the adjustable frame C, and the main frame A, all constructed and arranged to operate in the manner substantially as and for the purpose set forth.

2. The revolving rake or picker G, in combination with the rollers B H, arranged substantially as and for the purpose specified.

3. Constructing the revolving rake or picker with moveable rake bars *t*, arranged so as to be operated by the curved plates *u* and their own gravity, substantially as shown and described.

77,818.—OTTO JACOBI, Philadelphia, Pa.—*Manufacture of White Lead.*—May 12, 1868.—The converter acts in conjunction with a vinegar-making apparatus and a furnace. The heat of the furnace causes vapors to arise from the vinegar mash and travel toward the vinegar apparatus, whence the acetic acid passes to the chambers containing the

lead and converts it into acetate. Carbonic acid is then conducted into the converter to change the acetate to carbonate. The lead is contained in small wooden boxes with perforated sides.

Claim.—1. An apparatus for producing carbonate of lead, consisting of the furnace A, boiler D, converter G, and of the perforated boxes I I, or their equivalents, all made and operating substantially as herein shown and described.

2. The device set forth in the foregoing clause, in combination with the vinegar apparatus F arranged within the converter, as described.

3. The pipes B and J, in combination with the converter G, all made and operating as described, the pipes being provided with dampers *e* and *d* respectively, as specified.

77,819.—CHARLES KREBS, West Springfield, Mass.—*Countersink.*—May 12, 1868.—A wing on the end of the tool is twisted into a spiral, conical shape so as to form a countersink.

Claim.—A countersink, having one or more bent lips, when constructed substantially as herein described and set forth.

77,820.—ENOS S. LANEY, Waterloo, N. Y., assignor to himself and ENOS LANEY, same place.—*Finger for Shuttle Stop Rod in Looms.*—May 12, 1868.—The finger is made in two parts; the upper part socketed in the lower, and connected thereto by a strong torsion spring, which yields to blows and renders it less liable to slip around on the oscillating rod to which it is attached.

Claim.—The improved finger herein described, when constructed substantially as and for the purpose specified.

77,821.—GILBERT LAVERE, Bridgeport, Conn.—*Lamp Burner.*—May 12, 1868.—A cylindrical wall divides the interior space of the burner into two chambers and prevents the direct radiation of the heat upon the lower part of the chimney; air circulates freely through the outer wall and lower plate of the outer chamber. Air for the supply of the flame is introduced at an opening in the floor of the inner chamber and in immediate proximity to the wick tube.

Claim.—1. The combination of the central chamber *b* with the annular chamber *e* and wick tube *d*, substantially as shown and described, and for the purposes set forth.

2. The removable burner, substantially as shown and described, in combination with a rest *q*, the said burner being so constructed as to be lifted off from the said rest *q* without unscrewing, all as set forth.

77,822.—THOMAS JOSEPH LEIGH, London, England.—*Furnace for Burning Fuel for Heating Metals and for other Purposes.*—May 12, 1868.—The fuel is fed automatically or by hand into a furnace containing molten matter such as slag. The fuel passes down a side of the furnace perforated by tuyere holes and is carried over the surface of the molten material beneath an arch descending nearly to the surface. The resulting calorific current may be carried through the tubes or flues of a steam-boiler or to a reverberatory or eupola furnace.

Claim.—The combination of fuel in a bed of molten matter, and the construction and working of furnaces adapted to this purpose, as herein described.

77,823.—WILLIAM H. LIPPINCOTT, Pittsburg, Penn.—*Vulcanite Billiard Ball.*—May 12, 1868.—The perfect vulcanization is insured by treating the layers successively.

Claim.—Forming billiard balls and other balls of a similar nature, or for similar purposes, of successive layers of rubber, each layer being vulcanized as it is added, substantially as herein described.

77,824.—JOHN A. LOBB, Independence, Mo.—*Crutch.*—May 12, 1868.—The end of the hollow staff rests on a spring which is coiled around the central stem.

Claim.—1. The hollow staff A, in combination with the hollow bar *a*, the plug *d*, and the spring *e*, substantially as and for the purpose set forth.

2. The hollow bar *a*, in combination with the plug *d*, the spring *e*, and the clamps *e' e''*.

77,825.—ARTHUR LYON, WARREN SHUMARD, and JASPER N. ROBBINS, Goshen, Ohio.—*Saw Set.*—May 12, 1868.—The anvil has a tapering top to accommodate it to teeth varying in size. The rest bar is pivoted to the side of the adjustable anvil and is regulated by a temper screw to secure the proper set to the teeth. The points of the row of teeth rest against soft metal stops which are adjusted by temper screws.

Claim.—1. The chisel-pointed punch D *d*, so guided as to strike the teeth at their bases only.

2. The tapering anvil G *g*, adjustable to fit teeth of different widths, as explained.

3. The combination of the anvil G, supporting bar I, punch D, and stops or gauges F F', substantially as and for the purposes set forth.

77,826.—P. MARCELIN and JOSEPH SAUNDERS, Green Point, N. Y.—*Pan for Concentrating Sulphuric Acid.*—May 12, 1868.—The upper pans discharge by pipes near the bottom of the next pan in the series. The effect is to move the whole contents of the pan below.

Claim.—Providing sulphuric acid pans with elongated, downward extending spouts B, for the purpose of carrying the acid from the upper part of one pan to near the bottom of the next pan below, substantially as herein shown and described.

77,827.—CHARLES E. MASON, Elgin, Ill.—*Pallet for Time Pieces.*—May 12, 1868.—The slots for the jewels are cut through the pallet block which admits the adjustment of the jewels, in or out to insure correct action on the scape wheel.

Claim.—The pallet block or stud, when slit or cut across from side to side, substantially as described, for the purposes specified.

77,828.—MICHAEL MCGARRY, Westfield, N. Y.—*Wash Board.*—May 12, 1868.—The carriage containing the corrugated rollers is guided by rods and ways; the rods have springs beneath and are allowed to rise when the carriage passes over clothes of considerable thickness.

Claim.—The arrangement of the spring guides B and ways *b*, connected by eyes *e*, and bends *h*, as described, when combined with wash board A and rubber C C, as herein set forth.

77,829.—WARNER MILLER, Herkimer, N. Y., assignor to NATIONAL WOOD FIBER COMPANY, New York, N. Y.—*Machine for Making Paper Pulp.*—May 12, 1868.—Improvement on the patent of H and F. Marx, October 23, 1866. The blocks are pressed against the grindstone by a spring or weighted lever. The sieves are made of metallic plates which are perforated by elongated meshes separating the pulp according to the diameter of the fibers and delivering the different qualities into different receptacles.

Claim.—1. The operating of the followers E E', or, in other words, the feeding of the wood to the grindstone, by means of springs or a lever and weight, arranged substantially as herein shown and described, and for the purpose specified.

2. The particular application of the springs I K, as shown, to admit of the followers being relieved of their pressure, whenever it is required to withdraw the followers for the insertion of the wood to be ground.

3. The placing of two or more screens, P P', one above the other, in a shoe, Q, placed in a suitable box, N, and having a shake motion communicated to it by means of a cam, R, or its equivalent when such device is used in connection with or applied to a machine for making paper pulp, substantially as set forth.

4. The curved spout or chute T attached to the upper screen P, when said spout or chute is used in connection with a shoe containing two or more screens, and all arranged in such a manner as to admit of the dividing or separating of the pulp into two or more kinds or qualities of stock, substantially as set forth.

77,830.—JAMES W. MILROY, Galveston, Ind.—*Revolving Spade Plow.*—May 12, 1868.—The frame is mounted on wheels and supports a vertically adjustable frame which contains the operative mechanism.

ism. This consists of a wheel, armed with spades or forks on its periphery to penetrate and lift the ground as it progresses; and another wheel above, whose forks work in the intervals between those below and comminute the soil that may be carried up on the lower one.

Claim.—1. In a revolving spade plow, the hinged frame D, operating substantially as and for the purposes set forth.

2. The employment of one or more revolving plows or forks, arranged to operate substantially as described.

3. The combination of the lower spade or forked wheels R R, with the upper wheels R' R' gearing therein, substantially in the manner and for the purpose set forth.

4. The combination of the frame A, roller H, pawl L, and cords *v v*, all arranged and operating substantially as and for the purpose specified.

77,831.—A. H. NATHANS and MATTHEW THORNTON, Macon, Ga.—*Car Axle Box.*—May 12, 1868.—Around the neck of the axle is a plate upon whose face is a curved piece of packing to prevent the out-flow of the grease in the axle box.

Claim.—The curved packing *c*, when arranged on the side of the plate C, in the manner and for the purposes specified.

77,832.—JOHN NOVEK, New York, N. Y.—*Flour Sifter.*—May 12, 1868.—The barrel of flour is supported on a trestle above the sifter, which is reciprocated by a system of levers deriving their motions from a shaft with projecting cogs, and from a coil spring.

Claim.—1. A flour sifter consisting of the rotating drum shaft B, levers D, E, and F, and spring G, in combination with the seive H, all made and operating substantially as herein shown and described, for the purpose specified.

2. In combination with the above, the support or supports I, so arranged as to hold a barrel in an inclined position above the seive, substantially as herein shown and described, for the purpose specified.

77,833.—GEORGE N. PALMER, Greene, N. Y.—*Stone Gathering Machine.*—May 12, 1868.—The stones are drawn upon the shoe by the rakes upon the endless belts and are carried backward by the slotted conveyor, and dropped into the receiving box.

Claim.—1. The broad shoe or scraper, formed with a series of grooves or channels, and having projecting points or fingers for gathering and conveying small stones, as herein described.

2. The shoe D, as constructed, in combination with a series of rakes, E, with spring teeth *e e*, when secured to endless belts F F, or chain gear, for loosening and picking up small stones from the surface of the ground, substantially as herein set forth.

3. Hinging the grooved shoe or scraper D to the frame A A, and controlling it by the springs *h h*, in such a manner that it will adjust itself to the surface of the ground when in operation, substantially as herein described.

77,834.—WILLIAM P. PARROTT, (GEORGE HUGHES, executor,) and JOHN J. BORDMAN, Boston, Mass.—*Removing Metallic Scale from Glass and "Moils."*—May 12, 1868.—The "moils" is the metallic oxide which the glass derives from the blow-pipe or pouty to which it has adhered in the process of glass blowing. It is cleaned by boiling the fragments of glass in an acidulous solution. The glass is placed in a tray in one boiler and an acidulous vapor generated in the other, which has a stirrer to agitate the contents.

Claim.—1. The employment of heat and a weak solution of sulphuric or muriatic and fluoric acids, in manner substantially as described, for removal of the metallic oxide or scale from the "moils," or from the sand or silica used for making glass.

2. For the purpose set forth, the combination of the vessel or tray C with the boiler B and the furnace A.

3. The combination, as well as the arrangement of the acid-generator E with the boiler B and the

furnace A, the said boiler and generator being connected as described,

4. The combination of the condenser D with the boiler furnace and the vessel C, or the same and the generator E.

77,835.—LUTHER M. PARSONS, Waukau, Wis.—*Cooking Stove.*—May 12, 1868.—The furnace of the elevated oven is supplied with air from a pipe in the rear, the air passing through a passage beneath the stove flue. A slide determines the course of the air, either beneath the grate or at the fore-bridge. A damper in the floor of the flue may divert the incoming air and direct it to cool the oven.

Claim.—1. The arrangement, as herein described, of the damper K with relation to the air passage G and oven C, whereby the supply of cold air to the furnace A is cut off and directed through the oven to reduce the heat in the latter and the supply of oxygen to the fire, as set forth.

2. The arrangement of the air-supply flue G beneath the fire flue *a* of the stove, communicating with the furnace A through the ash pit when the stove is used with coal, and through the aperture *f* above the ash pit when used with wood, and whereby the cold air is heated by contact with the plate J before reaching the fire, as herein shown and described for the purpose specified.

77,836.—N. A. PATTERSON, Winchester, Tenn.—*Vote Register.*—May 12, 1868.—The name of each member is set up or cast in type upon each sliding block of a frame at the clerk's desk, and each block is connected by two wires to the member's desk. The wires serve respectively to draw the blocks to the "aye" or "no" side of the frame, where it is retained by a catch. The faces of the types are then inked and the vote printed.

Claim.—1. The catching strips G, or their equivalent, substantially as shown and described, in combination with the name blocks B and plate A, or its equivalent, all as and for the purpose set forth.

2. The springs *b*, attached and operating substantially as shown and described, or the equivalent thereof, in combination with the name blocks or chases B, all as and for the purpose set forth.

3. The springs *s*, of any suitable material, employed and operating substantially as shown and described, in combination with the strips G and plate A, or the equivalent thereof, all as and for the purpose set forth.

4. The device, consisting of the tablet H, strip I, and cross-piece J, or other equivalent mechanism, constructed and operating substantially as shown and described, in combination with the strips G, all as and for the purpose set forth.

77,837.—CHARLES T. POOLER, Deansville, N. Y.—*Perpetual Calendar.*—May 12, 1868.—Of two broad belts running upon horizontal rollers one bears the number indicating the day of the month, and the other the name of the month and the number of days therein, arranged in manner of a calendar. The belt bearing the initials of the days of the week is narrow, and outside that indicating the month and days, and is so situated that the name of the month appears above it. The rollers are turned by handles upon the outside of the case.

Claim.—1. A perpetual calendar, consisting of the bands C and E, working respectively around horizontal and vertical rollers, substantially as herein shown and described.

2. The perpetual calendar, when provided with the bands C and E, of which the latter partly covers the former, in combination with the hinged portion G of the frame in which the device is held, as set forth.

3. The band H and rollers I, in combination with the device set forth in the foregoing clauses.

77,838.—LEWIS PRAY, Portland, Me.—*Seat for Vehicles.*—May 12, 1868.—The movable seat is supported by X-frames, one leg of each of which is pivoted to the bed. The seat may be laid flat upon the bed, either forward or back of its usual position.

Claim.—The combination of the jump seat A, upheld by crossed legs *a a*, and pivoted, as shown and described, in combination with the sliding seat D of a vehicle body, all substantially as and for the purpose set forth.

77,839.—EMANUEL RABER, Lake, Ohio.—*Horse Hay Fork.*—May 12, 1868.—After grasping the hay the fork is lifted by the rod, which suspends it from the hinging point of the claws, the hook on the upper part of the stem engaging a hook on the trigger on the lower part. When the trigger is pulled the hooks are disengaged, the hinging point of the claws drops, and the weight is thrown upon the ropes, which open the claws and drop the hay.

Claim.—In combination with the pivoted forks A A the trigger C, hook F, and lines or cords *g*, connecting said forks with the bar E, so that the forks may enter and hold and carry the load or charge of hay upon their tines, and drop it at the place of delivery, substantially as herein described and represented.

77,840.—JOHN S. RAMSBURGH, Newmarket, Md.—*Fertilizer.*—May 12, 1868.—Composed of calcined bone 100 pounds, and sulphate of lime 25 pounds. The above, while heated, is poured into a mixing box and mingled with sulphate of soda 65 pounds, sulphate of lime 125 pounds, and leached ashes or muck 150 pounds.

Claim.—The compound for a fertilizer, composed of the ingredients, mixed in the manner and proportions substantially as herein described.

77,841.—WILLIAM RECKARDS, New York, N. Y., assignor to himself and LEONARD GATTMAN, same place.—*Bedstead, Chair, Secretary, and Wardrobe.*—May 12, 1868.—The front of the lower portion has a flap to let down and form a seat. Above it is a secretary with a falling flap to form a desk. Above the secretary is a cupboard. The desk and cupboard form the front part of the upper portion, which is hinged in the lower portion, and when the front part is oscillated forward 90° the back is found to be provided with a mattress.

Claim.—1. The box A, provided with a pendent hinged door C, and a hinged portion Ax, as shown, in connection with the adjustable box F, fitted in A, on a rod G, all being arranged in such a manner that the box F may be adjusted in a vertical or a horizontal position, substantially as and for the purpose specified.

2. The flaps D D, fitted to the inner sides of the box A, when used in connection with the hinged portion Ax of the box, substantially as and for the purpose set forth.

3. Dividing the box F into two compartments by means of a longitudinal partition *b*, one compartment containing a mattress G, and the other furnished to answer as a secretary or wardrobe, or both, substantially as and for the purpose specified.

77,842.—IRA D. RICHARDS and HENRY D. SNYDER, Carbondale, Pa.—*Fence Post.*—May 12, 1868.—The cast-iron lower portion has a step and upright flange, to which the wooden post is secured. A dovetail tenon on the face of the post enters a corresponding vertical mortise in the flange of the support.

Claim.—The fence post, with cast-iron bottom and wood top, as herein described and for the purposes set forth.

77,843.—GEORGE M. ROBINSON, New Wilmington, Pa.—*Horse Hay Fork.*—May 12, 1868.—The points are brought together like a spear head while entering the hay, and are then projected by depressing the sliding stem to which they are jointed. Being locked in this position the load is lifted, and is dumped when required by drawing the trigger cord, which releases the central stem and allows the weight of the hay to depress the prongs.

Claim.—The combination of the bars A and B, cutters D D, slotted center bar *a*, trip lever *f*, having the notch *n* and cam surface *m*, all constructed and operating together, substantially as shown and described, and for the purpose set forth.

77,844.—WILLIAM J. ROSS, Worcester, Mass.—*Lamp Burner.*—May 12, 1868.—The floor of the deflector has projections above, which secure the chimney by engaging its foot flange. Catches beneath the floor of the deflector are engaged by the bow spring, whose sides are drawn together by pressure

upon the thumb and finger piece when the chimney and deflector are to be removed.

Claim.—1. The spring G, secured within the burner, in combination with the pendent hooks *h* on the cone or deflector, for the purpose of securing the latter on the burner, as shown and described.

2. The upright projections *hx* on the lower part of the cone or deflector in combination with the hooks *h* and spring G, all arranged substantially as and for the purpose set forth.

77,845.—HERMAN SEIDEL, Roxbury, Mass.—*Piano-Forte Action.*—May 12, 1868; antedated May 2, 1868.—The weight piece of the damper instead of being arranged as a lever is a loaded piece of wood, arranged vertically in front of and close to the rest block, and having a wire foot to rest upon the rear part of the key. The foot and the supplementary guide pin slide in a guide shelf projecting from the rest block. An upper stem supports the damper.

Claim.—The arrangement of the weight piece G, provided with a guide pin *b*, or its equivalent, with respect to the damper E, the key A, the frame I, and the rest block F, the whole being substantially as hereinbefore explained.

77,846.—JOHN F. SHEPARD, Hampton Falls, N. H.—*Apparatus for Making Cigars.*—May 12, 1868.—Wrap the tube with paper or tobacco leaf, turning down the end over the mouth of the tube. Fill the hopper with fine-cut tobacco and force it into the tube by successive motions. Draw off the wrapper with its filling, the latter being ejected by the plunger; twist the end, and the cigar is finished.

Claim.—The combination and arrangement of the several parts of the device, viz., the hopper A, the cylindrical tube B, the plunger C, the ferrule D, the spring catch E, the groove in the plunger F, and the opening G in the bottom of the hopper, substantially in the manner and for the purpose above set forth.

77,847.—THEODORE F. SNOVER, Oconto, Wis.—*Machine Belt.*—May 12, 1868.—A fabric of wire warp and thread weft is interposed between two layers of leather, which are cemented to it.

Claim.—The machine belt, constructed as described, by interposing between two layers of leather, or other flexible material, a series of longitudinal wires, connected by transverse textile threads, all secured together as described for the purpose specified.

77,848.—CHARLES SPRINGER, New Castle, Pa.—*Watch.*—May 12, 1868.—An adjustable, grooved collar containing packing is placed around the winding arbor or the center square which moves the hands. The watch case shuts down upon the packing and closes the opening against dust.

Claim.—The adjustable collar D, containing the packing in the annular recess *a*, in combination with the back plate B, cap C, and post A of an ordinary watch, as herein described, for the purpose specified.

77,849.—ROBERT J. STEELE, Jr., Rockingham, N. C.—*Spring Seat for Saddles.*—May 12, 1868.—The curved metallic seat is connected to the saddle tree by bowed springs.

Claim.—1. The bent springs D, forming the support for the curved seat E, each spring being secured at its ends to the horizontal cross-bars C C at the front and rear end of the frame A, as herein described for the purpose specified.

2. Forming the support for the curved seat E of single springs, whose front and rear curved ends are secured to horizontal cross bars at the front and rear of the frame A, as herein described for the purpose specified.

77,850.—ZAPHNA STONE, Kinsmans, Ohio.—*Aerial Navigator.*—May 12, 1868.—The space between the ceiling and roof and that at the ends of the car, not occupied by the well for the passengers, are filled with hydrogen gas to give buoyancy to the machine.

Claim.—A balloon or aerial navigator, constructed with an upper part A, having a flat or plane surface and an upper convex surface, and adapted to be filled with gas, in connection with a pendent car C, having

compartments D D, which are also adapted to be inflated with gas, and a central compartment E for the passengers, substantially as herein shown and described.

77,851.—HIRAM TAYLOR, Cincinnati, Ohio.—*Lubricator.*—May 12, 1868.—The loose rod which regulates the flow of oil from the lubricator rests upon an inward projection or contraction in the lower end of the stem, and is preserved thereby from contact with the journal. The rod has an end grooved to admit increased flow when that end is presented.

Claim.—1. Supporting the rod D by the lower end *c'* of the hollow stem out of contact with the journal, substantially as set forth.

2. The notched or grooved rod D *d*, adapted, by reversing end for end, to change or graduate the freedom of delivery of oil, as herein explained.

77,852.—GREY UTLEY, Charlotte, N. C.—*Hay and Cotton Press.*—May 12, 1868.—Each lever has fulcrum bearing beneath a block which slides upon the side guide rods, and the lever is adjustably connected by a link to the cross-beam of the platen. The platen beam is held down by retainer blocks which gravitate upon the side guide rods and are held down by cams which have frictional bearing against the rods. The elevation of the fulcrum blocks is prevented by the same device.

Claim.—1. Operating the platen D, of a cotton or hay press, by means of the blocks G H, having the dogs *i i*, the rods E E, the link L, and the levers J J, all acting in co-operation with each other, in the manner and for the purposes specified.

2. The dogs *i i*, each having the arm *a*, and operating in combination with the blocks G H, rod E, and eccentric collar *m*, in the manner and for the purpose set forth.

77,853.—JONATHAN WALTON, Brooklyn, N. Y.—*Bail Ear for Pails.*—May 12, 1868; antedated April 30, 1868.—The prongs of the wire bail ear enter the wood and it is further secured by a wire staple around the neck.

Claim.—The bent wire bail ears B, constructed as described, the two prongs *b b* passing through the side of the pail A, and clinched upon the inner side, and held in position by means of the staple C, encompassing said ears below the upward-projecting loop *a*, their inner ends also passing through the side of the pail A, and clinched upon the inner side thereof, as herein shown and described.

77,854.—LAWSON S. WARNER, Chicago, Ill.—*Concrete Block Press.*—May 12, 1868.—The follower is raised to give pressure by a compound system of toggle levers, and the block is raised from the mold by a simple lever when the sliding cover has been removed.

Claim.—The spring S, in combination with the toggle bars H, G, E, and F, and follow bottoms D, substantially as shown and described, for the purpose of lowering the follow bottoms to their first position, all arranged as set forth.

77,855.—THOMAS P. WARREN, Norfolk, Va.—*Plow.*—May 12, 1868.—Improvement on the patent of Warren and Woodhouse, June 10, 1867. The moldboard is attached to the post and landside by bolts which pass through slots in the said moldboard so as to render the same adjustable. An angle iron sole is adjustably bolted to the landside.

Claim.—1. The slots *a a* and *a'*, when arranged in a vertical or inclined position in the moldboard, and all extending in the same or parallel lines, in the manner and for the purpose set forth.

2. The reversible heel iron and guide G, when constructed so as to be employed in the manner and for the purposes specified.

77,856.—GODFREY WIDMER, New York, N. Y.—*Adjustable Couch.*—May 12, 1868.—The laterally and longitudinally adjustable canvas covered couch has an eccentrically-hung head rest, so arranged that it can be turned upon its horizontal axis to adjust its height.

Claim.—1. A couch, consisting of a canvas or

other sheet F, which is fitted over an adjustable frame B C H, so that it can be stretched in either direction, as set forth.

2. The eccentric rings E E, when arranged as described, so that they serve to elevate the sheet F, to form the head rest of the couch, when said rings are adjustable around a common axis, as set forth.

3. The strap I, arranged on the under side of the sheet F, in front of the head rest, substantially as and for the purpose herein shown and described.

77,857.—WILLIAM YOUNG, Easton, Pa.—*Device for Clearing Pipes.*—May 12, 1868.—The nozzle of the flexible steam pipe consists of a hollow reamer which enlarges to the necessary size any contracted part of a cock or coupling in the frozen water pipe.

Claim.—The arrangement of the tubular reamer E with the steam pipe D, substantially as set forth.

77,858.—C. F. ALLEN, Paw Paw, Mich.—*Car Truck.*—May 12, 1868; antedated May 9, 1868.—Improvement on his patent, April 24, 1866, and June 18, 1867. The six-wheel truck has a rigid frame maintaining the wheels in the same line at all times, but allowing them to run over curves in the track by having the flange removed from the middle wheel of each trio. The truck is so supported that the weight shall be equally distributed upon the three axles, and is consequently balanced over the center of the middle axle, but giving it support when needed outside the same.

Claim.—1. So supporting the end of a car upon a six-wheeled truck that the weight shall be equally distributed upon all the wheels, by resting it upon a support over, but not upon, the middle axle, said support being sustained by springs placed on each side of and equidistant from the middle axle, and the whole weight being transferred to the axles through a rigid frame, substantially in the manner set forth.

2. In combination with the beam F, the braces G, and swinging beams H, placed on each side of the middle axle, and supporting upon their outer ends the side-bearing blocks N, so as to balance the weight of the end of the car over the middle axle, substantially in the manner set forth.

77,859.—GEORGE M. ALLERTON, New York, N. Y.—*Forming Tight Seams in Rubber Cloth.*—May 12, 1868.—The seam is riveted and India-rubber stoppers are placed over the rivets and the edges of the lap to render the seam strong and also tight.

Claim.—The stoppers to the rivets, and the lapping strips applied to and combined with the joint or seam of India-rubber cloth, as and for the purposes set forth.

77,860.—JACOB ALTHOUSE, Cross-roads, Pa., assignor to himself and JOSEPH V. WINEMILLER.—*Fertilizer.*—May 12, 1868.—Composed of air-slacked lime, 700 lbs.; broken bones, 180 lbs.; and wood ashes, 100 lbs. The above is put into a box and covered with 3 inches of ground plaster, and urine 320 lbs. gradually added. After the bones are dissolved, wheat bran, 400 lbs., is spread upon the barn floor, and the aforesaid composted therewith, with the addition of pulverized chicken dung 300 lbs.

Claim.—1. The above-described composition or fertilizer, compounded in about the proportions specified, for the purpose of manuring land.

2. The process described of mixing and preparing said composition or fertilizer, substantially as described.

77,861.—D. C. BAKER, Buffalo, N. Y.—*Washing Machine.*—May 12, 1868.—The clothes are held by the aprons in contact with the slatted, rotating cylinder, and carried beneath the liquor in the suds-box. The aprons are kept taut by an idler roller journaled in spring arms.

Claim.—The combination and arrangement of the slatted cylinder B, one or more rollers D, the series of aprons *k k k*, and spring roller E, when employed in the manner and for the purpose herein specified.

77,862.—E. H. BARNEY and JOHN BERRY, Springfield, Mass.—*Skate.*—May 12, 1868.—The toe

clamps are operated independently to give means of transverse adjustment. The socket which secures the heel to the skate is adjustable to compensate for wear in the heel. A projection upon the toe of the runner gives a center on which to turn when the heel is raised.

Claim.—1. The heel-socket F, consisting of the portion *p*, having the button-socket therein, and the threaded neck *r*, and operated by means of the screw G, thus securing the skate to the inner sole of the boot, all constructed and operating substantially as described, and for the purposes specified.

2. A skate, having the point or projection *t* formed upon the toe of the runner, substantially as described, and for the purposes specified.

3. A skate, having a concave bottom, with the chamfered or beveled sides *n n*, substantially as described and herein set forth.

4. The heel-fastening to a skate, having the neck *x'*, the button *h²*, the hole *m²* in the heel plate C, and the hole *m* in the button-socket, all of the same shape; the button *h²* and stem having upon its lower end the larger portion *s³*, substantially as described.

77,863.—AUGUST BERTRAM, New Albany, Ind.—*Finishing Leather.*—May 12, 1868.—Walrus fat is heated to a somewhat fluid state, and rubbed upon the leather, which is afterward dried over a slow fire.

Claim.—Rendering leather water-proof, when the same is accomplished by the process substantially as described.

77,864.—NELSON P. BOWSER, Ligonier, Ind.—*Power Indicator.*—May 12, 1868.—An index and pointer is combined with the common ball governor to indicate the power by the position of the same.

Claim.—1. The peculiar arrangement and combination of the dial S, pointer P, shaft M, coiled spring N, pulley K, cord I, pulley J, arm G, and sliding collar F, of the ball governor D, E, B, E, D; the several parts being arranged in the manner and for the purpose specified.

2. The combination of the power indicator with a grain separator, substantially as and for the purpose herein specified.

77,865.—GEORGE E. BRETHERILL, Rochester, N. Y.—*Waste Valve for Pumps.*—May 12, 1868.—The pump tube has a cast section which has a side passage for the water, and in line with the main tube is a stem carrying two valves; the lower one forms a check valve upon the top of the lower section of tube, when the pump is at rest, and is raised by the ascending current of water when the pump is operated. The raising of the lower valve closes the other against the port through which the water from the upper part of the pump escapes when it is at rest.

Claim.—The arrangement, in pump-pipes, of the automatic escape valve, substantially in the manner herein shown and described, and for the purposes set forth.

77,866.—HENRY D. BROWN, Tipton, Iowa.—*Sheep-Shearing Chair.*—May 12, 1868; antedated April 25, 1868.—The butt of the sheep rests in the hollow of the platform, and the hind legs are secured by straps. The sheep is leaned against one rack or other, to shear the respective sides; a strap on each being arranged to fasten the head. The racks are adjustable in inclination.

Claim.—1. Oscillating racks for sheep-shearing chairs, adjusted and fastened by braces, with a bolster attached to throw out the side of the sheep, and prevent the skin from wrinkling.

2. The manner of fastening the hind legs of the sheep by means of straps and pins, as shown in the drawings.

77,867.—ISAAC BUCKINGHAM, Seymour, Conn., assignor to himself and H. W. RANDALL, same place.—*Automatic Car Ventilator.*—May 12, 1868.—The circulation of air is caused by a fan whose revolution is induced by the movement of the car, by means of a windmill within a case upon the car top.

Claim.—The arrangement of the driving blades D within the case F, the said case provided with openings G and H, so that the said driving blades will re-

volve in the same direction, into whichever of the said openings the air enters, and having combined therewith, and so as to be operated thereby, the spiral blades C, upon a vertical shaft within a cylinder, B, substantially in the manner and for the purpose described.

77,868.—JOHN H. BULLOCK, Gold Hill, Nevada.—*Shoe for Amalgamators.*—May 12, 1868.—The quicksilver is thrown by its superior gravity, to the periphery of the pan, and is caught upon the points of the shoes and carried back to the center through grooves made at necessary angles in the faces of the shoes.

Claim.—The combination and arrangement, on the face of a shoe or grinder for amalgamators, of the grooves H H, with the supplementary grooves I I, by which the quicksilver is taken from different points at the outer edge of said shoe, and delivered at different points at the rear of the same, to be in the way of the following shoe, substantially as described.

77,869.—WESLEY B. CAMPBELL, Abingdon, Iowa.—*Rotary Steam Engine.*—May 12, 1868.—The periphery of the piston is formed into a number of sections of volutes, and it is driven by the pressure of steam upon the radial surfaces between them. A radially sliding spring valve works in the case.

Claim.—The arrangement of the following parts: The induction pipe A, the case B, wheel C, packing D, valve E, spring F, and eduction pipe G, substantially as set forth.

77,870.—M. G. COLLINS, Baltimore, Md.—*Device for Boiling and Stirring Fruit.*—May 12, 1868; antedated May 8, 1868.—The lower stirrer bar just fits the bottom and is revolved with a vertical shaft and higher stirrer by a hand crank and cog gearing.

Claim.—In a fruit-butter stirrer, the detachable frame C, with lids M, constructed and arranged as described, provided with the flanges E F, and supporting the posts G, having the shafts H upon one side of the vertical stirrer K, as herein shown and described.

77,871.—ARCHIBALD C. CRARY, Utica, N. Y.—*Heating Railroad Cars.*—May 12, 1868.—The caloric current from the locomotive boiler passes through the flues of a second boiler, the steam from which is used to heat the cars.

Claim.—1. The separate steam generator M on the locomotive, heated by the waste heat of the smoke or of the exhaust steam, for the purpose of heating the train of cars, and constructed substantially as herein described.

2. In combination with a separate steam generator, M, constructed as above specified, the use of pipes O, H, and I, in the manner as herein set forth and described.

3. In combination with a separate steam generator, M, and pipes O, H, and I, as above specified, the use of universal or compound joints, in the manner substantially as herein set forth and described.

77,872.—EDWARD DEETZ, Philadelphia, Pa.—*Adjustable Sofa.*—May 12, 1868.—The back of the sofa may be made horizontal or be fixed at any desired inclination.

Claim.—1. The rounded and notched rear portion of the end frame A of the sofa, in combination with the end frames of the back, hinged to the body, and provided with spring bolts adapted to the notches on the said rounded portions of the frames A, all as set forth for the purpose specified.

2. The above, in combination with the within described cords and pulleys, by which the spring bolts at the opposite ends of the sofa may be operated simultaneously, as described.

77,873.—WILLIAM C. DOUTHETT, Rochelle, Ill.—*Churn.*—May 12, 1868.—A side extension of the dasher rod passes through a spherical ball, jointed to an arm which is revolved by a hand crank. The dasher has a circular and vertical reciprocating motion, and carries vertical and horizontal perforated dashers.

Claim.—1. The provision, in a churn-operating

mechanism, of a weighted arm, F, applied substantially as and for the purpose described.

2. The combination, with the arm F, of the ball f^1 and jaws $f^2 f^2$, substantially as set forth.

3. The combination of the bent or twisted blades or wings J J with the disk or dasher B, substantially as and for the purpose set forth.

4. In a churn, the herein described mechanism, by means of which a complete rotary movement of the churn dasher is produced, while it shall, at the same time, be caused to rise and fall, as herein set forth and described.

77,874.—LEVI S. ENOS, Almond, assignor to NATHANIEL SWEET, Allegany County, N. Y.—*Alloy for Metallic Roofing.*—May 12, 1868.—The alloy consists of lead, $\frac{3}{4}$ lb; tin, $\frac{1}{4}$ lb; and antimony, 2 drams. It is rolled into sheets.

Claim.—The above-described compound, when made substantially in the manner and for the purpose specified.

77,875.—FREDERICK FILLINGHAM, Ithaca, N. Y.—*Rigging for Jib Sails.*—May 12, 1868.—The stay-sail, or jib, is adjusted in position by the lateral oscillation of the boom, to which its forward corner is connected.

Claim.—The construction, arrangement, and use of the jib sprit or boom, for the purpose of moving and adjusting the jib-sail to any point on the starboard or port side of the bowsprit and vessel, as and for the purposes described.

77,876.—JAMES C. FINN, Philadelphia, Pa., assignor to himself, WILLIAM HOWELL, and CHARLES A. DUY, same place.—*Decorating Walls.*—The veneering is placed upon the wall in pieces of like size, and formed into panels by molding strips which cover the joints.

Claim.—The decorating of walls with a material composed of veneers or ornamental papers, mounted on muslin, stiff paper, or other fabric, when the said material is tacked at the edges only to the walls, and when the joints between the pieces are covered by moldings or beadings forming part of the decoration, all substantially as and for the purpose herein set forth.

77,877.—D. L. GIBBS, Worcester, Mass., assignor to R. BALL & Co., same place.—*Mortising Machine.*—May 12, 1868.—The side arm of the bell-crank lever is actuated by stops to cause the semi-rotation of the pawl collar; and the pawl acts upon two ratchet notches of the tool spindle to cause its rotation in intermitting movements of 180° , so as to reverse the cutting edge of the chisel at each effective movement.

Claim.—1. The combination, with the chisel spindle, the pinion or segment gear thereon, and the pawl a and ratchet f , of the bell-crank lever and its toothed segment, actuated by stops $m n$, in the manner described, and the cam I and spring N, for completing the movement of the spindle, substantially as and for the purposes shown and described.

2. The combination, with the bell-crank lever and its toothed segment, arranged to operate the chisel spindle, as specified, of the friction spring H, ledge o , and stops $p p$, substantially in the manner and for the purposes shown and described.

77,878.—JAMES F. GORDON, Kalamazoo, Mich.—*Grain Binder.*—May 12, 1868.—The rake slides along a guide bar at the rear of the platform and makes its effective sweep toward the wheel frame where the gavel is seized and bound into a sheaf.

Claim.—1. The binding arm H, capable of adjustment in the direction of the length of the grain, in combination with an automatic twisting device, substantially as and for the purposes described.

2. The shafts G G², in combination with the binding arm H, substantially as and for the purposes set forth.

3. The arrangement of the cam wheel J, forked lever I, pitman f , and lever n , for giving a vertical vibrating motion to the arm H, substantially as described.

4. The hooked twisting wheel A³, constructed and operated as described and represented, having an

intermittent rotating motion, in combination with the stationary knife P³, as and for the purpose explained.

5. The clamp plates or jaws 2 and 3, arranged and operating in combination with the arm H, substantially as and for the purpose set forth.

6. The slide plate L⁴, arranged and operating in combination with the arm H, substantially as and for the purpose set forth.

7. The combination of the shaft 9, spring g^2 , chain h , and sector X, for giving an intermittent motion to the twisting device A³, substantially as described.

8. The combination of the reciprocating rake T, hinged weighted lever S, stop pin t^3 , and guide U, all arranged and operating substantially as described.

9. The employment of the jointed arms $t t^2$, stop pin t^3 , and hook t^4 , or equivalent devices, in connection with the connecting rods S S², $e e^2$, whereby the rake is held at rest for a specific period, every time it completes its motion toward the binder, substantially as and for the purpose explained.

10. The tension device, consisting of the arms H⁴ $h^5 h^6$ and spring h^4 , applied and operating substantially as and for the purpose explained.

11. The combination of crank lever e , rod e^2 , arm t , or its equivalent, slotted lever S, and pitman S², for the purpose of imparting a reciprocating motion to the rake, substantially as described.

77,879.—JESSE HAVENS, Auburn, N. Y., assignor to himself and GEORGE PALMER, same place.—*Stump Extractor.*—May 12, 1868.—The windlass barrel has differential portions around which the ends of the rope are coiled, the tackle block being hung upon the end of the rope.

Claim.—The differential cylindrical shaft D, tackle block G, and the rope C, in combination with the frame, substantially in the manner and for the purposes herein shown and described.

77,880.—WALTER B. HIGGINS, San Francisco, Cal.—*Carriage Spring.*—May 12, 1868.—The springs are formed of tough wooden strips, bent into elliptical form, and India-rubber cylinders are interposed between the carriage bed and the springs.

Claim.—The combination of the springs D D with the wooden spring A, to form the connection of the same with the body of the carriage, substantially as described.

77,881.—ROBERT V. HILTON, JOHN G. WEBSTER, and HIRAM E. WHEELER, Lowell, Mass.—*Chisel Handle.*—May 12, 1868.—The central plug is formed on the top of the handle to pass through washers of rubber or leather which are covered by another of rawhide.

Claim.—The handle C, plug A, elastic rings B B, and cap E, constructed and arranged in the manner and for the purpose as described.

77,882.—ROYAL E. HOUSE, Binghamton, N. Y.—*Electro Phonetic Telegraph.*—May 12, 1868.—The sound made upon the sounding plate by the motion of the armature is concentrated by deflection to a single point. A barrel-shaped case is placed upon the sounding plate and the sound deflected by the inside thereof to a point outside it. The proper form for the deflector may be discovered by the use of a light at the point of sound, and a number of small mirrors so disposed as to reflect the light to the desired point.

Claim.—1. The use of the reflector, shaped and proportioned in accordance with the principles described, and for the purposes set forth.

2. The respective arrangement and combination of the reflector and sounding head, as described.

3. The combination of the reflector with sounding head and limiters, as described, and for purposes set forth.

4. Hinging the sounder and adjusting its angle, as described, for the purpose of regulating the distance through which the permanent magnetic force shall move.

5. The use of a set of deflecting magnetized needles, constructed as described, and relatively arranged as described, for purposes set forth.

6. Constructing the axial aperture of a deflecting needle helix as described, for the purposes set forth.

7. The combination of a deflective needle helix, constructed with an axial aperture, as described, with a set of deflective needles, constructed and relatively arranged as described, for the purposes set forth.

77,883.—GEORGE W. HUNT, Hopkinton, Mass.—*Sleeping Car.*—May 12, 1868.—Improvement on his patent, Dec. 10, 1867. Each of the bed bottoms is hung by points at its opposite ends and near its rear side upon two long swinging links, the opposite ends of which are hung at or near the sides of the car. The length and disposition of the links are such that when thrown down the berth occupies its proper position; and when raised, the berth is inverted against the car top where its front side is sustained by bolts.

Claim.—1. The berth leaf or shelf *d*, when hung by links *f*, in such manner that it may be swung up and locked against the roof, or swung down and locked in position to form the berth, substantially as shown and described.

2. In combination with such swinging shelf *d*, the folding partition piece *h*, hinged crosswise at the top of the car, and folding up and locking against the bottom of the shelf *d*, or swinging down to form a partition or a support for the front of the shelf *d*, substantially as described.

77,884.—GEORGE B. ISHAM, Burlington, Vt.—*Culinary Apparatus.*—May 12, 1868.—The vessel is placed upon a stove hole, and has removable bottoms of iron and soapstone to regulate the heat. Perforated disks at various heights give means for roasting, broiling, &c. A soapstone disk is applied to baking griddle cakes, and a hollow bottom gives means for steaming.

Claim.—1. The combination of the several parts of a culinary apparatus, or steamer, baker, broiler, and fryer combined, all as herein described, and for the purpose set forth.

2. The particular construction of the outside, *A*, with its detachable bottoms *F* and *D*, all as herein described, and for the purpose set forth.

77,885.—JOSEPH H. JAMES, Warren, R. I., assignor to himself and SETH BAXTER, same place.—*Buckle.*—May 12, 1868.—The end of the strap is lapped around a bar of the tongue and then passed beneath a bar of the frame. It is clamped by drawing the bar of the tongue against the bar of the frame when tension is applied to the strap.

Claim.—A buckle composed of two frames, one sliding upon the other, and arranged with a thumb-rest, or its equivalent, substantially as described.

77,886.—WILLIAM J. KEEP, Buffalo, N. Y.—*Shield for Smoothing-Irons.*—May 12, 1868.—The slotted shield has a shank by which it is connected to the holder, and it slips over the smoothing-iron so as to ward the heat from the fingers.

Claim.—A shield-plate, *A*, for smoothing-irons, provided with the oblong opening or openings *a* for admitting the handle of the iron, and with a shank, *B*, for connecting a holder with the shield, constructed and operating substantially as herein specified.

77,887.—MINOR KILBOURNE KELLOGG, Baltimore, Md.—*Postage and Revenue Stamp.*—May 12, 1868.—The design of the stamp is printed in oil and water pigments having different colors. The first may be printers' ink, and the last consist of honey 3, and isinglass 7 parts, mixed with water and the desired pigment. The object is to render a canceling mark irremovable without defacing the design.

Claim.—So printing a revenue or postage stamp, or check requiring cancellation, with a non-fugitive color, and also with a fugitive ink or color, composed of the ingredients herein described, that the fugitive color shall lie in the blank places left after printing with the non-fugitive color substantially as described.

77,888.—JOHN E. KENNEDY, New Orleans, La.—*Screw Propeller.*—May 12, 1868.—The described shape is designed to prevent slip and to drive the water as nearly as possible in an unbroken column

without splashing. The rear and front surfaces of the blades have two reversed curves of different proportions. The outer represent arcs of circles of *greatly* less diameter than the inner. The water passes with a certain rapidity away from the first curve which has started it in motion, and impinges effectively upon the outer curve.

Claim.—Constructing the blades or wings of a screw propeller with two reversed curves, when the outer curves shall be drawn upon a radius equal to one-fourth only of the radius of an arc of the circumference of the screw, and the inner curves upon a radius three times the length of the radius of the said outer curves, substantially as herein described, for the purpose set forth.

77,889.—OSCAR C. KERR, Philadelphia, Pa.—*Sewing Machine.*—May 12, 1868; antedated May 4, 1868. The needle bar has vertical reciprocation. The loop carrier has reciprocation toward and from the path of the needle, and also a slight vertical movement. In making the stitch mentioned in the first clause of the claim, the upper thread being passed through the eye of the needle as the needle rises, the loop holder will pass through the thread at the back of the needle, which continues its ascent until the loop holder turns to a horizontal position, thus distending the loop while the needle rises above the fabric. The cloth and loop carrier have simultaneous movement; the projections of the latter pass into the loop and between the prongs of the loop holder, which recedes from the needle, disengaging itself from the loop which, as the needle continues its descent, is drawn up around the projections of the carrier. As the needle again commences to ascend, the loop holder is turned to a vertical position and moved forward so as to penetrate the new loop of the thread at the rear of the needle. As the needle passes upward and from contact with the fabric the loop left upon the holder is distended by the latter, which turns to a horizontal position, after which the fabric is moved onward and the loop upon the carrier is carried toward the other loop. The needle now descends between the projections of the carrier and through the loop upon them and in front of the other loop, after which the carrier moves backward and upward, so that the projections are withdrawn from the loop. The carrier then moves forward and downward, the projections passing into the other loop, while the holder recedes from the loop which is drawn around the projections.

Claim.—1. A loop carrier, *U*, constructed substantially as described, and operating in conjunction with an eye-pointed needle and a loop holder, *W*, to produce, from the needle-thread, the stitch, Fig. 15, in the manner set forth.

2. A needle, *n*, and loop holder, *W*, in combination with an adjustable loop holder, *U*, the whole being constructed and operating substantially as and for the purpose specified.

77,890.—IRA KINMAN, Freeport, assignor to SARAH KINMAN, Stephenson County, Ill.—*Curtain Fixture.*—May 12, 1868.—The roller is rotated by a crank which may be turned in the journal rod so as to engage a catch in the frame and set the roller to the desired elevation.

Claim.—The reversible crank-handle *h* and angular catch *g*, in combination with the roller *B*, and arranged to operate as set forth.

77,891.—JOHN D. KIRKPATRICK, Urbana, Ohio.—*Preventing Hogs from Rooting.*—May 12, 1868.—One jaw rests upon the snout and has a spout-shaped cutter which penetrates the gristle as the other is pressed against the end of the snout. The barbed plug is then inserted, and the barb prevents retroaction.

Claim.—The within-described instrument, consisting of the handles *A A' B B'*, and the plates or parts *D E*, having the openings *d f*, and the cutter *g*, provided with inclined side-pieces *h h*, substantially as and for the purpose set forth.

77,892.—E. I. KLINE, Kirkville, Iowo.—*Bee-Hive.*—May 12, 1868.—The hive is made in three cylindrical sections of glazed earthenware. The lower section has a concavo-convex diaphragm, the upper side of which the bees enter through a hor-

horizontal spout. The moth chamber is beneath the diaphragm and entered by holes through the outer shell; the moth chamber may be opened by removing a shutter. An upper chamber communicates with the main chamber through holes near the edges of two horizontal glass disks, the upper one of which is turned to open or cut off communication.

Claim.—A bee-hive, combining in its construction the following elements, viz: First, a base, A, constructed with a diaphragm, A', spout B, and openings C; second, a section, D, with slats at E; third, the double glass plates F; fourth, the section G; fifth, the glass plate H; and, sixth, a cap, I; said base sections, and cap being composed of glazed earthenware, and the parts being arranged substantially as described.

77,893.—JOSEPH KOEHLER, New York, N. Y.—*Fishing Apparatus.*—May 12, 1868.—The line is laid over a springjerk and lever trigger, so arranged that the spring is disengaged by a nibble at the hook, and the line is jerked to secure the fish.

Claim.—1. The trigger-lever *d*, applied substantially as specified, in combination with the spring jerk, the parts receiving the fishing line as set forth.

2. The swing arm *h*, in combination with the trigger lever and holding eye *ll*, or its equivalent, so that the parts may be folded as set forth.

3. The steel yard *n*, in combination with the trigger lever *d* and and jerk spring *c*, substantially as and for the purposes set forth.

4. The spring hook *q*, formed of the arms 14, extending from the coil 15, and terminating in the reverse hooks 16, so that the hooks can be opened by pressing the arms 14 toward each other, as set forth.

77,894.—WILLIAM O. LESLIE, Philadelphia Pa.—*Brick Machine.*—May 12, 1868.—Clay from the pit is thrown into the tub where it is crushed by the rollers and passes through the chute into the mixing tub, when it is acted on by revolving knives and swept into the box. The horizontally reciprocating plunger drives it into the molds as they are alternately presented by the carriage. The clay is then pressed by a vertically moving plunger operated by a cam. Segment cogwheels and rack actuate the mold carriage. A crank pin and slotted yoke operate the horizontal plunger which moves the clay from the box to the mold.

Claim.—1. The combination of the pug mill or mixing tub G, with the chamber *g'* having the plunger I working therein, the chamber *g'* with the plunger J, and the reciprocating mold carriage W, all constructed and arranged to operate substantially as shown and described.

2. The mold carriage provided with the racks T, in combination with the segment wheels S and S', and the spur wheels Q and Q', when arranged as shown and described, for the purpose of imparting to the mold carriage a reciprocating motion, as set forth.

77,895.—WILLIAM O. LESLIE, Philadelphia, Pa.—*Machine for Dressing Stone.*—May 12, 1868.—The cutters are attached to a rotating wheel and act upon the face of the stone, which rests upon a traversing table and is fed along to the cutters by gearing from the main driving shaft.

Claim.—The combination of the wheel A, having the cutters attached, with the table B provided with the rack *a*, and the shaft *m* provided with the pinion *u*, and having its outer end journaled in the lever L, all arranged to operate substantially as described.

77,896.—GEORGE F. LEWIS, Philadelphia, Pa., and FREDERICK D. STUART, Washington, D. C.—*Cylindrical Plate Printing Machinery.*—May 12, 1868.—The engraved cylinder is heated by a row of gas burners placed in the hollow axis of the cylinder, which may be cast iron, surfaced with steel or copper. The ink is applied by rollers adapted to stand a moderate heat. The whiting is applied to the detergent roller by a board which is held in contact with its lower side by a series of spiral springs.

Claim.—1. Applying whiting or other material, as a detergent, to the cylinder, in a solid form, by

means of boards *i*¹ *i*² and springs, *i* or equivalents, substantially as described.

2. The buff *f*³ applied to the detergent roller F, substantially as and for the purpose described.

3. The application of gas to heat the printing cylinder and the ink rollers, by means of pipes *b* passing through said rollers, and provided with burners or jets *b*¹ *b*², substantially as described.

77,897.—E. J. LEYBURN, Lexington, Va.—*Harvester.*—May 12, 1868.—The combined rake and reel revolves in the arc of a circle whose axis is parallel with the finger-bar. The rake is made to act as a reel-bar in gathering the grain, and then to descend automatically to sweep the gavel from the platform. That portion of the cam which causes the peculiar action of the rake is under command of the driver, so that it may be thrown out of action and allow a greater amount of grain to accumulate. The draught frame, platform, and finger bar are simultaneously adjustable upon the draught wheels in a vertical direction. The cutting apparatus may be raised independently of the tongue.

Claim.—1. The shifting device *f*, constituting an auxiliary to the cam J, substantially in the manner described, and applied to a combined rake and reel of the character substantially as described, whereby the raking can be stopped and started at pleasure while the reels and rake continue to revolve, substantially as set forth.

2. The combination of the vertically and bodily adjustable frame A³ with the rock shaft S and the inner and outer supporting wheels D and *d*³, substantially in the manner and for the purposes described.

3. The segmental toothed frame E, provided with a latch and lever, and pivoted to the draught frame A³, said frame having the axle of the supporting wheel D applied to it, and being attached, by means of a lever, B¹, to a pivoted draught pole, B, so that in the act of raising and depressing the draught frame the front end of said pole shall remain in one given position, substantially as described.

4. The idler, or pulley E¹, applied to the vibrating frame E, so as to maintain proper tension of the belt C¹ at all times, substantially as described.

5. The toothed segment frame E, adapted for suspending the frame A³, and for being geared with toothed pinions *a a*, and for being connected to the devices which actuate the wheel *d*³, substantially as and for the purposes described.

6. The continuously vertically revolving reel arms I¹, intermittent horizontally sweeping rake I², and a shifting device, *f*, in combination with a hand lever, G¹, and catching device, *y y*¹, substantially as described.

77,898.—JOHN LONGANECKER, New Pittsburg, Ohio.—*Stump Extractor.*—May 12, 1868.—A pinion on the sweep axis gears into a larger wheel on the shaft of the drum on which the rope is wound. The additional power of the tackle is exerted upon the end of the lever which is secured by a chain to a stump so as to twist out the latter as the lever is swept around.

Claim.—The combination of the tongue C, gears *b*¹ and *d*, windlass D, rope *d*², pulleys E and F, and lever G, with the frame A and braces *a*, when arranged and operating as and for the purpose set forth.

77,899.—JOHN MCCOY, Philadelphia, Pa., assignor to himself and W. T. SNELL, same place.—*Metal Can and Case for Putting up Alkalies.*—May 12, 1868.—The can has a body, bottom, an inner annular cover, and an outer cover, all composed of sheet metal, and secured by lap joints made tight without solder.

Claim.—The within-described can or case, composed of the body A, bottom *a*, inner annular cover *b*, and outer cover *d*, all being arranged and secured by lap joints, as set forth for the purpose specified.

77,900.—FRANKLIN P. McCULLON and WILLIAM WOODCOCK, Philadelphia, Pa.—*Oil Cup for Steam Pressure.*—May 12, 1868.—The flow of oil from the lubricator is adjusted by a screw-stem whose end is adjusted in proximity to the opening, or by a faucet.

In each case a pointer shows the extent of opening in connection with an index.

Claim.—1. The needle or plug B, and the index or finger E, in combination with an oil cup A, substantially as shown.

2. The key F', finger I, sieve K, in combination with an oil cup A, substantially as shown.

77,901.—ACHILLE F. MIGEON, Wolcottville, assignor to UNION HARDWARE COMPANY, Torrington, Conn.—*Skate*.—May 12, 1868.—The brackets by which the tread plates are secured to the runner have elongated mortises to receive tenons on the runner posts. One of the sole clamps is fastened by a screw to the tread plate, and the other is moved up to the edge of the sole by a temper screw.

Claim.—1. The metallic brackets *g g*, each formed with an elongated hole, receiving the tongue at the end of the runner arm, into which said tongue is riveted, so that said brackets stand as T-pieces across the arms of the runner, and are united to the sole plate by the screws or rivets *o*, as set forth.

2. The clamps *k l*, in combination with the screw *m*, that passes through the flange of the clamp *l*, and through a threaded hole in the runner, fitting said screw *m*, so as to confine the boot sole by the clamps *k l*, in the manner specified.

77,902.—WILLIAM HARTLEY MILLER, Philadelphia, Pa.—*Manufacture of Packing for Steam Engines, &c.*—May 12, 1868.—The fibrous material and the powder are united and prepared to resist steam and water by saturation in heated oil, grease, or wax.

Claim.—The process above described, or its substantial equivalent, whereby the combination of dry powdered and dry fibrous material may be secured from the effects of water or condensed steam.

77,903.—C. D. MOODY, St. Louis, Mo., assignor to himself and HORACE BILLINGS, Beardstown, Ill.—*Car Brake and Starter*.—May 12, 1868; antedated April 28, 1868.—The power expended in stopping the car is stored in a spiral spring surrounding the axle, and is expended in starting the car.

Claim.—The combination and arrangement of the wheels B, B', and D, with the axle A, and the spring C, as described and set forth.

77,904.—JOHN H. NOLF, Philadelphia, Pa., assignor to himself and JOHN D. WILLIAMS, same place.—*Composition for Refining and Toughening Iron*.—May 12, 1868.—For a charge of 500 lbs. of pig iron the following composition is prepared: Red lead, 1½ lb.; chloride of potash, 4 oz.; manganese, 5 oz.; and salt, 1½ pint. When the pig iron has been thoroughly melted in the puddling furnace the composition is thrown upon it and the dampers closed for a short time.

Claim.—The treatment of iron during the process of puddling with a composition consisting of the within-described ingredients, or their equivalents, in the manner and for the purpose described.

77,905.—GALEN ORR, Needham, Mass.—*Cutting and Forming Blind-Hook Blanks*.—May 12, 1868.—The blanks are cut economically from a plate according to the diagram, and are then forged to the shape required.

Claim.—Making blind-hook blanks by cutting plate metal to the shape herein specified.

77,906.—FREDERICK W. PALMER, West Richmondville, N. Y.—*Hand Fork*.—May 12, 1868.—Intended for gathering cut grain in the swath and pitching it on to the load without binding into sheaves. The tines have a double bend, forming a cradle for the grain.

Claim.—A hand-fork, substantially as described, for the purposes set forth.

77,907.—NELSON PALMER, Albany, N. Y.—*Horse Hay Fork*.—May 12, 1868.—The fork is pivoted to swing in a bail, and is held in position to retain hay by a bent spring piece which bears against a pin in the fork and a roller in the bail until it is discharged by the trigger cord to dump the load.

Claim.—The spring-etch *k*, in combination with

the bail *e* and roller *i*, for the purpose of holding the bail *e* in position, or releasing it at pleasure.

77,908.—GEORGE PANCAKE, Harrisburg, Pa.—*Machine for Wiring Blind Slats*.—May 12, 1868.—The staples straddle the knife-edged inclined plate and rest against the edge of the wheel, which is notched so as to carry at each rotation one staple into the chute traversed by the driver which thrusts the staple out of the chute and into the slat.

Claim.—1. Feeding the staples to the driver W by means of the wheel *b*, said wheel being constructed and operating substantially as described.

2. The staple-supplying incline *a*, in combination with the feeding wheel *b* and driver W, arranged to operate in the manner and by the means substantially as set forth.

77,909.—JOHN E. PARKER, Meriden, Conn.—*Reversible Knob Latch*.—May 12, 1868.—A projection upon the yoke enters a hole in the latch bolt, and an arm extends through the top of the case by which the yoke may be raised from the latch-bolt to permit the withdrawal and reversal of the latter. The case has inside guides to assist in the proper placement of the latch.

Claim.—1. The yoke B, provided with a projection, *a*, and arranged so as to be raised from the latch-bolt, substantially as shown.

2. In combination with the above, the fixed guides *d d*, for guiding and holding the latch-bolt in position, substantially as described.

3. The arm G, constructed so as to form a seat for the spring on the spindle C, and also as a means for operating the yoke B, to permit the removal of the latch-bolt, substantially as herein set forth.

77,910.—WILBUR F. PARKER, Meriden, Conn.—*Machine for Threading Screws*.—May 12, 1868.—The gimlet-pointed screw is clamped and rotated in contact with the cutter, which forms a thread at right angles with the surface of the screw around the point.

Claim.—The combination of the mandrel, or its equivalent, for rotating the screw blank and the guide R, with a chasing tool and mechanism for imparting to the said tool a movement of translation along the body of the screw blank, and curvilinearly along the curve or tapered extremity of the blank, substantially as described.

77,911.—GEORGE F. PECKHAM, Grafton, Ohio.—*Hair Dye and Dressing Compound*.—May 12, 1868.—Composed of water, 2 galls.; isinglass, 1 lb.; and sugar of lead, 2 oz.; evaporated to 2 quarts. Add spermaeti, 3½ lbs.; olive oil, 7 lbs.; lard, 4½ lbs.; white wax, 2½ lbs.; milk of sulphur, 4 oz.; and perfume to suit.

Claim.—A compound composed of the ingredients, and in nearly the proportions, substantially as herein described.

77,912.—TRUMAN PIPER and E. F. BRADLEY, Birmingham, Conn., assignors to HOWE MANUFACTURING COMPANY, same place.—*Machine for Sticking Pins*.—May 12, 1868.—The object is to place pins differing in size or color, or both, upon the same paper. A channel is arranged for each kind of pin and a cut-off operates to open the channel from which the required pins are to be received, the other channels being closed, each channel being opened in its turn automatically.

Claim.—1. In combination with the several independent channels, the cut-off device for each of the said channels, constructed and arranged substantially as described, and operating so as at the proper time to deliver the pins from either or several of the channels, substantially in the manner herein set forth.

2. The combination of the intermittently revolving ratchet, cam wheel, spring levers, and cut-off slides with the slide B, substantially as herein described.

77,913.—JAMES POWELL, Cincinnati, Ohio.—*Globe Valve*.—May 12, 1868.—The guiding collar neatly fits the outside of the screw upon the stem, so as to act as a guide in grinding. The aforesaid collar has a valve seat upon its lower side against which

the packing collar acts as a valve when packing the stem under a head of steam.

Claim.—1. The loose collar or guiding rim F, applied to the neck of a globe valve, substantially in the manner described.

2. The packing collar G, in combination with the loose disk valve and grooved hub C, as described and set forth.

77,914.—GEORGE RAYMOND, Fitchburg, assignor to himself and OLIVER P. CONKLING, Worcester, Mass.—*Detachable Noses for Bowls, &c.*—May 12, 1868.—The spout is attached to a shield or partial "breast," which is secured by bands to a hoop pressing circumferentially around the cup.

Claim.—The combination, with a detachable nose for bowls and other articles, provided with one or more loops *b*, as herein described, of an elastic band *c*, for holding the said nose to the bowl to which it is applied, substantially in the manner and for the purposes herein shown and specified.

77,915.—JOHN F. REINER, Columbus City, Iowa. *Joint for Shackles.*—May 12, 1868.—While the thills are raised the cross bolt on the thill iron is dropped into the slot on the upper side of the clip iron, and on lowering the thills into working position, a curved slot in the thill iron engages a pin passing transversely through the clip iron. This prevents accidental disengagement.

Claim.—A joint or shackle, having parts A and B, bolts C and E, clutch D, and hollows G, constructed, combined, and arranged substantially as specified.

77,916.—CHARLES F. RITCHEL, Chicago, Ill.—*Can Opener.*—May 12, 1868.—The point is thrust through the metal of the can, and the tool being rotated on this point as a center, the cutting lip makes a circular aperture in the plate.

Claim.—The can-opener, made of one piece of sheet metal, as described, provided with point D and blade E, both arranged and operating substantially as herein shown and specified.

77,917.—WILLIAM H. RODGERS, Brooklyn, N. Y.—*Gas Burner.*—May 12, 1868.—The gas burner has an igniting jet, and the latter is extinguished while the main jet is burning. In extinguishing the main jet, the gas is first passed through a small channel in the cock in order that the subsidiary jet may be lighted from the burner before the final extinguishment of the latter, leaving the igniting jet ready for subsequent duty.

Claim.—1. The cock *c*, formed with the gas ways 2, 4, and 7, in combination with the opening 3, and pipes 5 and 6, to supply gas to the chamber *f* and jet *i*, when the jet *e* is extinguished, the parts being arranged and acting substantially as and for the purposes set forth.

2. The regulating screw or cock 8, in combination with the jets *i* and *e*, as and for the purposes set forth.

77,918.—GEORGE W. ROLAND, Salem, Oregon.—*Harness Loop.*—May 12, 1868.—The frame has loops for the back and belly bands, and for the breeching and stay straps, and has trace slots beneath its raised front.

Claim.—A winged metallic loop for attachment to harness, constructed to operate substantially as described.

77,919.—HUGH B. RORKE, California, Mo.—*Mop Wringer.*—May 12, 1868; antedated April 29, 1868.—The roller frame hooks upon the edge of the bracket or tub. One of the rollers is journaled in an arm which is oscillated by the pressure of the foot upon the treadle.

Claim.—The rollers B B', either with or without corrugations, the ear pieces A, and lever C, when combined and arranged as described and set forth.

77,920.—HERMAN and LOUIS ROYER, San Francisco, Cal.—*Machine for Treating Hides.*—May 12, 1868.—Intended for treating hides for belting, &c. The end of the unhaird hide is secured in the slot of the central shaft, which is then revolved, winding the hide tightly thereon. The rotation is then reversed and the hide is thereby uncoiled, doubled

back, and recoiled in the other direction, stretching it and roughing the surface. The weight rests upon the hide and condenses it by lateral pressure as it is lengthened. It is then treated with oil and tallow in the usual way.

Claim.—1. The vertical shaft B with a slot, B', and set screws, *b b b*, said shaft having a forward and back motion, substantially as and for the purpose described.

2. The pins or rollers C C C set in the rings D and D', together with the grooved weight I, substantially as and for the purposes described.

77,921.—GEORGE O. SANDERSON, Boston, assignor to himself and E. D. GOODRICH, Cambridge, Mass.—*Soldering Furnace.*—May 12, 1868.—The "Bunsen" burner is combined with an air deflector and a portable furnace which serves to heat soldering tools, or glue pots.

Claim.—1. The flattened tube A D E when made and arranged substantially as described, and for the purpose set forth.

2. The combination, as well as the arrangement of a Bunsen burner with a deflector, G, the pieces K K' K'' K''', and the case N O, made substantially as described, and for the purpose set forth.

77,922.—ELIAS SANFORD, Meriden, Conn.—*Apparatus for Handling Iron in Rolling Mills.*—May 12, 1868.—The automatic handler receives the plate after passing through the rolls and elevates it so that the man can reach it to pass it again through the rolls. The plate is received in a pan, the man places his foot upon a treadle, which by means of a friction pulley rotates the shaft, winds up the cord, closes the jaw on the plate, and then lifts it, pan and all, to a position whence it can be reached by the tongs of the workman on the other side of the rolls.

Claim.—The pan C with the valve *a* attached, and its peculiar construction, with the perpendicular bar D and double-jointed lever F, by which it is carried around and over the upper roll, and presented to the man in front of the machine, substantially as herein specified.

77,923.—SOCRATES SCHOLFIELD, Providence, R. I.—*Regulating and Dispensing Mechanism.*—May 12, 1868; antedated March 20, 1868.—The vertical movements of a collar on the stem of the governor are communicated to a rack bar which actuates a pinion having an adjustable frictional bearing upon an arm. The deflection of the latter is communicated by the described devices to an oscillating segment armed with pawls which rotate a gear wheel in the other direction, and by appropriate devices regulate the area of steam opening to an engine, the water power to a wheel, &c.

Claim.—1. Causing the motion derived from any kind of governor, as transmitted in one direction, to be stopped and controlled by an obstructing point or notch, or system of elevations or depressions, operating under the action of a governor, transmitted in another direction, substantially as described.

2. Arranging the ratchet teeth in steps, or one above the other, in connection with a guard operating to produce a corresponding change in the elevation of the catches, substantially as and for the purpose specified, in any regulating or dispensing mechanism.

3. The combination of several elements, consisting, first, of a dispensing device, second, of a vibrating bar or lever, and third, of an opposing point, placed in connection or combination with any governor or other indicator of a desired change in the action of a machine, to operate substantially as described.

77,924.—JACOB H. SCHREINER, Camp Hill, Pa.—*Grain Drill.*—May 12, 1868.—To the tubular shank is attached a foot-piece which has a sharp toe forming a share. In front of the shank is a shin edge, and this is preceded by a guard bar which fulfills the functions of a colter.

Claim.—1. The peculiar construction of the foot B, substantially as and for the purpose herein set forth and described.

2. The combination of the foot B, cutter C, and boot A, substantially as herein shown.

3. The cutter guard E, substantially as and for the purpose set forth.

4. The combination and arrangement of the feed pipe or boot A, cutter guard E, brace D, cutter C, foot B, and share *d*, substantially as herein set forth and for the purpose specified.

77,925.—ALBERT SKINNER, San Francisco, Cal.—*Machine for Making Drain Pipe.*—May 12, 1868.

—A core is placed in the stationary steam-heated cylinder. A follower, attached to a piston head, moves up and down around a stationary core, passing through slots in the center block. A closely-fitting packing ring is placed around the core, and slips up and down upon it by the action of the piston and follower. Another ring is placed at the top of the cylinder, and the clay is held around the core and between the two rings, and pressed by the force of the engine on the piston. After pressure, the cross-head and rings are removed from the top of the cylinder, and the piston drives out the pipe.

Claim.—1. The follower G, constructed with slots G' G', and the curved openings F F, in which it slides, in combination with the stationary core E and ring N, substantially as and for the purpose set forth.

2. In combination with the above-claimed apparatus, the steam jacket J for heating the same, and the material worked thereby, substantially as described.

77,926.—J. C. SLAUGHTER, Crumpton, Md.—*Churn.*—May 12, 1868.—The dasher is duplicate; one set of blades being attached to the central post which revolves in one direction, the other blades being attached to a frame which surrounds the other, is sleeved upon it, and is rotated in the other direction.

Claim.—1. A casing, A, contracted in diameter near the bottom, in combination with a series of revolving blades, arranged nearer together at the lower than at the upper end of the casing, for the purpose set forth.

2. The frame G, having blades *m* extending across the same, and hung to the shaft C, in respect to its blades *n*, as and for the purpose specified.

77,927.—ALFRED G. SMITH, Marathon, N. Y.—*Foxing and Soling Boots.*—May 12, 1868.—The front portion of the boot, consisting of a sole, shank, and upper, is made in readiness to be slipped on over a boot, forming a "foxing," and being attached by screws through the sole of the latter and penetrating the sole of the boot proper.

Claim.—As an improved article of manufacture, a foxing or fronting and soling for boots and shoes, constructed separately from the work to which it is to be applied, substantially as and for the purpose set forth.

77,928.—JAMES D. SMITH, New York, N. Y., assignor to ARTHUR P. EMERY, same place.—*Measuring Faucet.*—May 12, 1868.—The measuring chamber, in the head of the faucet, has a rotary draining and measuring device operated by a hand crank upon the outside. An epicyclic train of wheels of differential character operates therewith. Through the latter, motion is communicated by the said crank to an indicator dial, preferably hung to revolve by spring or frictional pressure, with the gear, so as to be capable of independent adjustment relatively to the pointer.

Claim.—1. The combination, with a rotary measuring and drawing device, C, arranged in the chamber B of the faucet A, and turned from the outside by crank or handle G of the fast and loose differential wheels I J, pinion K, carried by the handle and wheels M N, or their equivalents, for operating the dial P, substantially as shown and described.

2. The dial P hung for independent action, as described, and for free rotation with the wheel N, by which it is driven by frictional gear with the latter, through a spring or springs interposed between said wheel and dial, essentially as specified.

77,929.—CHARLES F. SPAULDING, St. Johnsbury, Vt., assignor to himself and E. D. GOODRICH, Cambridge, Mass.—*Double Seamer for Tin Work.*—May 12, 1868.—The carrying disk has a rubber band to create friction upon the vessel acted on. The com-

pressing disk is journaled on top of the standard and is brought into conjunction with the former disk as required, or the disk and standard are thrown over out of the way by removing the brace and vibrating the post on its lower pivot.

Claim.—1. The carrying disk F, the shaft D, and crank E, when combined with the compressing disk H, operating substantially as described and for the purpose set forth.

2. The rubber band G, in combination with the disk F, substantially as described, and for the purpose set forth.

3. The standard K, pivot K' in combination with the brace N, substantially as and for the purpose set forth.

4. The combination and arrangement of the lever M, shaft I, sliding standard J, and standard K, substantially as described, and for the purpose set forth.

77,930.—GEORGE H. STEVENSON, Washington, Ohio.—*Ditching Machine.*—May 12, 1868.—The curved blade conforms to the shape of the rounded bottom of the ditch, and has two vertical cutters rising from its sides. A foot piece enables it to be used as a spade.

Claim.—The construction of a spade that will cut a ditch ready for tile, thirty inches deep, without the use of any other instrument, and is useful for digging post holes and many other useful things, which is done by the movable foot piece and peculiar shape of the blade and lips attached thereto.

77,931.—JAMES H. SWAIN, San Francisco, Cal.—*Boot and Shoe Last.*—May 12, 1868.—A metallic sole is attached to an ordinary last, and has a flange around it. The object is to elineh the pegs as they are driven through the sole.

Claim.—The projection or flange C, or its equivalent, on the face of the last, substantially as and for the purpose specified.

77,932.—WILLIAM SWINDELL, Allegheny City, Pa.—*Puddling and Boiling Furnace.*—May 12, 1868.—The inner faces of the boshes are cast against chills. A ledge around the bottom plate holds the boshes. The boshes are attached to the bottom plate and to each other by dovetail ribs on the former and lugs on the bottom plate. The latter has grooves below, which receive water pipes to cool the plate.

Claim.—1. A bottom plate for a puddling or boiling furnace, cast with a series of grooves in or along its lower surface, in which to arrange a series of water pipes, substantially as and for the purposes hereinbefore set forth.

2. The use of a series of tubular water chills *a'*, when arranged in grooves cast in the lower face of the bottom plate of a boiling or puddling-furnace, substantially as and for the purposes hereinbefore described.

3. Supporting the boshes of a puddling or boiling furnace by a ledge or rim *c*, on the upper face of the bottom plate, and extending around it in the outside line of the boshes, substantially as and for the purposes hereinbefore expressed.

4. Jointing the boshes of a puddling or boiling-furnace to the bottom plate and to each other by ribs *c*, so shaped as, in connection with lips *c'* to form a dovetail joint, substantially as and for the purposes set forth.

5. Making chill-faced boshes for puddling or boiling furnaces, by casting them against a metallic chill, substantially as and for the purposes hereinbefore set forth.

77,933.—GEORGE H. TAYLOR, New York, N. Y.—*Oscillating Rubbing Machine for Medical Use.*—May 12, 1868.—The spirally-ribbed rubber plays in an aperture in the couch, and is vertically adjustable to suit the adjustment of the couch. The rubber is rotatable upon a lever, which is oscillated by a crank.

Claim.—1. The rubber A, composed of India-rubber, and having its outer surface coated or covered with India-rubber; the said outer surface being furnished with projecting ribs, points, or corrugations, and the said rubber A being constructed substantially as and for the purpose specified.

2. The combination with the rubber A of the

forked rod C, hung on a pivot, E, and operated by any suitable mechanism, substantially as and for the purpose set forth.

3. The combination with the rubber A and rod C of the crank G, arm or connecting-rod H, and shaft I, substantially as described and for the purposes set forth.

4. The combination with the rubber A, driven by suitable mechanism, substantially as set forth, of the couch S, properly connected to the frame O, and having an opening, R, through it, for the said rubber A to work through, substantially as and for the purpose set forth.

77,934.—JOSEPH W. THORP, Hillsborough Bridge, N. H., assignor to himself and DAVID F. BROWN.—*Tailors' Pressing Machine.*—May 12, 1868.—The press-iron is attached by a ball and socket joint to the swinging arm, and is so arranged that a slight pressure on the handle brings the force of a toggle upon the spindle of the press iron, enabling the operator to bring a heavy pressure upon the goods with a slight exertion of power. Pins support the heater in the chamber of the iron to moderate the heat of the face.

Claim.—1. The arrangement of the socket E, the sleeve F, and the spindle J, with the press iron and its adjusting handle, substantially as set forth.

2. Supporting the heater at a distance from the face plate of the press iron, by means substantially as described and for the purpose specified.

3. The arrangement of the adjustable handle a and cam a' with the spindle J and press iron, for the purpose substantially as set forth.

4. The rubber or elastic bearing e, arranged in combination with the jack P, substantially as set forth.

77,935.—DANIEL H. TURNER, New York, N. Y.—*Apparatus for Cooling and Purifying Bone Black.*—May 12, 1868.—The heated charcoal is agitated by means of the lifters on the interior periphery of the revolving cylinder, and a current of cool air is drawn by a fan through the cylinder to remove dust and gases. The hot coal is distributed by an apron, and when purified passes out by a spout at the end of the cylinder. A sleeve regulates the amount of perforated surface through which the dust, &c. is removed.

Claim.—1. The combination of the circumferentially close revolving cylinder A, provided with interior lifters, and set horizontal, or thereabouts, screen, or screen extension C, at the forward end of said cylinder, and hot-air, gas, and dust conductor F, for operation together, substantially as specified.

2. In combination with the circumferentially close cylinder A, and screen forward extension C, the adjustable ring or cover K, essentially as shown and described.

3. The arrangement within the conductor F of the distributing apron H, for operation in connection with the cylinder A, provided with lifters, and set horizontal or thereabouts, as herein set forth.

77,936.—GUSTAV WEDEKIND, Philadelphia, Pa.—*Lamp Shade.*—May 12, 1868.—The supporting wires are looped to the ring and their ends are curved down to rest upon the side of the chimney, thereby making a holder which accommodates itself to various sizes of chimneys.

Claim.—In combination with the radial braces for supporting the shade on the chimney, the raised elbows on said braces to support the shade and prevent it from shaking about, substantially as and for the purpose described.

77,937.—SAMUEL G. WELLING, New Rochelle, N. Y.—*Bed Pan Attachment for Invalid Beds.*—May 12, 1868; antedated May 4, 1868.—The flaring-mouthed pipe passes through the mattress and communicates with a closed vessel beneath. The pipe has a stop-cock. A removable funnel fits upon its top.

Claim.—The movable elastic seat piece, in combination with the pipe and pan, substantially as and for the purposes set forth.

77,938.—WILLIAM M. WELLING, New York, N. Y.—*Artificial Ivory.*—May 12, 1868; antedated May

2, 1868.—Composed of gum shellac, 16; camphor, 1; and talc, 16 parts.

Claim.—The composition herein specified, prepared as set forth.

77,939.—E. B. WEST, St. Anthony, Minn.—*Churn Dasher.*—May 12, 1868.—The device is clamped to the table by the jaws and set screw. It has two vertical dasher shafts having opposite rotation, and an arm depending from the frame has a stationary paddle to prevent the revolution of the cream. The device is applicable to an open-topped cream vessel.

Claim.—1. The arrangement of the arm N and stationary paddle O, as specified, and for the purpose set forth.

2. The combination of the stationary arm N and its paddle O with the movable arms M I, their paddles, and the plate A, all constructed and operated as specified.

77,940.—DANIEL M. WHITE, Malden, Mass.—*Portable Music Stand.*—May 12, 1868.—The three legs are folded together into a cylindrical form and are held by a cap which forms the knob of the cane. The rest arms are pivoted to the end of a vertically adjustable rod sliding in the cane, and may be folded to the same and thrust into a socket at the lower end of the cane.

Claim.—So arranging a convertible cane and music-stand that when closed to form a cane, said cane shall consist of the hinged legs B B B and the tube A, said parts being adapted to inclose the rod D and folding rack C; and, when arranged as a music-stand, the legs B B B shall be extended to support the tube A and the rod D, and frame C be adjustably supported on the latter by means of the spring S, substantially as described.

77,941.—WILLIAM H. WHITE, Lynn, Mass.—*Tube Well.*—May 12, 1868.—The induction tubes have side openings, and slide radially in the lower section of the well tube. When inserting the well tube the heads of the induction tubes are flush with its outside, being held inward by springs, and when the well tube is inserted the induction tubes are forced outward by descent of an inner tube.

Claim.—The combination, with a well tube, A, of the movable strainers or induction tubes, applied and operating substantially as described.

77,942.—THOMAS B. WICKHAM, Granville, Ohio.—*Portable Fence.*—May 12, 1868.—The panels are braced by triangular frames into which the lower and the upper two bars are recessed. The lower corners of the frames are secured to stakes.

Claim.—The manner of locking and supporting the panels by the double brace and clamp B B, in combination with the stakes D D and lock C C, all substantially arranged as set forth in the foregoing specifications.

77,943.—WILLIAM J. WILLITS, Detroit, Mich.—*Platform Car Stake Holder.*—May 12, 1868; antedated April 28, 1868.—The stake is clamped to the sill by a bridle plate and bolts, which latter have transverse movement in the sill to allow the stake to drop down into a horizontal position, or to tighten the same when elevated. The bolts are drawn inward by a cam bar operated by a lever. The stake is hung to one of the bolts.

Claim.—1. The arm I, cams N N, collar H, staple bolts F F, &c., clamp E, plate R, projection O, staple bolt P, nut S, and lever L, for the purpose designed.

2. The combination and arrangement of the stake B, the sill A, the gain D in the floor C, the clamp E, the staple bolts F F, &c., the collar H, the arm I, the head K, the lever L, the cams N N, the projection O, staple bolt P, the plate R, the ring X, and the stop T, arranged substantially as described for the purpose designed.

77,944.—GEORGE H. TIFT, Morrisville, Vt.—*Vegetable Washer.*—May 12, 1868.—The vegetables are inserted through the door of the rotating cylindrical cage. The shaft of the cage is vertically ad-

justable by means of pivoted supporting blocks, which are turned thereunder.

Claim.—The combination of the bolt-headed journals C C, when attached to the rotating cylinder F, from its interior, and used with the pivoted blocks J J, in the manner as specified.

77,945.—HIRAM ALDRIDGE, Goshen, Ind., and WILLIS BEDFORD, Chicago, Ill., assignors to HIRAM ALDRIDGE.—*Horse Power.*—May 19, 1868.—Two or more pinion spur wheels are applied to the shaft so that it can be adjusted vertically and longitudinally. The main frame is of triangular form, and has three pinions beneath or above a horizontal toothed master wheel, each of said wheels being at the angle of the frame for equalizing, and for providing for a change of speed of the driving shaft.

Claim.—1. In combination with a stationary or mounted horse-power, a vertically adjustable shaft, E, which is provided with two or more pinion spur-wheels, for the purposes and substantially in the manner described.

2. The vertically adjustable shaft E, with two or more pinions upon it, in combination with sliding or compensating knuckles or couplings F, or their equivalents, substantially as and for the purposes described.

3. In combination with a shaft, E, which is made vertically adjustable, and also longitudinally adjustable, the adjustable collars *ll*, substantially as described.

4. The triangular L-shaped cast frame C C', constructed substantially as and for the purposes described.

5. The combined arrangement of the driving pinions G G G, radial shafts D D D', bevel wheels *c c c'*, arranged upon a triangular frame, C C', substantially as described.

77,946.—JEROME B. ARMSTRONG, Corunna, Mich.—*Strap Fastener.*—May 19, 1868.—A cam with an acute angular edge at the front end, and a narrow stem at the other end, is placed in a frame and held by a bolt. The shank of the strap holder is formed with a recess in which is a spring which raises the stem of the cam, and retains the strap at any desired point.

Claim.—1. The cam E, provided with the angular edge F and stem J, with the spring I, operating substantially as described, for the purposes set forth.

2. The combination and arrangement of the cam E, the recess H, the spring I, with the frame A, the hook B, the cross-bar C, the strap-bolt D, and the bolt G, all operating in the manner specified, and for the purposes set forth.

77,947.—SAMUEL AYERS, New York, N. Y.—*Truss.*—May 19, 1868.—The pad is made of cork surrounded by a flange from which the curved face of the pad rises. The pad is connected by a loop to the belt so as to adapt it to any position on the body.

Claim.—1. Connecting the pad of a truss with the band or strap by a loop, F, through which the belt slides loosely, substantially as described.

2. Making a truss pad of cork, substantially as described.

3. The flange E, around the edge of the pad, substantially as described.

77,948.—CHARLES H. BACON, Boston, Mass., assignor to himself and WILLIAM READ, JR., same place.—*Governor for Steam-Engines.*—May 19, 1868.—The link which controls the valve is operated by a shaft passing through a vessel containing water or other liquid. The shaft is allowed a horizontal motion and is provided with a propeller or series of wings, above the vessel, and forming part of the same are two equalizing air-chambers.

Claim.—The combination of the propeller and shaft *a b*, working within the cylinder A, constructed with one or more chambers B C, with the link E, crank *c*, and rod *d*, substantially as and for the purpose set forth.

77,949.—EMORY BARNES, Chelsea, Mich.—*Ditching Machine.*—May 19, 1868.—An arrangement of devices for operating a crane and scoop for deepening

water channels, and adapted particularly to excavating swampy lands.

Claim.—The combination of the sills Y, the posts B, the cross-tree C, the beam B, the braces A², the vertical shaft D, pulleys E, G, and H, the chain or rope R, windlass V, lever W, block F, crane I, bolt 2, lever J, scoop K, platform U, capstan V, lines P, S, N, T, and Q, cross-bar M, blocks O, and rope X, when arranged, constructed, and operating substantially as and for the purposes herein set forth and shown.

77,950.—NATHAN BARTLETT, Centerville, N. J., assignor to himself and FRANKLIN OSGOOD, Richmond County, N. Y.—*Furnace for Roasting Ores.*—May 19, 1868.—The ovens are constructed usually in three sections, connected together alternately at their ends into a continuous oven. Each section is connected at the front by a break or opening to the one below it. The lower end of the bottom section is connected with the furnace at the side.

Claim.—1. The sectional arrangement of the oven, and the breaks or openings by which the sections are coupled or united together, constructed and operating substantially as described.

2. The combination of the sectional oven with a furnace and chimney, constructed and operating substantially as described.

3. A sectional oven, as herein described, in combination with openings or doors in both ends of each section of such oven, for the purposes stated, constructed substantially as described.

4. Constructing a sectional oven with the sections alternately inclined to each other, for the purposes stated, arranged and operating substantially as described.

5. The arrangement and combination with each other in pairs of the sectional ovens, the furnaces, and the chimneys, in the manner and for the purpose substantially as described.

77,951.—BENJAMIN F. BEE, Harwich, Mass., assignor to the NEW YORK TAP AND DIE COMPANY, New York, N. Y.—*Machine for Cutting Eccentric Taps.*—May 19, 1868.—A rotating cutter, while cutting the eccentric threads upon a tap, is caused to approach and recede from the axial line of the blank as many times as there are cutting edges to be made while the blank is turned on its axis and fed past the position of the rotating cutter, the blank so eccentrically cut is subsequently fluted longitudinally by a milling machine, so as to produce cutting edges at the most protuberant parts of the threads.

Claim.—1. The combination in one machine of the following instrumentalities, viz: The rotating mandrel to support the blank, vibrating rotating cutter, inclined cutter arbor, feed screw, and regulating cam, formed and constructed to adapt them to the purpose to be accomplished, and all combined and operating in the machine substantially as before set forth.

2. The combination in a machine of the following instrumentalities, viz, the rotating mandrel, rotating cutter, mounted on a free arbor, cutter guide and spring, formed and constructed to adapt them to the purpose to be accomplished, and all combined and operating in the machine substantially as before set forth.

3. The combination in a machine of the following instrumentalities, viz, the rotating mandrel, rotating cutter, inclined cutter arbor, regulating cam, and weight, formed and constructed to adapt them to the purpose to be accomplished, and all combined and operating in the machine substantially as before set forth.

4. The combination in a machine of the following instrumentalities, viz, the rotating cutter, regulating cam, and adjustable connecting mechanism, formed and constructed to adapt them to the purpose to be accomplished, and all combined and operating in the machine substantially as before set forth.

5. The combination in a machine of the following instrumentalities, viz, the regulating cam, vibrating tool support, variable connecting mechanism, and a directing instrument, formed and constructed to adapt them to the purpose to be accomplished, and all combined and operating in the machine substantially as before set forth.

77,952.—HENRY W. BEINS, Mount Vernon, N. Y.—*Vulcanizing India-Rubber Car Springs and Other Articles.*—May 19, 1868.—The material being wound on a mandrel is placed in a tubular mold, and then put in a heater which is filled with steam. The ends of the mold project so that when the caps are attached the steam is prevented from coming in direct contact with the ends of the molds, causing the rubber to be vulcanized uniformly throughout.

Claim.—The molds *b*, secured in the heads or plates *a*, of the heater, and having their ends extending beyond such heads or plates, substantially as and for the purpose set forth.

77,953.—S. BICKERSTAFF, Cincinnati, Ohio.—*Hermetically Closed and Keyless Padlock.*—May 19, 1868.—The object is to provide a seal lock which can be opened only by the proper authority.

Claim.—A self-sealing or keyless padlock, consisting of two pieces only, the body and the shackle, and constructed without rivets, bolts, screws, or openings of any kind, except for the reception of the shackle, substantially as shown and described.

77,954.—HYPPOLYTE BROCARD, Paris, France.—*Packing for Joints of Steam and Water Pipes.*—May 19, 1868.—Washers or packings of lead, shaped in rolls, with longitudinal grooves, and placed between the surfaces to be joined; on being subjected to pressure the lead impresses itself with the surfaces to be united.

Claim.—The employment, as means of making the joints of metal pipes and other metal articles tight, of washers or packings of lead, rolled, substantially in the manner hereinbefore described.

77,955.—S. P. BURDICK, New York, N. Y.—*Buckle.*—May 19, 1868.—The buckle is provided with a cam extending across the width of the belt and secured to an axle, one end of which forms a lever, in combination with a stop and catch formed by projections on the edge of the shell of the buckle. By depressing the lever between the stop and catch the belt is secured at any point.

Claim.—1. The lip *e*, turned up from the lower face of the shell *A* to hold the lever *b*, when the cam *a'* is fully locked and operating in combination with said cam, shell, and lever, and the lip *e*, as herein described.

2. The construction of the shell *A* of a flat plate, having a depressed concave flange, *g*, at its front edge, substantially as and for the purpose described.

3. The guide *i*, secured to the shell *A*, and running crosswise to the belt, which is secured in said shell, substantially as and for the purpose set forth.

77,956.—JOHN P. BUTZ and ABNER MCFARLAND, Enterprise, Ind.—*Gate.*—May 19, 1868.—The gate is composed of a series of horizontal slats; the upper one which extends only a part way the length of the gate. A diagonal brace extends from the front end of the bottom slat to the end of a lever, by depressing which latter the front end of the gate is raised and the latch is withdrawn.

Claim.—1. The lever *D*, with the brace *C*, and the slats of *a a'*, used as and for the purposes set forth.

2. The combination of the lever *D* with the brace *C*, and the latch *e*, and ratchet-bar *g*, as and for the purposes specified.

77,957.—O. D. CHAPMAN, Chicago, Ill.—*Tube Well.*—May 19, 1868.—A series of chambers is made between the tube and wire cloth, and a chamber between the cloth and the outer perforated plate, so as to secure the greatest amount of filtering surface.

Claim.—The combination of the bands *d*, wire cloth *E*, spiral wire *F*, and perforated plate *G*, with the tube *A*, substantially as and for the purpose set forth.

77,958.—WILLIAM P. CHASE, Boston, Mass., assignor to R. HOE and COMPANY, New York, N. Y.—*Bookbinder's Beveling Machine.*—May 19, 1868.—The book cover or other article being held in position on the bed plate, a clean and even bevel of its edge is obtained by reciprocating the plane in its groove.

Claim.—1. The reciprocating plane, provided with an oblique cutter, in combination with the oblique

groove, to guide the plane in its travel, whereby I am enabled to obtain a smooth shear cut of the material, as set forth and specified.

2. The combination, with the oblique groove and reciprocating cutter of the adjustable plate *B*, for holding the material for the action of the cutter, substantially as set forth and specified.

3. The combination, with the oblique groove and reciprocating cutter *H*, of the adjustable bed *D*, for giving any desired bevel to the material, substantially as set forth and specified.

4. Making the face of the cutter or plane *H* concave, in combination with the oblique cutting iron *I*, whereby I obtain a clean, smooth cut, without abrading the material, substantially as specified.

5. The combination and arrangement of the oblique guides *C C*, reciprocating plane *H*, holding plates *B B*, and adjusting plate *D*, constructed and operating substantially as set forth and specified.

77,959.—ROBERT A. CHESEBROUGH, New York, N. Y.—*Lubricating Oil.*—May 19, 1868.—An oil or product made by filtering heavy crude oil according to the process described in patent No. 49,502 to same inventor, using in the process a heated filter and bone black.

Claim.—The product or article called by me Fil-trene, as a new article of manufacture.

77,960.—GEORGE F. CLEMONS, Springfield, Mass.—*Heel Cork.*—May 19, 1868; antedated May 15, 1868.—A single piece of steel plate is turned up at its narrowed ends with two curved ears, armed with projecting catches, forming inwardly clamping surfaces. The longest ear has a releasing lever, which is folded down when the heel cork is worn.

Claim.—1. A heel cork adapted to be self-securing to the boot by means of spring-clamping surfaces, substantially as described.

2. The releasing lever *g*, when employed substantially as described and for the purposes set forth.

77,961.—CHARLES J. COMSTOCK, Grand Rapids, Mich.—*Raft Dog.*—May 19, 1868.—The wedges are surrounded by a link, and driven into the logs, the rope being securely held on the logs by the link.

Claim.—The combination of the two wedges *A A*, the link *C*, and the rope *B*, when employed together in the manner as and for the purpose set forth.

77,962.—THOMAS CRANE, Fort Atkinson, Wis.—*Coal Stove.*—May 19, 1868.—Designed to afford a great heat radiating surface.

Claim 1.—A single cylinder drum stove, provided with an annular flue jacket *H*, surrounding its upper portion, and communicating with the fire chamber, by means substantially as described.

2. The means shown and described, of compelling the products of combustion leaving the fire chamber *A* to circulate entirely around the suspended jacket *H*, when this jacket is arranged and applied to a stove, substantially as described.

3. A flue jacket, *H*, made shorter than the fire-cylinder *A*, and applied to said cylinder so as to form an air space, *J*, which leads through the perforated top *P*, substantially in the manner and for the purpose described.

77,963.—WILLIAM DAMEREL, Brooklyn, N. Y.—*Umbrella.*—May 19, 1868.—The runner is elongated above the flange to which the stretchers are hinged, and to the upper end of the elongation is attached a collar held to the runner by links, and passing loosely through the upper flange of the runner. The stick is formed of double tubes placed one within the other, the inner one being provided with a rib for the purpose of stiffening it. The umbrella closes automatically.

Claim.—1. The conical collar *f*, connected to the runner *c* by means of links *h*, substantially as and for the purpose set forth.

2. The cam *e* on the spring hook *d*, arranged to operate with the collar *f*, substantially as described.

3. An umbrella-stick, made of an inner and outer tube, united throughout their length, substantially as described.

4. The bridge piece *i*, applied within a tubular umbrella or parasol stick, substantially as described.

77,964.—C. H. ECCLESTON, Oxford, New York.—*Looped Pin for Securing Artificial Teeth.*—May 19, 1868.—Upon the loop of the pin is formed a flat head, from which project shanks at right angles; the ends of the shanks being bent so as to hold them in the body of the tooth.

Claim.—An angular loop for securing artificial teeth, when made with an enlarged and flattened head, provided with projecting shanks, whose outer ends are bent at an angle therewith, all substantially in the manner herein set forth.

77,965.—PETER T. ELTING, Buffalo, N. Y., assignor to ELTING BOLT and DUSTER COMPANY, Cincinnati, Ohio.—*Bran Duster.*—May 19, 1868.—The fan wings are extended beyond the periphery of the screen, to prevent the flour from flying back against the screen, or at the joints, and from packing or clogging. At the eye of the screw disk is a serrated scouring plate to aid in scouring the bran when the motion of the disk is slow. The screen frame is made in sections, covered each with cloth, to enable them to be separately removed. The brackets supporting the case of the flour chamber are furnished with a double set of adjusting screws, to secure a close fitting joint between the case and screen disk.

Claim.—1. The fan wings J^4 , revolving within the chamber J , and extending downwardly and outwardly beyond the periphery of the screen disk, as and for the purpose set forth.

2. The combination of the serrated scouring plate, at the eye of the screen disk, with the surrounding screen cloth, as and for the purpose set forth.

3. Making the screen frames in sections, as and for the purpose set forth.

4. Supporting the brush-tempering wheel at two points by the brush-adjusting screws, and at a third point by the screw post from the flour chamber, for the purpose described.

5. The brackets K , with their adjusting screws $K^1 K^2$, for adjusting the flour case laterally and vertically, as set forth.

77,966.—BARTHEL ERBE, Birmingham, Pa.—*Reversible Knob Latch.*—May 19, 1868; antedated May 12, 1868.—The yoke is formed with a projecting hook, which falls into a depression in the latch, and is so arranged in relation to a screw hole and screw that the hook cannot be withdrawn from the depression in the latch. When the screw is removed, the latch may be withdrawn, so as to adapt it to a right or left hand door.

Claim.—The hook n , in combination with the depression l on the latch, arranged and operating as described, for the purpose set forth.

77,967.—O. J. EVERSON, Lake City, Minn.—*Fence.*—May 19, 1868.—The two contiguous end rails are pivoted together near the top, and may be adjusted to any desired angle by means of a horizontal stay brace projecting rigidly from one rail, and held by a pin in the mortise in the other.

Claim.—Connecting and adjusting the panels of a portable fence together, by means of the pin e and the stay brace C , constructed and used with the panels, in the manner and for the purpose set forth.

77,968.—WILLIAM B. FAHNESTOCK, Lancaster, Pa.—*Car Axle.*—May 19, 1868; antedated May 16, 1868.—The wheels of the car are placed upon a divided axle, to avoid torsion and strain in passing curves, and the stationary or adjustable plate prevents the wheels from coming together.

Claim.—The plate D , constructed and operating as described, in combination with a divided axle, as specified, and for the purpose set forth.

77,969.—HENRY FELTHOFF and LUCAS D. TINGLEY, Prince William, Ind.—*Mold for Making Drain Tiles.*—May 19, 1868.—The elongated slits are designed to admit air in the process of molding, and through the aperture in the lower tile water enters the drain, after having descended from a greater altitude than that where the drain is laid. Thus it flows into the drain along its entire length, and is in like manner carried off.

Claim.—The arrangement of the molds B and C

with pin p and elongated slits $b b$, substantially in the manner and for the purpose as herein shown and described.

77,970.—WILLIAM FOOTNER, Chicago, Ill., assignor to WILLIAM J. FOOTNER, same place.—*Consolidating Coal Dust for Fuel.*—May 19, 1868.

Claim.—Consolidating particles of coal by mixing with a solution of glue, and compressing, substantially as and for the purposes specified.

77,971.—H. E. FOWLER and W. W. HOLMES, Wallingford, Conn.—*Manufacture of Plated Spoons, Forks, &c.*—May 19, 1868; antedated May 4, 1868.—An iron bank is placed in a solution of zinc, sal ammonia, and muriatic acid, and then heated in a cylinder; the iron being then thrown into tin, the latter combines with and enters the pores of the iron bank, so that when rolled it has a smooth surface, which may be plated.

Claim.—The improvement in the manufacture of spoons, &c., from iron, substantially as herein described.

77,972.—H. W. FULLER, New York, N. Y.—*Creasing Apparatus for Sewing Machines.*—May 19, 1868; antedated May 5, 1868.—This relates to the creasing or marking apparatus, composed primarily of nipping fingers or points, and it creases or marks the fabric by producing a succession of nips or pinches while it is fed along.

Claim.—1. The mode, substantially as described, of conveying motion to the creaser or marker.

2. The combination of the means herein described, or the equivalent thereof, for giving motion to the marker, with a marking device having a fixed fulcrum of vibration, as and for the purpose specified.

3. Placing the set screw for the adjustment of the said lever at the center of said fulcrum, for the purpose stated.

4. The combination, with the lever, having a fixed fulcrum or center of motion, of a spring, which may be adjusted in elasticity or power relatively with said fulcrum.

5. The arrangement of the spring with respect to the lever and its fulcrum, so that the act of adjusting the lever, long or short, will also adjust the power of the spring, substantially as and for the purpose specified.

6. So attaching the points to the lever which carries them, substantially as described, that they may be readily detached and renewed, or others substituted, as specified.

7. Guarding and protecting the points by a movable rest, substantially as set forth.

8. The combination with such rest of a removable key, to regulate the speed of the points, for the purpose specified.

77,973.—GEORGE L. GERALD, Thorndike, Mass.—*Horse-Shoe Calking Vise.*—May 19, 1868.—This tool is of the nature of a combined anvil and vise, which latter is operated by a foot treadle. In the top of the tool are arranged steel plates of peculiar conformation, called "sows." The shoe to which the calk or calk sare to be applied can be grasped and held by the vise.

Claim.—A calking vise, having the dies a and b , with the shaping devices hereinbefore described, formed thereon; said dies a and b being opened and closed by means of the lever k , link l , and springs w , all constructed and operating substantially as herein described and for the purposes specified.

77,974.—E. F. GERDON and C. W. SCHINDLER, Albany, N. Y.—*Lubricator.*—May 19, 1868.—When the shaft to which the grease cup is applied rotates faster than usual, the grease is thereby melted and the shaft lubricated, but when the shaft revolves so as not to raise the temperature, the grease remains solid or "set."

Claim.—1. The stop e , in combination with the tubular conductor D , leg B , and top of cup A , substantially as and for the purpose set forth.

2. The disk f and spring g , in combination with the stop e and tubular conductor D of the cup A , substantially as and for the purpose described.

77,975.—GOUVION G. GRISWOLD, New York, N. Y.—*Umbrella*.—May 19, 1868; antedated March 12, 1868.—The crown piece and runner are so constructed that a rib or stretcher may be easily removed when broken and its place supplied by another.

Claim.—1. The combination with a notch or crown piece or runner for umbrellas or parasols, having an annular groove and radial slots in it for the ends of the ribs or stretchers to work in, of a ring of rubber, or other suitable elastic yielding material, for fastening said ribs or stretchers in said groove, while at the same time one or more of the said ribs or stretchers may readily be removed for repairs, substantially as set forth.

2. The combination with a notch or crown piece or runner of an umbrella or parasol, having an annular groove and radial slots in it for the ends of the ribs or stretchers to work in, of a metal, leather, or other suitable ring, for fastening said ribs or stretchers in said groove, said ring having one or more slots in its side to permit of the introduction or withdrawal of one or more of the ribs or stretchers, substantially as set forth.

3. The combination with the runner E of the spring catches G G, operated in part or wholly by the India-rubber or other elastic ring I, substantially as set forth.

77,976.—WILLIAM HALL, Georgetown, Ill.—*Sandal*.—May 19, 1868.—A number of iron bars, having their ends pointed and turned up so as to form spurs, are secured to the bottom of the shoe or sandal, to enable the wearer to walk upon the ice or roofs.

Claim.—The bars, spurred and affixed to the bottoms of the sandals or other covering for the feet.

77,977.—HARVEY D. HARADEN, Hartford, Vt., assignor to himself and C. W. HARADEN.—*Hub for Carriage Wheels*.—May 19, 1868.—The central metallic part of the hub has two sockets to receive the two wooden end portions, and said central part consists of a pair of parallel disks united by radial connections, between which the tenons of the spokes are fitted.

Claim.—1. The improved supporter A, or arrangement of disks, socket rings, and radial connections, as set forth.

2. The combination and arrangement of the two separate cylinders or pieces of wood B B, with the disks, socket rings, and their radial connections, arranged together and cast in one piece, as set forth.

77,978.—T. C. HARGRAVE and W. B. CHARLTON, Boston, Mass.—*Low Water Indicator*.—May 19, 1868.—The valve lever of the whistle is connected to an arm extending from the indicating tube by means of a weighted rod, in such manner that, by the expansion of the tube, caused by the admission of steam into the same when the water falls below a certain level, the valve will be raised and an alarm sounded.

Claim.—The arrangement of the pipe I, expansion tube H, provided with the cock G, arm F, adjustable weight rod D, in connection with the lever C and whistle B, substantially as and for the purpose set forth.

77,979.—JOHN HASELTINE METHUEN, assignor to CHARLES L. WHEELER, Cambridge, Mass.—*Pad for Horses' Hoofs*.—May 19, 1868.—The upper side of the cushion has radial ribs, between which air cells occur, the ribs bearing against the under side of the hoof of the animal, inside the shoe and partly under it, where there is generally sufficient space to admit the narrow flange. Vent holes admit air to the cells between the ribs.

Claim.—1. An elastic cushion, constructed substantially as described, for the purpose set forth.

2. The air chambers, formed as described, in combination with the air or vent holes C, for the purpose and substantially as described.

3. The narrow flange B, for the purpose and substantially as described.

4. The wires g, or equivalent, combined with the elastic cushion, in the manner and for the purpose substantially as specified.

77,980.—JAMES H. HOLLINGSWORTH, Philadelphia, Pa., assignor to himself, ALBERT BEMENTER, and W. C. ROSSELL, same place.—*Refrigerator*.—May 19, 1868.—The refrigerator is designed to be kept cold throughout without ice or any chemical cooling or freezing compound.

Claim.—Coil of pipes C. P. and pipes C' P', water tank W, outer and inside boxes A and B, salt S S, the whole combined and constructed and operating for the purpose and the manner herein described and set forth.

77,981.—WILLIAM H. HOVEY, Holly, Mich.—*Securing Tires to Wheels*.—May 19, 1868.—The head of each bolt has a hole, through which the point of the other bolt passes, and the points of the two bolts being clinched or riveted at the outside of the heads, the tire is firmly secured upon the felloe.

Claim.—The securing of tire B to the rim A by inserting between the same parallel bolts D D, provided with heads or plates C C, perforated to receive the ends of the bolts, and secured by riveting the same, substantially as described and for the purposes set forth and shown.

77,982.—C. S. HUNT, parish of Terrebonne, and JACOB B. KNIGHT, New Orleans, assignors to C. S. HUNT, WILLIAM F. PRATT, and PETER M. PETERSON, New Orleans, La.—*Apparatus for Collecting Marsh and other Gases*.—May 19, 1868.—The chamber is sunk into a gas-producing stratum, and the gas flows into it from all directions, the gauze preventing the intrusion of solid substances. Carbonaceous matter may be placed in the gas-conducting pipe to enrich the gas. The pump is employed to free the chamber of earthy and other matter accumulated therein.

Claim.—1. The chamber A, or its equivalent, in combination with a gas pipe C, and a pump D, when these several parts are constructed substantially as and for the purpose set forth.

2. The chamber A, or its equivalent, in combination with a pump, D, and a gas pipe, C, when the latter is partially filled with a hydrocarbon liquid or other agent, for carburetting or increasing the illuminating power of the gas, substantially as herein described, for the purposes set forth.

77,983.—C. S. HUNT, parish of Terrebonne, and JACOB B. KNIGHT, parish of Orleans, assignors to C. S. HUNT, WILLIAM F. PRATT, and PETER M. PETERSON, New Orleans, La.—*Illuminating Gas*.—May 19, 1868.—Composed of marsh gas, (hydride of methyle.) Nitrogen and carbonic acid are produced spontaneously in certain southern sections of the United States.

Claim.—The gaseous composition or compound herein described, consisting of marsh gas, commonly so called, and carbon, when the latter is infused or incorporated into the former, substantially in the manner and for the purpose set forth.

77,984.—MELVIN JINCKS, Dansville, N. Y.—*Match Safe*.—May 19, 1868.—An oscillating floor is so arranged in the match safe that the slide which draws out the matches tilts the floor and insures its depositing a match upon the slide, which then returns the floor to its horizontal position. The striking hands ignite the match when the slide is withdrawn.

Claim.—1. The rocking floor B, arranged as described, so as to be tilted by the slide C in its withdrawal, and returned to its horizontal position after depositing the match.

2. The combination of the floor B, slide C, and striking hands D D', when arranged and operating in the manner and for the purposes set forth.

77,985.—WILLIAM H. JOHNSON, Springfield, Mass.—*Cutting Machine*.—May 19, 1868.—This invention relates to machines for embossing and cutting pieces to form from a web or sheet of cloth, paper, leather, metal, or other similar material, and is shown, as embodied in the machine, arranged for cutting paper collars from two webs of paper.

Claim.—1. The combination of a cutter having a cutting edge of the required form, with a plain, hard surface or plate, harder than the cutter, co-operating,

substantially as described, as a device for cutting leather, cloth, paper, and other similar material.

2. The employment, in a cutting machine, of a duplex embossing die, in combination with two corresponding dies or matrices, placed opposite to each other, and co-operating, substantially as described, by which two sheets may be simultaneously embossed upon their contiguous surfaces by the same impression.

3. The employment in a cutting machine of two embossing dies, placed opposite to each other and facing toward each other, in combination with a central plate placed between the same, and co-operating, substantially as described, by which two sheets may be simultaneously embossed upon their exterior surfaces by the same impression.

4. The employment, in combination, of the cutting apparatus described, with two sets of embossing dies, as described, by which the several operations described can be simultaneously performed upon two sheets of material by the same impression.

5. The combination of the central plate with the two yielding pressers placed on opposite sides of the same, substantially in the manner and for the purpose described.

6. The method herein described for adjusting the length of the pitman, by means of the scarf joint, and the key inserted between the offsets therein, or substantially as described.

77,986.—ADONIRAM KENDALL, Buffalo, N. Y.—*Cut-off Valve Gear.*—May 19, 1868.—An arrangement of devices constituting a valve gear which is connected with the governor by a link, and operates to produce a uniformity in the supply of steam, and an equal movement of the engine under a variable pressure of steam.

Claim.—1. The levers I I', links K, and lever J, as constructed and arranged in combination with the pawls G, as herein set forth.

2. The arrangement of the lever L, in combination with the pawls G, substantially as herein described.

3. The arrangement of the oscillating valve N and walls Q Q', as set forth.

4. The stop U or T, as constructed and arranged in relation to the valve N and arms S, so as to operate said valve by the pressure of steam, substantially as set forth.

77,987.—CARL KUEHN, Vienna, Austria, assignor to JOSEPH R. VON WESSELY, New York City.—*Utilizing Tin Scrap or Waste.*—May 19, 1868.—The object is to obtain from the scraps of tinned iron which accumulate around tin shops, and are usually thrown away, both tin and iron in such forms of respectively segregated purity that they may be again used.

Claim.—1. The method, herein described, of utilizing tinned iron waste by digesting the waste in hot water, in combination with muriatic and nitric acids, substantially as set forth.

2. The method, herein described, of collecting the metallic tin from the solution herein described, by means of zinc plates immersed therein, and exciting galvanic action, to cause the tin to be deposited on the plates, as set forth.

3. The method, herein described of segregating the tin and the iron by means of heat, water, muriatic and nitric acids, evaporation, crystallization, and galvanic action.

77,988.—T. T. S. LAIDLEY, U. S. A.—*Tompion for Fire Arms.*—May 19, 1868; antedated May 1, 1868.—The tompion is made in two parts, a neck or projection on one entering a recess in the other. The neck is embraced by an annular packing which by bringing together the two parts of the tompion is made to fit the bore, and which, while effectively closing the latter, presents such limited contact surface that the tompion may be withdrawn with facility.

Claim.—In combination with a tompion, and means for expanding it, a tubular packing, substantially as and for the purpose set forth.

77,989.—HENRY O. LOTHROP, Milford, Mass.—*Steam Engine.*—May 19, 1868.—This invention has special reference to the method of connecting three

eylinder pistons to the same driving shaft, the object being to simplify and lessen the expense.

Claim.—The arrangement, with the rods b^4 connecting the pistons $A^1 A^3$ with their crank or driving shaft, of the rods $c^4 g^4$, and sliding cross-head e^4 , connecting the piston B^2 with said shaft, substantially as herein shown and described.

77,990.—ROBERT O. LOWREY, Salem, N. Y.—*Treating Leather, Cloth, and the like to render them water and fire proof.*—May 19, 1868; antedated May 12, 1868.—The object is to render leather and other material water-proof without closing the pores. The material is first saturated in a solution comprising gelatine or animal glue, soap, glycerine, or saccharine matter, dissolved in water. The fabric or material is then dried and pressed and afterward treated with an astringent solution consisting of alum and salt.

Claim.—The treating of fabrics, substantially as herein described, for the purpose of rendering them water-proof, either with or without the addition of the fire-proofing ingredients.

77,991.—ROBERT O. LOWREY, Salem, N. Y.—*Plastic Compound for Roofing and other Purposes.*—May 19, 1868; antedated May 12, 1868.—The compound of vegetable fiber and silicate of soda, after being molded into pipes, buckets, or other articles, or rolled into sheets of the desired size, is treated with a solution of chloride of calcium, which converts the soluble silicate of soda into an insoluble silicate, and thus cements the particles together in a firm mass.

Claim.—The compound produced by the admixture of silicate of soda with vegetable fiber, with or without the addition of sand, clay, and similar substances, and then treating the same with a solution of the chloride of calcium, substantially as described.

77,992.—ROBERT O. LOWREY, Salem, N. Y.—*Fibrous Compound for Roofing and other Purposes.*—May 19, 1868; antedated May 12, 1868.—The compound of vegetable fiber and silicate of soda is treated with a solution of alum, or alum and salt combined, which renders the silicate insoluble, firmly cements the fibrous particles, and renders the material fire and water proof.

Claim.—The material produced by the union of vegetable fiber, either alone or with sand and similar substances, with silicate of soda, and treated with a solution of alum, or of alum and salt combined, substantially as described.

77,993.—ROBERT O. LOWREY, Salem, N. Y.—*Producing Floor Cloth, Leather Cloth, and the like.*—May 19, 1868; antedated May 12, 1868.—A solution is first prepared as follows: Of gelatine, animal glue, soap, glycerine, or saccharine matter, or both combined, and dissolved in water. To this solution is added clay, plaster, or any substance adapted to form a pasty compound, which forms a water-proof body or coating to be applied to paper, cloth, or other fabric.

Claim.—The production of the new article herein described as a substitute for oil-cloth, rubber, leather, &c., when produced substantially as set forth.

77,994.—WILLIAM MANTEY, New Orleans, La.—*Tap for Cutting Screw Threads.*—May 19, 1868.—By partially removing the alternate threads they are prevented from acting, and ample space is afforded for the cuttings, thereby lessening friction.

Claim.—In the construction of taps for tapping nuts and the like, obliterating or diminishing every alternate cutting thread from the point of the tap back to near the termination of the end portion, but leaving, in a space near said terminal portion, all the cutting threads full and perfect, as herein described and shown.

77,995.—C. K. MARSHALL, New Orleans, La.—*Article for Food from Potatoes.*—May 19, 1868.—The potatoes or yams are washed, sliced, and dried after the manner of drying fruits, so as to adapt them for transportation to foreign markets.

Claim.—As a new article of manufacture and

commerce a desiccated yam, sweet, or other potato, prepared substantially as described and for the purpose specified.

77,996.—ELBRIDGE G. MATTHEWS, Boston, Mass., assignor to FRANK F. HOLBROOK, same place.—*Plow*.—May 19, 1868.—The mold-board at the front is attached to the standard by a mortise and tenon, and at a point behind it rests upon a bracket secured to the standard. The hooked bolt and nut, together with the brace, admit of the ready attachment to, and detachment of, the mold-board.

Claim.—1. The combination and arrangement of the bracket or rest *c*, the tenon *b*, and the mortised projection *a*, with the mold-board *D* and standard *A* of the plow.

2. The combination and arrangement of the duplex-pointed dog or brace *g*, the hooked bolt *e*, the nut *f*, and the eyes or staples *h h* and *i*, with the bracket, standard, and the mold-board, connected by means substantially as set forth.

77,997.—E. W. MATHEWSON, Norwich, Conn.—*Gauge*.—May 19, 1868.—By turning the screw shaft the point of the scratch-awl may be elevated or depressed, and by withdrawing said awl nearly out to the point and turning it into a vertical position, the bent point will form a gauge for points higher than could otherwise be obtained by a device of the same size.

Claim.—The slotted support *A B*, in combination with the shaft, worm wheel *H*, screw *F*, and pointer *C*, arranged and operating substantially as set forth.

77,998.—E. B. McCoy, Winsted, Conn., assignor to himself and R. COOK & SONS, same place.—*Carpenters' Bench Dog*.—May 19, 1868; antedated May 4, 1868.—By turning the central screw the hook or dog will be raised, and by turning either of the other screws the dog will be lowered; a slight reverse movement of the screw so turned causing the parts to bind, thereby retaining the dog in the desired position.

Claim.—The screw *C*, arranged with its gear *c*, and combined with one or more screws *D* of reverse threads, so as to operate together, and the one to bind the other, substantially as herein set forth.

77,999.—JOHN McFADDEN, Cadiz, Ohio.—*Truss Supporter*.—May 19, 1868.—The radiating buckles receive and retain a waist strap, two thigh straps, and a shoulder brace, so adjusted that the pad may be brought to bear upon the afflicted part with more or less force.

Claim.—1. A truss pad *A*, provided with a series of radiating buckles *a b c d e*, and acting in combination with the straps *B C D E*, substantially as and for the purpose described.

2. The additional brace *D'*, in combination with the pad *A*, waist strap *B*, and thigh strap *D*, substantially as and for the purpose set forth.

78,000.—RUFUS SPAULDING MERRILL, Boston, assignor to himself, LEVI LISCOM, and WILLIAM LINCOLN, Brookline, Mass.—*Bridge*.—May 19, 1868.—This bridge is of the kind which are built by projecting from the opposite shores or banks levers consisting of superposed layers of beams, projecting one in advance of the other. Angle-iron plates are used in lieu of wood.

Claim.—The construction of iron bridges, substantially in the manner herein described.

78,001.—ALFRED MONNIER, Philadelphia, Pa.—*Separating Cobalt and Nickel from other Ores*.—May 19, 1868.—Cobalt and nickel are separated from iron and manganese while in a state of solution by the use of any of the alkaline sulphurets.

Claim.—The treatment of a solution of cobalt, nickel, iron, and manganese, for the purpose of separating either one or both of the two former from either one or both of the two latter metals, substantially as herein set forth.

78,002.—GEORGE W. MYERS, Hartleton, Pa.—*Knife for Removing the Skins from Animals*.—May 19, 1868.—An additional blade with a rounded edge is applied to the cutting blade in such a manner as to

act as a guard between the cutting edge and the hide of the animal, the cutting or scouring of the hide being thereby prevented.

Claim.—The combination and construction of the guard *C*, that is movable and adjustable, with the knife blade *A*, as herein described, and for the purposes set forth.

78,003.—WILLIAM F. NEWCOMBE, Cleveland, Ohio.—*Wheelbarrow*.—May 19, 1868.—The iron arch or bridge supports the bottom and strengthens the front of the wheelbarrow, and adapts the wheel to be set at or near the center of the load, an opening being made in the bottom and front end to accommodate the wheel.

Claim.—The application of the iron bridge to strengthen the front part of a wheelbarrow, substantially as shown and described.

78,004.—JAMES M. PEIRCE, Mokena, Ill.—*Blind Slat Fastening*.—May 19, 1868; antedated April 30, 1868.—The button or fastener is pivoted to the bottom piece of the blind, and the slats are locked in a closed position by the button being set against the lower end of the connecting-bar of the slats. A pin or spring catch on the inside detains the button at a point below its pivot and prevents the opening of the slats from the outside.

Claim.—The use of a fastener or button, *A*, also the spring *E* and the pin *B*, as herein described, to prevent blind slats or blinds from being opened on the outside.

78,005.—HENRY PEMBERTON, Alleghany City, Pa.—*Manufacture of Sulphate of Alumina*.—May 19, 1868.—Hydrate of alumina is mixed with sulphuric acid and water, to form the neutral or slightly basic sulphate of alumina, which results speedily in the production of the desired salt of alumina.

Claim.—The employment, in the manufacture of the sulphate and other salts of alumina, of the improved process hereinbefore described.

78,006.—JOHN PONTON, Buffalo, N. Y., assignor to himself and JACOB F. HAYEN, same place.—*Gas Apparatus*.—May 19, 1868.

Claim.—1. An automatic machine, substantially as above described, for the purpose of making fixed illuminating gas, which will regulate itself and maintain any desired degree of heat, and supply itself with petroleum or other fluid hydrocarbon, in exact proportion as the gas generated by such machine is used or consumed from the gasometer.

2. The use of a retort, arranged with an inclination, together with a movable screw, or its equivalent, in the interior, substantially as described, arranged in such a manner that the gas generated from petroleum or other hydrocarbon, will have to travel over the whole interior surface of said retort previous to its being let free.

3. The application of any mechanical device attached to said retort, in the manner substantially as above described, whereby the expansion or contraction of said retort will regulate the supply of fuel to the furnace.

4. The application of any pyrometer to any retort, in connection with any mechanical device, which will automatically regulate the supply of fuel to any furnace used in the manufacture of gas.

5. The application of a gas furnace, substantially as above described, for the above purpose, the chief principle of which consists in utilizing the waste heat of the furnace for the purpose of causing the gas and atmospheric air, which are used as fuel, to be mixed at any high temperature before ignition.

6. A sub-reservoir in the above connection, substantially as described, the chief principle of which consists in its being hermetically sealed and entirely submerged, and so connected with the retort that the pressure of gas will drive the oil or other fluid hydrocarbon from the sub-reservoir to the retort, in lieu of atmospheric pressure.

7. The application of a float-valve, substantially as described, in connection with a reservoir, the chief principle of which consists in admitting only sufficient oil to said reservoir as will maintain any fixed level.

8. In connection with said reservoir, a ball, check,

or other valve, substantially as described, the chief principle of which is to prevent the return of any fluid or gas from said reservoir to the main source of supply from any undue pressure in said reservoir.

9. The application of an air mixer, arranged upon the principle of the old wet meter, substantially as above described, in connection with said apparatus, the chief principle of which consists in having any desired number of compartments, and each compartment having buckets running in one and the same direction, so that air or gas can be admitted to either compartment by a movable piston, or its equivalent, thereby mixing the gas and air in metrical proportions, as required. I do not claim a meter or air mixer in which the buckets are reversed.

10. That the said mixer may be worked by power other than the pressure of gas, which will then answer the purpose of exhausting the gas from the retort, and relieving it from pressure, as well as mixing the air and gas.

11. The application of a feed pipe to the retort, substantially as above described, the chief principle of which consists in being totally submerged in cold water to the very point of ingress to said retort.

12. The application of a spring or other valve, substantially as above described, attached to the said feed pipe, and arranged in any manner similar to that above described, so that the rise or fall of the gasometer will regulate the supply of oil to the retort.

13. In connection with the above apparatus, a tank or tanks, arranged in any manner, so as to protect the different parts of the above apparatus from heat.

14. A condenser, substantially as above described, arranged in such a manner that the distillate will return to said reservoir.

78,007.—WILLIAM P. PRICKETT, Philadelphia, Pa.—*Furnace for Melting Metals, Glass, &c.*—May 19, 1868.—In the rear of each pot is made an aperture leading into a surrounding flue obstructed at one end and communicating with the stack or chimney at the other. The apertures increase in size as they approach the obstructed end of the flue, the draught being thereby equalized around each pot.

Claim.—The application to furnaces of the base upon which the pots or crucibles rest, and the small apertures opposite each, that lead into the surrounding flue, and from thence into the main stack or chimney, substantially as herein described and set forth.

78,008.—WILLIAM C. RAY, Pleasant Run, and GIDEON LEIGH, Clinton Station, N. J.—*Fanning Mill.*—May 19, 1868.—The shoe has a lateral shaking motion imparted to it by a pitman attached to a crank on the fan shaft, by which motion is also imparted to a frame carrying a riddle and connected to a screen, the latter having an up-and-down motion as well as a longitudinal one.

Claim.—1. The combination, substantially as set forth, of the cranked fan shaft, the pitman O, the bell-crank lever P, which sustains the rear end of the pitman, the laterally vibrating shaking shoe D, the longitudinally vibrating screen frame G, and the horizontally oscillating balance lever S, for the purposes specified.

2. The combination substantially as set forth, of a longitudinally vibrating screen, F, suspended centrally from short radius bars *f*, with a longitudinally vibrating frame, G, suspended at its forward end by long radius bars *g*, and hinged at its rear end, *f'*, to the screen F, whereby an opening and shutting or rising and falling, as well as a longitudinally vibrating movement, is imparted to the latter, and the grain thereby thoroughly sifted.

3. The combination, substantially as set forth, with the pitman O, of the depending bracket R, the balance lever S, and the longitudinally vibrating frame G, for the purposes set forth.

4. The removable deflecting board L, arranged and operating as set forth.

78,009.—ADAM REICHERT, Cogan Station, Pa.—*Spring Wagon Seat.*—May 19, 1868.—The slides are intended to elevate either end of the seat so as to keep the same level when persons of unequal weight are riding thereon.

Claim.—The combination of the ordinary wagon seat A, of the springs C, constructed of iron, steel,

brass or other material, of the supports B fastened to said seat by hinges, and of the slides E E, for the purpose of elevating either end of the seat.

78,010.—CHARLES H. REYNOLDS, New York, N. Y., assignor to himself and ALBERT BRIDGES, Jersey City, N. J., and said REYNOLDS assignor to EDWIN RAY.—*Knife Sharpener.*—May 19, 1868; antedated May 7, 1868.—The knives are laid successively in grooves in the bed, and the stock being folded over so as to bring the file to bear upon the blade, is reciprocated upon the guide rod, drawing the file longitudinally along the edge of the blade.

Claim.—1. A knife-grinding machine, having a guide, A³, and file-carrying piece B, arranged to serve relatively to each other, and to a bed for holding the blade in position, substantially in the manner and for the purposes specified.

2. The within-described compound bed *a a¹ a² a³*, adapted to hold the blades both of knives and scissors, and to allow them to be acted upon by the file C, or its equivalent, substantially in the manner and for the purpose herein set forth.

78,011.—E. D. and J. P. RHOADS, Dayton, Ind.—*Trace Fastener.*—May 19, 1868.—The spring acting upon the fastening pin through the pivoted lever, retains the pin securely in the position in which it holds the trace.

Claim.—1. The arrangement of the ferrule B, with its perforated jaws *h h*, and the lever C, with its spring D, and pivoted pin *g*, said lever being pivoted to the outer end of the ferrule, and curved to the rear of the swingle-tree, to operate substantially as set forth.

78,012.—GEORGE RICHARDS, Boston, Mass.—*Throttle Valve for Locomotive Engines.*—May 19, 1868.—In starting the engine, the lever of the main valve first actuates a smaller valve which admits steam to the under side of the main valve and enables the latter to be opened with facility to any desired extent by the continued motion of the lever.

Claim.—The arrangement of an additional or supplementary valve with the throttle valve of a locomotive engine, when both are operated by one and the same lever, substantially as and for the purpose specified.

78,013.—JOHN RICHARDS, Cincinnati, Ohio.—*Bearing for Spindles.*—May 19, 1868.—The adjusting screw may be made to adjust the spindle, together with the socket sleeve, to different heights, and by the same adjusting screw—the step screw being backed out and the spindle fixed—the spindle can be tightened in its socket.

Claim.—1. The adjustable sleeve *b*, in combination with the screw *e*, for adjusting the spindle *c* to different positions in the socket, substantially as and for the purposes specified.

2. The oil-cell *n*, in combination with sleeve *b* and screw *e*, operating together in the manner and for the purposes set forth.

3. The adjusting screw *d*, in combination with the sleeve *b* and screw *e*, for adjusting the sleeve *b* and spindle *c*, substantially as specified.

4. The sleeve *b*, screws *e* and *d*, together with the lubricating cell *n*, when combined and operating in the manner and for the several purposes as specified.

78,014.—EDMOND RICHARDSON and JAMES H. COLE, Adrian, Mich., assignors to JAMES H. COLE.—*Device for Rolling Roofing.*—May 19, 1868.—A bed of sand inclosed by a rectangular frame forms a ground work upon which to form the sheets. The plastic material is poured upon the sand bed, and the felting material being wound upon the upper roller of the movable frame and passed around under the larger roller, said frame is moved along so as to pay out the felting and spread it upon the upper surface of the plastic material. The cutters on the sand bed frame shear off the felting to the proper width.

Claim.—1. The method herein described of making sheets of Egyptian case-hardened marble, or sheets of any similar material, by the application of the felting simultaneously with the rolling and pressing of the sheets, substantially as described.

2. The construction of the rolling instrument shown

in Fig. 1, having the rollers A and B, the former being provided with shoulders, *m* and *n*, and scrapers, *o o*, substantially as and for the purposes set forth.

3. In combination with said instrument, the frame E E, when provided with the cutters *i i*, substantially as described and for the purpose set forth.

78,015.—THOMAS L. RIVERS, St. Louis, Mo.—*Animal Trap*.—May 19, 1868; antedated May 13, 1868.—The trigger is hung by its hooked end upon the wire of the trap, and to set the trap the edge of the hinged door is placed upon the catch.

Claim.—The trigger A, with its rounded shoulders F F and catch C, in combination with the door, as above described, and for the purposes set forth.

78,016.—BENJAMIN ROBINSON, East Gloucester, Mass.—*Obtaining Gelatine from Fish Heads*.—May 19, 1868.—The fish heads are subjected to the action of steam in a close vessel, and then placed in and compressed by a powerful press, from openings in which the gelatine exudes.

Claim.—The process described, for obtaining gelatine from the heads of fish.

78,017.—LEVI ROGERS, Morehouse Parish, La.—*Medical Compound*.—May 19, 1868.—This compound consists of green swamp palmetto root, finely divided, placed in distilled water, and boiled slowly until considerably reduced by evaporation. While warm white sugar is added and afterward fifty drops of nitric acid.

Claim.—The medical compound herein described, when made of the ingredients herein mentioned, in the proportions and by the method stated, for the purpose set forth.

78,018.—LEVI ROGERS, Morehouse Parish, La.—*Medical Compound*.—May 19, 1868.—To a gallon and a half of distilled water is added one pound of finely divided green swamp palmetto root which is boiled slowly until evaporated to dryness. The residuum is then pulverized ready for use.

Claim.—The medical compound herein described, when composed of the ingredients herein mentioned in the proportions stated, and compounded by the method and for the purpose set forth.

78,019.—ALBERT E. ROSS, Hollis, Me.—*Sawing Machine*.—May 19, 1868.—A slide works in a groove in an upright and is connected at its lower end to a fixed spring. To the upper end of the slide are attached two cords passing over rolls, one of the cords having a hand-piece and the other passing down the opposite side of the upright. The saw is thrown upwardly by a spring and levers, and the wood is thrown out automatically when sawed.

Claim.—The combination of the slide *o*, lever *z*, lever *a'*, cords *q r*, spring *s*, and slide *v*, as and for the purposes set forth.

78,020.—EDWARD C. RYER, Burlington, Vt.—*Watch, Clock, and Lock Key*.—May 19, 1868, antedated May 7, 1868.—Upon a split spring-barrel is placed a sliding sleeve to which is added a winding ring that adjusts the key to the proper size. Another ring is applied to the barrel to strengthen the key when used at its largest size.

Claim.—1. The manner of applying the sleeve C to the barrel of an adjustable watch, clock, or lock key, all as herein described and shown, and for the purpose specified.

2. The ring A, or its equivalent, as applied to the sleeve C, all as herein shown and described, and for the purpose specified.

3. The ring G, as applied to the barrel B, all as herein shown and described, and for the purpose specified.

78,021.—JAMES SHEPARD, Bristol, Conn.—*Machine for Wiring Pans*.—May 19, 1868, antedated May 7, 1868.—A square roller, die, or swage is fitted to revolve in a suitable frame, immediately beneath a round roller with a narrow edge like the upper roller of a common wiring machine.

Claim.—The combination of the roller-die D with the revolving-die A, constructed and operating as described.

78,022.—A. D. SMITH, Grafton, Ohio.—*Loader for Locomotive Tenders*.—May 19, 1868.—Attached to the bottom of a box is a frame suspended by spring rods which operate latches attached to doors on the box. The box being loaded is swung over the tender, the doors opened and the load deposited.

Claim.—The frame D, its sustaining rods *f f*, the latches C C, in combination with the box A and trap-doors B B, all constructed and arranged to operate substantially as and for the purpose set forth.

78,023.—ALFRED STARR, New York, N. Y.—*Solder for Aluminum*.—May 19, 1868.

Claim.—The alloy specified, forming a solder for aluminum.

78,024.—EDWARD STEINEL, Amsterdam, N. Y.—*Mosquito Bar*.—May 19, 1868.—To the upper end of a bedstead is hinged a frame, from the cross-bar of which extend cords secured to a top-bar suspended from hooks in the wall. The frame is raised and lowered by the occupant pulling the cords.

Claim.—The hinged frame B, and top-bar C, in combination with cords *b*, and with a mosquito net, substantially as and for the purpose described.

78,025.—BENJAMIN F. STOVER and ABRAM H. STOVER, Ladoga, Ind.—*Churn Dasher Head*.—May 19, 1868.—The dasher head is concave on its under side and provided with a socket extending upward and downward sufficiently to brace the head upon the staff.

Claim.—The concave head A, of finely perforated or reticulated metal, having a socket B, as and for the purposes specified.

78,026.—JAY C. TAYLOR, Ann Arbor, Mich.—*Spring Bed Bottom*.—May 19, 1868.—The slats are shorter than usual and are suspended by springs of rubber webbing, secured to an adjustable bar provided with hangers, which act and partially rotate upon journals in a transverse bar attached to the head and foot rail of a bedstead.

Claim.—The combination of slats A, buckles B, rubber springs D, adjustable bar E, hangers I, journals F, and transverse bar G, when arranged and operating substantially as and for the purposes herein set forth.

78,027.—EDWIN THOMAS, Philadelphia, Pa.—*Neck Tie*.—May 19, 1868.—Various colored pieces of any material are held together by a catch so as to form a tie of ordinary length that will be reversible or changeable to any colored bow and ends desired.

Claim.—As a new article of manufacture, a neck tie composed of sections of material of different colors or quality, said sections being detached from each other, substantially in the manner specified, and for the purpose set forth.

78,028.—JOSEPH M. THOMPSON, Rome, N. Y.—*Salt and Sugar Evaporator*.—May 19, 1868.—Object is to cause the consumption of the gas and perfect combustion throughout.

Claim.—The admission of air by jets into the flame under the pots or pans, at points equidistant from each other.

78,029.—JAMES TRAINER, Vinton Station, Ohio.—*Animal Trap*.—May 19, 1868.—The compartments, levers, tilting platform, and catches are so arranged that by one operation the animal is securely imprisoned and the trap reset.

Claim.—In combination with a trap having the above-named devices, the tilting platform *d*, arm K, crank *l*, and the described connections, all arranged to operate in connection with the levers *e e'*, as and for the purpose set forth.

78,030.—CHARLES S. TYSON, Old Point Comfort, Va.—*Gun Carriage*.—May 19, 1868.—The recoil is taken up by means of springs, running back between bars or other surfaces inclining toward each other rearward, forming a wedge-shaped space in which the springs move, so that the recoil force will encounter a regularly increasing resistance.

Claim.—1. A mechanism for taking up the recoil of heavy guns, consisting of a spring or springs

working against or between inclined surfaces, so that the spring or springs will be more and more compressed as the carriage runs back, opposing a regularly increasing resistance to the recoil force, substantially as described.

2. In combination with the springs C C, and the inclined bars B B, the crank E on the forward axle of the carriage, the link-bar *e*, and the hinged coupling of the springs, all constructed, arranged, and operating substantially as described.

3. In combination with the inclined bars and springs, the intermediate sliding bars I I, as and for the purpose set forth.

4. In combination with the side-rails of the carriage pressing against the outer sides of the bars B B, and the cross-bar G and plates *g g* pressing against the upper and lower sides of said bars, and the springs C C, said bars B B, with their outer, upper, and lower sides parallel, and their inner sides inclined, substantially as and for the purpose set forth.

5. In combination with the inclined bars B B, springs, hinged coupling, and intermediate sliding bars, substantially as described, the transom plates D and D', to hold all the parts in place, as set forth and described.

78,031.—JOHN VAUGHN, Miami County, and ELI CHAMNESS, Grant County, Ind.—*Subsoil Plow*.—May 19, 1868.—The earth upon being plowed up is spaded, broken up, and thrown upon plowed ground, and any earth that may cling to the spades is removed by the jack or cleaner. The dash-board inclines at a suitable angle toward the under rim of the spade wheel to prevent the earth from falling back in the furrow.

Claim.—1. The construction and arrangement of the wheel B, substantially in the manner and for the purpose as herein set forth.

2. The combination of the frame A and dash-board *d* with the wheel B, substantially in the manner and for the purpose as herein set forth.

3. The combination of the plow D with the wheel B, substantially in the manner and for the purpose as herein set forth.

4. The combination of the jack or cleaner C and frame A with the wheel B, substantially in the manner and for the purpose as herein set forth.

78,032.—EDWARD WADHAMS, Yorkville, N. Y., assignor to himself and A. WADHAMS, same place.—*Metallic Tags for Straps*.—May 19, 1868; antedated December 28, 1867.—The end of a strap for skates, harness, or other purpose is encased within a thin strip of sheet metal, whereby the end of the strap is readily passed through the loop or buckle.

Claim.—As a new article of manufacture, a tag for straps, consisting of the metallic plate B, when provided with the two rectangular openings *a*, and strips *b*, and adapted to be bent over the end of the strap, as herein set forth for the purpose specified.

78,033.—JOHN L. WAIT, East Cambridge, assignor to himself and GEORGE J. SUTTON, Cambridgeport, Mass.—*Composing Stick*.—May 19, 1868.—The shoulder is provided with a clamp which clasps the ledge of the composing stick and retains the shoulder in the position in which it may be set, the cam lever being adapted to close the clamp with greater or less force.

Claim.—1. As my invention, the clamp C, as combined with the cammed lever E and the adjustable shoulder B, and formed to straddle or embrace opposite sides of the ledge of the composing stick.

2. The combination and arrangement of the screw *d* with the clamp *c*, the cammed lever E, and the adjustable shoulder B, arranged and applied together, substantially in manner and so as to operate as specified.

78,034.—HARVEY WEBSTER, Cambridge, Vt.—*Whistle Tree*.—May 19, 1868.—The grooves are employed respectively to inclose or guard the spring lever trigger, and obviate the impairing of the operation of the cast-off by the swelling of the wood. The cast-off, when released, detaches the hame tug from the draught pin.

Claim.—The plate A with its grooves B and C, the spring lever E, cast-off D, the spring F, the

draught pin G, all arranged and operated as shown and described.

78,035.—HARVEY WEBSTER, Cambridge, Vt.—*Thill Coupling*.—May 19, 1868.—To uncouple the thills from the vehicle, the flange of the wedge plate is pulled forward until the cap or bolt holder uncovers the thill-fastening bolt, then push the bolt out of the socket of the thill iron.

Claim.—The wedge plate A, bolt holder or cap B, and the spring C, as applied to thill couplings, and operated either by draught or pressure, all for the purpose herein specified.

78,036.—WILLIAM H. WHITE, New York, N. Y.—*Hat*.—May 19, 1868.—The crown is detachable so that various crowns can be used on the same hat brim or cap frame; the crown may be worn independently of the brim. An imitation band can be printed, pressed, or sewed on the crown so as to enable it to be packed in a small space.

Claim.—1. A hat or cap in which the crown is detachable or removable from the brim, substantially as and for the purposes herein shown and specified.

2. A hat composed of a brim, brim-former, or frame and crown, arranged substantially as herein described, so that each of said parts may be readily detached from or combined with the others, as set forth.

3. In a hat or head-covering in which a brim of suitable material is combined with a brim frame or former, as herein described, the combination with the brim and draw casing formed in the outer edge of the fabric of which the same is made, of draw strings or a draw string passing twice around the brim, under the arrangement and for operation as shown and set forth.

4. The combination of a detachable or adjustable and removable crown with a cap vizer and head band when the two latter are permanently fastened together or formed in one piece, substantially as and for the purposes herein shown and specified.

78,037.—DAVID F. WILCOX, Greenville, N. Y.—*Hop Pole*.—May 19, 1868.—The object is to provide a simple branching pole for so supporting and dividing the hop vines as to expose them effectively to the rays of the sun.

Claim.—The arrangement of the curved bars B B, passing through the pole A, arms C C C C, and cords D and *e*, all constructed and used substantially in the manner specified.

78,038.—LUCIUS LEANDER WOOLLEY, Medford, Mass.—*Door Lock*.—May 19, 1868.—The bolt is slid endwise by the circular tumbler. The lock is designed for the doors of stoves of railway carriages, the same being prevented from becoming accidentally unlocked, should the carriage be overturned.

Claim.—The combination and arrangement of the tooth-notch *a*, and the areal stop-notches *b c*, of the bolt C, with the segmental tumbler D, provided with the tooth *d*, and the two notches *e e*, arranged as specified.

78,039.—J. M. ALLISON, Cranberry, Pa.—*Corn Planter*.—May 19, 1868.—The supporting wheel has attached to it a cog-wheel which meshes with another on a shaft carrying arms or tappets which actuate in one direction the slide or slides whereby the corn is dropped; the return movement of the slides being effected by springs.

Claim.—The combination of the gear wheels O and N, shaft J, cams or arms I, slotted slides G, and springs L, with the drive wheel C, frame A, and hoppers E, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the adjustable slide bottom F with the hoppers E and slotted slide G, substantially as herein shown and described, and for the purpose set forth.

78,040.—HANS HEINRICH ANDRESEN and HANS ASBAHR, Davenport, Iowa.—*Venetian Blind*.—May 19, 1868.—The upper or outer edges of all the slats are hinged to suspension chains, and lifting chains are applied to the front or inner edges of the slats so that when the slats are hung up by their suspen-

sion chains they can be opened or closed more or less by raising their front edges by means of pull cords.

Claim.—1. Hinging the slats *a* by their edges to the suspension chains *C C*, in combination with a lifting chain or chains and pull cords, arranged substantially as described.

2. In combination with slats which are hinged and hung, substantially as described, attaching the free edges of the slats together by means of separate lifting chains *D D'*, substantially as and for the purposes described.

3. A Venetian blind which is constructed and operates substantially as described.

78,041.—FRITZ ASTHÖWER, Witten an der Ruhr, Prussia, assignor to JOSEPH R. VON WESSELY, New York, N. Y.—*Manufacture of Steel.*—May 19, 1868.—The materials are smelted in close crucibles in a furnace, the construction of each being such that the metal can be readily inspected during the process, and the crucibles removed from or placed in the furnace at any stage of the process without interrupting the operation of the furnace.

Claim.—1. The combination of the fire chamber *A* and crucible chambers *C E*, as and for the purposes set forth.

2. The construction of the dome of the furnace with vertical plugged openings, as described, to afford a view of the interior.

3. The crucibles, having plugged covers arranged beneath the openings in the dome, as and for the purpose described.

78,042.—DAVID BARTHOLOMEW and DAVID C. DINSMORE, Kirkville, Iowa.—*Churn.*—May 19, 1868.—The hinged brace permits the convenient removal of the barrel from its inclosing frame.

Claim.—The combination of the churn and the frame *A*, constructed with a removable brace, *A'*, and the arm *D*, for giving a reciprocating revolution to the dasher, and so adjustably connected with the pitman, *E* and driving mechanism that the churn may be removed from the frame, substantially as set forth.

78,043.—J. O. BELKNAP, Mobile, Ala.—*Propelling Pleasure Boats.*—May 19, 1868.—Designed for moving pleasure boats in a circle around a central standard planted upon a circular or polygonal wharf surrounded by water.

Claim.—The employment of a revolving frame, working on a vertical standard, and having arms or sweeps, to which pleasure boats may be attached, for the purpose of propelling such boats on the water, substantially in the manner above set forth.

78,044.—SAMUEL S. BENT, Portchester, N. Y.—*Chicken Coop.*—May 19, 1868.—The coop is provided with a metallic open-work end-piece, provided with sliding doors connected together so as to be operated simultaneously. The broods are protected by closing these sliding doors at night.

Claim.—A chicken-coop, formed with an open-work metallic plate, in the lower portion of which there are openings, closed when desired, by a range of doors or covers, substantially as and for the purposes set forth.

78,045.—DOUGLAS BLY, Macon, Ga.—*Piston Rod Adjuster.*—May 19, 1868.—The connecting rod is adjusted vertically to any extent, and a joint is provided so that the rod may adapt itself to the proper vertical position as the beam works up and down.

Claim.—The clamp *A*, combining both a free vertical adjustment of the rod and a joint for connecting with the walking-beam for insuring a free play, substantially as herein set forth.

78,046.—WILLIAM W. BOYINGTON, Chicago, Ill.—*Pavement.*—May 19, 1868.—The pavement is composed of blocks arranged in rows which rest alternately directly upon the foundation boards and upon plate boards nailed to the foundation boards, the blocks upon the plate boards being of less height than the others.

Claim.—A foundation for a wood and concrete pavement formed with a layer of boards, *A*, lengthwise with the street, and a layer of plates, *B*, trans-

verse, and nailed fast thereto, said plates being of equal widths, and with spaces between equal to the thickness of the blocks composing the wooden portion of said pavement, substantially as described.

2. The combination of the foundation *A B*, constructed as described, with the blocks *C* and *C'*, and concrete filling, in the manner and for the purpose herein set forth.

78,047.—JAMES L. BRIERLY, Auburn, Mass.—*Pipe-Wrench and Cutter.*—May 19, 1868.—A sharpened disk within a block is fastened to the end of the screw rod, and the pipe, being clamped between the disk and the hook, is cut by turning the instrument around the pipe.

Claim.—1. The slotted hook *C*, when pivoted to the lug *a*, formed upon the side of the nut *B*, and held against the pipe by means of the spring *E* pressing against its back, and secured at one end to the end of the lug *a*, all constructed, arranged, and operating as described, for the purpose specified.

2. The cutter block *F*, when provided with the lateral pin *e*, fitting through the slot in the spring hook *C*, whereby the cutter is guided and prevented from turning upon the rod *A*, as herein described, for the purpose specified.

78,048.—B. BRIDY, Detroit, Mich.—*Artificial Limb.*—May 19, 1868.—Relates to the construction of the ankle and toe joint with a view to simplify the appliances and render them durable.

Claim.—1. The combination of the parts *A* and *B*, by means of a hinge joint, constructed substantially as and for the purpose described.

2. The combination of the parts *A* and *C* by a hinge joint, substantially as and for the purpose described.

3. The combination with the hinge joint *d d*, constructed substantially as described, of the rubber or other yielding washer springs *f f'*, as and for the purpose described.

4. The combination with the parts *A* and *B*, and the hinge joint as described, of the India rubber or other yielding springs *D D*, substantially as and for the purpose described.

5. The combination with the parts *A* and *C*, and their hinge joints *d² d²*, of the rubber or other yielding springs *F*, substantially as and for the purpose described.

6. The combination, with the parts *A* and *B*, jointed together as described, of the semicircular spring *h*, substantially as and for the purpose set forth.

78,049.—W. P. BROOKS, Bloomington, Ill.—*Draught Attachment for Vehicles.*—May 19, 1868.—The evener is a flat bar, so that while either of the outer horses may be favored by adjusting one of the end hitching hooks on the bar lengthwise, the central horse may be favored by shifting its attaching loop higher on the central upright bar.

Claim.—A draught attachment or evener, composed of a bar, *A*, provided with bars *C*, having hooks *d' d''*, either or both, at its ends, in connection with the central bar *B*, with adjustable eye or loop *d*, attached, all constructed and arranged substantially in the manner as and for the purpose set forth.

78,050.—EDMUND BROWN, Burlington, Vt., assignor to himself and GEORGE D. WRIGHT, same place.—*Vegetable Masher.*—May 19, 1868.—A perforated inclined frame and a smooth presser, sliding or swinging thereon, are so arranged that the mashed body or pulp of the potato, or other article will be forced through the meshes of the frame, while the peels will fall into a special receptacle.

Claim.—1. A vegetable masher, consisting of a perforated stationary frame, and of a smooth swinging and sliding presser, as set forth.

2. The perforated frame of a vegetable masher, when composed of the stiff bars *a a*, and of the wire rods *b b*, arranged in front of and crossing the bars *a*, substantially as herein shown and described.

3. The sliding and turning presser *E*, provided with hooks *e*, in combination with the pins *h* on the posts *B*, and with the perforated fabric *a b*, or its equivalent, all operating as set forth.

4. The device set forth in the foregoing clause, in

combination with the sliding follower F, operating as specified.

5. The notched fixed scraper J, in combination with the frame D and with the presser E, all operating substantially as herein shown and described.

6. The combination of the frame A B and frames C D with the smooth swinging and sliding presser E, with the hooks *e* and pins *h*, with the follower F and scraper J, all made and operating substantially as herein shown and described.

78,051.—JONATHAN BUNDY, West Liberty, Iowa.—*Construction of Peat Cars.*—May 19, 1868.—The side-rails and tier of the transferable railroad upon which the ear is run form molds for the peat when it is discharged from the car. When the ear arrives upon the molding track the crank is released and the trap doors deposit the peat into the mold, and as the ear advances, when the first mold has been filled, the front board of the ear will force the peat forward to the next mold, and so on until the ear is exhausted of its contents.

Claim.—The ear A, provided with hinged bottom E E, when combined with the shaft G, cords or chains *s s*, bar *m*, and lever H, all arranged as and for the purpose set forth.

78,052.—ISAAC S. BUNNELL, Carbondale, Pa., assignor to himself, OTIS REYNOLDS, and GEORGE W. REYNOLDS.—*Corn Husker.*—May 19, 1868.—When the knife is pushed down past the end of the trough so as to separate the corn-cob from the stock, the outer arm of the rectangular lever will strike the standard, causing the other arm to throw the corn from the husk.

Claim.—The combination of the cast-iron gate, O, steel knife A, lever C, spring S, trough D, with bench B, as herein described, and for the purpose set forth.

78,053.—CHARLES BURNHAM, Philadelphia, Pa.—*Gas Heater.*—May 19, 1868.—The outer cylinder has a perforated disk within it near the top and the cylinders slide one within the other in order to raise or lower the perforated disk.

Claim.—The two cylinders arranged to slide telescopically, one within the other, to adjust the height of the plane of combustion or the length and capacity of the mixing chamber, substantially as described.

78,054.—E. P. H. CAPRON, Springfield, Ohio.—*Road Scraper.*—May 19, 1868.—By raising the handles, the rear end of the scraper is also raised, causing its forward end to catch against the ground, and by then moving the pivoted lever laterally the scraper is released, when it revolves and dumps its load.

Claim.—The combination of the scraper A, provided with the plate O, having the stop *e* and notch *n*, with the frame B, provided with the lever C, and pawl *h*, all constructed and arranged to operate as shown and described.

78,055.—ALEXANDER CARBROW, Potsdam, N. Y.—*Bolt Cutter.*—May 19, 1868.—The handles acting in conjunction with the knuckle joint and the cam upon the slide, force it toward the stationary cutter with great power.

Claim.—The devices as arranged and shown in combination, as and for the purposes set forth.

78,056.—WILLIAM B. CARGILL, New Haven, Conn.—*Fastening for Corsets.*—May 19, 1868.—A steel busk is, as usual, applied to each side of the corset, but one is made wider than the other and provided with a series of elips which receive between them, and hold, the narrow busk.

Claim.—1. The combination of the busk B with the recessed elips *a* of the busk A, substantially as described.

2. The recessed elip or female fastening device, formed with projecting lip or lips, substantially as described, and for the purpose set forth.

78,057.—D. M. CHURCH, Birmingham, Conn., assignor to himself, WILLIAM T. BEARD, and T. E. BEARD, same place—*Shuttle for Sewing Machines.*—May 19, 1868.—The bobbin is constructed without the pointed ends and turned like an ordinary spool, but smaller, corresponding in size to the ordinary bobbin.

The points which are at the ends of the ordinary bobbin are turned on detached caps between which the bobbin is placed.

Claim.—A bobbin for sewing-machine shuttles, provided with detachable ends or caps C C, having center points *b*, substantially in the manner as and for the purpose set forth.

78,058.—P. J. CLARK, West Meriden, Conn.—*Lantern.*—May 19, 1868.—The lower ends of two of the guards are bent below the ring in such a manner as to form shoulders, and the upper and lower parts of the lantern are connected together by passing the guards through the notches of the base flange, and the base is then turned.

Claim.—1. The ring E, formed as shown, with the lower ends of the guards D passing through it, and two or more of said guards provided with shoulders *d*, in combination with the flange *b* on the upper edge of the base C, with notches *c c* made in it, all arranged substantially as and for the purpose set forth.

2. The spring catch F attached to the under side of the flange *b*, when said spring catch is used in connection with the ring E and guards D, and all constructed and arranged as set forth.

78,059.—JOHN CLARKE, Redditch, England.—*Wrapper for Needles.*—May 19, 1868.—When the wrapper is opened, exposing the needles, by the opening out of the tail-piece of the wrapper, the needle sheath is caused to assume a vertical position, when the needles may be readily extracted.

Claim.—The sheath *a*, applied to the wrapper *b*, to operate in the manner and for the purpose substantially as set forth.

78,060.—WILLIAM F. COBB, Whitestown, Ind.—*Tenoning Machine.*—May 19, 1868.—The racks and pinions serve to adjust the chisels with their holders and guides toward or from each other, the adjustment being effected by turning a crank. The piece of lumber is held by the set screw upon the table with the end upon which a tenon is to be made longitudinally placed between the chisels, when the movement of the treadle will cause the chisels to descend and cut away a portion of the wood.

Claim.—1. The adjustable chisel-bar guides 4, rack-bars 3, crank 5, and pinions 6, in combination with central block D and its plates 11, arranged and operating conjointly, as and for the purpose described.

2. The construction of the chisel, consisting of the blade Q⁴, attached to the blade Q³ by the hinge joint *r*, and adjustable by means of screw *t* and link *f*, working in the arm *e*, whereby the chisel may cut a tenon at a right angle or less, all constructed and arranged to operate substantially as described.

78,061.—JOHN COMMINS, Charleston, S. C.—*Treating Mineral Phosphates for the Manufacture of Fertilizers.*—May 19, 1868.—The phosphate is heated and plunged into gas liquor from the gas-house, such liquor having been combined with sulphuric acid.

Claim.—1. Treating mineral or earthy or natural phosphates, while in a heated state, with gas liquor and sulphuric acid, when such phosphates have previously been treated with a solution of chloride of sodium.

2. Treating such phosphates, when in a heated state, with gas liquor, when such liquor is combined with sulphuric acid or any other acid or salt, whether such phosphates have been previously treated with a solution of chloride of sodium or not, substantially as and for the purposes described.

78,062.—PETER COMPTON, Sullivansville, N. Y.—*Bee Hive.*—May 19, 1868.—Various guarded openings are provided for ventilating the hive, the bottom being made of a webbing of fine wire cloth. A tube is used to transfer the bees from hive to hive. The comb-supporting bars are separated by metallic strips so that the honey adhering to each bar may be taken out separately.

Claim.—1. The herein-described improved bee hive, when constructed and arranged substantially as and for the purpose described.

2. In combination with the boxes D D, provided

with the detachable portions *h h*, and metal strips *i i*, the metallic perforated covers *k*, substantially as and for the purpose described.

78,063.—DANIEL T. CONDE, Beloit, Wis.—*Sad-Iron Holder*.—May 19, 1868.—The two parts of the holder are clasped upon the handle of the sad-iron, the holder being adapted for long or short handles by the adjustable slotted pieces of iron.

Claim.—A sad-iron holder, having lid *A*, adjustable irons *B*, pin *C*, bottom *D*, springs *E*, and shield *G*, adjusted, combined, and arranged substantially as specified.

78,064.—FREEMAN N. CORBIN, Champlain, N. Y.—*Whistle-Tree Evener*.—May 19, 1868.—When one horse pulls more than the other, the end of the double-tree to which the strongest pulling horse is attached will be drawn forward, and the clevis at the forward end of the double-tree moved toward the draught pole, while the other clevis will be moved outward therefrom.

Claim.—The combination of the double-tree *B*, clevises *F F*, bars *E E*, all arranged and applied to the draught pole *A*, to operate in the manner substantially as and for the purpose set forth.

78,065.—F. W. COY, Boston, Mass.—*Carpenters' Gauge*.—May 19, 1868.—The part which forms the guide may be set at any desired angle, so as to fit the level of the stock being worked.

Claim.—A carpenters' gauge, the guide *L* of which is capable of angular adjustment, in the manner and operating substantially as described and for the purposes set forth.

78,066.—EMERSON F. CRAWFORD, Canaan, Ind.—*Combined Seeder and Cultivator*.—May 19, 1868.—The running and operative gear are so constructed and combined that the several implements, viz, harrow, corn planter, young corn plow, seed drill, and meadow cultivator may be operated successively, receiving their motion from, and acting in combination with, the same running gear.

Claim.—The construction and arrangement of the framework and operative gear of the machine in such a manner that the different machines can be used together or successively, substantially as and for the purposes specified.

78,067.—JOHN C. CRAWFORD, St. Charles, Ill.—*Washing Machine*.—May 19, 1868.—The clothes, after being washed by the combined rolling and reciprocating motion of the large and heavy rollers, have the water expressed from them by the follower in the compartment at the end of the wash-tub.

Claim.—The combined washing machine and clothes presser, constructed as described, and consisting of the box *A*, having corrugated bottom *B* and partition *c*, the frame *a*, provided with plain rollers *C*, connecting rod *b*, and lever *D*, perforated bottom *G*, follower *F*, and lever *E*, all arranged and operating as and for the purpose set forth.

78,068.—A. J. CREEL, Hopkinton, Iowa.—*Liniment*.—May 19, 1868.—Turpentine and fish-oil are mixed together in one iron vessel, and oil of vitriol is then poured into the mixture gradually.

Claim.—A liniment, formed of the ingredients and in the proportions substantially as herein described, and for the purposes set forth.

78,069.—JOSEPH D. DAVENPORT, North Providence, R. I., assignor, by JOHN D. THURSTON, his trustee, to himself, HORACE M. CURTIS, and HENRY MARTIN.—*Clothes Drier*.—May 19, 1868.—The clamps consist of the upper thumb nut and the flanged sections of pipe which surround the central support and fill the spaces between the sets of bars.

Claim.—The application of a clamp, *E D*, to the slats *B* of a clothes horse, radiating from a common spindle, substantially as described for the purposes specified.

78,070.—V. R. DAVID, Sandwiah, assignor to himself and D. R. POMEROY, Plano, Ill.—*Inserting Artificial Teeth*.—May 19, 1868.—The wings or extensions of the plate are designed to aid the wearer

in retaining the lower plate in proper position. The air is exhausted by the operation of the mouth.

Claim.—The wings *C C*, constructed substantially as and for the purposes specified.

78,071.—ANDREW J. DAVIS, Hartford, Mich.—*Mop Wringer*.—May 19, 1868.—The sliding frame with the twisting device is drawn up near the handle when the mop is to be wrung.

Claim.—1. The sliding frame *D*, the shaft and gear wheels *E*, *F*, and *H*, arranged substantially as shown and described, in combination therewith, and with the mop *B* and frame *A*, for the purposes set forth.

2. In combination with the above, the holder *G*, constructed, arranged, and operating as described for the purpose set forth.

78,072.—JAMES E. DEAN, Canaan, Conn.—*Milk Can*.—May 19, 1868.—The milk can is enveloped in a case having a lining of felt, intended to keep the milk in a cool condition. The case may be readily detached or applied.

Claim.—The adjustable metallic case *A*, lined with felt or other non-conducting substance adhered to it, or without the lining, and the adjusting of it with the movable clasp *C D D*, substantially as and for the purpose set forth.

78,073.—EDWARD DENMEAD, Marietta, Ga., and WENDEL BOLLMAN, Baltimore, Md.—*Bridge*.—May 19, 1868.—The bolt is suspended from the top chords by the suspension rod, so as to make a better bearing for the angle iron and relieve the chords. The cushions interposed between the angle iron and chords are intended to ease the suddenness of the strain without allowing the two iron surfaces to come in contact.

Claim.—1. Supporting the angle irons *E* upon a bolt instead of upon the chords, substantially as and for the purpose described.

2. In combination with angle irons supported upon a bolt instead of upon the chords, the interposing, between said irons and chords, of an elastic cushion, substantially as and for the purpose described.

78,074.—ISAAC DRIPPS, Fort Wayne, Ind.—*Railway Car Stove*.—May 19, 1868.—The grating at the bottom of the draught opening prevents the coals from falling through the draught opening into the car, in case of accident. The stove-pipe hole is guarded by a perforated diaphragm, and the upper ventilating door, when open, exposes only a perforated portion of the stove cylinder.

Claim.—1. The grating *O* placed in the bottom of the draught opening *M*, and over the ash box, substantially as and for the purpose set forth.

2. The arrangement of the perforations *P* and door *N*, substantially as and for the purpose set forth.

3. A stove constructed with the grating *O*, perforations *P*, and perforated diaphragm *R*, arranged substantially as and for the purpose set forth.

78,075.—ALEXANDER DUNBAR, New York, N. Y.—*Horse Collar and Hames*.—May 19, 1868.—A folding horse collar, having the draught bar attached to the rear inner corner of the hames, so that it passes through the body of the collar.

Claim.—1. The draught hook *e*, attached to the staple *d*, and passing through the collar *A*, and a slotted plate *f*, attached to the hames, said plate *f* having its part *G* bent into the collar, all constructed and arranged to operate as herein described for the purpose specified.

2. In combination with the hames *B* and collar *A*, the adjustable link *b*, as herein described for the purpose specified.

78,076.—CHARLES DURANT, Jersey City, N. J., assignor to GEORGE F. DURANT, same place.—*Relay Magnet*.—May 19, 1868.—The armature or armature lever constitutes the only spring for effecting the recoil; the flexible joint in the extended armature, or armature lever, enables the platina point commonly used to open and close the local circuit, to be retained so as to move and operate over any space, however small, while the armature below the joint is free to move over greater or less space incident to varying currents, and a shifting bolt moving freely

through and upon the extended armature is substituted for the fixed platina point used for opening and closing the local circuit.

Claim.—1. The jointed armature, or armature lever, A or G, in combination with the magnet cores E or E', or Ex Exx, or either of them, substantially as herein shown and described.

2. The flexible joint, in extended armature or armature lever, substantially as and for the purpose herein fully set forth and described.

3. The shifting or sliding bolt in the extended armature or armature lever, substantially as and for the purpose herein fully set forth and described.

78,077.—PHILIP ESSER and FRANKLIN A. STEERE, North Providence, R. I.—*Machine for Setting Button Hooks.*—May 19, 1868.—A metallic button head is set upon a crooked neck and furnished with three prongs. The prongs being passed through the material are clinched.

Claim.—1. A machine for setting button holes, consisting of a revolving block, B, with acting faces as described, in combination with the spring pawl d, and jaws A A, operating substantially as set forth.

2. Constructing the jaw A with a receptacle, E, for the button hook, so as to hold and sustain the same while it is being inserted and its prongs clinched, substantially as shown and is worked.

78,078.—JULES FOUGERAT, New York, N. Y.—*Manufacture of Iodine.*—May 19, 1868.—The muscles or shells are first calcined, then pulverized and boiled in water. Sulphuric acid and protoxide of iron are then added to the mixture, in sufficient quantities to dissolve the crystals of the iodine, which are then precipitated by a current of chlorine gas, or by sulphide of carbon.

Claim.—1. Producing iodine from muscles, as set forth.

2. The process herein shown and described of producing iodine from muscles.

78,079.—M. H. GARDNER, New York, N. Y.—*Machine for Enameling Paper.*—May 19, 1868.—The enameling mixture is automatically and evenly distributed upon the paper, and blended and smoothed over the surface as the paper is fed through the machine.

Claim.—1. The arrangement, within the mixing vessel or chamber A, of the revolving brush B and stationary brushes C C, for operation together, substantially as described.

2. The combination, with the revolving brush B and stationary brushes C C, of the mixing vessel or chamber A, screen D, and slide or gate E, essentially as specified.

3. The traveling endless belt or apron J, constructed with thickened sides or edges n, and divided into sections by openings l, having fingers or grippers i, at or near their edges, as herein set forth.

4. The drums L, grooved at or near their one end, and provided with detachable rings M, in combination with the endless belt J, formed with thickened sides n, for operation together as described.

5. The combination of the trunk G, cylinder H, provided with openings c and d, revolving brush I, and valves or faucets b.

6. The rotary brush I, constructed substantially as described, with its rows of bristles, or certain of them, attached to or carried by sliding bars of less length than the brush stock, and adjustable along the same, to vary the width or length of the operating surface of the brush, to adapt it to different widths of paper, as herein set forth.

7. The angularly arranged brush or brushes N, adjustable as described, for operation on or over the surface of the paper or other material, essentially as and for the purposes herein set forth.

8. In combination with the distributing or leveling brushes N, the blending brush or brushes P, for action together, as specified.

78,080.—HENRY A. GASTON, Stockton, Cal.—*Cultivator.*—May 19, 1868.—When a "bit" or cultivator tooth needs to be turned end for end, the key is driven out and the bit slipped forward.

Claim.—1. In combination with an inclined re-

versible bit for a cultivator, the method of securing such bit to its standard, substantially as set forth.

2. The combination of the series of bits (so applied to their vertical standards) with the cultivator frame or carriage, substantially as described.

78,081.—GEORGE W. GOODWYN, Petersburg, Va.—*Churn.*—May 19, 1868.—The vertical reciprocating movement of the dasher is produced by the motion of the wheel connected to the treadle.

Claim.—The combination of a rocking wheel or lever I, with the straps G J, treadle F, dasher D, and spring E, the whole constructed and operating in the manner and for the purpose described.

78,082.—S. L. GRAY, Chillicothe, Ohio.—*Harness for Vicious Horses.*—May 19, 1868.—This harness is so arranged as to prevent the horse from kicking, rearing, and running away.

Claim.—The strap D and rings c, in combination with the strap C, pulley b, and straps F F, as herein described, for the purpose specified.

78,083.—C. C. HARE, Louisville, Ky.—*Cornice for Buildings.*—May 19, 1868.—Cast iron is placed inside the brackets, so as to render the cornice fire-proof.

Claim.—A cast iron or other metal bracket or look-out for receiving a sheet metal cornice, substantially as described.

78,084.—E. K. HAYNES, Hanover, N. H.—*Lamp Shade.*—May 19, 1868.—The screen is connected by staples to the two upright portions of the wire, so as to be adjustable vertically thereon.

Claim.—A lamp shade, made of a screen, supported upon two uprights, bent and joined at their lower ends to connect them, and to support the screen at proper distance from the chimney, and bent and made hook-formed at their upper ends to suspend the screen from the top of the chimney; the screen sliding upon the frame, and being supported relatively thereto, substantially as described.

78,085.—FREDERICK HAYTHORN, Philadelphia, Pa.—*Spinning Frame.*—May 19, 1868.—The ring-spinning frame is provided with a series of pivoted guards, there being one guard between each adjacent spindles to prevent the yarn of each bobbin or cop, while being spun, from coming into contact with that of the adjacent bobbin or cop.

Claim.—The guards E, in combination with the fingers D and shaft C, substantially as described for the purpose specified.

78,086.—WATSON A. HEATH, Apalachin, N. Y.—*Horse Hay Rake.*—May 19, 1868.—The lever extending from the main frame to the rake is made to force apart the upper ends and draw together the lower ends of two stop levers pivoted to the rear of the rake standard, thereby permitting the rake to revolve.

Claim.—1. The combination of the hand lever T, shaft S, standard R, and lever Q with each other, and with the frame E, standard M, and lever stops O, substantially as herein shown and described, and for the purpose set forth.

2. Pivoting the draught bars D, of the rake, to the frame E at points a short distance from the ends of said draught bars so that they may serve as levers in raising the rake-head from the ground, substantially as herein shown and described.

3. The combination of the hand lever K, shaft I, and arms J with the frame E and forward ends of the pivoted draught bars D, substantially as herein shown and described, and for the purpose set forth.

78,087.—G. A. HEIN, Waterford, Pa.—*Water Spout Fastening.*—May 19, 1868.—The rain spout or conductor is fastened to the building by a jointed elasp driven into the wall, so that the pipe may be attached or removed without removing the fastening.

Claim.—The conductor-fastening C, composed of two or more circular parts jointed together, and fastened to each other and to the building, substantially as herein shown and described.

78,088.—L. HENDERSON, Manson, N. C.—*Cotton Cultivator*.—May 19, 1868; antedated May 12, 1868.—Two plowshares are attached to a forward hinged frame, held in working position by a spring- catch, but turned back upon the main frame when not in use. The hoes or thinners are rotated by gearing driven by the main axle, and, as they pass along the row, cut out a portion thereof.

Claim.—The adjustable hinged plows E E, in combination with the gear wheels D and E, shaft F, and hoes G and H, constructed substantially as described and operating as and for the purpose set forth.

78,089.—JOSHUA HENDY, San Francisco, Cal.—*Concentrator*.—May 19, 1868.—The apparatus is used for saving finely-divided quicksilver, amalgam, and gold from the sands, and for concentrating and saving the sulphurets contained in ores. The connecting rod from the driving shaft accommodates itself to the circular line of direction in which the pan is reciprocated.

Claim.—1. The annular groove I, declining from a certain point to an opposite or discharging point, in combination with a vibrating or oscillating pan or concentrator, whose surface is convex or curvilinear, as described.

2. The discharge valve or gate M, when constructed and arranged to operate substantially as described.

3. The T-shaped distributors K K, pierced with holes *b b*, and having slots *b' b'*, said distributors being either stationary or movable, and when movable the notched edge *c c c*, with pawls, or their equivalents *d d*, operating therein for driving the said distributors, substantially as and for the purpose described.

4. The agitators or stirrers *a a a* attached to stationary or movable radial arms I' I', or their equivalents, with an oscillating pan, as described.

5. The peculiar construction of the frame A A, it being triangular in form, the projecting ends B B, for the crank shaft, the point A', in combination with an oscillating pan, substantially as described.

6. The overreaching supports or braces F F connecting at the point F', and in which the upper end of the vertical shaft turns, in combination with the frame A A, with the projecting ends B B and oscillating pan, substantially as described.

7. The peculiar construction of the ball crank pin N', when employed on an oscillating pan, substantially as described.

8. The oil groove H, either in the hub of the pan or on the shaft G, and the oil cavity J' above the hopper, for lubricating the sleeve and step, with an oscillating pan, substantially as described.

78,090.—RALPH D. HINE, Matteawan, N. Y.—*Facing Wool Hat Bodies with Fur*.—May 19, 1868.—The wool hat body, taken directly from the carding machine, is covered with fur upon its outer surface and under brim, and it is then placed between cloths and laid under a flat board or jigger, or other suitable device, in which a short, rapid, vibratory motion is combined with a slight pressure.

Claim.—In the manufacture of soft hats, applying a bat of fur to a bat of wool, taken directly from the carding machine, before either has been shrunk, basined, planked, or felted, and after causing them to adhere together by slight pressure, shrinking and felting them down to the required dimensions to form a solid, even fur surface upon the outer side and under brim, substantially as herein described.

78,091.—AUSTIN D. HOFFMAN, Minneapolis, Minn., assignor to himself, H. M. CARPENTER, G. F. TOWNSEND, and FREDERICK BRACKETT.—*Churn*.—May 19, 1868.—The pitman and segment are oscillated and reciprocated vertically, so as to give the dasher a compound reciprocating motion.

Claim.—The combination of the winch and crank, the pitman B, segment E', and pinion G, for communicating both a vertical and rotary reciprocating action to the dasher, substantially as set forth.

78,092.—JAMES HOFFMAN, Belvidere, N. J.—*Gage Frame for Slitting Raw Hides*.—May 19, 1868.—The tail of the hide is drawn beneath the

slotted end of the spring, which holds the hide while the slitting knife is being used.

Claim.—1. Grooving the upper edge of the frame or plank A upon which the raw hide is suspended longitudinally, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the slotted spring C with the grooved frame or plank A, substantially as herein shown and described, and for the purpose set forth.

3. Slitting raw hides by suspending them over a frame A, grooved longitudinally along its upper edge to guide the slitting knife, substantially as herein shown and described, and for the purpose set forth.

78,093.—HENRY O. HOOPEB, Diamond Springs, Cal.—*Machine for Polishing Wood*.—May 19, 1868.—The rotary and reciprocating polishing plates are mounted in an adjustable frame, which adapts them to the size of the work, and a set of feed-rollers carry the article to the plates.

Claim.—The circular rotary polishing plates E, and the reciprocating polishing plates H, arranged with and attached to the adjustable framing B', all constructed to operate as described, for the purpose specified.

78,094.—ISAAC A. HORN, Cincinnati, Ohio.—*Plate for Artificial Teeth*.—May 19, 1868.—The vacuum chambers, together with the sharp ridge on the outer rim of the plate, are intended to prevent food, especially hard particles, from passing over the upper edge of the plates.

Claim.—The suction or vacuum chambers, operating against the cheek and alveolus, and the sharp ridge on the outer rim of the plate, these to be made of any material used in dentistry, substantially as and for the purposes above set forth.

78,095.—VAN RENSSLAER W. HORTON, Palmyra, N. Y.—*Farm Gate*.—May 19, 1868.—The gate is slid back until the cleat on its end meets the loop of the movable support, when the gate balances upon a pin or other fixed support, and may be turned thereon as upon a hinge.

Claim.—1. The combination, with a sliding and swinging gate, of a movable support, provided with a roller or rollers, and loosely attached to the bottom rail of the gate by a loop or its equivalent, the whole so combined and operating substantially as herein shown and described, that the gate, when closed, rests centrally upon the support, and has a free sliding movement through or upon it in being opened and shut, and lifts it and carries it out of the passage when swung to one side.

2. The movable support K, consisting of the body represented by Fig. 3, the rollers *b b*, and the loop *e*, shown in combination with body at Fig. 2, the whole combined operating substantially as herein shown and described.

78,096.—J. P. HUMES, Winnebago City, Minn.—*Medical Compound*.—May 19, 1868.—A remedy for lung diseases. The stalk, leaves, and root of the "resin weed" are prepared by separate distillation, after which the resin and liquid are boiled together. Equal parts of the stalk and root syrup are then put together, and when cold alcoholic extract of the weed or root is added.

Claim.—The medicinal combination formed of the ingredients and in the manner substantially as herein described.

78,097.—GOTTLLOB KAISER, New York, N. Y.—*Permutation Lock*.—May 19, 1868.—The adjustable finger-pieces in the rings enable the setting of the latter to be accomplished in the dark as well as in the daytime.

Claim.—The thumb-pieces *e*, in combination with the rings C, bolt B, stamps *a*, and case A, arranged, constructed, and operating substantially as and for the purpose set forth.

78,098.—JOEL F. KEELER, Pittsburg, Pa.—*Scale Beam*.—May 19, 1868.—A number of movable poises are attached to the scale beam, and provided with stops, so as to determine the amount which the several poises shall each weigh.

Claim.—A polypoised scale beam, provided with

adjustable or variable weights and stops, and constructed and operating substantially in the manner and for the purposes as described.

78,099.—C. F. KELLER, Nevada, Ohio.—*Machine for Taking the Toll from Grain in Grist Mills.*—May 19, 1868.—The whole quantity passing through the spout is first separated into two halves, one of which is subjected to successive dividing processes, until the desired proportion is attained.

Claim.—A machine for tolling grain as it passes through it, and composed of a series of divided passages, and guiding and directing partitions, as and for the purpose described and represented.

78,100.—MICHAEL KIRKHAM, Eminence Post Office, Ind.—*Shield Plow.*—May 19, 1868.—This device is designed to prevent clods (in plowing young corn) from falling upon the plants, and at the same time to deposit the loose soil around the roots.

Claim.—The above-described shield, when made of rigid vertical bars, having both their lower and upper ends united by rigid horizontal bars, substantially as set forth.

78,101.—JOHN GEORGE KRIECHBAUM, Yonngstown, Ohio.—*Safe Door Lock.*—May 19, 1868.—The bolts are arranged in pairs, moving in opposite directions, so that there will be always one bolt out, which locks the door, unless one bolt is, at the proper time and by the proper motion, thrown out of gear. The keyhole is opened by moving a plate on the under side of the safe.

Claim.—1. The screw *a*, when operating as herein shown and described, in combination with the bar *I*, all made and operating substantially as herein shown and described.

2. The bar *f*, bar *I*, and plate *K*, when arranged as described in combination with the spring *l*, shank *k*, and plate *J*, (or stem *k* of key, and head *J* of the same,) all made and operating substantially as herein shown and described.

3. The bolts *M* and *N*, when the same are so arranged in one lock that when one bolt is moved out the other is drawn in, and *vice versa*, as set forth.

4. The rack *o*, when hinged to the bolt *M*, so that it can be turned up and thrown out of gear, as and for the purpose set forth.

5. The pin *t*, on the plate *o*, in combination with the slotted partitions 2 and 3, and hinged spring-plates *P* and *R*, all made and operating substantially as herein shown and described.

6. The plate *P*, when provided with a slot *w*, and when combined with the pin *t*, and bar *I*, all made and operating substantially as herein shown and described.

7. The plate *P*, when arranged in combination with the catch *S*, so that a full turn of the key will not keep it up, as set forth.

8. The plate *R*, when provided with a slot or recess, *y*, and when combined with the pin *t* and bar *I*, all made and operating substantially as herein shown and described.

9. The bar *I*, when provided with recesses *g*, *h*, and *x*, in combination with the plates *K*, *f*, *R*, and *P*, all made and operating substantially as herein shown and described.

78,102.—LOUIS F. LANNAY, Indianapolis, Ind.—*Machine for Washing Bristles, &c.*—May 19, 1868.—The bristles, which are subjected to frictional contact with the rubbing blocks, are clamped between the two sliding, toothed frames, one of which frames has movement within the other, and is lowered to clamp the bristles, and raised to release the same by the cam and its accessories.

Claim.—1. The combination of the vertical grooved frame *B*, crank shaft *E*, and pitman *F*, with the sliding frames *G* and *D*, for the purpose of holding and operating the said frames, substantially as shown and described, and for the purpose set forth.

2. The adjustable convex corrugated rubbing blocks *K*, in combination with the frames *G* and *D*, and cam *H*, substantially as herein shown and described, and for the purpose set forth.

78,103.—ISAAC W. LEGG, Long Eddy, N. Y.—*Pulling Hop Poles.*—May 19, 1868.—The block serves

as a fulcrum for the levers, which being made to grasp the hop pole, and then depressed, draw the pole out of the ground. The plate applied to the under side of the levers prevents them from turning sidewise.

Claim.—The levers *A*, when hinged to the upper edge of the wedge-shaped block *C*, by means of the pin *B*, and cross-bar *e*, said levers also provided with the plate *f* upon their under sides, as herein described for the purpose specified.

78,104.—LEOPOLD LEHMANN, Monee, Ill.—*Tin Ware.*—May 19, 1868.—Tinned wire is applied to the bottoms of tin ware.

Claim.—The application of round tin wire to the bottoms of tin ware, in the manner and for the purposes substantially as herein specified.

78,105.—N. C. LOMBARD and MELLEN BRAY, Boston, Mass., assignors to MELLEN BRAY.—*Machine for Forming Sheet Metal Ware.*—May 19, 1868.—Improvement on patent granted to M. Bray, December 12, 1865, and relate to the mechanism by which the dies are operated and controlled, and to a device relieving the toggles from a portion of the strain and shock attending the downward movement of the shell and plunger.

Claim.—1. Imparting the motion of the vibrating shaft *V* to the side toggles that operate and control the motion of the cutting and holding dies by means of the vibrating cranks *W W*, and the oscillating slotted levers *X X*, substantially as described.

2. So constructing the oscillating levers *X X* that a portion of the slot or path may be adjusted, substantially as described.

3. The combination of the vibrating cranks *W W* with the central crank *B'*, by means of adjustable dogs or stops, *Y Y*, substantially as described.

4. The yielding stop bars, for arresting the downward motion of the shell and plunger, substantially as described.

5. The spring fingers *d'*, or their equivalents, for removing the dish from the male forming die, substantially as described.

6. We do not claim, broadly, wedges placed under toggles for adjusting the same, for we are aware that such have been used before; but what we claim is the use of wedges under toggles for adjusting the pressure of the same when they are so attached to the toggles, and to the base in which they slide, that they may be freely moved out or in, while at the same time they hold the toggles firmly in their proper relation to the base, and prevent them from being disconnected from the same.

7. Fitting the plunger *G* to the shell *E* in such a manner that the plunger shall rest upon the shell, and be moved with it when the shell is moved up by the action of the side toggles, substantially as described.

78,106.—S. HOWARD LOMBARD, Winona, Minn.—*Dough Kneader.*—May 19, 1868.—The frame carrying the kneading roller is secured to the end section of the kneading board when it is desired to cut up the dough, form loaves, &c. When the instrument is not in use, the roller frame is secured to the middle section, and the end sections are folded up against it.

Claim.—The sectional hinged board *A*, having a detachable frame *B* and roller *C*, arranged for use therewith, substantially as shown and described.

78,107.—JOSEPH LORENZ, Cincinnati, Ohio.—*Organ Pipe.*—May 19, 1868.—The device is applied to a *vox-humana* pipe; the wind tube inclosing the customary reed being surmounted by a pipe composed of two cone frusta, joined base to base, and being open at its lower end to afford the usual communication with the reed, and closed at top by a dome-like apex instead of the usual open summit. At the widest part of the pipe is an elliptical ventage for the sound, and where a symphonic note is desired, an additional but smaller orifice is provided above.

Claim.—The *vox-humana* organ pipe *A B C c D*, formed as and for the purpose set forth.

78,108.—R. O. LOWREY, Salem, N. Y.—*Manufacture of Water-Proof Fabrics.*—May 19, 1868.—The several fabrics are rendered water proof by a

gelatinous or saponaceous compound, and are subsequently treated with a solution of alum and salt.

Claim.—1. The new water-proof fabric, produced by the combination and treatment of paper, cloth, and leather, or similar articles, substantially as herein described.

2. The process, as herein described, of combining and treating paper, cloth, and leather, or similar articles, for producing a new water-proof fabric, substantially as described and for the purposes set forth.

78,109.—JOHN H. MABBETT, Jersey City, N. J.—*Chicken Coop.*—May 19, 1868.—The mode of connecting the sides of the coop adapts them to be folded together when the ends are removed, so that the coop may be compactly stowed away when not in use.

Claim.—1. The coop, having its sides hinged, hooked, or otherwise connected, in such manner that they may be folded together when the ends of the coop are removed, substantially as herein set forth.

2. The combination of the detachable slatted end frame with the sides of the coop, substantially as and for the purpose herein set forth.

3. The shelf or ledge provided within the coop, substantially as and for the purpose specified.

78,110.—OSBORNE McDANIEL, New York, N. Y.—*Fruit Basket.*—May 19, 1868.—The side flaps are separated from the end flaps so that the former can bend with the grain freely upon a full curve, with an excess of wood, when green or wet, to allow for shrinkage in drying.

Claim.—1. The improved fruit basket or box made of one piece of veneer, having the flaps cut out at the corners, substantially as described, and bent in a curve with the grain of the wood, so as to prevent splitting in bending, and to provide for shrinkage, as herein set forth.

2. In a fruit box made of a single piece of veneer, as described, bending two sides with the grain of the wood, when green or wet, in such manner that there shall be an excess of wood in the curve, to provide for the shrinkage of the wood in drying or seasoning.

78,111.—GEORGE W. MANUEL, San Francisco, Cal.—*Gang Plow.*—May 19, 1868.—The lever crank arms, and their accessories, enable the frame and plows to be adjusted vertically. The outermost plow may be made to work close up to a fence, stump, or stone.

Claim.—1. The arrangement of the crank arms *d e f*, under the hounds or bars, and in relation thereto, as and for the purposes set forth.

2. In a gang plow, having a series of plows arranged on bars or hounds parallel to each other, placing the one plow on the bar *g*, outside of the wheel *a*, and in front of the axle, as and for the purposes recited.

3. The combination of the extended crank arms *d* and *e*, with the lever *l* and curved bar *o*, as and for the purposes herein set forth.

4. The crank screw *r* and plates *s* and *t*, for elevating and depressing the tongue, as described.

78,112.—GEORGE A. MARINER, Chicago, Ill., assignor to himself and JOHN B. TURCHIN, same place.—*Preserving Powder.*—May 19, 1868.—When the ingredients composing the powders are exposed to the air, or moistened by water or the juices contained in substances treated, or when dissolved in liquids containing said substances, free sulphurous acid gas is generated so as to form neutral mineral or vegetable salts of such a nature that when the powders are used by direct application to food, the salts thus formed are not injurious to health.

Claim.—The powders, composed of sulphites, bisulphites, or hyposulphites, or any compound evolving the sulphurous acid gas, when acted upon by acids or acid substances, in combination with vegetable or mineral acids, or with vegetable or mineral acid salts, or desiccated vegetable juices, with or without the absorbents herein specified, for the purpose of generating the sulphurous acid gas, and applying the same to various uses, substantially as and in the manner herein set forth and specified.

78,113.—CHARLES MELLINGER, Cornwall, Pa.—*Furnace for Roasting Ores.*—May 19, 1868.—The damper regulates the passage of the heat and products of combustion from the smelting furnace to the desulphurizing furnace here represented. The ore to be desulphurized is placed on the grated arch through which the heat rises, and the larger lumps roll into the chamber adjoining the exit opening, through which chamber the heat passes from that beneath the grated arch.

Claim.—1. In combination with a desulphurizing furnace or oven for preparing iron ore for smelting, the sliding door or damper B, arranged and operated substantially as described.

2. In combination with a desulphurizing furnace, for the purposes mentioned, the grated or perforated arch F, substantially as described.

3. The combination of the arch F, the chambers E and H, the apertures J and L, and the damper B, substantially as and for the purposes described.

78,114.—JOHN MILHOLLAND, New Concord, Ohio.—*Horse Hay Fork.*—May 19, 1868.—When the fork is loaded the handle falls below the upper eye, and is thus protected from any blow which might casually discharge the load.

Claim.—The construction and arrangement of the handle C, connected with the sliding bar B by the arm E, turning on the pivots *e e'*, the lower ends of said handle pivoted to the stud *e* upon the bar A, the bent trigger F *f* pivoted upon the pin *e* of the bars E and handle C, all operating as described, for the purpose specified.

78,115.—WILLIAM J. MILLER, Washington, D. C.—*Sash and Shutter Fastening.*—May 19, 1868.—By turning the operating rod at the inside of the sill the locking bar which holds the shutter catch is raised, and at the same time the hook which fastens down the sash is turned so as to release the same.

Claim.—The combination of the shutter catch *b*, lock C, rod *h*, hook *k*, and plates *i* and *j*, or the equivalents of said plates, constructed, arranged, and operated in the manner substantially as shown and described, and for the purpose of locking or unlocking shutters and sash from within the room.

78,116.—MARQUIS D. MOORE, Brooklyn, N. Y.—*Button.*—May 19, 1868.—The larger part of the button is recessed, dovetailed, and notched, and the smaller interlocking part has a corresponding form, the two parts being stitched to the respective portions of the garment and made to hold the same together.

Claim.—1. The fastener formed in two sections, A B, fitted to each other, substantially as shown and described, for the purpose set forth.

2. The lateral spurs *a** of the piece B, arranged to act in connection with the notches *b'* at the sides of the recess in the piece A, substantially as and for the purpose specified.

78,117.—ENOCH R. MORRISON, Pittsburg, Pa.—*Machine for Casing Tobacco.*—May 19, 1868.—Tobacco leaves and a liquid compound are placed in a receiver which is rotated for a short time for casing or sweetening tobacco.

Claim.—The method of casing tobacco by means of a hollow revolving vessel, receiver, or its equivalent, working on a shaft, journals, or rollers, the receiver being made of any required shape or dimensions for the purposes set forth.

78,118.—E. A. MULLER and THEODOR STOCK, Chicago, Ill.—*Doubler for Stills.*—May 19, 1868.—An upright cylinder is closed at both ends and provided on the interior with a series of pans and abutting plates which detain the ascending vapors and arrest the products of condensation, so that the lower degrees of spirits will be separated from the finer, while the pure alcoholic vapors are allowed to escape to the cooler, and the low wines reconducted to the mash.

Claim.—1. Arranging around the outside of a rectifier or doubler, A, a series of annular cooling vessels, D D, which communicate with the upper part of the vessel A, substantially as and for the purpose herein shown and described.

2. The arrangement and combination, within the

eylinder A, of the dishes E, plates F, and combined dishes and plates G, all made and operating substantially as herein shown and described.

78,119.—BARAK T. NICHOLS, Newark, N. J.—*Manufacture of Cart Saddles.*—May 19, 1868.—The bridge is bent so as to play freely in the groove of the bridge pieces and apply the main pressure to the upper part of the same, and the under side of each bridge piece resting on the back of the pad is rounded in order to turn without causing the pad to chafe.

Claim.—The bridge *a*, bridge pieces *c c*, pads *f*, tugs *i*, and tug straps *j*, all combined, constructed, arranged, and connected, substantially in the manner and for the purposes specified.

78,120.—WILLIAM R. NICHOLS, Philadelphia, Pa.—*Car Spring.*—May 19, 1868.—The layers at the top and bottom of the spring are fitted to a sleeve and are secured at the lap joints. The saddles assist in maintaining the component parts of each spring in their proper lateral position.

Claim.—One or more springs, each of which is composed of one or more layers, in the manner described, in combination with saddles constructed and adapted to the said spring or springs, substantially as specified.

78,121.—P. O'BRIAN, Philadelphia, Pa.—*Mop and Scrubbing Brush Holder.*—May 19, 1868.—The holder is adaptable to scrubbing brushes of different size, and may serve as a mop head.

Claim.—1. Cross-bar B, cast on shank A, with opening *c c*, and projections *d d*, for the use and purpose as specified and herein set forth.

2. The swinging clamp E, made of wire or other material, in the shape shown, and for the use and purpose as specified and herein set forth.

3. A "mop and brush holder," constructed of shank A, cross-bar B, nut N, swinging clamp E, and hook F, as connected, combined, and adjusted, for the use and purpose specified and herein set forth.

78,122.—VOLNEY O'BRIAN, St. Johns, Mich., assignor to DEWITT C. and AMELIA O'BRIAN.—*Fireman's Elevator.*—May 19, 1868.—A telescopic arrangement of frames supported upon a wheeled truck and projected upward by a crank and gearing.

Claim.—The arrangement, in a machine for the purpose set forth, of the wagon B, stationary frame C, movable frames, ropes, and sheaves, and lateral supports G H, and screws L, substantially as described.

78,123.—GEORGE T. PALMER, Brooklyn, N. Y.—*Crib and Bedstead.*—May 19, 1868; antedated May 5, 1868.—For elamping the sides of the covers of a bed so as to hold them in place.

Claim.—A bedstead, provided with a clamp, composed of the part B, having spring bolts *a*, and racks *b*, or their equivalents, substantially as and for the purpose shown and set forth.

78,124.—CHARLES B. PAYNE, Bloomington, Ill.—*Harness Buckle.*—May 19, 1868.—A double buckle having enrvd wings and a central loop, arranged to be self-attaching to the straps and other parts of the harness.

Claim.—A double buckle, constructed with a central plate, A, wings, B B, and loop, D, cast in one piece, and with both ends alike, substantially as and for the purpose described.

78,125.—WILLIAM PERKINS, London, and GEO. GRANGER TANDY, Penge, England.—*Material for Insulating Telegraph Conductors.*—May 19, 1868.—The sulphur and rubber are combined by being passed between rollers, or by mastication, and then the anthracene and naphthaline are added by a similar process.

Claim.—The combination of anthracene or paranaphthaline and naphthaline, with India-rubber, gutta percha, gum ballata, and other analogous vulcanizable substances, and sulphur, for the purpose of producing a preparation or compound applicable to the uses or purposes above mentioned, or any analogous purposes.

78,126.—ADOLPHI PHILIPPI, Elizabethport, N. J.—*Railway Switch Plate.*—May 19, 1868.—A cast iron bed, with upward projecting flanges around all sides, serve to prevent a wrought iron plate and an interposed wooden layer from sliding off the bed; a series of T-shaped blocks being arranged on the wrought iron plate to hold the rails down.

Claim.—Switch plate, consisting of bed plate A, elastic bed B, and plate C, and of the removable blocks D and E, all made and operating substantially as herein shown and described.

78,127.—J. S. PIERSON, Brooklyn, N. Y.—*Machine for Cutting and Stamping Soap.*—May 19, 1868.—The stamps are first brought down upon the slab by depressing the lever, and, while holding down the stamps, the treadle is depressed to bring down the knives. The stamp frame rises by the action of its sustaining springs.

Claim.—1. The combination of stationary knives F, sliding slab table G, stamps I, and cross knives P, for operation together, substantially as specified.

2. The cross knives, frame, and stamp frame arranged independently of each other, in combination with devices for separately operating the same by foot and hand, as herein set forth, and whereby the slab may be held by the stamps while the cross knives are entering and receding, essentially as described.

3. The combination of the knives F, made of a sloping character, as shown and described, and sliding slab table G, for action in concert, as specified.

78,128.—CLARK POLLEY, Sinking Spring, Ohio.—*Mole Trap.*—May 19, 1868.—The mole in attempting to effect a passage underneath the cross-bar on the lower end of the trigger staff, actuates the trigger, and releases the tube carrying the prongs, and is consequently impaled by the latter.

Claim.—The combination of one or more pointed stakes A, with a cross piece, B, the tubes, *e* and *d*, the spring *g*, trigger staff *n*, lever *l*, erutch head *b*, having points *f f*, all constructed and operating together substantially as shown and described, and for the purpose set forth.

78,129.—A. C. RAND, Westfield, Mass.—*Covering Whips.*—May 19, 1868.—To a whip stock is applied thread which has been saturated with a water-proofing solution, the thread being applied to the stock before such solution is dry upon the same.

Claim.—The process of covering whips, substantially as herein specified.

78,130.—WARREN RICHARDS, Jr., Cincinnati, Ohio, assignor to himself and SHIPLEY and SMITH, same place.—*Gauge for Embossing Presses.*—May 19, 1868.—The gauge is attached to presses for embossing and stamping initials, monograms, &c., upon paper, envelopes, and cards, the impression being made at any desired part of the article.

Claim.—1. The arrangement, substantially as described, of the slotted plate C, stops H, and springs I, or their equivalents, as and for the purpose specified.

2. The combination of the longitudinal slot F and branch slot G, for the object explained.

78,131.—PETER RICHMOND, Aberdeen, and ABNER MCFARLAND, Allensville, Ind.—*Boot Crimper.*—May 19, 1868.—The leather to be crimped is adjusted to a crimping form, which is placed in or against the mouth or upper ends of the upright jaws. The cam lever at the end of the table is drawn outward at the top, thereby causing the forked rod to force the form and leather downward between the jaws.

Claim.—1. The lever E, in combination with the hook *j*, when constructed, used, and operated substantially as and for the purpose set forth.

2. The arrangement of the jaws B B, bolt *g*, eccentrics, C and D, lever E, and forked rod *j*, the several parts being constructed and operated substantially as and for the purpose specified.

78,132.—CHARLES H. RIGGS, Windsor Locks, Conn.—*Planer Chuck.*—May 19, 1868.—The chuck is arranged upon the bed plate so that the work can be

quickly secured, and the chuck rotated with facility the work being thereby brought at any desirable angle to the action of the tool.

Claim.—1. In a milling or planing chuck, the combination of the bed plate *a* and angle iron *b*, chuck *g g'*, screw bolts *e*, and nuts *f*, substantially as and for the purpose described.

2. The combination of the round or dovetail adjustable nuts *s*, screws *s'*, with the jaws *m*, with the index *u*, substantially as shown and set forth.

78,133.—CONRAD FREDRICK LUDWIG RISCH, Huntingburg, Ind.—*Heliometer.*—May 19, 1868.—This device enables the exact degree of latitude at which an observation is made to be ascertained with facility, and it also serves to indicate date and time when the latitude is known.

Claim.—1. A heliometer, constructed and arranged to operate in the manner herein shown and described.

2. The plate *E*, when arranged as herein shown and described, and when provided with a pointer, *K*, in combination with the curve *d*, on the stationary frame *A*, all made as set forth.

3. The plate *F*, when arranged as set forth, in combination with the curve *L* and pointer *l*, on the stationary frame *A*, all made and operating substantially as herein shown and described.

4. The sun dial *H*, on the revolving block *C*, when combined with the plates *E* and *F*, all made and operating substantially as herein shown and described.

5. The sun dial *D* and gnomon *f*, in combination with the semi-cylindrical dials *H* and *H'*, and their gnomous *g*, all made as described.

6. The manner herein shown and described of making, dividing, and arranging the plate *E*.

78,134.—HENRY R. ROBBINS, Baltimore, Md., assignor to himself, J. J. MORAN, and G. COLTON, same place.—*Steam Pipe Coupling for Railroad Car Heaters.*—May 19, 1868.—A flexible and self-adjustable joint, for connecting the ends of the steam pipes in a train of cars, so as to admit of the heating of the cars by steam or hot air from the locomotive.

Claim.—1. The combination of the pipe *D* with the sleeve *E*, sliding pipe *F*, having the opening *f*, and the spring *G*, substantially as and for the purpose specified.

2. The cap *I*, composed of one piece, and operating in connection with the spring *M* and pipe *C*, substantially as and for the purpose described.

3. The cap *J*, composed of two parts, *j j'*, and operating in connection with the pipe *F*, springs *n n*, sleeve *E*, and cap *I*, substantially as and for the purpose set forth.

4. The combination of the pipes *C* and *E*, and sliding section *F*, with the spring *G*, when the parts are constructed to operate in the manner and for the purpose described.

5. The combination of two sliding caps *I* and *J*, with connecting steam pipes *C F*, to prevent the escape of steam from the joint formed where they connect, substantially as specified.

78,135.—ALBERT J. ROOF, Peoria, Ill.—*Rolling Pin.*—May 19, 1868.—The hollow of the rolling pin is enlarged at each end to receive the blocks forming part of the two detachable instruments. The disk on the stem of the masher forms an abutment for the masher block at one side, while the springs serve a similar purpose at the opposite side, when the masher is in use.

Claim.—A rolling pin, constructed in the form herein shown, and having combined therewith, in the manner described, a cake cutter and vegetable masher, the latter working with the springs *B*, substantially as specified.

78,136.—JOHN RUHL and ELIAL S. HERRINGTON, Defiance, Ohio.—*Hay Raker and Loader.*—May 19, 1868.—The lever and its accessories are employed to raise and lower the teeth which follow the hind wheels and gather the hay, so that it may be reached by the slatted toothed conveyer that elevates and deposits the hay upon the wagon.

Claim.—The lever *N*, slide *m*, bar *L*, and rod *p*, combined, as and for the purpose set forth.

78,137.—GEORGE O. SANDERSON, Boston, assignor to himself and FREDERICK M. BAKER, South Reading, Mass.—*Cake Cutter.*—May 19, 1868.—The spring plunger will, if permitted, withdraw the cutter from the dough, leaving the cake or biscuit upon the board, but in case it be desired to lift the biscuit from the board the disk may be held by the crooked end of its stem until the cutter is moved to the place of deposit.

Claim.—In a biscuit cutter, the combination and arrangement of the disk *B*, spring *D*, and stem *C C'*, substantially as described and for the purpose set forth.

78,138.—JAMES SANDERSON, Fredericksburg, Ohio.—*Hoisting Apparatus.*—May 19, 1868.

Claim.—The arrangement of the ways *A A*, the tilting frame *I*, car *E*, with its rollers *g g*, hooks *x x*, windlass *C D*, and cord *m*, the whole combined and operated as specified.

78,139.—LEVI SCOTT, Burgettstown, Pa.—*Churn.*—May 19, 1868.—The two vibrating arms carrying rollers upon their extremities, and operating in conjunction with the polygonal wheel and the pendulum, serve to regulate the motion of the churn dasher.

Claim.—The combination and arrangement of the wheel *P*, rollers *N N*, segment-head *L*, pendulum *J K*, horizontal lever *G*, weight *C*, dasher rod *S*, pitman *H*, and brake *F*, with the gearing *D D D D*, and frame *A*, constructed substantially as described.

78,140.—THOMAS SHIPTON, Newark, N.J.—*Feed Water Heater.*—May 19, 1868.—The cylinder, suspended from the lever, is caused to descend by the water within it when that within the reservoir rises to a certain point, the valve of the water supply pipe being thereby closed.

Claim.—1. The cylinder *h*, suspended from the lever *g* of the valve *f*, and connected with the reservoir *a* by the flexible pipe *j*, substantially as and for the purpose herein set forth.

2. In combination with the reservoir *a*, the elbow *b*, having a flat lower surface, the exhaust pipe *c*, and water supply pipe *d*, provided with a broad flange, *e*, around its top, forming a seat for the valve *b*, all constructed and arranged to operate as and for the purpose herein specified.

78,141.—SILAS SHIRLEY, Santa Clara, Cal.—*Tire Tightener.*—May 19, 1868.—The metallic tip on the end of the spoke incloses an adjusting screw having a central head and right and left threads, which latter work in nuts on the extremities of the felloe for the purpose of drawing together or spreading apart the same. The covers for this adjusting device are kept closed by a screw, but may be readily removed to admit of the application of a wrench.

Claim.—In the tip *B*, having sockets for the felloes, the covers *F F*, substantially as and for the purpose herein described.

78,142.—CHARLES A. SIECKE, Philadelphia, Pa.—*Apparatus for Bundling Cigars.*—May 19, 1868.—Designed to facilitate the packing of cigars in bundles, the parts being adjustable to accommodate cigars of different sizes.

Claim.—The base *A*, back *B*, permanent frame *C*, and adjustable frame *C'*, in combination with the adjustable rods *G G'*, or their equivalents, the whole being constructed and arranged substantially as and for the purpose herein set forth.

78,143.—ANSELMO B. SMITH, Plattsmouth, Neb.—*Carriage Wheel.*—May 19, 1868.—The dovetail form of the inner end of the spokes in connection with the concave collar prevents the shifting of the spokes in the direction of their length, and in case of shrinkage, the spokes may be adjusted outward to tighten them and the tire by placing a thicker band on the hub.

Claim.—1. The wheel, consisting of the beveled and dovetailed spokes *b*, with the inner inclined end resting upon the collar *d*, surrounding the tube *C*, and secured in place against the concave collar *G* by means of the loose collar *F* and nut *E*, all constructed as described, for the purpose specified.

2. The securing of the hub on the axle by means of

the slot *e* in the axle G, the key or slotted disk H, and the screw cap I, all arranged substantially as and for the purpose specified.

78,144.—EDWARD A. SMITH, St. Albans, Vt., and HASKELL G. SMITH, Goshen, Conn.—*Harvester*.—May 19, 1868; antedated May 9, 1868.—A movable bush of brass or other similar metal is introduced into the bar which is attached to the inner end of the cutter bar and connects the latter with the pitman rod from the driving crank.

Claim.—The bush *e*, made as set forth, and introduced in the end of the cutter bar, to receive the journal of the connecting rod, in combination with the oil receptacle *i*, as and for the purposes set forth.

78,145.—H. B. SMITH, Essex, Conn.—*Fan*.—May 19, 1868.—The wings are all connected together by means of a central pin, and when the fan is folded up the handles can be turned so as to rest on the wings to which they are attached.

Claim.—As a new article of manufacture, a fan, whose handles C are pivoted to the outer ends of the extreme wings of the same, substantially as described, for the purpose of allowing them to be folded out of the way, as set forth.

78,146.—MATTHEW D. SMITH, Independence, Iowa.—*Seeder and Cultivator*.—May 19, 1868.—By a lateral movement of the first-mentioned lever the distributing rod and slide are simultaneously moved longitudinally, thereby uncovering the exit passages for the seed and throwing the rod into gear with its driving wheel.

Claim.—1. The combination of the pivoted lever J, distributing rod C, and slide E, when arranged and operating as and for the purpose set forth.

2. The combination of the lever F with the rod G and shovel arms H', substantially as described.

78,147.—MOORE SMITH, Worcester, Mass., assignor to himself and T. W. WELLINGTON, same place.—*Horse Rake*.—May 19, 1868.—The rake head is released from the stop bar, and at the same time the grooved ring is thrown into engagement with a ratchet sleeve on one of the wheel hubs, thereby causing the rake to be raised by power derived from the wheel.

Claim.—1. The combination, with lever P, chain or cord *j*, and stop piece S, of the stop bar R, said parts being arranged in relation to each other substantially as and for the purposes set forth.

2. The combination, with axle or head A, of the foot-piece T, arm *m*, and treadle U, substantially as and for the purposes set forth.

3. The combination of the unlocking piece G with the grooved ring F and its inclined tooth or projection *e*, substantially as and for the purposes set forth.

78,148.—WILLIAM SPRAGUE, Lynn, Mass.—*Water Closet*.—May 19, 1868.—The supporting lever is forced downward and the concave cover connected thereto is thus carried downward and sidewise, so as to be out of the way.

Claim.—In combination with the casing A, having outlet F and hinged seat B, the concave cover D, rock shaft *a*¹, link *e*, pivoted lever E, having extension *a*², and spring G, all constructed and arranged to operate in the manner and for the purpose substantially as herein shown and described.

78,149.—GEORGE STACKHOUS, Mount Washington, Pa.—*Bread, Meat, and Vegetable Cutter*.—May 19, 1868.—The box has a sliding top, permitting the cut substance to be placed in front of the spring-actuated plunger, which feeds it forward to the knife, the latter being operated by the hinged end of the box.

Claim.—1. The inclined actuating surfaces *f f*, connected with a hinged end, D, by rods *d d*, all substantially as described, for the purpose of operating the knife *n*, all as set forth.

2. The movable partition *b* operated by spring tension, substantially as and for the purpose described, in combination with the inclined rods *f f*, hinged end D, and knife *n*, all as set forth.

3. The box A A A C, having a sliding top, B,

hinged end D, and slots *j*, in combination with the spring G, partition *b*, and knife *n*, all as set forth.

4. The concave and convex strips *g g*, substantially as described, in combination with the inclined surface *f f*, rod *d d*, hinged end B, and knife *n*, for the purpose of imparting a lateral movement to the latter all as set forth.

78,150.—H. P. STAFFORD and J. A. LEFORGEE, Decatur, Ill.—*Regulating the Supply of Water to Steam Generators*.—May 19, 1868.—When the float rises by the increase of water in the boiler, the elliptical valve in the supply pipe closes correspondingly, and at a certain point entirely shuts off the water.

Claim.—The arrangement of the float A, stem B, solid ball R, spindle C, valve E, box D, perforated arm F, adjustable connecting rod J, slotted arm H, stem *s*, and elliptical valve G, in the supply pipe P, all constructed and operated as herein shown and described.

78,151.—ELI T. STARR, Philadelphia, Pa.—*Articulator*.—May 19, 1868.—This device being free from regular hinges and moving on cone-shaped pivots retained in position by springs, admits of a ready detachment of the parts and self-tightening or close working of the joints, and the upper plate, which is bent or crooked, may be reversed so as to change the distance between the two plates to suit both upper and lower dentures.

Claim.—1. The attachment of the lower plate A to the upper plate B, or its bracket, by cone-shaped pivots *a*, arranged to fit V-shaped grooves *b*, and retained in position by springs, substantially as specified.

2. Constructing the reversible upper plate B with a crook, as at *d*, essentially as and for the purpose herein set forth.

78,152.—JOSEPH STEGER, New York, N. Y.—*Scuttle Cover and Ladder*.—May 19, 1868.—The lever extends from a hinged ladder to a hinged scuttle cover of a house or vessel, so that by turning down the ladder the scuttle cover is raised, and by raising the ladder the scuttle cover is closed and locked.

Claim.—The arrangement of a lever, *e*, connecting the ladder A and cover B, substantially as and for the purpose described.

78,153.—FRANCIS A. STERRY, Canton, Mass.—*Anti-Friction Roll*.—May 19, 1868.—Raw hide saturated with oil, is used as a substitute for wood and metal.

Claim.—As a new article of manufacture, a self-lubricating wheel for pulleys, sheaves, &c., constructed as described, consisting of the plates of raw hide C soaked in oil, revolving upon the shaft A, and held in position by means of the rivets D and metallic plates B, as herein described, for the purpose specified.

78,154.—STEPHEN STOUT, Tremont, Ill.—*Trace Holder*.—May 19, 1868.—The traces when detached from the whiffle-tree are hooked to the device which is attached to the harness directly above the horse's hips, or at the point where the hip straps are attached to the back strap.

Claim.—The device B E F, formed by forming the hooks E and guard loops F upon or attaching them to the ring B, constructed substantially as herein shown and described, and for the purpose set forth.

78,155.—MICHAEL H. SULLIVAN, Providence, R. I.—*Cribbing Preventer*.—May 19, 1868.—The head of the animal is flexed back against the neck, and the end of the spindle, impinging against the jaw, thrusts the pricking points into the neck, causing the animal to desist from cribbing, &c.

Claim.—1. The combination of the pricking points *g*, screw shank *b*, hollow spindle *a*, spring *s*, and plate B, substantially as described, for the purpose specified.

2. The plate B, in combination with the longitudinally sliding pricking points *g*, substantially as and for the purpose shown and described.

78,156.—WILLIAM SWAN, New York, N. Y., assignor to himself and LOUIS DUHAIN, Jr., same place.

—*Ornamenting Fabrics.*—May 19, 1868.—A series of small beads or drops, made of gum arabic or other gum, is secured to the fabric, said beads being translucent, presenting the appearance of drops of water or particles of crystal.

Claim.—An ornamental fabric, provided with drops or beads *a a*, that are composed of the material, and are made and applied in the manner, substantially as herein shown and described.

78,157.—ISAAC C. TATE, New London, Conn.—*Brace for Bits.*—May 19, 1868.—Secured to each arm of a brace which has a slotted socket, is a cast-steel spring jaw, which clamps the round portion of the bit, and on which is formed the shoulder for sustaining the head or shank of the bit.

Claim.—The combination of the spring jaws C with the socket of the bit stock, substantially as herein shown and described.

78,158.—EDWIN J. TOOF, Fort Madison, Iowa.—*Pencil Holder.*—May 19, 1868.—A pencil holder has an erasing pad near the point, the rubber or sponge being thus always in a convenient position for use.

Claim.—1. The combination of the case *b* and its erasing pad B with the inner case *a* and finger rest *d*, all constructed and operated substantially as shown and described, and for the purpose set forth.

2. The attachment of an erasing pad, B, to the pencil end of a pencil case or holder, substantially as shown and described, and for the purpose set forth.

78,159.—JEAN BAPTISTE TOSELLI, Paris, France.—*Apparatus for Freezing.*—May 19, 1868.—The liquid to be congealed or cooled is contained in a metallic cylinder inclosed by another cylinder and surrounded by the chemical refrigerating substances, the apparatus being rotated or oscillated to thoroughly agitate the liquids.

Claim.—1. The method of congealing and cooling liquids by the application of the chemical refrigerating substances, substantially as herein described.

2. The successive mixture and combination of water and subcarbonate of soda with nitrate of ammonia, as and for the purpose herein described.

3. The apparatus herein described, or its substantial equivalent, for congealing and cooling liquids with chemical refrigerating substances, substantially as described.

78,160.—JOHN JACKSON WAIT, Oreana, Nevada.—*Lamp Chimney Cleaner.*—May 19, 1868.—The instrument consists of a wooden handle, to which are attached a spring and ension connected with a guide and thumb piece, by which the spring is expanded to press against the inner surface of the chimney.

Claim.—The combination of the cushion G and the spring E, the thumb piece F, at the lower end of the spring, and the slide D, operating on the guide plate C, the whole constructed and made to operate substantially as and for the purpose herein described.

78,161.—W. Y. WARNER, Wilmington, Del.—*Snow Plow.*—May 19, 1868.—This car, with its steam-boiler and arrangement of steam pipes, is employed for the purpose of melting snow or ice upon or between the rails.

Claim.—1. The steam pipes F arranged beneath the body of the car, parallel to the track, in combination with a pipe or pipes, E, having nozzles so arranged that steam may be discharged in a series of jets on the track between the rails, as and for the purpose described.

2. The combination of the above and the water reservoir D, as and for the purpose specified.

3. A casing, surrounding a track-cleaning apparatus, in combination with a flue or flues, H, arranged to conduct the vapors from the casing, substantially as and for the purpose set forth.

78,162.—SETH WAY, La Porte, Ind.—*Sled.*—May 19, 1868.—The bolts which fasten the runners and side pieces of the sled to the knees, also serve to secure those parts to the cross-beams and fasten the shoes to the runners.

Claim.—The combination of the knees E E, head-

block C, thimbles I I, braces J J, and tongue K, respectively, constructed and arranged substantially as set forth.

78,163.—WILLIAM WEBSTER, Morrisania, N. Y.—*Weaving Pile Fabrics.*—May 19, 1868.—The support of the wire head serves to push the wire forward, the head being transferred to a point quite or nearly opposite to the fell of the cloth, or where a wire is left on being bent up by the reed.

Claim.—1. In combination with the pusher, the spring A², sliding block A³, and spring A⁶, all constructed and arranged substantially as described.

2. The herein-described apparatus for operating pile wires, when constructed and arranged substantially as described.

78,164.—DAVID WEISER, Philadelphia, Pa.—*Hammer Handle.*—May 19, 1868.—The beveled ends of the cheek-pieces are introduced into the recess of the hammer head, and the handle being then driven into its place wedges apart the ends of the cheek-pieces.

Claim.—The handle D, collar B, its cheek-pieces *d d'*, with beveled ends, adapted to the dovetailed recess *c*, in the head of a hammer or other tool or implement, the whole being constructed and arranged substantially as and for the purpose herein set forth.

78,165.—WILLIAM WHARTON, Jr., Philadelphia, Pa.—*Railroad Switch.*—May 19, 1868.—The switch rails and the main rails are brought into contact with each other by the lever, and the wheels of a car passing from the main track to the turnout, or *vice versa*, will gradually mount the inclination of the movable switch rail so as to raise the flanges over the permanent main rail.

Claim.—The permanent rail A, and laterally flexible rail A', of the main track, in combination with the movable switch rail D, forming a continuation of the rail B of turnout, and the fixed rail B' of the same, the whole being arranged and operating substantially as and for the purpose herein set forth.

78,166.—THOMAS J. WHITNEY, Whitpain Township, Pa.—*Car Brake.*—May 19, 1868; antedated May 9, 1868.—When the engine is checked and the buffer-bars come together, the brakes are applied to the cars by power derived from the sliding motion of the buffer-bars and transmitted through the medium of the devices claimed.

Claim.—1. The buffer-bar A, rod C, band O, rock-arm H, rods *e e'*, lever D, bolt T, and the rubber block or spring S, when constructed and combined as shown.

2. The notched rod C and the rod N, in combination with a clamp fixed to the axle K of a car, as shown.

3. The notched rod C, in combination with the rock-arm H, rods *e e'*, lever D, rod G, and the brake-bars E and F, as shown and described.

78,167.—JAMES WILKINSON, Bowling Green, Mo.—*Lifting Jack.*—May 19, 1868.—A movable fulcrum is actuated in a vertical direction by the lever that moves the weight, at each successive stroke of said lever, so as to maintain the fulcrum at a uniform distance from the weight to be raised.

Claim.—1. The posts A A, when provided with the segmental serrated grooves *a¹ a³*, and combined with a movable fulcrum, B, substantially in the manner and for the purpose herein shown and described.

2. The fulcrum head B, when provided with the spring bearing pins *b*, and otherwise arranged, as herein set forth and described.

78,168.—ZABDIEL A. WILLARD, Boston, and WILLIAM G. ADAMS, Franklin, Mass.—*Treating Metals and Minerals.*—May 19, 1868.—Immediately after the stream of melted metal leaves the orifice of the crucible, it encounters a jet or blast of air or gas, which is projected across the jet of metal with considerable force.

Claim.—1. The process of dispersing or subdividing melted metals or minerals into fine particles, by means of a blast of highly compressed air or other gases, which impinges upon one or more fine streams thereof, the gases present, and the temperature of

the metal, being respectively such that chemical action shall be thereby prevented, substantially as described.

2. The process of converting metals or minerals into other products, by means of a jet or blast of air or gas, acting upon one or more fine streams of said metals or minerals in a melted state, as described, which jet or blast subdivides and disperses the material, and also acts chemically upon the same, substantially as described.

3. The process of converting metals or minerals into other products by means of a blast of air or other gas applied thereto, when said metals or minerals are continuously supplied in regulated quantities to said blast in a subdivided and highly heated condition, substantially as described.

4. The treatment of metals or minerals, by either of the methods before claimed, in a chamber filled with an atmosphere chemically so composed that by means of the same, in combination with the gas introduced by the dispersing blast, the desired chemical reaction may be produced or prevented, substantially as described.

5. An apparatus, (for the performing some of the operations described,) consisting, substantially, of the combination of a crucible or reservoir with one or more delivering jets, a furnace for heating the same, and one or more blast pipes, corresponding to said jets, co-operating substantially as described.

6. An apparatus, consisting of the combination last claimed, in combination with the converting chamber, substantially as described.

7. Combining with the converting chamber, as described, a means for supplying gas thereto separate from the discharging blast, substantially as described.

78,169.—LINUS WOODWORTH, Troy, Pa.—*Horse Hay Fork.*—May 19, 1868.—One bow is pivoted within the other, and after their pointed extremities have been forced into the hay, the lower ends of the bows are spread apart by the depression of the slide bar, which latter is raised by the tripping cord so as to close the bows and discharge the hay.

Claim.—The two bows, pivoted together, and having their extremities pointed, and furnished with lateral spurs or shoulders, in combination with the toggle bar, slide bar, and shank, substantially as and for the purpose specified.

78,170.—O. H. WOODWORTH, Columbia City, Ind.—*Winding Stop for Weight Clocks.*—May 19, 1868; antedated May 7, 1868.—The upward impingement of the weight against the elevating rod throws the stop pawl into engagement with the teeth on the disk which is made fast upon the winding shaft, the winding up of the shaft being thereby stopped at the desired point.

Claim.—1. The application of the ascending motion of the weights of weight clocks, when such weights are being wound up, to the stopping of the winding of the clock at any desired point in the ascent of the weights, for the purposes specified.

2. The construction and application of a weight clock winding stop, operated by the ascending motion of the clock weights when they are being wound up, substantially in the manner and for the purposes described and illustrated.

3. The combination and arrangement of the elevating rod *e*, the connecting rod *r*, the stopping pawl *u*, and the stops *o*, when used in connection with the winding shaft *n*, and weight *W*, in the manner described, and for the purposes mentioned.

78,171.—JACOB J. WRIGHT and JOHN H. PENNY, Harrison, Ohio.—*Corn Planter.*—May 19, 1868.—The hinge joint and adjusting chain adapt the plow to any desired position in relation to the dropping device, the ground wheel runs in the furrow made by the forward share, and the covering shovels are loosely hung to the shaft of said wheel so as to override obstacles.

Claim.—1. The hinge joint *F* and adjusting chain *G*, when used in combination as a means of giving mobility and adjustment to the plow and seed box for the purpose specified.

2. The covering shares *J*, when swiveling on or near the axle of the ground wheel or wheels as described, and for the purpose specified.

3. The gravitating round headed plug *R*, for the purpose described.

78,172.—JOHN ZIMMER, Pittsburg, Pa.—*Furnace for Boiling and Puddling Iron and other Metals.*—May 19, 1868.—The chamber or basin of the puddling furnace is provided with boshes or water spaces which are connected with an elevated tank by supply and return pipes, so that the same water is used continually.

Claim.—A cast iron puddling basin or chamber, having a bosh or water space east therein around its sides, in combination with an elevated water tank, and communicating with each other by means of supply and outlet pipes, the whole being constructed, arranged, and operating substantially as and for the purposes herein set forth.

78,173.—JOHN W. ADAMS, Spring Creek, Wis.—*Car Coupling.*—May 26, 1868.—The coupling pin is sustained by the engagement of one of its projections with the top of the lever pivoted within the frame upon the draw head. The rod projecting toward the opposing bumper receives the thrust which releases the pin, the latter being quickly thrown downward by the spring within the draw head.

Claim.—The arrangement of the lever *h* and rod *j*, with the pin *C* and spring *D*, when constructed as described, and operated by the link *D*, secured substantially as set forth and for the purposes specified.

78,174.—M. CHRISTOPHER ANDREWS, Lawrence, Mass.—*Railroad Car Ventilator.*—May 26, 1868.—This device is designed to open or close simultaneously all the alternating shutters on one side of the turret of "monitor cars." All the shutters may be closed at once, yet it is the practice to have one-half of the shutters open while the carriage is moving in one direction, and to reverse the position of the shutters, *i. e.*, open those which are closed and close the open ones, when the carriage moves in the opposite direction.

Claim.—1. The arrangement of the hinges of each two consecutive shutters of a series thereof, so that such two shutters shall open in opposite directions, as explained, and the combination therewith of mechanism, as specified, or its equivalent, whereby such shutters may be operated in manner as set forth.

2. The combination or mechanism for operating shutters, arranged as specified, each consisting of the slide bar *H*, and its operative lever *I*, or the equivalent thereof, a series of slotted and bent levers, *F*, and their connecting links, the whole being arranged together substantially as explained.

3. The arrangement of my shutter operating mechanism with the inner surface of the shutters and the side of the car, whereby such mechanism is all brought within the car, when the shutters are closed.

78,175.—WILBER F. ARNOLD, New Britain, Conn.—*Lock Snap Hook.*—May 26, 1868.—The hook is detached from its mooring by pressure upon the thumb latch, which unlocks the latch proper and at the same time presses open said latch.

Claim.—The lock thumb latch *d*, with the latch *c* and hook *b*, substantially as and for the purpose described.

78,176.—JOSHUA B. BARNES, Fort Wayne, Ind.—*Wrench.*—May 26, 1868.—The jaws present three grasping edges the more firmly to seize the object to be held or turned, and the jaws are readily adjustable to objects of different diameters.

Claim.—The combination of the jaws *A* and *B*, straps *C C*, and spiral spring *F*, arranged and operating as and for the purposes set forth.

78,177.—ELWIN E. BERRY, Farmington, N. H.—*Table Leaf Support.*—May 26, 1868.—On elevating the table leaf to a horizontal position, the gravitating lever drops, and by bearing against the yoke or staple serves, in conjunction with the curved arm, to support the leaf.

Claim.—The combination of the lever catch *D*, or its mechanical equivalent, with the arm or strut *B*, and the staple *C*, so as to operate therewith, as described, when they are applied to a table or other like article, substantially in manner as specified.

78,178.—GEORGE W. BISHOP, Stamford, Conn., assignor to LAFAYETTE FARRINGTON, same place.—*Carpet-Cleaning Machine.*—May 26, 1868; antedated May 12, 1868.—The two sets of brooms act alternately upon the carpet, which is wound from the lower feed roller onto the upper roller and subjected to the action of the beaters and brushes as it is moved along within their field of motion.

Claim.—1. In a carpet-cleaning machine, the arrangement, on a divided shaft, of the brooms J J', operating substantially as herein specified.

2. The weighted beaters *b c*, attached to and in combination with the roller H, when arranged spirally around said roller, substantially as herein specified.

3. The arrangement and combination of the rollers C F G E for feeding, guiding, and winding up the carpet, in combination with the beaters *b c* and brooms J J', substantially as herein specified.

78,179.—CORNELIUS BOLLINGER, Harrisburg, Pa.—*Steam Engine Piston.*—May 26, 1868; antedated May 14, 1868.—The cone, working through the head of the piston, acts on the sectors which tighten the packing, and the lugs on the cone, in conjunction with lugs on the cylinder head, hold the cone while the piston is turned to screw in the same.

Claim.—1. The conical nut H, constructed with a female screw on the inside, to fit the piston rod, and a male screw on the outside, to fit the piston head, in combination with the piston head and rod, as described.

2. In combination with the conical nut H, provided with lugs I I, the corresponding lugs on the head of the cylinder.

78,180.—THOMAS H. BRADY, New Britain, Conn.—*Lantern.*—May 26, 1868.—The bands or rings being of cast metal, adapt the vertical guard rods to be attached to them by riveting or by countersinking and soldering, thus making a strong, durable guard.

Claim.—A lantern guard, having the upper and lower rings, or either of them, made of cast metal, as described, as a new article of manufacture.

78,181.—CHARLES BROWN, Buffalo, N. Y.—*Hay and Straw Cutting Machine.*—May 26, 1868.—The hay is cut, winnowed, and crushed consecutively. The heavier and better hay passes over the separating plate as it is discharged from the crushing rollers, while the light chaff passes under the same. The feed table is composed of a series of narrow slats with intervening spaces, through which small stones and trash may pass.

Claim.—1. The combination of the cutting and crushing mechanism, substantially as described, and for the purpose set forth.

2. The combination of the cutting and cleaning mechanism, substantially as described, and for the purpose set forth.

3. The vertical cleaning chambers, with air apertures in the front and back sides thereof, and exhausting fan combined therewith, substantially as described, and for the purpose set forth.

4. The dividing and separating plate L, arranged in the manner and for the purpose set forth.

5. The feed table G, constructed and arranged as described, for the purpose set forth.

6. The rotary feeder K, arranged and operating as set forth.

78,182.—MORGAN W. BROWN, New York, N. Y.—*Making Transparent Soap.*—May 26, 1868.—In carrying out this invention, one hundred pounds of settled curd or grained soap may be melted in a digester, and then twenty-five or thirty pounds of sal-soda, previously melted without water, are added to the hot soap. The paste is thoroughly incorporated at a low degree of heat. A hundred to a hundred and twenty-five pounds of glycerine are poured into the digester, and after the whole has been subjected to a moderate heat and agitated until it forms a thin transparent fluid, it is allowed to settle, and then drawn off into cooling molds or soap frames.

Claim.—The means and mode of treating and settling a soluble hard soap, as herein described, to render the same transparent, substantially as specified and set forth.

78,183.—WILLIAM C. BURCH, Gloucester, N. J.—*Hand Drill.*—May 26, 1868.—Within the bore of the lever head the drill shaft is encompassed by the helical spring or brake, which is employed in lieu of the pawl and ratchet usually seen in hand drills.

Claim.—The combination and arrangement of the helical brake with the drill shaft and the head of the operative lever, the whole being to operate substantially as described.

78,184.—WILLIAM A. CHAMBERLIN, Alexander, N. Y.—*Bed Bottom.*—May 26, 1868.—The rubber blocks constitute elastic fulera, which, by yielding slightly, produce at the ends of the long arms of the levers, where the slats are supported, the most ample vertical play.

Claim.—1. The hinged levers B B, supporting cross-pieces C C, India-rubber blocks *s s*, and slats A A, arranged and operating substantially in the manner and for the purpose set forth.

2. Hinging the ends of the levers to the cross-piece by means of hook or eye bolts *f*, and extended key rod *g*, in the manner and for the purpose shown and described.

78,185.—CHARLES H. CHILDS, Cleveland, Ohio.—*Gas Apparatus.*—May 26, 1868.—As the gravitating cover or float descends, air is forced from the upper central chamber downward through the perforated tubes which are surrounded with fibrous material, and thence into the lower central chamber, from which it passes off for use, in the form of gas, through the exit pipe. The textile material becomes saturated with the fluid and evolves the gaseous and volatile elements thereof, which are disseminated above the bulk of the fluid in the lower central chamber.

Claim.—1. The perforated tubes H, surrounded with textile or fibrous material, and chamber C', in combination with the chamber E and annular space F, substantially as and for the purpose specified.

2. The pipes M N and chamber C', in combination with the diaphragm G, annular chambers C, and cover D, arranged as and for the purpose set forth.

78,186.—CHARLES A. COGSWELL, Maquoketa, Iowa.—*Cultivator.*—May 26, 1868; antedated May 12, 1868.—The rod has free vertical play in the eye which attaches it to the plow beam, and in hilling up potatoes and other crops, the rod raises the stems and leaves of the plants to prevent them from being covered.

Claim.—The attachment of the curved rod A to the standard and beam of the ordinary shovel plow or cultivator, in the manner and for the purpose above specified.

78,187.—THOMAS CRANE, Fort Atkinson, Wis.—*Washing Machine.*—May 26, 1868.—The stationary, perforated partition serves as an abutment against which the articles are forcibly compressed and beaten by one end of the oscillating box, while the other end of it forces the water through the partition upon the articles after every beating stroke.

Claim.—1. The construction of the oscillating cradle with a bottom *c*, which is independent of the tub, in combination with the stationary partition C, arranged with said cradle, substantially as described.

2. The cradle, constructed with a bottom, and with its back board closed, and its front board perforated, in combination with a perforated removable partition C, arranged within the cradle, but connected to the outer tub, substantially in the manner described.

3. The cradle, having a bottom and ends, substantially as described, and a top which is hinged and fluted or roughened on its under surface, in combination with the board A' of the tub, substantially as described.

78,188.—MARTIN M. CROOKER, Rutland, Vt., assignor to himself and AZRO B. ALLEN, same place.—*Railroad Car.*—May 26, 1868.—The flexible doors are fitted to slide in grooved ways, and occupy a hitherto useless space under the roof when open. Pulleys and cords for opening and closing the doors are to be applied when desired.

Claim.—A rail car, in which its doors are flexible.

and are arranged to pass up under the roof and over one another, substantially in the manner and for the purpose described.

78,189.—T. E. CURTISS, Titusville, Pa.—*Lubricating Compound*.—May 26, 1868.—This is made from the residuum of crude petroleum or coal oil, as a base, with the addition of finely-bolted rye flour.

Claim.—The within-described lubricating compound, composed of the materials and substantially in the proportions set forth.

78,190.—ALBERT H. DANIELS, Hartford, Conn.—*Eye Glasses*.—May 26, 1868.—The studs, in conjunction with the method of applying the nose-spring, are designed to increase the energy and adjustability of the same.

Claim.—1. The spring *a*, constructed and applied to the frames of the eye glasses, substantially as described.

2. The studs *c c*, made and applied to the frame of the eye glass, and the spring, substantially as described, for the purpose specified.

78,191.—D. G. DANIELS, Cincinnati, Ohio, assignor to himself and F. MORTIMER ATKINSON, Chicago, Ill.—*Car Spring*.—May 26, 1868.—This method of constructing the spring is designed to secure a uniform distribution of resistance over the entire area of both plates when they are subjected to pressure.

Claim.—A spring, which is composed of plates *A A*, bent in the form of segments of a cylinder, and put together at right angles to each other, substantially as described.

78,192.—CHARLES B. DICKINSON, Brooklyn, N. Y.—*Combined Arm Rest and Paper Cutter*.—May 26, 1868.—When the instrument is used as an arm rest, to facilitate writing near the bottom of a book page, it is held in place by slipping the metallic plate into the book. Said plate may be also used as a paper cutter.

Claim.—The combined arm rest and paper cutter, made substantially as and for the purposes set forth.

78,193.—CHARLES F. DODGE, Williamsport, Pa.—*Sash Supporter*.—May 26, 1868.—The roller binds between the inclined plane and the window sash, and prevents the latter from shaking or from falling when raised. By raising the lever the roller is made free and the sash permitted to descend.

Claim.—The combination and arrangement of the pivoted double inclined plane *B*, roller *C*, lever *A*, and stop or beam *D*, in a suitable box or casing, substantially as shown and described, for the purpose specified.

78,194.—JAMES W. DREW, Stockbridge, Mich.—*Regulating Common Lumber Wagon*.—May 26, 1868.—The resistance of the wheel to the force which has a tendency to make it rotate, and which is due to the striking of one of the wheels against an obstacle, causes the wheel to override the obstacle, and thus is avoided the sudden lateral motion of the tongue, which frequently injures the horses.

Claim.—1. The use and application of the wheel *B* to common team wagons, for obviating the knock and jerk of the tongue or draught pole *F*, on rough roads, as substantially shown and described.

2. The bar *D*, pinion *C*, combined and operating in the manner as herein shown and described.

78,195.—JOHN L. DUFFEE, Washington, D. C.—*Mounting Photographs and Engravings*.—May 26, 1868.—The paper, glass, wood, or other material is made smooth and white by painting, enameling, or other process, and covered with a mixture of clarified beeswax, balsam of fir, and spirits of turpentine, heated to such consistency that it will flow off the surface, leaving a thin film thereon. The picture to be mounted is rendered translucent by wax, varnish, or other substance, and applied to the prepared surface before the film of the mixture has hardened. The tint of the background is designed to influence the appearance of the picture.

Claim.—The mode of mounting photographs or other pictures produced upon paper, substantially as herein described.

78,196.—RUFUS DUTTON, New York, N. Y.—*Manufacture of Finger Bars for Harvesters*.—May 26, 1868.—The blank or plate is formed, as stated, by machinery, and when cut longitudinally produces two finger bars, the process avoiding the usual forging and shaping.

Claim.—Constructing the finger bars of harvesters, substantially as described, that is, forming, by suitable machinery or mechanism, a metallic plate of the required thickness for a finger bar, and of a width sufficient for two bars, and having both of its edges or sides turned up or raised above the general surface or plane of the plate, and then dividing or cutting such plate obliquely lengthwise, so that when so divided there will be formed two separate plates, each suitable for a single bar of tapering form, and each having a raised or turned up edge, for the purpose set forth.

78,197.—RUFUS DUTTON, New York, N. Y.—*Constructing Finger Bars of Harvesters*.—May 26, 1868.—The double ribs are designed to strengthen the bar at both sides.

Claim.—Constructing the finger bars of harvesters substantially as described, that is, forming a metallic plate of a breadth sufficient for two bars, such plate having its edges raised or turned up, and also having ribs or raised portions toward its center and parallel with its edges, so that when such plate is divided diagonally lengthwise, into two parts, it will form two bars, each having two parallel ribs or raised portions, substantially as set forth.

78,198.—T. B. FAGAN, Mendon, Ohio.—*Ditching Machine*.—May 26, 1868.—The shaft carrying the ditching wheel is attached to the arms or supports, and adapted for adjustment thereon by elips or eyes. The side pieces of the chute are inclined so as to prevent the dirt, after leaving the shovels, from falling back into the ditch.

Claim.—1. In combination with the wheel *F*, the arms or supports *D D*, provided with adjustable holes, as and for the purpose described.

2. In combination with wheel *F* and supports *DD*, the chute *E*, constructed and employed substantially as and for the purpose specified.

3. The combination of the ditching wheel *F*, chute *E*, supports or arms *DD*, and shaft *J*, furnished with pinions *j j*, arranged and operating substantially in the manner and for the purpose set forth.

78,199.—J. H. FLEMING, Groton, Ohio.—*Churn*.—May 26, 1868.—The hinged cover affords ready access to the inside of the churn, and when thrown back it relieves the shaft of the dasher, allowing it to be withdrawn.

Claim.—The dasher *D'* constructed as set forth, in combination with the hinged cover *B*, with the gearing arranged in connection therewith, substantially as and for the purpose set forth.

78,200.—JOHN FLORY, Flietksville, Pa.—*Machine for Rounding the Corners of Slate Frames*.—May 26, 1868.—The cutter has a progressive and a rapid rotating motion, and as its shaft is supported in a frame which vibrates automatically, the corner of the slate frame presented to it is cut off and rounded, the teeth of the cutter being curved in such a manner as to give the edge of the frame the desired shape.

Claim.—In combination with the disk or arm *G*, with its crank pin, the connecting rod *H* and the arm *I* on the shaft *J*, for vibrating the frame *K* and cutter *V*, substantially as described.

78,201.—A. H. FORD, Williamsfield, Ohio.—*Upsetting Tires*.—May 26, 1868.—The heated tire is placed in the grooves and held by driving keys into the mortises; the wheel attached to the screw is turned so as to bring the arms together sufficiently to give the tire the desired set, the adjustable support affording a bearing for the inside of the tire, thus preventing it from kinking.

Claim.—The combination of levers *A A*, pivoted together by an eccentric joint, with adjustable support *E*, and screw *I*, substantially as described.

78,202.—EDWARD HAMILTON, Chicago, Ill., assignor to himself and MATHEW D. RAPP, same

place.—*Bridge*.—May 26, 1868; antedated May 9, 1868.—The chords consist of a combination of thin but wide sheets of metal, iron, or steel, arranged edgewise with wood or iron bracing between the sheets to prevent them from bulging or buckling.

Claim.—1. In combination with the sheets A of metallic plates, placed edgewise to sustain the incumbent weight, a system of cross braces, B, to support the same, substantially in the manner set forth.

2. In combination with the metallic plates, disposed as set forth, and wooden cross braces for supporting the same, plates for inclosing the spaces between the edges of the sheet, substantially as set forth.

78,203.—GEORGE D. HART, Muncy, Pa.—*Cultivator*.—May 26, 1868; antedated May 11, 1868.—This is designed as an improvement on the cultivator described in letters patent No. 63,384, dated April 2, 1867, and special reference to the method of connecting the plow standard to the frame.

Claim.—The above, as set forth, whether used in combination with this machine or separate in any other, reference being had to letters patent above referred to.

78,204.—WILLIAM C. HART, Nantucket, Mass., assignor to himself and CHARLES S. JONES, same place.—*Lounge*.—May 26, 1868.—The back may be turned over from one side to the other of the seat and of the head or arm rest, adapting the lounge to be used either as a right or left lounge.

Claim.—The improved lounge, as made with the reversible back, and with the connections and supports thereof, applied to and arranged with the two extremes of the body of such lounge, substantially in manner as specified.

78,205.—JAMES HEMPHILL, Pittsburg, Pa.—*Steam Engine Slide Valve*.—May 26, 1868.—The steam exerts an upward counter pressure against the plate attached to the stem of the valve cover, the valve being relieved of pressure in a corresponding degree.

Claim.—The combination of the valve cover *e*, with its stem *e'*, and the diaphragm *s*, and plates *o o'*, arranged substantially as described for the purpose set forth.

78,206.—ROBERT HENEAGE and F. W. BREED, Buffalo, N. Y.—*Railroad Car Ventilator*.—May 26, 1868.—The coupling of the air supply pipe is so constructed that both halves may be used indifferently as males and females, thus conforming to the adaptability of each car to be connected to either end of any other car. The windwheel and suction screw or fan arranged within the pivoted case exhaust the vitiated air from the car.

Claim.—1. The coupling E, when constructed and operating substantially in the manner shown and described.

2. The pivoted case H, provided with wings *n n* and vane *l*, in combination with the windwheel I, screw or fan J, and register *p*, the whole arranged and operating substantially as and for the purpose set forth.

3. The combination of the two devices, herein described, for supplying pure air, and withdrawing the impure air, from railroad coaches, substantially as set forth.

78,207.—ROBERT HEWSON, San Francisco, Cal.—*Parlor Skate*.—May 26, 1868.—The axles are kept in place and in contact with the friction rollers by the straps or boxes in which they turn.

Claim.—In a parlor skate, the use of the wheels B, having their axles D turning upon the friction rollers C C C, the whole constructed and arranged as herein described.

78,208.—SIDNEY HUDSON, Milford, Mich.—*Grain Register*.—May 26, 1868.—The "striker" is moved by a crank so as to alternately close and open the two apertures through which grain flows from the threshing machine into the measures. Said crank is connected by a worm with cogs on the register shaft, so that every time a measure is filled and the "striker" shifted, the fact is recorded upon the tallying register.

Claim.—1. The construction of the striker C, and its connections, working over the apertures B, in the receiving box A, substantially as described for the purpose designed.

2. The combination and arrangement of the striking and tallying machines, substantially as described for the purposes indicated.

78,209.—DAVID H. IRLAND, Fayette, N. Y.—*Apparatus for the Manufacture of Coal Gas*.—May 26, 1868.—The soot which is carried up from the retort is caught in the ash pan within the elevated condensing cylinder, containing water below the pan. Passing through the condensing cylinder the gas is relieved of its aqueous elements before reaching the lime purifier.

Claim.—The interposed condensing cylinder B, constructed with the elevated ash pan D, and water chamber G, and employed in connection with the retort A, purifier H, and gasometer K, substantially as and for the purpose herein set forth.

78,210.—DAVID JEWETT, Lynn, Mass., assignor to himself and ALBERT LEACH, same place.—*Axle Box for Railroad Cars*.—May 26, 1868.—Spherical balls are confined in corresponding recesses or chambers and revolve in contact with the journal or axle, thereby reducing friction.

Claim.—The construction and arrangement of an axle box, when composed of the parts C C, A A, and combined with the rollers D, D, and grooved axle D, in the manner and for the purpose herein described.

78,211.—ARZA B. KEITH, North Bridgewater, Mass.—*Machine for Cutting Heel Seats*.—May 26, 1868.—The function of this machine is to cut out the concavity in the heel to fit upon the convexity caused by the filling piece of the shank. The invention combines with a reciprocating gouge-like shank, means for relative adjustment between the knife and heel holder, adapting the same machine to cut heel seats to fit upon different shanks.

Claim.—1. So combining, with a reciprocating or vibrating knife, *d*, a heel support, *k*, that relative adjustment may be made between the two, substantially as and for the purpose specified.

2. Pivoting the piece *k* to the slide *i*, and combining therewith means for changing the angle of *k*, substantially as and for the purpose described.

3. In combination with the piece *k*, a side-adjusting screw, substantially as set forth.

78,212.—EDWIN H. KEITH, Bridgewater, Mass.—*Machine for Molding Wood Screws*.—May 26, 1868.—The machine is for producing molds for casting screws from screw patterns, and is designed to enable a large number of molds to be formed from a very few patterns. Provision is also made for the ready removal of patterns and the substitution of others for the purpose of forming screw molds of different sizes.

Claim.—1. The combination, with the perforated table C, of the screw patterns *g g g g* and the mold board E, provided with the perforations as described, substantially as and for the purpose set forth.

2. The detachable spindles *h*, provided with the pattern screws *g* and corresponding guide screws *i*, substantially as and for the purpose specified.

3. The perforated table or plate C, provided with the adjusting strips or gauges *e e' e'' e'''*, as and for the purpose described.

4. So forming the molds of the runners, leaders, and sprues, and connecting them with the molds for the screws, that the breakage of the metal will be at or near the center of the screw heads, as set forth.

78,213.—JOHN LE FERRE, Charlestown, Mass.—*Forming Carriage Axles*.—May 26, 1868.—The axle is composed of two or more pieces of metal welded together in such a manner as to mutually strengthen each other, the object being to avoid the breakages which occur in consequence of the defects which sometimes exist in the single piece which constitutes the common iron axle.

Claim.—The method herein described of constructing a carriage axle, A, namely, by placing two or more

steel or iron bars longitudinally, one upon the other, welding the same thoroughly together, then turning down the taper *b*, with the shoulder *m* thereon, and then adjusting on said taper *b*, and against the shoulder *m*, a suitable collar, 6, and washer, 7, all in the manner substantially as set forth.

78,214.—DAVID C. LINCOLN, North Vassalboro', Me.—*Soap*.—May 26, 1868.—The combination of the nitrate of potash with the soap is designed to improve the detergent quality of the latter, and the former also acts as a bleaching medium and a curative of cutaneous affections.

Claim.—The combination of nitrate of potash with a fat, or oil and an alkali combined, to form a soap, as set forth.

78,215.—JOHN S. LOOMIS, Brooklyn, N. Y.—*Machine for Polishing Wood*.—May 26, 1868.—The sand block or rubber is attached to a reciprocating bed which also carries a reciprocating brush. These parts, in conjunction with the rotating brushes, operate to sand-paper and polish the wooden molding as it is moved forward upon the adjustable bed by the yielding feed rollers.

Claim.—The sand block or rubber B, cup D', pipe T, revolving brushes W W, dusting brush N, stationary rubber F, emery cup D, and adjustable bed G, all combined and operating in the manner and for the purpose substantially as described.

78,216.—HALSEY B. LUCAS, Middletown, Conn.—*Skate Fastener*.—May 26, 1868.—This fastening affords a leverage to assist in tightening the straps about the feet, and it also forms a shield to protect the instep from bruising or pinching. An adjusting strap is employed in connection with the fastener, as it is not of itself adjustable.

Claim.—1. The heel strap buckle for a skate, shaped to conform to the curve or instep of the foot, as shown at *a a a*, and constructed with the loop *b b'*, and with a curved locking lever *e g*, all substantially in the manner and for the purpose described.

2. The two curved portions *a c*, constructed as described, in combination with the curved loop *b*, having a curved portion *b'*, and with the adjusting strap B, substantially in the manner described, and for the purpose of facilitating the fastening of a skate upon the foot, as set forth.

3. A curved self-locking skate buckle, such as described and shown, as a new article of manufacture.

78,217.—JOHN MAGEE, Chelsea, Mass., assignor to the MAGEE FURNACE COMPANY.—*Cooking Stove*.—May 26, 1868.—The object of the auxiliary flue is to collect heat radiated from the bottom of the stove, such heat being conducted to the oven in order to increase the heat of and ventilate the same. The current of air created also effects the consumption of the gases arising from the fuel in the fire box.

Claim.—The auxiliary flue L placed below the bottom of the return flue K, and provided with suitable perforations or openings *e*, in combination with one or more tubes or conductors M, and one or more perforated trunks N O, or perforated plates, substantially as and for the purpose described.

78,218.—C. K. MARSHALL, New Orleans, La.—*Metallic Door and Shutter*.—May 26, 1868; ante-dated May 14, 1868.—This mode of constructing the metallic door or shutter is especially designed to render the same light and cheap so as to be available wherever wooden doors and shutters are employed.

Claim.—A double cased and double paneled metallic door or shutter, when the same is constructed and arranged substantially as described.

78,219.—DAVID MARSHALL, Pittsburg, Pa.—*Socket Board for Reed Instruments*.—May 26, 1868.—The ordinary socket board is faced with another slotted or socketed board, the sockets in the facing board being shorter than those in the main board, so that the currents of air in passing through the reeds impinge against said facing board, causing the parts to vibrate in unison and producing an effect akin to that of a sounding board.

Claim.—The board *i*, placed immediately below

and in contact with the socket board *b*, and having an opening or openings *s s'*, under each reed, coinciding with but shorter than the openings or sockets *a* in the socket board, substantially as and for the purpose described.

78,220.—NORMAN and ABRAHAM MAYBEE, Monroe, Mich.—*Scraper*.—May 26, 1868.—The front of the bottom of the scraper is corrugated and forms a cutting edge, and cutting blades are situated at the points between the corrugations. The bail also carries share blades operating in conjunction with cutting edges at the sides of the scraper, the object being to cut away roots and other obstructions which would otherwise impede the operation of the scraper.

Claim.—The combination of the scraper A, draught bail C, and handle B, all constructed and arranged substantially as described, and for the purposes specified.

78,221.—B. J. McAFEE, Delphi, Ind.—*Brick Machine*.—May 26, 1868.—The mold beneath the spout is filled with concrete, and the rotation of the table then brings the mold beneath the former, which is screwed down so as to press the brick. The table is further rotated, and the brick is expelled by raising the plunger by means of a lever.

Claim.—The combination of the frame A and table C with the molds D D, spout I, former G, screw H, plungers E, and lever F, all arranged and operating substantially as and for the purpose described.

78,222.—WILLIAM McALLISTER, Lawrence, Mass.—*Machinery for Printing Yarn*.—May 26, 1868.—The desired number of skeins are stretched upon the wire netting so as to be firmly held thereon, the coloring matter being allowed to penetrate the yarn, so as to leave an even impression upon both sides of the fold.

Claim.—The holder D, made of wire netting, or its equivalent device, for holding skeins of yarn during the process of printing the same, substantially as set forth.

78,223.—STEPHEN B. McCracken, Detroit Mich.—*Spring Bed Bottom*.—May 26, 1868; ante-dated May 12, 1868.—A wooden button or disk is affixed to the upper and smaller end of the conical coiled spring to adapt the webbing or cover to be attached thereto by a screw.

Claim.—The button-headed half spring fastened to the webbing or other cover by the use of a common screw and convex washer, as shown in Fig. 3, substantially as and for the purpose herein described.

78,224.—HENRY MCGANN, Cleveland, Ohio.—*Feeding Boilers*.—May 26, 1868.—The pendulum with the float attached is suspended within a chamber wherein the water descends as that in the boiler descends, and being connected with the plug of the supply cock the pendulum turns the latter to admit water to the boiler, the water being stopped off by the reverse operation.

Claim.—The arrangement of the pendulum B, shaft C, case A, segmental arm E, wheel F, and cock H, substantially as herein specified.

78,225.—ALANSON H. MERRIMAN, New Britain, Conn.—*Press Spindle Adjustment*.—May 26, 1868.—By loosening the nuts and turning the collar the tool stock or spindle can be easily and quickly adjusted.

Claim.—The combination of the tool stock or spindle A A with the sleeves B and E, and collar C, arranged and operating substantially as and for the purpose described.

78,226.—F. C. MILLER, Evans Center, N. Y.—*Portable Oven*.—May 26, 1868.—When a pan is not needed it is withdrawn, but the front section thereof is reinserted into the outer case to prevent the heat from escaping.

Claim.—The combination, with the chamber B, provided with central heating space *i*, and surrounded by jacket A, of the pans, made up of two parts C D, the latter being detached, and in skeleton or open form, for allowing a free passage of air or steam, and covered by slides F, the whole operating in the manner and for the purpose herein set forth.

78,227.—WILLIAM MILLER, JOHN J. BECKER, and ABRAHAM SIMCOX, Fort Wayne, Ind., assignors to themselves and JACOB MILLER, same place.—*Peg Float.*—May 26, 1868; antedated May 15, 1868.—This device is for rasping pegs from boots and shoes, and the cutter, instead of being worked directly by hand, is reciprocated by a crank wheel, connecting rod, and elbow lever.

Claim.—The elbow lever D and connecting link *d*, in combination with the reciprocating cutter A and guides B, the whole being constructed and operated in the manner and for the purposes specified.

78,228.—MARSHAL MORSE and P. W. SAWYER Grey, Me.—*Cheese Cutter.*—May 26, 1868.—The knife is depressed by the action of a segmental gear upon a rack, so that when the knife reaches the table, having cut the cheese, the blank part of the gear is presented to the rack, which, together with the knife, is then elevated by the spring.

Claim.—1. The combination of the coil *h*, rack *g*, slide *k*, and knife *l*, as and for the purpose described.

2. The slide stop *m*, in combination with the self-retracting knife *l*, as and for the purposes described.

78,229.—ELIAS A. PAINE, Sutton, Mass.—*Shuttle.*—May 26, 1868.—After the yarn has been woven from the bobbin the operative raises the spindle, and the bobbin, being released from the spring catch by this motion, is removed and a full one put upon the spindle, which is turned back into shuttle. The catch engages the notch of the bobbin, and is held therein by the pressure of the coiled spring.

Claim.—The combination with the spindle head, formed between the points 1 and 2 and the points 1 and 3, in the manner specified, of the lever *b* and its cam 4, and the spring for actuating said lever, with or without the bobbin-holding catch, the said parts being constructed and arranged for operation as herein shown and set forth.

78,230.—JOSEPH PALMER, Concord, N. H.—*Welding the Ears of Elliptic Springs.*—May 26, 1868.—On the 3d day of September, 1867, United States letters patent No. 68,464 were granted to the same party for a die for making heads of elliptic springs, by which die are punched ears to be fixed on the ends of the springs preparatory to welding. The present invention has reference to a machine for welding the ears upon the main leaves, for the purpose of producing what are styled "French heads."

Claim.—The combination of the wedges F F, the drop A, the upper and lower dies C D, the slides *a b c d*, and end pieces I I, all constructed and arranged as shown, and by means of which vertical and lateral blows are given at the same time, for the purpose set forth.

78,231.—JAMES PERRY, Brooklyn, N. Y.—*Combined Oven and Bath.*—May 26, 1868.—The bake-oven and furnace are connected by suitable pipes or ducts with a room in which the temperature is raised to the required degree for the administration of hot-air and other baths, by the diffused or wasted heat resulting from the baking process.

Claim.—1. The method of utilizing the heat from the interior of a baking oven or furnace for the purpose of warming apartments, substantially as herein specified.

2. The spaces under or by the sides of bath rooms, with their pipes communicating with the open furnace or oven, when the arrangement of the several parts is substantially as and for the purpose of operating in the manner shown.

3. The combination of the boilers O O, located in an inclosed space, with one or more conductors of the waste heat from a baking oven, whereby the said waste heat is caused, without coming in direct contact with said boilers, to warm the water required for use in the manufacture of bread and the administration of baths, substantially as herein specified.

4. The combination, with a system of radiating pipes located in an apartment, of a series of waste-heat conducting pipes, and a series of steam-conducting pipes, so that either the waste heat or the steam, or both together, may be employed at such time as may be required for warming the apartment, substantially as herein specified.

78,232.—JAMES PERRY, Brooklyn, N. Y.—*Apparatus for Apportioning, Expanding, and Shaping Dough for the Manufacture of Bread.*—May 26, 1868.

—This consists, primarily, in combining with a kneader, in which dough is prepared under pressure of gas, a valve, so arranged that the dough may be delivered into the atmosphere with such diminished pressure as shall not exceed the tenacity of the dough, thereby preventing the rupture of and the escape of gas from the dough.

Claim.—1. The combination, with a kneader, A, of the valve I and its chamber, substantially as herein specified, whereby the expansion of dough, prepared under pressure of gas, can be regulated as desired.

2. The double-head valve I, constructed and operating substantially as herein specified.

3. The combination, with the kneader A, of the perforated plate or strainer *a'*, substantially as herein specified, for preventing lumps of unmixed dough, or other hard substances, impeding the perfect operation of the valve I.

4. The combination of the hollow arm D with one or more chambers and pistons, substantially as herein specified, whereby the dough may be apportioned and shaped as desired.

5. The movable cross-head F, in combination with the wheel E and rack bars S S, substantially as described, whereby the capacity of the chambers H H may be increased or diminished as desired.

6. The combination, with the valve I, of the balance lever *b*, and its appendages, substantially as and for the purpose herein specified.

7. The combination, with the arm D and table J, of the arcs *e' e'*, substantially as specified, whereby the pans are brought under and away from the chambers H H, for filling and discharging them.

78,233.—PHILIP POUILLAIN, Greensboro, Ga.—*Cultivation of the Cotton and other Plants.*—May 26, 1868.—When the plants are set out, the cups in which they have germinated are placed in a hole,

with the top about level with the surface of the ground. The sides are gently tapped to loosen the cup from the earth, when the cup is drawn upward over the plant, which is left standing in place without injury to the root.

Claim.—1. The improved cup, having taper sides, and both ends open, when adapted and employed for germinating and transplanting cotton and other small and tender plants, in the manner and for the purpose herein described.

2. The improved method herein described for transplanting cotton and other plants, by means of the device, in the manner and for the purpose herein set forth.

78,234.—CHARLES LOWELL RIDGWAY, Boston, Mass.—*Water Gauge for Steam Boilers.*—May 26, 1868.—The lever, when vibrated on its center, will open and close the inlet passages of the gauge simultaneously, thus affording a ready means of cutting off the connection with the boiler in case of the breakage of the tube, or when otherwise required.

The lever may also be removed into a position to close the lower inlet passage, admit the steam at the top of the gauge, and open a passage at its lower end when it is desired to blow off to clear the gauge.

Claim.—1. The water gauge D, attached to a lever or bar, B, provided with passages *g i*, and arranged, in relation to the inlet passages or tubes through which the water and steam are admitted from the boiler, substantially as described.

2. The passages *h, n, i, o* in the bar A, and lever B, in combination with the adjustable stop *m*, or its equivalent, so arranged as to allow the steam to be blown through the gauge, substantially as set forth.

3. The passage *i* in the lever B, in combination with the passage *l* in the bar A, and the stop pin 6, arranged so as to allow the water in the glass tube D to escape when the connections with the boiler are cut off, substantially as described.

78,235.—LEWIS S. ROBBINS, New York, N. Y.—*Agricultural Steam Boiler.*—May 26, 1868.—The parts cited in the claims are improvements to be applied to boilers used for boiling or steaming feed for

eattle, horses, &c., heating water, and generating steam for agricultural purposes generally.

Claim.—1. The corrugated plates H in the fire box, substantially as and for the purposes described.

2. The protecting sleeve K on the pipe J, substantially as described.

3. The supply pipe J, provided with the cocks *n, o,* and L, and connected with the water reservoir *m,* substantially as described.

4. The method of forming the joint between the cap C and the boiler, substantially as described.

5. The combined vacuum and safety valve, constructed and operating substantially as shown and described for the purposes specified.

78,236.—SAMUEL ROCKAFELLOW, Museatine, Iowa.—*Harvester.*—May 26, 1868.—The object is to afford better facilities to the operator for guiding and controlling the cutter-bar during the operation of the machine.

Claim.—The double hinge G, constructed substantially as described, in combination with the frame A, cutter bar B, links *g'*, crank *g''*, and levers H and I, the said parts being arranged to operate substantially as and for the purpose described.

78,237.—ORESTES SAMPSON, Petersburg, Ill., assignor to SAMPSON and FRACKELTON.—*Corn Planter.*—May 26, 1868.—This machine is controlled by two men, a driver and a dropper, and when it is desired to go from field to field or turn at the end of the row, the dropper dismounts and the driver bears with his feet upon the cross-bar of the levers, thereby raising the seeding mechanism so as to balance it upon the axle.

Claim.—1. A corn planter, consisting of an axle mounted on wheels, and having the inclined bars B attached thereto, with their rear ends provided with seed hoppers H, shares *u,* and covering wheels *h,* or their equivalents, arranged to operate substantially as described.

2. The levers E, arranged as described, in combination with the frame carrying the seeding mechanism, and pivoted to the axle or front frame, for the purpose of elevating the seeding devices, as described.

3. Providing the bars B with a flat surface on their under side, where they rest upon the ground, in front of the shares *u,* for the purpose of pulverizing and smoothing down the earth to form a seed bed, as herein set forth.

78,238.—SYLVANUS SAWYER, Fitchburg, Mass.—*Rattan Machine.*—May 26, 1868.—The stick of rattan is split by a series of radial, rotating disk cutters, to which it is presented centrally by a series of adjustable guides, which adapt themselves to the varying size of the stick. The pith or central portion of the stick passes through the annular cutter.

Claim.—1. The combination of the series of revolving splitting cutters with the series of guides, substantially as described.

2. Combining each revolving cutter and its guide with the other cutters and guides of the series, by means of the gears I, so that they shall be made to simultaneously approach and recede from the center of the stick, substantially in the manner and for the purpose described.

3. The combination of the series of revolving splitting cutters with the annular or tubular cutter, substantially as described.

4. The combination of the revolving splitting cutters, the tubular cutter, and the guides, substantially as described.

5. The combination of the splitting apparatus, before described, with a suitable feeding mechanism for carrying forward the stick, substantially as described.

78,239.—JOHN SEELY, North Java, N. Y.—*Horse Rake.*—May 26, 1868.—The ends of the rake teeth are curved in such a way that they slide over the ground with but little friction, and do not plow into the earth.

Claim.—A revolving rake, formed of three ranges of tines, with their ends inclined or curved as specified, so that the rake can be drawn along upon the points of two of the ranges of tines, and the forward range of tines pass at an inclination beneath the hay, as specified.

78,240.—ALFRED B. SHEAFER, Ephrata, Pa.—*Main Bolt or Goose-neck Stay on Carriages.*—May 26, 1868.—This consists in providing a socket or socket under the fifth wheel and around the main bolt, for the introduction of gum-elastic to act as a follower and prevent rattling.

Claim.—The socket *a* in the enlarged curve B of the main bolt stay A, when made substantially in the manner and for the purpose specified.

78,241.—J. F. SINGLE, Painesville, Ohio, (WILLIAM PETTINGELL, administrator.)—*Implement for Harvesting Grapes.*—May 26, 1868.—The pads, owing to their position and elasticity, begin to hold the stem just before the cutting blade operates, and the jaws retain their hold upon the cluster after the stem is severed until released by opening the handles. The serrated blade holds the stem firmly while the cutter blade operates.

Claim.—1. Constructing the described implement in the manner of forceps or pliers, and providing the broad jaws thereof with correspondingly broad pads or cushions, of an elastic nature, as India-rubber, so as to operate substantially in the manner and for the purposes herein specified.

2. The shear-edge blade *d* and serrated blade *e,* in combination with the jaws *b b* and handles *c e,* operating so as to sever the stem of the cluster with certainty, as herein set forth.

3. The combination of the several parts of the described implement, to wit, pads *a a,* jaws *b b,* shear-edged blade *d,* serrated blade *e,* slotted stop plate *f,* and handles *c e,* all arranged so as to effect the purposes herein set forth.

78,242.—GEORGE H. SPAULDING, Norwich, Conn., assignor to AMERICAN MOLDED COLLAR CO., Boston, Mass.—*Machine for Molding Collars.*—May 26, 1868.—The elastic bed serves to firmly hold the collar throughout its entire length, and insures the application of an even pressure to the entire molded surface thereof.

Claim.—The combination with an expanding former of an elastic bed or cushion, C, against which the collar is pressed, substantially as shown and for the purpose described.

78,243.—ORRIN STONE, Ionia, Mich.—*Cultivator.*—May 26, 1868.—The lower frame carrying the cultivator teeth or plows may be raised by the driver by means of a lever, and, when raised, the lower hinged frame is supported and carried by the fixed frame.

Claim.—The combination of the fixed and the yielding frames, when united together by flexible connections, and the under or yielding one is made capable of being raised and carried by the fixed one, in the manner and for the purpose herein described and represented.

78,244.—MATTHEW THORNTON, Macon, Ga.—*Journal Box for Railroad Cars.*—May 26, 1868.—The upper section of the collar constantly maintains its proximity to the axle, but the under section is adjustable by the gland and screw bolts; and in the act of adjusting the same the packing is forced against the under section, and thus the joints, where oil might waste or dust enter, are kept closely packed.

Claim.—The packing of a journal box by means of a divided collar, the fibrous packing, and the gland, arranged to operate in conjunction with the axle, substantially in the manner and for the purpose described.

78,245.—GODFREY WEILAND, Buffalo, N. Y., assignor to himself and IRA R. AMSDEN, same place.—*Harvester.*—May 26, 1868.—A self-acting clutch coupling, applied to the driving shaft of a mowing machine, to prevent motion of operative parts when machine is backed. One half of the clutch coupling is movable on a square shank carried by the loose pinion or by the driving wheel, while the other half is keyed to the driving shaft, and forms a shell which covers the first-mentioned half, the parts being held in contact by a spiral spring.

Claim.—The combination of the pinion C or the driving wheel hub, having a square shank D, the

movable part E, fixed part B, with covering rim *a'* and coiled spring F, constructed, arranged, and operating in the manner and for the purpose described.

78,246.—JOSEPH WHARFF, Bangor, Me.—*Machine for Boring Hubs for Wagon Wheels.*—May 26, 1868.—The hooked bar and its accessories confine the wheel hub upon the platform, toward which the boring tool shaft is advanced by a weight,

Claim.—Improved arrangement and application of the hooked bar F', the screws E' H, and the lever nut *c*, with respect to each other.

78,247.—H. WHISLER and J. S. BERRY, New Market, Ohio.—*Still.*—May 26, 1868.—A constant stream of water descends upon the apex of the channel, and passes down in the convolutions of the spiral, thereby condensing the vapor formed inside of the cap. The condensed vapor flows out through the pipe and the water passes off by the conduit.

Claim.—The cap C, when constructed with the spiral channel *e*, pipe *g*, and conduit *f*, in the manner substantially as set forth.

78,248.—ELI F. WILDER, Lowell, Mass.—*Implement.*—May 26, 1868.—This instrument combines the several tools necessary to make or repair a belt, namely, a belt punch, awl, lacing stripper, knife and square.

Claim.—The belt punch, when constructed and arranged to operate as and for the purpose set forth.

78,249.—E. P. WILLIAMS, Yorkville, S. C., assignor to himself, W. L. HOPSON, and A. R. HOMESLEY.—*Ventilating Portable Churn.*—May 26, 1868.—Two of the blades upon the inclined dasher shaft act as beaters, while a third blade is so applied as to merely penetrate or cut through the cream.

Claim.—The beater arm B, blades C, C, and D, in combination with the driving wheel F, and dasher or pinion wheel E, when the whole is constructed and arranged so as to operate substantially as described, and for the purpose specified.

78,250.—JEROME B. WITHEY, Lexington, Mich.—*Penman's Arm Rest.*—May 26, 1868.—The device is made adjustable to suit the thickness of the book, or the height of the folio to be written upon, from the table upon which the book may be spread open.

Claim.—The planes A B, the adjustable supporting connections C C, the supporting brace D, the rack E, the check brace F, and the stop G, when arranged substantially as described and for the purposes set forth.

78,251.—THOMAS K. BACON, Norwich, Conn., assignor to himself, GEORGE A. PRATT, WILLIAM T. NORTON, and HIRAM B. CROSBY, same place.—*Drill Holder.*—May 26, 1868.—One end of the screw is adapted to a wrench or screw driver, and by turning the screw the jaws are moved together or apart, and thus made to firmly clamp or release the drill or drill holder.

Claim.—The combination of the jaws *d* with the washer *a*, the right and left thread screw *e*, and the bar *a'*, the same being constructed and operating conjointly with and in the socket *b*, in the manner and for the purpose herein set forth.

78,252.—F. B. BATCHELDER, Prairie du Chien, Wis.—*Broom Holder.*—May 26, 1868.—The device is secured to a wall or other fixture, and constitutes a place of deposit for brooms, &c., when not in use.

Claim.—The blocks A B, each formed with a semi-circular recess in its inner face, and connected together by the spring D, all constructed and arranged to operate in the manner and for the purpose substantially as set forth.

78,253.—HENRY BAUGHMAN, Columbus, Ohio.—*Bee-Hive.*—May 26, 1868.—The covered way by which the bees enter is surrounded on three sides by another covered way designed to entrap the miller. The small tubes supply the food to the feeding troughs, and the gauze covering protects the bees from being crowded into the troughs. Each outside frame has a face of wire gauze, which, when the

comb frames are put together, forms inclosed chambers, the comb frames being entirely surrounded by an air space.

Claim.—1. The projecting entrance for the bees, surrounded by the false entrance to the air chamber, as arranged and described.

2. The feeding troughs, with their connecting tubes and wire gauze covering, as shown and described.

3. The combination of comb frames with the wire gauze covering, as arranged and shown.

78,254.—JOHN W. BOUGHTON, Appleton, Wis.—*Sign for Tobacconists.*—May 26, 1868.—An automaton smoker, appropriate as a sign for dealers in cigars, tobacco, &c.

Claim.—1. The combination, with an image figure, of the mechanism for automatic smoking, substantially as and for the purposes set forth.

2. The application of the air bellows A, provided with the tubes B C, and their valves, to an inanimate figure, for simulating the operation of smoking, substantially as shown and described.

3. In combination with the air bellows A, the reciprocating piston *k*, bar *h*, pitman *g*, and crank *f* of the clock movement D, arranged and operating in the manner and for the purpose described.

4. As an improved tobacconists' sign, the mechanical or automatic smoking image herein described.

78,255.—ALFRED B. BUEL and GEORGE W. ROOT, Pittsfield, Mass.—*Shears.*—May 26, 1868.—These shears are especially intended to cut around or sever transversely tin or sheet iron pipes, and they have four cutting corners or edges, whereby a narrow ribbon or strip of metal is removed, and an opening made for the progress of the shears.

Claim.—The shears, consisting of blade A, with its two cutting edges *o o'*, blade A', with its jaws *a a'*, slot *e*, and cutting edges *p p'*, constructed as described, as a new article of manufacture.

78,256.—F. J. BURCHAM, Racine Wis., assignor to himself and L. S. BLAKE, same place.—*Tanning Hides and Skins.*—May 26, 1868.—The hides are first soaked, then fleshed and beamed. A vat of water is supplied with salt and sulphuric acid, and the hides are introduced. The hides are handled and they remain up over night, an addition of sulphuric acid and salt being made at the end of two days. They are then hung up until they become "sanned," or half dry, after which they are subjected to repeated swabbings with an astringent solution, and then softened and dressed by machinery. They are further swabbed with strong tan liquor containing alum, also with kerosene oil. Finally they are stuffed, dried, softened, and dressed, and depilated by lime and potash dissolved in rain water.

Claim.—The herein-described process for tanning hides and skins, substantially as and for the purpose described.

78,257.—JOHN W. BURNHAM and WILSON COLON, Middletown Point, N. J.—*Potato Digger.*—May 26, 1868.—These devices are for raising the apron and scoop and the scoop alone. As the machine is drawn forward the scoop raises the potatoes and dirt, and conducts them to the apron, by which they are deposited upon the shaking frame, which separates the dirt from the potatoes.

Claim.—1. Connecting the oscillating frame D, which carries the lower apron roller F and the scoop H, by means of a rod and crank, with a lever, L, so that the position of the apron and scoop can be adjusted at once, as set forth.

2. The arrangement and combination with each other of the roller C, oscillating frame D, roller F, apron G, scoop H, rods *l m* and *r s*, and levers L and M, all made and operating substantially as herein shown and described.

3. Providing the lower part of the frame D, which carries the endless apron and the scoop, with curved projections *h h*, moving in curved guides E E, as set forth.

78,258.—A. G. BUSBY, Philadelphia, Pa.—*Copying Ink.*—May 26, 1868.—The ink thus made is intended to remain moist for such a length of time

after being applied to the paper that a distinct copy may be obtained by the application of dry blotting paper in the usual manner.

Claim.—An ink composed of water, galls, sulphate of iron, indigo, sugar, gum arabic, or other well known ink-making ingredients, in combination with glycerine or gelatine, or both, and bichloride of mercury or its equivalent, the whole being combined in the proportions substantially as described for the purpose specified.

78,259.—W. E. CAMERON, Green Island, N. Y.—*Folding Stool.*—May 26, 1868.—When the stool is folded up for storage or transportation the seat cloth is wrapped around it and secured by buttons.

Claim.—The plate A, constructed as described, and provided with the ears $a^1 a^2$, to receive the arms B D, whereby the arms B are adapted to be folded up beside the arms D, when the latter are folded, substantially as described for the purpose specified.

78,260.—EDWIN M. CHAFFEE, Providence, R. I.—*Rubber and Gutta Percha Hose.*—May 26, 1868.—The hose thus flattened is less bulky upon the hose reel and elsewhere when not distended with water.

Claim.—The rubber or gutta percha hose, flattened between plane surfaces, under the heat of vulcanization, substantially as described for the purpose specified.

78,261.—JAMES P. CHENOWETH and EDWIN P. BAUGH, Philadelphia, Pa., assignors to BAUGH & SONS, same place.—*Apparatus for Treating Offal.*—May 26, 1868.—The boues, offal, manure, or other material to be dried, being passed into the rotary cylinder, are caused to traverse the same throughout and discharged at the end adjacent the fan. The hot fan blast, together with the steam and offensive gases, may be allowed to pass off directly through the chimney, but by closing a damper they may be conducted to the fan and driven into the ash pit of the furnace.

Claim.—1. Treating offal by subjecting it, in a revolving cylinder, or its equivalent, to the combined action of heat applied to the outside of the cylinder, and to a blast of heated air or products of combustion introduced into the cylinder, all substantially as and for the purpose herein set forth.

2. The revolving cylinder D, constructed substantially as described, in combination with a fireplace, C, oven A, and pipes, passages, and fans, or equivalent devices, whereby the surface of the said cylinder is heated, and a hot blast forced through the interior of the same, in the manner and for the purpose herein set forth.

3. The spiral rib i , having a tendency to force the material through the cylinder in a direction opposite to the course of the hot blast, as described.

4. The pipes H and H' and the fan F', arranged, in respect to the furnace C and compartment b of the oven, substantially as herein described for the purpose specified.

78,262.—WILLIAM R. CLARK, Indianola, Ill.—*Corn Planter.*—May 26, 1868.—The forward seat is supported upon a spring extending upward from the rear frame of the machine, and is occupied by the person who drops the corn by vibrating a vertical lever, the rear seat being occupied by the driver.

Claim.—The hinged frame A and B, with the seats G and F upon one part, and the plows and hoppers upon the other, substantially as shown and described and for the purpose specified.

78,263.—JOSEPH CONNER, Jr., Chicago, Ill.—*Stair Carpet Fastener and Protector.*—May 26, 1868.—This device is to protect the carpet from the feet without concealing any material portion of the carpet from the view.

Claim.—1. A device, B, having axial extensions $c c$, the same constituting a combined stair rod and protector, or stair-carpet fastener and protector, substantially as and for the purpose described.

2. The combined stair rod and protector B c in combination with the ears or holders $e e$, substantially as described.

3. The depressed lip a , on the front edge of the

protecting cover B on the combined stair rod and protector, as described.

78,264.—MORTON E. CONVERSE, Rindge, N. H., and ABEL T. ATHERTON, Lowell, Mass.—*Manufacture of Pyroligneous Acid.*—May 26, 1868; antedated May 13, 1868.—The object is to save and collect the products of the destructive distillation of wood in the kiln; that is to say, pyroligneous acid, pyroxylic spirit, wood tar, &c.

Claim.—The application and arrangement of the flue tubes $f f$ and $g g$, in one or more rows, to a kiln, in such a manner that they will conduct, carry off, and save, the products of destructive distillation of wood, substantially as described and set forth.

78,265.—GEORGE N. CREAMER, Trenton, N. J., assignor to himself and JOHN B. LALOR, same place.—*Safety Hatch.*—May 26, 1868.—This hatch is self-closing, and to be opened by a person standing any number of stories above or below the floor to which the hatch is applied.

Claim.—1. The construction and arrangement of hatchways, when operated in the manner and for the purpose herein described.

2. The combination of the hatch carriages A A, levers J, weights C, cords I, and pulleys k , in the manner and for the purpose herein described.

3. The locking device or levers J, in combination with the truck or carriage A A, in the manner and for the purpose herein described.

78,266.—WILLIAM H. DEFREES, Andover, Mass.—*Forging Machine.*—May 26, 1868.—The object is to cause the hammers, when moving to give the blow, to traverse in a direction from the body of the rod or blank to be forged toward the end or point thereof, thus giving what smiths term a drawing blow. The rod or blank is cut by shears remote from the hammers, which in consequence are permitted to work uninterruptedly.

Claim.—1. The combination, for the purpose specified, of two or more pairs of sliding hammers, d , an independent spring j , to work each hammer, inclined ways for each slide or hammer, and an inclined rotative cam, operative on all of the slides or hammers, all arranged and operating substantially as set forth.

2. For moving the blank bed from the hammers to the cutters, the combination of the cam h , the hand-worked slide d' , and the several levers and connections between said slide and the blank bed, which cause the bed to be moved by the cam h , substantially as described.

3. For causing the cutters to operate upon the forged nail, to sever it from the nail rod when in position over the fixed cutter, the combination of the hand lever which moves slide d' with the hooked rod o , pendent from the cutter arm v , to throw the hook of said rod into gear with the vibrating pin u , worked from a motor, f , on the main shaft, substantially as described.

78,267.—R. C. DENHAM, Richmond, Me.—*Reefing Fore-and-aft Sails.*—May 26, 1868.—This has reference to the reefing of such fore-and-aft sails as have a hoisting-gaff which slides upon the mast and are furled on the boom. The sail is reefed by dropping the peak of the gaff to a diagonal line drawn from the throat of the sail to its clew, and securing the gaff in that position to a re-enforcing band or rope, which is secured to the sail on said line, and which, as it were, separates the sail into two triangular parts.

Claim.—Combining with the diagonal re-enforced line of a fore-and-aft sail, and with the gaff of such a sail, gaff down-hauls, and eyes or leaders, in the manner substantially as described, so as to secure the gaff to the aforesaid line in the act of reefing.

78,268.—FRANÇOIS DURAND, Paris, France.—*Brick Machine.*—May 26, 1868.—The piston connected to the crank shaft communicates motion to the rear piston during the latter part of the motion of the former, through the medium of the transverse pin and the grooved side-bars, so that after the brick has been pressed by the movement of one piston the two move together and discharge it upon an off-

bearing belt or band operated by the devices cited in the second clause of claim, the oscillating disk being raised to receive the molded brick.

Claim.—1. The combination of the pin *b*, pitman *B'*, pistons *P P'*, grooved bars *G*, cams *e*, yokes *C'*, and crank shaft *A*, all arranged and operating as herein described for the purpose specified.

2. The combination of the eccentric disk *D*, connecting rod *J'*, gear wheels *F F'*, ratchet *j'*, upon shaft *E*, the catch *j*, and the oscillating arm or disk, as herein described for the purpose specified.

78,269.—DRAKE W. DENTON, Ithaca, N. Y.—*Roofing Compound.*—May 26, 1868.—Bituminous coal is converted into coke by heat, and the coke is pulverized and mixed with coal tar. Coal ashes may be applied to the surface. Pulverized commercial coke may be employed.

Claim.—1. Preparing my roofing material of the substances and substantially in the manner set forth.

2. Its use with coal tar as described.

3. The use of coal ashes, in combination with the described material, and in the manner set forth.

78,270.—G. W. FARLEY, Manchester, N. H., assignor to himself and W. H. HUMPHREY, same place.—*Ice Calk.*—May 26, 1868.—The calk plate is hinged or pivoted to a fastening plate which is screwed to the front side of the heel, so that the calk plate may be turned up to lie upon the face of the heel with the spurs projecting outward, or turned down to lie upon the shank of the shoe with the spurs fitting closely at the sides thereof. The button retains the calk plate upon the heel or shank as the case may be.

Claim.—The button *C*, with notches *i i*, and provided with the spring *s*, or its equivalent, in combination with the pins *e e*, the tongue *d*, and the plates *A B*, all constructed, arranged, and operating as and for the purpose herein described.

78,271.—A. H. FATZINGER, Washington, N. J.—*Paper Clip.*—May 26, 1868.—A series of clips are attached to a cleat, which is nailed or screwed to the wall, the clip serving to hold the bill by its upper end.

Claim.—The curved elastic clips *B*, perforated, and attached to the strip or cleat *A*, in combination with the spurs *a* in the latter, substantially in the manner as and for the purpose set forth.

78,272.—A. J. FELLOWS, Meriden, Conn.—*Tape Box.*—May 26, 1868.—The lever is pressed forward when it is desired to release the spring catch from the teeth on the tape drum, the latter being provided with the coiled spring of ordinary tape boxes.

Claim.—The catch *G*, in combination with the toothed drum *B*, spindle *H*, lever *I*, coiled spring, case *A*, and tape *C*, substantially as described for the purpose set forth.

78,273.—JOHN FOSTER, Pawtucket, R. I.—*Machinery for Printing Yarn.*—May 26, 1868.—This consists in combining with a pair of fluted printing rollers an elastic or yielding cushion, which modifies the action of such rollers, and upon which, instead of upon the yarn to be printed, the grinding or cutting effect of the rollers is expended.

Claim.—The combination, with a pair of fluted or grooved rollers *A A'*, in a machine for printing yarn or other material upon both sides, of an elastic apron, *G*, or its equivalent, substantially as described, for the purposes specified.

78,274.—O. S. GARRETSON, Buffalo, N. Y.—*Window-Sash Fastening.*—May 26, 1868.—When the rails meet, the wedging sides of the head strike over the melines of the catch, and the yielding of the spring allows the head to engage with the teeth, locking the parts securely together so that they cannot be separated without pressing inward upon the bolt.

Claim.—1. The combination of the bolt *E*, provided with the wedge head *h*, and the catch *C*, provided with teeth, or a series of teeth, *b*, operating in the manner and for the purpose substantially as herein set forth.

2. Securing the plate *G* to the case *D*, by eyelets or hollow rivets *k*, attaching in the ordinary screw-holes *l*, as herein set forth.

78,275.—ALEXANDER GOODHART, Newville, Pa.—*Link.*—May 26, 1868.—This is designed as a substantial ring or link, to be used in place of a hook for connecting two chains, and which may be so made as to present the appearance of a common link when in place.

Claim.—A link formed of the parts *A* and *B*, the latter being provided with a curved shank, *b¹*, and a tenon, *b²*, and operating in connection with the part *A*, substantially in the manner and for the purpose specified.

78,276.—GEORGE M. GUILD, Boston, Mass.—*Sounding Board for Pianos.*—May 26, 1868.—The sounding board is strengthened by two series of ribs, the ribs of the main series running diagonally across the surface of the board, and the ribs of the auxiliary series running across the main ribs, thus rigidifying and strengthening the board in each direction and admitting of the use of a very thin board, having freedom of vibration.

Claim.—In combination with a sounding board, and the main supporting ribs *e* thereof, the auxiliary ribs *e*, crossing and secured to the ribs *e*, substantially as shown and described.

78,277.—MICHAEL GUMFORY, West Middlesex, Pa.—*Trace Tug Loop.*—May 26, 1868.—The loop is secured to the trace by rivets passing through the bars or shanks which project from the loop. The lateral bars of the frame or loop afford attachment for the back and belly bands, and the bow for the side strap.

Claim.—The tug loop *A*, when arranged with shanks *B B*, and attached to the trace by rivets *a a*, substantially in the manner and for the purpose as herein shown and described.

78,278.—AMOS HADLEY, Washington, D. C., assignor to himself and ROBERT CLENIGHEN, New York, N. Y.—*Door Indicator.*—May 26, 1868.—The indications on the rotary disk, as to whereabouts and time of return, are seen through a mica-guarded opening in the front plate of the indicator.

Claim.—The rotating disk between the two stationary plates, all as shown and described, and for the purposes specified.

78,279.—ISAAC HALL, New York, N. Y.—*Wood Carving Machine.*—May 26, 1868.—The pivoted bars are so connected that the parallelism of the work and pattern, whose holding frames are pivoted to the respective centers, is always maintained.

Claim.—The combination of the parallel pivoted bars *D*, pivoted connecting bars *F*, double arms *G*, adjustable arms *I*, and centers *H* and *J*, with each other, and with the frame *C*, substantially as herein shown and described, and for the purpose set forth.

78,280.—FREDERICK HARDEN, Conshohocken, Pa.—*Safety Valve.*—May 26, 1868.—The weight of all the movable parts of this safety device, together with the pressure of steam upon the lower valve, counteracts the steam pressure upon the larger valve so long only as the steam pressure remains within safe limits.

Claim.—The arrangement of the cap *F* and weighted ring *G*, with relation to the stem *E* and the valves *C D*, of different diameters, as herein described, for the purpose specified.

78,281.—E. P. HARRIS, Conneautville, Pa.—*Seed Planter.*—May 26, 1868.—The spring holds down the cut-off which takes the superfluous seed away from the aperture in the seed slide. The slide attached to the seed slide is employed to regulate the capacity of the seed aperture.

Claim.—1. The cut-off *F*, with the spring *G*, in connection with the aperture *a* in the slide-bar *H*, provided with the inclined rear end *b*, all arranged substantially as and for the purpose specified.

2. The slide *L*, applied to the slide-bar *H* in relation with the aperture *a*, substantially as and for the purpose set forth.

78,282.—JOHN K. HARRIS, Springfield, Ohio.—*Harness.*—May 26, 1868.—The object is to obtain a limited elastic draft from the breast collar or hame-

tug without destroying the flexibility of any of the parts. The coiled springs encircle thongs of raw hide or other strong, flexible material. The stops limit the elastic movement, and prevent breakage by over-strain.

Claim.—1. The provision in a breast collar or hames strap, of the flexible, extensible, and elastic device X x M, the same being provided with check pieces b b', C D, substantially as and for the purposes herein explained.

2. The arrangement of draft strap B, open leather frame or breast-strap A, thongs X, spiral springs M, and check pieces b b', C D, as and for the purpose specified.

78,283.—E. K. HARVEY, Quincy, Ohio.—*Revolving Harrow and Roller.*—May 26, 1868.—The journals of the harrow extend through cam slots in the housings, and have their bearings in the ends of the spanner on the out side of the frame, so that when the harrow is raised by the depression of the lever, its driving wheels are unshipped.

Claim.—1. The lever h, arm n, and spanner e, in combination with the harrow H, substantially as described.

2. The harrow H, housings d, and spanner e, combined and operating substantially as described.

78,284.—FREDERICK HAWKINS, Chicago, Ill.—*Concrete Brick Machine.*—May 26, 1868.—The lid is guided and prevented from binding in the grooves by a rack, which is rigidly attached to the under side of said lid, and moves in a slot in one of the flanges projecting from the vertical sides of the press-box. The brick is pressed by the wheel, chain and toggle arrangement, and is discharged by the action of a pinion upon a rack fixed to the stem of the follower.

Claim.—The mold L L', provided with slotted flange S and lid M, with its rack T and pinion W, the follower N, with its rack Q' and pinion P, levers Q, R, I, and H, chain F, drum E, and wheel Z, all arranged and operated substantially as and for the purposes herein set forth.

78,285.—HENRY HENLEY, Halbert's Bluff, Ind.—*Drier.*—May 26, 1868.—The fruit, or other substance to be dried, is laid upon the top of the boiler and in the spaces between the pans, and steam from the boiler, passing through supply pipes, fills the pans, but, having egress through other pipes, does not rise above the atmospheric pressure, and maintains a certain temperature.

Claim.—1. The construction and arrangement of the movable steam-heated pans C, so as to apply a regular heat above and below the chambers E.

2. The combination of the boiler B, removable pans C, and flexible pipes C', when arranged and operating as and for the purpose set forth.

78,286.—CHARLES HESS, Lyons City, Iowa, assignor to ROBERT T. T. SPENCE, same place.—*Churn.*—May 26, 1868; antedated May 14, 1868.—The friction wheels obviate noise, and the form of the paddles renders them capable of gathering and packing the butter into one corner of the churn, which is effected by giving them an oscillating motion after the churning is completed.

Claim.—The combination and arrangement of the friction pulleys A, D, C, C, with the peculiar ogee, curved-shaped arms or paddles F F F F, when constructed and arranged for the purposes above set forth.

78,287.—MARIE L. HILL, New York, N. Y.—*Shoe.*—May 26, 1868.—The object is to produce a shoe which, after the outer covering is worn at some places, will still appear whole, and not be rendered useless by the exposure of the filling, which is commonly white in other shoes.

Claim.—As a new article of manufacture, a quilted cloth slipper or shoe, formed by interposing between the soft filling and the outer covering a textile lining of the same color as the outer covering, whereby, as the latter becomes worn through or torn, the slipper or shoe will not be destroyed, but present the same uniform color exteriorly, as herein shown and described.

78,288.—CHARLES HOLLIDAY, Huddlesfield, England.—*Machinery for Printing on Fabrics.*—May 26, 1868.—The printing material passes down the tubes and fills the countersinks, and on turning the roller in contact with the surface to be printed upon, the printing material is left thereon in a quantity and figure depending on the quantity and depth of the countersunk cavities. The countersinks fill again by the gradual flow of the semi-fluid matter, and the process is repeated. The fluidity of the material is increased by heat, applied through the medium of steam, hot water, or otherwise.

Claim.—The within-described process of ornamenting goods by applying coloring or ornamenting material through tubes impressed against the material, with or without the aid of needles or leading wires, substantially as herein specified.

2. The application of heat, in connection with the tubes in the above process, substantially as and for the purpose specified.

3. In connection with printing through tubes, the enlargement of the tubes at and near the printing surfaces, so as to form cups, which tend to determine the depth in the tube from which coloring or other viscid matter is drawn at each impression, substantially as and for the purpose herein specified.

78,289.—STEPHEN HYDE, New York, N. Y.—*Surcingle.*—May 26, 1868.—Two rubber straps are sewed to the ends of the girth and to the buckle strap, in order to render the girth capable of yielding when the animal breathes, or lays down, or exerts himself in any unusual manner.

Claim.—As a new article of manufacture, a surcingle, provided with two elastic joints, a a, when inclosed in leather cases D, and secured to the buckle and tongue straps b d, as herein shown and described, for the purpose specified.

78,290.—GEORGE W. JACOBS, Quincy, Ohio.—*Vegetable Slicer.*—May 26, 1868.—The cabbage, or other vegetable to be cut, is placed in the upper box, which is reciprocated over the knives by turning the crank, the follower constantly pressing the vegetables down upon the knives until the box is empty, and the cut material being delivered into the lower box through the slots in the table.

Claim.—The combination of the plates D D, the knives d d, slots b b, and slots c c, in the table A, and movable box E, as and for the purpose specified.

78,291.—TRUMAN P. KEELER, Worcester, Mass.—*Adjustable Hammer and Drop.*—May 26, 1868.—The cam-bearing shaft is movable longitudinally, so as to bring a larger or smaller cam to operate upon the toe projecting from the hammer stem, and the stop block is connected therewith and adjusted simultaneously by the same lever. So long as the treadle is depressed, the device is a regularly working hammer, but when the foot is removed from the treadle it rises, and stops consequently engage with the cams and hammer, retaining the latter in an elevated position, to be dropped at the will of the operator.

Claim.—1. The combination, with the hammer, of an adjustable stop block F, and mechanism for operating the same, substantially as and for the purposes set forth.

2. The combination, with the hammer, of the stop block, for checking its upward movement, the cams and cam-shaft for operating the hammer, and the lever e, connected with and arranged to adjust both the cams and the stop block, substantially in the manner and for the purposes shown and set forth.

3. The combination, with the adjusting lever, connected with the cam shaft and stop block, as specified of the stop piece G, or its equivalent, substantially as and for the purposes set forth.

4. The stop bar J, and treadle, or equivalent means for operating the same, in combination with the hammer-actuating cams, under the arrangement and for operation as shown and set forth.

5. The combination, with the hammer, and cams for operating the same, of the stops p and J, connected with and actuated by the treadle H, in the manner and for the purposes herein shown and specified.

6. The combination and arrangement, with the

hammer, its actuating cams, and the stop block for checking its upward movement, of the mechanisms herein described for adjusting said cams and stop block, and for arresting and holding the said cams and hammer, whereby the machine may be used either as a hammer or as a drop, and the stroke of the hammer, in either case, may be varied, substantially as shown and set forth.

78,292.—HENRY KING, Waterbury, Conn., assignor to himself and FRANCIS STAPPERS, New York, N. Y.—*Grate Bar*.—May 26, 1868.—The construction of this grate bar is designed to more freely admit air to the burning fuel, and also to prevent the bar from being injured by fire by bringing the air into contact therewith at many points.

Claim.—A grate bar, formed in two longitudinal sections, or in one piece, having spaces *a* through the same, wider at the bottom, with apertures *a'* opening into said spaces *a*, substantially as shown and described, and for the purposes set forth.

78,293.—JOHN KOFFEND, Appleton, Wis.—*Plow*.—May 26, 1868.—By raising or lowering the heel of the adjustable landside the direction of the point is slightly changed, thereby causing the plow to work at a greater or less depth.

Claim.—The combination of a pivoted, adjustable, auxiliary landside, with the ordinary landside of a plow, whether said auxiliary landside be placed upon the outer or inner side of said ordinary landside, substantially as herein shown and described, and for the purpose set forth.

78,294.—HUGH LAIRD, Mechanicsburg, Pa.—*Horse Hay Fork*.—May 26, 1868.—The bow approaches the tines as they are thrust outward from the stock after the latter has been inserted in the hay. The hay is thus caught and held between the bow and the tines, and the bow recedes from the tines as they are drawn into the stack to discharge the load.

Claim.—The combination of the compressing and retaining bar or bow *D*, with the elevating tines or prongs *C C*, operating substantially as and for the purpose described.

78,295.—WILLIAM LEHMAN, Newville, Pa.—*Composition to be Applied to Leather*.—May 26, 1868.—A composition consisting of whale oil, beef tallow, hog's lard, lampblack, beeswax, and indigo.

Claim.—The application of the composition herein described to boots, shoes, harness, straps, bellows, and leather manufactured articles generally, by which the same will become water-proof, and wear one hundred per cent. longer.

78,296.—EDWIN LEIGH, St. Louis, Mo.—*System of Pronouncing Orthography*.—May 26, 1868; antedated May 19, 1868.—This system consists in giving to common letters of the alphabet peculiar sounds, by peculiarities in the form or construction of said letters, without departing from the established orthography; in giving to combinations of letters a pronunciation dependent upon the peculiar forms and style or character of the common alphabetic letters of which the word is composed; in employing light-faced letters, (skeleton, hair-line, outline, dotted or broken-lined, phantom or other light-faced letters,) of otherwise the same general form, size, upright position, and same general character as the rest of the letters; in employing the same, or a like phonic sign in different alphabetic letters to denote the same sound; and in inserting or inclosing, when desirable, a phonic sign in the skeleton or outline of an alphabetic letter.

Claim.—1. The use of a skeleton outline, or light form of an alphabetic letter, with a phonic sign included within it, or constituting a part of it, to indicate a particular sound of that letter.

2. The use, in cases where several alphabetic letters must be employed for the same sound, of phonic signs closely resembling each other, so as to be substantially the same phonic sign, though used as the whole or parts of different letters.

3. The employment of light-faced letters, (as skeleton, hair-line, outline, or in any way made of lighter color,) of otherwise the same general form, size, up-

right position, and character as the rest of the font, for silent letters, in combination with phonic letters, in order to indicate the pronunciation of words without changing the common orthography and familiar outline of the word or word picture.

4. The employment of phonic vowel and consonant letters, (or peculiarly constructed forms of the alphabetic letters,) in combination with any peculiar class of letters for the silent letters, in order to indicate the pronunciation of words without changing the common or established orthography, substantially as described.

78,297.—ALEXANDER LISK, Philadelphia, Pa., and ADAM WOOLEVER, Allentown, Pa.—*Converting Cast Iron into Wrought Iron and Steel*.—May 26, 1868.—The iron is melted in a puddling furnace, and the following substances are then intimately mixed and stirred into the iron, namely: marble-dust, nitrate of soda, borax, litharge, yellow prussiate of potash, common salt, saltpetre, and black oxide of manganese.

Claim.—The process of manufacture, substantially as and for the purpose set forth.

78,298.—JAMES R. LOGAN, Rolla, Mo.—*Sawing Machine*.—May 26, 1868; antedated May 18, 1868.—The carrying wheels are so applied that they may be turned from their normal position at right angles to the axle, and held or fixed in a position parallel with the axle, so that the machine may be moved laterally in order to transfer the saw from the point at which the log has been sawed to the next point at which it is to be sawed. The socket and spring catch sustain the saw in an elevated state when not in use.

Claim.—1. Moving a sawing machine in the manner described, by means of the wheels *C C* attached to the axle *F*, substantially as and for the purpose specified.

2. The socket *f* attached to the cross-bar *J* on the front part of the frame *A*, and provided with the catch *K*, substantially as and for the purpose specified.

78,299.—NARDO F. LOI, New York, N. Y.—*Pipe Wrench*.—May 26, 1868.—Various devices can be applied to the ends of the levers for the purpose of adapting the instrument to grasp or clamp different objects.

Claim.—1. The fixed handle *A*, when its head *a* is perforated at right angles to the handle to receive the screw shank of the adjustable jaw *c*, which is placed above and parallel with the jaw *b* of the handle *C*, as herein described, for the purpose specified.

2. The construction, arrangement, and operation of the handle *C*, having the perforated jaw *b*, the pivoted nut *B*, screw-threaded handle *A*, head *a*, and adjustable jaw *c*, as herein described, for the purpose specified.

3. The jaws *d*, *e*, *f*, when adjusted in the arm *b* of the lever *C*, by means of the notches and transverse pin *g*, as herein described for the purpose specified.

78,300.—NELSON LONG, Watertown, N. Y.—*Apparatus for Rolling Dough*.—May 26, 1868.—Two methods of graduating the distance between the dough roller and dough board are shown, the object being to roll the dough into sheets of any desired thickness. In one instance the adjustment is effected by providing the auxiliary roller with elongated bearings and set-screws, and in the other instance by raising or lowering the side bars which form the bearings of the sliding frame.

Claim.—1. The combination, with the board or receptacle for holding the dough or other material, of the dough roller, and the sliding or transverse frame for supporting the same, hinged or pivoted in the manner described, so as to be adjustable to different heights above the said board or receptacle, substantially in the manner and for the purposes shown and specified.

2. In an apparatus, such as described, the combination, with the auxiliary roll and the elongated bearings formed for its reception in the sliding frame, of adjusting or set screws or equivalent means for regulating the position of the journals of the roll

in their bearings, substantially in the manner and for the purposes shown and set forth.

3. The combination with the side boards, which form the bearings for the sliding frame, of the top plates provided with inclined projections *c*, as described, and the correspondingly notched sliding bars, and its adjusting screws for raising and lowering said top plates, under the arrangement and for operation as herein shown and set forth.

78,301.—WILLIAM R. MANLEY, New York, N. Y.—*Paddle Wheel*.—May 26, 1868.—The crank connection between the controlling frame and guard beam permits the bearing of the controlling frame to change its position in relation to the guard beam whenever the guard beam changes its position in relation to the main wheel. In consequence of the diagonal arrangement of said connection the controlling frame is moved to the least extent by movements of the paddle guard in vertical and horizontal directions. The arrangement of the paddle cranks is intended to equally divide the weight of the controlling frame between the paddle wheel and the paddle-wheel guard. The link connection relieves the shafts, on which the paddles turn, of the weight of the controlling frame.

Claim.—1. The combination of the controlling frame *E* of the paddles with the guard beam *F* and crank arm *G*, substantially as hereinbefore set forth.

2. The arrangement of the crank arm *G* diagonally to vertical and horizontal directions in which the guard beam may be moved by strains upon the vessel, substantially as hereinbefore set forth.

3. The arrangement of the paddle-crank arms *D* and the crank arm *G* at equal angles to a vertical line, substantially as hereinbefore set forth.

4. The combination of the controlling frame *E*, guard beam *F*, crank arm *G*, link *N*, and main shaft *B*, substantially as hereinbefore set forth.

78,302.—T. F. MANTEY, New Orleans, La.—*Extension Ladder*.—May 26, 1868.—The chair is elevated by an extensible ladder or lazy-tongs, and the parts recited in the claim are for anchoring the apparatus and turning and steadying the ladder when elevated.

Claim.—1. The winches *v*, in combination with the extension lattice *A* and chains *b*, for the purpose of adjusting the lattice, when elevated by the screw *G*, at any desired angle, as herein shown and described.

2. The crank screw *J* and bar *K*, in combination with the frame *T* and extension lattice *A*, all substantially as and for the purpose shown and described.

3. The combination of the pintle base *R*, extension lattice *A*, adjustable plate *Q*, having the projection *q*, bearing the pin *r* and tongue *M*, all arranged and operating as described for the purpose specified.

78,303.—FRANKLIN W. MARRIOTT, Richwood, Ohio.—*Corn and Seed Planter*.—May 26, 1868.—This implement is guided by hand, and the seed is dropped at intervals by the action of a toothed wheel on the axle upon a slide beneath the hopper, said slide being returned after each impulse by a spring.

Claim.—A seed planter, constructed and operated in the manner substantially as shown and described.

78,304.—MARK M. MARTIN, Cochran, Ind.—*Railway Car Seat*.—May 26, 1868.—The object of these improvements is to make the car seat susceptible of a greater number of changes than the ordinary sleeping chairs, so as to render it comfortable to all classes of the traveling community.

Claim.—1. In combination with the seat body *A*, hinged at *a* to the frame *B*, the knuckle joint *E E'*, arranged and adapted to operate in the manner stated.

2. The combination of the car seat *A B*, leg-supporting flap *J*, and elastic thong *K*, for the object explained.

3. The combination of the foot rest, consisting of the wings *L L'*, inclined board *N*, and hinged leaf *O*, with the neck bar *R* and stand *S*, for the purpose explained.

4. The combination of the rail *D*, hooks *d d'*, and

flap *J*, adapted to receive and enable the ready removal of the mattress *F*, in the manner herein described and set forth.

78,305.—S. F. MATHEWS, Mechanicsburg, Pa.—*Gas Regulator*.—May 26, 1868.—The position of the adjustable thimble is regulated by the pressure of the gas, and determines the quantity which is allowed to flow through to the burners.

Claim.—1. The nipple-tube *B* and the thimble *E*, constructed, arranged, and operating substantially as and for the purposes described, in combination with a gas pipe.

2. The body of the governor *A*, the case *C*, tube *B*, thimble *E*, and spring *h*, in combination, forming a gas regulator, substantially as shown and described.

78,306.—JOHN C. McCLAMROCH, Edina, Mo.—*Animal Trap*.—May 26, 1868.—The moving of the bait-hook lever by the animal withdraws the spring catch from the free end of the weighted trap door, which then falls and deposits the animal in the main box of the trap. The hinged gate prevents the return of the rat from the detachable cage.

Claim.—1. The described arrangement of the bait hook *H*, U-shaped lever *I*, connecting rod *J*, bell crank levers *K N*, and adjustable spring catch *M*, with relation to the pivoted trap door *C*, all constructed and combined to operate in the manner and for the purpose substantially as set forth.

2. The detachable receptacle *S*, provided with partitions *s¹* and slides *s² s³*, and having a grated top, when said receptacle is adapted to be connected with the box *A* by means of the adjustable passage *Q*, in which the gate *R* is hinged, all constructed and arranged as and for the purpose set forth.

78,307.—JAMES McCLEISH, New York, N. Y., assignor to himself and E. V. HAUGHWOUT & Co.—*Gas Apparatus*.—May 26, 1868.—A gas apparatus for lighting steamboats, railway cars and other conveyances and movable structures. The devices shown are chiefly designed to maintain an equable pressure upon the gas in the holder.

Claim.—1. The constructing of the gas holder *B* with rigid or inflexible top and bottom plates *a b*, and flexible gas-tight sides, the latter being folded or crimped, substantially in the manner as herein shown and described.

2. The pressure arms *C D*, arranged and applied substantially as set forth, and used in connection with springs or equivalent weights for the purpose of exerting a uniform pressure on the gas holder, substantially as set forth.

3. The windlass drum *m*, provided or arranged with a coil or barrel spring, and used in connection with suitable cords, for the purpose of raising or assisting in raising the gas holder during the process of the filling of the same, substantially as set forth.

4. The elevating of the arms *C D* through the medium of the windlass *G* and cords *k k l*, arranged and applied substantially as set forth.

5. The drum *s*, provided with an internal coil spring *t* and a fusee, *w*, on its exterior, in combination with the cords *a' a''*, *c'*, *d'*, arranged as shown, or in an equivalent way, for compressing the gas holder and exerting an equal or uniform pressure on the same.

6. The cords *f*, *k k*, and *l*, in combination with the windlass *H*, all arranged to operate substantially as and for the purpose specified.

7. The receiver *K*, with the pipes *J*, *L*, and *M* communicating therewith, and provided with stop cocks, and all arranged substantially as shown and described.

8. The rollers *h'*, on the top plate *a* of the gas holder, in combination with the vertical guide rods *i'*, arranged substantially as shown and described, for the purpose of retaining the holder in proper position.

9. Braeing or staying the holder *B* by means of the straps *ax*, extending around the interior of the holder and transversely across it, as shown and described.

78,308.—MARTIN MEYERS, Jr., Philadelphia, Pa.—*Refrigerator*.—May 26, 1868.—The hinged doors are attached to the front of the sliding drawers which contain the shelves whereon the articles are sup-

ported within the refrigerator. The hinged doors afford access to the interior of the refrigerator and constitute in themselves, shelves whereon the articles may be placed when withdrawn from the refrigerator.

Claim.—In refrigerators, the construction of the sliding drawer shelves E, with swinging doors C, and with a space, D, between their backs and the inner wall of the case, and the tubes g, communicating with the atmosphere, substantially as and for the purpose described.

78,309.—CHARLES G. MILLER, Brattleboro, Vt., assignor to S. M. SPENCER & CO., same place.—*Benck Drill.*—May 26, 1868.—The drill is rotated by the depression of the right angular lever and collar, which causes the pin projecting from said lever through the slotted tube to engage with the screw shaft, below which the pin is carried in its downward motion. When the pin is raised preparatory to another downward or effective motion, it is disengaged from the screw shaft, but the motion of the drill is continued in the meantime, by the balance wheel.

Claim.—1. The sleeve M, fixed slotted tube I, screw shaft J, pin i, and right angular lever N g, or its equivalent, when said parts are applied to and used in connection with a drill, substantially as shown and described.

2. The movable bed H, arranged and operated substantially as shown, the slotted tube I, screw shaft J, balance wheel K, and the adjustable pin i, operated as shown or in an equivalent way, all combined and arranged for operating the drill L, substantially as described.

78,310.—D. K. MILLER, Reading, Pa.—*Permutation Lock.*—May 26, 1868.—After the peripheral spaces of the rings or disks have been brought into line by the turning of the handle, the handle is pushed inward and then turned until the projection and shoulder on the inner disk are brought directly beneath the tumbler, when the latter will fall into the spaces of the loose disks and the projection on the inner disk will enter the recess of the tumbler and the projection of the tumbler pass to one side of the inner disk. The obstructing tumbler being thus removed, the bolt may be retracted. The split rings embrace the grooved peripheries of the loose disks, and the spaces into which the tumbler falls occur between the ends of said rings, which ends are serrated to adapt them to gripe as well as turn upon the disks.

Claim.—1. The disk E with its projection p and shoulder c, and secured to a shaft, D, in combination with disks F, or their equivalents, and with a tumbler, G, having a recess and a projection adapted to the projection and recess of the disk E, the whole being constructed and arranged within a casing, A, and operating substantially as and for the purpose described.

2. The serrations or teeth upon the ends of the split ring t, for the purpose described.

78,311.—JOHN P. MILLER, Somerset, Pa.—*Curtain Fixture.*—May 26, 1868.—The curtain is held at the point to which it is raised by the spring tongue, which binds the cord against a loop or buckle frame attached to the stirrup.

Claim.—The stirrup C and its ramp FG, the cord D, and the pulley E, combined, arranged, and operating substantially as and for the purpose set forth.

78,312.—GEORGE MOEBS, Detroit, Mich.—*Cigar Header.*—May 26, 1868.—The cigar is headed by a dexterous turn in the cup, and is then left standing in the cup, in order that the gum employed in pasting the leaf may be dried by means of the hot water in the vessel in which the cup is set.

Claim.—The metal cup A, for heading cigars, constructed and operating substantially as described.

78,313.—EDWARD L. MOLINEUX, New York, N. Y.—*Bluing.*—May 26, 1868.—The perforated box is intended to afford a means of transporting, retaining, and using soluble laundry bluing. In use it is immersed in water or other liquid, and being then

raised the water filters through the holes and colors the water.

Claim.—Paeking laundry bluing, when in lump or pressed, for transportation and use, in perforated boxes, substantially as described.

78,314.—MARY E. MOTT, Rouse's Point, N. Y.—*Corpse Preserver.*—May 26, 1868.—The sack is filled with ice and laid upon the abdomen of the corpse, and the tube conducts the water from the sack to a suitable receptacle.

Claim.—The flat rubber sack a, having a slit and laeing, as shown, and the discharge tube b, all substantially as shown and described, and for the purpose set forth.

78,315.—B. NEWBURY, Coxsackie, N. Y.—*Cooking Stove.*—May 26, 1868.—The function of the arm and set screw is to adjust the attaching plate to a horizontal position, and that of the pivoted brace arm is to support the shelf and permit it to be turned down at the rear side of the stove when not required for use.

Claim.—1. The combination of a hinged shelf, E, with the rear part of the stove, whether said shelf is hinged directly to the stove or to a removable plate attached to said stove, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the removable plate A and removable yoke B with the hinged shelf E, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the arm C and set screw D with the plate A, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the pivoted brace arm F with the hinged shelf E, substantially as herein shown and described, and for the purpose set forth.

78,316.—MOSES HIGBY NICHOLS, Hancock, N. Y.—*Shipping Case.*—May 26, 1868.—The cushions form an elastic support for the jar containing the butter or honey. The jar is surrounded with a close chamber containing air which is designed to insulate the contents of the jar and preserve them from the effects of the atmosphere.

Claim.—The combination of the slides B, octagonal cover F, and elastic cushions C, with each other, and with the case A and jar D, substantially as herein shown and described, and for the purpose set forth.

78,317.—ALFRED NOBEL, Hamburg, Germany, assignor to JULIUS BANDMANN, San Francisco, Cal.—*Explosive Compound.*—May 26, 1868.—The explosive substance nitro-glycerine, and an inexplusive, porous substance (such as silicious earth) are brought together to form a composition which, without losing the great explosive power of nitro-glycerine, is very different as to its explosive and other properties, and more safe and convenient for transportation, storage, and use.

Claim.—The composition of matter, made substantially of the ingredients and in the manner and for the purposes set forth.

78,318.—B. S. NORRIS, Ripley, Ohio.—*Press.*—May 26, 1868.—When the presser is to be raised both pawls are held away from the presser stem by hooking the links on the proper pins on the post, and when the presser is to be operated both pawls are allowed to be faced against the rack on the stem, the lower pawl giving the presser its effective movement and the upper pawl preventing the retrogression of the presser.

Claim.—The combination, with the frame A, of the presser B, hand lever C, spring pawls a and c, and the weight D, substantially as and for the purpose described.

78,319.—JOHN B. OSIER, Ogdensburg, N. Y.—*Device for Cutting Sheet Iron.*—May 26, 1868.—The angular knife is depressed by the treadle, and in passing the lower straight knife commences to cut at each outside edge of the sheet iron or tin and finishes at the middle.

Claim.—The construction and arrangement of the frames A A with the perpendicular guides C C, an-

gular knife, and cross-bars D and E, with the spring H, and sliding guide F, and treadle I, all arranged and connected for the purpose set forth.

78,320.—JOHN A. OWENS, Little Falls, N. Y.—*Starch Tray.*—May 26, 1868.—The metallic bottom is designed as a substitute for the common wooden bottom, which being constantly wet is roughened by the shovel used to take up the starch, thereby inducing eddies and deposits of the refuse with the starch. Likewise the curves at the connected ends of each pair of trays are employed in lieu of the common square end divisions which induce the refuse to settle in the corners. The partitions are situated near the point where the stock enters, and collect and retain the sand and dirt, and prevent the same from settling with the starch.

Claim.—1. Forming the bottoms of the trays of galvanized iron.

2. Forming the connected ends of each pair of trays with a curve, substantially as described, and for the uses and purposes mentioned.

3. The partitions E and F, one or both, for the uses and purposes mentioned.

78,321.—THOMAS PERCIVAL, Augusta, Me.—*Corn Husker.*—May 26, 1868.—The bottom of the hopper permits but one ear of corn to descend through it at a time, and each ear thus delivered from the hopper takes position in a groove and in front of the plunger, by which it is advanced to the stripping device.

Claim.—1. The use of the expanding stripper I, composed of the several stripping tools, as described, so arranged that the pressure of the ear will cause them to open to receive it, whether the closing of the same be effected by means of a single elastic rubber spring, or by other means, and whether their cutting edges be straight or toothed, the whole operating in the manner and for the purpose substantially as described.

2. The butting knife H, formed of a plate of steel, having through it a round or oval hole or holes, with beveled cutting edges, operating in the manner and for the purpose substantially as described.

3. The hollow ended plunger C, constructed and operating in the manner and for the purpose substantially as described.

4. The combination and arrangement of parts of a machine for husking corn, when constructed and operating in the manner substantially as described.

78,322.—EUGÈNE PERTUISET, AUGUSTE MUNDL, and JEAN ETIENNE ARMIDE DE FLÉRON, Paris, France.—*Igniting Explosive Projectiles.*—May 26, 1868.—The object is to produce a projectile which, without the usual percussion or friction priming or fuse, will explode when it reaches the terminus of its flight; and the specified mixture or fulminating compound consists of chlorate of potash, sulphur, hunting powder, and animal black. The bullet or ball may be exploded without the use of a fuse.

Claim.—1. An explosive projectile, composed of a tube or equivalent hollow metallic body, filled with a detonating or fulminating compound, which will be ignited or inflamed by the action of the heat developed by the impact or penetration of the projectile, substantially as herein shown and set forth.

2. The fulminating mixture or composition, substantially as herein specified.

3. The percussion fuse, for containing the fulminating compound, made substantially as and for the purposes herein shown and set forth.

78,323.—LOUIS VICTOR PIGUET, New York, N. Y.—*Watch.*—May 26, 1868.—A pin, serving as a pendant winder and setter, fits through the pendant and has at its inner end a crown wheel which gear into a pinion which is fitted in the movement. This pinion is made to gear with two other pinions, one of which is mounted upon a swinging bar and gears into the barrel ratchet, while the other is upon an oscillating shifting bar, and can, by a push piece, be brought to gear into the common pinion, and thus complete the setting apparatus.

Claim.—1. The combination of the knob *h*, spring plate L, and lever E, operating as herein described, whereby the pressure upon the knob *h* throws the

setting mechanism in gear and the winding mechanism out of gear, substantially as herein shown and described.

2. The arrangement in the watch case of the key C, having pinion *b*, wheel D, spring lever E, wheels F G, shifter plate L, knob *h*, pinions K, J, *g*, H, and I, all constructed and operating as described, for the purpose specified.

3. The arrangement of the key C, wheel D, spring lever E, pivoted upon the pin *c* of said wheel, and bearing the wheel F, and the wheel G, all operating as described, in such a manner that by turning the key C in one direction the wheel F is bound between the wheels D G to wind the watch, and turning the key in the opposite direction releases the wheel F and prevents the winding of the watch, as herein shown and described.

4. The key C, having the crown gear wheel *b*, in combination with the wheels D F G, spring lever E, spring arm L, pinion K, wheels J H *g* *h* I, as herein described, whereby the watch is wound and set by the same key, independently of each other, as herein shown and described.

78,324.—M. H. POPE, Susquehanna Depot, Pa.—*Horse Hay Fork.*—May 26, 1868.—The pivoted, bifurcated arm, when turned to a horizontal position so as to inclose the shank in its slot, causes the lower shoulder of the shank to engage the edge of the opening in the cap of the case, if the shank be raised; but when the shank is depressed the pivoted end of the arm engages the upper shoulder thereon, thereby retaining the tines in a horizontal position. The lever is turned upward to lock the arm in its horizontal position.

Claim.—The slotted arm *h*, lever *f*, both pivoted to the cap E of the case B of hay harpoon, all substantially as shown and described, and for the purpose set forth.

78,325.—J. W. RAND, Charlestown, Mass.—*Pattern for Cutting out Shirts.*—May 26, 1868.—The object of this system of cutting shirts or shirt patterns is to enable persons unskilled in the art to readily lay out a pattern of any ordinary size.

Claim.—1. My improved system of cutting shirts or shirt patterns, the same consisting in the employment or combination of a front plate or pattern, O, a series of yoke plates or patterns, A A', &c., a back-side plate, S, a front-side plate, R, a sleeve pattern, Q, and a bosom pattern, H, the whole being constructed substantially in manner as set forth, and to be used together, as and for the purpose described.

2. The combination therewith of the series of plates I I', &c., for cutting out the neck portion of a bosom, as set forth.

3. The combination of the front plate O with one or more yoke plates, A, &c., each of such parts being provided with a scale of measurements or division so combined or arranged that the corresponding figures on each indicate the width, respectively, for cutting the front and back parts of shirts or shirt patterns of any ordinary size.

4. A yoke formed with a series of measurements or scale of divisions arranged near each end of it, in manner as set forth.

5. The front plate O, provided not only with a scale of divisions, arranged as set forth, but formed with a rectangular bosom space, A B C D, as explained.

78,326.—L. T. RICHARDSON, Clayville, N. Y.—*Manufacture of Hoes.*—May 26, 1868.—The blank or pattern as it is cut from the cast-steel bar is formed with the shank or neck dropped below the ears of the hoe, the object being to facilitate the finishing process.

Claim.—The cavities or recesses *d d*, in the blank or pattern of the hoe, in the process of manufacture, substantially as and for the purposes described.

78,327.—JAMES L. ROWLAND, Milwaukee, Wis.—*Manufacture of Artificial Stone.*—May 26, 1868.—The pulverized sand, rock, or other mineral, and dry, finely-powdered hydraulic cement, and some one or more of the native earths and oxides of metals (also finely pulverized) are mixed together by means of sieves or otherwise, and the mass is

sprinkled with water or a solution of salt. During the process of moistening the ingredients are thoroughly mixed; and after being molded into the desired shape the material is subjected to external pressure, and it is finally indurated in tanks by carbonic acid applied alone or in connection with water, heat, or steam.

Claim.—1. The use of the various kinds of sands, rocks, scorias, and other hard mineral substances, crushed and otherwise treated, as described, and combined with a cement, or a cement and a salt, prepared substantially as set forth.

2. The use of sand in its natural state, or when it is deprived of its coarser grains, in combination with the improved cement, and with water alone, or with a solution of one or more of the salts herein specified.

3. The use of native earths, metallic oxides, or other like substances, prepared and combined, substantially as described, for the purpose of coloring the stone.

4. The methods of treating and preparing hydraulic cement for the manufacture of stone, substantially as described.

5. The use of carbonic acid in the process of hardening manufactured stone, or other articles having lime for its base, substantially as described.

6. The use of steam in combination with carbonic acid gas, substantially as described.

78,328.—MOSES RUREL, Chicago, Ill.—*Outlery.*—May 26, 1868.—The handle pieces may be of wood. They are secured to the shank by having the metallic tips cast upon the beveled ends and upon the shank. The metal of each tip is united through a hole in the shank, and the uniting metal also fills notches in the ends of the side pieces preventing their lateral displacement.

Claim.—The beveled side pieces B B, having notches in their ends and held in place by the cast metal C C D D, having lugs F fitting in said notches, substantially as set forth.

78,329.—RICHARD SAMUEL, Walden, N. Y.—*Portable Fence.*—May 26, 1868.—This fence is made up of a series of hurdle frames which are connected together by the post or tie bar and its appurtenances, the object being to adapt the kind of fence in question to various formations of land.

Claim.—1. The construction and arrangement of my hurdles, when used in connection with the tie-bar D D, slats E E, tie bolt F, and standards H and I, with the bar M, all as shown and set forth.

2. The construction of my brace, having standards H and I, of uneven length, when used in connection with the hurdles and tie bar, arranged and constructed as shown and described.

78,330.—JOHN J. SANDERS, Jr., New York, N. Y.—*Mirroring Machine.*—May 26, 1868.—Planing knives are combined with the circular saws in such a manner that the edges of the moldings which are being sawed may, at the same time, be planed.

Claim.—1. The block C, attached to the saw D, for the purpose of holding the planing knives E, all constructed, arranged, and operating as described, for the purpose specified.

2. The adjustment of the planing knives E in the block C, by means of the inclined grooves e, nut F, and screw bolt d, all constructed, arranged, operating as described, for the purpose specified.

78,331.—WILLIAM G. SANFORD, Union City, N. Y.—*Mail Car and Mail Bag Receiver.*—May 26, 1868.—The rod attached to the ear strikes the suspended mail bag and draws it from the hook when it falls upon the hinged incline and is delivered into the ear. In this way the mail is received by a ear while under full headway, and simultaneously mail is delivered from the ear by means of the trap door.

Claim.—1. In combination with a car, A, a sliding section, B, and trap door C, for delivering the mail, when said door is disengaged by an arm, D, actuated by a post on the side of the track, and so arranged that in falling it shall form a chute, to direct the bags in falling away from the track, substantially as described.

2. The combination and arrangement of the slid-

ing section B, the trap door C, and slide F, for simultaneously discharging and receiving the mail, substantially as described.

78,332.—HIRAM H. SCOVILLE, Chicago, Ill.—*Stone Breaker.*—May 26, 1868.—Power is so applied to the hopper that each revolution of the driving shaft causes the ends of the hopper to approach and recede from the central fixed column, the effect being that of a double-acting breaker.

Claim.—The fixed central column C, with its corrugated faces in combination with the corrugated faces on the oscillating hopper D, the arm K, the shaft H, with its eccentric or crank, all arranged and operating substantially as herein described.

78,333.—HIRAM M. SHAW and GEORGE G. TINDALL, Fremont, Ohio.—*Windmill.*—May 26, 1868.—The weight of the water elevated by the windwheel is made to suspend the operation of said wheel when the trough is filled. The tilting of the trough when full actuates the parts whereby the wings are turned into their inoperative position.

Claim.—1. The rods f, when provided at their outer ends with the cross h, in combination with the disk H and weighted arm g, whereby, as the disk is raised the cross h is changed from a vertical to a horizontal position to render the sails inoperative, as herein shown and described.

2. The combination of the pivoted trough J, rod m, disk H, weighted arms g, eye F, rods f, cross h, and hinged sails A, all arranged as described, for the purpose specified.

78,334.—JOHN SHIMER, Bronson, Mich.—*Clamp for Holding Leather to the Currier's Bench.*—May 26, 1868.—This instrument clamps the hide to the bench or block upon which it is placed for working and dressing, a spring catch and ratchet being employed to maintain the jaws in their clamping position and permit the hide to be readily liberated.

Claim.—1. The clamp pincers B B, as constructed, having a spring catch, D, for holding them, and the hide or leather E on the bench C or block, for manipulating, substantially as herein described.

2. The stirrup or ratchet bar F and lever pawl f when applied to clamps, for tanners' and curriers' use, substantially as set forth.

78,335.—ARIEL B. SPROUT, Hughesville, Pa.—*Horse Hay Fork.*—May 26, 1868.—A hay-elevating fork, consisting of two rods or bars, armed with barbs or prongs, and hinged together near the center, and spread out or contracted by means of a jointed lever.

Claim.—1. A hay-elevating fork, provided with a penetrating point, and with rigid barbs, hooks, or spurs, operating substantially as described.

2. A hay-elevating fork, having barbs, hooks, or spurs, which are thrust into and withdrawn from the hay, or equivalent material to be raised, by a lateral movement, relative to each other, of the bars to which said barbs or hooks are attached.

3. A hay fork, provided with rigid barbs or hooks, which are covered when the fork is to be inserted into or released from the hay, and uncovered after the fork has been inserted, for raising the hay.

4. A hay fork, composed of bars having a lateral or shear blade movement relative to each other, a penetrating point, barbs or hooks, and a mechanism or device for operating the bars and hooks, to cause them to seize and hold or release the load, as desired.

5. Giving to the holding hooks or spurs a lateral and upward movement or thrust, by means of toggle links or levers connected therewith, for the purpose of operating said hooks substantially as described.

78,336.—ANSON P. STEPHENS, Brooklyn, N. Y.—*Composite Pipe.*—May 26, 1868.—Hydraulic cement is the material cited as the non-metallic lining. The corrugated metal opposes a bursting as well as a compressing force, and prevents the endwise movement of the non-metallic material.

Claim.—1. The combination of a thin corrugated metallic sleeve with a non-metallic lining, substantially as before set forth.

2. The combination of a thin corrugated metallic

sleeve with a non-metallic covering, substantially as before set forth.

3. The combination of a thin corrugated metallic sleeve with both a non-metallic lining and a non-metallic covering, substantially as before set forth.

78,337.—WILLIAM TIBBALS, South Coventry, Conn.—*Priming Metallic Cartridges.*—May 26, 1868.—A copper case is first formed in the usual manner. The metallic disk or anvil is then made, it being of the same diameter as the case, into which it is dropped; the case is then drawn down to the diameter of the bore of the fire-arm for which it is intended, leaving the anvil securely locked in the flange thus formed at the base.

Claim.—Securing the anvil B by drawing or forming the shell A down over it, in the manner shown and described.

78,338.—DANIEL TIERNEY, New York, N. Y.—*Tailors' Square.*—May 26, 1868.—This improvement is designed to facilitate the drawing of outlines upon cloth, in conformity with measurements.

Claim.—A tailors' T-square, consisting of the cross-piece A, to which the bar or ruler B is pivoted, the bar having suitable graduated scales *a b c*, and a pointer *d*, or its equivalents, and the cross-piece being provided with marks *e*, or their equivalents, on its surface, and with marks *f* on its front edge, all arranged as set forth, for the purpose specified.

78,339.—GABRIEL UTLEY, Chapel Hill, N. C.—*Plow.*—May 26, 1868.—The object is to secure the parts in such a manner that they shall not be weakened by having bolt holes in them, and may be readily detached.

Claim.—1. Securing the moldboard E to the plow by means of the dovetailed tongue *e'*, formed upon its inner side, fitting into a dovetailed groove formed in the forward side of the arm G, cast solid upon the side of the standard C, substantially as herein shown and described, and for the purpose set forth.

2. Securing the point F to the plow by means of the dovetailed tongue *b'*, formed upon its under side, and fitting into a dovetailed groove formed in the forward side of the arm H, cast solid upon the side of the lower part of the standard C, substantially as herein shown and described, and for the purpose set forth.

3. Connecting the moldboard E and point F to each other by means of the pin I, passing through the lower part of the said moldboard E, and through the extended end of the tongue *b'*, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the tongued point F, tongued moldboard E, grooved arms H and G, and standard C, with each other, substantially as herein shown and described, and for the purpose set forth.

78,340.—JAMES D. VAN HOEVENBERGH, Kingston, N. Y.—*Carriage.*—May 26, 1868.—The notched side plates and hooks are so arranged that on slightly raising the seat, the hooks are released from the notches, permitting the seat to be freely moved backward or forward, it being securely fastened in any desired position. The object of the straps under the springs is to hold up the carriage body in case the springs break. When the wagon is descending a hill, the tongue slides back and forces the brake blocks against the wheels, but in backing a coupling pin prevents the sliding of the tongue.

Claim.—1. The combination and arrangement of the notched side plates D D, and inclined hooks H H, for fastening movable seats, substantially as and for the purpose herein specified.

2. The India-rubber straps C C, under the springs B B, secured thereto, and arranged in combination therewith, substantially as and for the purpose herein set forth.

3. The break blocks P P, balanced by the counter weights R R, in combination with the double whiffle-tree break bar N, and sliding tongue L, substantially as and for the purpose herein specified.

78,341.—A. J. VAN ORNUM, Hartford, Vt.—*Wood Turning Lathe.*—May 26, 1868.—The mandrel

is provided with a sliding sleeve having a square socket in one end, which, in conjunction with the spurs on the end of the mandrel, serves to hold the shaft of wood while it is being turned from the other end, until the sliding turning tool comes in contact with the end of said sleeve, when the latter is pushed back by the tool. Thus the whole length of the shaft of wood may be turned.

Claim.—The sleeve B, having a square socket B', and adapted to rotate with and be moved longitudinally upon the center A, substantially as and for the purpose herein set forth.

78,342.—JOHN B. T. VAN PATTEN, Sing Sing, N. Y.—*Globe Valve.*—May 26, 1868.—By screwing down the spindle, the valve is closed as in the ordinary globe valve, if the pressure be on its under side. When the spindle is raised, and the valve left free, it acts as a check valve, as pressure upon its upper side will close it. The valve is guided to its seat by reason of the stem being in the tubular spindle and bottom piece.

Claim.—The construction of valve C and hollow spindle K, and their arrangement with reference to wheel H and spindle E, substantially as described and set forth.

78,343.—LEWIS M. VAN SICKLE, Woodbridge, N. J.—*Brick Machine.*—May 26, 1868.—The clay is forced outward from the rectangular mud box through slots or openings in opposite sides of said box and near the bottom thereof, and received by molds, in each series of which the clay is pressed by a plunger deriving a vertical, reciprocating motion from the vertical, central shaft. The plungers are caused to alternately rise and fall, and the horizontally reciprocating frames—through the medium of which motion is communicated from the shaft to the plungers—carry bars or dischargers, corresponding in number and divisional spaces with the molds. The vertically sliding gates are opened and closed alternately by the action of the sweep upon pivoted frames.

Claim.—1. The operating of the plungers F from the vertical shaft C, through the medium of the slotted arms J J, the reciprocating frame H, bars G F, connected with the bars *i*, fitted in the framing B, and having the plungers F attached to them, substantially in the manner as and for the purpose specified.

2. The gates K K, operated as shown, in combination with the discharges *m*, and the plungers F, all arranged so as to be operated from the shaft C, in the manner substantially as and for the purpose specified.

78,344.—JOHN VAN WINKLE, New York, N. Y.—*Wood Cleaver.*—May 26, 1868.—The pendent bar is designed to protect the edge by preventing it from striking the earth or stones when in use. It is also intended to protect the fingers of the operator and the floor.

Claim.—A hatchet or cleaver A, formed or provided with a pendent bar, D, at its forward end, said bar extending below the cutting edge of the tool, and guarding the same from injury when in use, substantially as described.

78,345.—GEORGE VOWLES, New Hudson, Mich.—*Potato Digger.*—May 26, 1868.—The rake which follows the knife and fingers is intended to throw to the surface any potatoes which may escape said fingers.

Claim.—1. The knife C, constructed with fingers C², and bowed arms C¹, by which it is adjustably attached to the handles B, and connected also therewith by the braces F, substantially as described.

2. In combination with the knife, the adjustable spring E, for regulating the depth of the cut substantially as described.

3. In combination with the knife and fingers, the rake D, substantially as described.

4. The arrangement of the tongue A, handles B, and cross brace B', and knife C, substantially as set forth.

78,346.—JOHN R. WILLIAMSON, Bethlehem, N. J.—*Fruit Can.*—May 26, 1868.—The "cam" is a bar

extending entirely across the lid and having eccentric gudgeons upon its ends. The bar is applied and secured by fitting the gudgeons into the ends of the grooves and working them down in the grooves till they reach the bottom of the same. The handle is then bent down upon the cover, whereby the gudgeons are brought above the axis of the bar.

Claim.—1. The cam D, having the handle *d*, and working in grooves *b*, that are provided in the sides of the can, when said cam is operating, substantially as described, to hold down the cover of a fruit can, as set forth.

2. The combination of the can A, which has the flange *a* and grooves *b*, with the cover B, elastic C, and cam D, all made and operating substantially as herein shown and described.

78,347.—WILLIAM D. WILSON, Watertown, N. Y.—*Horse Hay Fork.*—May 26, 1868.—The plug is forced downward by hand, causing the prongs to emerge from the case and enter the hay; the downward movement is continued till the spring-actuated lever passes below the tripping lever, when the stop is forced through a slot in the tube, and the parts are thereby held in the relative position which enables the prongs to sustain the load. A pull upon the tripping cord disengages the two levers and the spiral spring then withdraws the prongs within the case and so discharges the load.

Claim.—1. The levers *k l*, in combination with the plug *e*, as and for the purpose set forth.

2. The levers *k l*, in combination with the arm *l'* and screw *l''*, in manner described.

78,348.—JOHN S. WOOD, Hartford, assignor to himself and ELIZABETH P. SEYMOUR, West Hartford, Conn.—*Brick Machine.*—May 26, 1868.—The rock shaft is connected by vertical rods with the horizontal reciprocating rod which carries the presser. The rock shaft and, consequently, the presser derive a variable motion from the main shaft through the medium of a lever whose lugs or tappets act alternately upon the loose arm and fixed crank which are attached to the rock shaft, and which may be adjusted with respect to each other by means of the notched pivoted bar. The front end of the grate swings upward to permit the passage of such obstructions as may project from the molds, and the grate and gate move simultaneously.

Claim.—1. The notched bar H, hinged to the loose arm *h* upon the shaft G, and serving to connect said arm with the crank *f*, substantially as described, for the purpose specified.

2. The lever *i*, having lugs, *l m*, fitted loosely upon the rock shaft G, and connected with the main driving shaft, in combination with the loose arm *h*, crank *f*, and hinged rack bar H, for the purpose of giving motion to the rock shaft G, substantially as described.

3. The swinging grate M, in combination with the sliding gate N and the pins *n*, all made and operating substantially as herein shown and described.

78,349.—J. F. ZACHARIAS, Leesburg, Va.—*Railroad Station Indicator.*—May 26, 1868.—The supplemental roller or shaft may be acted upon by springs to cause the apron to bind properly upon the rolls. The pressure rollers press the apron against India-rubber straps or bands upon the central driving roller.

Claim.—1. The combination of the apron or band E, rollers F F', cord G, and operating roller L, substantially as described.

2. In combination with the foregoing, the supplemental roller or shaft R, substantially as described.

3. The arrangement, with the elements in the foregoing first clause, of the pressure rollers P P, substantially as described.

78,350.—C. F. ANTHONY, Chicago, Ill., assignor to himself and JOHN CHARTERS.—*Hassock Machine.*—May 26, 1868.—This instrument is for stuffing and shaping carpet hassocks. The bottom part holds the covering and gives shape thereto while being stuffed, and the top part holds the stuffing material.

Claim.—The three-part hoop A B B, whose top, A, is removable, and the lower part B B hinged at the bottom, and having a rim, C C, with projecting

brads *a a*, &c., for holding a hassock cover, substantially as and for the purpose set forth.

78,351.—WILLIAM ARROQUIER, Worcester, Mass.—*Clothes Drier.*—May 26, 1868.—This clothes drier is passed out through a window and supported thereat in the manner shown. The lines upon which the clothes are hung may be moved upon their pulleys so as to bring any part thereof or any of the suspended clothes within reach of the person inside the building.

Claim.—1. The combination, with the side pieces D D and end pieces E E, of the eyes *b b*, endless bands or cords *m*, pulley supporting pieces F, and ear pieces *f*, substantially as and for the purposes set forth.

2. The combination, with the hinged and folding clothes-drying frame, of cords B, or their equivalents, for supporting the same upon the exterior of the window, substantially as and for the purposes set forth.

3. The combination, with the frame C, ears *f*, and eyes *b b*, of the supporting wires or cords B B, and the fastenings *h*, substantially as and for the purposes set forth.

4. The combination, with the frame C, and ears *f*, of the buttons *n*, substantially as and for the purposes set forth.

78,352.—DANIEL ASHWORTH and ROBERT B. EATON, Woburn, Mass.—*Apparatus for Concentrating Sulphuric Acid.*—May 26, 1868.—The retorts through which the acids pass in the process of condensation are made wholly or partially of platinum to prevent breakage and waste. The steam or vapor from the retorts is conducted to the oil of vitriol chamber so as to dispense with steam from a separate boiler. A reservoir or vessel, formed with a double casing, is so arranged that the oil of vitriol will pass through the space formed by the double casing previous to its concentration, and thus become heated by the concentrated acid in the inner portion of said vessel, the concentrated acid being in an equal degree cooled by contact with the inner casing of the vessel.

Claim.—1. Conducting the steam or vapors from the retorts to the oil of vitriol chamber, for the purpose and in the manner substantially as described.

2. Cooling the concentrated oil of vitriol and heating the vitriol before its concentration, by passing the same around or through a vessel, I, constructed as described.

3. Constructing the pan *c*, with tubes or flues *d*, for the purpose specified.

4. Conducting the acid from one retort to the other, by means of siphons or tubes, as described.

5. Constructing the retorts of platinum, or partly of platinum and partly of glass, when the same are arranged in a series and communicate with each other, as set forth.

78,353.—JAMES BALL, New York, N. Y.—*Envelope Machine.*—May 26, 1868.—By the devices named in the claims the machine is rendered capable of gumming the seal flaps as well as the lower or end flaps, and of performing the several other functions which are necessary in order to the completion of the envelope.

Claim.—1. The arrangement of a revolving gummer, G, having a different velocity from the table which supports the blanks, in combination with the reciprocating table C, substantially as and for the purpose described.

2. Giving to the revolving gummer a positive compound rising and falling and revolving motion, substantially as and for the purpose described.

3. The cam *u*, stop *u'*, and weight or spring *t'*, in combination with the pinions *r r'*, on the shaft of the gummer G, substantially as and for the purpose set forth.

4. The self-adjusting clamp *x* to act on the pile of blanks, substantially as and for the purpose described.

5. Giving to the pile of blanks a motion under the gummer G and picker H, substantially as and for the purpose set forth.

6. The arrangement of an automatic stop-motion, composed of the latch *d*, and notch in the frame A, in combination with the gummer and picker, and

with the platform D supporting the blanks, substantially as and for the purpose described.

7. The arrangement of distinct strips N, catching over the edges of the lower creasing box, and attached thereto by set screws, substantially as and for the purpose set forth.

8. The heels w^2 attached to the folding wings $v^2 v^{2*}$, by one or more set screws, substantially as and for the purpose described.

9. The spiral carriers O, to carry the envelopes along, and retain them free from pressure until the gum has dried, when arranged substantially as described.

10. The combination of two or more sets of spiral carriers O O', running in opposite directions, substantially as and for the purpose set forth.

11. Increasing the pitch of the serew threads at the receiving ends of the spiral carriers O O', substantially as and for the purpose described.

12. The separator c^3 , in combination with the spiral carriers, substantially as and for the purpose set forth.

13. The reciprocating conveyer d^3 , in combination with the spiral conveyers O O', constructed and operating substantially as and for the purpose described.

14. The arrangement of a transparent panel or pane, f^3 , in the receiving table P of the envelope machine, substantially as and for the purpose set forth.

78,354.—JAMES BALMER, Brooklyn, N. Y., assignor to himself and WILLIAM GREENLEAF, same place.—*Self Clinching Spike*.—May 26, 1868.

Claim.—A spike split or divided longitudinally, and having its split parts so beveled or inclined that when driven into the wood the portions on opposite sides of the split or cleft will diverge in opposite directions parallel with the split or cleft, substantially as herein described.

78,355.—CHARLES W. BARNES, Janesville, Wis.—*Spring Catch and Stop for Doors*.—May 26, 1868; antedated May 19, 1868.—The knob fastened to the base board or wall of a room, is provided with a spring catch to receive a staple or loop in the door and thus hold the door open, a slight pull being sufficient to detach the loop and permit the door to be closed. The rubber seat keeps the spring in place and serves as an auxiliary thereto.

Claim.—Knob A, metallic springs C, rubber seat E, and staple D, connected to a door, when the whole are constructed and used substantially as and for the purposes described.

78,356.—SIMEON L. BARINDS, St. Joseph, Mo.—*Perpetual Calendar*.—May 26, 1868.—This invention has reference to a device by means of which the day of the week may be readily ascertained when the year, month, and day of the month are given.

Claim.—1. The combination of the card-board E and dials D B, having letters and figures marked on them, substantially as and for the purposes set forth.

2. The combination of serew wheels F G, screws H I, and dials D B, substantially as set forth.

78,357.—FRANCIS BATES, Niles, Mich.—*Saw Set*.—May 26, 1868.—The jaws and the set serews therein permit the set to be freely moved along the saw blade, and yet the latter is sufficiently braced thereby in a lateral direction while each tooth is being bent by the lever. The lever is adjustable vertically by its attaching serew, and the degree of its vibration is limited by the screws in the frame of the set.

Claim.—A saw set, consisting of the frame A, provided with the jaws B, and set serews b , for holding the saw, and having the lever E arranged to operate therein, substantially as shown and described.

78,358.—THOMAS L. BAYLIES, Richmond, Ind.—*Inking Apparatus for Printing Presses*.—May 26, 1868.—This apparatus is employed in connection with a printing press for the purpose of adapting the same to print in different colors at a single operation.

Claim.—1. The inking slats e , e' , and e'' , hinged and so arranged in sets as to all occupy the same horizontal plane, and also to admit of their being

separated and brought in contact with the different colored inking rollers, substantially as described and for the purpose set forth.

2. The grooves t , t' , t'' , in the sides of the frames, in combination with the inking slat frames, or their equivalents, by which said inking slats are directed against the surfaces of their respective inking rollers, substantially as described and for the purpose set forth.

78,359.—WILLIAM BELLAIRS and HENRY DE MOTT, Atkinson, Ill.—*Window Blind*.—May 26, 1868.—The purpose of one cord is to adjust the slats, and that of the other to raise the whole blind, the latter being counterbalanced, when raised, by the weighted tassels.

Claim.—The arrangement of the slats A A and folding bar B in casing C, arranged either outside or inside of the window, and operating by means of the cords D and F and loaded tassels E and G, substantially as and for the purposes above set forth.

78,360.—NICHOLAS H. BORGFELDT and FREDERICK W. RITTERHOFF, New York, N. Y.—*Machin*

for Granulating and Finishing Tobacco.—May 26, 1868.—A machine to facilitate the manufacture of killikinick and eigarette tobacco. The tobacco scraps from which such tobacco is manufactured are thrown into a hopper, whence they pass into the upper sieve, through which the tobacco which is broken up by the spiral brush is forced, while that portion which is not broken up is carried out at the end of the sieve together with whatever pieces of wood and other hard substances may have been introduced with the scraps. The fine particles of tobacco and dust pass into and are separated by a lower sieve containing an agitating serew.

Claim.—In a device for granulating and finishing tobacco, the arrangement of the spiral brushes, cylindrical sieve B, conveyer serew E, cylindrical sieve D, and the discharges F G, when constructed and operating as herein described.

78,361.—ROBERT J. CLAY, Flushing, N. Y.—*Alphabet Toy*.—May 26, 1868.—The pictorial illustrations with their representative letters are successively brought behind the transparent portion of the front, and the advent of each is announced by a stroke upon the bell, thus securing attention.

Claim.—1. A traveling alphabet, preferably of pictorial character, operated automatically, by means of clock work, within a stand or case, by causing the same to wind and unwind intermittently on and off drums, and so as to expose but a letter at a time, substantially as specified.

2. In combination with an intermittently traveling alphabet apron, operated automatically as described, the bell R, struck to indicate the changes made in the exposure of the letters, essentially as herein set forth.

3. The combination of the alphabet apron C, drums D E, spoke driving wheels F G, bell R, with its hammer e , and clock or watch work, all arranged within a stand or case, having a partially transparent front, for operation as described.

78,362.—ROBERT F. COOKE, Newark, N. J.—*Cotton Picker*.—May 26, 1868.—The shaking device operates against the lower part of the stem of the plant in such a way as to open the bolls and allow the cotton to separate itself therefrom. A blast of air blows the separated cotton into a receptacle or conveyer.

Claim.—1. Opening the bolls of cotton plants and disengaging the cotton from the bolls by means of knocking or shaking the cotton plant, as set forth and specified.

2. The arrangement of flails d at the lower end of a revolving shaft operating the cotton plant, in the manner and for the purpose substantially as set forth.

3. In combination with a shaking device which loosens the cotton from the boll, the use of a blast of air to blow the thus loosened cotton into a receiver, substantially as described.

4. The blast opening J, in combination with the screen or receiver F, said opening and receiver extending nearly from the top to the bottom of the cot-

ton plant, in the manner and for the purpose set forth.

5. The trough G, provided with an endless conveyer belt, L, to convey the cotton from the receiver F to the after part, or to any other desired part of the machine, constructed and operated substantially as set forth.

6. The guides V and W, or their equivalent, arranged and constructed so as to lift up the lower branches of the cotton plant, and to guide the plant, in the manner and for the purpose substantially as set forth and described.

7S,363.—WILLIAM DE CAMP, Newark, N. J., assignor to himself and A. R. E. FALCK, same place.—*Paring Knife for Boots and Shoes.*—May 26, 1868.—When the instrument is in use, the edge of the guide piece is inserted between the sole and the upper leather in the joint, and being pressed to the bottom guides and regulates the cutting. It will be seen that the guide piece is between the point of the knife and the upper leather.

Claim.—The handle A, guide piece y, adjuster V, wedge C, knife B, and the screw S, all combined, constructed and arranged substantially in the manner and for the purpose specified and shown.

7S,364.—PETER S. CRAWFORD, Rockford, Ill.—*Harness Buckle.*—May 26, 1868.—The object in tapering the tongues from the mid-length to the extremity is to give them greater strength and facilitate the buckling and unbuckling of the straps.

Claim.—As an article of manufacture, the circular frame A, having tongue, B, of tapering form, hinged to bars C C, D or D D, substantially as shown and set forth.

7S,365.—JOHN A. EVARTS, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place.—*Chandelier.*—May 26, 1868.—The base or body of the chandelier, as well as the base of the pulley arms, is so constructed that the arms are locked therein by bolting the parts of the body together. A bolt holds together the two parts of the hollow case, admitting of the removal of one part, in order that weights may be added or removed, according as the chandelier is heavier or lighter.

Claim.—1. The flange A, combined with the parts B and C, and constructed so as to receive and hold the arms E, substantially in the manner described.

2. The arrangement of the pulleys b upon their arms G, when the said arms are secured in the base F, substantially in the manner and for the purpose set forth.

3. The weight, consisting of the two parts of the case, H and I, secured together by the bolt L and nut N, and provided with adjusting weights P, substantially in the manner herein set forth.

7S,366.—WILLIAM A. FENN, West Meriden, Conn.—*Covered Dish.*—May 26, 1868.—The spring secures the sleeve in its position within the bearing, but when it is desired to remove the cover the sleeve may be drawn out of the bearing, thus permitting the trunnion to be lifted through the slot in the bearing.

Claim.—The arrangement of the sleeve d upon the trunnion C, and combined with a bearing, a, which said bearing is provided with an open slot, the whole constructed and arranged to operate in the manner set forth.

7S,367.—M. ISADORA FINDLEY, New York, N. Y.—*Waist Belt or Girdle.*—May 26, 1868; antedated May 15, 1868.—A metallic waist belt for ladies and children; a loose sliding buckle being made to engage with apertures arranged in a series, so as to adapt the belt to waists of different size.

Claim.—The detached buckle B, with its knob or button-shaped projections d, in combination with the perforated ends of the belt, for use essentially as shown and described.

7S,368.—ISAAC N. FROST, Peoria, Ill.—*Churn.*—May 26, 1868.—The dashers are semi-circular plates which pass each other as they are moved up and down; their rods are attached to a compound crank and are permitted lateral movement by slots in the

lid, which slots are always closed by the sliding plates.

Claim.—1. The dashers G G, propelled by a crank, in connection with the sliding plate through which they pass, substantially as shown.

2. The sliding plate A A, to close the slot in the top, as shown.

3. The slot, covered with a movable plate, through which the dasher may pass, substantially as shown.

7S,369.—FREDERICK GERFEN, West Hempfield Township, Pa.—*Hay Cutter.*—May 26, 1868.—This hay cutter is used in cutting hay from the mow. The mode of operation is to introduce the point into the mass and apply the proper pressure to the handle. The central rest is to afford a leverage, but is not essentially a part of the instrument. When the supplemental handle is grasped, the handle proper and the shaft serve as a guard to protect the handle.

Claim.—The "hay cutter," constructed and arranged substantially as and for the purpose specified.

7S,370.—GEORGE WILLIAM HAWKSLEY and MATTHEW WILD, Sheffield, England.—*Combination of a Puddling Furnace with a Steam Generator.*—May 26, 1868.—The object is to so combine a furnace with a boiler, or water jacket, as to render the heat simultaneously available for boiling or heating metals or other materials, and for generating steam.

Claim.—The furnace e and boiler a, constructed as described, the former being located within the latter, in such manner as to be wholly surrounded by water, the arrangement being such that the heat of the furnace generates the steam of the boiler, as shown and described.

7S,371.—MICHAEL HENDERSON, Detroit, Mich.—*Car Brake and Starter.*—May 26, 1868.—The power of the momentum is stored in the springs when the cars are stopping, and this power is utilized in overcoming the inertia of the cars in starting.

Claim.—1. The longitudinal bars K, shafts D and O, when connected with the bar G, and operated by the lines or chains L, secured by ratchets and pawls X, substantially as and for the purposes set forth.

2. The combination of the above-named parts with the parallel longitudinal rods H, provided with spiral springs G, sleeves J, and connecting bar T, the line or chain I, cylinder E, and shifting bar G, when arranged and operating substantially as herein set forth.

7S,372.—JOHN HEROLD and MERCER BROWN, Frederick, Md.—*Polish for Leather.*—May 26, 1868.—A compound, including spirits of wine, Venice turpentine, lamp-black, resin, gum turpentine, India-rubber, neats-foot oil, oil of lavender, and gum shellac.

Claim.—The within described mixture, when compounded and used substantially as and for the purpose herein set forth.

7S,373.—ELIJAH HOLMES, Lynn, Mass.—*Vegetable and Fruit Slicer.*—May 26, 1868.—The bars to which the knives are riveted are pivoted at both ends, and from their inner ends rigidly project crooked arms, whose terminal points are pressed upon by the broad flange of the adjusting nut, which on being turned depresses or relieves the crooked arms, and thus produces a simultaneous and uniform adjustment of all the knives, each crooked arm being pressed against the nut by a spring fastened to the back of the wheel.

Claim.—1. The combination of the knife H, the bar F, the arm I, the nut J, and the spring d, or their mechanical equivalents.

2. The combination of the several parts, as above described, so that several knives shall be controlled and adjusted by a single screw or nut, for the purposes and in the manner substantially as above set forth.

7S,374.—F. HULL, Birmingham, Conn.—*Skirt Former.*—May 26, 1868.—The form upon which the hoop skirt is made is provided with an expanding or adjusting apparatus, which is pivoted to the front arms, and so connected to the others that the ex-

pansion gradually increases from the front to the rear.

Claim.—The arrangement of the adjusting bar G, pivoted to the front arms, and provided with the bars H, I, and L, corresponding to the other arms of the form, the whole constructed so as to be adjusted by the raising or lowering of the bar G, substantially as and for the purpose specified.

78,375.—A. G. HUNTER, Flint, Great Britain.—*Manufacture of Soda and Potash.*—May 26, 1868.—The alkaline silicate is mixed with a solution of bicarbonate of lime, whereby silicate of lime and alkaline bicarbonate are produced.

Claim.—The process of converting silicate of soda or silicate of potash into the corresponding carbonate, by double decomposition with bicarbonate of lime, as substantially described herein.

78,376.—JERRY A. HUNTER, New London, Va.—*Machine for Straightening Tobacco.*—May 26, 1868.—The tobacco first passes through the brush to be cleaned, it being guided thence by the upright plain rollers to the grooves of the horizontal rotating rollers, which straighten the tobacco and press the bundles to a proper size for prizing.

Claim.—The funnel-shaped brush, and upright self-acting rollers attached.

78,377.—P. F. KESSLER and JOHN CARLISLE, Dayton, Ohio.—*Steam Heater.*—May 26, 1868.—This heater is made up of radiating shells each of which is traversed transversely by short tubes separated by division plates, and arranged in parallel series so as to form corresponding steam channels. The induction steam pipe communicates by lateral apertures with each of the shells, the steam passing from one channel to another; and the projections of the interposed plates, cause a more effective impingement of the air against the heated surfaces.

Claim.—1. The metallic plates D and the case E, in combination with the shells A in radiators, as and for the purposes set forth.

2. The arrangement of the shells A A, pipes b b, partitions a a, nipples B B, steam pipe C, and case E, when the several parts are constructed and operate substantially as and for the purposes set forth.

78,378.—THOMAS LANGSTON, Meriden, Conn., assignor to E. MILLER and Co., same place.—*Lantern.*—May 26, 1868.—The object is to construct the lantern so that by the removal of the lamp socket the globe may be taken from within the guards for the purpose of cleaning, and be replaced when broken. The guard flange is large enough to permit the globe to be withdrawn through it.

Claim.—The combination of the lamp socket A with the lower guard flange C, when the said guard flange is provided with one or more internal projections, f, and the set screw G, so as to secure the said socket to the flange, substantially in the manner herein set forth.

78,379.—Canceled.

78,380.—PATRICK LENNOX, HIRAM H. ROBBINS, and EDWARD HAYES, Lynn, Mass.—*Machine for Beaming Hides.*—May 26, 1868.—The effect of the brake is to enable the whole hide to be beamed at one operation, thereby avoiding the necessity of removing it from the machine and turning it about end for end. The beaming tool has the necessary elasticity imparted to it by the bracket and springs. The arrangement of the cranks, shafts, &c., is designed to conduce to strength of parts, and secure an equable, steady motion.

Claim.—1. In a machine for beaming hides or dressing leather, a device so constructed and applied thereto as to automatically press upon or clamp the hide to its supporting table, and hold it in position under the action of the beaming tool, in order to manipulate the hide at one operation.

2. As a device for accomplishing the above result, the combination and arrangement of the brake bar g with the vibrating levers s s, such levers being pivoted to the guides b b, and actuated by the wipers u u, and operating in connection with the beaming tool

essentially in manner and for the purpose as herein shown and described.

3. The mode of suspending the beaming tool from the sliding carriage c, that is, by means of the plate or bracket j, posts i i, and springs k, &c., substantially in manner and for the purpose as herein shown and described.

4. The arrangement or disposition of the twin cranks e e, as supported by the shafts f f, and carrying between them the two rods d and n, and eccentric, p, essentially as herein set forth and explained.

78,381.—ALEXANDER LEVERTY, Bridgeport, Conn.—*Running Cornice.*—May 26, 1868.—By the use of two corresponding instruments or molds the molding is run upon the wall, and the angle formed at the same operation. The first mold is run upon one wall to the angle, then the mold is held in position and the angle dressed off by the surface of the mold. The molding upon the other wall is then run to the angle, meeting and intersecting with the first.

Claim.—Molds or forms for running stucco cornices constructed in the manner herein described, so as to form, complete, the molding into the internal angles, substantially as set forth.

78,382.—WILLIAM LINDON, New Haven, Conn.—*Watch Key.*—May 26, 1868.—The sheath prevents the filling up of the tube of the key.

Claim.—A key, provided with a sheath, B, the upper end of which is slitted so as to form springs to secure the sheath to the key, substantially as set forth.

78,383.—W. A. LONG and J. E. LAVEY, Plymouth, Ind.—*Grain Car.*—May 26, 1868.—The boxes are hinged together at their adjacent ends. By means of the rack bars, cog wheels, and shafts the ends of the boxes may be raised so as to incline their bottoms toward the intermediate revolving gate through which the grain is discharged into the trough suspended beneath the ear.

Claim.—The arrangement of the boxes A A, with the revolving gate C between, and rack-bars D D, shafts g, and cog wheels operated by the levers j, and placed at the outer ends of the boxes, substantially as and for the purposes specified.

78,384.—ROBERT O. LOWREY, Salem, N. Y.—*Shoe.*—May 26, 1868.—The water-proofing process referred to is described in letters patent granted to the same party on the 10th day of December, 1866.

Claim.—A water-proof shoe or covering for the foot, when manufactured of cloth, paper, or leather, made water proof by my patented process herein mentioned, or either of these materials, or of any combination of the same, substantially as herein described, as a new article of manufacture.

78,385.—NICHOLAS LUMSDEN, San Francisco, Cal.—*Boot and Shoe.*—May 26, 1868.—This invention relates to a machine for making serewed boots and shoes upon unplated lasts, the object being to provide a gauge by which the length of the serew and the depth to which it penetrates shall be regulated, so as to avoid the necessity of plating the last with metal to stop the serew. A clamp is employed to secure the wire firmly while the serew is being cut, said clamp being readily disengaged when desired. The last is provided with a movable support which can be operated by the foot, to withdraw the last from the machine, while, by means of a slide and a series of adjustable turning joints, the last is easily moved and turned into any position for receiving the serews.

Claim.—1. The regulating guide, consisting of the sliding-rod L and its adjustable nut M, together with the serew plate I and the wire-holding clamp, the whole constructed and operating substantially as and for the purpose described.

2. The adjustable last standard, constructed and operating substantially as and for the purpose described.

3. The device, consisting of the spring W, rod V, cylinder g, and barrel h, for obtaining a perpendicular motion of the last, and a pressure against the

screw plate, substantially as and for the purpose described.

78,386.—BENJAMIN K. MALTBY, Cincinnati, Ohio, assignor to THOMAS N. DRAKE, same place.—*Coffee Roaster.*—May 26, 1868.—In operation the end wings throw the coffee toward the middle of the concave bed, the central double wing returning it to the ends. The wings are attached to the rotary shaft and carry elastic plates to adapt the stirrer, accommodate itself to any irregularities that may exist in the bed, and to fit closely thereto without undue friction.

Claim.—A coffee roaster, provided with an axle or shaft, to which paddles, acting as inclined planes, and combined with elastic plates, are attached, and which revolves within a stationary semi-cylindrical bed, the whole being constructed, arranged, and operated substantially in the manner and for the purpose described.

78,387.—JOSEPH P. MANTON, Providence, R. I.—*Holder for Lathe Planer.*—May 26, 1868.—Two bars of metal, secured together side by side, constitute the tool-holder. The bars are riveted together at their rear ends and a portion of the surfaces in juxtaposition are cut away at the front end to enable that end to yield to the strain of a clamp-nut which binds the tool in the mortise, half of which latter is made in each of the bars.

Claim.—A tool-holder, constructed substantially as herein described.

78,388.—JAMES MCNAMARA, Buffalo, assignor to himself and C. D. PAGE, Rochester, N. Y.—*Machine for Dressing Brick.*—May 26, 1868; antedated May 18, 1868.—The brick to be dressed is supported upon one of the plates of the endless carrier, and is brought to rest in a position to have its five remaining sides acted upon by plates or platens, of which those whereby the sides of the brick are pressed are hinged so as to be closed upon or against the brick by the downward movement of a sliding frame, and then opened or turned into a horizontal position to allow the finished brick to be conveyed away and a new one brought into position for treatment.

Claim.—1. Alternately arresting and releasing the endless carrier B, by means of the lever J, winch, and arm *q r*, spring *u*, and wedge *t*, arranged and operating substantially as set forth.

2. The hinged plates *g g* and springs *j j*, in combination with a vertically-sliding frame for operating them, substantially in the manner and for the purpose specified.

3. In combination therewith, the end plates *m m*, rods *n n*, and springs *p p*, arranged and operating substantially as and for the purpose set forth.

4. The combination of the plates or platens *g g*, *m m*, and *w*, for dressing brick by simultaneously pressing it on all sides, when operated substantially in the manner specified.

5. The machine, as a whole, constructed, arranged, and operating substantially as described.

78,389.—LEVI MILLER, Johnsville, Ohio.—*Gate.*—May 26, 1868.—The gate is made in two parts, the lower of which is sustained at any height by means of a pin, the object being to effect the elevation of the lower part of the gate when necessary, as in case of snow or other obstruction, without raising the entire gate.

Claim.—The construction of a farm gate in the manner as herein described and represented.

78,390.—H. WALKER NEAL, Sidney, Ohio.—*Plow.*—May 26, 1868.—One of the wheels of the plow is mounted upon a supplemental axle, attached to a lever pivoted upon the main axle, and provided with proper devices for holding it in position, said wheel being thus adapted for hill-side plowing. The mode of attaching the plow-beam maintains its parallelism with the tongue when lowered or raised.

Claim.—1. The lever E, when pivoted upon the main axle, as set forth, for raising and lowering the wheel A'

2. The combination of the levers E and E', notched flange *e*², and spring *e*³, for the purpose of holding the wheel A' in desired position.

3. The combination of the tongue B, lever G, clevis H, and plow-beam C, arranged and operating as and for the purpose set forth.

78,391.—GAIUS L. PARKER, Coventryville, N. Y.—*Boiler for Making Maple Sugar.*—May 26, 1868.—The bottom of the boiler forms an arch which is open at both ends. The boiler may be placed upon the ground and fire built in the arch. The material to be heated is brought into contact with the top as well as the sides of the arch.

Claim.—The cast-iron heads B B, with narrow flanges extending outward, so that the sheet metal A may be bent or stamped to conform to the shape of the heads, and thereto be riveted to the flanges, all constructed and used as specified.

78,392.—HARRISON C. PEARSONS, Ferrysburg, Mich.—*Sun Dial.*—May 26, 1868.—The hinge joint renders the dial adjustable, so as to make the angle between the horizon and the axis of the dial equal to the latitude of the place where the dial is to be used, by means of the graduated arc attached to the gnomon. The instrument is thus adapted for use in any part of the world.

Claim.—The combination of the polar dial A and the equatorial dial B with the semi-cylinder C, when employed instead of a plane surface for the equatorial dial.

78,393.—JOHN H. RHODES, Brooklyn, N. Y.—*Fire Plug.*—May 26, 1868.—The hydrant yields laterally under the impulse occasioned by the unequal flow of water in the hose connecting the same with the fire-engine, and the destructive jarring incident to the ordinary hydrant from such impulse is avoided.

Claim.—The hydrant, having its lower end working on a universal joint communicating with the water-main, and its upper end sustained by suitable springs, substantially as and for the purpose specified.

78,394.—H. SCHUYLER ROSS, Buffalo, N. Y., assignor to CHARLES G. ROSS, New York, N. Y.—*Baggage Check.*—May 26, 1868.—All or a portion of the names of places on any route are stamped or engraved upon the plate, and holes or beveled slots are formed in the plate at or opposite each name, to receive the lugs of an index or pointer showing the destination of the baggage. Another pointer may be employed to show whence the baggage came.

Claim.—1. The combination of a baggage check, containing many names and perforations, with a separate and detachable pointer or indicator, substantially as herein specified.

2. A detachable metallic index or pointer, so constructed as to securely retain a given position upon a baggage check, containing many names and perforations, substantially as and for the purpose specified.

78,395.—H. SCHUYLER ROSS, New York, N. Y., assignor to CHARLES G. ROSS and HENRY B EELLS.—*Steam Water Ejector.*—May 26, 1868; antedated May 14, 1868.—The auxiliary suction pipe is so arranged relatively to the surrounding steam way or nozzle that the steam employed for forcing the water acts upon the water in a surrounding pipe or reservoir as well as upon the water rising in the auxiliary suction pipe.

Claim.—1. The arrangement of the water pipe or conductor E, in such relation to the steam pipe or jet C, that the discharge end of such water pipe shall open or discharge within the steam pipe or jet, substantially as herein specified.

2. The arrangement of the water pipe or conductor E, so that by a longitudinal movement of the said water pipe or conductor, the flow of steam from the steam pipes or jet C, may be entirely shut off or regulated, substantially as herein specified.

78,396.—E. W. SANDERSON and W. A. SHATTUCK, Hillsboro County, N. H., assignors to themselves, BENJAMIN WHITING, and H. J. MILLER.—*Hand Seed-Sower.*—May 26, 1868.—The strap is adjustable and regulates the amount of seed which passes into the delivery groove of the cylinder. The plow yields, when opposed by immovable obstacles.

Claim.—1. The cylinder A with grooves and

straps D, made and arranged and operating with serew F, substantially as and for the purposes set forth.

2. The arrangement of the plow G with spring H, arranged and operating substantially as and for the purposes above set forth.

78,397.—ALVAH L. SAWYER and WILSON BALDWIN, Detroit, Mich.—*Spring Bed Bottom.*—May 26, 1868.—Two rectangular frames, to the upper of which the slats are attached, are connected by a central transverse spring and by blocks interposed between the frames at points between the ends of the spring and the ends of the frame.

Claim.—The combination of the transverse bars A A and F F, the longitudinal bars B B and E E, with the fulcrum blocks C C C C, the crotched transverse spring D, and the slats H H H, &c., when constructed, arranged, and operating substantially as herein set forth and shown.

78,398.—AUGUSTUS SCHUFFERT and GEORGE COOPER, Wyandott, Mich.—*Churn.*—May 26, 1868.—The vertical shaft to which the dasher is attached derives motion through gearing from the horizontal shaft.

Claim.—The combination and arrangement of the shafts B and E, together with the wheels C and D, and the dasher, operating as and for the purpose above described.

78,399.—CALEB L. SHOTWELL, Allamuchy, N. J.—*Apparatus for Measuring Cloth.*—May 26, 1868.—The device is used by inserting the tubular nose between the folds of the goods to be measured, the end of the cord being held fast at the point of insertion and running the same around between the folds until the end is reached. The number of yards are indicated on the large dial and the fractions on the small dial.

Claim.—1. The combination, with an apparatus, constructed substantially as described, for measuring cloth in the roll or piece, of a dial or indicator, substantially as described.

2. The combination with a cloth-measuring device, of a reel, cord, and dial, substantially as described, and for the purpose set forth.

3. The measuring apparatus, constructed as described and shown by the drawings.

78,400.—PHILANDER H. STANDISH, Martinez, Cal.—*Mounting the Cutters of Rotary Plows.*—May 26, 1868.—A number of horizontal arms are attached to the bottom of a vertical driving shaft and carry stout iron hubs turning on horizontal axes. Through these hubs the cutters pass vertically, and, for use in soil which contains but few stones, they are braced by pieces of cast iron which is strong enough for ordinary work but which breaks off if the cutter strikes a stone, thus allowing the hub to revolve until the cutter has passed over the stone, when a new supporting piece is attached. In land where stones are abundant a stiff spring is employed in lieu of the cast-iron piece.

Claim.—1. The revolving hubs E E and the supporters F F, constructed and operating substantially as and for the purpose described.

2. A flexible or yielding arm, having the spring G, or its equivalent, together with the rotary cutter, substantially as and for the purpose described.

78,401.—ANSON P. THAYER, Syracuse, N. Y.—*Machine for Grinding the Cutters of Mowing Machines.*—May 26, 1868.—This machine grinds the cutters without detaching them from the harvester. The cutter bar is first moved so as to bring one edge of all the cutters centrally between the fingers, and the foot of the end post is then placed upon the cutter bar and the legs upon the ground, care being taken to have the sliding frame parallel with the edge to be acted upon. The grinding stone being then adjusted in an angular plane to suit the beveled edge of the cutter, the operator, while sitting upon the bench, turns the cranks with both hands, the effect being to rotate the grinding wheel and at the same time cause it to move along and grind the edge of the cutter. The machine is shifted from one cutter to another, and all the edges at one

side being thus consecutively ground, the grinding wheel, as also the machine itself, is changed in position so as to grind the opposite edges of the cutters.

Claim.—1. A portable grinding mechanism for grinding the cutters of mowing machines, provided with a bench forming a seat for the operator, substantially as and for the purpose described.

2. A mowing machine grinding wheel provided with means for pressing it upon the cutter blades with a yielding pressure, substantially as and for the purpose described.

3. The combination of the vertical extensions C¹ and C³ of the frame C with the bench, substantially as and for the purpose described.

4. The mechanism of a portable cutter-grinding machine, constructed substantially as described, in combination with driving mechanism arranged for the application of both hands of the operator to the driving shaft, substantially as and for the purpose described.

5. The combination, with the frame C and the swinging frame D, of the serewed sleeve H provided with a swivel joint, substantially as and for the purpose described.

6. The combination of the oscillating frame D with the feeding serew E arranged within the frame, and serving as the axial support of the same, substantially as and for the purpose described.

7. The rotating feeding serew, in combination with the sliding frame, grinding wheel, and its operative mechanism arranged with the serew, substantially as and for the purpose described.

8. The combination of the frame C with the adjustable sleeves a¹ and a², posts B¹ and B², and the bench A, substantially as and for the purpose described.

9. The combination of the frame C with the sleeve a², post B², provided with the spiral spring b² and adjustable rings b and b¹, substantially as and for the purpose described.

10. The combination, with the frame C, of the crank shaft C², vertical shaft I, and screw shaft E, provided with the connecting-gear wheels, substantially as and for the purpose described.

78,402.—EWING W. TIBBELS, Chester, Pa.—*Stump Extractor.*—May 26, 1868.—The stump is wrenched upon its vertical axis and loosened and torn from the earth, the draught animal moving in a circle around the stump and applying the power to the extremity of the lever.

Claim.—The combination of the wheeled draught axle A, the draught bar D, and the lever E, with the chain and the dog attached thereto, for operation, substantially as and for the purpose specified.

78,403.—L. E. TRUESDELL, Chicago, Ill.—*Lock Bar for Bridges.*—May 26, 1868.—A method of splicing iron bars. Bolt holes in the ends of the bars are dispensed with, the object being to obviate weakening the same.

Claim.—The corrugated ends of two or more bars of iron, A and A², B and B², when firmly held together within the compressible sides of fluted clamp plates C, D, and E, as and for the purpose specified.

78,404.—Z. B. WAKEMAN, Rockford, Ill.—*Railroad Rail.*—May 26, 1868.—The block is fitted in between the adjacent ends of two opposite rail sections, and a key or wedge is passed through the apertures in the rails and the opening in the middle of the block, thereby securing the three parts together.

Claim.—The combination of the hollow-shell rail A, with its interior notches, and the block B, when connected thereto by the wedge-shaped key C, all constructed as specified.

78,405.—WILLIAM P. WENTWORTH, Detroit, Mich., assignor to himself and THOMAS S. SPRAGUE, same place.—*Stake Holder for Cars.*—May 26, 1868; antedated May 16, 1868.—The object of this holding device is to sustain the stake in a vertical position under heavy lateral pressure, and permit the same to be readily released so as to be turned down.

Claim.—The combination and arrangement of the stake A, the cap or socket B, the strap C, the hinge joint E, the button F, the slot G, the pins H and I,

and the bevel K, arranged as described, or any other substantially the same, for the purpose designed.

7S,406.—L. F. WHEATON, Madison, Conn.—*Dust Pan.*—May 26, 1868.—The object is to avoid stooping, the points serving to hold the pan firmly in the required position while the dirt is swept thereon.

Claim.—A dust pan, having the points α arranged near its handle edge so as to elevate and hold the pan, substantially in the manner and for the purpose described.

7S,407.—CARMIE WIGHTMAN, Batavia, Ill.—*Wool Box.*—May 26, 1868.—A device for packing and tying wool. The four leaves are raised by the treadle in order that they may open and form an extended horizontal surface upon which the fleece is placed. They are raised by hand and settle down within the frame in the form of a box. The fleece being thus made compact is tied by cords which were arranged upon the leaves before placing the fleece thereon.

Claim.—The leaves C C, D D, bed I, frame A B, guides F F, cross piece N, in combination with lever K, pulley P, and cord M, the whole being constructed and arranged to raise and lower said leaves, substantially as set forth.

7S,408.—SIMON WING, Boston, Mass.—*Photographic Camera.*—May 26, 1868.—A spring maintains the contact of the partition with the diaphragm; a uniform and simultaneous shut-off is provided for the lenses, and the handle of the shut-off is removable so as to be inserted through the box and attached after the lens block has been introduced.

Claim.—1. The self-adjusting partition C, so acting as to be in contact with the diaphragm in all positions of the lenses, without interfering with the adjustment of the latter, substantially in the manner and for the purpose described.

2. In combination with a sliding shut-off, the handle G, constructed and operated in the manner and for the purpose set forth.

7S,409.—HENRIETTA T. WOOD, San Francisco, Cal.—*Ointment.*—May 26, 1868.—Lard, mutton tallow, beeswax, *arnica montana*, and stramonium leaves or flowers.

Claim.—The above-described composition for ointment, made of the ingredients enumerated, mixed or compounded in about the proportions specified.

7S,410.—ROBERT ANDREWS and EDWARD ARMSTRONG, Alleghany, Pa.—*Governor Valve.*—June 2, 1868; antedated May 12, 1868.—A valve is suspended by means of a spring, and so arranged with relation to the cylinder and piston and the boiler as to regulate the supply of steam to the cylinder in proportion to the increase or decrease in the pressure of steam in the boiler or in the travel of the piston.

Claim.—The arrangement of the valve B, stem C, spring D, adjustable suspension bar g , and column f , constructed, arranged, and operating substantially as herein described and for the purpose set forth.

7S,411.—DEXTER AVERY, Westfield, Mass.—*Carrier for Braiding Machine.*—June 2, 1868.—The spring encircles the hook rod, to which the thread is attached, and works in a tubular holder. At the side of the tubular holder is a rod upon which slides a slotted tube from which an arm projects and rests upon the ratchet end of the bobbin, preventing the latter from turning. As the hook rises it raises the arm and liberates the bobbin.

Claim.—The hollow spindle A, spring D, and hook rod C, in combination with the rod e , sleeve E, and arm h , all made and operating substantially as and for the purpose herein shown and described.

7S,412.—GEORGE C. BARNEY, Chicago, Ill.—*Filling for Beds, Cushions, &c.*—June 2, 1868.

Claim.—1. As a new article of manufacture, a bed or mattress filled with paper cut into small pieces, as herein shown and described.

2. The use of paper cut into small pieces, for filling beds, mattresses, cushions, &c., as herein shown and described.

7S,413.—D. W. BASHORE, Palmyra, Pa.—*Lamp Shade.*—June 2, 1868; antedated May 22, 1868.—The shade is cut through on one side, so that the size of the same may be varied to adapt it to chimneys of different sizes. Openings are made near the top to allow the air to pass through freely.

Claim.—1. An adjustable shade or lamp shade, constructed and arranged substantially as described.

2. In combination with a lamp shade, constructed as described, the openings in the same, at or near where it comes in contact with the chimney, substantially as described, and for the purposes set forth.

7S,414.—ANDREW F. BAUM, New York, N. Y., assignor to L. H. ROCKWELL.—*Catamenial Sack.*—June 2, 1868; antedated May 22, 1868.—The edges of the sack are rolled into a solid bead or rib and curved with soluble rubber, to make a strong and elastic binding.

Claim.—An India-rubber catamenial sack, formed with rolled edges $a a$, substantially as described.

7S,415.—ROBERT BELL, East Saginaw, Mich.—*Feathering Paddle Wheels.*—June 2, 1868.—An eccentric rim attached to a circular plate, which latter is secured to a loose eccentric on the main shaft, in connection with eccentrics at one end of the buckets, causes the buckets, as the wheel rotates, to turn or "feather," so that they will enter and leave the water with their faces in a vertical position.

Claim.—1. The combination of the circular plate F, eccentric E, rim G, eccentric H, eyes I, and double buckets D, all constructed and arranged as described for the purpose specified.

2. Constructing the buckets with two pieces or faces, $a a$, and fitting the same loosely on fixed axles, C, substantially as and for the purpose herein set forth.

3. The eccentrics H of the double buckets D, connected with the feathering-rim G by means of eyes, I, fitted upon the eccentrics, and bolted to the sides of the rim, the latter being firmly secured to the plate F, as herein described, for the purpose specified.

4. Having the end plates $b b$ of the bucket slotted from their centers outward, with plates $l x$ bolted to the inner surfaces of the end plates, over the slots, substantially as and for the purpose set forth.

7S,416.—JAMES W. BICKNELL, New York, N. Y.—*Thill and Pole for Carriages.*—June 2, 1868.

Claim.—Thills, or shafts, or poles, of vehicles, made, in whole or in part, of tubular metal, substantially as herein specified.

7S,417.—A. R. BLOOD, A. HATHAWAY, and V. R. BEACH, Independence, Iowa.—*Cultivator.*—The foot piece rests on the arms of the teeth, so that the latter can be easily pressed into the ground, and are raised by means of a cam lever pivoted to the hind end of the tongue.

Claim.—1. The foot piece M, arranged as described, for pressing the teeth in the ground, substantially as specified.

2. The seed box F, furnished with diamond-shaped holes, in combination with slide e , likewise furnished with diamond-shaped holes, and arranged to operate as and for the purpose set forth.

3. In combination with the above, the cam lever I, foot piece M, and arms G G, to which are secured the teeth J J, all arranged as and for the purpose set forth.

7S,418.—WILLIAM BOYD, Hartford, N. Y.—*Machine for Bending Circles.*—June 2, 1868.—For bending irons known as carriage circles or fifth wheels. A table is formed with a succession of circular faces decreasing in diameter upward; two wheels are arranged with their planes at right angles to each other, and a third wheel is on the opposite side; a jointed lever is used to raise the wheels to get the rod or bar under them.

Claim.—The wheels H I L, table A, and jointed lever C B E, set screws $b b$, and circular faces $a a a$, all constructed and operating substantially as and for the purpose shown and described.

7S,419.—WESLEY BRADLEY, Vienna, Me.—*Cart Body.*—June 2, 1868.—The rod for securing the tail-

board is bent at different angles, and fastened by a spring catch.

Claim.—The bent rod C, provided with the handle, in combination with the pin for fastening, as shown, for the purpose herein described and set forth.

78,420.—JAMES M. BRYAN, Penningtonville, Pa.—*Tire Bending and Punching Machine.*—June 2, 1868.—An unequal armed lever pivoted to a stand, bears with its short arm against the long arm of a similar lever, which is pivoted to links or stirrups. A rest extends across the bed plate beneath the mandrel, and is provided with bearings which carry cylindrical rollers or formers. The bending die is secured to the lower end of the mandrel.

Claim.—1. The arrangement, herein described and shown, of the levers B and C, supports B' and D', and stirrups C' and d, for the purposes set forth.

2. The arrangement, herein described, of the rest E, rollers F F, adjustable die d², and mandrel D, for the purposes set forth.

78,421.—DANIEL BUDD, Valatia, New York.—*Machine for Cleaning and Renovating Feathers.*—June 2, 1868.

Claim.—1. An apparatus for cleansing and drying feathers, consisting of a feather-holding vessel, heated by means of steam, admitted either into the vessel or into a jacket or jackets applied thereto, and combined with beaters or agitators, for stirring the feathers within said vessel, substantially as and for the purposes shown and set forth.

2. The combination; with the feather-holding vessel, of the steam-jackets or chambers upon the exterior of the same, one of said chambers being perforated so as to allow steam to pass into the interior of said vessel, and the branch pipes and cock for supplying the steam to said chambers, under the arrangement and for operation, as set forth.

3. The combination, with the jacketed feather-holding vessel, as described, of the rotary beaters or arms, and spindle and crank with which they are connected, mounted in the said vessel, substantially in the manner and for the purposes herein shown and set forth.

78,422.—ALBERT G. BUZBY, Philadelphia, Pa.—*Railroad Rail.*—June 2, 1868.—A thin plate of steel or iron covers the adjacent ends of two rails, which are recessed on their treads; it is bent beneath their flanges, to prevent the jar to the wheels in passing the ends of the rails.

Claim.—A clip composed of a thin flexible plate of steel or tough iron, bent and applied to a rail or rails, substantially as and for the purpose herein set forth.

78,423.—DANIEL CAINE, Battle Creek, Mich.—*Machine for Sowing Fertilizers and Seeds.*—June 2, 1868.—A revolving stirrer, a reciprocating serrated clearer and feeding roller are so arranged as to mix evenly the fertilizing material and seed in a single hopper while being sown.

Claim.—The hopper A, in combination with the stirrer E, clearer F, and feeding roller R, arranged relatively with each other, and with an axle, D, and wheels W, and constructed and operated substantially in the manner and for the purpose as set forth.

78,424.—ALEX. CAMPBELL, Oxford, Ind.—*Corn Cultivator.*—June 2, 1868.—The standards are secured in mortises in the frames at any desired angle, by means of wedges and stay rods, so as to admit of their being changed and adjusted as required.

Claim.—The attaching of the upper ends of the standards B to the frame A, by pivoting the former in mortises b in the latter, in connection with the rods d and the adjustable bar e attached to the draught pole, all arranged substantially as and for the purpose set forth.

78,425.—WESLEY B. CAMPBELL, Abington, Iowa, assignor to himself and HARRISON SMYTH, same place.—*Rotary Steam Engine.*—June 2, 1868.—The wheel runs in a chamber in the steam chest. The floats are attached to the hub of the wheel only at their middle portion, the ends extending over the hub, leaving a space between the floats and the hub sufficient to receive the flange of the side pieces of the

steam chest, so that the steam shall act on the floats, and not press on the hub of the wheel.

Claim.—1. The arrangement of the wheel B, floats B', the ends b, flanges c, side plates C, and steam chest A, whereby to relieve the hub from the pressure of the steam, substantially as set forth.

2. The arrangement of the wheel B, the valves F, arms G, rods H, and cams I, substantially as set forth.

78,426.—N. L. CARPENTER, Natchez, Miss.—*Steam Boiler Furnace.*—June 2, 1868.—Vertical wells or recesses are sunk in the brick work beneath the boiler, into which recesses project deflecting plates attached to the boiler. Near the bridge-wall is arranged a perforated tube for the admission of air to aid combustion.

Claim.—1. In combination with a steam boiler, the wells or recesses D, E, and F, (more or less in number,) and the deflecting-plates G, arranged substantially as and for the purposes herein shown and described.

2. In combination with the wells D, E, and F, and plates G, the perforated air-tube H, substantially as and for the purposes described.

78,427.—WILLIAM T. CARROLL, Medway, Mass.—*Rings for Spinning Machine.*—June 2, 1868.—Extending from the top surface of the ring supporter is a flange, or there may be three short posts, through which pass adjusting screws, by which the ring may be readily adjusted with reference to the spindle.

Claim.—The combination as well as the arrangement of the flange c, or the posts f and the adjusting screws e, with the ring A, and the supporter B thereof, to be placed on and within the ring rail, as specified.

78,428.—A. W. CASE, South Manchester, Conn.—*Thrust Bearing.*—June 2, 1868.—One or more wheels are formed upon or attached to the shaft, and two friction wheels are placed upon each side of the shaft and parallel with it. A piece of candlewick passes through holes in the blocks, under grooves in the under side of the journal, into an oil cup.

Claim.—1. An improved thrust bearing, formed by the combination of the wheels E, one or both, and friction wheels D, with each other and with the shaft B, substantially as herein shown and described, and for the purpose set forth.

2. The oiling device, formed by passing a piece of candlewick, or other suitable fibrous conductor, through holes in the blocks C, and along grooves in the under side of the journals of the friction wheels D, substantially as herein shown and described, and for the purpose set forth.

78,429.—HENRY S. CHAPIN, Delhi, Ohio.—*Railroad Frog.*—June 2, 1868.—An arrangement of chairs and rails at the intersection of two tracks, the rails being made in short lengths or sections at the ends most subjected to wear, so as to be readily removed for repairs.

Claim.—The chairs A, constructed substantially as set forth in the described combination with the sections or pieces of rails B C D E, arranged as described, and for the purpose specified.

78,430.—HENRY C. CLARK and ROBERT B. LITTLE, Providence, R. I.—*Apparatus for Conveying and Dumping Coal.*—June 2, 1868.—The bucket is constructed with a hinged gate provided with a pin or stop, which, striking against an obstacle, causes the gate to open and discharge the contents. The carriage for holding the bail rests on the inclined track in such a manner that it can be moved up by the loaded bucket while the same is being dumped, to prevent the abrupt stoppage of the bucket and injury to the working gear.

Claim.—1. The construction of a conveying and dumping apparatus or bucket, A, with a hinged front gate, B, and stop a attached thereto, and operating substantially as herein shown and described.

2. The clasp F, for securing the rope C to the truck D, said clasp consisting of two plates, c and d; hinged and locked together, substantially as herein shown and described.

3. The adjustable carriage G, running on the outer

edge of the track E, and holding the dumping bail H, suspended by a chain or cord, *n*, the said carriage being free to be moved upward on the track, substantially as and for the purpose herein shown and described.

4. A coal-conveying and dumping apparatus, consisting of the bucket A, having the hinged front B, with the stop *a* of the rope C, clasp F, truck D, carriage G, and bail H, all combined with each other, and made and operating substantially as herein shown and described.

7S,431.—S. P. COLE, Janesville, Wis.—*Uterine Supporter*.—June 2, 1868.—Designed as an improvement upon patents Nos. 41,607 and 64,644. The cup is of hard rubber, surmounted by a soft-rubber ring of elliptical form, in which is secured a diaphragm composed of a thin sheet of soft rubber.

Claim.—The uterine supporter, formed by the combination of the soft-rubber cushion A, of elliptical form, the cup B, soft-rubber ring R, and soft-rubber diaphragm *d*, substantially as herein shown and described, for the purpose specified.

7S,432.—WILLIAM HENRY COX, Portland, Me.—*Sand Throwing Machine*.—June 2, 1868.—To a cylindrical, hollow handle is attached a V-shaped body, the end of which is provided with a slot, having a lip extending somewhat below the same, so that the sand may be thrown out by using one hand only.

Claim.—The sand-throwing machine or device, constructed as herein set forth and for the purposes specified.

7S,433.—WILLIAM R. CRANDALL, Deansville, N. Y.—*Hop Box*.—June 2, 1868.—A cubical box or frame is divided into four compartments, in which are fitted bottomless boxes, over which the sacks for containing the hops are slipped. When the boxes are filled they are drawn out, leaving the hops in the sacks.

Claim.—The hop boxes *a a a a*, and bottomless compartment boxes *d d d d*, substantially as shown and described, constructed and employed together, all as and for the purpose set forth.

7S,434.—LYMAN B. CRITTENDEN, Pittsburg, Pa.—*Press for Finishing Brick*.—June 2, 1868.—By means of the gasket and sub-plunger any excess of material is pressed upward into the chamber under the plunger, and if the material be deficient the gasket or sub-plunger forces the material outward from the center to the edges of the brick, for the purpose of insuring solidity and uniformity. The sliding frame operates on a slider or cross-bar, acting as a feeder, and carries one or more brick trays.

Claim.—1. In a machine for pressing brick, the construction and use, either singly or in gangs, of a plunger, *m*, chambered on its under face, and fitted with a sub-plunger of any elastic or non-elastic material, such sub-plunger being supported by or resting against a spring or a cushion of condensed air, or other equivalent device, substantially as and for the purposes hereinbefore set forth.

2. The use of wedge-shaped guides *i*, in connection with a cross-bar, *h*, or its equivalent, for regulating the position of the bricks on each platen or tray F, so that they shall be fed directly under the pressing devices, substantially as above set forth.

3. The boxes *l* and plungers *m*, with suitable devices for imparting to them the motions described, in combination with a feeding device consisting of a sliding frame, D, cross-bar, *h*, and guides, *i*, the whole being constructed and operated substantially in the manner and for the purposes hereinbefore set forth.

7S,435.—G. B. CUBBERLY, Milwaukee, Wis.—*File*.—June 2, 1868; antedated May 20, 1868.—The object is to produce a file which can be sharpened on a common grindstone, which is effected by removing the handles and end blocks to grind the teeth on the sides. To grind the edges, the side key is removed.

Claim.—Stock A, end blocks B, side key C, and teeth D, in combination, substantially as and for the purpose described.

7S,436.—JAMES M. CUYKENDALL, Metomen, Wis.—*Horse Shoe*.—June 2, 1868.—A wedge-shape

dovetail is secured to the upper surface of the calks, said dovetail fitting in grooves on the under side of the shoe. A screw in the side of the shoe prevents backward motion of the calk, and the latter can be readily inserted or removed.

Claim.—1. Inserting the screws D into the side of the shoe directly beneath the calks, in such a manner that the heads of the screws bind upon the calks and secure them in place, substantially as herein shown and described.

2. The grooves *c* in the center of the tenon *a'* of the toe calk C, in combination with the tenon *d* in the groove *b'*, and with the screw D, all made and arranged substantially as and for the purposes herein shown and described.

7S,437.—O. E. DOOLITTLE, Boston, Mass.—*Fruit Preserving Box*.—June 2, 1868.—The absorbent substance deposited between the bulkheads is designed to absorb the moisture evaporating from the fruit, and the large body of air contained between the inner and outer boxes assists in the preservation of the fruit.

Claim.—1. The combination and arrangement of two or more boxes, the inner one being the containing box, and the space between filled with air, and communicating with the inside of the containing box by the help of slats or apertures, when the same is used in combination with a moisture-absorbing substance contained within the limits of the inner box, for the purpose of preserving fruit, all substantially as described.

2. In boxes for preserving or containing fruit, the placing of a moisture-absorbing substance or substances in communication with the atmosphere around the fruit, all substantially as and for the purpose described.

7S,438.—R. H. DORN, Port Henry, N. Y., assignor to himself and I. J. GREENE, same place.—*Boot Crimping Machine*.—June 2, 1868.—Upon a suitable bench a slide is made to move forward and back by a pinion gearing in a rack, on which rack is carried a series of right-angled formers. These formers pass between two clamping jaws provided with smoothing rollers, which bear against that part of the leather which is crimped in the angle of the formers, producing a smoothing or rubbing action.

Claim.—1. The slide B, provided with the crimping formers *b'*, in combination with the clamping sliding jaws *c c*, substantially as and for the purpose described.

2. The slide B, provided with the crimping forms *b'*, in combination with the clamping sliding jaws *c c*, provided with the rigid plates D, substantially as and for the purpose described.

3. The combination with the plates *c c*, slide B, and crimping forms of the smoothing rollers, substantially as and for the purpose described.

7S,439.—GEORGE DOUGLASS, Bridgeport, Conn.—*Carriage Spring*.—June 2, 1868.—The object is to prevent jars or concussion from being transmitted from the seat to the spring, and to allow to the latter a greater yielding movement or play.

Claim.—The insertion of India-rubber strips *b b* in chambers or recesses *a a*, in the cast metal socket or seat A of the spring, substantially in the manner as and for the purpose herein set forth.

7S,440.—NOAH DREW, Howell, Mich.—*Washing Machine*.—June 2, 1868.—A series of yielding and adjustable plunger heads are attached to a rotary crank shaft, and act successively against the clothes.

Claim.—A connecting rod constructed in two parts, *r¹ r²*, in combination with the tube *t*, spiral or equivalent spring *s*, and adjustable plunger heads *p*, substantially as and for the purpose herein described.

7S,441.—WARREN W. DUTCHER, Hopedale, Mass.—*Temple for Looms*.—June 2, 1868.—A mode of fastening the spindle of the temple roller in place, the object being to dispense with the screw heretofore cut on the spindle for that purpose.

Claim.—The temple, constructed substantially as described, the trough standard, and the inner end of the overhanging cap, being provided with sockets,

closed at their outer ends, such sockets being to receive and hold the roller spindle in place, in manner as set forth.

78,442.—HARMON P. ECKLES, Catskill, N. Y.—*Combined Cultivator and Hoe.*—June 2, 1868.—The frame in which the shafts of the cultivating paddles have their bearings is loosely attached to the axle, and the frame carrying the cultivator teeth has pivotal attachment to the forward part of the main frame, and both frames are adjustable vertically by a lever.

Claim.—1. The fans or paddles *ff*, when attached to shafts *KK*, and operated substantially as and for the purpose specified.

2. The combination of the shafts *A* and *KK*, gear wheels *II*, and *HH*, and frame *S*, when arranged substantially as described, and for the purpose of operating the paddles or plates *ff*, as herein specified.

3. The combination of the cultivator frame *L* with its teeth *MM*, secured to the frame *C*, as described, with the shafts *KK*, frame *S*, and paddles *ff*, for the purpose of cultivating or pulverizing the earth, and ridging or hilling the same, at one and the same time, as herein set forth.

78,443.—AUGUSTUS R. EHLERS, Tannersville, Pa.—*Saw Mill.*—June 2, 1868.—The saw advances and increases the bite of the teeth during the down stroke, and recedes during the up stroke.

Claim.—The combination and arrangement of the oscillating slide *c*, the oscillating guide rods *ee*, the rock shafts *gg'*, and the eccentric *k* on the driving shaft *B*, for producing a forward and backward movement of the saw below its upper end, which moves in the same vertical plane, as herein shown and described.

78,444.—LUCIUS H. EMMONS, Noblesville, Ind.—*Mop Head.*—June 2, 1868.—The rotation of the screw attached to the handle causes the clamping piece to move toward or recede from the hooks, and thus the mop cloth may be grasped or released without manipulation.

Claim.—The piece *A*, furnished with the hooks *D*, and the piece *E*, arranged in relation thereto, and operated by means of the screw *B*, substantially as and for the purpose set forth.

78,445.—JOHN S. EVERITT, Oshkosh, Wis.—*Adjustment of Gearing for Horse Powers.*—June 2, 1868.—An adjustable clutch is placed upon the shafts carrying the master pinions of the horse-power, which pinions may be thereby slightly rotated and adjusted upon their shafts, for the purpose of insuring the proper relative positions of all parts of the gearing and equalizing the strain upon the teeth.

Claim.—The clutch, with inclined faces, for the purpose of adjusting the gearing of the horse-power, as set forth.

78,446.—AUGUST FESSLER, Vienna, Austria, assignor to JOSEPH R. VON WESSELY, New York, N. Y.—*Hand Stamp.*—June 2, 1868.—The handle slides upon the tubular ink reservoir, and is connected by a yoke, with a stamp suspended on trunnions, which pass through vertical slots in the stationary frame. The handle is held in its elevated position by the spring, and the stamp, when at rest, has its face turned upward and held in contact with the inking pad. When the handle is depressed the projection on the stamp passes between pins on the frame, causing the stamp to turn so as to present its type side downward. The stamp is likewise reversed during its ascent.

Claim.—1. The large air-tight tubular reservoir, constructed and arranged as and for the purposes set forth.

2. The combination of the open frame, the tubular reservoir, the tubular handle, the yoke, the stamp, and the reversing devices, these parts being arranged as described, for joint operation.

78,447.—RICHARD C. FLEMING, Philadelphia, Pa.—*Vent for Barrels.*—June 2, 1868.—The expandible bag is supplied with air so as to increase its bulk, and thus fill the space produced by drawing off

the contents of the barrel, without permitting the air to come in direct contact with the contents.

Claim.—1. The combination of the screw ring *A* with the tube *C*, tubular rod *E*, and bag *D*, all made and operating substantially as herein shown and described.

2. The bellows *F*, in combination with the device set forth in the foregoing clause.

78,448.—ANDREW FRENCH, Philadelphia, Pa.—*Machine for Grinding the Cutter of Mowing Machines.*—June 2, 1868.—The grinding surface of the grindstone or emery wheel is made to traverse in a plane or any required curvature, to grind the edge of the cutting tool. The device is designed for dressing the edges of harvester cutters and other tools, and may be made to give the bevel back of the cutting edge the required slant.

Claim.—1. The swinging or vibrating frame *G*, hinged at the end opposite the grindstone or emery wheel, consisting of the post *i*, arm *k*, and continuation *V* of the said arm *k*, in combination with the lowering and raising adjustments, made in the manner and for the purpose described.

2. The guide plate *B*, made in the manner and for the purpose described.

3. The slide *D* and set screw *e*, in combination with the guide plate *B*, swinging or vibrating frame *G*, and sliding slot *U*, as described, and made in the manner and for the purpose indicated.

4. The wheels or pulleys *M* and *N*, swinging or vibrating frame *G*, slide *D*, set screw *e*, and emery wheel or grindstone *C*, in combination with the guide plate *B*, made in the manner and for the purpose described.

78,449.—JAMES E. A. GIBBS, Steele's Tavern, Va.—*Door Lock.*—June 2, 1868.—The two bars or bolts extending outward at either side of the key hole, have attached to their inner ends rack bars, which engage with a gear wheel on the inner end of the cylinder. When the cylinder is revolved the beveled ends of the guards slide along the face of the cylinder, and do not interfere with its movement, but in case an improper key is used the ends of the guards drop into the slot of the cylinder and prevent its movement.

Claim.—1. The combination of the series of guards or wards *N* with the slotted cylinder *E*, substantially as herein shown and described, and for the purpose set forth.

2. Forming the key *K* in such a manner that it may fill up the slot in the cylinder *E*, and so that its face may correspond with the face of said cylinder, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the tumbler *L* with the slotted cylinder *E*, and with the guards or wards *N*, substantially as herein shown and described, and for the purpose set forth.

78,450.—ALFRED GOODRICH, Burnt Prairie, Ill.—*Stump Extractor.*—June 2, 1868.—The windlass shaft is turned by vibrating the lever, the link of which engages and releases the teeth of the larger ratchet wheel successively. The pawl and smaller ratchet wheel maintain the acquired tension while the link is moving from one tooth to another.

Claim.—The construction and arrangement of the pyramidal frame *P* upon the runners *R*, shaft *S*, ratchet wheels *uw*, of unequal diameters, pawl *h*, standard *S'*, pivoted lever *L*, and link *i*, as herein described for the purpose specified.

78,451.—THOMAS GRIST, Philadelphia, Pa.—*Reflecting Gas Burner.*—June 2, 1868; antedated May 19, 1868.—The burner surmounting the reflector is designed to illuminate the upper part of the room. The holes in the reflector for the admission of the pipe being larger than the latter, the air has free passage through the burner and keeps it cool.

Claim.—1. The arrangement of the burner *e*, on the top of the reflector *F*, as and for the purpose set forth.

2. The combination of the distributor *B*, pipe *E*, passing through the reflector, and the burner *e*.

3. The perforated washers *h* and *i*, in combination with the pipe *E*, the reflector *F*, and the openings in the latter.

78,452.—WILLIAM C. HOOKER, Abington, Ill.—*Gate*.—June 2, 1868.—When the gate is in position to close the roadway the pivoted frame to which the gate is pivoted at top leans over the gate.

Claim.—The gate B B B, swung between the swinging frames D D, substantially in combination with cords E E, or their equivalent, the uprights A A, and weights J J, all as and for the purpose set forth.

78,453.—C. H. HOWARD, Lewiston, Me., assignor by mesne assignment to himself and HORACE N. JORDAN, same place.—*Warping Frame*.—June 2, 1868.—A device for carrying the slack of the yarns above the warper frame when, by reason of a breakage, the yarn beam is suddenly stopped.

Claim.—The combination with the stationary guide rolls, or rods *o*, of the weighted rising rod, bar, or roll, so arranged as, in its ascent, to take up the slack, substantially as set forth.

78,454.—HENRY HOWARD, Springfield, Mass.—*Valve Gear for Steam Heating Apparatus*.—June 2, 1868.—The induction and eduction valves are in one case, both being opened and closed simultaneously by the turning of the same wheel. The screw-threaded pipe connecting the double valve case and heater is provided with a partition, and that part of the pipe which communicates with the induction valve is extended to facilitate the egress of water from the heater during the ingress of steam.

Claim.—1. The double case F, in combination with valves *g g'*, substantially as herein set forth.

2. The partitioned pipe G, formed on the double valve case F, as herein specified.

3. The prolongation I, formed on pipe G, as herein specified.

4. The valve *g* and stem *e*, in combination with the valve *g'* and stem *e'*, bar D, screw E, and case F, substantially as herein specified.

78,455.—ASA HOYT, Chicago, Ill.—*Pavement for Streets and Walks*.—June 2, 1868.

Claim.—1. The use of gas-house lime in compounding street pavements, when mixed and applied substantially as specified, and for the purposes set forth.

2. A pavement compounded as specified, that is, of small stone and gravel, coal or pine tar, sand, cement, and gas-house lime.

3. The use of alum water at the time of laying, as specified.

78,456.—EDWARD P. HUDSON, New York, N. Y.—*Furnace for Roasting Ores*.—June 2, 1868.

Claim.—1. Forcing heated air or oxygen, in addition to the products of combustion, through ores, for the purpose of removing sulphur, phosphorus, and similar injurious substances therefrom, substantially as herein specified.

2. The chamber or reservoir *a*, below the bottom of the fire chambers or flues, with a passage or passages *h*, at or near the base thereof, through which air is forced and heated by the roasted ores therein, and in turn cools the said ores ready for withdrawal, substantially as herein specified.

3. Introducing air, in excess of that required for combustion, but regulated in quantity, into the ores, through the fire chambers, over the fires, so as to be heated thereby, before passing through the ores, substantially as herein specified.

4. The arrangement of one fire chamber higher than the other, substantially as and for the purpose herein specified.

78,457.—SAMUEL HULBERT, Ogdensburg, N. Y.—*Plow*.—June 2, 1868.—The several parts of the plow are connected together by keys driven between projecting surfaces, and forming, in conjunction therewith, a dovetail coupling, the object being to dispense with bolts.

Claim.—The improved manner of fastening the plow and cultivator together, separately and connectedly, in manner and for the purposes as herein described and constructed.

78,458.—EDWARD JEWETT, Rindge, N. H.—*Veneer Cutting Machine*.—June 2, 1868; antedated

May 18, 1868.—The bolt from which the veneer is cut is held upon the carriage by means of dovetailed ribs projecting from the face of the carriage and entering corresponding grooves in the bolt, which may be prepared to receive the ribs before being subjected to the heating and steaming process which the wood undergoes, to fit it for the action of the cutters.

Claim.—1. Attaching and securing the "bolt" to the carriage A by means of dovetailed ribs D D, substantially as and for the purpose set forth.

2. The adjustable ribs D D, moving in grooves cut in the carriage A, and secured by set screws, or their equivalent, substantially as and for the purpose set forth.

3. The vertically adjustable clamping rib, (Fig. 7,) substantially as and for the purpose set forth.

78,459.—GEO. KIRTLAND, New Haven, Conn., assignor to S. SMITH, same place.—*Lightning Rod*.—June 2, 1868.—The coupling for joining the tubular sections consists of a central cylindrical part, and two tapering plugs projecting from the respective ends of the central portion. The plugs are forced into the adjacent ends of the tubes, the surface of the cylindrical part being coincident with the periphery of the rod when the coupling is completed.

Claim.—1. The internal connection for tubular lightning rods, constructed substantially in the manner herein set forth.

2. The socket L, provided with an India-rubber packing, in combination with the rod E, so as to operate substantially as specified.

78,460.—MOSES LEWIS, Odell, Ill.—*Harvester Cutter*.—June 2, 1868.—For cutting grass, a guard facing is placed in recesses in the fingers, said guard facing consisting of a bar having teeth which coincide in position with and project slightly at each side of the fingers. The grass is cut between the teeth of the guard facing and of the cutter bar.

Claim.—The removable bars D F, adapted to be substituted, one for the other, in the same finger bar, for reaping or mowing, as herein shown and described.

78,461.—THOMAS R. MARKILLIE, Winchester, Ill.—*Tightening Wheel Tires*.—June 2, 1868; antedated May 27, 1868.—The contiguous ends of the tire are upset and formed into heads tapped to receive a right and left screw by which the tire is tightened or loosened. Covering the screw is a cap forming a continuation of the curve of the tire, and provided with side walls. On the inside is a metal shoe adjustable with the cap.

Claim.—The cap E, with side walls thickened at *e*, for the purpose described, the plates *c e*, the shoe F, and bolts *d*, arranged as described, combined with the tire B and felloes A, substantially as and for the purpose set forth.

78,462.—CARLO MARGUTTI, Milan, Italy.—*Railway*.—June 2, 1868.—Relates to a mode of constructing locomotive engines and the tracks over which they run, so as to increase the friction or traction between the engine and the track, for ascending inclined planes, and passing around curves of short radii.

Claim.—1. A locomotive, provided with the eccentric segments F', which act upon a corrugated or wave-shaped rail M, in the manner substantially as shown and described.

2. Operating the eccentric segments F' by means of the reciprocating bars D D' and the attached bearings E of the same, substantially as shown and described, and for the purposes set forth.

3. The combination of the reciprocating bars D D' with the steam-driving cylinders P, substantially as shown and described, and for the purposes set forth.

4. The arrangement of the bars D D', connected together substantially in the manner shown and described, so that the movements of the bars D D' on one side, and its attachments, will produce a movement in the opposite direction of the other bars D D' and their attachments.

5. The combination of the reversing pulleys F with the eccentric segments F', substantially as herein shown and described.

6. The springs *a* in combination with the eccentric

segments F', substantially as shown and described, and for the purposes set forth.

7. The slots a^2 in the eccentric segments F', as and for the purposes shown and described.

8. In combination with the eccentric segments F' and pulleys F, the buttons e , for holding said segments F' against the pulleys F, substantially as shown and described.

9. In combination with the eccentric segments F', the rail M, constructed and arranged substantially as described, for the purpose specified.

10. The propulsion of railway cars by means of corrugated or worm-shaped rails M, and a locomotive mechanism in conjunction with said rails, substantially as shown and described, and for the purposes set forth.

78,463.—WILLIAM MASON, Taunton, Mass.—*Mounting Picker Staffs.*—June 2, 1868.—The under surface of the rocker is V-shaped in cross section and fits in a corresponding groove of the bed. An open link consisting of two cylindrical journals keeps the rocker in its right place on the bed, the form of which latter prevents sidewise motion in the picker staff.

Claim.—The bed, formed with a V-shaped groove, and the rocker, with its under surface of the corresponding form, in combination with the open link, by which the rocker is kept in place on the bed, substantially as and for the purpose set forth.

78,464.—DON CARLOS MATTESON, Stockton, Cal.—*Gang Plow.*—June 2, 1868.—To the front ends of two parallel beams of unequal length are secured two metal bars extending downward and provided with a perforated bar that carries an adjustable plate having a ring to which the doubletree is attached. The arbor that carries the easter wheel at its side is provided with a scraper extending from it at right angles.

Claim.—1. The bars E F, attached to the front ends of the beams A B, with the perforated draught-bar G attached thereto, substantially as and for the purpose specified.

2. The attaching of the easter wheel J to a single arbor, K, provided with a scraper, f , substantially as and for the purpose set forth.

78,465.—HIRAM S. MAXIM and JOHN F. LOCKWOOD, New York, N. Y.—*Gas Machine.*—June 2, 1868.—This machine is intended more particularly for use on railroad cars. Hydrocarbon in a reservoir is heated by a flame produced from the contents of the reservoir, the gas thus produced operating a valve, which, when closed, prevents the further escape of liquid to the flame. When the heat is too high, it will cause the gas in the reservoir to expand and close the valve. The fire will then go out until so much of the gas has escaped that the valve will again open, when the fire will at once be started again. The heat is thus governed and controlled by the state of the contents of the tank.

Claim.—1. In an apparatus for making carburetted air, controlling the heat used for evaporating the hydrocarbon liquid by the pressure of the contents of the vessel in which the said liquid is held, as set forth.

2. Constructing the tank A with an elastic head, side, or bottom, b , by which the position of the valve B is controlled, as set forth.

3. Drawing the air to be carburetted into the pipes through which the hydrocarbon vapor is conducted by means of the escaping force of the vapor, as set forth.

4. The manner herein described of heating or boiling hydrocarbon liquid with a flame of its own gas, said flame being increased or diminished by the pressure of the vapor so generated, as set forth.

5. The tank A, valve B, pipes c , d , f , and g , arranged and operated as set forth, to cause the heating of the contents of the tank, as set forth.

6. The above, in combination with the elastic head b , made as set forth.

7. Arranging an independent burner, l , in the pipe D, substantially as set forth, for the purpose of igniting the burners g , as specified.

8. The jet pipe j , arranged in the tube E, for the purpose of causing the escaping vapors to draw air

into the tube E, and to have such air carburetted, as set forth.

9. The outer case G, in combination with the gas apparatus, as set forth, said case being provided with apertures or valves.

10. A gas machine, made and operating substantially as herein shown and described, and consisting of the tank A, elastic head b , valve rod C, valve B, pipes c , d , f , and g , discharge pipes D and E, jets h and j , burner l , and splashing board n , all made as set forth.

78,466.—PATRICK J. MCGUINNESS, New York, N. Y.—*Bridle Bit.*—June 2, 1868.—The bit is composed of two pieces hinged or pivoted together in the middle, one end of each piece being connected with the reins, while the other end carries a step which is near to the end of the other bar, and which when on the rear side of the bar prevents the two bars from turning independently around their pivot, and when the step is in front of the other bar, the two bars will be turned when pulled by the reins, thus acting as a curb bit.

Claim.—As a new article of manufacture, a curb and driving bit, consisting of the bars A B, provided with rings b , stops c , and sliding cheek pieces d , when said bars are each curved in opposite directions from the center, all constructed, arranged, and operating as set forth.

78,467.—JAMES MONTGOMERY, Croton, N. Y.—*Car Axle and Wheel.*—June 2, 1868; antedated May 16, 1868.—Intermediate bars of double-headed shape in their transverse section are combined with segmental bars arranged to resemble the double frustum of a cone and welded together at the ends of the axle for the length of the sockets. The outer ring and central brace or stay are cast in one piece, and have orifices through which the segmental bars are passed, to prevent slipping of the ring. The eyes or hubs to the wheels and bearings to the same are cast on the ends of the axle.

Claim.—1. In reversely conical-shaped axles, made up of segmental bars, as described, the insertion, between the latter, and welding with them at their ends, of I-shaped bars, substantially as specified.

2. The combination, with a reversely conical-shaped axle, composed of segmental or separate bars, arranged as specified, of the outer ring and interior central brace B, cast in one piece, and through which the bars are run or passed, as herein set forth.

3. The combination, with the axle made of wrought metal, of the wheel hubs or central portions cast thereon, together with their bearings or journals, essentially as specified.

78,468.—ROBERT C. MORTON, West Lubeek, Me.—*Ore Separator.*—June 2, 1868.—This invention relates to the separation of metallic ores by the pulsation or undulation of water and consists of a series of plunger levers vibrating above a series of water cells, the plunger levers and cells being arranged to pulsate the water with different degrees of force.

Claim.—1. The series of lever or hinged plungers C C' C'' C''', &c., acting upon the series of cells D D' D'' D''', substantially as shown and described, in combination with the corresponding compartment tray H, all as and for the purpose set forth.

2. The adjustable bars s , substantially as shown and described, in combination with the rollers d and cams e of the shaft h , all as and for the purpose set forth.

3. The lever rocks k , substantially as shown and described, in combination with the box G, slide E, and plungers, all substantially as shown and described, and for the purpose set forth.

4. The bar A, rubber springs j , plates f , and lever plungers, all constructed and operating substantially as shown and described, and for the purpose set forth.

5. Tray H, having partitions $u u u$, substantially as shown and described, in combination with a series of plungers and a series of cells D D' D'' D''', all as and for the purpose set forth.

78,469.—CRAWFORD MUNNS, New York, N. Y.—*Stump Extractor.*—June 2, 1868.—The triangular frame is pivoted to the platform by a pintle bolt so

that it can be readily moved to front in any direction. The platform is composed of hinged leaves attached to a middle part which enables it to be readily adapted for transportation.

Claim.—1. The pintle *d*, in combination with a stump extractor and its base or platform, substantially as described for the purpose specified.

2. The triangular frames *A A* of a stump extractor, arranged substantially as shown and described, and secured to the base *B* by means of the pintle bolt *d*, or its equivalent, for the purpose set forth.

3. The hinged leaves *B' B'* and base *B*, in combination with a stump extractor, all constructed, arranged, and operating substantially as shown and described for the purpose set forth.

4. The platform *B*, substantially as shown and described, when combined with the pintle bolt *d* of a stump-extracting machine, all as set forth.

7S,470.—CHARLES MURDOCK, Ellenville, N. Y.—*Machine for Crozing and Chamfering Barrels.*—June 2, 1868; antedated May 18, 1868.—The cutter blades are caused to move forward toward the barrel, and acting upon the inner surface of the same, produce the necessary chamfer thereof, and crozes or grooves therein to receive the barrel heads, the cutters, after such operation has been completed, being withdrawn from the barrel, when it can be removed and another inserted in its place.

Claim.—1. The combination of the sliding frames *E E*, upon each side of the main frame, and bearing the crozing and chamfering cutters *J K*, with the barrel-holding frame *g*, all operating as described, whereby both ends of the barrel are chamfered and crozed at the same time, as herein shown and described.

2. The arrangement of the sliding frames *E E*, in which the cutter-head shafts are hung and turn, connecting-rods *V V*, and lever arm *T*, in combination with the sector-shaped arm *R*, all arranged together and operating as and for the purpose specified.

3. The arrangement of the sliding sleeve *Y*, having wedge-shaped arms, of the cutter-head shafts, connecting levers *W W*, lever arm *U*, and sector-shaped arm *S*, all connected together and operating as and for the purpose specified.

4. The barrel-holding frame *g*, having spring jaws for grasping and holding the barrel while being operated upon by the croze and chamfer cutters, arranged so as to be raised or lowered, substantially in the manner described and for the purpose specified.

7S,471.—WILLIAM H. MYERS, Baltimore, Md., assignor to SYLVESTER MATHIAS, same place.—*Tuyere.*—June 2, 1868.—Across the top plate are two ridges provided with slots penetrating to the air chamber, and serving as outlets for the air from the bellows. The escape pipe passes down from the center of the fire bed through the bottom of the air chamber.

Claim.—1. An escape pipe *D*, or its equivalent, independent of the duct which conveys the blast to the fire, descending from the center of the tuyere, to convey away ashes, dust, &c., from the bottom of the fire, and to admit a direct draught when the bellows is not in operation, substantially as set forth.

2. A tuyere, constructed with the air chamber *B*, outlets *C C*, and the escape pipe *D*, substantially as described.

7S,472.—FRIEDRICH NEUHAUS, Belleville, Ill.—*Tailor's Seat.*—June 2, 1868.—The seat is provided with a fixed or a hinged back, and with a vertical backward and forward as well as a laterally adjustable elevated knee support, so as to enable the occupant to sit with his legs comfortably supported, and without interrupting the circulation of blood in the same.

Claim.—1. A tailor's seat, provided with a back, *B*, and an adjustable knee support, *F*, substantially as herein shown and described.

2. The devices herein shown and described of attaching the cushion *F* to the seat *A*, said devices consisting of the eye *a*, rods *C, D*, and *E*, all made as described, and operating so as to allow the backward and forward, up and down, and lateral adjustment of the cushion, as set forth.

7S,473.—H. B. NORTON, Rochester, N. Y.—*Potato Digger.*—June 2, 1868.

Claim.—1. The combination of the loose frame *C*, carrying the operating apparatus, with the axle and driving wheels, when said frame is capable of being elevated by the joint action of the team and operator, as herein set forth.

2. The combination of the folding bars *L L* with the lever *K* and frame *C*, in the manner and for the purpose specified.

3. The arched axle *B*, when employed in combination with the driving wheels *A* and endless apron *I*, whereby the edge of the wheels may be reduced to the minimum, and a free passage for vines is left over the apron, as herein set forth.

4. The shares *D D*, set angularly and with the land sides inward, in combination with the scraper *H*, whereby the sides of the row are first plowed off and then scooped up, as herein set forth.

5. Adjusting the shares *D D* centrally, irrespective of the scraper, both at the top and bottom, by the slots *b b'*, as herein described.

6. The construction and arrangement of the bearings *t*, rollers *s s'*, and angular caps *u*, as herein specified.

7. The combination of the inclosed and alternating agitator *W* with the endless apron *I*, as herein set forth.

8. The combination of the side guards *E E* with the endless apron *I*, as herein specified.

9. The construction and arrangement of the endless apron, the same consisting of the flexible sides *v v*, the \wedge -shaped or half circular slats *w*, and the stay pieces *w'*, united by rivets, the whole operating in the manner and for the purpose specified.

10. The combination of the tension rods *e* with the plow standards *a* and endless apron *I*, whereby the plows, scraper, and apron are drawn forward at pleasure, to make them tant, as herein set forth.

11. The combination and arrangement of the offsets or notches *h'*, and the springs *z*, with the curved slots *h*, in the manner and for the purpose specified.

12. The combination of the door *r* and lever *q* with the open receptacle *M*, arranged and operating as herein set forth.

13. The employment of two bearing rollers *s s*, on opposite sides, for sustaining the front end of the apron without a connecting shaft, as herein set forth.

7S,474.—H. B. NORTON, Rochester, N. Y.—*Fruit Jar.*—June 2, 1868.—A cover having concentric flanges projecting downwardly to form a groove for the wax, and also to serve as a guide in applying the same and to prevent intrusion of the wax, is combined with an externally beveled jar mouth.

Claim.—In combination with the concentric rims *b b'*, projecting vertically from the cover *B*, the externally beveled mouth *d* of the jar, for compressing the packing substance against the outer flange, to prevent its entering and commingling with the contents of the jar, substantially as set forth.

7S,475.—RICHARD O. BRIEN, Dalton, Ohio.—*Railroad Car Stove.*—June 2, 1868.—The stove is so arranged as to maintain a vertical position in case the car should be overturned. A detachable bed plate, having a concavity in the center of its upper side, fits loosely on a cross bar of the frame and receives the lower end of the stove to prevent any slight motion from the inclinations of the car.

Claim.—1. The combination of the arm *H* and weight *I* with the spindle *D* of the pivoted frame *C*, substantially as herein shown and described, and for the purpose set forth.

2. The detachable bed plate *M*, in combination with the pivoted frame *C* and swinging stove *A*, substantially as herein shown and described, and for the purpose set forth.

3. An improved railroad car stove, formed by the combination of the swinging stove *A*, pivoted frame *C*, supporting frame *E*, weighted arm *H I*, and detachable bed plate *M*, with each other, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

7S,476.—G. W. PACKER, Toulon, Ill.—*Extension Step Ladder.*—June 2, 1868.—The sides of the

lower part are connected at both ends and slightly curved between. The upper part is like an ordinary ladder. To a bolt in rear of the hinge is attached a truss over which a chain connecting the two parts passes.

Claim.—An extension step ladder, consisting of the hinged parts B C, truss E, and chains G, constructed and arranged substantially as herein described.

78,477.—JAMES PARK, Jr., Pittsburg, Pa.—*Manufacture of Plates of Combined Steel and Iron.*—June 2, 1868.—The object is to produce plates or sheets of metal which shall combine the hardness and susceptibility to polish and tempering qualities of high-tempered steel, with the toughness, strength, and susceptibility to formative action of dies or swages possessed by wrought iron and other soft, fibrous metals.

Claim.—Giving a welding heat to the iron or fibrous metal side only of the ingots, in the manner hereinbefore described, and then uniting these surfaces by welding them together, either with or without an interposed layer of wrought iron or other fibrous and malleable metal, substantially as hereinbefore set forth.

78,478.—MILTON E. PHILLIPS, Lena, Ill., assignor to himself, PAUL WETZEL, and GEORGE WETZEL, same place.—*Table and Quilting Frame.*—June 2, 1868.—The parts are so constructed as to constitute either a table or a quilting frame as desired, by a simple change of arrangement.

Claim.—The combination, substantially as set forth, with a centrally-divided leg, a centrally-divided hinged table top, pivoted supports, and spring detents, of horizontal frame pieces, ratchets, and a horizontal brace, for the purposes specified.

78,479.—ISAAC A. PINNELL, Boonville, Mo.—*Nail Extractor.*—June 2, 1868.—The pressure upon the curved fulcrum through the lever handle will cause the jaws to clamp firmly the head of the nail and retain it while the nail is being withdrawn.

Claim.—The lever handle A, fulcrum bar C, having the curved fulcrum *b*, the claw levers D and E, having the claws *a a*, all pivoted together, constructed to operate substantially as shown and described, and for the purpose set forth.

78,480.—HENRY POTH, Pittsburg, Pa.—*Wheel.*—June 2, 1868.—The hub flanges are formed with corresponding wedge-shaped feathers or projections, which, when the said plates are brought together, slide upon each other and form the mortises of the hub, and provide the means by which the tenons of the spokes are wedged or clamped in place.

Claim.—The hub flanges *a a*, provided with corresponding wedge feathers *b b*, when adapted to be drawn together by means of the differential screw-box *d e*, on which the screw caps *g* are fitted, the tenons of the spokes being protected by elastic material *k*, all constructed and arranged as and for the purpose described.

78,481.—JOHN C. RAYMOND and FRANCIS T. ALLYN, Brooklyn, N. Y., assignors to F. T. ALLYN.—*Low Water Indicator.*—June 2, 1868.—Upon turning the connecting nut which surrounds the expandible tube upon the connecting rod attached to the moving end of the tube in one direction the whistle will be made to blow, thus allowing the adjustment to be such that a very small expansion of the tube will blow the whistle. If the nut is turned the other way to stop the whistle when the tube is expanded by being filled with steam, the indicator will show that it has been tampered with.

Claim.—The stop *g*, in combination with the lever *k*, rod *o*, nut *p*, expanding tube *e*, and with the valve stem *i* of the whistle, all as shown and described.

78,482.—GEORGE RECTOR, Sodus, Mich.—*Harvester.*—June 2, 1868.—The arms to which the sickles are connected project from the rock shaft on opposite sides and thus cause the sickles to move in opposite directions, and, by means of a series of holes in the crank of the rock shaft, the stroke of the

sickles may be increased or decreased at will. The cutting apparatus is hinged to a vertical U-shaped frame upon the side of the machine and is readily adjusted vertically.

Claim.—1. The arrangement of the rock shaft *a*, and the two sickle bars *d* and *h*, the latter being located in line with the tread of the wheels, and hinged to the adjustable yoke D, substantially as described.

2. The U-shaped frame D, with the horizontally projecting arm to which the finger bar is hinged, and having the projecting brace bar G arranged to bear against the rear side of the finger bar; said frame D being adjustable vertically, all constructed and arranged to operate as herein described.

3. The combination of the driving gear L, crank shaft *t*, with its sliding gear *m*, pitman *n*, and rock shaft *a*, when said parts are constructed and arranged to operate as and for the purpose set forth.

4. The combination of the two sickle bars *d* and *h*, pitman *i*, and rock shaft *a*, provided with its two arms, and crank *r*, having a series of holes for adjusting the stroke, as herein set forth.

78,483.—ALEXANDER K. RIDER, Nazareth, Pa., assignor to himself, C. H. DELAMETER, and G. H. REYNOLDS.—*Valve for Steam Engines.*—June 2, 1868.—Designed more particularly for steam pumping engines, steam hammers, and the like, in which no cranks or working parts are employed. The master valves are provided with passages by which ultimately the main valve is thrown by the action of the steam without any mechanical connection.

Claim.—The master valves D¹ D², operated by and controlling in turn the action of the steam in throwing the main valve G, substantially as and for the purposes herein set forth.

78,484.—J. S. ROWELL and IRA ROWELL, Beaver Dam, Wis.—*Elevator for Cultivator Bars.*—June 2, 1868.—Two roller stands or bearings are arranged on the top of the frame over the cylinder rod and under the hopper, extending upward and to the rear to receive the end of a roller which is provided with suitable sheaves to receive the chains which elevate the bars.

Claim.—1. The roller stands or bearings, constructed and arranged as and for the purpose set forth.

2. The sheaves D D', provided with the inclined catch *d* and loop *c*, in combination with the ratchet *b*.

3. Pivoting the jaw, as described, out of line with the groove in the sheave, so as to form an automatic locking and unlocking device, as set forth.

4. The combination of the sheaves D D', bearings B B', and roller C, as arranged, and operating in the manner and for the purposes set forth.

78,485.—J. S. SANDS, St. Joseph, Mo.—*Apparatus for Curing Hops.*—June 2, 1868.—The object is to provide for easy and perfect ventilation of the apparatus and to enable the hops, while curing, to be thoroughly stirred from the outside of the house, which is effected by means of a traveling shaft and arms.

Claim.—1. The ventilators H H', lever S, ropes *e e'* and *g*, pulley *p*, and wheel P of a hop-curing house, all arranged, in relation to each other, substantially as and for the purpose specified.

2. The racks *b b'*, shaft B, with its pinions *c c'*, driving wheel C, with its radial arms *d d'* *d''*, &c., *h h'* *h''*, &c., pulley D, wheel E, and endless rope *m*, of a hop-curing house, all arranged relatively to each other, substantially as and for the purpose specified.

3. A hop-curing house, combining the above specified devices, all arranged substantially as and for the purpose specified.

78,486.—WILLIAM SERVISS, Sidney, Ohio, assignor to JASON MCFAY and JASON S. CARY.—*Machine for Grooving Sheet Metal.*—June 2, 1868.—The offset consists of a tapering metallic bar placed in a tapering spline in the side of one of two parallel arms upon which is guided a rack, supported at one end by the seaming wheel. A gauge extends the entire length of the arm.

Claim.—1. The offset F, substantially as shown

and described, in combination with rack D, wheel G, and arm B, as and for the purpose set forth.

2. The gauge E, constructed and operating substantially as and for the purpose shown and described, in combination with the arms C and B, and wheel G, all as set forth.

78,487.—CARL SEYLER, Cleveland, Ohio.—*Vine Trellis.*—June 2, 1868.—A device for tightening up the wires of trellises, so that they be readily and at all times kept strained and properly secure for the trailing of the vine.

Claim.—The plug or shaft D, studs *a'*, and ring F, as arranged, in combination with the arms A, for the purpose and in the manner substantially as set forth.

78,488.—ALBERT B. SHEPARD, Sand Bank, N. Y.—*Floating Water Power.*—June 2, 1868.—Designed for utilizing and economizing the power of running waters upon rivers or streams which are liable to great and sudden changes in depth. A rotating motion is communicated to the wheels by the current, and the same is communicated to shafting on the shore; the rocking of the frame permitting the float to rise or fall without moving the cross-bar on the shore.

Claim.—The arrangement, upon the floats A A A, of the wheels C, keyed upon the shaft D, having the gear wheel E, the shaft F having the beveled pinion G and pulley K, the hinged frame H supporting the pulley shaft *g*, and attached to the shore by the shaft H', as herein described, for the purpose specified.

78,489.—HARVEY SILVER, Lowell, Mass.—*Flier for Spinning Machine.*—Antedated May 23, 1868.—To opposite sides of the flier arms is secured a saddle of hardened metal, at the top of which is a projecting portion turned or bent over to form a spring, through the middle portion of which is a hole opposite a hole in the saddle; in the latter is inserted a guide pin; the object being to prevent the arms or sides from being worn or cut by the yarn, and to facilitate the removal and renewal of the worn guide pins.

Claim.—1. The spring portion, shown and described, when combined with the saddle, and constructed and arranged for the removal and replacing of the guide pin *e*, for the purpose and substantially as described.

2. The guide pin *e*, when constructed as described, and applied to the spring portion and the saddle *e*, as and for the purpose described.

3. The combination of the saddle, spring portion, and pin with the flier arm or arms, for the purpose and substantially as described.

78,490.—LORENZO D. SNOOK, Barrington, N. Y.—*Harvester.*—June 2, 1868.—In this machine cog wheels are dispensed with, and motion is imparted to the enters by means of a cam wheel within the felloe of one of the supporting wheels, and a vibrating lever connected to the cutter bar by a rod.

Claim.—1. The construction and arrangement of the lever E, provided with the anti-friction wheels and arm, with the plate F, and forked wedge-shaped lever G, when applied and actuated as and for the purpose set forth.

2. The laterally adjustable coupling R, in combination with the connection H, when made and used as and for the purpose specified.

3. The hook L, when made and applied to keep the cutter bar in place, substantially as specified.

78,491.—WILLIAM W. SPENCER, Pittsburg, Pa.—*Self Fastening Buckle.*—June 2, 1868.—The object is to dispense with sewing, riveting, or punching of holes in the leather to which the buckle is fastened.

Claim.—A buckle provided at each end with two transverse bars *cc*, arranged as described, for facilitating the casting process, in combination with transverse bars F and G, as and for the purpose set forth.

78,492.—C. PH. STEINMETZ, Madison, Wis.—*Plow.*—June 2, 1868.—The plowshare is attached to a vibrating upright shaft by which it is rendered reversible by means of a lever or handle, so as to turn

a furrow to the same side in crossing and recrossing the field on adjoining furrows. Stops are employed to keep the lever in place. A cultivator may be used interchangeably with the plowshare.

Claim.—1. The swivel clevis *a*, as constructed, arranged, and fully described and shown.

2. The combination of the reversible plowshare A or cultivator share E, with the vibrating upright shaft B, lever D, and stop C, as shown and described.

3. The swivel clevis *a*, reversible plowshare A or cultivator share E, vibrating shaft B, lever D, stop C, notched bar or standard *e*, with wheel G, key *f*, and plates F, all constructed and arranged in combination with a plow frame, as shown and described.

78,493.—THOMAS H. STILWELL, M. D., New York, N. Y.—*Ear Trumpet.*—June 2, 1868; antedated May 18, 1868.—Two trumpet-shaped tubes are inserted one in each ear to support the drum, and are connected together by a copper or other wire to establish an electrical current between the tubes. A coiled wire is inserted in each tube to increase the vibrations.

Claim.—The tubular trumpets A A, connected by means of a wire rod B, and having vibrating wires C arranged within them, substantially as and for the purpose specified.

78,494.—WILLIAM P. TOWLES, Baltimore, Md.—*Suspender.*—June 2, 1868.—The suspenders are so formed that the strain shall act on a common center, and also serve as a brace to the shoulders, being adapted to any form of the same.

Claim.—The combination and arrangement of the adjustable non-elastic shoulder straps C, center A, elastic strap D, rings E, and button-hole straps B, substantially as and for the purpose herein shown and described.

78,495.—CROMWELL FLEETWOOD VARLEY, London, Eng.—*Telegraphing.*—June 2, 1868.—The objects of this invention are to cut off the disturbance arising from earth currents, to obtain a high speed of signalling through long circuits, and, should the conductor become partially exposed, to preserve it from being eaten away by electrolytic action.

Claim.—1. So arranging telegraphic apparatus as to work by the variation of the increment and decrement of electric potential, and not by the direct action of the electric current itself, as and for the purposes set forth.

2. The use of an induction coil at the receiving end of the cable, one of its wires being connected between the cable and the ground, and the other or secondary wire connected with the receiving instrument, as and for the purposes set forth.

3. The use of a condenser or condensers between the receiving end of the cable and the earth, with or without resistance coils between the cable and the earth, as and for the purposes set forth.

4. The use of a condenser at the sending end of the cable, with or without resistance coils connecting its two armatures, as and for the purposes set forth.

5. The use of a condenser at each end of the cable, the cable being connected with the ground through a resistance coil and a battery, so as to keep the cable always negatively electrified, as and for the purposes set forth.

78,496.—GEORGE WARNER, Cleveland, Ohio.—*Cap for Marine Stove Pipe.*—June 2, 1868.—The top shield is attached to the cap above the opening and made to press upon the top of the flexible side shields so as to retain them in any desired position; the object being to prevent the stove from smoking.

Claim.—The top shield C and the two flexible side shields B B, in combination with the cap A, as described, and when used in the manner and for the purposes set forth.

78,497.—WILLIAM H. WATROUS, Hartford, Conn.—*Electro Plating Frame.*—June 2, 1868.—Two jaws jointed together with an adjusting screw at the top for opening and closing the same; for holding articles suspended in electro plating fluid.

Claim.—The holding frame A, constructed substantially as and for the purposes herein shown and described.

78,498.—ALEXANDER WEBSTER, Seneca Falls, N. Y.—*Apparatus for Distilling.*—June 2, 1868.—A perforated steam pipe is combined with a perforated cylinder, through which the steam or vapor passes from the still to the coil, in connection with which is a cap for collecting the lighter portion of the vapor, whereby two qualities of liquor are obtained.

Claim.—The cap C, combined with the cylinder A and the tube B, substantially as and for the purposes described, separating the lighter and more refined portion of the vapor which rises from a still in the process of distillation from the heavier portions, for the purpose of obtaining two or more qualities of liquor, substantially as described.

78,499.—ALFRED WEED, Boston, Mass.—*Self-Boring Stop Cock.*—June 2, 1868.—The thread is cut at a considerable distance from the entering end so as to bring the induction end of the faucet to the proper position within the cask.

Claim.—A faucet, provided with a screw thread, *f*, on its barrel, for the purpose set forth, its entering end provided with a closed boring tool, *d*, and the blank or smooth surface *o*, between the screw thread and the boring tool, in which blank surface are the inlets *c*, communicating with the passage through the faucet, and also provided with handles *e*, by which the borer is turned, the smooth surface pushed into the tap hole, and the faucet turned as it is screwed into the tap hole.

78,500.—WILLIAM WHARTON, Jr., Philadelphia, Pa.—*Railway Switch.*—June 2, 1868.—The object is to prevent the rails from yielding to the lateral strain occasioned by the passing cars when the force is only applied, as usual, to one point in moving the switch rails.

Claim.—Switch rails, arranged to move laterally from a fixed point, in combination with a shaft having two or more graduated cranks, or their equivalents, for serving the twofold purpose of operating and laterally steadying at different points the said switch rails, substantially as set forth.

78,501.—WILLIAM WHITELEY, Springfield, Ohio.—*Plow.*—June 2, 1868.—The object of this invention is to so construct the plowshare or mold-board that in turning the sod it will produce a great number of minute fractures upon the earth side of the furrow slice, the said fractures being evenly distributed, and are caused by the elongation of the furrow slice while being inverted.

Claim.—1. The construction and use of plows, when the shapes of those parts which cut and invert the furrow slice are determined and obtained by the herein described rule, substantially as set forth.

2. The method of obtaining modified forms of the plow shape, substantially as herein described.

3. In combination with the draught bolt J, the stirrup G, or its equivalent, which surrounds both bolt and beam, and binds them firmly together, without perforating or otherwise weakening said beam.

4. In combination with the post, to which the mold-board is connected, the bolt J, or its equivalent, for the purpose of connecting the draught rod at a rigid point in front of the plow post.

5. In combination with the post C and beam D, the notched flange E, for the purpose of shifting the position of the said beam in relation to the post C, so that a team of two or three horses may be used at pleasure.

6. In combination with the clevis L, or its equivalent, the eye bolt M and washers N, substantially as and for the purpose set forth.

7. In combination with the front projection at the top of the plow post and the land side of share, the colter Q, or its equivalent, secured to said projection, or its equivalent, in front of the clamping stirrup, in order to equalize the upward pressure, substantially as set forth.

8. The brace S, in combination with the post C and stirrup G, substantially as and for the purpose set forth.

9. The stirrup G, constructed with the horizontal portion *h*, to enable the beam to be adjusted sideways, as described and for the purpose set forth.

10. The share B, constructed with the land-side bar R, substantially in the manner shown.

78,502.—HOSEA WILLARD, Vergennes, Vt.—*Butter Worker.*—June 2, 1868.—One of the wings is rigidly attached to the spindle while the other may be revolved, in connection with a shallow pan in which the butter is to be placed.

Claim.—The rod or spindle B, with the wings C and D connected therewith, in combination with a tray or trough, and operating substantially as and for the purposes herein shown and described.

78,503.—LEWIS S. WISWELL, Utica, N. Y.—*Machine for Fastening Lacing Hooks to Gaiters.*—June 2, 1868.—A series of devices for automatically feeding the hooks to the leather, driving them through the same, bending the points, and clinching them by a single simple motion.

Claim.—1. The slides G and H, constructed substantially as described.

2. The punch D, with recess for holding the hooks, constructed substantially as described, in combination with the said slides.

3. The arms L, pin F³, and spring L', constructed and operating in combination, substantially as described.

4. The cam F, lever C, and punch D, in combination, substantially as described.

5. The agitator, constructed and operating substantially as described.

6. The ways K K', constructed and operating substantially as described, in combination with the arms L.

78,504.—JONATHAN WOLFROM, York, Pa.—*Horse Hay Fork.*—June 2, 1868.—The frame slides up and down within the tines and projecting points are pivoted to the end of each, so that when the frame is raised the points are brought to a horizontal position to raise the hay. The descent of a central tine aids in discharging the hay.

Claim.—The tines A and frame D, substantially as shown and described, in combination with the points E, middle tine G, latch lever *d*, and slot *i*, or the equivalent thereof, all as and for the purpose set forth.

78,505.—WENDELL WRIGHT, Bloomfield, N. J.—*Clasp for Fastening Garments.*—June 2, 1868.—Threehinged plates held open or closed by springs, the central plate being provided with slits and the two outer ones with spurs or points to hold together the edges of any textile fabric.

Claim.—The plates A, B B, connected together by joints or hinges, provided with springs *b b*, the plates B being provided with spurs or points, all constructed and arranged substantially in the manner as and for the purpose set forth.

78,506.—WALTER AIKEN, Franklin, N. H.—*Needle for Knitting Machine.*—June 2, 1868.—The corrugations are designed to take the place of the double shank as usually made.

Claim.—The improved knitting machine needle, made with a series of flexures or corrugations, *a a a*, in its shank, substantially as represented in Fig. 1 of the aforesaid drawings, and as hereinbefore specified.

78,507.—ADAM BAIERLE, FREDERICK HARTMANN, and FREDRICH REESE, Chicago, Ill.—*Ice House for Brewers and Butchers.*—June 2, 1868.

Claim.—A building for preserving meats, beer, and similar articles, consisting of the ice chamber B and cooling vault A, provided with one or more ventilators I, all constructed and arranged substantially as shown and described.

78,508.—DAVID H. BALL, Sinnamahoning, Pa.—*Shingle Machine.*—June 2, 1868.—Across the upper face of the carriage on which the block is placed are bolted metal plates upon which dogs, attached to the head block, are made to rest and slide, and by which they are prevented from springing. On one end of a set rod is a square block or nut against which rests a spring attached to the block carriage.

Claim.—1. The plates *o o*, when arranged in relation to the head block *p*, and the dog *p' p'*, said dogs being constructed to rest or slide on the plates, as and for the purpose specified.

2. The block *s* and spring *s'*, constructed and arranged to operate as and for the purpose set forth.

78,509.—C. T. BELBIN, Baltimore, Md.—*Oyster Dredge*.—June 2, 1868.—A method of attaching the draught rods to the rake head, the object being to prevent the teeth from catching as the instrument is drawn over the roller on the gunwale of the vessel.

Claim.—The combination of the two bolts *m* and *n*, with the lug *o*, the rods *A* and *B*, and the head *C*, when all said parts are combined and arranged so as to operate together, substantially in the manner and for the purposes set forth.

78,510.—JOSEPH H. BODINE, and TRUMAN A. HILL, Mount Morris, N. Y.—*Device for operating Water Wheel Gate*.—June 2, 1868.—The gate is a circular plate with apertures through it which correspond in number with the water ways between the chutes of the shell.

Claim.—The arrangement of the pivoted sector *m*, pinion *P*, and hand wheel *S*, and pivoted connecting rod *u*, with relation to the circular register gate *G*, whereby said gate is operated horizontally to open and close all the water ways at once, as herein shown and described.

78,511.—ALEXANDER H. BRAINERD, Rome, N. Y.—*Churn Dasher*.—June 2, 1868.—The dasher is so constructed and applied that it rotates as the staff is reciprocated vertically.

Claim.—1. The head *B*, pivoted upon the reciprocating staff *A*, and provided with spiral flanges *F*, substantially as described.

2. In combination with the above, the beveled floats *E E'*, substantially as and for the purposes specified.

78,512.—JAMES BURNS, New York, N. Y., assignor to himself, RICHARD McCULLOUGH, and JOHN FANNING.—*Machine for Shaving Screws*.—June 2, 1868.—Relates to the shaver, which is that portion of the machinery employed for turning off the head of the screw blank. The oscillating and reciprocating carriage carries a gripping holder up to the spring guide, (into which the screw blank is fed by its own gravity,) and seizing the screw blank carries the same up to a stationary tool and holds it during the operation of shaving the head, and then discharges the shaved blank.

Claim.—1. In combination with the stationary tool *b* and spring guide *Y*, the forked lever *U*, cam *M*, and gripping holders *R R*, for taking the screw blank from the spring guide, holding, bringing up, and rotating same against the stationary tool during the operation of shaving the blank head, and discharging the blank without the aid of a punch, for either feed or discharge of the screw blank, substantially as described.

2. The combination of the oscillating and reciprocating gripping-holder carriage *J*, cams *K K'* *N*, and spring *O*, arranged substantially as and for the purposes set forth and described.

78,513.—ELIJAH BUTTON, Annapolis, Md.—*Cork Extractor*.—June 2, 1868.—The extractor is inserted into the bottle and pushed against the bottom with a force sufficient to expand the springs, when the cork is inclosed between the springs and withdrawn.

Claim.—The cork extractor, consisting of springs, having their lower ends adapted to turn on the ring *h*, all operating as described, whereby the cork is caged lengthwise in the bottle, without turning the latter upside down, as herein shown and described.

78,514.—JAMES CALKINS, New York, N. Y.—*Preserving Wood*.—June 2, 1868.—Steam, together with the products of combustion from the furnace of the steam generator, is admitted to the chamber containing the wood, and the wood, having been by this means deprived of its contained moisture, is subjected to the action of the vapors of oil, carbolic acid, or other antiseptic before cooling or exposure to the atmosphere. The apparatus is such that the successive processes and entire treatment are completed without removing the wood from the treating chamber.

Claim.—1. The employment of steam, in combination with the gases of combustion, generated as described, admitted together into the treating cham-

ber, for the drying of wood and other materials, substantially as set forth.

2. The process of preparing and treating wood or other material by means of steam, and of superheated steam and carbonic oxide, or the gases of combustion, and subsequently treating with the hot oleaginous vapors under pressure, while in a highly heated condition from the previous treatment, substantially as described.

3. The described apparatus, consisting essentially of the generator *A* and its appurtenances, the treating chamber or chambers *Y* and *K*², tanks *M* and *L*, with their several systems of pipes and cocks, arranged, combined, and operating substantially in the manner and for the purposes set forth.

4. In combination with the treating chamber or chambers and the generator, the water gauge or regulator, contained within the dome *M*², or its equivalent, for regulating the pressure of the steam or vapors employed, operating substantially as set forth.

5. The combination of the pipe *U* with the fire chamber *D* and generating chamber *C*, whereby the gases of combustion may be directly admitted into the steam space, substantially as set forth.

78,515.—THOMAS J. CHRISTY, Olney, Ill.—*Harvester Cutter*.—June 2, 1868; antedated May 25, 1868.—A cutting apparatus for reaping and mowing machines, in which the cutting teeth go to make up an endless chain which has a continuous circulating movement upon the finger beam.

Claim.—The combination of the chain sections *b*, formed with projecting heels *b'*, for both driving and guiding the blades *a* and links *e* bolted to the sections *b*; the pinion *d* driving the chain through the medium of the projecting heels *b'*; the central bar *g* with ledges *g' g'*, forming guide ways for the heels *b*; the finger beam *e*, with the upturned flanges *e'*, and the cap plate *f*, when the said parts are constructed, arranged, and employed in the manner and for the purpose specified.

78,516.—FRANCIS DILTON, Auburn, N. Y.—*Halter Buckle*.—June 2, 1868.—This improvement has reference to the manufacture of what is known among harness makers as the "five-ringed halter."

Claim.—1. In combination with the three-tongued buckle, the loop *S* for securing the ends of the straps, substantially as described.

2. The application and use of the said buckle in the manufacture of halters, when the same is constructed and used in the manner above specified.

78,517.—WM. DOYLE, Albany, N. Y.—*Cooking Stove*.—June 2, 1868.—The center of the incandescent fuel is immediately under the vessel to be heated. The products of combustion pass from the fire box down the front flue and front corner flues to the lower front or cross flue, whence they are conducted by the extension flue into the direct draught flue and thence to the outlet.

Claim.—1. The construction and arrangement of extension flue *C*, in combination with a revertible or return flue, *F*, under the oven of a cooking stove, substantially as shown and described.

2. Flue stopper *B'*, in combination with flue plates *a* of extension flue *C*, when constructed as and for the purpose set forth.

3. The construction and arrangement of front-descending flues *A A*, in combination with extension flue *C*, substantially as set forth.

4. The arrangement and combination of front-descending flues *A A*, cross or connecting flue *H*, extension flue *C*, and revertible flue *F*, substantially as shown and described.

5. The construction and arrangement of a front descending and direct flue or flues, *A A*, and cross flue, *H*, united by extension flue, *C*, with a revertible flue, *F*, under the oven of a cooking stove, when all of said flues are operated and controlled by one damper, *P*, substantially as set forth.

78,518.—GUSTAV L. ENGGREN, Brooklyn, N. Y.—*Valve for Steam Engine*.—June 2, 1868; antedated May 27, 1868.—The oscillating valve controlling the engine ports are in constant or positive gear with the stem of the subsidiary valve or piston, which latter carries the independent valve or slide which deter-

mines automatically the cushioning effect at the terminus of the stroke of said piston in both directions of its travel.

Claim.—1. The combination, with the valve or piston D, having a passage, *h*, through it, and aperture *s*, in communication with the exhaust passage H, or its equivalent, of a valve or slide, L, constructed and operating, by the throw of said piston, to effect or regulate the cushioning of the piston at or toward the close of its stroke, but allowing of a free escape for vapor or air on the forward side of said piston, in the early portion of its action, in either direction, essentially as herein set forth.

2. The combination of the piston D with its independent valve or slide L, operating in connection with exhaust passages, as described, and valves J J', constructed and arranged for action together, substantially as shown and described.

78,519.—FRANCIS H. ESCHERICH, Baltimore, Md.—*Breech-Loading Fire-Arm.*—June 2, 1868.—Means for opening and closing a breech-loading fire-arm, in which the barrel itself is hinged and moved for loading.

Claim.—1. The construction of the angular pins *g g'*, of the forwardly-projecting part *g*, and the downwardly-projecting part *g'*, and operated by the hook *l* of the lever F, substantially as herein described and for the purpose specified.

2. The cam E, provided with projections *g h i*, and bulging part *j*, in combination with the lever F, provided with hook *l* and arm *k*, substantially as and for the purposes described.

3. The cam E and lever F, constructed as described, in combination with the hook *n*, provided with recess *o*, and the hollowed recess *m*, substantially as and for the purposes set forth.

4. The cam E, lever F, and hook *n*, constructed as described, in combination with the pin *q*, provided with a downward projection *q'*, and secured to the spring *r*, and with the hold *p* in the breech, substantially as and for the purposes set forth.

78,520.—CHARLES H. FOWLER, Roxbury, Mass.—*Lathe Tool Holder.*—June 2, 1868.—The plug or double-tapering tube is split at each end after the manner of small drill chucks, so that when it is compressed within and between the bores of the bar and hollow nut it firmly grips the cutting tool.

Claim.—As an improved tool-holding device for metal-turning lathes, &c., the combination and arrangement of the bar A, screw sleeve or hollow nut *c*, and double-tapering tube *d*, the whole being arranged and operating as herein shown and described.

78,521.—SAMUEL W. GEAR, Whitestone, N. Y.—*Door and Window Catches.*—June 2, 1868.—When the door or shutter is closed one curved spring will fit into and be clasped by the other with sufficient force to hold the door in a closed position.

Claim.—The two springs *b c*, constructed to lock one within the other, as shown and described, and arranged in relation with each other upon the door and frame, substantially as and for the purpose specified.

78,522.—JOB HARRISON, Whitewater, Wis., assignor to himself, GEORGE W. ESTERLY, and C. C. LEWIS, same place.—*Attachment to Cooking-Stove Fire Chamber.*—June 2, 1868.—The arch is designed to concentrate the heat below the front stove holes and to conduce to a more perfect combustion of the gases.

Claim.—1. So applying the arch D to the fire chamber of the stove that the air chambers *s t* are formed, one between the arch and oven, and the other both back of and above said arch, all in the manner substantially as herein described and shown.

2. The arch D, or its equivalent, constructed substantially as described, and applied to a stove for the purpose set forth.

78,523.—RICHMOND HATHAWAY, Chicopee, Mass., assignor to himself and LEVI O. ALLEN, Gardiner, Me.—*Cloth and Clothes Pin.*—June 2, 1868.—A single spring wire is bent around so as to form a coil spring in the center, two jaws at one end which are operated by levers at the other end.

Claim.—As an article of manufacture, the clothes

pin constructed as described, viz., with the central coil *a*, the levers *d d*, the central depressions to admit the line, and the pointed and ring jaws, all as set forth.

78,524.—LAWRENCE HOLMS, Paterson, N. J.—*Filter.*—June 2, 1868.—The valves are reversed in order that the water may be forced through the filtering beds in a direction contrary to its course during the filtering operation, so as to carry back and discharge any accumulations of matter which may have been deposited upon the wire gauze or gratings or in the chambers.

Claim.—The arrangement of the valves G H, passages *c d e f*, openings *a b a' b'*, water spaces *i k*, and filtering beds *m x*, as and for the purpose described.

78,525.—CHARLES KAESTNER, Chicago, Ill., assignor to himself and JOSEPH BECKER, same place.—*Barbers' Chair.*—June 2, 1868.—The locking bolts are at right angles with the journals upon which the reversible seat is mounted, and are thrown into and withdrawn from sockets on the frame by the handle, through the medium of the pivoted levers.

Claim.—A reversible hollow spring seat, provided with the locking bolts *d*, levers G, and handle D, when constructed and arranged to operate substantially as described.

78,526.—JOSEPH KEPLER, Crawfordsville, Ind.—*Churn.*—June 2, 1868.—The concave breast is studded with tooth-like projections, and the cream is forced over it by the dasher. The cream, impelled by the dasher, passes through an opening in one end of the longitudinal partition and is then conducted to the opposite end of the box whence it flows into the dasher chamber to be again forced over the concave breast. The scroll top is placed above the dasher to prevent undue splashing.

Claim.—The device of a single concave breast, with metal points, the convex-concave bottom B descending from the elevated breast C, through the openings F F, Figs. 1 and 2, in combination with perforated top M, in Fig. 4, dash, Fig. 3, and scroll top, Fig. 6, inclosed in a box, substantially as herein set forth.

78,527.—EMIL LAASS, Syracuse, N. Y.—*Arch of Furnace for Evaporating Kettles, &c.*—June 2, 1868.

Claim.—The arch made in sections, A A, jointed at the crown by the cylindrical keystone B, and resting at the spring loosely upon the ways *a a*, the whole so arranged that the arch, or either section thereof, can be adjusted bodily in or out without elevating, and can be readily taken apart, as herein set forth.

78,528.—JAMES LEE, New York, N. Y.—*Lamp-Chimney Cleaner.*—June 2, 1868; antedated May 22, 1868.—The leather washer protects the rubber disks from the screw head.

Claim.—The lamp-chimney cleaner, constructed as described, consisting of the elastic disks B, secured to the end of the handle A, at right angles to its axis, by means of the screw C, and provided with the flexible washer D, as herein shown and described.

78,529.—JOSEPH F. LIGHT, Worcester, Mass.—*Shaft Coupling.*—June 2, 1868.—The shafts are held together by the clasps or threaded collars, which are tightened upon the shafts by the nuts, and retained in their relative position by pins or keys.

Claim.—1. The combination of the ends of the shafts, when shaped or cut away and applied to each other, substantially as shown in Figs. 2 and 3 of the drawings, so as to prevent the independent longitudinal movement of the one shaft with respect to the other, with holding nuts for encircling and coupling said shafts in the manner herein shown and specified.

2. The combination, with the clasps B B, of the guide-pieces or pins 2 2, or either, substantially as and for the purposes set forth.

78,530.—O. E. LOOMIS, Ellenburg, N. Y.—*Soap.*—June 2, 1868.—The ingredients are water, lime, sal-

soda, fish-oil, starch, resiu, saltpeter, alcohol, and white kaolin.

Claim.—A soap compounded of the ingredients and in the manner herein set forth.

78,531.—W. J. LUDLOW, Cleveland, Ohio.—*Seat for Harvester.*—June 2, 1868.—The seat is suspended from and has pivotal attachment to the spring support which is rigidly attached to the machine, so that the lateral motion incident to such machines is not communicated to the seat.

Claim.—A seat for harvesters, mowing machines, and horse rakes, suspended so as to swing laterally, constructed and arranged substantially as and for the purpose herein set forth.

78,532.—LOUIS A. MATOS, Philadelphia, Pa.—*Balance.*—June 2, 1868.—An improvement in the balance, for which United States letters patent No. 39,145 were granted to Sandy Harris, July 7, 1863. Under the present improvement the vial is first placed in the pan, and the balance weight is then adjusted on the bar until the scale is in equilibrium. The index finger is then placed at that part of the vernier indicating the weight required and the fluid is poured into the vial until the scale is again in equilibrium.

Claim.—The adjusting or sliding balance weight L, in combination with the vernier or graduated arc, and the vibrating weight, which is suspended on an arm which is pivoted to the chord of the arc, substantially as shown and described.

78,533.—JOHN MCKILLOP, Brooklyn, N. Y., assignor to ANDREW MACKAY and JOHN WARD, JR., same place.—*Safety Bridle.*—June 2, 1868.—The lever jaws are suspended by the ring from the throat latch of the bridle and provided with a rein by which they may be forcibly brought together to compress the horse's windpipe and thus choke the animal into submission. The spring retains the jaws away from the throat of the animal when the device is not in requisition.

Claim.—1. The choking apparatus, composed of the two lever jaws, constructed and combined for operation, substantially as and for the purpose specified.

2. The combination of the spring *f* with the two lever jaws A of the choking apparatus, substantially as and for the purpose specified.

78,534.—JUDAH MOSES, Hartford, Conn.—*Galvanic Spectacle.*—June 2, 1868.—A voltaic pile is secured to the end of each temple or bow, the design being to create an electrical current by the contact of the moisture or perspiration of the head with said piles, and thereby obtain the therapeutic effects due to the application of electricity to the nerves of the head.

Claim.—The combination with the temples or front of a pair of spectacles, of an electric battery or batteries, so arranged and connected therewith that an electrical current may be caused to pass through the same, substantially as and for the purposes herein specified.

78,535.—CHARLES MUDLER, Cleveland, Ohio.—*Button.*—June 2, 1868; antedated May 22, 1868.—This mode of constructing the button is intended to obviate the cutting away of the attaching thread by the edge of the button hole of the suspender.

Claim.—The button, constructed of two plates or disks, A B, having a rigid connection by means of the shank or pin C, and the lower disk being shouldered or grooved out, so as to form a circular depression, in which the thread used for sewing on the button is buried below the plane of the said disk, the whole combined in the manner as and for the purpose set forth, as a new article of manufacture.

78,536.—E. P. NEEDHAM, New York, N. Y.—*Reed Musical Instrument.*—June 2, 1868.—The front of the exhaust chamber of the melodeon, or other analogous reed instrument, is made of India-rubber, or other elastic material, impervious to air, said front being attached to rock shafts and to the lower front edge of the reed boards, and provided with

apertures, through which wind is admitted to the reed openings.

Claim.—The flexible front *c* of the exhaust chamber A, in combination with the movable reed boards, whereby the requisite movement of the said reed boards is allowed, substantially as herein set forth.

78,537.—SAMUEL A. OTIS, Boston, Mass.—*Railway-track Scraper.*—June 2, 1868.—The scrapers are applied and adjusted so as to be capable of automatic adjustment to suit the varying gauge of tracks. The levers, link, and rock shaft are employed to raise and lower the scrapers.

Claim.—1. The combination and arrangement of the shoes B B, sleeves Q Q, rod M, and fork O O, substantially as described and for the purpose set forth.

2. The combination with the lever G, in a track-scraping machine, of the foot lever G' G'', substantially as described and for the purpose set forth.

3. The combination and arrangement of the lever L, the link E, and the rocker shaft D, made substantially as described and for the purpose set forth.

78,538.—JOHN B. PERKINS and AL COLBURN, Hollis, N. H.—*Seed-sowing Machine.*—June 2, 1868.—The seed drum is attached to the axle and occupies the bottom of the hopper, and the axle also carries pins, which actuate the arm, whereby the seeds are stirred. The spring attached to the pivoted plow beam restores the same to its operating position after it has overridden an obstruction.

Claim.—1. The vibrating plow beam C, held by the spring E, in combination with the coverer V, arranged substantially as described and for the purpose set forth.

2. The agitator K', arranged and operated substantially as described and for the purpose set forth.

78,539.—WILLIAM ROBINSON, Brooklyn, N. Y.—*Lamp Burner.*—June 2, 1868.—The trough around the space between the wick tube and the bottom of the burner secures the return to the body of the lamp of the surplus oil which is drawn up the wick tube. The detachable external trough prevents the condensed vapors from dripping over the external surface of the lamp.

Claim.—1. The trough *f*, arranged in relation with the openings *b*, at the sides of the wick tube, substantially as and for the purpose specified.

2. The annular trough D, made detachable, and constructed with the internal flange, whereby it may be fitted between the burner and the lamp, substantially as and for the purpose specified.

78,540.—JAMES ROSS, North Cambridge, Mass., assignor to himself and FERDINAND FAIRBANKS, New York, N. Y.—*Lubricator for Steam Engines.*—June 2, 1868.—This lubricator is of the kind in which the cock shuts off the steam passage and opens communication with the feed inlet when the lubricator is to be charged with oil, but which, on being turned, reverses the open and closed conditions of the passages for the purpose of establishing an equilibrium of pressure above and below the oil, to secure its flow, its passage from the cup being effected in consequence of its displacement by the water resulting from the condensation of the steam admitted to said cup from the steam cylinder. The turning of the cock in the present instance varies the altitude at which the steam is admitted to the cup, and likewise the condensing surface thereof.

Claim.—The construction, in a lubricator of the character herein specified, of the cock C and its seat D, with their openings arranged substantially as described, whereby provision is made for varying the extent of steam-condensing surface in the oil cup or reservoir of the lubricator, and thereby regulating the flow of oil or grease, essentially as herein set forth.

78,541.—JOHN ROSS, Brooklyn, N. Y.—*Feed Regulator for Mills.*—June 2, 1868; antedated May 25, 1868.—The regulator is adjustable longitudinally on the shaft by means of a yoke, clasp, and lever. The wings act as a screw to urge forward the grain, and, by centrifugal force, they throw it between the stones.

Claim.—1. The use of the feed regulator A, B, and

J, to close partially or wholly the throat of a conical mill, in the manner described.

2. The combination of the cone J with its wings I, to direct the grain into the throat of the mill.

78,542.—ROGER SANDIFORD, Joliet, Ill.—*Plow Clevis.*—June 2, 1868.—The double, segmental clevis has a row of holes in order that the reversible, transverse clevis may be regulated as to height by the bolt passing through the said double clevis. The device enables the depth of penetration to be varied, and also affords facilities for changing the lateral direction of the plow.

Claim.—1. The double, segmental clevis *a*, when constructed, operating, and arranged as and for the purposes set forth.

2. The transverse, oscillating clevis *e*, when constructed and arranged as and for the purposes described.

3. The combination and arrangement of the segmental clevis *a* and transverse, oscillating clevis *e*, when arranged, constructed, and operating as and for the purposes set forth.

78,543.—PETER G. SCHLOSSER, Middletown, Md., assignor to himself and A. P. BAER, Baltimore, Md.—*Composition for Depilating Hides.*—June 2, 1868.—For the depilation of dry or imported hides, the ingredients are spent tan liquor, nitrate of potassa, chloride of sodium, sulphuric acid, tartaric acid or vinegar, and wheat bran. In treating green hides the nitrate of potassa, chloride of sodium, and wheat bran are omitted.

Claim.—1. The composition, substantially as above described, for depilating dry hides.

2. The composition, substantially as above described, for depilating green hides.

78,544.—JOHN SEE, Philadelphia, Pa.—*Composition for Covering Roofs, Pavements, Walks, &c.*—June 2, 1868.—Hydraulic cement, sand, and salt, together with iron ore, turnings, borings, or filings, are mixed together in water, the mass forming a mortar, to be applied with a trowel.

Claim.—A composition of ingredients, herein named, substantially as and for the purposes specified.

78,545.—GIDEON O. SPENCE, Titusville, Pa., assignor to himself, A. R. WILLIAMS, and J. S. LATHROP, same place.—*Process of Treating Petroleum for the Manufacture of Lubricating Oils.*—June 2, 1868.—The ingredients referred to are enumerated as follows: first, chloride of sodium, or any of the haloid salts; second, hydrated potassa, or any alkali of the same or analogous chemical and electrical action; third, muriate of ammonia, or any of the hydro-salts; fourth, spirits of turpentine, linseed oil, or oil of like solvent property; fifth, flour of sulphur.

Claim.—1. The use of the first chemical ingredient, herein specified, in the manufacture of lubricating oil from petroleum or coal oil, or their products, for the purpose specified.

2. The use of the second chemical ingredient, herein specified, in the manufacture of lubricating oil from petroleum or coal oil, or their products, for the purpose specified.

3. The use of the third chemical ingredient, herein specified, in the manufacture of lubricating oil from petroleum or coal oil, or their products, for the purpose specified.

4. The use of the fourth chemical ingredient, herein specified, in the manufacture of lubricating oil from petroleum or coal oil, or their products, for the purpose specified.

5. The use of the fifth chemical ingredient, herein specified, in the manufacture of lubricating oil from petroleum or coal oil, or their products, for the purpose specified.

6. The use of the second and third chemical ingredients, herein specified, in combination, in the manufacture of lubricating oil from petroleum or coal oil, or their products, substantially as and for the purposes specified.

7. The use of the five chemical ingredients, herein specified, in combination, in the manufacture of lubricating oil from petroleum or coal oil, or their products, substantially as and for the purposes specified.

78,546.—ELI F. STACY, Gloucester, Mass.—*Fisherman's Nipper.*—June 2, 1868.—A device used by fishermen as a protection to their hands against the rubbing action of the lines.

Claim.—As a new article of manufacture, a molded elastic gum "nipper," as described, and for the purpose set forth.

78,547.—JOSEPH B. STEARNS, Boston, Mass.—*Telegraph Apparatus.*—June 2, 1868.—A means for transmitting messages simultaneously over a single wire in opposite directions. The keys or other circuit breakers, and the electro-magnets, are so constructed and arranged that the current from the battery of the home station will be divided so as to pass around the cores of the magnet in opposite directions, one portion passing over the line to the distant station, and the other portion passing through a rheostat to the ground; the one portion thus neutralizing the effect of the other portion, and producing no magnetism in the cores or effect upon the armature, while at the same time a current from the distant battery may pass through one-half of the wire, or one set of wires on each helix, to the key or circuit breaker, and thence through the battery to the ground, if the circuit breaker is in contact with the front stop, or through a rheostat to the ground if in contact with the back stop, or through all the wire on each helix and a larger rheostat to the ground, if between the two stops and in contact with neither.

Claim.—1. In an electro-magnet coil constructed of two opposing or neutralizing conductors, making each of the conductors of the same length, and giving them each an equal number of turns, as and for the purpose set forth.

2. A key or other circuit breaker, the back stop of which is connected with the ground by a wire, in which is placed a rheostat or other resistance, and for the purpose set forth.

3. Combining an electro-magnet, constructed as described, or in any other manner, to produce either complete or partial neutralization of its cores, with a key or circuit breaker having a connection between the back stop, or its equivalent, and the ground through a rheostat or other resistance, as and for the purpose described.

4. Combining an electro-magnet, constructed as described, or in any other manner by which either a complete or partial neutralization of its cores is produced, with a key or circuit breaker having no connection between its back stop and the ground, as specified.

5. In combination with an electro-magnet, constructed substantially as described, the key A, the key or circuit breaker C, local battery B, and rheostat F, all constructed and operating substantially as and for the purpose set forth.

78,548.—JOSEPH B. STEARNS, Boston, Mass.—*Telegraph Apparatus.*—June 2, 1868.—The purpose of the two electro-magnets acting upon the armature post in opposite directions is to enable two messages to be sent simultaneously over the same wire in opposite directions. The several parts of the apparatus are so arranged as to maintain an equable resistance to the current of the battery or batteries, and enable the finer adjustments to prevent the movement of the armature to be effected by the movement of the electro-magnet toward or from the armature, without changing the resistance of the rheostat. In connection with the relay, composed of a plurality of magnets operating upon the same armature in opposite directions, a key is employed to close one circuit before or at the same time that it opens another.

Claim.—1. The combination of a relay, consisting of two electro-magnets, so arranged as to act upon the same armature post in opposite directions, with a key that shall close one circuit before or at the same time that it opens another, when the same are constructed and made to operate substantially as described.

2. The combination of the relay, constructed substantially as described, the sounder key S, and rheostat R, when the whole are connected and made to operate substantially in the manner and for the purpose set forth.

3. In combination with the rheostat R', the double

relay, when the latter is so constructed as to effect the finer adjustments of the forces acting upon the armature or armatures, as set forth.

4. So arranging the several parts of the apparatus that the resistance offered to the current from the battery at either end of the line is always the same, whatever may be the position of the key at the opposite end.

5. In combination with the key S, constructed as described, the rheostat R', inserted between the key and the ground, substantially as and for the purpose described.

78,549.—ALDEN S. STEVENS, Attica, N. Y.—*Fruit Picker.*—June 2, 1868.—The stems of the fruit are severed by the cutting teeth of the cylinder, into which the fruit falls, to be conducted thence to the ground by the tubular cloth attachment.

Claim.—The combination of the hollow cylinder A, open at both ends, and provided with cutting teeth *a*¹ at its upper edge, with the conducting bag F attached to its lower edge, and manipulating rod or pole C, connected to its side, as and for the purpose set forth.

78,550.—BENJAMIN D. STEVENS, Decorah, Iowa.—*Axe Handle.*—June 2, 1868; antedated May 18, 1868.—The rubber reduces the effect of the rebound upon the handle. The point of the wedge enters the handle, and after the latter is inserted into the eye of the axe or hammer, the flange of the wedge is flattened down to secure the handle in the eye.

Claim.—1. Inserting India-rubber, or similar elastic substance, in the eye of axes, hammers, and analogous tools, when placed in the position for the purpose substantially as described.

2. The wedge C, when constructed and used as and for the purpose set forth.

78,551.—JAMES SUTHERLAND, Brooklyn, N. Y.—*Liquid Meter.*—June 2, 1868.—The object is to afford abundance of time for the cylinders to fill and discharge. The valves are operated successively by the independent piston or pistons adjacent to that or those which they control; and being operated suddenly, and while the pistons which operate them are at or about midway of their stroke, the desired object is attained.

Claim.—1. A liquid meter, composed of two or more cylinders, fitted with independent pistons, when these latter are controlled by valves, operated so that either one piston or connected pair or set of pistons is or are made to actuate the valve which controls the other piston or connected pair or set of pistons, substantially as specified.

2. The combination of the cylinders C C' and D D', with their pistons and valves, so arranged and operating as that either one set of pistons to said cylinders are reversed in their action by the motion of the valves which control them, when the other set of pistons are midway of their stroke, or thereabouts, essentially as herein set forth.

3. The combination of the cylinders C C' and D D', with their pistons, yokes H H', tappets L L', arms M M', and valves J J', for operation together, and in connection with suitable inlet and outlet passages, substantially as shown and described.

78,552.—GEO. W. THOMPSON, New York, N. Y.—*Wagon for Advertising.*—June 2, 1868; antedated May 25, 1868.—Transparent signs for advertising are placed upon the periphery of a reel mounted upon a wagon platform, and revolving upon a vertical axis.

Claim.—1. The employment of the vertically arranged revolving drum of advertisements or signs, substantially as and for the purposes herein shown.

2. The arrangement of the pulley J, with the guide pulleys L L, and the pulley I, for transmitting motion to the axle F, substantially as and for the purpose stated.

78,553.—JAMES K. THOMPSON, Chicago, Ill., assignor to himself and WILLIAM B. HOWARD, same place.—*Turn Table.*—June 2, 1868.—The frame is mounted upon bearing wheels, and moves around the pivot of an ordinary spider; said frame consisting of a bearing circle made up of boiler iron and angle iron, and strengthened by cross beams

surmounted by trussed beams, upon which the draw-bridge rests.

Claim.—The bearing frame G, consisting of bearing circle H, cross beams *k k*, and trussed bearing beams M M, each of the above said parts constructed as described, and the whole arranged, and operating substantially as and in the manner herein set forth and specified.

78,554.—NATHANIEL N. TOMLINSON, New York, N. Y.—*Machine for Making Treennails.*—June 2, 1868.—The stick out of which the treenail is to be made, is inserted in the flaring opening in which the knife and gauge rest are adjustable, to suit the varying diameters of the treenails, by means of their respective screw and cog wheel connections; the cog wheel pertaining to the knife screw having motion parallel to the elongated cogs of the wheel pertaining to the gauge rest screw as the two wheels rotate together. The diameter to which the rest and knife conform, is indicated by the gauge disk.

Claim.—The combination of the slotted slide *b*, holding the adjustable knife *a*, the movable gauge rest *g*, its connecting rods *i i*, sliding screw *h*, the two screw wheels *c* and *s*, with the gauge disk *k*, constructed and arranged substantially as hereinbefore described.

78,555.—JOHN B. TROXELL, Hancock, Md., assignor to himself and SAM'L H. DAVIS, same place.—*Sausage Stuffer.*—June 2, 1868.—The sausage meat is ejected forcibly from the cylinders into the skin or casing, which is held upon a tube inserted in an opening between the journaled ends of the cylinders. By placing both cylinders in communication with the single discharge opening and providing the intervening valve, the contents of both cylinders may be ejected at one filling.

Claim.—The single discharge-opening for the cylinders A A, valve E, and hollow journals *a a*¹, combined and operating substantially as and for the purpose set forth.

78,556.—GEORGE VERRY, Norwich, Conn., assignor, to himself and O. G. GRAVES, same place.—*Valve and Steam Passage.*—June 2, 1868.—The live steam entering the cylinder through the steam port at one end has access at the same time to a space directly beneath the corresponding end of the valve, and the exhaust steam passing through the port at the opposite end has access to a space at that end of the valve, the object being to relieve the valve of pressure. By turning the plugs, they open or close, or vary the effective area of the steam ports, and hence they serve to stop, start, or change the speed of the engine.

Claim.—1. The arrangement of the receiving and exhaust ports B B', C C', and cut-off plugs E E, substantially as herein described.

2. The recesses A A', in combination with the ports B B', C C', substantially as and for the purpose described.

78,557.—WM. W. VIRDIN, Baltimore, Md.—*Tide Motor.*—June 2, 1868.—The object is to obtain sufficient power and motion, from the ebb and flow of tides through bayous or the mouth of inlets, to raise water to a proper height for furnishing a supply of the same at distances remote from the point at which it is raised, also, to obtain power for driving machinery.

Claim.—1. A floating vessel or buoy, B, constructed with water passages through it, and provided with a cut-off, B', and a water wheel, D, said buoy being arranged in a suitable passage way for water, in such manner that the wheel D will be caused to turn both by the ebb and flow of the tide, substantially as described.

2. The buoy B B', constructed with bulkhead apartments, substantially in the manner and for the purposes described.

3. The chamber or chambers J', in combination with a buoy B, having an aperture or apertures, *i i*, and constructed substantially as described, for the purpose of receiving water to be raised by the elevator J, substantially as described.

4. The endless chain of double-chambered buckets, in combination with a perforated drum G, *h i*, sub-

stantially in the manner and for the purposes described.

78,558.—JAMES WALTON, Sunfish, Ohio.—*Cider and Wine Mill.*—June 2, 1868.—In making cider the apples are fed through the right-hand hopper, and being reduced to pomace by the corrugated rolls, fall upon the apron which carries the pomace between secondary rolls, which express the juice therefrom. The juice runs down the incline, and dropping through the perforations falls upon a strainer. In making wine the grapes are passed through the left-hand hopper, so that they are not acted upon by the corrugated rolls.

Claim.—The arrangement of the hoppers P Q, grinding rolls B B', apron F, rolls G G' G'' I I', incline M, concaves N and O, and receiver R, substantially as and for the purpose set forth.

78,559.—MILES WATERHOUSE, Passaic, N. J.—*Apparatus for Dyeing.*—June 2, 1868.—Steam is discharged from nozzles below the supplemental perforated bottom, and acts after the manner of an ejection pump upon the liquid below the same, forcing it upward through the vomiting tubes, whose nozzles discharge it upon the exposed surface of the material to be dyed, such material being packed in the vat above the supplemental bottom. A partial vacuum is produced by the displacement of the liquid dye-stuffs at the bottom, and when the liquid is discharged at the top it is forced downward through the goods by atmospheric pressure, a circulation of the liquid being thus maintained so long as steam is admitted.

Claim.—The combination and arrangement of the several parts, substantially as and for the purposes shown and described.

78,560.—WILLIAM C. WELLS, Philadelphia, Pa.—*Ice Creeper.*—June 2, 1868.—The creeper is secured by buckle straps to the shoe, and prevents the wearer from slipping upon the ice.

Claim.—A "creeper," composed of a piece of leather or other soft material, with metal "spurs" fastened thereon by means of metal "washers," and by riveting, when said piece of leather, with spurs thereon, is constructed separate from the shoe, and is intended to be worn beneath the sole of the shoe, and is attachable to and detachable from the shoe, substantially as shown and described.

78,561.—ISAAC N. WOOD, Fall River, Mass.—*Hoe.*—June 2, 1868.—The inner edges of the tubular blade and nose are sharpened. The implement is more particularly intended for weeding and stirring the soil.

Claim.—The improved hoe as made with the short, open, tubular blade, combined or provided with an angular nose, arranged with respect to such blade and its shank, substantially as specified.

78,562.—HOWELL WRIGHT, Taunton, Mass., assignor to REED & BARTON, same place.—*Manufacture of Table Ware.*—June 2, 1868.—This alloy is composed of nickel and copper melted together, and run into bars to be rolled and worked into the desired form.

Claim.—1. The within described alloy of nickel and copper, or any other substantially the same, all as and for the purposes set forth.

2. The improved table ware, made substantially as described.

78,563.—JOHN H. ADAMS, Portland, Maine.—*Carriage Seat.*—June 2, 1868.—Devices to prevent the seat from being jolted out of place; also, to prevent it from sliding backward and forward in consequence of the motion of the carriage.

Claim.—1. The swinging hinged or pivoted bar *b*, either with or without the studs *h*, in combination with the projection *e*, the said bar *b* being attached, as set forth, to the carriage sides, and capable of being fastened thereto, as set forth, and the projection *e* to the carriage seat as and for the purposes described.

2. The clamp *l*, in combination with the projection *e* on the seat, as and for the purposes described, the said clamp *l* being secured as herein set forth.

78,564.—WILLIAM AUSTIN, Philadelphia, Pa., assignor to himself and WILLIAM OPDYKE, same place.—*Construction of Sheet Metal Conductor Pipes.*—June 2, 1868.—Designed for conducting water from the roofs of buildings.

Claim.—A water conductor or pipe, made of corrugated sheets of metal, so as to yield to the internal pressure caused by the freezing of the water therein, substantially as described.

78,565.—QUIMBY S. BACKUS, Winchendon, Mass.—*Vise.*—June 2, 1868.—The parts of the sectional tube which cover the screw shaft are adapted to slide one within the other, this provision conducing to compactness in such vises as have the screw shaft protected from shavings and filings.

Claim.—The method of protecting the screw shafts of vises with the sectional tubes *h, i, k*, arranged and operating substantially as described.

78,566.—ADDISON BARKER, Comanche, Iowa.—*Hay Loader.*—June 2, 1868.—As the wagon moves forward, the elevating rope attached to the fork is wound upon the hub, and the weight is thus raised to the desired height; the crane is then turned so as to bring the hay over the wagon, into which the hay is deposited when the hand releases that end of the rope which engages the stop.

Claim.—The drum *F*, arranged outside of the wheel *G*, in combination with the sheaves *C* and *O* and stop *L*, for taking in the slack of the rope *B*, essentially as shown and described.

78,567.—JOHN H. BARNES, Troy, N. Y.—*Toy.*—June 2, 1868.—The object is to combine in the ordinary box whistle, which is blown by the mouth, flared flanches, and a strong cord tied to a loop, so that when the toy is whirled rapidly around, the wind, acting upon the flanches, will produce a fluttering noise, and at the same time the air passing through the holes will produce a shrill and continuous whistling.

Claim.—The combination, in a toy whistle, of the flanches *a'* and *a''*, with a cord and ring fastened by a loop or equivalent, substantially as described, and for the purpose specified.

78,568.—ALMA BEDFORD, Coldwater, Mich.—*Harness Buckle.*—June 2, 1868.—The loop receives the end of the strap through which the tongue of the buckle passes, and it also serves to cover and protect the cross bar around which the strap is passed.

Claim.—A harness buckle, provided with the cross bar *E* and loop *D*, when constructed as herein described, as a new article of manufacture.

78,569.—BENJAMIN BEST, Dayton, Ohio.—*Composition for Destroying Insects in Fruit Trees.*—June 2, 1868.—The tree or shrub is surrounded, at a short distance above the ground, with a band of cotton, wool, or straw, saturated with a composition consisting of sperm or whale oil, pine tar, carbonate of ammonia, potash, and coal tar.

Claim.—The mode of protecting trees, by the application of the hereinbefore-described composition to bands of fibrous material surrounding the trees, substantially as described.

78,570.—WM. N. BRAGG, Richmond, Va., assignor to himself, W. H. TRAINHAM, and J. B. WINSTON, same place.—*Car Seat and Chair.*—June 2, 1868.—The occupant of the chair can adjust the back to any desired angle by means of a hand lever, which, on being released, allows the pawl to drop into the nearest notch in the plate and hold the seat stationarily in the desired position.

Claim.—1. The combination of the arm *A* with the bars *A¹* and *A²*, and rock shaft *a³*, and the bell crank *C¹*, and rod *c*, to operate the pawl *C*, substantially as and for the purpose specified.

2. The combination of the above parts, *A, A¹, A², a³, C¹, c*, and *C*, with the hook *b* of the leg, with the notched plates *d¹*, for the purpose specified, and as substantially described.

78,571.—LEVI BRONSON, Buffalo, N. Y., assignor to himself and JAMES BRAYLEY, same place.—*Shaft Coupling.*—June 2, 1868.—The headless bolts are held against endwise movement in one direction by the

guard flanges, and in the other direction by the keys.

Claim.—The guard flanges C C of the ring A, in combination with the forked shafting E, headless bolts D D, held by keys *p p*, the whole arranged as described, and operating in the manner and for the purpose set forth.

78,572.—HENRY S. BROOKS and JACOB S. LEHMAN, Martickville, Pa.—*Mode of Constructing Iron Posts for Rail Fence.*—June 2, 1868.—The fence rails are inserted into the spaces between the iron rods and cast-iron supporting plates.

Claim.—The intervening rail supports *c*, with their perforated flanges *x*, in combination with the two round iron sides A A', top and bottom plates *d d'*, and bed plate B, all arranged and applied in the manner and for the purpose specified.

78,573.—WALTER G. BROWNSON, Wellsville, Ohio.—*Telegraphic Repeater.*—June 2, 1868.—In this invention, the various instruments in an electro-magnetic telegraph system are so constructed and combined that the main circuit is kept constantly closed by the key or circuit breaker when at rest; and the movements of said key in writing produce, announce, and repeat, in the usual manner, and without reversal, the customary signals upon the sounders, registers, and repeaters of the apparatus, by opening instead of closing the main circuit.

Claim.—1. So combining the local circuit, influencing and operating a registering, repeating, or signal instrument, in an electro-magnetic telegraph system, with a receiving or relay instrument on a main circuit in said system, as that said local circuit shall stand open when the main circuit is closed, and vice versa, all substantially in the manner and for the purpose herein set forth.

2. An electro-magnetic telegraph relay or receiving instrument, so constructed as that the contact of its armature lever with a suitable connecting conducting point to close a local circuit, shall be broken, and the local circuit thereby opened when the receiving magnet becomes excited, all substantially in the manner and for the purpose herein set forth.

3. The combination and arrangement of the armature lever of a telegraphic repeating instrument with the wires of the local circuit, and a connecting and conducting post in said circuit, so as that the local circuit shall be closed through said lever and post when the magnet attracting said lever is inactive, all substantially in the manner and for the purpose herein set forth.

4. So combining the connecting device in a repeating instrument whereby the main circuit is closed, with an insulated pin upon the armature lever thereof, as that said main circuit shall be opened when the magnet of the instrument is excited, all substantially in the manner and for the purpose herein set forth.

5. The improved connecting and conducting post M, in my repeating instrument, when constructed with a horizontal arm, *s*, carrying an adjusting screw and connecting pin *r*, and combined with an elastic metallic strip *p*, from a second conducting post, L, to open and close an electrical circuit, all substantially in the manner and for the purpose herein set forth.

6. The telegraphic switch P, constructed of an insulated pivoted plate, provided with metallic strips, each so disposed thereon as that, by a proper alignment thereof, a connection may be formed thereby between any two detached pins or points beneath the plate communicating with the wires of electro-magnetic batteries, to be broken by turning the plate upon its pivot, so as to change the alignment, all substantially in the manner and for the purpose herein set forth.

7. My improved key or circuit breaker, so constructed as that, when at rest, the main circuit connected therewith shall be closed thereby through its lever, its base plate, and an insulated anvil, substantially in the manner and for the purpose herein set forth.

78,574.—JAMES BURSON, Yates, Ill.—*Paddle Wheel.*—June 2, 1868; antedated May 23, 1868.—The carriers or angular frames are supported upon the same axes as the paddles, and each carrier is pro-

vided with four pins or guide rods projecting from the angles. These guide pins successively enter and traverse different ways as the wheel revolves, and the feathering of the paddles is thereby effected.

Claim.—1. The plates or carriers *h*, for holding the guide rods D E in four angular positions, in combination with the ways L N U W and J K Y M, all arranged and operating substantially as shown and described.

2. The combination of four guide rods to either bucket, with separate rails or tracks to either pair of said rods, for operation together, substantially as and for the purpose or purposes herein set forth.

78,575.—J. M. BUTTERS, North Fryeburg, Me.—*Clothes Drier.*—June 2, 1868.—The bars are hung in semi-circular brackets so as to extend radially therefrom, and are attached by a continuous pivot around each bracket. The bars are sustained, when extended, by being set back under the ledges on the brackets.

Claim.—The combination of the bars D D' with brackets A and A', pivots *d d'*, and projections *a a'*, and back B, the whole constructed as described, and operating as set forth.

78,576.—A. B. CANDEE, Hamden, and L. S. TAYLOR, Southington, Conn., assignors to ÆTNA NUT COMPANY.—*Die for Making Axle Nuts.*—June 2, 1868.—Machine for manufacturing nuts which are used upon the end of carriage axles, for securing the wheel thereon. A pair of dies cut off the blank from the bar of heated metal, and transfer the blank to a position opposite the punches, which form the nut in the same die which transfers the blank.

Claim.—The combination of the cut-off block K, gripping dies F and H, die L, and punch *a*, all constructed, arranged, and operating in the manner substantially as described.

78,577.—WILLIAM C. CLEVELAND, Cambridge, Mass.—*Spool Guard.*—June 2, 1868.—The spring guard prevents the thread from unwinding from the spool, unless required to do, but allows it to do so freely when required. The thread is cut by being drawn against the edges of the niche in the guard. The guard prevents the spool from rolling when laid down or when it falls.

Claim.—The spool guard C, provided with projections *a*, so constructed as to clamp the spool between them, and to serve as axles for the spool to rotate upon, substantially as herein set forth.

78,578.—SETH L. COLE, Brooklyn, N. Y.—*Gas Burner.*—June 2, 1868.—As the gas is turned off to a small flow the cap is raised to protect the diminished flame from the action of the wind.

Claim.—Adjusting the cap A upon the jet or burner by means of the cogged bar *c* and ratchet wheel *d*, or a section thereof, or by any device that will cause the cap to move up or down, by simply turning the stop cock B, which regulates the flow of gas to the jet or burner, for the purpose substantially as described and shown in the drawings.

78,579.—MONROE M. COPP, Albion, N. Y.—*Thill Coupling for Carriage.*—June 2, 1868.—The clamp hook or convex-headed cap is situated between the branches of the forked thill iron, and forms part of a bolt which is secured in the jack by a nut.

Claim.—The convex-headed cap C, provided with the square shoulder *b* and screw nut *k*, said head being recessed to receive one-half of the draw bolt *h*, and form, with the recess of the bar A, a complete eye, and a shield to exclude dust from the same, in combination with the forked thill iron B and jack A, arranged and operating substantially as and for the purposes set forth.

78,580.—COLEMAN DEFRIES, London, Great Britain.—*Foot Light for Theaters.*—June 2, 1868.—The burners occupy different elevations in front of a reflecting surface, so as to produce a favorable disposition of the light. A glass front protects the dress of the players from the flames. The vitiated air passes off into the chambers of the iron framing, and thence to a flue, a special flame being employed to induce the passage of the vitiated air into said flue.

The chain which carries the colored glass may be revolved by a crank in the hand of the prompter, so as to present the glass before the burners and thus throw a colored light across the stage.

Claim.—The exclusive use of an improved foot-light, constructed and arranged substantially as herein described, and shown on the accompanying sheet of drawing, whether the mechanism for raising and lowering colored mediums be or be not applied thereto.

78,581.—THOMAS DOOLEY, South Boston, Mass.—*Manufacture of Toe Calks and Blanks for the Same.*—June 2, 1868.—These toe calks are, by welding, made integral with the shoes. The surface welded to the shoe is of wrought iron, and the surface which comes in contact with the ground is of steel.

Claim.—A calk or calk blank having a relative disposition of iron and steel, produced and shaped substantially as described.

78,582.—JOHN DUCHESNE, Lacon, Ill.—*Side Gear for Threshing Machines.*—June 2, 1868.—When the position of the separator is to be changed, the swiveling post with which the horse-power is connected is unlocked by withdrawing the spring bar from that one of the depressions of the foot plate in which it may rest at the time, and the separator is swung round upon the swiveling post as a pivot.

Claim.—1. The swiveling post *k*, for the purpose of rendering the connection between a horse-power and separator adjustable, substantially as described.

2. The combination of the swiveling post *k*, spring arm *m*, and notched foot plate *h*, as and for the purpose set forth.

3. The combination of the swiveling post *k* with the gearing *l i e d*, and shaft *e*, as and for the purpose set forth.

4. The cap *n*, in combination with the gearing *c d*, as and for the purpose set forth.

5. The slotted ease *o*, in combination with the gearing *l i* and swiveling post *k*, as and for the purpose set forth.

78,583.—ABRAHAM DYSON, St. Louis, Mo.—*Street Scraper.*—June 2, 1868.—The scrapers rest upon the ground as the machine advances, and all the refuse matter between the forward scrapers is gathered together and carried along by the rear scraper until the cam, by acting upon the arm of the lever raises said rear scrapers, which dropping as soon as the cam and arm disengage, leave the dirt collected in a heap. The driver by keeping the lever in a depressed state may hold up the rear scrapers so as to make a continuous line of scrapings.

Claim.—1. The wheels *f f'* and *N*, blocks *e e' e'' e'''*, shafts *d d'*, and frame *D*, with their connecting chords *x x'* and elastic bands *l l' l'' l'''*, of a street scraping machine, all arranged relatively to each other and the rest of the machine, substantially as and for the purpose shown and described.

2. The lever *O* with its arm *v*, link *s*, frame *D*, and cam *r* of a street scraping machine, all arranged relatively to each other and the remaining parts of the machine, substantially as and for the purpose shown and specified.

3. The combination of the scrapers 1 2 3 4, &c., and *h h'*, with the frames *D*, *E*, and *F*, all constructed, arranged, and operating substantially as and for the purpose shown and specified.

4. A street scraping machine, combining the devices above mentioned, when constructed, arranged, and operating substantially as and for the purpose shown and specified.

78,584.—CHARLES F. ESPICK, Plymouth, Ind.—*Chimney Clasp.*—June 2, 1868.—Designed as a means of protecting house chimneys from the weather; also to ornament the same and bind the material together. The upper flanges of the sections lie upon the top of the chimney, leaving the flue free. The vertical flanges fit snugly against the outside of the chimney.

Claim.—The sections *A* and *B*, constructed substantially in the manner specified, of any required size, and bound together around the upper end of a chimney, as and for the purpose set forth.

78,585.—CALEB FOSTER, Wappinger's Falls, N. Y., assignor to ELIAS BROWN, same place.—*Die for Cutting the Teeth of Metallic Combs.*—June 2, 1868.—The male and female cutting dies and follower are arranged to operate in such a manner that two combs will be formed simultaneously out of one piece of metal plate, the teeth of one comb being formed by the metal which was included in the spaces between the teeth of the other, and the teeth of both combs being pointed by the same operation.

Claim.—The combination of the male and female dies *A B*, follower or plunger *D*, spring *E*, or its equivalent, and the cutting lips *b b* on the male die, all arranged for joint operation, substantially in the manner as and for the purpose specified.

78,586.—JOHN FRISCH, Albany, N. Y.—*Bread Knife.*—June 2, 1868.—The two rollers are applied to a common table knife and constitute a gauge to secure a uniform thickness of slices which on being cut pass between the blade and the gauge. The lower roller held below the edge of the knife by the spring, protects the table from damage when the knife has passed through the loaf.

Claim.—1. The employment of roller *H*, when arranged to regulate the thickness of the slice, and also to yield to the pressure of the knife, substantially as and for the purposes described.

2. In combination with the above, spring *m*, bars *B C*, slides *g g*, and roller *h*, all arranged substantially in the manner and for the purpose set forth.

78,587.—CHAUNCEY W. FULLER, Earlville, Ill.—*Culinary Vessel.*—June 2, 1868.—The steam rises through the inner vessels and passes through the upper perforated plate to the cover, upon the underside of which it gradually condenses, and running down the surface of the cover or falling in drips upon the upper perforated plate, it runs to the lower edge thereof and falls along the side of the boiler to the water below and not upon the articles contained in the vessels.

Claim.—In combination with the boiler *A*, diaphragm *B*, and cover *D*, the vessel *C C* and perforated plate *E*, when so constructed and arranged that the drip from the condensed steam shall fall outside of and not into the vessels, substantially as described.

78,588.—JAMES M. GALE and IRVING M. AVERY, New York, N. Y.—*Cooking Apparatus.*—June 2, 1868.—An apparatus for cooking several kinds of food by steam at the same time. The condensed steam dripping through the holes of the upper plate of the diaphragm is conducted by the lower plate to the sides of the vessel, which it follows to the bottom, thus avoiding all the food upon the partitions. The upper chamber contains divisions for hot water, tea, and coffee.

Claim.—1. The construction of the diaphragm *C*, consisting of the coneave and conical disks *c f*, alternately perforated, and connected as described, substantially as set forth.

2. The combination of the removable diaphragm or diaphragms *C* with the cylinder *A* and lugs *i i*, substantially as and for the purposes set forth.

78,589.—A. E. GILLILAN, Marion, Iowa.—*Churn.*—June 2, 1868.—The dashers are reciprocated vertically at opposite sides of the vertical slotted board or partition in the churn. The dashers are connected to and operated by the same crank shaft, and each dasher has two bevel-edged slats pivoted between the end pieces of the dasher.

Claim.—The dashers *E E* and adjustable slotted board *B*, as constructed in combination with arms *f f*, *g g*, and crank shaft *D*, when all are arranged and operated as and for the purpose set forth.

78,590.—LEWIS GRAHAM, Plymouth, Ill.—*Wagon Seat.*—June 2, 1868.—A spring seat for vehicles, secured to the wagon body by the levers which are hinged at their inner ends to the middle of the seat.

Claim.—The levers *B B*, slotted and hinged at their inner ends to the wagon seat *A*, with the stationary headed bolts *E E* and tubular rubber springs *D D*, arranged and used as and for the purposes set forth.

78,591.—C. WATSON GUERRANT, Leaksville, N. C.—*Combined Square and Calipers.*—June 2, 1868.—An instrument for carpenters and machinists. The device is designed to be used either as inside calipers, outside calipers, try-square, bevel gauge, compasses or rule.

Claim.—The combination of the bars A and B, and slotted arm C, arranged and operating as described, for the purposes set forth.

78,592.—NEWTON B. HALL and HERBERT JONES, Branford, Conn., assignors to THOMAS KENNEDY, same place.—*Cement for Fastening Door Knobs and for Other Purposes.*—June 2, 1868.—A cement for securing mineral or porcelain door knobs to their metallic necks: alum, sand, and sulphate of zinc, pulverized and mixed in water.

Claim.—The cement, produced by the combination of materials and in the proportions herein fully set forth and described.

78,593.—SANFORD V. HALL, McGrawville, N. Y.—*Washing Machine.*—June 2, 1868.—The cap piece prevents the water from being thrown upward by the roller, the spiral springs moderate the pressure of the fluted roller upon the clothes, and the metallic side ganges attached to the machine and standards, adapt the latter, together with the washing roller, to be adjusted vertically to suit the bulk of the clothes to be washed.

Claim.—The spiral springs *g g*, the grooved side gauges *h h*, and the cap piece *f*, in combination with the fluted roller *e* and rub board *a*, all constructed and operated substantially as described.

78,594.—TIMOTHY HOLLAND and JOHN T. CODY, Cincinnati, Ohio.—*Lubricator.*—June 2, 1868.—The amount of oil which flows from the globe may be regulated, as occasion may require, by elevating or depressing the valve so as to increase or diminish the area between it and its seat, the rotation of the valve effecting the desired change in its position.

Claim.—The combination and arrangement, substantially as described, of the globe A *a*, socket B, tubular stem C *c* I D, chamber H *h*, and valve F G *g*, as and for the purpose set forth.

78,595.—H. L. HOTCHKISS, New Haven, Conn., assignor to L. CANDEE AND COMPANY, same place.—*Over-shoe.*—June 2, 1868.—Over-shoes in which a portion of the upper is formed of cloth joined to a rubber foxing. The lower edge of the fabric is protected, so as to obviate the fraying thereof, by applying a narrow strip of vulcanized rubber which lies partially on the foxing, with the remainder upon the fabric at its lower edge. The process of vulcanization whereby the shoe is completed, also secures this binding to the shoe and fabric.

Claim.—The application of the binding *a* to the shoe, and so as to protect the edge of the fabric, in the manner and for the purpose substantially as specified.

78,596.—GOTTLÖB KAISER, New York, N. Y., assignor to himself and VOSSNACK and STEINS, same place.—*Still for Spirits.*—June 2, 1868.—The dephlegmator receives the vapors from the rectifier, and delivers them, free from refuse, to the condenser, and consists in a horizontal worm pipe, placed in a vessel filled with water of a certain temperature. The lowest points of the worm are provided with return pipes leading to the different compartments in the rectifying column. The less refined spirits are returned, to lower the more refined, and the fusel oil is returned to higher compartments. The mash heater is provided with perforated steam pipes, whereby the mash is stirred and mixed and prevented from adhering to the sides and bottom.

Claim.—1. The within-described combination of two stills, with the mash heater, and rectifier, and column, and defecator, and a condenser, connected and arranged for joint operation, substantially as and for the purposes herein set forth.

2. In connection with the above, introducing the mash into the mash heater gradually or by small increments, so as to maintain a uniform or nearly uniform temperature in the heating vessel, substantially as and for the purpose herein specified.

3. In a mash-heating vessel, B, constructed and arranged substantially as herein specified, the within described provision for agitating the contents, by the injection of steam into the same, in the manner and with the advantages herein set forth.

4. Cooling the dephlegmator with water from the condenser by means of connections and cocks, arranged as shown, so that the cold water is economized, and the cooling of the dephlegmator is gradual and uniform, all as and for the purposes herein set forth.

78,597.—MICHAEL LAUFENBURGE, Two Rocks, Cal.—*Shoe for Separators.*—June 2, 1868.—The sieves are placed at an inclination to each other and are connected by rods to a horizontal driving shaft by which the sieves are driven to and fro in ways. Beneath the shaft is a horizontal screw which conveys the tailings to the elevator.

Claim.—The combination of the screw I with the two inclined sieves C and C', vibrating in alternation, substantially in the manner and for the purposes herein described.

78,598.—JOHN LEE, Massillon, Ohio.—*Gate.*—June 2, 1868; antedated May 27, 1868.—By raising either of the laterally projecting hand levers the hinged fulcrum is caused to bear down upon the top rail, and the catch being simultaneously retracted, the gate is thrown into a vertical position, opening the roadway. By the depression of the lever the gate is thrown down and locked.

Claim.—1. The blocks or revolving fulera *d' d'*, and hinged fulcrum *b*, attached to top rail B of gate, and the hand levers *d d*, when used in combination with the same, constructed and operating as described, and for the purposes set forth.

2. The sliding latch F and inclined plane *l*, and rope *a*, for locking and unlocking the gate, constructed as described, and operating as set forth.

3. The weight box attached to rail B, and operating in slot *f*, on pivot bolt *e*, constructed as described, and operating as set forth.

4. The sliding pivot and guide blocks *i i*, for keeping the gate in a vertical line while being operated, constructed as described, and for the purposes set forth.

5. The levers *a' a'*, with slots *m*, and concave or convex ends, and convex or concave in post A, to correspond, constructed and operating as described, and for the purposes set forth.

78,599.—THOMAS MAITLAND, Williamsport, Pa.—*Tooth Brush.*—June 2, 1868.—The hollow rubber head is provided with teeth or projections which, being of the same material, form the brush for the teeth. The tenon on the end of the handle is fitted into the hollow head.

Claim.—The hollow head B and its bristles, made of India-rubber, and combined with the handle A, having a tenon on its end, all constructed and used substantially as specified.

78,600.—ROBERT J. MALCOLM, Cincinnati, Ohio.—*Apparatus for Generating Gas.*—June 2, 1868.—The cylinder is divided into three departments. Fluid being poured into the uppermost department runs through one of the valve-guarded pipes into the lowest one, forcing the accumulated gas into the middle department and thence out through a conducting pipe, for use. When the fluid has escaped from the uppermost department the apparatus is revolved so as to reverse the position of the upper and lower chambers.

Claim.—1. Carburetting air by reversing the vessels or chambers *x* and *z*, substantially as described.

2. The combination of vessels or chambers *x* and *z*, so that as the compound vessel is revolved or reversed, air is drawn in and forced out alternately, as described.

3. The valves *f f'*, *g g'*, *h h'*, *i i'*, in combination with their respective pipes, when used as set forth.

4. The floats *d d'*, and cross-bar C', or its equivalent, as specified.

5. The combination of the cylinder A, frame B, and floats *d d'*, when operating as and for the purpose specified.

78,601.—ISAAC MARSH, JR., Milton, Pa.—*Composition Tile or Slab for Floors, &c.*—June 2, 1868.—The supporting frame is made to constitute a part of the tile or slab, in order to obviate the bending or variation in shape to which a resinous composition tile or slab has a tendency.

Claim.—A composition tile or slab for pavements, &c., consisting of the composition surrounding and supported or strengthened by an interior platform or framework, substantially as described.

78,602.—CLABURN S. MCMAHAN, Centerville, Ind.—*Pump.*—June 2, 1868.—The lower valve is opened by the rod which extends downward at the outside of the pump stock, passes through an elongated aperture in the stock and thence upward to the valve. The object is to obviate the freezing of water in the pump. The piston is tapered, and its leather covering secured by a band, the object being to dispense with the employment of tacks and such other means of securing the leather covering as injure the inside of the pump by frictional contact therewith.

Claim.—The piston P, in combination with valves C and d, when the latter are provided with hoisting appendages, as described, and the whole arranged and operating substantially as and for the purpose set forth.

78,603.—SAMUEL NORRIS, Springfield, Mass., and WILHELM MAUSER, and PAUL MAUSER, Oberndorf, Wurtemberg, assignors to SAMUEL NORRIS.—*Breech Loading Fire Arm.*—June 2, 1868.—The breech block has a catch or projection extending from its surface, and is turned upon its axis to close the breech. In opening the breech the catch is turned into line with a longitudinal aperture. The firing pin passes through the cylindrical block and is driven forward by a spring which is held by a catch and released by means of an ordinary trigger.

Claim.—1. The combination of a main spring k, formed substantially as herein described, with the handle of the breech block C, and arranged to propel the firing pin or other striking device of a breech loading fire arm, substantially as and for the purpose herein set forth.

2. The sliding block C, handle j, spring k, and catch m, of a breech-loading gun, constructed, combined, and operating in such manner that the piece is cocked by turning the said handle, substantially as herein set forth.

3. Securing the breech block C by means of the recess k³ and catch m, substantially as and for the purpose herein set forth.

78,604.—JOHN K. O'NEIL, Kingston, N. Y.—*Weighing Scoop.*—June 2, 1868.—A catch holds the balance in position, so that the two constitute a handle of suitable shape and size. When anything is to be weighed in the scoop the balance is turned up with the bail; the indexes on the balance determining the weight of the article.

Claim.—1. The hollow handle B to the scoop, for the purpose of receiving the balance D, substantially as herein set forth.

2. Securing the balance to the handle when not in use for weighing, substantially as specified.

3. So shaping the balance that it will form a counterpart to the handle, and compose part of it when brought down thereto, substantially as described.

4. The arrangement of the notches c c, or their equivalent, upon the scoop, in relation to the bail and balance, substantially as and for the purpose set forth.

5. Attaching the balance to the scoop bail by the extension of the balance spring itself, as herein specified.

6. The combination and arrangement of the weighing rack t, swivel shaft r, pin s, and the balance spring, substantially as and for the purpose herein set forth.

7. The elastic washer n around the index pivot, and pressing upon the index, substantially as and for the purpose herein specified.

8. The combination of the adjustable dial and adjustable index, to be used together, for making double or successive adjustments, as specified.

78,605.—JACOB PFAU, Cincinnati, Ohio.—*Manufacturing Fruit Cans.*—June 2, 1868.—An edge is first turned on the sheet of tin and a semi-cylindrical shape is then imparted to the sheet by dies. The semi-cylinder is then placed in a drop press, by which the tin is forced into a die so as to produce a shoulder or ledge which projects outwardly from the cylinder. The cylinder is placed within a drop press which forms the crease around its open mouth.

Claim.—1. The mode of manufacture of a creased and open mouthed fruit can body in one piece, substantially as described.

2. An open mouthed and creased fruit can, whose body and the shoulder for receiving the wax are formed of one piece, in the manner set forth.

78,606.—ENOCH PIPER, Camden, Me.—*Refrigerator.*—June 2, 1868.—The upper part of the receptacle for the freezing mixture serves as a receiving pan to guide the mixture into the lower part. Articles to be frozen are placed upon the shelves, which are packed in the smaller chamber. Designed as an improvement upon his patent of August 5, 1862.

Claim.—1. A refrigeratory apparatus, one or more of the inner walls of which are deep, narrow vessels of thin metal, to receive the freezing mixture, substantially as described.

2. The employment, in a refrigeratory apparatus, of one or more receptacles B D, for the freezing mixture, constructed of thin metal, in the form and proportions substantially as shown and described, to serve as partitions between the sides, as constructed.

3. The combination of shelves F F, open at the sides and top, and having a bar across the top, substantially as described, with a refrigeratory chamber, C, formed substantially as described.

78,607.—ANSON H. PLATT, Philadelphia, Pa.—*Lamp Burner.*—June 2, 1868.—Two distinct wicks, of equal and uniform width and thickness, are inserted between the tubes, so that while the circular space at the top of the tubes is completely filled by the wicks, triangular spaces are formed below.

Claim.—The combination and arrangement of the concentric wick tubes or plates 2 3, with open spaces b b therein, the movable wick regulator 4, perforated plate k, and apron a, substantially as and for the purposes herein specified.

78,608.—JOHN RICHARDS, Cincinnati, Ohio.—*Hanger for Shafting.*—June 2, 1868.—The box, mounted on the hanger, vibrates in a horizontal plane and vertically in the line of the shaft, and is also capable of vertical and lateral adjustment independently of the hanger frame.

Claim.—1. The stem C, formed to receive the lugs d, substantially as shown.

2. The combination of the adjusting screws h h and eye bolt E, when used substantially as herein shown and for the purposes specified.

3. The cylindrical screw piece o, for adjusting the box, when formed to receive the bolt E, in the manner and for the purposes described.

4. The screws h h, in combination with the stem piece C, for adjusting the box S, as herein shown, and for the purposes specified.

5. The stem piece C, screw piece o, eye bolt E, and screws h h, combined and operating substantially in the manner and for the purposes specified.

78,609.—BENJAMIN ROBINSON, Thomaston, Me.—*Carriage Thill.*—June 2, 1868.—The bolt which connects the forks at the end of the thill is rigidly attached to the thill during the process of manufacture. The bolt is prevented from rattling in its bearing, and the thills are sustained when the horse is withdrawn therefrom.

Claim.—The arrangement of the cap e upon the projection a, the said cap being secured by bolts 1 and 2, in conjunction with the rubber piece f, the rigid bolt of the shaft, the sides 3 of the forked end of the shaft, the projection h, and either with the elastic strip, for the two purposes of rendering the shaft holder adjustable and the shaft self-supporting, as described.

78,610.—MAX ROSENTHAL, Philadelphia, Pa.—*Composition for Preparing Paper for Transferring*

Stamps and other Printed Matter.—June 2, 1868.—A mixture of starch, washing soap, rock candy, and glycerine is applied to one side of unsized paper and allowed to dry; it is then coated with another mixture of gum arabic and rock candy.

Claim.—A chemical compound, composed of the ingredients, mixed in the proportions and quantities, and applied to unsized paper, as herein described, and for the purpose set forth.

78,611.—CYRUS W. SALADEE, Newark, Ohio, and JOHN S. HALL, Pittsburg, Pa.—*Hoe.*—June 2, 1868.—The lips are formed by making incisions in the hoe blade and then turning up the metal in the manner shown. The brace is formed of separate cast or stamped metal and riveted to the blade.

Claim.—The lips *w*, *x*, and *y*, when formed substantially as described, as part of the hoe blade, in combination with the brace B, substantially as and for the purposes set forth.

78,612.—CYRUS W. SALADEE, Newark, Ohio, and JOHN S. HALL, Pittsburg, Pa.—*Grater and Slicer.*—June 2, 1868.—The table may have either a grater or a slicing blade secured to its upper surface. The fruit is placed in the holder above the table and pressed downward while the crank is turned. The hollow plug is inserted in the holder when a small fruit or vegetable is to be acted upon.

Claim.—1. The frame A, table B, and crank D, substantially as described, in combination with the grater G, substantially as and for the purposes set forth.

2. The frame A, table B, and crank D, substantially as described, in combination with the slicer S, substantially as and for the purposes set forth.

3. The hollow plug *e*, in combination with the holder E, in the manner and for the purpose substantially as shown and described.

78,613.—JACOB SHELLER, Wilmington, Del.—*Composition for Filling the Pores of Wood for Varnishing.*—June 2, 1868.—Liusced oil, Japan varnish, turpentine, sugar of lead, and arrowroot.

Claim.—The combination of the within-named ingredients, when mixed in the several quantities and proportions as herein described, and for the purpose set forth.

78,614.—BRYAN SMITH, Falkland, N. C.—*Cotton-Seed Planter.*—June 2, 1868.—The cylinder is rotated by the contact of its arms with the earth. As the cylinder revolves the pins pass through slots in the hopper and carry the cotton seed to the ground. The plow prepares the earth to receive the seed, and the coverers smooth the earth and cover the seed.

Claim.—1. The cylinder B, constructed with arms C and pins E, substantially as and for the purposes set forth.

2. In combination with cylinder B, the coverer K, constructed and operating substantially as specified.

3. A cotton planter, having cylinder B, coverer K, and plow G, constructed and operating substantially as and for the purposes described.

78,615.—JOHN SPEAR and JOHN A. HULL, Carbondale, Ill.—*Pruning Shears and Knife.*—June 2, 1868.—The longer cutting blade has two cutting edges, the concave edge being intended for use as a knife, and the forward end of said blade projects beyond the end of the other blade so as to be used as a chisel. The two-part clasp is secured to the handle and has a socket to receive the end of a pole.

Claim.—1. The shears, consisting of the double-curved blade C, the blade B, with the projecting thrust cutting edge or chisel G, and the curved edge D, arranged as described.

2. In combination with the pruning shears herein described, the clasp, Figs. 3 and 4, constructed and operating substantially as specified.

78,616.—ALBERT T. STEARNS, Dorchester, Mass.—*Cutter Head for Planing Machine.*—June 2, 1868.—The two sets of cutters on each side of each center or main cutter are confined by a single bolt, through which they project like bolt keys. Each cutter or set of cutters is supported laterally directly

against a cheek or cheeks on the stock, and the main cutter is placed in a plane of attachment on the head beyond the plane of attachment of the side cutters.

Claim.—1. The combination of the slotted screw bolt with the cutter head and side cutters, constructed and arranged substantially as set forth.

2. The cutter head, constructed with the side cutters, arranged relatively to the center cutters, substantially in the manner and for the purpose set forth.

78,617.—WILLIAM STINE, Elmore, Ohio.—*Eaves Trough.*—June 2, 1868.—The cross-bar is made fast to the trough by the wire, which is secured to the bar along its upper edge, bent around the trough and bent or twisted together at the ends.

Claim.—1. The construction and arrangement of the bars *e* and *f*, and cross-bar *a*, for holding an eaves trough, substantially as described.

2. In combination with the above, the wire *b b*, as and for the purpose set forth.

78,618.—DANIEL J. STONE, Warwick, R. I.—*Mop Wringer.*—June 2, 1868.—The end of the mop is fastened to an apron which passes out between the rolls with the mop and thence passes upward around the back roller and under the plate which acts as a floor scraper, said apron being attached to a pulley eord which is attached to the slide in front.

Claim.—1. The combination of the rolls, apron, and rod for operating the same, when arranged as herein set forth, and for the purpose specified.

2. The combination of the rolls C F and plates *x*, as herein set forth, and for the purpose specified.

78,619.—L. C. STUART, New York, N. Y.—*Electro-Magnetic Engine.*—June 2, 1868.—The secondary current induced by withdrawing the electric current from one set of magnets is utilized by directing it into the current supplying the other set of magnets. The coils of the magnets are supplied with the electric current through the medium of the disks whose faces run in contact with the conductors, each of the disks being made of three distinct, insulated parts.

Claim.—1. In the employment of a series of rotary magnets, arranged in pairs, and so connected that the magnetization of one set of magnets is effected before the demagnetization of the other, substantially as and for the purpose as described, in combination with a series of stationary magnets, when arranged and operating in the manner substantially as hereinbefore described, for the purpose set forth.

2. Alternately energizing and demagnetizing the electro-magnets, without breaking the connection between the poles of the battery, in the manner hereinbefore described.

3. Conveying the induced or secondary current from the magnets as they are demagnetized, along with the current running to supply another set of magnets, substantially in the manner herein described, for the purpose set forth.

4. The employment of a series of adjustable conductors, substantially as described, whereby the speed and draught of the engine may be governed at pleasure, as hereinbefore set forth.

5. The combination of the disks *a* and *b*, and the conductors *e*, *f*, *g*, and *h*, when arranged and operating substantially as described.

78,620.—SAMUEL SWAN, New York, N. Y.—*Bench Hook for Carpenter's Bench.*—June 2, 1868.—The spring raises the free end of the tongue to the extent permitted by the position of the screw bolt in relation to the lower threaded socket in which it is held.

Claim.—The bed plate E, constructed substantially as described, and fitted with a hinged tongue, actuated by a spring, as set forth.

78,621.—HOMER TULLER, Ash Grove, Ill.—*Bee Hive.*—June 2, 1868.—The bees have access to the honey boxes through the slatted bottoms of said boxes, which rest upon the slatted bottom of the hive.

Claim.—1. The box or hive A, constructed substantially as described, when used in combination with honey boxes B, as and for the purpose specified.

2. The honey boxes B, having the top side made of

glass, and a series of slats at the bottom and one end, hinged in the manner substantially as and for the purpose set forth.

78,622.—**ISAAC VAN KERSEN**, Kalamazoo, Mich.—*Mode of Constructing Loose Prairie Fences.*—June 2, 1868.—The intention is to connect together ten or twenty sections or lengths of fence and draw them to the place where the fence is to be situated.

Claim.—Constructing a fence with wheels and axles permanently attached to one end of each panel, while the other end is connected by hooks and eyes, and the panels supported by braces D D, the whole constructed, arranged, and operated substantially as and for the purpose set forth.

78,623.—**SMITH D. WACKMAN**, Auburn, N. Y.—*Machine for Grinding the Cutters of Mowing Machines.*—June 2, 1868.—The cutters, while being sharpened, are held in a clamp frame suspended from overhanging arms in such a manner that the cutters can be presented to the grindstone at any desired angle.

Claim.—1. The combination, substantially as set forth, with a grindstone, of an oscillating adjustable clamping frame, suspended from overhanging arms, for the purposes set forth.

2. The combination, substantially as set forth, with the frame A, of the vertical detachable turning posts G, the overhanging slotted brackets H, the journals, the swiveling suspension rods, and the clamp bar, for the purposes specified.

3. The combination, substantially as set forth, of a supporting frame, a bed plate turning on a pivot on said frame, a grindstone mounted on and turning with said bed plate, an adjustable overhead supporting frame, and a suspended oscillating clamping frame, for the purposes specified.

78,624.—**AWSBERT H. WAGNER**, Staunton, Va.—*Grinding Mill.*—June 2, 1868.—The spider and screw rod change the position of the rollers on the inclined planes to raise or lower the bed stone and thus adjust it to the upper stone.

Claim.—The spider V, the rollers U W, the inclines X X, the rod Y, and nut a, when arranged and operating in the manner and for the purposes specified.

78,625.—**ALVAH WALKER**, Oswego, N. Y.—*Water Elevator.*—June 2, 1868.—A person approaching the well takes hold of the ring attached to the end of the elevating rope, which he draws as he walks, thus raising the bucket of water to the top of the well by the time he reaches it.

Claim.—The curb C, pulley G, pulley or pulleys H, and cord F, arranged horizontally, with the fastening I, all combined and arranged substantially as and for the purposes described and shown.

78,626.—**WILLIAM WALTON**, East Palestine, Ohio.—*Cultivator.*—June 2, 1868.—Designed for adapting the hoes to various widths of furrow and preventing contact between the handles and the plants.

Claim.—Attaching the handles D directly to the wings B, and providing an adjustable brace in the curved bars H, in the manner and for the purpose substantially as herein set forth.

78,627.—**HERMAN C. WEIHE**, Philadelphia, Pa.—*Counter Shafting.*—June 2, 1868.—A shifting mechanism for accelerating the back travel of the slide rest of a screw-cutting or other slide lathe.

Claim.—1. The parallel counter-shafting B B', sliding spur wheel H, fixed pinion I, and the loose cone pulley E, when combined and arranged substantially as shown and described.

2. The parallel counter-shafting B B', fixed pulley G, loose pulley F, sliding feather a, collar b, shifting lever K, and the loose cone pulley E, when combined and arranged substantially as shown and described.

3. The parallel counter-shafting B B', loose pulley F, fixed pulley G, sliding feather a, loose cone pulley E, feather c, sliding gear H, and the pinion I, when combined and arranged substantially as shown and described.

4. The main shafting A, parallel counter-shafting

B B', pulley C, pulley D, loose cone pulley E, feather a, loose pulley F, and the fixed pulley G, when combined and arranged as herein shown and described.

78,628.—**GEORGE M. WHITE** and **CHARLES S. MEEKER**, New Haven, Conn.—*Curtain Fixture.*—June 2, 1868.—Upon raising the curtain by drawing down the cord, the lever is drawn into a depressed position in which it allows the cord to pass freely through it.

Claim.—The lever K, constructed so as to receive the cord, and permit its free passage therethrough while in a depressed position, or hold the cord, as the case may be, substantially as herein set forth.

78,629.—**WILLIAM WICKERSHAM**, Boston, Mass.—*Electro-Magnetic Engine.*—June 2, 1868.—Magnetic power is applied through the medium of chains mounted upon rotating wheels and shafts and made up of magnetic and non-magnetic links, the motion of said chains being effected by the attractive force of helices arranged as stated in the claims.

Claim.—1. In electro-magnetic engines, the arrangement of the magnetic bars in an endless chain, having alternate magnetic bars and links of non-magnetic metal, the chain being so arranged in the engine that all the magnetic bars can pass successively through the same helix or column of helices, substantially as described, and for the purpose set forth.

2. In electro-magnetic engines, the construction of two chain gears on parallel shafts, of suitable form and distance apart to receive the electro-magnetic chain, all arranged in such manner that the gears and chain can revolve together, substantially as described.

3. In electro-magnetic engines, the arrangement of two or any desirable number of chain gears on the same shaft, with the corresponding number of electro-magnetic chains, all working concurrently together and communicating their power to the same shafts, substantially as described and for the purpose set forth.

4. In electro-magnetic engines, out of a thin ribbon-shaped strip of metal, the formation of two or more helices, as described, and so arranging them in the engine, in columns or otherwise, that each shall receive a different series of magnetic bars through it, and so further arranging them that when the circuit is closed through one helix, it shall be closed through all of the series thus formed of said strip, substantially as described.

5. The circuit cylinder, with its spiral conductors so formed and in such connection with the helices, that it shall continue the same relation between the closed circuits and the position of the magnetic bar, or as near as may be, as it advances through the column of helices.

6. Such disposition of these spiral conductors around said circuit cylinder, that one of them will perform the same function for each magnetic bar as it enters a column of helices, or for all the magnetic bars of a series which enter a series of said columns at the same time, substantially as described and for the purpose set forth.

7. Such an arrangement of the spiral conductors e e e, on the sides of the cylinder, in combination with its movable arrangement on its shaft, as will close the circuits in such manner in its middle position that there will be no tendency of the magnetic bars to move in either direction, and as will open the circuits in such manner in its upper and lower positions as will give motion to the magnetic bars, but in diverse directions, the upper position in one direction, and the lower position in the opposite direction, substantially as described and for the purpose set forth.

8. In combination with the cylinder, the device, consisting of the sliding bar o and the spring q, for moving the circuit cylinder to and holding it in any position needful to stop the engine or running it in either direction, as described.

9. Making each alternate helix, of those formed of the same strip of metal, coil around in a diverse direction from the others, in such manner that when an electric current passing through a line of helices, so formed of the same strip of metal, produces a north polarity in one end of a magnetic bar, placed in any

one of said helices, a south polarity will be produced in the same end of a magnetic bar placed in either of the adjoining helices of the same line, the electric current flowing in the same direction through all the helices in the same column, substantially as and for the purpose described.

10. Such an arrangement of the columns of helices on the opposite sides of the engine that through any two columns, one on the back and the other on the front of the engine, through which the same electro-magnetic chain passes, the electric current shall flow in diverse directions, giving north polarity to the upper end of a magnetic bar in one, while it gives south polarity to the upper end of the magnetic bars in the other, and *vice versa*, all substantially as described and for the purpose set forth.

7S,630.—WILLIAM WICKERSHAM, Boston, Mass. *Railway Rail Chair.*—June 2, 1868.—The "screw cylinders" clamp the flanges of the rails to the chair, and their upper ends constitute spiral inclines which abut against corresponding surfaces on the chair, so that the partial rotation of said cylinders causes them to move downward and firmly clamp the rails to the chair as often as the readjustment of the clamp is necessitated by the wear of the parts.

Claim.—1. In a railway rail chair, the screw cylinders *a a*, when constructed to work or operate automatically, substantially for the purpose set forth.

2. In combination with the screw cylinders, the springs *d d*, as described and for the purpose set forth.

3. The construction of the screw cylinders *a' a'*, with the spaces *f* and wedge *g*, in combination with the chair, substantially as described and for the purpose set forth.

4. In combination with the screw cylinders, the metallic strips *i i*, as described and for the purpose set forth.

7S,631.—JESSE WILKINSON, Urbana, Ill., assignor to HORACE BALLARD WILKINSON, same place. *Herding and Securing Cattle.*—June 2, 1868.—The halters of the cattle are attached to a sheave which runs upon a taut rope, so that they may feed or graze within limits determined by adjustable stops upon said rope.

Claim.—The combination of the windlass for stretching the rope *D*, the said rope, the post *C*, and trusses *B B*, resting upon the ground, together with the traversing block and pulley *E*, and adjustable stops *G*, substantially as and for the purpose set forth.

7S,632.—CHARLES A. WINN, Lockhaven, Ill.—*Brick Machine.*—June 2, 1868.—The steam-engine forms part of the machine and supplies power to operate the blades or arms which temper the clay in the pug mill; and it also forms a means for introducing steam, heat, and hot water to the mill, in furtherance of the tempering and reducing process.

Claim.—1. A complete and portable brick machine, composed of the steam boiler *A*, cylinder *C*, clay mill *D*, constructed as described, combined and arranged in one portable apparatus in the manner and for the purpose herein set forth.

2. The formation of the annular chamber *e* of the clay mill *D*, with the elevated chambers *g g*, the spiral steam tube *G*, as connected with the boiler, and arranged in the annular chamber *E*, and the stationary perforated steam pipes *H H*, passing directly from the boiler through the clay mill, horizontally, all combined in the manner and for the purpose herein set forth and described.

7S,633.—VALENTINE WOOD, Richmond, Ind.—*Flood Fence.*—June 2, 1868.—A fence to be located on creek bottoms and such places as are liable to overflow. The fence yields to the water and is prostrated but not liable to be swept away.

Claim.—The fence panel *A*, the lower bar *B* of which is pivoted to posts *C*, and which is supported in an inclined position by braces *D*, when arranged in relation to the embankment *E*, to operate substantially as described.

7S,634.—CHARLES D. WRIGHTINGTON, Fair Haven, and BENJAMIN P. RIDER, Chelsea, Mass.—*Brick Machine.*—June 2, 1868.—The arm on the upper shaft, actuated by a cam ledge, gives a partial

rotation to the feeding screws and causes them to fill the molds while the mold wheel is in motion, and smooth the upper surface of the clay in the spaces between the blades in the bottom of the hopper. The molds being filled, the mold wheel makes one-fourth of a revolution and comes to rest, whereupon a table is brought up against the under side of the mold wheel to sustain the pressure which is applied to the clay in the molds by the descending followers. The table descends with the pressed bricks upon it, they being transferred therefrom to an off-bearing device by an oscillating board attached to swinging arms.

Claim.—1. The secondary motion given to the screws by the cam ledge *II* and the arm *K*, in addition to their primary motion for feeding down the clay into the forming tube by the gear wheels, for the purpose of smoothing the clay and finishing out the filling of the tube, substantially as described.

2. In combination with the mold wheel *P* and pressing followers *9, 10, 11, 12*, the rising and falling table *Y*, under the mold wheel, and the delivering apparatus *s, t, u, v*, when arranged and timed in their motions and periods of rest, to operate together, substantially as described.

7S,635.—ARCALOUS WYCKOFF, Elmira, N. Y.—*Pavement.*—June 2, 1868.—The saw dust or tan bark absorbs part of the coal tar which is spread upon the flooring, and prevents the superimposed sand and gravel from working under the ends of the blocks.

Claim.—1. A pavement, formed of blocks of wood of irregular forms and uniform length, resting upon a plank floor, and having the intermediate spaces filled with a fibrous material and gravel or sand and coal tar, substantially as set forth.

2. The arrangement and method of forming foundations between the blocks of wooden pavements, by forming a base of saw dust, tan bark, or analogous fibrous material, and placing thereupon gravel or sand, to fill up such spaces, in the manner and for the purpose herein described.

7S,636.—WILLIAM MULLALLY, Boston, Mass.—*Apparatus for Extinguishing Fire.*—June 2, 1868.—In case of fire, the apparatus is inverted, which has the effect of mixing dry acid on the foraminous shelf with the water already charged with the opposite acid, thus producing and charging the water with carbonic acid gas, which, upon the opening of the cock, forcibly discharges the water from the vessel.

Claim.—1. An apparatus for extinguishing fires, composed of the vessel *A*, the foraminous shelf *e* or its equivalent, and the escape cock *f*, the vessel *A* being provided with a filling aperture, and the whole being constructed, adjusted, and operating essentially in the manner and for the purpose as herein shown and described.

2. The employment of the foraminous shelf, or its equivalent, as before set forth and explained.

7S,637.—LEWIS J. ATWOOD, Waterbury, Conn., assignor to himself and HOLMES, BOOTH & HAYDENS, same place.—*Lamp Burner.*—June 9, 1868.—The cone and chimney holder are formed of one piece of metal, or permanently connected, and are hinged to the burner shell so that the chimney holder and cone can be moved simultaneously.

Claim.—1. A cone or deflector, with a circular range of springs to form the chimney holder, in combination with a perforated burner shell, to which said deflector and chimney holder are hinged, substantially as set forth.

2. A ring *n*, formed around the edge of the burner shell by the sheet metal turned over, in the manner and for the purposes set forth.

7S,638.—G. C. AVERY, Waldron, Ind.—*Plow and Planter.*—June 9, 1868.—The standards are jointed to arms attached to rock shafts, which latter being partially rotated in a backward direction, raise the plows, seed boxes, &c., to the position in which they are held when not in use.

Claim.—1. The combination of the rock shafts *C C'*, standards *d d*, and seed boxes *H H*, arranged and operating substantially as described.

2. The combination of the rake *g*, and seed box *H*, with the standard *d*, as set forth.

78,639.—PIERRE JOSEPH BADOUX, New York, N. Y.—*Evaporator*.—June 9, 1868.—Hollow boxes, situated one at either side of the partition, communicate with the interior of the shaft and are perforated to receive the ends of spiral pipes which receive the heating fluid from the hollow shaft at one side of the partition, and conduct it again into the shaft of the other side of said partition.

Claim.—The construction of the within-described rotary evaporator, for evaporating all fluids at a low or high temperature, by means of the hollow spirals or serpentine, with any number thereof, substantially as described and set forth.

78,640.—ANNA E. BALDWIN, Newark, N. J.—*Process of Treating Milk to obtain Useful Products*.—June 9, 1868.—The cream is used as a substitute for animal marrow in making pomatum, ointments, &c., the refuse being employed as soap grease. The curd from the milk is used for feeding or cheese making, and cordial or vinegar is made from the whey.

Claim.—The improved methods of obtaining products from milk, substantially as and for the purposes herein described.

78,641.—EDMUND BENNET, Nankin, Mich.—*Potato Digger*.—June 9, 1868.—The vines and potatoes are taken up by the slatted scoop and forced upward until they reach the curved teeth upon the upper endless chain which tear off and separate the vines, while the potatoes drop under the teeth of the lower belt and are thereby conveyed to the shaker.

Claim.—1. The method of separating the vines from the potatoes, by the curved teeth in the endless chain K, and endless belt L, and shield N, arranged substantially as described and for the purpose specified.

2. The combination of the above with the frame or box A, the wheels B, the axles C, the cog wheels D and O, the pinions E, H, and P, the shafts G and I, the shaker M, the wheels X, the slatted scoop J, the lever R, the cord or chain S, and the fulcrum T, when constructed substantially as and for the purpose described.

78,642.—M. G. BRIGGS, Boston, Mass.—*Folding or Ironing Table*.—June 9, 1868.—When the table in an extended form is to be employed as a "press board," the cross frame and supporting legs at one end are detached in order that the dress may be drawn over and extended about the leaf. The auxiliary leaf supports a flat iron, starch bowl, or other utensil.

Claim.—1. The apparatus or device above described, consisting of the leaves A A', twin cross frames or legs *c c' d d'*, and auxiliary leaf or shelf *g*, the legs being pivoted to each other and to the leaves, and provided with the stops *f* or *f'*, and the whole operating together in manner and for the purpose as herein shown and described.

2. Applying one pair of cross frames or supports to the leaf by means of the bar *h* and pin *j*, or its equivalent, essentially in manner and for the purpose as explained.

78,643.—L. CHAPIN, Antwerp, N. Y.—*Cheese Hoop*.—June 9, 1868.—The sheet iron exterior is lined with tin, either end of the device answering for top or bottom.

Claim.—The within-described cheese hoop, composed of sheet iron and tin, and formed in the manner specified.

78,644.—S. E. CHASE, Boston, Mass.—*Making Horseshoe Nails*.—June 9, 1868.—The nails are successively acted upon by dies, the first of which gives the nail its proper curve and the bevel at the point end, while the second acts to force the nail through a hole in the bed, thereby cutting off the superfluous metal at the point and rectifying defects in the shape of the nail.

Claim.—In finishing nails, the process of curving their bodies and beveling their points, and afterwards forcing them through an open die to shear off superfluous metal, substantially as and for the purpose specified.

78,645.—GEORGE R. CLARK, New York, N. Y.—*Hoisting Machine*.—June 9, 1868.—The device may be used as an ordinary crank and windlass, but the wheels can be variously disposed with reference to each other to enable the power to be increased in being transmitted from the crank to the windlass.

Claim.—1. Primary wheels 32 and 33, pinion wheels 16 and 15, in combination with revolving case C.

2. Revolving case C, crank D, and collar O, when constructed, arranged, and operated substantially as herein set forth.

78,646.—GEORGE R. CLARK, New York, N. Y.—*Elevator*.—June 9, 1868.—A revolving wheel is applied under the platform or table and provided with anti-friction rollers above and below, the lower ones meshing with a screw thread lever whose operation is controlled by a lever and clutch, the entire power being transmitted by means of a crank shaft, wheel, and endless belt.

Claim.—1. The combination and arrangement of the hollow and revolving table and worm, parallel guides, rollers, and their supporting brackets, when the whole is operated by means of pulleys and endless belt, substantially as described.

2. The endless belt *t*, when the same is used in combination with the table or platform *p*, anti-friction rollers *b b*, and screw-thread arm *t'*, when the whole is so constructed as to operate substantially as described, and for the purpose specified.

3. The combination of the lever *r*, the guide bar R, and the clutches *q* and *q'*, the stop lever H, and the stop pin *w'*, when the same are used and operated in the manner substantially as described.

78,647.—JOHN C. CLINE, Philadelphia, Pa., assignor to himself and HENRY C. KING, same place.—*Bedstead*.—June 9, 1868.—The slots in the slats, and the journaled head and foot bars constitute a yielding attachment for the slats and allow the full play of the springs under super-imposed weight.

Claim.—The bed bottom, composed of the slats *e*, attached at head and foot to the bars *e* and *f* respectively, said bars being free to turn on end bearings or journals, in combination with springs *k* and spring bar *h*, these several parts being constructed and arranged and operating substantially as shown and described.

78,648.—I. FREMONT COLBY, Washington, D. C., assignor to himself and DANIEL C. COLBY, same place.—*Coffee Mill*.—June 9, 1868.—The supply reservoir contains the coffee to be ground, the smaller chamber constitutes a hopper, and the chamber below receives the ground coffee.

Claim.—Providing the coffee mill with a supply reservoir, B, in combination with the smaller chamber C, and chamber E, all arranged for the purposes specified and set forth.

78,649.—ISAAC COLE, Brooklyn, N. Y.—*Fastening for Gloves*.—June 9, 1868.—Two buttons are connected by a chain which is fastened by one end to one of the buttons, and rove through the other button, the free end of the chain being provided with a knob which prevents it from becoming detached.

Claim.—The glove fastening, consisting of buttons *a* and *b* and chain *d*, the head of one button being hollow or partly hollow, and within which is placed eccentrically a vertical post, *e*, and having on its periphery openings *h k*, and a contracted slot *f*, leading into the hollow head, whereby the chain enters through one opening, then around the eccentric post and out through the other opening, both in fastening and unfastening the glove, substantially as described.

78,650.—LEWIS COSLER, Yellow Springs, Ohio.—*Thresher for Grain, Clover, Flax, &c.*—June 9, 1868.—The conveying aprons are tightened and slackened by the adjustable arms. The extension sieve catches the grain or seed which may be blown beyond the shoe by the fan. The inclined throat directs the grain to the shoe. The cleaned seed and the refuse matter are respectively discharged by the two horizontal conveying rollers.

Claim.—1. The adjustable arms M, as herein set forth.

2. The extension sieve U, for the purpose set forth.
 3. The construction of the inclined-shaped throat L, when located at the top of the apron K, as herein described and for the purposes set forth.

4. The arrangement of the two conveyers R and S, when located and operating with the sieve T, as described and set forth.

78,651.—JOHN O. COUCH, Middlefield, Conn.—*Clothes Pin.*—June 9, 1868.—The rubber band causes the arms to spring together, prevents them from passing each other by keeping them approximately in line, and prevents the pin from being thrust down too far upon the clothes line.

Claim.—The employment of a rubber or elastic compound in combination with a metallic clothes pin, made as herein described, and adapted to operate therewith, as and for the purposes herein set forth.

78,652.—JOHN W. CRAIG, Knoxville, Ill.—*Brace for Bit.*—June 9, 1868.—When the spring catch is raised the lever is thrown outward by the spring and acts with a short purchase to raise the bit and thus liberate it from its socket.

Claim.—The device for holding bits in braces, consisting of the pivoted spring lever C, formed with the toe *b*, which engages with the bit, the free end of said lever adapted to catch under the spring catch D, secured upon the end of the brace, and provided with a round hole for the passage of the bit, all constructed and arranged to operate as herein shown and described.

78,653.—PATRICK DONOUGHE, Loretto, Pa.—*Mode of Attaching Handles to Cross-cut Saws.*—June 9, 1868; antedated May 19, 1868.—The shank can be raised or lowered in the opening of the handle so as to adapt the two parts to suit saws of different width. The washer allows the handle to turn readily when it is being secured on the saw.

Claim.—The arrangement of the handle *a*, ferrule *b*, washer *c*, rod *d*, and nut *e*, the whole being constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

78,654.—JOHN C. DURBORROW, Ellieott's City, Md.—*Harvester Rake.*—June 9, 1868.—The inclined jointed driving shaft passes through the fixed gear wheel and the incline of the standard, and has a short shaft attached to its end at right angles to its axis.

Claim.—The inclined shaft C, jointed at G, and provided with the fixed gear wheel B, in combination with the revolving gear wheel E, and inclined rake and reel arms, all constructed and operated in the manner and for the purpose set forth.

78,655.—H. G. EASTMAN, Poughkeepsie, N. Y.—*Penholder.*—June 9, 1868.—Assists the learner to acquire a correct style of penmanship. The ring fits upon the fore-finger near its junction with the hand, and the thumb and middle finger rest upon the supports at the lower end of the penholder. The "form," in conjunction with the above-mentioned parts, is made to keep the hand in the desired position.

Claim.—1. The combination of the egg-shaped hand support or "form" A with a penholder, by means of the swivel joint, or equivalent therefor, substantially as hereinbefore described.

2. In combination with a penholder, the ring F, as hereinbefore set forth.

78,656.—JOHN S. EVERITT and OSSIAN COOK, Oshkosh, Wis.—*Steam-Engine Oscillating Valve.*

June 9, 1868.—The opposite bores are respectively provided with inclined planes, which are slotted to receive adjusting bolts, and attached to arms that may slide upon the valve stem, the object being to reset the parts when frictional wear would otherwise render them imperfect in operation.

Claim.—1. The valve bores S S of the valve H, constructed with inclines *n n*, slots *x x*, arranged relatively to the arms *m m*, and valve stem C, as a means of adjustment in compensating for wear.

2. The valve case A A, when constructed as described, and arranged relatively to the oscillating-balance valve H, as herein set forth.

78,657.—JOHN FILKINS, Sandwich, Ill.—*Mop Wringer.*—June 9, 1868.—The mop is placed between the rollers, the treadle forced down by the foot, and the crank turned by hand, a pail being set beneath to catch the water expressed from the mop.

Claim.—The combination of the standards C C, D D, rollers P R, springs Z Z, levers J J, having projections L, and treadle O, substantially as herein described.

78,658.—W. G. FREEMAN, Richmond, Va.—*Petticoat Pipe for Locomotive.*—June 9, 1868.—The smoke and gases passing out of the mouths of the tubes, strike against the cone, which causes them to converge toward the center of its smaller opening, through which they pass and find exit through the petticoat pipe into the stack.

Claim.—The combination of the cone or converging sheet E with a petticoat pipe, D, closed at its lower end, when arranged and operating as described, for the purpose of equalizing the draught through the tubes by converging the escaping products of combustion toward the mouths or nozzles of the exhaust pipes.

78,659.—GERHARD FUCHS and JOSEPH LUGART, Logansport, Ind.—*Beer Cooler.*—June 9, 1868.—A stream of water is forced upward through the vertical pipes, and cools the beer as it descends in contact with said pipes. The beer is received by the pan situated immediately under said pipes, and conducted thence into the tortuous pipe in the ice box, from one end of which it is drawn off.

Claim.—The pan H and ice pan K, provided with a tortuous pipe, J, through which the beer is passed and cooled, substantially in the manner specified, and arranged under the pipes B B as herein described, all operating for the purposes set forth.

78,660.—ERNST GESSNER, Aue, Saxony.—*Fulling Mill.*—June 9, 1868.—A spring or weight forces the tub up to the beaters with a yielding pressure, rendering the tub capable of adjusting itself to a larger or smaller quantity of goods. The beaters are arranged in pairs, each pair being connected together by springs and acted upon by a common eccentric.

Claim.—1. The toothed segments *e*, gearing in pinions *e*, in combination with the beaters and tub or tubs of a fulling mill, substantially as and for the purpose set forth.

2. The springs *v* or *f*, in combination with the tub or tubs of a fulling mill, substantially as and for the purpose described.

3. The springs *k* and adjusting screws *k'*, in combination with the eccentrics L and beaters B of a fulling mill, substantially as and for the purpose set forth.

78,661.—AMOS W. GRIFFITH, Boston, Mass.—*Clothes Drier.*—June 9, 1868.—By means of cords attached to the outer end of the side-pieces, and passed over pulleys on the outer end of the frame, the clothes-line containing the clothes may be drawn out of the window by a person standing inside the room. The clothes and line are drawn in again by means of the flexible side-pieces.

Claim.—1. The supports B B, constructed with a recess and openings, in combination with the flexible frame D and the fastenings *d*, as and for the purpose set forth.

2. The flexible sliding frame D D E, as and for the purpose specified.

3. The flexible side-pieces D D, in combination with the cord E and adjustable end-piece D' D', as and for the purpose set forth.

78,662.—REUBEN S. HALL, Hamburg, Mich.—*Fruit Gatherer.*—June 9, 1868.—The fruit is detached by means of the wire or rim, the latter affording attachment for the bag, which conducts the fruit to the ground.

Claim.—The combination and arrangement of the semi-circular wires C, the outwardly projecting rim B, and the bag or conductor, as herein represented.

78,663.—JOSEPH F. HARCOURT, Cincinnati, Ohio.—*Tackle Block.*—June 9, 1868.—An improve-

ment in inside iron-strapped tackle blocks, intended to effectually support the pin or axle without reducing the strength of the partitions.

Claim.—A two or more sheave tackle block, whose partitions, C, extend from side to side in one piece, and are formed with grooves, G', in their sides for the reception of the inner, forked straps D', all as herein described, for the purpose specified.

78,664.—WILLIAM N. HARRISON and JOHN J. HARRISON, Hornby, N. Y.—*Corn Planter.*—June 9, 1868.—The tubes are adapted to rise or fall with the surface of the soil. The covering rollers are held to their work by the springs, but permitted to yield vertically to obstructions by reason of their attachment to the hinged arms. The seed cells of one series are further apart than those of the other series, and the partition or "slide" enables either to be brought into requisition.

Claim.—The slide tubes J J, attached to cross-bar j, the covering rollers K K, connected with hinged arms m m, and springs L L, and the double sets of seed holes f f', with shifting slide i, the whole arranged as described, and operating in the manner and for the purpose specified.

78,665.—JACOB D. HAYNE, New Antioch, Ohio.—*Corn Coverer.*—June 9, 1868.—The two series of tines rake the large clods, grass, &c., away from the furrows, the shares throw the loose earth upon the corn, the weighted roller pulverizes the remaining clods and produces a level surface, and, by the adjustment of the clevis, the shares may be made to penetrate the earth to a greater or less depth.

Claim.—1. The arrangement, substantially as described, of the two series of rearwardly diverging tines F F', adjustable shares G G', g g', H, and roller I, as and for the purpose set forth.

2. In combination with the described elements F F', G G', g g', H, and I of the preceding clause, the adjustable clevis L l, M m, for the object explained.

78,666.—ASAHEL HAYS, Guy's Mill, Pa.—*Seed Planter.*—June 9, 1868.—The droppers are connected to the slide, which is actuated by cams on the forward gear wheel, the latter being thrown into and out of gear by a lever.

Claim.—1. The slide P and the droppers I I and H H, when operated as described, for the purposes set forth.

2. The whole seed planter, when constructed as described, for the purposes set forth.

78,667.—RUDOLPH HERR, Brooklyn, N. Y.—*Heels for Boots, &c.*—June 9, 1868.—The hollow heel is made of metal, or any suitable hard substance, and combines and contains, in parts or in one solid piece, the yoke or counter, the sole, and the heel proper.

Claim.—The combination of the above-described yoke, sole, spurs, tap hole, and heel, with its filling and cross-bar, as within described, and for the purposes set forth.

78,668.—FLEURY HUOT and CONSTANT BAUDOUN, New York, N. Y.—*Hat.*—June 9, 1868; antedated May 22, 1868.—Imparts an embellishing luster to the surface.

Claim.—A bonnet, having metallic foil or leaf pressed upon its surface, for the purposes and as specified.

78,669.—DAVID HUTCHISON, San Francisco, Cal.—*Plate for Artificial Teeth.*—June 9, 1868.—Designed to insure the retention of the plate in its proper position, and to avoid irritating the palate, especially when the tissues of the alveolar and palatine arches are of unequal hardness.

Claim.—A flexible cavity plate, having, in part or in whole, the palatine portion of the plate made of flexible material, D, in connection with a compound cavity or series of cavities, united, or otherwise, with a cavity on the center or palatine portion of the plate, and upon the internal or external (or both) borders of the alveolar ridge, substantially as and for the purpose specified.

78,670.—TIMOTHY W. JOHNSON, Granger, Ohio.—*Farm Gate.*—June 9, 1868.—The parallel links

cause the gate to rise, so as to avoid obstructions, while it is being opened by means of the shaft, lever, and connecting link.

Claim.—The links B B', gate A, links F, shaft H, and lever G, as arranged, in the manner as and for the purpose set forth.

78,671.—WILLIAM C. JONES, Orangeville, Ohio.—*Sheep-Shearing Table.*—June 9, 1868.—The table is tilted, the sheep backed upon it, and the table then restored to its horizontal position. The sheep is held by straps and rests upon the curved block while under the operation of the shears. The spring-supporting rests sustain the leaves in the several positions they are made to assume in turning the sheep.

Claim.—1. The tilting table B, with the folding leg M.

2. The spring-supporting rests E E, in connection with the notches J, in the legs C C.

3. The bed B, provided with leaves A A, secured in position by the hook G and staple H.

4. The block D, in combination with the straps I and F F, all operating in the manner described, and for the purposes set forth.

78,672.—ELI KEITH, Wabash, Ind., and ALFRED A. EYLAR, Pontiac, Ill.—*Composition for Tanning.*—June 9, 1868.—Either terra-japonica, gambier, cutch, or bark may constitute one ingredient, to be used in connection with lye, common salt, and liquor *aluminie compositur*.

Claim.—The tanning composition and process, substantially as herein specified.

78,673.—ZENO KELLEY, New Bedford, Mass.—*Bomb Lance for Killing Whales.*—June 9, 1868.—The head is charged with powder, and when the harpoon penetrates the fish, the bar which is pivoted obliquely in the head serves to release the spring-actuated hammer which explodes the cap.

Claim.—The hammer V, spring h, rod j, pin i, and bar g, in combination with head E, all arranged as and for the purpose set forth.

78,674.—CHARLES T. MASON, Sumter, S. C.—*Electric Fan for Lamps.*—June 9, 1868.—Increasing the draught of air to an illuminating flame by means of a fan operated by electricity as a prime motor.

Claim.—1. The application of electricity, to cause the revolution of a fan for the production of a draught of air, substantially as and for the purpose described.

2. The combination of the electric coil A and fan F, and their respective equivalents, in manner substantially as and for the purposes described.

78,675.—J. VAUGHN MERRICK and WILLIAM H. MERRICK, Philadelphia, Pa.—*Hoisting Apparatus.*—June 9, 1868.—The weight is connected to the cam levers in such a manner that in the event of the breaking of the hoisting rope the cage will be promptly arrested.

Claim.—The combination, with a hoisting cage, of a weight, arranged to move in a contrary direction to the said cage, when the said weight is attached to arresting cams, levers, or their equivalents, all substantially as and for the purpose herein set forth.

78,676.—E. H. MERRILL and H. E. MERRILL, Akron, Ohio.—*Apparatus for Making Bottles of Clay.*—June 9, 1868.—The bar and eccentric roller serve to lock the hinged sections of the mold when closed. A spiral grooved core is forced into the mold, and the bottom, consisting of a circular slab of clay, is then inserted in the large open end of the bottle. The disk is then slidden up until it covers the opening of the mold and the bottom of the bottle, against which it is pressed and rotated, thereby uniting the bottom to the bottle.

Claim.—1. The combination of the bar G, adjusting stays a, roller F, and bottle mold, in the manner substantially as described.

2. The disk C', provided with curved or radial arms or grooves D', terminating within a short distance of the margin of the disk, leaving a rim around the entire edge, for the purpose set forth.

78,677.—MARTIN METCALF, Grand Rapids, Mich.—*Machine for Grooving and Swaging Sket*

Metal.—June 9, 1868.—The function of this machine is to lock and finish a joint of pipe or other seam. The length of pipe being first prepared by having its locks turned, is drawn into the machine by two rollers of the small frame, it being grooved as it passes in, and beaded and swaged in at its small end; in passing out of the machine the seam is turned down and finished.

Claim.—1. The peculiar arrangement and construction of the small frame C C C C, with the rollers 1 2, and the oscillating shaft *d*, Fig. 2, substantially as and for the purpose specified.

2. The construction and arrangement of the small frame C C C C, with the rollers 1 2, and the shaft *d*, in connection with the small lever *b*, slot *f*, and stop pin *n*, substantially as and for the purpose described.

3. The combination of the parts constituting the small frame, with its shaft *d*, rollers 1 and 2, cog wheels 1' 2' 3, lever *b*, and thumb screw *h*, with the large frame A A, the stationary roller 4, and swage rollers B B, and eccentric lever D, substantially as and for the purposes specified.

78,678.—ADOLPH A. MEYENDORFF, New York, N. Y.—*Distilling Apparatus.*—June 9, 1868.—The objects of this invention are to prevent loss of the alcoholic contents of the mash, separate the spirits according to their degree of purity, and decompose the condensed liquid in the rectifier so as to cause it to give off any alcohol it may contain.

Claim.—1. Arranging in one distilling apparatus two stills, and connecting them by means of pipes, in such manner that the vapors of one can be forced through the mash in the other, substantially as herein shown and described, for the purpose of completely extracting the alcoholic contents of the mash, as set forth.

2. Arranging, in combination with the double still A B, a testing apparatus, consisting of a tub, *f*, and worm *e*, and so operating that the strength of the mash can be ascertained directly from the still, as set forth.

3. The vapor collector G, arranged between the still and rectifier H of a distilling apparatus, substantially as herein shown and described, for the purpose of condensing the weakest and most impure contents of the vapor, as set forth.

4. The rectifier H, when provided with false bottoms *g* and *h*, between which detaining devices *l* *l* are arranged, and, when so arranged, that all liquids condensed above the lower false bottom *g* are, by means of pipe *j* and K, or *j* alone, separated from the low wines in the lower compartment of the rectifier, substantially as herein shown and described.

5. The vessel L, containing decomposing or flavoring ingredients, when arranged in combination and connection with the rectifier of a distilling apparatus, substantially as herein shown and described.

6. A distilling apparatus, consisting of two boilers A B of a vapor collector, G, rectifier H, column I, and final condenser J, and of a vessel, L, containing decomposing or flavoring ingredients, all made and operating substantially as and for the purpose herein shown and described.

78,679.—HENRY M. MYERS, Alleghany City, Pa.—*Manufacture of Shovels.*—June 9, 1868; antedated June 5, 1868.—The blank is so formed that it may be drawn or "plated" out by passing it backward and forward between suitable rolls, the drawing action of which is always in a line parallel to the longitudinal plane of the blade and handle straps of the shovel.

Claim.—A blank, for the manufacture of shovel blades, made of steel or iron, of the form, and with the tang portion split, substantially as herein described, and for the purpose set forth.

78,680.—THOMAS NEWMAN, New Orleans, La.—*Switch for City Railroads.*—June 9, 1868.—The supplemental bars are designed for use upon those city roads that, beginning with one, run into two tracks. It necessitates the use of differently constructed wheels upon the two sets of ears.

Claim.—The supplemental short bars B, in combination with an ordinary switch, C, at the point at which a single track city railroad runs into two tracks, when constructed as shown and described, for the purpose set forth.

78,681.—WILLIAM T. NICHOLSON, Providence, R. I., assignor to THE NICHOLSON FILE COMPANY, same place.—*Machine for Cutting Files.*—June 9, 1868; antedated June 5, 1868.—The cutting edge of the tool is much longer than the cut which it is required to make, but the whole length of the cutting edge is made use of progressively during the process of cutting the blank from tip to heel.

Claim.—In a file-cutting machine, a "rolling bed," whose longitudinal axis is set angularly with the line of motion of the carriage, or of the cutting chisel if the former be stationary and the latter movable, in combination with such cutting chisel, substantially as described, for the purposes specified.

78,682.—M. L. NICKELS, Dunlapville, Ind.—*Grain Drill.*—June 9, 1868.—The reciprocating motion of the seed slide is derived from the ground wheel, the connection being made by the slotted arms and curved pitman.

Claim.—The arrangement of the slotted arms C C, pitman D, slides F F, and plates H H, with the frame A, and its hoppers I, when the several parts are constructed and operating substantially as and for the purposes set forth.

78,683.—J. E. NOLAN, Chicago, Ill.—*Shoe Brush.*—June 9, 1868.—The small brush is so applied that it may revolve and be made to wear evenly.

Claim.—The combination of the brush B with the piece *b*, projection *d*, the connecting piece *a*, the screw *c*, and brush A, as specified.

78,684.—WILLIAM W. NORTON, Dundee, Ill.—*Machine for Threading Thimble Skeins.*—June 9, 1868.—The adjustable slide supports a head and has fixed to it a detachable device for holding the larger end of the skein in position when the screw threads are being cut; an adjustable lever is arranged to slide on a rod attached to the bed plate and is employed to operate the adjustable slide, and the dies which cut the screw are operated by a lever pivoted to the bed plate.

Claim.—1. The improved machine for threading thimble skeins, consisting of the parts herein specified and shown, all constructed and arranged as described.

2. The device G, with the lug H thereon, the slide A' having a head, B, the rod C, slide D, lever E, and hook F, all constructed and arranged substantially in the manner set forth.

78,685.—DANIEL E. PARIS, Troy, N. Y.—*Grate and Ash Sifter in Cooking Stoves.*—June 9, 1868.—The grate is operated from the outside of the stove and is designed as an improvement on the one for which a patent was granted to the same party December 31, 1867.

Claim.—1. A fire grate made in two parts, having journals eccentrically attached, and arranged to dump or discharge its contents from the center of the fire box, whenever the two parts are moved off their supports and allowed to fall down perpendicularly, substantially as described.

2. The elongated points *o o*, on the shaker E, or stops on the side plate of the stove for the shaker to strike against, or an equivalent therefor, which shall prevent the shaker from driving either part of the grate in too far when in use, and so as to prevent it from dumping while in operation.

3. The support bars *e e*, placed over and in combination with a vibrating fire grate, for the purpose herein described and set forth.

4. A sifting pan, situated below or in front of a fire grate, having attached to its bottom, sides, or ends, two or more open movable sifting grates or sieves, and arranged to vibrate inside of the stove, by means of a pronged or double shaker, operated from the outside of the stove, substantially as herein described and set forth.

5. The lifting and sifting grate G H, or equivalent, in the hearth of a cooking stove, provided with journals I I, projecting through the hearth, and adapted to be shaken or vibrated from the outside, substantially as shown and described.

6. A bail, attached to a sifting pan, or to its movable bottom grate or grates, and so arranged as to move the grate or grates backward and forward, by

raising said bail up perpendicularly and letting it down horizontally, substantially as herein shown and described.

78,686.—DANIEL E. PARIS, Troy, N. Y.—*Water Reservoir Attachment to Cooking Stove.*—June 9, 1868.—The extension piece or reservoir seat is projected backward beyond the back of the water reservoir sufficiently to form a covering to a warming closet or hot oven attached to and supported by said extension piece.

Claim.—1. A cooking stove, constructed to be used with or without a water reservoir, by means of an opening through the back of the stove, through which the flue passes when used with a reservoir, and which is closed by a movable piece, or by a "pipe collar bag," when used as a plain top stove, substantially as herein shown and described.

2. A pipe collar, or a flue opening, through the rear part of the top plate of a cooking stove or range, arranged to receive a smoke pipe, also an opening through the back plate of the stove, arranged to receive a reservoir seat or flue chamber, so that either opening may be used separately or alternately as an exit passage, substantially as and for the purpose described.

3. A reservoir or water tank, having the whole or a part of the bottom surface elevated sufficiently far to sit over an ordinary pipe collar, and so that the outer edges of the reservoir will set down level on the stove top, substantially as herein shown and described.

4. The extension piece or reservoir seat D, serving both as a sunken pit or flue chamber, underneath the reservoir, and also as a top covering to a warming closet, when said piece or seat is fitted to and combined with an ordinary stove top, and so arranged that the stove can be used with or without said piece, substantially as herein described and set forth.

78,687.—DANIEL E. PARIS, Troy, N. Y.—*Oven of Cooking Stove.*—June 9, 1868.—Admits of direct radiation from the fire box into the oven through the back fire plate and the front oven plate for roasting or broiling, but this direct radiation is shut off when the oven is used for baking.

Claim.—1. The heating of the oven of a cooking stove by direct radiation from the fire box through the plates intervening between the two, when said plates are constructed with bars and damper, substantially as and for the purpose described.

2. The broiling pan, and rack P and R, constructed and located as and for the purpose described.

3. The self-supporting oven slide I, constructed and arranged as herein shown and described.

4. A slide or rack, placed at or near the bottom plate of the oven, either over or under it, and made self-supporting when partly or mostly drawn out, substantially in the manner and for the purpose herein described.

5. A movable self-supporting roasting spit or rack, arranged with hooks, or appliances for holding meat while roasting, placed at or near the top part of the oven of a cooking stove or range, in the manner substantially as and for the purpose described.

6. A movable oven crane or rack, made to swing in or out of the oven of a cooking stove or range, placed at or near the bottom, or at the top of the same, or attached to the back oven plate, substantially as and for the purposes herein described.

7. For stove ovens, a movable self-supporting rack or spit, for holding meat while roasting, in combination with a movable self-supporting oven slide or crane, made for holding a dripping pan, and placed underneath said spit or rack.

78,688.—DANIEL E. PARIS and CHARLES S. DAVIS, Troy, N. Y., assignors to D. E. PARIS, same place, and CLEMENT OLHABER, Cincinnati, Ohio.—*Hot Water Tank on Cooking Stoves.*—June 9, 1868.—A hot water reservoir, designed for attachment to any common stove top.

Claim.—1. The horizontal flue in or under the bottom of the reservoir, formed by elevating a part or the whole of the bottom above the outer lower edges of the reservoir sufficiently high to allow the products of combustion to pass rearward under the same into the exit-pipe, substantially as described.

2. The base slide or bottom piece *g g*, or its equivalent, made either permanent or movable, and forming the rear part of the bottom to said horizontal flue, and connecting both with the reservoir and the back flue piece *G* or its equivalent, substantially as herein described and set forth.

3. The self-mounting cover or covers *C C*, together with the back piece *D*, formed with the concave prongs *N N*, the convex half rounds *O O*, the crooked hooks *L*, and the elongated slot *M*, or their equivalents, so arranged and hung that the drip of the cover shall fall back into the reservoir.

4. The attaching, fastening, or supporting a reservoir to or by a stove top, by means of bolts, pins, bars, hooks or lugs, inserted in or through the ordinary pipe collar or exit passage opening of the top plate of the stove.

78,689.—A. B. PARSONS, Dunton, Ill., assignor to himself and EDWARD REDHEAD, La Crosse, Wis.—*Tube Well.*—June 9, 1868.—The tube is grooved vertically and has a coil of wire around it, and is covered by a cylindrical screen; the object being to obtain a protected space to insure the entering of the water into the tubes.

Claim.—The combination of the tube *B*, provided with grooves and holes, the spirally arranged wire coil *E*, and the gauze screen *F*, arranged and operating in the manner and for the purposes set forth.

78,690.—JOHN W. PUGH, Grand Rapids, Mich.—*Caster.*—June 9, 1868.—The edges of the slot in the sliding plate engage the grooves in the caster shank and hold the latter in place.

Claim.—The disk *A*, with a square opening in its center, and provided with a space within which works a slotted metal plate, *C*, when used in combination with the caster, having a shank, *B*, with grooves on three sides, as herein set forth, all constructed and operating substantially as specified.

78,691.—AMOS D. PURINTON, Dover, Mass.—*Composition for Setting Posts, Timber, &c.*—June 9, 1868.—Composed of water, clay, and pyroligneous acid, and is run into the hole prepared in the earth for the post or timber.

Claim.—The above-described argillaceous composition, as well as the employment or use of it, substantially in manner, and under circumstances, and for the purposes, as described.

78,692.—JULIO H. RAE, Syracuse, N. Y.—*Lumber Drier.*—June 9, 1868.—The water resulting from the condensation of the vapor eliminated from the material to be dried is allowed to flow out through the gutters and traps, but the latter prevent the escape of heat. The vapor rising from the water contained in the wells supplies the requisite quantity of moisture to prevent the checking or cracking of the lumber.

Claim.—A kiln, *A*, for drying lumber, peat, or other materials, containing the following combination, to wit, a corrugated metallic roof and metal lining, *r a*, gutters *d e*, traps *h*, and wells *F*, substantially as and for the purpose described.

78,693.—O. P. RICE and J. H. GERRY, Springfield, Mass.—*Stem Winding and Setting Watch.*—June 9, 1868.—By withdrawing the winding arbor from the stem of the watch the winding gear is disengaged and the gear for setting the hands engaged.

Claim.—The reciprocating arbor *K*, having the incline *d* and annular groove *e*, in combination with the segment *x*, spring lever *q'*, when constructed and operating substantially as herein described and set forth.

78,694.—JOHN SHELLABERGER, Shane's Crossings, Mo.—*Tile Cutting Machine.*—June 9, 1868.—The clay tube is cut into lengths by wires attached to pivoted carriers. When the latter are operated independently the cutting wires move in a circular path, giving a corresponding convex and concave shape to the cut ends of the pipe. The frame and cutting wires can be operated in a vertical plane so as to cut in a direct line across the tube.

Claim.—1. The pivoted cutters *C E D F*, con-

structed and operating substantially as and for the purpose described.

2. The hinged frame B, in combination with the cutters C D E F, for the purpose of adapting them to cut in a vertical plane, substantially in the manner and for the purpose specified.

78,695.—WILLIAM C. SMITH, Warrensburg, Mo.—*Sugar Evaporator.*—June 9, 1868.—The upper pans are filled with juice containing the defecating agent, and the flue dampers are adjusted so as to direct the entire heat under one of said pans, and subsequently under the other pan. As the contents of the pan in front of the driver are reduced by evaporation they are kept at the desired depth by an occasional movement of the crank. The series of dampers check the boiling at the finishing end of the pan.

Claim.—1. The pan A A, as arranged on the body R of the device, and in connection with the flues formed by the partition D and the dampers *m m*, and the pan B B, divided by the partition *r*, having a gate, *h*, when used in connection with the movable frame F, carrying the skimmer *i*, and a driver, J, moving upon the cogs L by means of the cog wheels *c*, operated by the cranks *n n*, and used substantially as described, and for the purposes set forth.

2. The dampers *g g g g*, with the connecting bar G, and the ash pit S, when applied to a sugar evaporator, substantially as and for the purpose specified.

78,696.—CALEB S. STEARNS, Marlboro, Mass., assignor to himself, CHARLES F. DAVIS, and THOMAS COREY, same place.—*Machine for Cutting Leather.*—June 9, 1868.—An improvement on his patent of September 25, 1866. The presser block employed in the previously patented machine is dispensed with, the cutter being depressed by a mechanism attached directly to the frame, and thrown into action at the required time by a clutch.

Claim.—1. Attaching the cutter or die to a movable frame, so that it can be brought over any portion of the table B, in combination with a mechanism attached directly to the frame and moving therewith, for depressing the cutter, substantially as described.

2. The frame U, in combination with the movable frame C and the clutch for throwing the mechanism into action, which operates the cutter, substantially as set forth.

78,697.—CALEB S. STEARNS, Marlboro, Mass., assignor to himself and THOMAS COREY, same place.—*Machine for Splitting and Rolling Leather.*—June 9, 1868.—The leather, having been split, is led down between the carrying cylinder of the splitting machine and a roller, which is brought up thereto and made to press it upon the surface of the cylinder. A spring presser bar is provided with independently acting blocks to insure the feeding of the leather to the knife and insure a strip of uniform thickness. The knife, instead of the carrying cylinder, is adjusted in order to regulate the thickness of the leather to be split.

Claim.—1. The roller S, for rolling leather, in combination with the carrying cylinder C, when the roller S is acted on by levers T, or their equivalent, all constructed and arranged substantially as and for the purpose described.

2. The blocks M, with the springs N, acting independently of each other, and constructed substantially as described.

3. The screws Q and plates R, in combination with the knife E, substantially as set forth.

4. The roller D, for feeding the split leather out of the machine, when used in combination with the carrying cylinder C, and arranged substantially as and for the purpose set forth.

78,698.—AMBROSE TOWER, New York, N. Y.—*Pen and Pencil Holder.*—June 9, 1868.—The stamped plate is formed into a pen slide, which is fitted to move within the pen barrel. An ordinary lead-pencil is likewise fitted to slide in the barrel and serves as the penholder. The pencil may be slid out of and retracted within the barrel independently of the pen, and *vice versa*.

Claim.—A pencil-point protector, having barrel *i*

and slot *s*, in combination with the stamped plate, Fig. 1b, constructed and operating substantially as specified, and all equivalents of the same.

78,699.—JAMES TYZICK, St. John, New Brunswick.—*Nail Extractor.*—June 9, 1868.—A pin prevents the clasp of the fulcrum from sliding off the bar. The respective functions and conjoint operations of the three parts are obvious.

Claim.—The combination of the lever A, sliding fulcrum D, and hook or griper E, the whole constructed and arranged to operate substantially as specified.

78,700.—JOHN UNDERWOOD, Muscatine, Iowa.—*Harvester Rake.*—June 9, 1868.—The grain, as it is felled by the cutters, is moved backward and upward and delivered upon a platform, upon which it is moved laterally toward the inner side to a position where it may be conveniently bound by hand.

Claim.—1. The combination of a revolving rake and gatherer, a concave grain receiver, B, a rear elevated platform, C, a reciprocating follower, P, and a binder's support, K or D, operating substantially in the manner and for the purposes described.

2. The revolving rake and gatherer, with its teeth applied to a rocking bar, in combination with the devices described and shown for causing the teeth to assume in their circuit the different positions required, and with a concave grain receiver, substantially as and for the purpose described.

3. The binder's support K, which is attached to the finger-bar, in combination with the elevated platform C and reciprocating follower P, substantially as described.

78,701.—ARZY EMONS VAN GIESON, Newark, N. J., administrator of the estate of AMZI H. VAN GIESON, deceased, assignor to NEWARK PATENT LEATHER COMPANY.—*Knife for Splitting Leather.*—June 9, 1868.—The knives are of great length, the blade is made in pieces of convenient length for tempering, such pieces being secured together by clamps or otherwise.

Claim.—The construction of a knife for splitting leather, in sections, forming together a continuous knife, substantially as hereinbefore set forth.

78,702.—ABRAHAM V. W. VAN VECHTEN, New York, N. Y.—*Head and Shoulder Rest.*—June 9, 1868.—The main strap is suspended from the ceiling or side of a room, over a bed or chair, or from the roof or side of a car, over a car seat, the occupant of the seat or bed being thereby enabled to support his head and body in a comfortable position.

Claim.—A head and shoulder rest, composed of the main strap A, branches B, loops D, and head rest E, all as shown and described.

78,703.—SAMUEL WEHRLY, San Francisco, Cal., assignor to himself and E. V. SUTTER, same place.—*Spur.*—June 9, 1868; antedated May 4, 1868.—The curved steel dog is inserted between the top of the heel and the counter of the boot. The strap attached to the plates which slide upon the main band is adjusted snugly against the front part of the boot heel, the springs force the arms against the racks, and thus the spur is held firmly upon the heel.

Claim.—A spur, having the dog *o*, the rack *m*, and arm *d*, together with the spring *c* and slotted plate *b*, the whole constructed and operating substantially as and for the purpose described.

78,704.—ISAAC P. WENDELL, Philadelphia, Pa.—*Lubricating Journal of Car Shaft.*—June 9, 1868; antedated May 23, 1868.—An air chamber, an oil distributing plate, and a tube are so combined that the pressure of the air in said chamber assists the tubes in supplying the journals with oil; the chamber being designed as an additional improvement upon the invention set forth in a United States patent granted the same party January 1, 1867.

Claim.—1. The combination of the air chamber D with the oil-distributing plate B and supply tube C, arranged in the oil box A, or other oil reservoir, substantially in the manner above described, and for the purpose set forth.

2. The box A, having a division plate, *a*, and oil

chamber, *b*, beneath it, in combination with the distributing plate *B*, substantially as described and for the purposes specified.

3. The construction of the distributing plate *B*, with inclines and scrapers, substantially as described and for the purpose set forth.

78,705.—JOHN L. WHIPPLE, Detroit, Mich.—*Spring Seat*.—June 9, 1868.

Claim.—The spring seat herein described, the same formed by the combination with the frame *A* of the series of double-coil springs *D* on the four sides thereof, and having their loops or bights pointing inwardly, and connected by the transverse and longitudinal interlaced webbing, as and for the purpose set forth.

78,706.—MELVIN WOOD, Babe's Corners, Mich.—*Churn*.—June 9, 1868.—The dashers are operated in a cream chamber situated in a box for containing hot water.

Claim.—The combination of the box *A*, posts *B B*, double crank *C*, the connecting rods *D D*, the oscillating dashers *E E*, the cover *F*, the false bottom *G*, the openings *H I J*, and the balance wheel *K*, and water spaces *L L*, when arranged and operating for the purposes herein set forth.

78,707.—WILLIAM P. YEOMAN, Waukegan, Ill.—*Machine for Edging Wall Paper*.—June 9, 1868.—An adjustable table supports the paper and guides it between the rolls, which are covered with cloth and provided with circular knives, and a spring for keeping them in position for trimming the edges of the paper.

Claim.—1. The combination of rollers *J K*, spring *P*, knives *S S*, cloth *m m*, and rings *N O*, substantially as and for the purpose set forth.

2. The combination of the table *D* with rollers *J K*, substantially as herein specified.

78,708.—G. W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY, same place.—*Harvester*.—June 9, 1868.—When the driver depresses the lever the easter wheel constitutes a fulcrum therefor, and the point at which the bar carrying said wheel is pivoted to the shoe being thereby raised, the whole shoe, together with the enter bar and lower part of the frame, is raised at the same time.

Claim.—1. The frame *A* of a mowing machine, when constructed of a single bar, *a*, approximating in form to a horseshoe, and a transverse strengthening bar, *b*, when the extremities of the bar *a* are bent down for the attachment of the shoe *E*, and finger-bar, substantially as herein shown and described.

2. In combination with the above, the main wheel *C*, when arranged between the driver's seat and the transverse bar *b*, substantially as and for the purpose set forth.

3. The wheel *J* on the hinged bar *I*, in combination with the slotted shoe *E* and with the lever *f*, all made and operating so that the finger bar can be easily raised by means of the lever *f*, as set forth.

78,709.—G. W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY, same place.—*Harvester*.—June 9, 1868.—On the platform is a seat for the person who binds the grain. To adapt the quantity of grain cut to the ability or skill of the binder, one of the shoes at the end of the finger bar is adjustable so that the width of the swath may be varied.

Claim.—The movable adjustable shoe *G*, when arranged substantially as described, so as to adjust the width of the swath to the capacity of the binder, as set forth.

78,710.—G. W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY, same place.—*Harvester*.—June 9 1868.—The finger beam is hinged to a bar or holder, which is pivoted to the frame and connected at its free end to a rope operated by a lever which may be locked in a ratchet plate so as to hold the finger beam at any desired height. The guide posts brace the bar or holder against horizontal strain.

Claim.—The described combination with each

other of the finger bar *G*, finger-bar holder *F*, pivot *a*, posts *J* and *J'*, cord or chain *b*, and lever *H*, all made and operating substantially as and for the purpose herein shown and described.

78,711.—G. W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY, same place.—*Harvester Reel*.—June 9, 1868.—The reel is adapted to grain of different heights, and is so constructed that it shall not thresh out the grain while bearing it to the action of the entters.

Claim.—1. Making the sweeps of harvester reels of flexible bands or straps, substantially as herein shown and described.

2. Making the arms by which the sweeps of a harvester reel are connected with the shaft *A* of spring metal, so that they can be folded against the shaft when the sweeps are taken off, as set forth.

3. A harvester reel, when composed of the shaft *A*, spring-bars *B*, and bands or straps *C*, the latter being adjustable on the bars *B*, and all made and operating substantially as herein shown and described.

78,712.—G. W. N. YOST, Corry, Pa., assignor to CORRY MACHINE COMPANY, same place.—*Mowing Machine*.—June 9, 1868.

Claim.—1. Hanging or pivoting the vibratory lifting bar *Q* upon the crank shaft, substantially as and for the purpose set forth.

2. In combination with the vibratory or lifting bar *Q*, the stationary segment, traveling pinion and hand lever, or its equivalent, by means of which the said bar *Q* may be readily manipulated by the driver, which at the same time it is free to move, as required, when not controlled by him, substantially as described.

78,713.—NICHOLAS E. YOST, Corry, Pa.—*Road Scraper*.—June 9, 1868.—The coupling bolt at the converging ends may be withdrawn and the opposite ends of the timbers brought together and held by said bolt.

Claim.—1. The reversible timbers *A A'*, pivoted upon a center brace, when constructed and operating substantially as and for the purposes set forth.

2. The timber *A*, in combination with the two plow points, *B B'*, constructed and operating substantially as and for the purposes set forth.

3. The timber *A'*, in combination with the two eastings *C C'*, constructed and operating substantially as and for the purposes set forth.

4. The extension brace *E E'*, in combination with mortise *e*, tongues *f*, bolt *g*, and castings *D D'*, constructed and operating substantially as and for the purposes set forth.

5. The tongue *I* and cross-bar *J*, when secured to the scraper by means of bolts *c* and *g*, and in combination with the timbers *A A'*, constructed and operating substantially as and for the purposes set forth.

78,714.—J. C. ZIMMERMAN, Eberly's Mill, Pa.—*Corn Sheller*.—June 9, 1868.—The inclosing case of the sheller is made in sections which are permitted by the springs to expand and contract according to the size of the corn to be shelled.

Claim.—The combination of the casing *B*, its springs *x x* and sheller *F*, with the sieves *S R*, fans *h h*, conveyer *P*, operated, the shafts *D H* and their eogs, the whole constructed as and for the purposes specified.

78,715.—WILLIAM ARMOUR, Belfast, Ireland.—*Paper Box*.—June 9, 1868.—The two main parts, which are joined by the flexible connection, are of pasteboard covered by thin or ornamental paper, and each is provided with a cover. The box is held in a closed position by an elastic band made fast to one of the main parts.

Claim.—1. A paper box, composed of the two covered boxes *A A*, united by the hinge *a*, in the manner described.

2. The elastic fastening *C* to the hinged boxes *A A*, as described.

78,716.—BENJAMIN ARNOLD, East Greenwich, R. I.—*Net for Fishing*.—June 9, 1868.—This net is made of a single strand of small twine, the object

being to expedite and cheapen the manufacture of the article, by obviating the frequent filling of shuttles and the doubling and twisting operations heretofore required.

Claim.—1. The method herein described of inter-looping, twisting, and forming a net of a continuous length of cord, substantially as described.

2. Netting constructed as herein described, as a new article of manufacture.

78,717.—JOHN BINNS, OSKALOOSA, Iowa.—*Flue Block.*—June 9, 1868.—The block encircles the stove pipe where it passes through a partition or flooring. It is molded of clay and then baked to form a material like common brick or fire brick.

Claim.—The combination of the hollow cylindrical block A, having an outer shoulder *a*, the outer cylindrical block C, having internal shoulders *b* under its upper end, to form a square chamber, the core B, sections *e*, and perforated cap E, all constructed and arranged as shown and described, for the purpose specified.

78,718.—WILLIAM BLAY, Helena, Montana Territory.—*Pick Handle.*—June 9, 1868; antedated June 4, 1868.—The strap passes across the end of the handle and down its opposite sides, to which it is riveted. It strengthens the handle and permits the ready attachment and detachment of the pick.

Claim.—The metallic strap B, constructed and applied to the pick handle, as shown, and adapted to be pressed through the eye of the pick, and secured therein by means of a key *m*, as described and represented.

78,719.—WALTER BRITTON, Abingdon, Ill.—*Tire Shrinking and Punching Machine.*—June 9, 1868.—The heated tire is placed in the lugs and keyed fast, and the cam levers being actuated backward the tire is compressed or shrunk. When the machine is to be used for punching holes, a rest plate or stirrup having clamp edges is set on the frame, and a plate having a punching point is keyed to the plate which is actuated by the cam levers.

Claim.—1. The plate D, bearing slotted lugs *a a*, the cam levers E E, spring *b*, in combination with the frame plate G, slotted lugs *e e*, all constructed, arranged, and operating substantially as shown and described, and for the purpose set forth.

2. The plate and punch M and *n*, and stirrup L, for joint use with the subject-matter of the preceding claim, in the manner and for the purpose described.

78,720.—EDOUARD CHÂTELAIN, St. Imier, Switzerland, assignor to ERNEST FRANCILLON, same place.—*Watch.*—June 9, 1868.—A mechanism for winding and setting watches by means of the stem, a longitudinal motion of the same throwing it into gear with the barrel or with the minute wheel.

Claim.—1. The sliding stem carrying the loose wheel B, and the sliding clutch C, in combination with the oscillating levers D and E, which operate so that the clutch will, by them, be moved in an opposite direction to the sliding motion given to the stem, substantially as and for the purpose herein shown and described.

2. The above in combination with the spring F, made and operating as described.

3. The loose bevel-gear wheel B, which is only turned when connected with the sliding clutch C, in combination with the bevel-gear wheel H, by means of which motion is imparted to the wheel which winds up the spring, as set forth.

78,721.—ANDREW CLARK, Lafayette, Ind.—*Apple Parer, Corer, and Slicer.*—June 9, 1868.—An apple is placed on the fork and pared by turning the crank. Another apple is then placed above, in contact with the first, and the treadle pressed upon causing the cross-piece to bear the second apple and the fork downward, when the pared apple encounters the coring tube and the radial cutters whereby the apple is severed into a number of parts.

Claim.—1. The cam plate R and its dependent mechanism, substantially as described, for the purpose of paring apples and other similar fruit, all as set forth.

2. A sash, D *ff* C, and a yielding fork, O, with its

proper mechanism, substantially as described, in combination with the radial cutters *c*, coring tube *d*, and cylinder V, all as set forth.

3. The cam plate R, wheel T, plate S, and arm U, all constructed and operating substantially as and for the purpose set forth.

4. The arrangement of the several parts of the machine, substantially as shown and described, and for the purpose set forth.

78,722.—E. DETWILER, Milwaukee, Wis.—*Spittoon.*—June 9, 1868.—The cover is raised by pressure upon the treadle, and falls back to its place, closing the spittoon, when the pressure is removed.

Claim.—A spittoon, constructed with outside shell A, with cover B, with inside curb C, with receptacle D, lever E, with treadle F, and connecting-rod H, secured together with springs I I, substantially as and for the purpose specified.

78,723.—RUDOLPH D'HEUREUSE, San Francisco, Cal.—*Friction Railway Brake.*—June 9, 1868.—When the cars are to be stopped the wheels are lowered upon the rails, and the brake blocks pressed into their grooves from above.

Claim.—The double-flanged or grooved wheels for brakes on railway cars applied and operated substantially as herein described and represented.

78,724.—JOSIAH DODGE, Grass Valley, Cal.—*Hoe.*—June 9, 1868.—The forks of the shank brace the pick and hoe blade respectively, the pick being intended to fulfill the requirements of deep cultivation, and work the ground where a plow could not be conveniently used.

Claim.—In combination with a hoe, the pick B and the forked shank D, substantially as and for the purposes herein shown and described.

78,725.—LUTHER H. DODGE, Oshkosh, Wis.—*Shingle Machine.*—June 9, 1868.—The carriage holding the shingle block is moved back from the saw by the positive action of a revolving arm and stud, the object being to dispense with the use of the objectionable spring commonly employed for the purpose in question.

Claim.—The combination of the shaft P, sleeve *m*, bevel wheels M N Q L, the arms *a b*, arm D, and plate E of the carriage, substantially as described, for the purpose specified.

78,726.—PATRICK W. DOLAN, Jersey City, N. J.—*Tailors' Rule.*—June 9, 1868.—The head-piece is placed in the crotch, and the rule extended to a point as near the floor as may be desirable. The remaining measurements are taken with the tape, and noted in the usual manner.

Claim.—1. The rule, consisting of the parts A C, grooved in each edge, to receive the ends of the clasps D E, the latter being provided with a set screw, G, all constructed and arranged to operate in the manner and for the purpose substantially as herein set forth.

2. In combination with the adjustable rule A C, the head-piece F, having a curved upper surface, and the pivoted tape H, substantially as and for the purpose set forth.

3. The adjustable rule A C, provided with the head-piece F, shaped substantially as shown, and the tape measure H, the whole arranged substantially as described, for the purpose specified.

78,727.—JOHN F. W. DORMAN, Baltimore Md.—*Brush.*—June 9, 1868.—The packages of bristles are designed to be made and sold independently of the handle, a device being provided to enable them to be readily attached and detached.

Claim.—The combination of the package A, when constructed as described, with the handle B, having a male screw on its lower end, and the tapering ferrule D, having at its upper end a female screw, to receive and hold the handle, the several parts being constructed to operate in the manner and for the purposes set forth.

78,728.—FRANK DOUGLAS, Norwich, Conn.—*Planing Machine for Wood.*—June 9, 1868.—A method of adjusting the cutters in the head, adapt-

ing them to be held more firmly, and enabling two single or cap cutters to be employed; also, a peculiar form of spindle and method of attaching it to the shaft, whereby it may be instantly and accurately adjusted; also, a method of adjusting the spindle shaft, enabling it to be readily adjusted and oiled.

Claim.—1. The braces *e e*, when constructed in the double inclined form, and used in connection with the plug or wedge *F*, in the manner and for the purposes specified.

2. The fixed guide *G*, when employed in connection with the cutter head *C*, and the table *E*, substantially as and for the purpose set forth.

3. The combination of the tapering spindle *B*, having a cylindrical screw on its lower end, with the tapering socket, having its lower end cylindrical, and cut into a female screw to receive the screw on the lower end of the spindle, when said parts are constructed to operate in the manner described, and employed for the purpose of attaching a cutter head to its shaft:

4. The combination of the taper-bearing box *n* with the oil cup *m*, when made so as to slide one on to the other, to adjust shaft *A* to its proper bearing, and to compensate for the wear of said parts in the manner specified.

78,729.—GEORGE A. FAIRFIELD, Hartford, Conn.—*Sewing Machine.*—June 9, 1868.—In this machine novel means are employed for lubricating the bearing surfaces of the needle bar, the journal of the thread conductor, and the needle bar actuating link; also for regulating the feed and the tension of the thread, adjusting the pressure of the foot, and preventing rattling of the shuttle during operation.

Claim.—1. The combination, with the oil hole above the needle bar, of the crossing distributing passages in the top of the needle bar, whereby all the sides or faces of the bar may be oiled at the same time from a single orifice and from the outside of the casing.

2. The combination, with the oil grooves in the needle bar, of the orifice for conducting oil to the axis or pivot of the thread conductor, substantially as shown and described.

3. The combination, with the devices last above claimed, of an oil passage, for lubricating the link which actuates the needle bar.

4. The tension device described, the same consisting of a flanged roller, and a rigid curved yoke spanning part of its periphery, and adjustable, as to its pressure, by a spring.

5. As a means for varying the feed, the employment of an adjustable rod, having a pin or projection thereon, movable within a slotted sleeve, upon the rock shaft, that imparts motion to the feed bar, substantially as shown and described.

6. The combination, with the lever *q*, and its plate, of the rod, sleeve, and rock shaft, substantially as and for the purpose set forth.

7. The spring *R*, for imparting adjustable pressure to the presser foot, when constructed, arranged, and operating as described.

8. A shuttle race, slightly inclined to the line of traverse of the shuttle driver, as and for the purpose set forth.

9. A shuttle race and shuttle driver race, cast in one piece, when the same are in lines which approach each other.

78,730.—LEVI S. FALES, New York, N. Y.—*Manufacture of Fertilizers.*—June 9, 1868.—The nitrogenized material is placed in a tank and subjected to the action of steam, generated from the waste ammoniacal water of gas factories and waste acid from oil refineries. The mass is thus dissolved to a pasty consistency, and being afterward allowed to cool, assumes the form of fine powder. A preparation of blood and sulphuric acid, diluted with water, is added to the powdery mass, and the whole incorporated with peat or sea sand.

Claim.—1. The within-described process of preparing the bones or equivalent highly-nitrogenized substances, previous to their admixture with other materials, substantially as herein set forth.

2. The manure composed of the several materials set forth, combined in the manner and in about the proportions herein specified.

78,731.—WILLIAM T. FRY, New York, N. Y.—*Breast Pump.*—June 9, 1868.—The purpose of the breast shield is to relieve the nipple of pressure during the operation of the pump.

Claim.—A breast pump, in combination with an India-rubber breast shield, when the latter is applied directly to the milk receptacle of the former, and all arranged substantially in the manner as and for the purpose set forth.

78,732.—E. GIBBS and O. W. GIBBS, Richland Center, Wis.—*Bed Bottom.*—June 9, 1868.—The upper slats, which are mounted upon springs, are confined at the ends within wire loops fastened to cross-bars fixed to the head and foot boards, said loops being covered with cloth to prevent the slats from making a noise when they move.

Claim.—An improved spring bed bottom, formed by the combination of the cross slats *D*, staples *F*, longitudinal spring slats *E*, coiled wire spring *J*, longitudinal spring slats *G*, wire loops *H* wound with cloth, or its equivalent, and cross-slats *I*, with each other and with the side-rails *B* and end-rails *C*, of the bedstead, substantially as herein shown and described, and for the purpose set forth.

78,733.—THEODORE A. GOFF, San Francisco, Cal.—*Apparatus for Turning Wrist Pins, Crank Pins, &c.*—June 9, 1868.—The several parts are readily detached and rejoined in order to bring the cutters into proper position to turn off a cross head wrist pin or crank pin in place. The cutters are adjustably secured to a two-part ring worked by an eccentric pawl and ratchet, and having a sliding, as well as rotary, motion.

Claim.—The arrangement of the several parts of the machine as herein recited, whereby it may be used to turn off a wrist pin or a crank pin in place, as set forth.

78,734.—GEORGE H. GOLDSMITH, Waverly, Ill.—*Sheet Metal Folding Machine.*—June 9, 1868.—By turning the crank a cam on the internal surface of the barrel is brought in contact with a stud pin, whereupon the arm attached to the break bar rises to a vertical position, carrying the break bar with it; and, at the same time, a flute of the revolving roller is brought against the projecting end of the metal, and as said roller revolves the lap is formed. By continuing the turning of the crank the cam is disengaged from the stud pin, allowing the break bar to fall to its primary position.

Claim.—1. The cog-wheel *E*, bearing cam blocks *h*, or other equivalent device, substantially as shown and described, for the purpose of operating the break bar *F*, all as set forth.

2. The arm *i* and stud *k*, or the equivalent thereof, substantially as shown and described, in combination with the break bar *F* and cog-wheel *E*, all as and for the purpose set forth.

3. The fluted roller *A*, substantially as shown and described, in combination with the blade bar *I*, break bar *F*, and cog-wheel *E*, all as and for the purposes set forth.

4. The channel *l* of the blade bar *I*, substantially as shown and described, and for the purpose specified.

5. The pinion *D* and cog wheel *E*, substantially as shown and described, in combination with the roller *A*, break bar *F*, and blade bar *I*, all as and for the purpose set forth.

78,735.—E. R. HALL, Utica, N. Y., assignor to himself, D. M. GOLDEN, and B. G. EATON.—*Horse Hay Rake.*—June 9, 1868.—By pressing on the main lever the pivoted lever is raised from the rear projection, allowing the rake to revolve and discharge the hay, back action of the rake being prevented by the spring stop. An adjustable shaft is provided with cleaners which pass between the teeth of the rake and scatter the hay.

Claim.—1. Levers *m* and *n*, in combination with the stop *h*, substantially as and for the purpose specified.

2. Main lever *H*, constructed and operating in connection with rake shaft *F*, substantially as set forth.

3. The combination of levers *m* and *n* with lever *H*, substantially as described.

4. The employment, in a horse hay rake, of foot

lever T, in combination with pawl S, and connecting rod P, substantially as and for the purpose specified.

7S,736.—LYDIA HAYS, Ames, Iowa.—*Pad Billet.*—June 9, 1868.—The billet is formed of metal and has a series of holes to receive the ends of thumb screws passing through the leather strap of the harness saddle, by which means the billet may be made longer or shorter as required. The lower end of the billet forms a loop to receive the buckle, which is kept in place by a plate screwed to the loop.

Claim.—A metallic pad billet, B, having the buckle E attached, as shown, and secured to the leather strap A by the screws C C, substantially as shown and described.

7S,737.—CHESTER HEALD, Marshalltown, Iowa.—*Sleigh.*—June 9, 1868.

Claim.—A wrought or malleable iron sleigh knee *a a b*, when welded to a cast iron runner, so as to form braces, and to equalize the weight of load on all parts of the runner, substantially as shown and described, in combination with a cross beam plate, H, runners A, cross beams D D, all substantially as shown and described, and for the purpose set forth.

7S,738.—HENRY HENLEY, New Garden, Ind.—*Press.*—June 9, 1868.—One end of the beam is kept in place by an adjustable stirrup, while the other is attached by means of a piece, rectangular at its lower end, which fits into a mortise, and is secured by a pin on which it hinges, while the top of the piece being round forms a swivel.

Claim.—1. The beam *b*, hinged at *n y*, and secured in an adjustable manner to upright *d* by means of stirrup *r*, (or its equivalent,) substantially as set forth and for the purpose specified.

2. The flexible rods *e* and *e'*, in combination with the uprights *d* and *d'*, and beam *b*, substantially as set forth, and for the purpose specified.

3. The door *P*, provided with a track upon its inner side, whereby, when it is swung down in a horizontal position, it receives the carriages C, which are rolled out upon it to discharge their loads, as herein shown and described.

7S,739.—D. H. HEYEN, New York, N. Y.—*Propeller.*—June 9, 1868.—The ball-joint allows the propeller wheel shaft to be moved laterally. In navigating canals by steam, especially when there is a side wind, or in turning short curves, this device enables the bow of the boat to be moved laterally, either with or without headway.

Claim.—1. The combination of the propeller wheel C and shaft D, when adjustable laterally upon the central pivot E, slotted segmental plate F, support G, pinion *h*, upon the upright shaft J, engine shaft O, pulley P, and pulley R, all arranged as described for the purpose specified.

2. The combination of the propeller C, shaft D, having the ball-joint E, slotted segment F, and pinion *h*, upon the shaft J, all constructed and operating as and for the purpose specified.

7S,740.—JOHN C. HOFER, Bell Air, Ohio.—*Coopers' Croze.*—June 9, 1868.—When the two parts are brought together, they form a V-shaped cutting edge, and the manner of attachment adapts the bits to be placed nearer to the edge of the guide, so as to bring the cutting edges against the staves in the most favorable position for action.

Claim.—The bit A, formed in two parts, having the alternate corners of their forward ends beveled or ground off, said parts secured to each other and to the guide B by the slotted clamping bolt C, as herein described, for the purpose specified.

7S,741.—FRANCIS H. HOLTON, Brooklyn, N. Y.—*Nursing Nipple.*—June 9, 1868.—The stop flanch prevents the nursing nipple from passing too far into the infant's mouth.

Claim.—1. The India rubber-nipple, having the annular or circumferential stop-flanch, constructed in one piece therewith, substantially as and for the purpose specified.

2. The hollow flanch *b*, for attaching the nipple to the tube, by means of the perforated button B, substantially as shown and described.

7S,742.—C. S. HUNT, Parish of Terrebonne, La.—*Heating Device for Chairs, &c.*—June 9, 1868.—Designed to keep the human body warm through the

medium of a chair, stool, or the like, under circumstances in which stoves or other ordinary means of heating are not available.

Claim.—A chair constructed substantially as herein described, that is to say, provided with the metal bottom, and the combustion chamber, adapted to receive a gas jet or its equivalent, substantially as and for the purpose described.

7S,743.—GASPAR HUNZIKER, Summit, Miss.—*Apparatus for Distilling Wood.*—June 9, 1868.—

Provision is made for the admission of hot air and steam, and for the escape of hot air and gas; also, for condensation. The apparatus has an interior railway track, so that the wood or other substance to be distilled may be conveniently conveyed into the oven.

Claim.—The oven A, constructed as described, having the rounded lower edges, and the central longitudinal inclined trough G, whose inclined wings, *a*, support the vertical strips and rails *e*, for the carriages C, the inclined plates *a'*, above the wings *a*, the cold-air pipes *y*, beneath said inclined wings, and between the flues F, the top of said oven provided with the condensing dome T, all arranged as described for the purpose specified.

2. The arrangement of the furnaces K, inclined flues F, trough G, cold air pipes *y*, draught pipes *h*, steam pipes *t*, hot air chambers M, and carriage-supporting rails *e*, as herein described, for the purpose specified.

3. The door P, provided with a track upon its inner side, whereby, when it is swung down in a horizontal position, it receives the carriages C, which are rolled out upon it to discharge their loads, as herein shown and described.

4. The furnace flues F, when arranged to pass beneath the curved bottom of the oven A, upon each side of the projecting trough G, and curving outward, extend in an inclined direction upon each side of said oven to the front thereof over the furnaces, to unite in the chimney S, as herein described for the purpose specified.

7S,744.—LYMAN JENNINGS, Winchendon, Mass.—*Shingle Machine.*—June 9, 1868.—

The cutters are moved by cog wheels, which gear with a rake on the top of the back plate, and the shingle block is raised and pressed against the cutters by pinions on the ends of the shaft, which actuates the cog wheels, and which gear with the racks on the lifting uprights.

Claim.—The combination of the horizontally sliding cutters *g g g* and the rack *c* with the wheels I I, pinions *d d*, racks *k k*, for operating the sliding block rest D, as described.

7S,745.—CHESTER L. JOHNSON, Utica, N. Y.—*Top.*—June 9, 1868.—

The top may be made to run within the casing while held in the hand, but if thrown upon the floor, the two will whirl together, by reason of the contact of the upper shoulder of the top with the casing.

Claim.—The top A and casing C, constructed substantially as described.

7S,746.—T. B. JOHNSON, De Witt, Iowa.—*Vise.*—June 9, 1868.—

The vise adapts itself to the shape of the object to be held, whether the same be straight-sided or tapering.

Claim.—1. The elbow shank C, and movable jaw E, constructed and arranged substantially as herein shown and described, in combination with each other, and with the stationary jaw A, and clamping screw D, as and for the purpose set forth.

2. The combination of the spring F with the elbow shank C, and with the movable jaw E and screw D, arranged substantially as herein shown and described and for the purpose set forth.

7S,747.—JOHN JOHNSON, Boston, assignor to himself and N. A. BRACKETT, Quincy, Mass.—*Machine for Enameling Molding.*—June 9, 1868.—

For enameling moldings preparatory to gilding the same. The invention includes means for warming the preparation, distributing the same evenly on the molding, smoothing it, and scraping off the surplus.

Claim.—1. The brushes G, mounted upon the vertical shafts E, one of which is adjusted laterally by

the screw F, and both bearing beneath the brushes the disks H, arranged in relation with the vertically adjustable brush L, as herein described, for the purpose specified.

2. The combination of the furnace P, feed rollers B U, brushes G G L, and laterally-adjustable scraper N, all arranged and combined to operate in the manner substantially as and for the purpose set forth.

3. The combination of the furnace P, brushes G G L, elastic roller B, feed roller U, scraper N, and guides T V, all arranged as described, for the purpose specified.

78,748.—JOEL F. KEELER, Pittsburg, Pa.—*Hollow-Headed Scale Beam.*—June 9, 1868.—The scale beam is constructed in such a manner that while the weight and the fulcrum are brought near to each other, they are kept on separate pivots, held firmly in their respective places. The fulcrums of the main beams rest on fixed bearings, while the weight is suspended on platform bearings that oscillate, or *vice versa*.

Claim.—1. Adapting hollow-headed scale beams, of any known construction, to use as primary levers in the construction of compound lever platform scales, substantially as herein described.

2. The use of the combined link-bearer *f'* and link *f*, in the construction and operation of platform scales, substantially as described.

78,749.—J. DWIGHT KELLOGG, Jr., Northampton, Mass.—*Churn Dasher.*—June 9, 1868.—The dasher is rotated in one direction to make the butter, and in the opposite direction to gather it.

Claim.—A churn dasher, constructed with spiral rows of arms, *a a*¹, *a*², &c., and strips M M' N N', attached to the arms, and arranged in combination with each other and with the shaft A and the rows of arms, in the manner described, and for the purposes specified.

78,750.—FREDERICK W. MANSFIELD, Fitchburg, Mass., assignor to himself and H. C. HITCHCOCK, same place.—*Saw-horse.*—June 9, 1868.—Two curved levers, serrated on their upper inner sides, are so arranged upon a saw-horse that by pressing upon the lower end of one of the levers, the jaws will firmly hold the wood while being sawed.

Claim.—The construction of the curved serrated levers A C, composing the clamp attachment, when arranged and adapted to be applied to a saw-horse, in the manner and for the purpose herein shown and described.

78,751.—JOHN McCLOSKEY, New York, N. Y., assignor to HENRY MCGUCKIN, same place.—*Cooking Range.*—June 9, 1868.—A chamber communicating with the fire chamber retards the products of combustion sufficiently to burn the escaping gases. When either of the broilers are slid into position for use, the shifting of a plate or damper throws the fire-chamber into communication with the ovens, and though them with an air space under the cover of the range, whence the odors and vapors are conducted into the exit pipe. The divisions of the water back have separate induction and eduction pipes, which supply fresh water from, and conduct heated water to, independent cylinders separated by an annular chamber, which has inlet and outlet pipes, and is used as a means of supplying heated air.

Claim.—1. Forming an air chamber across the back of the range in communication with both the ovens of the range substantially as described, so as to form a continuous oven and hot-air space along three sides of the fire chamber.

2. The gas-combustion chamber, placed above the air chamber and beneath the smoke-exit pipe, substantially as described.

3. The broilers I, one or more, arranged over the ovens, so that they can be projected over the fire chamber, substantially as described.

4. The bottom grate, when made in the form here shown, supported by journals at its ends, so that it may be taken out and turned upside down, thus enabling one to use it as a concave or a convex grate, substantially as described.

5. Separating the divisions Q Q of the water-backs, by an air space, so that the temperature of the water

in one will not affect the temperature of the water in the other, substantially as described.

6. The inlet and outlet air pipes in the annular air chamber, that is placed between the water cylinders, substantially as described.

7. Conducting the hot water pipe that leads from the water back to the inner cylinder V, through the outer cylinder U, and across the annular space W, substantially as described.

8. Providing a range with staples *a*, or their equivalents, for the purpose of suspending it from a ceiling, as board, substantially as described.

78,752.—THOMAS MILNER, Houston, Texas.—*Circular Saw Guide.*—June 9, 1868.—The movable jaw supports one of the plugs which are set up against the saw near its periphery, to steady the same in operation. The guide rods, flange, and shoulder serve to steady and guide the jaw as it is moved by the screw bolt. The flange also excludes dirt from the screw threads.

Claim.—1. The arrangement of the bolt C within the plate A, the rods *r r*, working in the holes *o o*, acting in combination to operate the movable jaw K, as and for the purpose specified.

2. The flange P and shoulder *s*, constructed and arranged to operate substantially as and for the purposes shown and described.

78,753.—THOMAS B. MOORE and GARRET DE BOW, Bridesburg, Pa.—*Bed Bottom.*—June 9, 1868.

Claim.—1. The slats B of a bed bottom, joined together by a continuous webbing, C, which also serves as the covering for the padding, substantially as and for the purpose described.

2. The covering for the slats of bed bottoms, secured to the slats by means of the grooves in the edges of the slats, and the strips fastened therein, substantially as and for the purpose described.

3. The rails of a bed bottom frame joined together by means of the metallic plate D, having the several lips and flanges described, and the button *a*, substantially as and for the purpose set forth.

4. The combination with the slats B and springs F, of the saddle E, substantially as and for the purpose described.

5. The combination, with the springs and the rails, of the rod upon which the springs are wound, provided with the movable brackets G, and arranged in the said combination, substantially as and for the purpose described.

78,754.—SMITH MORTON, Valparaiso, Ind.—*Attachment for Bake Oven Doors.*—June 9, 1868.—When the temperature of the oven reaches a point at which the contents may burn, the metal will fuse and the door open, and give an alarm.

Claim.—The application to the doors of ovens of a latch or catch held immovable by the within-described metal or metallic alloy while it is unfused, but which, when the said metal is fused, turns and unfastens itself, in combination with a weight or spring, to open the door, and the fusible metal and alarm on the inside of the oven, substantially as shown and described.

78,755.—GUSTAV MULLER, Newark, N. J.—*Dobereiner Self Lighting Lamp.*—June 9, 1868; antedated June 4, 1868.—The main vessel contains dilute sulphuric acid, and a piece of suspended zinc is situated within the lower part of the internal flask; when the cock is opened the air in the flask is displaced and hydrogen is evolved by the contact of the zinc with the acid. This gas is directed against the platinum, combining with the oxygen condensed within the same so as to form water. The heat thus liberated ignites the platinum to inflame the gas which subsequently issues from the jet.

Claim.—1. Providing an inflammable lamp with a vertical or inclined channel, *c*, substantially as described, for the purpose of preventing the accumulation of sulphuric acid in the channel, as set forth.

2. Seemring the spongy platinum of an inflammable lamp within a bell, G, for the purpose of protecting the same, as set forth.

3. A self-lighting lamp, when provided with a vertical or inclined channel *c*, and with a bell, G, suspended above the outlet of the channel, all made

and operating substantially as and for the purpose herein shown and described.

78,756.—JOHN B. MUNSON, Bailey Hollow, Pa.—*Bed Clothes Holder.*—June 9, 1868.—The bed clothes are clamped at each side by a long bar attached to arms connected with the side rails of the bed, the bar being operated by means of a cord, pulley, and crank from the head of the bed.

Claim.—In combination with the cross bar F, secured to arms D d', which are hinged to staples E, fixed in the rail B, the cord H, pulley J, drum K, crank L, ratchet wheel N, and pawl M, all arranged to operate as and for the purpose herein set forth.

78,757.—THOMAS NEWMAN, New Orleans, La.—*Rope Trace.*—June 9, 1868.—The end of the rope which is used for a trace is provided with a leather covering and metal clips so as to form a ready means of attachment to the harness and hames.

Claim.—In combination with the rope trace A, the leather coverings, metal clips B, Cx, and E, and the chain D, all arranged as described for the purpose specified.

78,758.—MANLY PACKARD.—North Easton, Mass.—*Sole Edge Plane.*—June 9, 1868.—The shank of the throat piece is pivoted to the stock so as to enable it to be turned and adjusted in relation to the knife, as desired.

Claim.—1. As my invention or improvement in the sole edge plane, the knife C, the throat piece D, and stock A, as constructed in separate pieces, and arranged together and combined by means substantially as described, so as to enable the knife to be adjusted with respect to the throat piece, and such throat piece to be moved relatively to the knife, all as and for the purpose or purposes as explained.

2. The arrangement and combination of the abutment or supporting projection e, the stock A, the adjustable knife C, and the throat piece D, movable relatively to the knife, as and for the purpose hereinbefore described.

78,759.—WILLIAM T. PARSONS, Thomasville, Ga.—*Car Brake.*—June 9, 1868.—Pendent shoes are employed in connection with mechanism whereby they are let down under the wheels so as to partially receive the weight of the latter and act as a check to stop their revolution.

Claim.—1. The combination of the flanged shoes S, pivoted to the lower ends of the bars D D', which are hung from the frame A, by means of pivots e e', with the shaft g, bearing grooved pulleys P P' P, ropes or chains m m', drum d' and spring R, all constructed and arranged to operate in the manner and for the purpose herein set forth.

2. The device for retaining the shoes S in an elevated position, away from the wheels, said device consisting of the beveled pin b fixed in the shaft g, centrally-pivoted lever L, having projecting pin i and spring u, all constructed and arranged to operate in the manner substantially as herein set forth.

3. The flanged-shoe S'', hung to the lower end of the single bar D'', which is connected to the pivoted lever L' by a yielding joint, substantially as described.

4. The combination of the slotted shoe S, pivoted bar D''', lever l, pivoted at g, and springs v v'', all constructed and arranged to operate in the manner and for the purpose substantially as herein specified.

78,760.—J. D. PERRIN and JOSEPH SAUNDERS, Brooklyn, N. Y.—*Retort for Concentrating Sulphuric Acid.*—June 8, 1868.—At the upper part of each retort is arranged a spout or pipe leading into a funnel on the upper end of a pipe which extends nearly to the bottom of the next retort.

Claim.—Providing a retort with a projecting pipe or spout, a, and with a pipe, B, substantially as described, so that communication between various retorts can be established, as herein specified.

78,761.—AMOS H. RHODES, Fall River, Mass.—*Gib.*—June 9, 1868.—A recess is formed in the "gib," in which is fitted a metallic block secured by bolts, screws, or shoulders so as to admit of the ready removal of the "gib" when necessary.

Claim.—The construction and arrangement of

"gib" A¹, removable block B¹, and bolts D¹ and E¹, operating substantially as and for the purpose set forth and described.

78,762.—RODNEY RICE, Pittsfield, Vt., assignor to himself and J. H. SPAULDING.—*Wagon and Carriage Brake.*—June 9, 1868.—Upon the depression of the treadle the inner ends of the brake levers are drawn forward and the brakes applied through the medium of the jointed levers and connecting rods.

Claim.—1. The treadle c, levers b b, and links a a¹, in combination with the brake levers F F¹, arranged and operating substantially as described.

2. The brake levers F F¹, provided at their inner ends with interlocking hooks, f, working in the loop G, substantially as and for the purpose described.

3. The independently-hinged brake levers F F¹, connected centrally by a sliding or hook joint, and operated by means of levers and connecting links, arranged substantially as described.

78,763.—THOMAS H. SAVERY, Wilmington, Del.—*Expanding Pulley.*—June 9, 1868.—The sectional rims of the expanding pulley are moved in and out radially by means of a spiral or scroll slot in the face of a disk, which latter revolves on the shaft of the pulley and is engaged by corresponding teeth on the face of the arms which form part of the sectional rims composing the rim of the pulley.

Claim.—The expanding rims C of a pulley, operated by means of a hand wheel, E, and scroll disk, A, both working on the pulley shaft D, and connected by any suitable train of gear wheels, substantially as shown and described.

78,764.—AUSTIN SEELY, Alton, Ill.—*Valve Gear for Steam-Engine.*—June 9, 1868.—Designed as an improvement upon the patent granted to B. F. Day in 1854.

Claim.—1. The additional throttles T, arranged with reference to both cylinders, substantially as shown, for the purpose of operating the engines, and controlling and modifying the expansion of the steam used, all as set forth.

2. The expansion of cylinder B, in combination with the additional throttle T', substantially as and for the purpose shown and described.

3. The additional throttle valves T' T'', arranged in the pipe connections, substantially as shown, and for the purpose specified.

78,765.—DAVID SMITH, Newburyport, Mass.—*Brick Machine.*—June 9, 1868.—A series of presses moves in a circular track, and has a corresponding intermittent movement; each press coming to rest directly against and simultaneously with one of the molds; at the same moment the follower has a movement from a point within the track of the molds toward one of the presses, moving the brick from the mold into the press, and properly pressing it.

Claim.—1. The annular series of open molds l, operating in combination with arms j k, substantially as described.

2. The intermittent rotary series of presses m o, constructed and operating, in combination with the follower n, substantially as described.

3. The combination and arrangement of the annular series of molds l, and the intermittent rotary series of presses m o, constructed and operating substantially as described.

78,766.—JOHN P. SMITH, Claverack, N. Y.—*Shaker for Thrashing Machine.*—June 9, 1868.—The upper part of the carrier, whereby the straw is conveyed from a thrashing machine, is alternately lifted and dropped by the shaking arms.

Claim.—1. The rotating shaking arms f, in combination with the endless carrier or shaker B, substantially as and for the purpose specified.

2. The arrangement of the shaking arms f, transverse shaft e, endless carrier or shaker B, and frame A, substantially as and for the purpose specified.

78,767.—EDWARD SPAULDING, Brooklyn, N. Y.—*Mosquito Screen.*—June 9, 1868.—Relates to mosquito screens for closing door or window openings,

and which, when not required for use, are wound upon a roller by the force of a coiled spring.

Claim.—So constructing and arranging the spring H with the roller F and screw bearing *o*, that the uncoiling force of said spring is exerted to tighten the bearings, and the contractile force to keep the screen in place, and permit its removal when required, substantially as described.

78,768.—HEDGES L. SPENCER, Social Circle, Ga.—*Millstone Dress.*—June 9, 1868.—The furrows are so arranged as to cause the stones to move rapidly and thoroughly comminute the grain.

Claim.—The improved millstone dress, composed of the furrows *a b c d*, made and arranged as herein shown and described.

78,769.—JAMES SWAN, Seymour, Conn.—*Manufacture of Augers and Bits.*—June 9, 1868.—The upper surfaces of the holding dies are grooved to conform to the desired shape of the cutters, and the parts are so arranged as to reduce the lips and bring them to a knife-like edge at their cutting parts.

Claim.—1. The rising and falling and partially-rotating arbor H, provided with the swaying and drawing dies J J, in combination with the holding dies B B, all arranged substantially as and for the purpose set forth.

2. The combination of the cam N, bevel wheels K L, pins *d e*, arbor H, and the spring I, all arranged to operate the arbor in the manner substantially as and for the purpose set forth.

78,770.—H. G. TAYLOR, Port Hope, Canada West.—*Combined Square and Bevel.*—June 9, 1868.—One part of the stock and the blade always preserve their relative positions, and constitute the square. The other part of the stock and the blade form the bevel, the two parts being held against casual movement by means of the screw and nut.

Claim.—A combined square and bevel, composed of a stock formed of two parts, A A', connected by a screw and nut, B, and a blade, C, fitted between said parts, and connected with part A, all arranged substantially as shown and described.

78,771.—AUGUSTUS THAYER, Albany, N. Y.—*Implement for Sharpening Cutlery.*—June 9, 1868.—The peculiar construction of the "cutters" furnishes a variety of grooves in which to sharpen cutlery. The "cutters" are, when not in use, covered by a movable tube. A polygonal collar upon the neck of the steel prevents the device from rolling when laid upon a table.

Claim.—1. The cutters C, two or more, constructed as shown, with beveled ends, and fitted in a slot in a tang, B, and secured therein by a screw or wedge, substantially as and for the purpose set forth.

2. The grooves *d* in the ends of the cutters, for burnishing or hardening the cutting edges, substantially as set forth.

3. The beveled shoulders *e*, in combination with the cutters C, substantially as and for the purpose specified.

4. The sliding or adjustable tube E, either with or without the polygonal plate F, substantially as and for the purpose set forth.

78,772.—RALPH THOMAS, Waterbury, Conn., assignor to himself and E. PARKER, same place.—*Sash Fastener.*—June 9, 1868.—The spring bolt and the hinge cap are respectively secured to the sashes, which they serve to lock together.

Claim.—A sash fastening, consisting of the case A and spring bolt C, in combination with the hinged cap D, all made and operating substantially as herein shown and described.

78,773.—G. J. THORN, Peatonica, Ill.—*Windmill.*—June 9, 1868.—Under any direction of the wind the wings on one side of the shaft will be at right angles to said direction, when the sleeve is down, and when any wing passes to the other side of the shaft by the revolution thereof the same will be thrown down "into the wind," while the opposite wing will be thrown up before the wind. When the tank is filled the float rises and gives a corresponding movement to the sleeve to stop the mill.

Claim.—1. The windmill, having each of its arms B provided at opposite ends with wings C, placed at right angles to each other, said arms passing in different vertical planes through the vertical shaft A, and through openings *a*¹ in the sleeve E, all arranged as described for the purpose specified.

2. The sleeve E, suspended upon the shaft A by the rods F, attached to the arms of the governor, and provided with a series of openings, *a*¹, in different vertical lines, for the passage of the arms B, and for the operation of the cams *a*², as herein described, for the purpose specified.

3. The device for changing the position of the wings C, consisting of the V-shaped cranks *a*² upon arms B, and the V-shaped openings *a*¹ in sleeve E, substantially as shown and described.

78,774.—ELISHA WIARD WALTON, Stockton, Cal., assignor to himself and WILLIAM H. DERRICK, same place.—*Horse Hoe.*—June 9, 1868.—A brace between the handles enables either handle to be set in line with the beam. The shares are made with two sharp edges, so as to be reversible and self-sharpening, and are provided with a point having a mortise for the reception of the lower ends of the standards.

Claim.—1. The regulating brace *m*, constructed substantially as and for the purpose above shown.

2. The standard E E of a horse hoe, constructed substantially as above described.

3. The reversible hoe point D, with its slot or mortise X, constructed and operated substantially as above shown.

4. The reversible shares A, and also their two sharp-cutting edges, constructed and operated substantially as above shown.

5. The mold-board B, in combination with the share A, substantially as above shown.

6. The wedge L, with its screw and nut, constructed and used substantially as and for the purpose above described.

7. A horse hoe, with or without the mold-board B, constructed and operating substantially as above described.

78,775.—THOMAS P. WARREN, Norfolk, Va., assignor to D. W. WARREN.—*Clevis Iron.*—June 9, 1868.—A plate provided with holes is attached to a bent rod or bar, which forms the clevis, so that by placing the plate in a horizontal or a vertical position, and adjusting the attachment of the same, the plow may be made to cut a deep or shallow furrow, or be made to take more or less land, at pleasure.

Claim.—1. The combination of the perforated plate D with the bent rod C, when the said parts are constructed to operate in the manner set forth.

2. In combination with a perforated draught plate D and a rod or link, C, for attaching it to the plow beam, the screw nuts *n n*, by which the plate can be adjusted back and forth on the rods or link, so as to cause the plow to run more or less to land, in the manner described.

78,776.—WILLIAM WERTS, Pana, Ill.—*Car-axle Cap.*—June 9, 1868.—The door is secured to the box by means of bolts on either side, placed within chambers and surrounded each by a spiral spring. By adjusting a nut at the bottom of the bolts the tension of the springs may be regulated to hold the door closed with any desired power.

Claim.—1. The combination of the eye bolt D, coiled spring F, and chamber E, with each other, with the door B, and with the cap or box A, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the cross-head bolt G, coiled spring I, and chamber H, with each other, with the notched or grooved slotted projection *b*³, formed upon the door B, and with the cap or box A, substantially as herein shown and described, and for the purpose set forth.

78,777.—WARREN W. WHITE and MARTIN KING, Lowville, N. Y.—*Refrigerating Milk Can.*—June 9, 1868.—By means of this can a cooling liquid is accommodated in chambers so arranged as to present a cool surface to the inclosed milk all around.

Claim.—The combination of the jacket A B and

cylinder D, together with the hollow lid H, the ventilating tube J, and the connecting tube E, substantially as specified, and for the purposes therein set forth.

78,778.—CHARLES I. WILMANS and WESLEY J. WOLFE, Olney, Ill.—*Dough Kneader*.—June 9, 1868.—The three compartments contain respectively the flour, the rising dough, and the kneading and rolling apparatus. The adjustable rollers roll out the dough to any desired thickness, for crackers, cakes, pastry, &c. The removable sectional cover forms, in connection with an extensible frame beneath the box, a table to receive the dough as it comes from the roller.

Claim.—1. The combination of the pivoted kneader M m P, the stationary kneading board P' and curved bottom H, all constructed, arranged, and operating as described, for the purpose specified.

2. The adjustable roller Q Q', arranged and operating in combination with the kneader P substantially as specified.

3. The removable covers L L', in combination with the sliding frame W and hooks X, substantially as and for the purpose set forth.

4. The removable kneading board P', in combination with the grooves a³, roller Q Q', and kneader M P, for the purpose set forth.

5. The relative arrangement of the compartments C D E, removable partition F, stationary partition G, bottom H I, and cover K, substantially as and for the purpose set forth.

78,779.—MORITZ WOLF, Philadelphia, Pa.—*Jacquard for Looms*.—June 9, 1868.—The invention relates to a new arrangement of the jacquard attachment of a carpet loom, and consists in the use of a double set of needles, by which the harness is operated.

Claim.—1. Operating the cylinder A by means of the cylinder F, needles o, strings l, slotted extension n of the lifter D', the frame K, all made and operating substantially as and for the purpose herein shown and described.

2. Two or more independently-acting cylinders, in combination with the vertical needles, substantially as described, for the purpose specified.

78,780.—DAVID WRIGHT, Boston, Mass.—*Composition for Gilding Moldings*.—June 9, 1868.—Composed of China chalk, borax, gum arabic, and glue, dissolved in water.

Claim.—The preparation or compound for preparing frames, moldings, ceilings, and all surfaces for gilding in gold and silver, substantially as set forth and described.

78,781.—THOMAS P. AKERS, New York, N. Y.—*Steam and Water Indicator for Boilers*.—June 9, 1868.—When steam takes the place of water in the tube it expands, and imparts motion to a system of levers and rods, and thereby opens the valve of the whistle, giving an alarm. The inverted valve, under excessive pressure of steam, yields, and in consequence thereof the valve of the whistle is operated upon in a reverse direction, allowing the steam to escape, and giving an alarm as before.

Claim.—1. A low-water and high-pressure indicator, in which the adjusting parts are so constructed and arranged as to be locked in their adjusted position independent of any covering or other surrounding devices, substantially in the manner shown and described.

2. The combination of the expansible tube A with the levers I and K, the jointed lever L, and the part M, together with their connections and fastenings, substantially as and for the purpose set forth.

3. The combination of the inverted valve Y', the valve stem Y, the nut X, the cap G, the spiral spring W, and the whistle E, substantially as shown and described.

4. The tube A, and the levers I, K, and L, with their connections and fastenings, when combined with the inverted valve Y', the valve stem Y, the nut X, the cap G, and the spiral spring W, whereby to produce the double effect of indicating low water and excessive pressure of steam, substantially as herein set forth.

78,782.—WILLIAM BELLIS, Richmond, Ind.—*Governor*.—June 9, 1868.—Designed to close automatically in the event of the snapping or running off of the governor belt, or the sudden suspension of governor action from any cause. A device is employed for holding said governor valve open when the throttle is shut, so as to enable the engine to be started by the opening of the throttle.

Claim.—1. The construction of the triple-disk valve I J K i j k, substantially as and for the purpose set forth.

2. The diaphragm D d E F f G H, constructed as described, when arranged in relation to the triple-disk valve I J K, substantially as and for the purpose specified.

3. The combination of the adjustable bracket S, weighted prop or latch R r, and weighted lever P p, with the governor valve I J K and governor N, all constructed, arranged, and operating substantially as and for the purpose described.

78,783.—LOUIS W. BOSART, St. Marie, Ill.—*Portable Fence*.—June 9, 1868.—Arms project from the gate post between the vertical panels, which connect the horizontal fence rails, pins being passed through said arms in order to secure the fence section to the gate post. The fence is sustained by trestles introduced between the sections.

Claim.—1. In combination with the panels, the gate posts D, constructed and arranged substantially as and for the purpose set forth.

2. The trestles C, with slots and notches c'', and projections c', in combination with the panels A and A', substantially as described.

78,784.—PURMORT BRADFORD, New Haven, Conn., assignor to SARGENT & Co., same place.—*Cast Metal Bracket*.—June 9, 1868.—The parts are so formed that they may be locked and held together without the use of rivets.

Claim.—The base A, shelf B, and brace C, constructed so as to be united and locked together by hooks or projections on one part, and corresponding mortises or recesses in the other, so that when the three parts are set together, they will be locked and held in place, substantially as set forth.

78,785.—CHARLES BROWN and LEONIDAS GERTH, Peoria, Ill.—*Plow*.—June 9, 1868.—The knives precede the plows, cutting the sod into strips in order to render the action of the plows more perfect. The plow frame may be replaced by a cultivator frame, and the knives dispensed with when desired. The levers regulate the position of the frames vertically.

Claim.—A combined plowing and cultivating machine, having levers B and F, with ratchets thereto, rod C, chains D, knives G, frames H, P, and O, and swinging bars M, constructed, arranged, and operating substantially as specified.

78,786.—EDWARD L. BROWN, Philadelphia, Pa.—*Process of Combining Wrought and Cast Metal*.—June 9, 1868.

Claim.—1. Preparing wrought metal for combining it with cast metal for castings of all descriptions, where great strength of any kind is required, by first thoroughly coating it, by galvanic action or other process, with nickel, or any other metal or metals, alloys of metals, or metallic or mineral substances, or their alloys, not easily oxidizable and very difficult to fuse, and which only melt, or whose point of fusion is at a higher degree of heat than the molten cast metal to be poured about it, the whole substantially as above described.

2. The production of castings, strengthened by the introduction of wrought metal coated with a metal, alloy of metals, or substance less fusible than the cast metal, substantially as above set forth.

78,787.—WILLISTON CONNER, Rensselaerville, N. Y.—*Hop Pole*.—June 9, 1868.—Small, accessory poles are applied to the main pole by means of iron collars placed one above the other and having rings or sockets to hold the small poles. The teeth of the collars prevent them from turning on the pole.

Claim.—The combination of the large and small rings B B', constructed as described; that is to say, each having three openings a on the outer parts, and

one central opening with teeth, and used with the poles A and CCC, as and for the purposes specified.

78,788.—ALPHONSO W. COOK and ROBERT DEMPSTER, Buffalo, N. Y., assignors to themselves and J. S. SEMON, same place.—*Hydrocarbon Burner*.—June 9, 1868.—In using the lighter products of petroleum, the coil serves to convert the fluid into vapor before it issues into the retort. When a heavier quality of petroleum is used, the coil is detached from the feed pipe, and a dripping pan applied in the place thereof, the fluid being caught in said pan, and the sediment discharged through the pipe thereof.

Claim.—1. The coil of pipe G, in combination with the feed pipe F and retort A, arranged and operating substantially as and for the purpose described.

2. The dripping pan H and discharge pipe h^1 , in combination with the feed pipe F and retort A, for the purpose and substantially as described.

3. The plate C, having openings C^1 and C^2 , in combination with the furnace B, draught flue E, and retort A, constructed and arranged substantially as herein set forth.

4. The removable bottom plate M, in combination with the retort A, for the purpose and substantially as herein described.

5. The annular air chamber n and outlet n^1 , in combination with the retort A, for the purpose and substantially as herein described.

6. The chamber I, plugs or bushings i^1 , and strainer J, in combination with the feed pipe F, for the purpose and substantially as herein described.

7. The combination of the force pump P, feed pipe F, and blow-off pipe L, for the purpose of cleaning the inside of the retort A, substantially as described.

8. The application and use of the apparatus herein described, for generating steam, in the manner and for the purposes substantially as herein set forth.

78,789.—WILLIAM CORSON, Camden, Ohio.—*Portable Fence*.—June 9, 1868.—The "flexible bar" is depressed, and the matched ends of the rails fitted together to unite the panels.

Claim.—The flexible bar D, in combination with bar C and notch e , substantially as described.

78,790.—JAPHETH CROSS, Adrian, Mich.—*Weather Strip*.—June 9, 1868.—By the closing of the door the strips are made to protrude from the grooves in the edges of the door, wherein they are imbedded, against the jambs and sills of the door frame, the strips being drawn back again into the grooves upon the opening of the door.

Claim.—1. The combination of the strips a , b , c , and d , with the bed pieces f and h , to be used in doors and windows, all constructed in the manner and for the purposes substantially as set forth.

2. The combination of the spring catch k with the levers l and strip b' , constructed and operating in the manner set forth.

78,791.—SAMUEL T. CURTISS, El Paso, Ill., assignor to himself and LYMAN P. THOMPSON, same place.—*Churn*.—June 9, 1868.—The dasher has vertical, angular projections, with intervening spaces presenting wide mouths for the entrance of the cream, but having small terminal throats through which the cream must pass, with great friction, as the dasher revolves.

Claim.—The dasher F, constructed and arranged to operate substantially as and for the purpose herein set forth.

78,792.—DANIEL L. DICKSON, Durham, Ill.—*Grain Drill*.—June 9, 1868.—The grooved wheels deliver the seed from the hopper to the discharge spouts. The flanges of the ground roller run in the seed furrows to pack the earth over the seed at the bottom of the furrows.

Claim.—The arrangement of the shaft F in the box J, and provided with a series of wheels with circumferential grooves, in combination with the hinged fluke-bars O O, that extend under the hopper to the flanged roller C, the various parts being constructed and operating substantially as specified.

78,793.—JAMES B. EADS, St. Louis, Mo.—*Subaqueous Foundation*.—June 9, 1868.—A caisson, open at both ends, is first sunk, from which the sand and light subsoil is removed. A platform to sustain the masonry is guided by upright posts, and around the platform is arranged an interior caisson for excluding the water.

Claim.—The combination and arrangement of the outer caisson, its ribs or posts B B', with the internal caisson C, in the manner and for the purpose substantially as herein set forth.

78,794.—HENRY A. ELLIS and C. FREDERICK GLADDING, Norwich, Conn.—*Hawser Clamp*.—June 9, 1868.—The lever is recessed so as to form a flange which acts as a cam upon a pin for the purpose of raising the guide with the movable jaw. The guide has a rib running in a slot in the upright bracket to which it is bolted.

Claim.—The double cam-shaped lever I, in combination with the moving jaw C, when operating through the guide G and pin p , substantially as described, and for the purpose set forth.

78,795.—HENRY FLAD, St. Louis, Mo.—*Water Meter*.—June 9, 1868.—The revolutions are counted by a magnetic needle, placed outside of the apparatus, and actuated by a soft iron bar attached to the piston rod and inclosed within the piston chamber. The upper part of the piston chamber is filled with compressed air, while the liquid flows through the bottom portion.

Claim.—1. The air check in the chambers A, C, and D, to prevent the flow of liquid in any direction but that of the line of traverse of the piston, substantially as set forth.

2. The combination of the magnet E, the soft bar e , and the revolving piston B', when acting substantially as set forth.

78,796.—JAMES FLOOD, New Haven, Conn., assignor to WILLIAM SANDERSON, New York City.—*Attaching Handles to Cutlery*.—June 9, 1868.—The tang is round or cylindrical near the bolster, and twisted at the end, while the intermediate portion is flat.

Claim.—The employment of the twisted tang, in combination with the composition handle molded around, all substantially as described for the purpose set forth.

78,797.—JOHN FOREMAN, Pottstown, Pa.—*Truss Framed Bridge*.—June 9, 1868.—The posts of the respective halves of the bridge are inclined in opposite directions. The arrangement of the posts, braces, and suspending bolts, obviates the employment of the usual heavy vertical posts and counter braces.

Claim.—The arrangement, substantially as described, of the inclined posts, suspension rods, and diagonals, for the purpose specified.

78,798.—ELLIOTT E. FURNEY, Chicopee, Mass.—*Caster for Furniture*.—June 9, 1868.—A circular lever on being turned inward upon its pivot acts as a break upon the roller, and locks together the two plates of the caster in order to render the latter inoperative.

Claim.—1. The lower plate g of a caster, when constructed with the elongated curved projection g' thereon, and having the projection or bearing m , said plate g being used in connection with the spindle B and roller D, when constructed and operating substantially as described, and for the purposes herein specified.

2. The combination of the plate g , having a spindle B, with the circular lever d , said lever d operating in conjunction either with the plate b or with the furniture to which the caster may be attached, all constructed and operating substantially as herein described and for the purposes specified.

78,799.—GEORGE GARRETT, Elkhart City, Ill.—*Cultivator*.—June 9, 1868.—The fender shields the young plants from the clods thrown toward them by the shovels. The brace beams allow the shovels to pass obstructions without injury.

Claim.—Providing a double cultivator with a

fender, F, having bearing chains, *ff*, when the same are united and combined with the beams B and C C, and the whole is so constructed and arranged as to operate substantially as described and for the purpose specified.

78,800.—WILLIAM F. GOODWIN, East New York, N. Y., assignor to himself and CHARLES R. SQUIRE, New York, N. Y.—*Harvester*.—June 9, 1868.—The pinion to which the cam is attached terminates a system of speed-multiplying gear mounted upon the main axle, and from which motion is communicated to the cutter through the medium of a yoke surrounding the cam, a pitman rod, crank lever, &c. The cutter bar may be turned up vertically or over the tongue in passing obstructions, without suspending the motion of the knife.

Claim.—1. The employment of a cam or eccentric, in combination with the multiplying gear, shown and described, for the purpose set forth.

2. The cam A attached to the pinion A², or a sleeve projecting from the latter, and working on and rotating round the shaft H of a harvester, in the manner and for the purpose substantially as described.

3. The arrangement of the hoisting apparatus of a harvester, whereby the cutter bar may be drawn up and turned over on the tongue, in combination with the retracting spring E, arranged and operated in the manner and for the purpose substantially as described.

78,801.—C. N. Goss, Claremont, N. H.—*Horse Rake*.—June 9, 1868.—The yielding stock or pressure bar resists the independent movement of the tooth bars without interfering with their vibration upon a common center for discharging the load or passing an obstruction. The levers enable the bars and teeth to be raised or held down to their work by the driver. Safety springs are applied to the teeth individually.

Claim.—1. The arrangement of the two pivots or centers D *d*, upon which the tooth bars turn in the described relation to each other and to the shafts or thills, for the purpose set forth.

2. The arrangement of the stop bar I relative to the tooth bar pivots D *d*, substantially as and for the purpose set forth.

3. The arrangement of the rock shaft D, substantially as described, whereby it is made to constitute the rest or support of the independently pivoted tooth bars, as well as the common center upon which said tooth bars are vibrated to discharge the gathered load.

4. The levers H and L, in combination with the pivoted tooth bars and stop bar I, substantially as described, whereby the driver is enabled to hold the teeth down to their work, and to raise the same for discharging the load, or for passing an obstruction, as set forth.

5. The coil spring G, applied to and operating in combination with the rake bars and pivoted rake teeth, substantially as and for the purpose set forth.

78,802.—ISAAC C. HATCH, Camden, N. J.—*Brick Drying Apparatus*.—June 9, 1868.—The fan blast is heated by contact with the pipes, pervades the masses of wet bricks on the cars, and carries off through perforations in the roof and sides of the kiln the moisture emanating therefrom.

Claim.—One or more kilns, built as herein described, and provided with hot air or steam pipes P P', in combination with fans F within the rear end of each kiln, all constructed, arranged, and operating as and for the purpose herein set forth.

78,803.—C. HOPKINS, Philadelphia, Pa.—*Tool for Jeweling Watches*.—June 9, 1868.—The part to be jeweled is clamped to a bed having an opening in which rests a centering screw with a depression in its point to receive the centering needle of the reaming tool. The ends of the reamer being introduced into the jewel hole, the instrument is rotated on the centering needle, and the upper flange of the socket bent up so as to admit the jewel.

Claim.—1. The bed A, having the clamp *a* and the centering screw J, substantially as and for the purpose above described.

2. Forming the ends of the reaming instrument,

as shown at *m m' m''*, substantially as and for the purpose set forth.

3. The reaming tool above described, composed essentially of the bent spring arms G G, having the cutting edges *m m' m''*, and the exterior screw threads, with the adjusting centering needle I, and the screw nut F, working up and down upon the arms G G, in the manner described, all said parts being constructed and arranged to operate together substantially as specified.

78,804.—CORNELIUS A. HOWARD, New Haven, Conn., assignor to himself and RICHARD McCLOY, same place.—*Compression Coek*.—June 9, 1868.—The valve is operated by a screw upon the plug so as to close the valve down upon the inlet when turned in one direction, and close the end of the plug when turned in the opposite direction, and so as to open from the inlet to the plug when in an intermediate position.

Claim.—The valve C, constructed with the passage *a*, and arranged within the chamber B, and combined with the plug D, when the said plug D is arranged so as to operate the said valve to close the inlet at one extreme and the plug at the other, and open at intermediate positions, substantially in the manner herein set forth.

78,805.—GEORGE JONES, New Haven, Conn.—*Sprinkler and Dredge*.—June 9, 1868.—Designed as an improvement on the patent of Keep & Dummer, granted July 3, 1866. A ball joint is formed on the spindle within the cup, so as to allow the cover to be more fully opened.

Claim.—The arrangement of the ball joint between the spindle D and plunger C, and combined with the cover B and cup A, so that the cover may be turned from the cup, substantially as herein set forth.

78,806.—JOHN ALLCOCK JONES, Middlesborough, England.—*Manufacture of Iron and Steel*.—June 9, 1868.

Claim.—The preparation of iron and the production of cast steel, by firstly submitting cast or pig iron to the process of puddling, boiling, and balling, and then subjecting the balls so obtained, either whole or in fragments, to fusion in separate crucibles or receptacles.

78,807.—JOHN KERR and DAYTON C. KERR, Ames, Iowa, assignors to themselves and S. H. MILLER, same place.—*Slide Snap for Harness*.—June 9, 1868.—To adapt the harness for horses of different sizes, an adjustable slide snap hook is applied to the saddle pad, to regulate the distance between the saddle and thills.

Claim.—The adjustable snap hook D, in combination with the metal plate A and socket B, all constructed and arranged substantially as herein described for being attached to the pad of the saddle of a harness, as set forth.

78,808.—WALTER KING, Richmond, Mo.—*Horse-Power*.—June 9, 1868; antedated May 27, 1868.—When the machine is to be used as a locomotive horse-power, the housing and its attachments only are brought into requisition; the peripheries of the driving wheels are drawn over the ground and their effective rotation is insured by the projections on their peripheries. This locomotive horse-power may be readily adapted for use in connection with stationary machinery.

Claim.—1. A locomotive horse-power A C D, in combination with a stationary machine B B¹ B², substantially in the manner shown and described.

2. The housing A, when combined with the driving shafts C D¹ and the wheels C¹ C², substantially as shown and described.

3. The wheels C¹ C², the bosses *c*¹, and spring clutches *e*², when constructed and arranged as described and set forth.

4. The pole E, when formed of two pieces *e e*¹, and applied to the housing A, so as to form a one-horse or a two-horse machine, as described and shown.

78,809.—J. J. McLANE, Sagetown, Ill.—*Churn*.—June 9, 1868.—The temperature of the cream may be regulated by water in the chambered bottom of

the churn. The agitating arms may be set at any desired angles with each other, and so held by clamping their thimbles or collars tightly together upon the common axis.

Claim.—The arrangement of the box A, with the metal bottom B C, two cross-shafts D D, having movable arms H H, and adjustable by the journals *j* and bearings *h*, the several parts being constructed and operating substantially as specified.

78,810.—ABRAHAM S. MILLER, Bluffton, Ind.—*Machine for Scutching Flax.*—June 9, 1868; antedated June 5, 1868.—Four obtuse-angled knives are attached to revolving arms on a shaft driven by belt and pulley. The broken flax is fed upon a knife secured to an upright which vibrates at its base upon journals to accommodate itself to large or small quantities, the upright being governed and held in place by a bow spring.

Claim.—The knives O, upright C E, base D, and spring bar F, all combined, constructed, and arranged as and for the purpose herein set forth.

78,811.—ABRAHAM S. MILLER, Bluffton, Ind.—*Machine for Breaking Flax.*—June 9, 1868; antedated June 5, 1868.—A pitman and accessory devices are attached to an ordinary hand break, so that the latter may be driven by horse or steam power.

Claim.—The guide H, in combination with the break I, constructed and arranged as and for the purpose set forth.

78,812.—SAMUEL MILLS, Clinton, Ill.—*Churn.*—June 9, 1868.—The box is set in a pail or vessel containing the cream, and a reciprocating motion given to the dasher, by the action of which the cream is drawn in, forced through the perforations in the dasher and side of the box, and thus converted into butter.

Claim.—1. The box A B, constructed as described, and used while partially submerged in the cream, in combination with the wire gauze or perforated plate C.

2. The dasher *b c*, provided with flaps *e e*, in combination with the box A B, substantially as and for the purpose set forth.

78,813.—FREEMAN MOORE, Carrollton, assignor to himself and J. H. TRESSEL, Carroll County, Ohio.—*Bee Hive.*—June 9, 1868.

Claim.—1. The movable bottom board D, provided with a slide *r*, in combination with the wedges *t*, or their equivalent, when constructed and arranged substantially as and for the purpose specified.

2. The slotted honey board I, in combination with perforated pasteboard and fancy honey receptacles K, when constructed and used substantially as and for the purpose herein set forth.

3. The cover R, when provided with a queen cage *i S*, and slide *p*, substantially as and for the purpose specified.

4. Suspending the movable frames *f* and the dividers *d* by means of metallic hooks thereon, and the horizontal wire rods and braces *g*, as and for the purpose herein set forth.

5. The air chambers *m*, and the double ventilators *o* and *n*, in combination with the slides *u*, when arranged and used as and for the purpose herein set forth.

6. The comb guides H, when constructed and used in the manner and for the purpose set forth.

7. The dividers &, when constructed and used in manner and for the purpose set forth.

8. The combination of the honey box N, as constructed, with the pasteboard separator, and arranged in the hive, as and for the purposes set forth.

78,814.—JOHN P. MOORE, Morning View, Ky.—*Grinding Mill.*—June 9, 1868.—The bed stone yields to any hard substance that may enter with the grain, and the parts are thus preserved from injury.

Claim.—Supporting the lower edge of the bed stone F by means of the screw rod H, nut H², and spring I, arranged as herein described, for the purpose of giving elasticity to the bed stone in its relation to the runner.

78,815.—HENRY MULLER, North Cambridge, Mass.—*Machine for Stuffing Leather.*—June 9, 1868.—The wheel is formed with a close circumference, a close skirting adjoining the circumference to prevent the escape of oil, and the sides of the wheel are formed with arms or spokes, so as to admit of the free circulation of air through the wheel.

Claim.—1. In the process of stuffing leather, the employment, subsequent to treating the leather with oil in a warm close drum or wheel, of a wheel or drum, so constructed so as to admit free access of the air to the leather, substantially as and for the purpose described.

2. The wheel with the close circumference *a*, and skirting *b*, the door *c*, and cross-bars *d*, when made open at the heads or sides of the wheel or drum, as and for the purpose described.

78,816.—HARVEY D. PALMER, Leonidas, Mich., assignor to S. O. KAEMPFER, DAVID G. WILLIAMS, and WILLIAM C. WILSON, Elkhart, Ind.—*Horse Hay Fork.*—June 9, 1868; antedated June 4, 1868.—The prongs assume a vertical position by their own gravity, and in so doing close together and grasp the hay. The prongs are expanded by means of a rope connected thereto through the medium of links and rods.

Claim.—The movable head-piece F, to which the prongs D are pivoted, in combination with the standard A, link *c'*, and rods *d'*, and E, substantially as and for the purpose set forth.

78,817.—CHARLES PARHAM, Philadelphia, Pa.—*Sewing Machine.*—June 9, 1868.—The object is to apply to machines constructed upon the Howe principle the devices for carrying and guiding the shuttle patented by same party November 21, 1854.

Claim.—The combination with the bracket, of the carrier, driver bar, groove, and feed wheel, as described, for the purposes set forth.

78,818.—CHARLES PARHAM, Philadelphia, Pa.—*Sewing Machine.*—June 9, 1868.—The shuttle face plate or guide is so constructed that while it serves as a guide for the shuttle upon the open or face side, there may be imparted to it a reciprocating and intermittent motion parallel to the shuttle time of motion, the shuttle face plate not being permanently fixed to any part of the machine, but loosely fitted in the proper position for the effectual performance of its double duties.

Claim.—1. The combination of the shuttle carrier T, the guide V, the cam slotted down, hanging arm S', directly attached to the carrier and the crank M, the whole constructed and arranged substantially as described.

2. A shuttle driver or carrier S having a downwardly hanging arm S', in combination with a guide V and groove W, constructed and arranged substantially as described.

3. A reciprocating shuttle face plate having feed teeth on its upper edge, substantially as described.

4. A reciprocating shuttle face plate, having feed teeth on its upper edge, in combination with movable stripper plate O, substantially as described.

5. A reciprocating shuttle face plate having feed teeth on its upper edge, in combination with a movable stripper plate O, and needle shield E, substantially as described.

6. The combination of a reciprocating shuttle face plate, having feed teeth on its upper edge, a movable stripper O, and a reciprocating cam or wedge on the upper surface of the shuttle carrier or driver, for the purpose of operating the feed stripper, substantially as described.

78,819.—DANIEL E. PARIS, Troy, N. Y., assignor to BURDETT, PARIS & Co., same place.—*Hot Water Tank on Cooking Stove.*—June 9, 1868.—The several features of this invention may be understood if considered in connection with patents heretofore granted same party, said patents covering the inventions which the present improvements are intended to simplify.

Claim.—1. For the purpose of heating the reservoir only, a double flue between the oven and the reservoir, so arranged as to conduct the products of combustion downward in front of the back plate of

a cooking stove, and upward in the rear of it, substantially as here shown and described.

2. A double-acting damper, situated below or underneath the pipe collar of a cooking stove, having its base at or near the back plate of the stove, while its top part shall move from side to side of said pipe collar, in combination with the reservoir in rear of, and the double flue below, said damper, substantially as herein shown and described.

3. The back of a cooking stove as a division plate for an upward and downward flue, or a double flue at the rear end of the same, in combination with a water reservoir, when situated substantially as herein shown and described.

4. A pipe collar to a cooking stove, situated at one side or end of the stove, and over or nearly over a double smoke flue, and so placed that it shall receive the currents from either flue, as the damper below is shifted from side to side of said pipe collar, substantially as herein shown and described.

5. In combination with a water reservoir, two flue dampers, both situated at one side or end of a cooking stove or range, and arranged or capable of producing the results substantially as herein shown and specified.

6. The upright flue R, situated in rear of the back plate of a cooking stove, connected and in combination with the flue chamber K and the pipe collar G, three sides of which flue are formed by the concave shape of the reservoir, substantially as here shown and described.

7. The rearwardly and upwardly projecting flue seat K, or its equivalent, when used to conduct the smoke or products of combustion from the rear flue or flues of the stove into the flue R, or into a similar flue formed in or near the center of the reservoir, substantially as herein shown and described.

78,820.—EDWARD M. PARKER, Zion, Md.—*Horse Hay Fork*.—June 9, 1868.—The fork being thrust into the hay the curved tine is revolved by the crank arm, to gather and compress the hay within the fork, which is thus made to take up a large quantity at each operation.

Claim.—A hay fork or elevator, when the same is provided with two straight tines, in combination with a center tine, of curved formation, the latter being controlled by a crank lever with a suitable bearing pin.

78,821.—RUFUS H. PEABODY, Chelsea, Mass.—*Button-Hole Stitching Machine*.—June 9, 1868.—Designed as an improvement upon the clamp used for holding, spreading, moving, and guiding the button hole under the needle in the process of stitching, and consists in a new mode of spreading the jaws of said clamp.

Claim.—1. The combination, with a clamp substantially as described, of a spreader lever projecting backward from the hub *d*, and constructed and operating as and for the purposes described.

2. In combination with clamp and lever *g*, the device for securing said lever in any desired position within the range of its movement, for the purposes described, consisting of the teeth *n* and stationary pawl *m*, or their equivalent.

78,822.—HENRY PEASE, Brockport, N. Y.—*Coal Cook Stove*.—June 9, 1868.—The object is to economize and preserve uniformity of heat.

Claim.—The combination and arrangement, with the oven B and central fire pot E, of the hot-air flue *a*, surrounding the oven, and the cold-air flue *i*, surrounding the fire pot, the effect being to equalize the temperature of the oven by shielding from over heat and cold, as herein set forth.

78,823.—H. H. PEMBER, New York, N. Y.—*Boiling Kettle*.—June 9, 1868.—This device prevents the water which boils over from falling on the stove.

Claim.—A vessel, provided with a channel, B, around its upper edge, which communicates with the interior of the vessel by means of apertures E, as described, and for the purpose specified.

78,824.—LORENZO D. PENNINGTON and JOHN G. WOODFILL, Vevoa, Ind.—*Horse Rake*.—June 9, 1868.—The depression of the right handle of the rake

allows the rake head to revolve, while the reverse operation stops it at the desired moment.

Claim.—1. The bail C, rod *g*, and bolts K and *m*, with the slot *c*, in the continuation of the band *n*, or their equivalents, when arranged to operate substantially as and for the purposes specified.

2. In combination with the bail C, rod *g*, bolts K and *m*, and slot *c*, the spring D and studs *a a*, all arranged to operate in the manner and for the purposes as set forth.

78,825.—NELSON PETERSON and GEORGE W. JONES, Antioch, Cal.—*Forging Apparatus*.—June 9, 1868.—Devices are provided for increasing or diminishing the tension of the spring by which the hammer is raised, the hammer being depressed with the requisite force by means of a treadle.

Claim.—1. The bar H, with its slotted lever N, screw P, and spring I, in combination with the link J and handle B, substantially as described.

2. The bearings E, having the recesses *a a a* for supporting the axle D, so as to allow the hammer to be used on any part of the anvil, substantially as described.

78,826.—GEORGE T. PILLINGS, Leicester, England, assignor to himself and JOHN W. MASSEY.—*Shade Fixture*.—June 9, 1868.—A circular rack, pivoted to the frame, has attached to its arm a pin on which a loose pulley for the curtain cord works. By turning the worm the arm is thrown around until the proper tension of the cord is attained.

Claim.—The combination and arrangement of the frame B, provided with eyes *e* and *e'*, worm W, circular rack R, and pulley L, so as to operate substantially in the manner and for the purpose specified.

78,827.—T. W. PORTER, Boston, Mass.—*Shaft Coupling*.—June 9, 1868.—The torsion and end thrust are received by the key and knobs, while the bolts and plane bearings are especially concerned in keeping the shaft in line.

Claim.—1. A shafting coupling, divided longitudinally in halves, as shown at A and A, and secured together by bolts passing outside the shaft, as shown at *i i'*, and with the spline or key *a*, or its equivalent, formed upon or inserted in the coupling, substantially as described and shown.

2. The plane bearings *h*, formed in a longitudinally-divided coupling, substantially as and for the purposes specified.

78,828.—D. WEBSTER RANKE, Limestoneville, Pa.—*Gas Generator*.—June 9, 1868; antedated June 4, 1868.—The gas tube is protected from the heat of the flames. The retort has heat radiated upon it from a covering plate or "deflector." The apparatus is for generating gas from spirits or hydrocarbon oils.

Claim.—The gas generator, constructed as described, consisting of the annular reservoir A, in the inner side of which the curved pipe *c* is secured, its base extending within the reservoir, above the level of the oil, and the burner upon its end extending to the central opening in the reservoir A, and provided with the protector E, the perforated deflector B, above the reservoir, and the supply pipe D, all arranged as described for the purpose specified.

78,829.—HENRY J. REEDY, Cincinnati, Ohio.—*Hoisting Machine*.—June 9, 1868.—The platform is supported on the mid-length of a single rope, whose ends, after passing upward and over two sheaves, are attached to weights, which not only counterbalance the platform but cause the rope to hug the sheaves.

Claim.—1. The combination, substantially as described, with a hoisting platform, of the suspending rope E, weights H H', rollers *d*, sheaves F F', and shaft G, or their mechanical equivalents, by which the platform is both balanced and enabled to be elevated and depressed in the manner explained.

2. The arrangement, substantially as described, of the shaft P, ratchet wheel R, rubber S, lever T, and pawl U V, or their mechanical equivalents, for the purpose set forth.

78,830.—NATHAN RICHARDSON, Gloucester, Mass., assignor to "THE RICHARDSON MILL COM-

PANY," same place.—*Ice Crusher*.—June 9, 1868.—The spikes split the larger pieces of ice, so that the teeth of the crusher may grapple them, said crusher being of the kind described in Patent No. 35,472, granted to same party, June 3, 1862.

Claim.—In an ice-crushing mill, the vibrating teeth or spikes M M M, &c., operated by the cams D D', or their mechanical equivalents, in combination with the toothed crushing wheels, substantially as described and for the purpose set forth.

78,831.—LOUIS EDWARD RIVOT, Paris, France, assignor to JACQUES GAILLARDSON, San Francisco, Cal.—*Process of Treating Gold and Silver Ores*.—June 9, 1868.—This invention relates to the process of treating ores for which a patent was granted to same party May 31, 1864, and January 28, 1863, and consists in mixing gold and silver ores, before being submitted to the action of superheated steam, with oxide of iron, in lieu of pyrites.

Claim.—1. The roasting, by means of superheated steam, of auriferous and argentiferous ores, when previously combined or mixed with oxide of iron, substantially as set forth.

2. The roasting of auriferous and argentiferous ores by mixing therewith oxide of iron, combined with iron or roasted pyrites, and then submitting the whole to the action of superheated steam, substantially as set forth.

78,832.—JAMES T. ROBINETT, Petersburg, Va., assignor to himself and G. W. GOODWYN, same place.—*Journal Box*.—June 9, 1868.—The tubes lead from the lubricant reservoir to the face of the journal. When the parts are put together the tubes are cylindrical, but their outer ends are afterward upset or turned outward against the walls of the expanded outer ends of the socket, thereby firmly securing the two plates together.

Claim.—The method of attaching the brass plate C to the iron piece A, as herein set forth.

78,833.—J. S. ROWELL and IRA ROWELL, Beaver Dam, Wis.—*Seeder and Cultivator*.—June 9, 1868.—The hollow axle of each ground wheel is combined with the casting which unites the ends of the frame pieces, so as to finish off the end of the frame, and afford a bearing for the ground wheel, as well as for the spindle of the gear, which drives the seeding wheels, and receives the linchpin.

Claim.—1. The combination of the hollow axle and end-piece of frame, arranged as set forth, to form a bearing and end-piece.

2. The spindle D, secured firmly in the hub of the driving wheel, to form a double bearing for same.

78,834.—WILLIAM SANDERSON, New York, N. Y.—*Construction of Handles of Table Cutlery*.—June 9, 1868.—It is proposed to employ any composition that may be compressed while in a soft state, and which will securely embrace the metallic tang, and afterward become hard and inflexible.

Claim.—Forming the handles by molding a suitable composition, under pressure, around the tang or metallic portion of the instrument, substantially as hereinbefore set forth.

78,835.—JOSEPH W. SCHAYER, Boston, Mass.—*Machine for Stuffing Leather*.—June 9, 1868.—An auxiliary chamber outside the stuffing wheel supplies heated air to the stuffing chamber, so as to prevent the contact of the leather with heated surfaces.

Claim.—1. In combination with a stuffing wheel, a heating apparatus placed in a chamber, h, auxiliary to and opening into the stuffing wheel, but separated therefrom by an open work or perforated partition, m, substantially as described.

2. Combining with a rotary stuffing wheel an axial pipe, through which oil may be thrown into the stuffing chamber while the wheel is in rotation, substantially as described.

78,836.—ELIPHALET S. SCRIPTURE, Brooklyn, N. Y.—*Carriage Top*.—June 9, 1868.—The joints of the bow braces, as well as those which join the main bow to the seat, comprise opposing counterpart surfaces, which being held together with great force, by means of thumb screws or screw nuts, are made

inecapable of rotation, and the bows or the whole top are consequently retained in the desired position.

Claim.—What I claim as new, and desire to secure by letters patent, is not the circular corrugated wedge friction surfaces as when made by themselves, as the same has been made by me, and described in my patent, dated January 7, 1868, for compasses, calipers, &c., but I wish to claim their application, as described, when combined with a carriage seat and top, substantially in the manner and for the purposes set forth.

78,837.—GEORG SEBOLD, Durlach, Germany, assignor to JOHN F. ZISEMANN and HEINORE RASHCOL, St. Louis, Mo.—*Machine for Placing Friction Matches in Frames for Dipping*.—June 9, 1868.—This machine receives the splints in large quantities, sets them properly in frames, where they are secured for simultaneous dipping.

Claim.—1. The receiving or feed box I, arranged with longitudinal plate ridges i^1 , having transverse projecting slats i^2 , substantially as set forth.

2. The pressure slide K, actuated by ropes and weights, in combination with the feed box I, substantially as and for the purpose set forth.

3. The guide tube box F, and its tubes f^2 , the sieve G, and check sieve H, substantially as and for the purposes set forth.

4. The boxes I and F, in combination with the axle f^1 , the shaking lever N, and pivot n^3 , substantially as set forth.

5. The guide slat frame E, having longitudinal slats e' , in combination with the splint frame D, having transverse slats d^1 , and the channel plate B, substantially as and for the purposes set forth.

6. The splint frame D, arranged with slats d^1 , chamfered at ends, substantially as set forth.

7. The spaces c , in combination with the slats d^1 , of the frame D, constructed and operating substantially as set forth.

8. The compressor device Q, acting upon the slats of the frame D, substantially as and for the purpose set forth.

9. The supporting bar L, in combination with the shaking lever M and shaking wheel m^1 , acting substantially as set forth.

78,838.—I. SHELLABARGER, Decatur, Ill.—*Apparatus for Dampening Grain*.—June 9, 1868.—Water is introduced into an inclined grain chute to moisten the grain just as it enters the rotating cylinder.

Claim.—The combination and arrangement of the cylinder A, grain chute B, and water pipe c' , when the whole is constructed so as to operate substantially as described.

78,839.—JOHN ANDERSON SIMPSON, Liverpool, England.—*Umbrella and Parasol*.—June 9, 1868.

Claim.—As a new article of manufacture, an umbrella, constructed as herein described, the joints or junction of the ribs and stretchers being covered, and protected from injuring the covering by rubber shields, as and for the purposes herein set forth.

78,840.—G. W. SLAGLE, J. L. MILLER, and H. C. HOY, Washington, D. C.—*Soap*.—June 9, 1868.—Composed of resin soap, alcohol, borax, dissolved in solution of ammonia, aqua-ammonia, beef gall, and pumice stone.

Claim.—The mode of manufacturing soap from the ingredients, and substantially in the manner set forth.

78,841.—JAMES HARVEY SMILEY, Caroline, N. Y.—*Wagon Brake*.—June 9, 1868.

Claim.—The combination and arrangement, consisting of the slide C, the cord or cords F, levers G and H, and springs P, and pulleys, and rollers, and plates, as described, making a brake sliding out and against the wheels, and retracting out of sight, substantially as set forth.

78,842.—ALFRED STARR and WILLIAM M. WELLING, New York, N. Y., assignors to WILLIAM M. WELLING.—*Artificial Ivory*.—June 9, 1868; antedated June 2, 1868.—Composed of shellac, gum copal, gum camphor, and tale.

Claim.—The compound herein specified, prepared as set forth.

78,843.—LORENZO P. TEED, Lewisburg, Pa.—*Combined Threshing Machine and Grain Separator.*—June 9, 1868.—The threshed material passes between the apron, whose strips prevent the return of loose pieces of straw without interfering with the free passage of the straw rearward, said strips adapting themselves to the quantity of material passing beneath them. The slats of the upper sieve of the shoe may be adjusted so as to vary the width of the spaces between them, in order to suit the size of the grain that is to pass through the same.

Claim.—1. The apron F, consisting of a number of sheet metal strips, suspended above the shaker frame D, substantially in the manner and for the purpose herein set forth.

2. The slats *y*, having wires *y*¹ at their edges and adjustable upon a frame, substantially as and for the purpose described.

3. A plate or plates, *k*¹, so hung, adjacent to an opening in the case of a fan, *G*¹, that the passage of air into the said case will cause the plate to be adjusted, substantially as and for the purpose described.

4. The arrangement of the shaker frame D, platforms H and K, bands *g* and *w*¹, with their bars or scrapers, and the sieves *t*¹, all substantially as and for the purpose specified.

78,844.—ELISHA H. TOBY, Bridgeport, Conn., assignor to himself and A. R. HALE, same place.—*Device for Raising and Lowering Windows.*—June 9, 1868.—A metal socket, provided with an inwardly projecting flange, is inserted in the upper sash, so that the latter can be lowered and raised by a hooked rod.

Claim.—As an article of manufacture, the socket A, constructed with the internal flanges or rim *a*, and with or without the flush plate B, and so as to be applied to the sash, substantially as set forth.

78,845.—CROMWELL FLEETWOOD VARLEY, London, England.—*Electro-Pneumatic Apparatus for Transmitting Dispatches.*—June 9, 1868.—A mechanism is employed for introducing into the message pipe the compressed air, by which the message carriers or pistons are transmitted in one direction; another mechanism for opening communication between the said pipe and the air exhaust, by means of which the carriers are drawn in the opposite direction; and another for cutting off communication at any moment with both the compressed air and the exhaust chambers of the apparatus.

Claim.—1. Operating the pistons and valves of the main compressed air and exhaust pipes *o* and *n*, by means of a series of auxiliary valves and pistons, and pipes connecting the exhaust and compressed air chambers with the cylinder, and arranged to be operated by the keys or buttons, substantially in the manner and for the purposes herein set forth.

2. The combination, with the valve rods M and L, and their detents, of the sliding rod 4, arm 3, and piston rod of the cut-off cylinder V, substantially as herein shown and described.

3. The combination, with the cylinder V and its piston, of the cut-off mechanism herein described, arranged in such manner that either the depression of the stop or key *a*¹, or the arrival of the carrier at the distant end of the message pipe, shall connect the said cylinder with the exhaust, substantially as and for the purposes herein shown and set forth.

4. The use of the valves *x y*, arranged in chest N, so as to be operated by the movement of the arm 3, for the purpose of destroying the vacuum in the chest and message tube, as set forth.

5. The combination, with the message tube, and mechanism for connecting the same with the air-compressing apparatus of the cylinder F, and piston and slide valve arranged to cut off communication between the message tube and receiving chamber, substantially as herein shown and set forth.

6. Connecting the slide valve, cylinder F, with both the compressed air and the cut-off mechanism, substantially in the manner and for the purposes specified.

7. The combination, with the message tube, of the herein-described mechanism for connecting the same with either the compressed air or exhaust apparatus, and for cutting off the said connections, under the

arrangement described, so that all the operative parts of such mechanisms shall be actuated by means of the button A, *a*, and *a*¹, in the manner and for the purposes set forth.

78,846.—LUTHER R. WALLACE, Adrian, Mich., assignor to himself, RICHARD B. ROBBINS, and NELSON B. FASSETT, same place.—*Seeder, Drill and Roller.*—June 9, 1868.—As the cylinder revolves the seed is discharged into either the drill tubes or the broadcast sowing tubes by means of a shifting handle.

Claim.—1. The employment of one hopper and one cylinder, or their equivalent, to supply both drill and broadcast sower with the seed to be sown, the whole arranged in front of the rollers B B, substantially as set forth and described.

2. The hollow adjustable seed cylinder E, in combination with the couveave W, broadcast tubes L, and drill tubes N, substantially as set forth and described.

78,847.—D. B. WESSON, Springfield, Mass., assignor to MASON FIRE ARMS COMPANY, same place.—*Breech-loading Fire-arm.*—June 9, 1868.—The devices which lock and unlock the breech are made to resist and prevent any forward movement of the breech, relative to the frame or stock, as well as any upward movement of the same. The tumblers and movable block co-operate to raise the hammers to the half cock at the same time that the end of the barrel is disengaged from the movable block. The usual trigger spring is dispensed with.

Claim.—1. The metallic block *b*, and the recessed projection E, upon the breech or loading end of the barrel or barrels, when constructed, arranged, and operating substantially as and for the purposes set forth.

2. The described construction and arrangement, in reference to each other, of the block *b* and tumbler *f*, whereby the hammers shall be raised to the half cock in the operation of releasing the breech from the frame, substantially as described.

3. The projection *i*, upon the sear *h*, in combination with the opening *i*¹, in the plate *j*¹ of the trigger *j*, substantially as and for the purpose specified.

78,848.—JOHN WHITLOCK, Birmingham, Conn.—*Shackle Jack.*—June 9, 1868.—Facilitates the insertion of the bolt which couples the thills and shackles by forcing backward the shackle eye and compressing the rubber packing sufficiently to bring in line the bolt holes of the two parts of the shackle.

Claim.—The combination of the hook frame H H' with the slide F' and the screw G, or their equivalents, for the purposes above described.

78,849.—JOHN WIARD, New Britain, Conn.—*Cattle Tie.*—June 9, 1868.—The tie is placed around the animal's neck or horns, the socket properly adjusted and clamped to the rope, and the hook passed into the hole in the adjacent end of the thumb screw.

Claim.—1. The socket B, combined with the thumb screw C, when the said thumb screw is provided with a head, having a perforation at one or both ends, so far to one side from the center or axis of the screw as that, when the tie is secured, the screw will be prevented from turning, substantially as herein set forth.

2. The hook G, formed upon the base, F, constructed with the lug I and the seat L, and provided with an eye, E, or its equivalent, and combined with the snap P, when the said snap is attached to its seat L, and supported by the lug I, substantially as herein set forth.

78,850.—LEWIS WILKINSON, Boston, Mass.—*Ball Caster.*—June 9, 1868.—Extensions retain the ball in the socket so that it cannot drop out by gravity when the caster is raised, while by slight strain or pressure the ball may be readily drawn from or pressed into the socket.

Claim.—1. A furniture caster, having a ball, *f*, secured in a cup or socket, *a*, by extensions, *g*, substantially as shown and described.

2. In combination with socket *a* and extensions *g*, the pins or projections *e*, against which the surface

of the ball bears and rotates, substantially as shown and described.

3. In combination with the ball-containing cup or socket, the flanged plate or disk *c*, and screw spindle *d*, cast integral with the socket piece, substantially as described.

78,851.—FRANCIS H. WILLIAMS, Syracuse, N. Y.—*Construction of Safes.*—June 9, 1868.—The door must be moved outward and at right angles to the adjoining wall of the safe before it can be swung open upon its hinges. By withdrawing the hinge pintle, the leaves of the hinge may be made to lie closely against the safe.

Claim.—1. So constructing and hinging the safe door *A*, and fitting it into the frame *D*, that this door shall be allowed to move bodily and squarely up to and from its seat without being rotated within the door casing, substantially as described.

2. Fitting the door *A* to its frame *D*, by means of acute-angular stepped faces *h h' i i'*, substantially as described.

3. Providing the double-leafed hinges *b b* with a removable pintle, *c*, when such hinges are applied upon the door of a safe or vault, substantially as and for the purposes described.

78,852.—FREDERICK WITTRAM, San Francisco, Cal.—*Anchor.*—June 9, 1868.—This construction is designed to insure the catching or imbedding of one or both of the arms or flukes, whatever may be the position of the anchor in falling to the bottom.

Claim.—An anchor, having the shank *A*, with the opening *B* and *C*, and the two arms or flukes *D* and *E*, moving freely, through the shank, to either side, the whole constructed and operating substantially as and for the uses and purposes herein specified.

78,853.—DEVOLSON WOOD and STILLMAN W. ROBINSON, Ann Arbor, Mich.—*Steam-Engine.*—June 9, 1868; antedated March 31, 1868.—A single piece constitutes the piston, piston rod, and tool-holder; a two-part cylindrical annulus is fitted to the cylinder and rod so as to serve as a head. The follower may be in two parts like a coupling nut, and the piston packed in the usual way.

Claim.—The segmental pieces *A A*, to serve as a cylinder head, substantially as described.

78,854.—WILLIAM ADAIR, Liverpool, England.—*Pump.*—June 16, 1868. Patented in England April 5, 1867.—A closed cylinder containing a plunger, together with an open cylinder and a feed pipe inserted at the bottom of the cylinders and carried up either between them or outside, and having communication with the open cylinder at the bottom and with the closed one near its top.

Claim.—The combination of the open and closed cylinders, the later provided with a valve cover and plunger, the two operating by means of valves, and a feed pipe, and a branch thereof, substantially as described.

78,855.—EDWARD L. BALCH, Boston, Mass.—*Music Type.*—June 16, 1868; antedated June 4, 1868.—Relates to printing music charts with ligneous type for use in schools, &c., the object being to provide thick and heavy lines for the musical staff and stems of the notes to enable them to be read at a distance.

Claim.—The wooden type for printing musical charts, provided with right-angular shoulders *B*, overlapping each other, whereby continuous and unbroken lines for the musical staff and notes are formed, as herein shown and described.

78,856.—LEONARD W. BEAL, Dixon, Ill., assignor to himself and A. D. DREW, same place.—*Plow.*—June 16, 1868.—The plow is formed of a single plate with rounded points so as to be reversible, and is secured to a standard attached to a frame so as to be adjusted to different heights.

Claim.—1. A plow plate *A*, constructed substantially as described, so as to dispense with a land-side and separate point, and operating as specified and described.

2. The plow plate *A*, when constructed in the curved form, symmetrically before and behind its

point of attachment to its standard, so as to operate and be reversible, substantially as described and shown.

3. The combination of one or more plows, *A*, constructed substantially as described, with a frame, *C*, and wheels *W*, substantially as set forth.

4. Securing the axle *E* to the frame *C* in such a manner as to be adjusted at pleasure, to vary its direction across the frame, substantially as herein set forth and described.

78,857.—SAMUEL S. BENT, Port Chester, N. Y.—*Hens' Nest.*—June 16, 1868.—A shelf is provided for the hen to light upon, and a rib to serve as a foothold in stepping into the nest. Object of the invention is to avoid vermin, and enable the nest to be inspected and the eggs readily removed.

Claim.—1. A metallic hens' nest, formed with rounded corners, and with the rib *g* at the front end, as and for the purposes specified.

2. The lighting shelf *p*, in combination with the metallic hens' nest, formed as aforesaid.

3. The side partitions *h*, combined with the metallic hens' nest, to separate one nest from another, as and for the purposes set forth.

4. A movable door or window, *k*, in combination with the frame and hens' nest, to give access to the same from outside the coop, substantially as set forth.

78,858.—JAMES BOUNDS, Bridgeport, Conn.—*Pepper Box Top Fastener.*—June 16, 1868.

Claim.—Forming a single piece of spring wire, *U*-shape, and securing one end of it to the under side center of a box or bottle top so arranged that said lid will rest upon the top of the bottle, as and for the purpose set forth.

78,859.—THOMAS BOYD, Alleghany City, Pa.—*Heating Buildings.*—June 16, 1868.—An ordinary fire chamber and its smoke flue are surrounded with an air chamber which terminates in the fireplace of an upper room, the smoke pipe passing up into and out of the fireplace of said upper chamber into a side flue.

Claim.—The arrangement of the flues *1, 2, 2'*, and *4*, fireplaces *m* and *n*, air chamber *3*, and valve *o*, the whole being constructed, arranged, and operating as herein described, and for the purpose set forth.

78,860.—GEORGE R. BRAMHALL, Chicago, Ill.—*Method of Lowering Cylinders.*—June 16, 1868.—For sinking sections of a tube beneath water where said sections are to be secured and bolted together and gradually lowered; when the lowering is completed the inclined ways are separated from the platform, and the cylinder or tube brought to a vertical position.

Claim.—1. The combination and arrangement of the inclined way *D*, hinged at the bottom, as shown, and the hinged adjustable platform *D'*, with its means of elevation and depression, substantially in the manner and for the purposes specified.

2. In combination with the above, the clamps *F f*, operating in the manner and for the purposes set forth.

3. In combination with the hinged platform *D'* and ways *D*, the linked rods *h*, arranged to operate as and for the purposes described.

4. The frame *L*, with its movable bars *M N*, in combination with the ways *D* and frame *I*, arranged in the manner and for the purposes described.

78,861.—DANIEL W. COLBURN, Loami, Ill.—*Wrench.*—June 16, 1868.—One jaw is made longer than the other and has a slightly concave surface so as to obviate the necessity of removing the wrench to get a fresh grasp.

Claim.—This improved construction of the jaws *A* and *B*, in the manner herein specified, and for the purposes set forth.

78,862.—JOSIAH COPLEY, Jr., Alleghany City, Pa.—*Forging Machine.*—June 16, 1868; antedated June 4, 1868.—The forging and welding dies, while in action, may be opened and closed to any desired degree, and their force gradually increased or diminished and adjusted to the work required of them.

Claim.—1. Operating the dies *J* and *K* by means

of the slotted lever C, arm D, and cam P, constructed and arranged substantially as herein described, and for the purpose set forth.

2. The combination of the treadle *l*, connecting rod *n*, and shifting guides *m*, when used in connection with the cam P, arm D, and lever C, as herein described, and for the purpose set forth.

3. The guides *i*, when used in combination with the dies J and K, as herein described and set forth.

78,863.—M. C. CRONK, Auburn, N. Y., assignor to himself and W. BOYNTON, same place.—*Machine for Grinding Knives of Moving Machine.*—June 16, 1868.—A series of devices for holding and adjusting the cutters in proper position in relation to the grindstone.

Claim.—1. The combination of the plates D and E, arranged to operate as and for the purpose specified.

2. Lever G, rod *k*, and spring *l*, all combined and operating substantially in the manner and for the purposes set forth.

3. The combination of lever G, screw *m*, and spring *h*, arranged and operated substantially as and for the purpose specified.

4. The combination of lever G, bolt P, bars L and M, arranged and operating substantially for the purpose set forth.

78,864.—DAVID CUMMING, Jr., New York, N. Y.—*Method of Locking Nuts.*—June 16, 1868.—When the nut is screwed up to its place the portion of the soft metal key outside of the nut is to be riveted up against the nut, destroying the thread on that portion, and preventing the nut from coming off.

Claim.—The key, of lead or other similar soft metal, when constructed and applied substantially as herein described and for the purpose set forth.

78,865.—JOSÉ F. DE NAVARRO, New York, N. Y., assignor to EMERY ROTARY MACHINE COMPANY.—*Device for Attaching Pumps to Barrels.*—June 16, 1868.—Designed to obviate the necessity of adjusting a separate clamping screw, the device being made to automatically accommodate itself to different sizes of pipe and diameters of bung hole.

Claim.—The clamping sleeve A, of two or more parts, doweled together, and of conical exterior, with internal gripping ribs, or projections, for clamping the suction pipe of the pump, substantially as shown and described, for the purpose set forth.

78,866.—JAMES DODD, Providence, R. I., assignor to himself and GEORGE BROWN, same place.—*Composition for Preparing Sizing.*—June 16, 1868.—For six hundred pounds of starch or sizing are used one ounce of carbonate of soda, sixteen ounces of common hard soap, and two ounces of borax.

Claim.—The above-described composition, as well as its combination with starch or sizing, for warps.

78,867.—JAMES DUFF, Peoria, Ill.—*Drop Press.*—June 16, 1868.—The drop press is provided with a secondary or following hammer, and a cushion between the two hammers so arranged as to prevent the rebound.

Claim.—The following hammer B, air chamber *b*, air passage and stop cock *d*, and plunger *a*, in combination with the hammer A, when arranged in the manner and operating as and for the purpose herein described.

78,868.—CHARLES R. ELMER, Bridgeton, N. J.—*Single-Tree Brace.*—June 16, 1868.—The single-tree is hooked to the chain at a point equal in distance from the clevis to the width of the furrow, so as to enable the horse to walk in the furrow instead of on the landside.

Claim.—The combination and arrangement of the chain C and brace E with the beam A and single-tree F, substantially upon the principle above described, and for the purpose set forth.

78,869.—CHARLES M. FRENCH, Rochester, Pa.—*Plow.*—June 16, 1868.

Claim.—So constructing a plow, as that the joint between the share and mold-board shall be about on a line at right angles to the plane of the share bar or landside of the plow, said joint being so arranged,

with relation to the share and mold-board, as to give depth and strength to the forward part of the share bar, and also, so that the several parts may be duplicated, the whole being constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

78,870.—GEORGE P. GANSTER, New York, N. Y.—*Manufacture of Illuminating Gas.*—June 16, 1868.—Air is forced into one end of the outer drum through any suitable porous capillary material saturated with carbon and placed in the space between the drums, and thence through the other end of the inner drum out into the gas holder. The capillary material is kept wet by the revolution of the drums.

Claim.—1. In an apparatus for carburetting air, the arrangement of the inner and outer drums D and F, through which the air passes from the pump A.

2. The combination and arrangement of the carburetting apparatus shown and described, with the air-foreing apparatus in the same case or cylinder, substantially in the manner set forth.

78,871.—SAMUEL GARDINER, Jr., New York, N. Y.—*Gas Burner.*—June 16, 1868.—A coil of platinum wire is arranged in the upper end of a hood placed over the burner, which retains sufficient heat to re-ignite the gas after it has been extinguished. A sufficient quantity of gas passes through a very small groove made in the key, when the main supply is shut off, to keep the platinum hot enough to again light the gas.

Claim.—1. The combination of the coil C with a key, D, formed with one or more notches, apertures, or grooves, as at *d*, so as to permit a slight leakage of gas when the main supply is turned off, as shown and described.

2. The combination of the coil *c*, or its equivalent, with the hood or cap B, substantially as and for the purposes specified.

78,872.—ALEXANDER WIMBISH HARRIS, New York, N. Y.—*Suspender.*—June 16, 1868.

Claim.—1. A suspender or brace, substantially such as described, consisting of a single piece of webbing, leather, cloth, or other equivalent material, passed through and sliding freely in two button strap loops, and the two ends connected by a buckle or equivalent means, by which the length can be adjusted at pleasure, as and for the purpose described.

2. As a new article of manufacture, a suspender or brace consisting of a single piece of webbing or other equivalent material, constructed substantially as described, in combination with a slide to secure an adjustable crossing of the webbing or other material, substantially as described.

78,873.—J. H. G. HAWES, Newark, N. J.—*Combined Influx and Vent Valve.*—June 16, 1868.—The valves are separated and so arranged as to prevent collapse in boilers and also siphonic action through the supply pipes.

Claim.—The arrangement with the pipe A D of the two valves C E, separate and independent of each other, adapted to operate substantially as and for the purpose described.

78,874.—THOMAS HAWKS, Rochester, N. Y.—*Composition for the Manufacture of Beer, Ale, Porter, &c.*—June 16, 1868.—The object of the invention is to reduce by evaporation the infusion of malt and hops, commonly called wort, to a state in which the condensed product is of much less bulk than the original ingredients and is a portable and merchantable commodity.

Claim.—As a new product, the extract of malt and hops, or, as I term it, concentrated wort, prepared in suitable proportions for the manufacture of ale, beer, and other malt liquors or beverages, when condensed to a sirup or substance of thick consistency, substantially as herein described, either with or without the addition of gelatine, or with or without the addition of cane sugar, substantially in the manner and for the purpose herein set forth.

78,875.—THOMAS HAWKS, Rochester, N. Y.—*Concentrated Malt Extract.*—June 16, 1868.

Claim.—As a new product or composition of matter

the extract of malt, or, as I term it, concentrated malt, when condensed to a sirup or substance of thick consistency, substantially as herein described, either with or without the addition of cane sugar, or with or without the addition of gelatine, substantially in the manner and for the purposes herein set forth.

78,876.—WINFORD R. S. HUNTER, Blackberry Station, Ill., assignor to himself and H. T. ROCKWELL.—*Bed Bottom.*—June 16, 1868.

Claim.—The combination of the cross sill A, springs *a a*, slats B, blocks D, slats C with the slots *c*, and elastic strap *b*, all arranged in the manner and for the purposes set forth and shown.

78,877.—F. A. JEWETT, Shrewsbury, Mass.—*Churn.*—June 16, 1868.—Stationary arms or floats are secured to a stationary shaft, and the cylinder rotates around the same, carrying the milk around upon the inner periphery until it comes in contact with the floats. A ventilating hole passes through one end of the stationary shaft and up through one of the stationary arms or floats, which is covered with a cap, to permit ingress and egress of air.

Claim.—1. The combination, with the cylinder I, of the stationary arms or floats N, substantially as and for the purposes set forth.

2. The combination of the stationary arms N with the stationary shaft K, substantially as and for the purposes set forth.

3. The combination, with the cylinder I, of the stationary shaft or spindle K, and stationary arms N, or their equivalents, substantially as and for the purposes set forth.

4. The combination, with the stationary shaft K and one of the arms N, of the air or vent hole *f*, substantially as and for the purposes set forth.

5. The combination of the cap *g* with the vent arm N, substantially as set forth.

6. The combination, with the cylinder I and spindle or shaft K, of the flanged or hub pieces *b c*, substantially as and for the purposes set forth.

7. The combination and arrangement, with the cylinder I, of the arms R R, spring bar P, screws *w w*, and cover O, substantially as and for the purposes set forth.

8. The combination, with the cylinder I, of the holding-screw pad I7, substantially as set forth.

9. The combination, with the front frame pieces A A and brace E, or its equivalent, of the swing table or shelf G, substantially as and for the purposes set forth.

78,878.—ARTHUR KIRK, Alleghany City, Pa.—*Distilling Petroleum.*—June 16, 1868; antedated February 10, 1868.—The different products of distillation are designed to be completely separated according to their gravity. A float attached to an index lever indicates the amount of residual oil remaining in the still during an exhaustive distillation of the oil.

Claim.—1. Effecting a continuous distillation of petroleum, or other distillable substances, by causing it or them to flow through a succession of stills, giving off in each still the more volatile ingredients, the stills being connected by trap pipes *x y z*, &c., so as to prevent the backward flow of the substance to be distilled, substantially as above set forth.

2. A nest or battery of stills, for purposes of distillation, two or more in number, connected together by pipes, each pipe leading from the upper part of one still to the lower part of another still, substantially in the manner and for the purposes above set forth.

3. In connection with a still, for distilling petroleum, and other distillable substances, the use of a float *s*, with suitable index lever *l*, arranged and operated substantially as and for the purposes hereinbefore set forth.

78,879.—THOMAS LEFFEL, Springfield, Ohio, assignor to himself and HENRY C. BARNETT, same place.—*Water Wheel.*—June 16, 1868.—The floats are formed with parabolic curves on their edges. Each has a central longitudinal ridge or fin fitting into a corresponding groove on the periphery of a supporting ring. The water is discharged both above and below the ring into the center of the wheel.

Claim.—1. A wheel, formed of a series of single

floats, the faces of which are constructed in the form described, and which are centrally attached to a ring, K'', and arranged to receive and discharge the water, substantially in the manner set forth.

2. The combination of the floats L and ring K'', when respectively constructed and connected, substantially as set forth.

78,880.—JOHN LEMMAN, Cincinnati, Ohio, assignor to J. A. FAY & Co., same place.—*Guide for Band Saws.*—June 16, 1868.—A combination of anti-friction rollers and fixed guides; the first to support the back of the saw, and to have a lateral adjustment. The fixed guides serve as a lateral support and are made to accommodate saws of different widths.

Claim.—The combination of the roller *b* with fixed lateral guides *c c c*, one or more, arranged and operating substantially in the manner and for the purposes specified.

78,881.—H. W. LIBBEY, M. D., Cleveland, Ohio.—*Nursing Bottle.*—June 16, 1868.—Two concave disks form a chamber for holding the lacteous fluid. The disks are secured together and provided with an elastic covering and with central and marginal openings to allow access to the chamber. The elastic covering is inflated by means of a tube surrounded by a shell or mouth piece.

Claim.—1. The disk A B, provided with central and marginal openings C D, for the purpose specified.

2. The elastic covering F, in combination with the disks A B, for the purpose set forth.

3. The tube H, shell G, valve *b'*, and elastic tube I, all constructed and arranged to operate in the manner and for the purpose substantially as set forth.

78,882.—HENRY MARTIN, Galveston, Ind.—*Machine for Cutting Staves.*—June 16, 1868.—Two knives or cutters are so arranged as to chamfer the ends of the staves simultaneously with the cutting of them from the block and make them all of equal length.

Claim.—The cutters E E, constructed as described, attached to the fingers C of the stave machine, extending above their upper ends, and having an inclination inward and obliquely over the top edge of the stave, thereby bevelling or chamfering its ends, as herein shown and described.

78,883.—JOHN S. MILLIKAN, Thorntown, Ind.—*Truck for Moving Houses.*—June 16, 1868.—The upper bolster moves on a pivot so as to give the desired change of the object to be hauled to any desired position.

Claim.—A truck for moving buildings, having transverse bars *c c*, bolts, *d d d d*, *f f*, and *g*, and bolsters *e e*, constructed, combined, and arranged substantially as herein specified.

78,884.—MORTIMER BIRDSILL MILLS, De Witt, Iowa.—*Sewing Horse.*—June 16, 1868.—The feeding slide is attached to the inside of the upper end of the stationary jaw, and is operated by a rod attached at its upper end to a crank, the lower end extending through the seat.

Claim.—1. The feeding slide, and the manner in which it is worked.

2. The mode and operation of punching the holes.

78,885.—WILLIAM MOORE, Kokomo, Ind.—*Water Indicator for Steam Generator.*—June 16, 1868.

Claim.—The arrangement of the hollow valve Y, with its side apertures S, the sleeve *o o*, connecting rod R, lever D, and the float and its rod B, all constructed, arranged, and operating substantially in the manner herein specified.

78,886.—DUNCAN MORRISON, Portland, Me.—*Staging.*—June 16, 1868.—An arrangement of devices by which a staging can be elevated and lowered by a person standing on the platform, and held in any desired position.

Claim.—1. The combination, with the center standards of the levers *c* and spring catches *d*, connected with the platform B', in the manner and for the purpose herein set forth.

2. In combination with platform B', the crank

o, pulley *p*, cord *v*, shaft *q*, and cords *t u*, as and for the purpose herein set forth.

3. The combination of cranks *k*, cords *k'*, and springs *i*, connected with the cranks *k*, as described, and for the purposes set forth.

4. The combination of the bars *m* with the clamps *n* and springs *h h* on the platform, to release the said springs, as and for the purposes herein set forth.

5. The combination and arrangement of the staging, so that it may be folded, as herein described, in the manner and for the purposes set forth.

78,887.—WILLIAM A. MORSE and JOHN G. POWELL, Philadelphia, Pa.—*Eraser*.—June 16, 1868.

Claim.—An eraser blade made from thin sheet metal, when the same is stiffened by corrugations as shown and described, for the purpose set forth.

78,888.—HENRY L. C. MÜLLER, Bridgeport, Conn.—*Shoe Lacing Device*.—June 16, 1868; antedated June 2, 1868.—Designed for fastening the upper ends of shoe strings to obviate the necessity of tying the same. The string is laid under and around the hook and clamped between the springs.

Claim.—A string holder, *D*, for shoe lacings, made and operating substantially as herein shown and described.

78,889.—JOHN T. NORRIS, Tiffin, Ohio.—*Harvester Cutter*.—June 16, 1868.—The cutters are fastened to the cutter bar by pins passed through the sides of the bar, and slots and lugs on the base of the cutters, so as to enable the cutters to be easily taken out, replaced, and ground. The knives are held closely together by means of a wedge.

Claim.—1. The knife *B*, provided with slot *b* and lug *d*, substantially as and for the purposes herein set forth.

2. The combination of the knife *B*, as constructed, with the bar *A*, provided with pins *a a*, set screws *e* and *f*, and wedge *C*, or their equivalents, substantially as and for the purposes herein set forth.

78,890.—DANIEL E. PARIS, Troy, N. Y.—*Warming Closet on Cooking Stove*.—June 16, 1868.

Claim.—1. A warming oven to a cooking stove, situated underneath and supported by the bottom of the same, situated between and in combination with the supporting legs of the stove, when made in framework and constructed substantially as herein shown and described.

2. In combination with the warming rack below, and the reservoir seat above, a hot oven or closet, made in framework, the different parts being put together by means of bolts, locks, or lugs, and without the use of solder or other adhesive material, when constructed substantially in the manner and for the purpose herein shown and described.

3. A warming rack, situated below a warming closet, having its rear side partly or wholly supported by pendent bars, or their equivalent, attached both to the rack and the closet above, for the purpose and substantially in the manner herein shown and described.

4. The slide *M*, or its equivalent, placed in baking ovens or warming closets, and made to be self-supporting, when drawn out of said oven or closet, for the purpose herein described and set forth.

78,891.—DANIEL E. PARIS, Troy, N. Y.—*Hearth and Ash Sifter in Cooking Stove*.—June 16, 1868.

Claim.—1. A movable sifting grate or grates, placed permanently within the hearth or ash pit of a stove, and made to vibrate by means of a handle or shaker, operated from the outside of the stove, in combination with the surrounding walls of said hearth, or their equivalent, which act as the sides of a pan, to hold the ashes and coals on said sifting grates as they fall from the fire grate above.

2. A covered sifting chamber, the sides of which are formed by the hearth or ash pit of the stove, and by the slide or conducting plate below the fire grate, the bottom of which is formed by an open or perforated sifting grate or grates, and the top by a movable cover to said hearth, in combination with an ash pan or ash chamber, situated just below said grate or grates.

3. A sifting grate or grates thus situated, con-

structed to dump or discharge its contents into a chamber or movable pan below, and in combination therewith, substantially as here shown and described.

4. An opening at the lower front of the hearth or ash pit of a stove, of sufficient capacity to remove the ashes or an ash pan from the chamber below the sifting grate or grates, and in combination with said grate or grates, when the latter are constructed substantially as herein shown, or are placed permanently within the hearth or upper part of the ash pit of a stove.

5. The closing of said opening at the lower front of the hearth by a drop door or falling plate, having its lower edge or ends attached to the hearth or ash pit, and so constructed that, when it is let down at or near a level with the bottom of said hearth, it will thus remain, for the purpose of supporting, and in combination with, the ash pan, when the latter is made to be drawn out, in the manner and substantially as herein shown and described.

78,892.—CHARLES H. PERKINS, Providence, R. I.—*Construction of Toe Calks for Horseshoes*.—June 16, 1868.—An improvement on his patent of April 9, 1861. The object is to give additional strength to the welded joint between the calkin and the shoe.

Claim.—A toe calkin for horseshoes, furnished with chisel-edged tenons or spurs *b b*, set opposite to each other, and with their faces parallel with each other and with the longitudinal axis of the calkin, substantially as described, for the purposes specified.

78,893.—GEORGE WILLIS PIERCE, Boston, Mass.—*Umbrella*.—June 16, 1868.—Clamps provided with prongs are employed to secure the coverings of umbrellas to their frames, instead of thread.

Claim.—1. The clamp 1, (represented by Figs. 2 and 3,) provided with one or more prongs *a a*, for the purpose specified, the whole made and operating substantially as described, and for the purpose specified.

2. The clamp 5, in combination with the ring 4, (represented by Fig. 4,) when made, combined, and operating substantially as described and for the purpose specified.

78,894.—WILLIAM POTTS, Handsworth, England.—*Ventilating Apparatus*.—June 16, 1868.—A sufficient draught is established in the vertical tubes by means of gas flames at or near the lower ends of the said tubes.

Claim.—1. The improved method, herein described, of ventilating rooms and buildings, by constructing and arranging, at the highest convenient part of the room or building, two independent or separate channels, extending at different levels along one or more sides of the room or buildings, and provided throughout their length with ornamental or other perforations, or wire gauze, through which the vitiated air is drawn into the upper channel, and the fresh air passes from the lower channel in the manner specified, whereby the room may be ventilated without creating a perceptible or injurious draught.

2. The arrangement, in the cornices of rooms or buildings, of two independent and separate ventilating channels, and the ornamental or other perforations or wire gauze with which the same are provided, for dividing and distributing the air drawn from and discharged into the place to be ventilated, in the manner and for the purposes shown and set forth.

78,895.—BENJAMIN H. REYNOLDS, Canterbury, and JOHN BACHELDER, Norwich, Conn.—*Lubricating Device*.—June 16, 1868.—Wipers made of flexible cords, or equivalents, are drawn diagonally across the shaft, with an inclination toward the lubricating wheel in the direction it is running. The lubricating wheel is made to revolve by means of a pin set in the shaft.

Claim.—1. The wipers *j j*.

2. The arrangement of the pin *e* and groove in the hub of the lubricating wheel *d*, to provide for expansion and contraction.

78,896.—EDWARD ROBERTS, Philadelphia, Pa.—*Apparatus for Cutting the Teeth of Wheels*.—June 16, 1868.—Two cutting disks are arranged parallel

with each other on the same rotary shaft, and equidistant from an imaginary straight line passing through the center of the wheel which is to be cut.

Claim.—The combination of the spindle, collar, and clamping nut, for supporting and clamping the wheel, with the device, consisting of the two cutter disks, stretcher, tightening nut, and adjustable shaft or arbor, all arranged substantially as described.

78,897.—ALFRED ROOKER, London, England.—*Faucet.*—June 16, 1868; patented in England, September 25, 1867.—The inner edge of the stem of the tap is made hollow to receive the cylinder of cork, and with an annular cutting edge. A stop is placed in the stem to prevent the cork cylinder from reaching and closing the holes in the stem.

Claim.—1. The annular cutting edge *b* and the hollow part *B*, applied to a tap having perforations therein, and acting substantially as herein described.

2. The cutting edge *b* of the hollow part *B* of the stem, which receives the excised plug, in combination with the stop *C*, all substantially as and for the purpose herein set forth.

78,898.—S. P. SHIPLEY, Olena, Ohio.—*Bee Hive.*—June 16, 1868.—The hive is provided with transverse bars, and made in two parts, so that when full one part can be readily removed and an empty section substituted.

Claim.—The parts *A* and *B*, constructed with slotted top, combined with each other and with the cap *D*, as and for the purpose substantially as set forth.

78,899.—A. D. SMITH, Grafton, Ohio.—*Lock Nut.*—June 16, 1868.—A small part of the inner diameter of the nut is set into the concave or flat sides of the screw provided for the purpose, so that the nut may be secured at any point.

Claim.—The mode herein shown and described of securing nuts from turning, substantially as and for the purpose set forth.

78,900.—JUSTIN E. SMITH and MARK H. DASENBROOK, Warrenville, Ill.—*Weather Strip.*—June 16, 1868.—The lower edge of the strip passes beneath a roller and is gradually forced down as the door continues to close, so as to effectually close the space beneath the door.

Claim.—The combination of the strips *D B*, spring *S*, arranged in a recess, as shown, when said spring is operated by the rod *s* and arm *b*, in the manner and for the purposes specified.

78,901.—W. W. STEVENS, Portland, Me.—*Tea Pot.*—June 16, 1868.—The bottom plate of the tea pot has a downwardly projecting edge which rests on the stove or other heating apparatus so as to prevent contact with the entire bottom of the tea pot.

Claim.—The improvement in the construction of pots liable to melt from the influence of heat, consisting of the bottom as herein shown, and applied as illustrated, for the purposes set forth.

78,902.—RICHARD B. STILLMAN, Almond, N. Y.—*Clothes Drier.*—June 16, 1868.—A series of bars are hinged to movable hubs so as to admit of their being turned or swiveled round to radiate from the frame, to widen the space at the ends, when let down, and supported in a horizontal position for hanging clothes.

Claim.—The series of swivel hubs or studs, *d d d d*, hinged slats or bars *b b b b*, as constructed and arranged, in combination with the frame for holding and folding up the bars, substantially as and for the purposes herein set forth.

78,903.—REBECCA WEAVER, Washington City, D. C.—*Fastening for Buttons.*—June 16, 1868.—Studs provided with eyes through which is passed a chain having a bodkin at one end, for attaching and securing the same to wearing apparel.

Claim.—1. The button or stud constructed with heads *e* and *f*, connected together by posts *i i*, between which are one or more eyes, substantially as and for the purposes specified.

2. The chain *e c*, fastening slide or slides *j j*, and bodkin *h*, arranged and applied for fastening buttons, substantially as and for the purposes herein set forth.

78,904.—THOMAS WELCH, Churchville, N. Y.—*Harvester.*—June 16, 1868.—Two gear wheels and a pinion surround the main axle, one of the wheels being permanently fixed to the axles. A flexible counter-shaft is supported in two bearings in the frame and is provided with two pinions and a gear wheel, one of the pinions being fixed to the said shaft, all so arranged that fast or slow motion may be transmitted to the knife, and the motion and register of the latter will always remain the same, regardless of the change of position of the finger bar or vibrating frame.

Claim.—1. A vibrating gear and finger-bar frame in harvesters, in combination with a jointed counter-shaft, *B'*, for the purpose set forth.

2. With a two-wheeled jointed-bar harvesting machine, counter-shaft *B'*, in combination with two frames, one being rigid and the other vibrating, said shaft running across, and having journals in each frame, in which it works freely in all variations of either frame, as set forth.

3. In a two-wheeled jointed-bar harvesting machine, a triple gear, mounted upon two shafts, and meshing together, the wheels *H, J, and N*, with their pinions *M, I, and L*, representing said gear, the whole operating in the manner and for the purpose set forth.

78,905.—WILLIAM P. WELCH, Boston, Mass.—*Guide for Band Saw.*—June 16, 1868.—Elastic frictional rollers direct the band saw to the rigid guideway in which the saw is guided to the wood to be sawed.

Claim.—The adjustable guide block *C D*, having the elastic guide rollers, *L, L', and L''*, arranged in relation to each other and cheeks *A B*, all constructed and operating in the manner and for the purpose substantially as described.

78,906.—HIRAM B. WELLMAN, Indianapolis, Ind.—*Construction of Oil Cans.*—June 16, 1868.—The water in the outer chambers acts as a cut-off between the oil in the can and that in the spout, to protect the same against explosion.

Claim.—The use of water-chambers, so combined with an oil can that the oil from said can must pass through the water in its passage to the spout, as and for the purpose set forth.

78,907.—GEORGE WILCOX, Neenah, Wis.—*Grain Chaffing Mill.*—June 16, 1868.—The shoe is of concave form, and is made narrow at the rear end. Guides on the rim of the sieve keep it balanced directly over the rollers. The propelling shaft is provided with friction rollers, and is supported in a forked brace attached at each end to the shoe.

Claim.—1. The shoe *a*, which encases the sieve, and compresses the blast upon the rear part of sieve.

2. The attaching of the shoe *a* to levers *c c*, and holes *f* and *y*, whereby the whole may be raised or lowered at will when attached to the threshing machine.

3. The guides to front and rear end of sieve.

4. The arranging of the conical sieve within the shoe *a*, as set forth.

5. The brace *R*, as attached to shoe *a*.

6. The arranging of shaft *8* with rollers 2 and 3, and pulley 1, for propelling the sieve.

7. The machine herein described, when its several parts are arranged and combined, as set forth.

78,908.—CHARLES O. YALE, Rome, N. Y., assignor to himself and THEODORE W. MAHLER, same place.—*Corn Husker.*—June 16, 1868.—Two rollers of the same or different diameters are arranged over a reel, and operated by endless cords arranged over pulleys. A conveyor, having intermittent motion, carries up the ears singly from the hopper to the husking rolls. Over the husking rolls is a series of rings toothed on the inside and outside. Between the conveyor and husking rolls is a plate over which is an arm which pushes the ear toward the rolls.

Claim.—1. The rolls *C* and *D*, in either form as described, in combination with the reel *F*, or its equivalent, for the purposes mentioned.

2. The pulleys *C¹, D³, D⁴, and D⁵*, endless cord *D²*, and spring *D⁶*, constructed and arranged sub-

stantially as described, and for the purposes mentioned.

3. The conveyer H and arms H¹ and H², constructed and arranged substantially as described, and for the uses and purposes mentioned.

4. The conveyer H and husking rolls L and L¹, constructed and arranged substantially as described, and for the uses and purposes mentioned.

5. The rings M M, constructed and arranged substantially as described, and for the uses and purposes mentioned.

6. The plate K and the arm I³, constructed and arranged substantially as described, and for the uses and purposes mentioned.

7. The table B and reel F, constructed and arranged substantially as described, in combination, for the uses and purposes mentioned.

78,909.—GEORGE P. YORK and WILLIAM H. WILSON, Westfield, N. Y.—*Machine for Grinding the Cutters of Mowing Machines.*—June 16, 1868.—The grindstone is provided with mechanism for communicating a lateral motion of the same to and from the cutter bar, in connection with a table also provided with means for moving to or from the stone. Posts are secured to the table in a manner to be adjusted to or from the side of the stone, the upper extension of the said posts being suitably inclined toward the face of the stone, and provided with wood or soft metal facings, to prevent injury to the edges of the cutters.

Claim.—1. The combination, with a table provided with means for holding a cutter bar, as described, of a grinding wheel, arranged to slide laterally, substantially as and for the purposes described.

2. The combination, with the posts L and L¹, of the gauges M¹, substantially as and for the purpose described.

3. The combination, with cutter-grinding apparatus, of the posts and gauges, provided with the facings of wood or other soft material, substantially as for the purpose described.

4. The combination, with a grinding stone provided with means for effecting a lateral movement thereof, of the guides and posts, substantially as and for the purpose described.

78,910.—Canceled.

78,911.—JAMES U. ADAMS, Richfield, Mich.—*Packing for Piston Head.*—June 16, 1868.—Composed of a series of rings, surmounted by springs, and sawed vertically to the center from opposite directions, allowing a space between, in which is inserted a plate of copper.

Claim.—1. The springs E and rings D in combination with the piston head B, substantially as described.

2. The copper, H, or other metal, inserted in the manner described, and for the purposes specified.

78,912.—JOHN ADAMS, Transfer, Pa.—*Hay Raker and Loader.*—June 16, 1868.—The teeth are attached to a cross-bar, which is connected to the machine by means of arms, one end of which is secured to the cross-bar, and the other ends hook and ride upon the journals of the lower roller. The lower end of the rails of the frame rides upon the journals of the lower roller, and the upper end is adjustably supported by hooked arms.

Claim.—1. The rake, constructed as described, of the curved teeth I, attached at their upper ends to the head H, and the curved bars J attached at their outer ends to said head, and adapted to turn freely upon the axle of the roller B, by being hooked over the same, as herein shown and described.

2. The adjustable frame D, carrying the rollers and endless belt of hooks, when recessed at its lower end, to rest upon the axle of the roller B, to which it is held by the tension of the endless belt G, as herein shown and described.

78,913.—JOSEPH F. APPLIGATE, New Albany, Ind.—*Wagon.*—June 16, 1868.—The rear end of the perch pole is received in a metallic case or sheath beneath the rear hounds. Stops projecting downward from the under side of the body prevent the rear axle from moving either forward or back be-

yond them. The king bolt is extended from the bolster to a point above the top of the body.

Claim.—1. The perch pole C, used in combination with the case or sheath of the rear hounds, substantially as and for the purpose set forth.

2. The body G, provided with the stops I and J, and used in combination with the rollers *a a*, and the extension perch pole C, as and for the purpose set forth.

3. The extended king bolt H, in combination with the body G and the perch pole C, as and for the purpose set forth.

78,914.—JAMES C. ARMS, Northampton, Mass.—*Fastening for Pocket Books, &c.*—June 16, 1868.—A raised surface is formed near each end of a rectangular plate, upon which a strap is to be clasped and held by a slide.

Claim.—The clasp, consisting of the stationary piece B, and the slide *c*, when said parts are constructed and united, substantially as shown and described.

78,915.—ELIAS C. ATKINS, Indianapolis, Ind.—*Machine for Polishing Metal Plates.*—June 16, 1868.—Designed as an improvement on Reuben Cave's patent of February 1, 1859. The object is to provide a means for regulating or controlling the movement of the metal plate during the process of grinding and polishing, by elevating and depressing the rollers in the same ratio as the upper grinder.

Claim.—The combination of the stone, Q, running adjustably upon the yoke R, adjustable plates S, attached to the latter, and the rollers M and N, and spring bearings therefor, attached to the plates S, said parts being arranged in relation to each other, substantially as and for the purpose set forth.

78,916.—ELI H. BABCOCK, Canandaigua, N. Y.—*Drill Chuck.*—June 16, 1868.—The drill is secured in an elastic conical jaw, with a screw thread thereon, and a conical nut which engages therewith, and also an elastic reducer, so as to hold drills of different sizes.

Claim.—In combination with the chuck A, the nut B, and the reducer C, substantially as and for the purpose described.

78,917.—H. J. BAILEY, Pittsburg, Pa.—*Hydrant.*—June 16, 1868.—The operating parts are so arranged as to be readily removed from the casing when desirable, without the necessity of digging up the hydrant or disturbing its connection with the supply pipe.

Claim.—1. The construction of the tube E, valve *h*, removable seat F, and plate I, arranged to operate in connection with the valve *u*, substantially as shown and described.

2. The hollow valve tube E, the nut *m*, the plate I, and the valve seat F, constructed, arranged, and operating substantially as and for the purposes described.

78,918.—THOMAS S. BELL, Wapello, Iowa, assignor to himself, G. R. REED, and J. S. ANDREWS, Louisa County, Iowa.—*Pruning Shears.*—June 16, 1868.—The beveled sides of the blades are serrated near their cutting edges, to keep them from slipping on the wood while cutting. The outer end of one of the blades is connected by a bar to one of the handles, so as to act as a compound lever.

Claim.—The blades A and B, serrated on their beveled sides, and connected at their rear ends, and operated by means of the handles C and D and bar E, substantially as and for the purpose set forth.

78,919.—ALBERT P. C. BONTE, Cincinnati, Ohio.—*Wood Turning Lathe.*—June 16, 1868.—Invention relates to that class of lathes employed in turning elliptical forms, and consists in the provision of a counterpoise to prevent the sway or lurching motion to which such lathes are subject.

Claim.—The adjustable counterpoise H I, constructed substantially as described, and arranged relatively to the chuck E F of an eccentric or elliptical turning lathe, to operate in the manner and for the purpose specified.

78,920.—JOHN G. BOYER, Springfield, assignor to MOSES WIAIT and GEORGE GORR, Lehigh County, Pa.—*Stump Extractor*.—June 16, 1868; antedated March 27, 1868.—The chain is provided with movable hooks, to enable it to be conveniently hitched to the object to be moved.

Claim.—The portable power, consisting of the mechanism arranged substantially as described, and provided with the chain *j*, having movable hooks *l* and the stationary hook *m*, all mounted on the frame *A*, constructed as set forth.

78,921.—J. TOBIAS BRAUN, Randolph Centre, Wis.—*Wind Wheel*.—June 16, 1868.—This invention consists chiefly in a device for transferring motion from the horizontal wing-shaft to the horizontal driving-shaft, by which the machine to be operated is set in motion. The said device is so arranged that the horizontal wing axle can turn freely around its own axis when revolved by the wind, and also around an imaginary vertical axis when set by the wind.

Claim.—1. The device for connecting the crank *b* of the axle *B* with the cranks *h h* on the spindle of a windmill, said device consisting of the jointed bifurcated rod *J* and annular plate *m*, in combination with the jointed rods *J'*, *n*, and plate *o*, all made and operating substantially as described.

2. The jointed swivel rod *I*, connecting the axle *B* with the spindle of a windmill, in combination with the jointed rod *J*, *J'*, annular plate *m*, plate *o*, and jointed rods *J'*, *n*, all made and operating substantially as herein shown and described.

78,922.—GUSTAVUS V. BRECHT, St. Louis, Mo.—*Clamp of Hub-Boring Machine*.—June 16, 1868.—The clamps are provided with slots or mortises through them for the reception of wrought iron or steel nuts for the screws to work in, so that the threads may be renewed when necessary without requiring entirely new clamps.

Claim.—As a new article of manufacture, a clamp *A*, for a hub-boring machine, cast or formed with slots, for the reception of nuts, and provided with projections *a*, and serrated edges, as and for the purpose set forth.

78,923.—HENRY H. BROWNE, Mount Vernou, N. Y.—*Advertising Device*.—June 16, 1868.

Claim.—As a new article of manufacture the device herein described, the same consisting of the business card *b*, and the mirror *a*, which are retained together by the rim *c*, whose periphery is perforated, and the parts thereby form a combined business card, mirror, and pin cushion, substantially as specified.

78,924.—NORMAN BURDICK, Albany, N. Y.; assignor to himself, JACOB H. SHEAR, and JOSEPH PACKARD, same place.—*Cupola Furnace*.—June 16, 1868.—Invention relates to the discharging and confining the products or refuse coal, cinders, &c., left in the bottom of the cupola after the melted iron has been drawn therefrom, so as to compel the smoke, heated air, and noxious gases to escape through the cupola into the outer air, instead of into the building.

Claim.—1. The use of a sliding bottom to a cupola furnace, constructed substantially in the manner and for the purpose above described.

2. The in-laying of such bottom with some non-fusible substance, substantially in the manner and for the purpose above described, in combination with the chamber of a cupola furnace.

3. The cam levers *b b*, in combination with the bottom *B B*, substantially in the manner and for the purpose above described.

4. The form of the pit, in combination with the cupola furnace, constructed substantially in the manner and for the purpose above described.

5. The bottom *B B*, the wheel and axle *D* and *E*, the chain *y y*, the truck wheels *a a a a*, the cam lever *b b*, the guides *R R*, in combination with the cupola of a melting furnace, substantially in the manner and for the purpose above described.

78,925.—GEORGE CARLTON CASSARD, Baltimore, Md., assignor to himself and L. & J. L. CASSARD, same place.—*Lard Cooler*.—June 16, 1868.—The in-

ner vessel containing the lard is surrounded by a space, to be filled with cold water passed in and out through proper pipes. Air is forced through a tubular shaft into the inner vessel. Wooden scrapers prevent the cooled lard from accumulating on the sides of the vessel. Movable wooden slats pass between fixed ones to agitate the liquid contents of the inner vessel.

Claim.—1. The combination and arrangement of the wooden tank *B*, having the inclined walls, with the metallic vessel *C*, having the upright walls and funnel-shaped bottom, the central discharge pipe *D*, and the filling and regulating pipes *G H*, when said parts are constructed and arranged in the manner and for the purpose set forth.

2. The combination of the vessel *C* with the vertical tubular shaft *I* and the hollow arms *I' I'*, having the outlet holes *a a a*, substantially as described.

3. The combination of the scrapers *r r*, springs *s s*, and the shaft *I*, having arms *P P* to support the scrapers and springs, substantially as described.

4. The combination of the shaft *I*, the fixed slats *n n*, and the movable slats *m m*, supported by and rotated with the shaft and its arms, and meshing between the fixed slats, when said parts are employed in connection with the vessel *C* and tank *D*, having the space *F* between them, as described.

78,926.—ROBERT CAWTHORNE, Lyons, Iowa.—*Tire Setter*.—June 16, 1868.—Upon a tub of water is arranged an adjustable circular platform, supported upon rests fitted so as to turn easily on bolts. An adjustable nut on the screw standard and platform serves to regulate the dish of the wheel.

Claim.—1. The rests *c c c c*, for the purpose specified.

2. The arrangement and combination of the rests *c c c c* with the tub *A*, step *H*, standard *E*, platform *J*, nuts *D* and *O*, when operating substantially as and for the purposes herein set forth and specified.

78,927.—JOHN CHRISTIANSEN, New York, N. Y., assignor to himself and B. KREISCHER, same place.—*Hoisting Apparatus*.—June 16, 1868.—A double-armed lever is placed loosely on the driving shaft, and carries two pinions which mesh into gears mounted on said driving shaft, and one of which also meshes into a stationary internal gear, while the other meshes into cogs on the inner surface of the drum, to which the hoisting rope is attached.

Claim.—1. The combination of the lever *D*, carrying the pinions *b b'*, with the shaft *A*, gears *a a'*, internal gears *d d'*, stationary rim *f*, and drum *E'*, substantially as and for the purpose described.

2. The combination of the stationary rim *f* supporting the friction rollers *e*, with the hoisting drum *E*, substantially as and for the purpose set forth.

78,928.—DAVID C. COLLIER, SAMUEL CUSHMAN, and NEWELL E. FARRELL, Central City, Colorado Territory.—*Ore Roasting Furnace*.—June 16, 1868.—The cylinder being made to rotate slowly, the alternate elevation and depression of each end of the same causes the ore to be carried from end to end, and falling upon and being retained a short time at each semi-rotation of the cylinder, passes entirely around the partition in the same, thus subjecting every particle of the ore to the great heat from the fire box.

Claim.—1. An apparatus for roasting and chloridizing ores, composed of a cylinder, *A*, rotating on an axis inclined to the true axis of the cylinder, within which, in the line of the rotating axis, is a partial partition for receiving and retaining the ore for a short time at each semi-rotation of the said cylinder *A*, in combination with a fire box, *J*, and flue *K*, substantially as shown and described, and for the purposes set forth.

2. The wheels *B*, in combination with a rotating cylinder, *A*, substantially as shown and described, and for the purposes set forth.

3. The partial partition in a plane in the center of the rotation of the cylinder *A*, and placed at right angles to a line drawn from the man-hole *H* or *I* to said partition, or its equivalent, and in combination therewith, and with any fire box, *J*, substantially as shown and described, and for the purposes set forth.

78,929.—JAMES S. CONLIN, New York, N. Y.—*Shooting Gallery.*—June 16, 1868.—The object of this invention is to construct shooting galleries so as to make them convenient for use, easily operated, and entirely safe.

Claim.—1. The weighted ball-proof door M, so arranged between the tunnel G and pistol target J that when the door is unfastened it will swing open to protect the attendant at the target from balls inadvertently discharged, substantially as set forth.

2. Forming the targets J and A' with holes through their centers for the bull's eye, and with drop plates or blocks K and B', which are connected with the front of the gallery by means of cords and bells, substantially as and for the purposes herein shown and described.

3. Pivoting or hinging the pistol target J to the partition I, so that it may be swung back out of the way, substantially as herein shown and described, and for the purpose set forth.

4. The pistol target J, when connected to the front of the gallery by means of a cord, 7, so that it may be swung to its place from the said front of the gallery, substantially as set forth.

5. The arrangement in front of the rifle target A' of the partition R, formed with an opening, S, and provided with a sliding ball-proof plate, T, which latter is so connected, by means of a cord, V, to the door U, that when said door is opened the opening S is covered by the plate T, to protect the attendant, substantially as described.

6. The combination of the weighted door U and sliding ball-proof plate T with each other and with the partition R and rifle target A', substantially as herein shown and described, and for the purpose set forth.

7. The combination of the plate or block E', having three or more arms projecting from it, shaft D', ratchet wheel F', weight I', and stop arm K', with each other, with the drop plate or block B' and target A', substantially as herein shown and described, and for the purpose set forth.

8. The combination of the adjustable rest Q', shaft T', ratchet wheel W', pawl V', and rod X', with each other, and with the forward part of the gallery, substantially as herein shown and described, and for the purpose set forth.

9. An improved shooting gallery, constructed and arranged substantially as herein shown and described, and for the purpose set forth.

78,930.—GEORGE COOPER, New York, N. Y., assignor to VICTOR E. MAUGER, same place.—*Lithographic Press.*—June 16, 1868.—A water reservoir is provided with a slotted bottom, in which felt, blanket, or other porous fabric is clamped, so as to conduct the water below the reservoir with the requisite slowness. The lithographic stone is secured upon a movable carriage, upon which is fixed another stone or slab to transfer the moisture to the printing stone. A series of revolving porous wipers or rollers transfer the moisture from the surface and edges of the slab to those of the printing stone.

Claim.—1. Wetting a lithographic stone by moistening the surface of another stone, and transferring the moisture from the same to the printing stone, as described.

2. Wetting a lithographic stone by means of a moist roller or rollers, F, and wipers H H G, under and between which the stone passes, substantially as described.

3. The water-containing vessel A, when provided with an adjustable slot that is filled with absorbing material or fabric, B, substantially as herein shown and described.

4. The up-and-down, adjustable elastic plate I, when arranged as set forth, for the purpose of equally distributing the moisture over the slab E, in the manner specified.

5. Securing the wipers H H to adjustable bars or springs d d, for the purpose of adapting the machine to stones of greater or less width and thickness, as specified.

6. The combination of the slotted vessel A, cloth B, screws, or their equivalents, a, carriage C, stones E, wipers F, G, and H, and distributor I, with each other and with the stone D, all made and operating substantially as and for the purpose herein shown and described.

78,931.—JOHN DANNER, Canton, Ohio.—*Pencil Sheath.*—June 16, 1868.

Claim.—A pencil case or socket, with a rubber or other flexible or elastic lining, e, contained in an enlarged chamber, b, in the inside thereof, which rubber will, by its friction, hold a pencil inserted therein and protect its point, and be itself held in the chamber by the recessed shoulders thereof, substantially as described.

78,932.—WILLIAM DAVIS, Detroit, Mich.—*Preserving Meat, &c.*—June 16, 1868.—The spaces between the compartments are designed to be filled with four conductors of heat. A goose-neck trap below lets the water escape without admitting the air.

Claim.—1. The construction of a ear body, room, box, or chest, provided with compartments A B C, ice receptacle D, chimneys or funnels E, and hatches G, when arranged and operating substantially as described, and for the purposes set forth.

2. The goose-neck trap F, or equivalent, in combination with the receptacle D and compartments A B C, when arranged substantially as and for the purposes set forth.

78,933.—DAVID DAVY, Sheffield, England.—*Piston Valve for Steam Hammers.*—June 16, 1868.

—The steam or other fluid is admitted into the valve chest between the two pistons, and the exhaust steam passes into the valve chest from the cylinder at each end of the valve chest, and from thence into the exhaust pipe. The pistons or valves are hollow, and around their circumference are posts corresponding with and opposite, or nearly so, to other posts in the valve casing, so that communication is established between the top and bottom of the cylinder.

Claim.—The hollow piston valve, provided at the top and bottom with the valves e e, between which the annular space b is formed, arranged to operate in relation with the ports d g in the cylinder, the induction port a, and exhaust H, as herein described, for the purpose specified.

78,934.—GAIUS S. DEANE, Grand Rapids, Mich.—*Gauge Wheel for Plow.*—June 16, 1868.—When the hollow axle becomes worn the bolt which secures it to the standard may be loosened and the axle turned half around, so that the wear will come on the other side. The false hub, when it becomes too loose, may be easily removed, and replaced by a new one.

Claim.—1. The combination of a false hub, E, with the hub of a cast-iron plow wheel, substantially as herein shown and described, and for the purpose set forth.

2. The hollow axle C, secured to the standard A by a bolt, D, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the recessed standard A, bolt D, hollow axle C, cap F, removable false hub E, and cast-iron wheel B, with each other, said parts being constructed and arranged substantially as herein shown and described, and for the purposes set forth.

78,935.—D. A. DICKINSON, Baltimore, Md.—*Ventilating and Drying Corn and Grain.*—June 16, 1868.—Between the sides or ends of the crib or bin, in which are bored holes, and to the inner surface of each side or end, are secured inverted V-shaped covers, to provide for the needed circulation of air, and also for distributing the corn or grain in bulk.

Claim.—Ventilating and drying corn and grain by means of the inverted V-shaped covers and holes in the siding or walls, as herein recited.

78,936.—HENRY H. DICKINSON, West Northfield, Mass.—*Tail Clasp for Milkers.*—June 16, 1868.—A clasp or spring is attached to the leg of a cow while being milked, and is so constructed that the tail of the cow may be firmly grasped and held during the operation of milking to prevent the tail being whisked in the face of the operator.

Claim.—A tail clasp, for milkers' use, when constructed and operating substantially as herein described and for the purposes specified.

78,937.—FRANZ DIEBOLD, Boston, Mass.—*Wash Bench.*—June 16, 1868.—Three bars of wood are so

constructed that when united they will form convenient supports for two wash tubs, or two of them may be united to form a support for one wash tub.

Claim.—The combination and arrangement of the bars A, B, and C, with the pins D, and the necessary legs, for the purposes specified.

78,938.—WILLIAM DONALDSON, Cincinnati, Ohio.—*Machine for Making Bungs for Casks.*—June 16, 1868; antedated January 3, 1868.—This invention relates to a combination of parts by which the circular and lateral feed is effected, and also by which the timber is held steady while being operated upon by the knives, and released while being cut off by the saw.

Claim.—1. The combination of the cam R', pivoted guide plate S', pin f', block F', claws G', spring H', pawls or claws I', spring J', and cylindrical clutch C' with each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the center M' and adjustable slotted plate N' with each other and with the cylindrical clutch C', as herein shown and described, for the purpose specified.

78,939.—JOHN P. DORMAN, Galesburg, Ill.—*Sleigh.*—June 16, 1868.—The sleigh or sled is constructed of malleable iron and zinc in such a manner that it may be readily taken apart and stowed away when the season of its use is over.

Claim.—The construction and arrangement of a sleigh or sled of malleable iron and zinc, substantially in the manner and for the purpose as herein set forth.

78,940.—WILLIAM M. DOTY, New York, N. Y., assignor to himself, EZRA P. DOTY, and ELLIS DOTY, Jancsville, Wis.—*Washing Machine.*—June 16, 1868. This machine is designed for beating, squeezing, rubbing, soaping, and washing garments, &c., and can be adapted to either process separately.

Claim.—1. The mode of connecting the legs with the suds box by fitting the upper L-shaped parts of the legs around flanges projecting from the box, and by connecting and holding together the same by means of ties or rods, substantially as herein shown and described.

2. The combination, with a suitable coneave or rubbing board of a swinging or oscillating wash board, formed in two parts, hung independently of each other upon the same axis, the one being rigidly connected to the said axis or shaft, and the other loosely mounted thereon, substantially in the manner and for the purposes set forth.

3. The oscillating and divided wash board, composed of two parts or jaws, as herein described, in combination with a device for elamping and holding together said parts, substantially as and for the purposes herein shown and specified.

4. The combination, with the jaws of the divided wash board, of the eccentric clamping roll D, and the arms or links by which the same is held to the wash board, substantially as herein shown and set forth.

5. The combination, with the divided wash board and its elamping device, of the shaft C and pendent arms, by which the said board is connected with the shaft, substantially as herein shown and set forth.

6. The oscillating and divided wash board, and its clamping device, in combination with the movable stop m, arranged and operating as herein shown and set forth.

7. The plates h and i, in combination with the slotted end board b of the suds box, all made and operating substantially as described, so as to form a closed up-and-down movable bearing for the shaft C.

8. The combination, with the jaws of the divided wash board, of a beating frame, G, all arranged in one swinging frame, as described.

9. The beater frame, when hinged or made movable within the swinging frame, substantially as and for the purpose herein shown and described.

10. The manner of arranging the slats in the beater or presser frame so that the turning of garments is promoted, as set forth.

11. The beater frame, when arranged as described, in combination with the boards g and n, and slat

frame I, under the arrangement and for operation substantially as herein shown and described.

12. The combination, with the shaft, for operating the wash board, of a handle or lever mounted upon said shaft, substantially in the manner described, so that it may be set or adjusted to various heights.

13. The toothed disk J, in combination with the lever F and shaft C, the whole being arranged for operation substantially as herein shown and described, and for the purpose specified.

14. The valve M, when arranged as described, and when provided with a stop, p, working on an inclined plane, in combination with a suds box, substantially as and for the purposes herein shown and described.

15. In a washing machine in which the suds box is divided into two compartments, as described, the combination, with the larger compartment, containing the clothes-washing apparatus, of the smaller compartment and the tube or conduit therein for admitting water from the exterior into the said box, substantially in the manner and for the purposes herein shown and specified.

16. The combination, with the divided suds box and the tube or conduit o, of the trough H, under the arrangement and for operation as herein shown and set forth.

78,941.—WILLIAM F. DRAPER, Hopedale, Mass.—*Loom.*—June 16, 1868.—The object of this invention is to prevent the formation in the cloth of thick and thin places occasioned by the continued operation of either the take-up or let-off mechanisms after the breaking or running out of a filling and the shifting of the driving belt.

Claim.—1. The arrangement and combination of the arm J, and its shoulder, i, or the equivalent of the latter, with the arm H and its actuating mechanism, the slide rod d, and its actuating mechanism, (inclusive of the vibratory whip roller, or any equivalent therefor, placed over the yarn beam,) and the lever h and other mechanism for setting back the impelling pawl, n, of the ratchet o, the whole being substantially as explained.

2. The combination of the spring catch f', or its equivalent, with the stop motion and the mechanism for actuating the retaining pawl of the cloth beam ratchet.

3. The combination of the slider N, or its equivalent, with the stop motion and the spring catch f', applied to the slider T thereof, as and for the purpose specified.

78,942.—JEAN MARIE DROUYER, Carondelet, Mo.—*Meat Mincer.*—June 16, 1868.—Three cylinders are arranged one over the other, the two upper ones being provided with cutters fixed in shafts. The cutters on the two shafts rotate in opposite directions. The meat is conveyed from the first to the second cylinder by drivers and dropped into the lowest cylinder, whence it is ejected by a piston.

Claim.—1. The combination of the cutters m, drivers r, shafts i i', cylinders b b' b'', all constructed and arranged substantially in the manner and for the purpose set forth.

2. The piston T, spring T'', and cam V, constructed, arranged, and operating together, substantially as specified.

3. The combination of the different parts herein specified, arranged substantially as described and for the purpose set forth.

78,943.—JONATHAN G. DYER, Chicago, Ill.—*Coffee Pot.*—June 16, 1868.—An imperforate plate is arranged near the bottom of the coffee pot and is provided with a hinged valve below the spout. In the imperforate plate is a central opening which receives a strainer containing the coffee.

Claim.—1. In a coffee or tea pot, the combination of the imperforate division plate b, the vessel or receptacle B, with the handle c, and the supporting and guiding wires, all constructed and arranged substantially as shown and described.

2. The valve d, in combination with the division plate b, as and for the purpose set forth.

78,944.—NELSON B. EVELAND, Hartford, Conn.—*Shuttle for Sewing Machine.*—June 16, 1868.—The

spring, or other device usually added to the shuttle for giving the requisite degree of tension, is dispensed with, and a simple slot, curved at the end nearest the heel is used instead.

Claim.—The slot in the shuttle, formed as described, with a long portion, *c*, and an abruptly curved end, *d*, and for the purpose set forth.

78,945.—MATTHEW FALON, M. D., Bloomington, Ill.—*Truss.*—June 16, 1868.—A divided pad is provided with a wheel fastened to a movable head which is pivoted on a large spring so that the parts of a rupture can be drawn together, and the head be easily moved to either side.

Claim.—1. The divided pad *A*, working by means of one or more spiral or elliptic springs, substantially as and for the purposes herein set forth.

2. The combination of movable adjusting bar *D*, with wheel *d*, and spring *f*, arranged and operating substantially as and for the purposes herein set forth.

3. The movable head *e*, arranged and operating substantially as and for the purposes herein set forth.

78,946.—MATTHEW FALON, M. D., Bloomington, Ill.—*Abdominal Supporter.*—June 16, 1868.—The pads are provided each with a spring set against a cogged wheel by means of which they can be set to suit any form of the abdomen either in a pregnant or unpregnant state.

Claim.—1. The arrangements of two pads, *B*, made of any suitable material, and arranged in front on a supporter, substantially as and for the purposes herein set forth.

2. The springs *a* and wheel *b*, forming the adjusting attachment *C*, arranged and operating substantially as and for the purposes herein set forth.

78,947.—LUTHER H. FARNSWORTH, Hudson, Mass.—*Awl Haft.*—June 16, 1868.—The shanks of the jaws are connected together by a pin near their lower ends; upon a screw extending from the socket are placed disks of leather cemented or glued together to form the handle.

Claim.—1. The jaws *A A*, as made with the conical and screwed shanks, and the socket head *B*, as made with a conical mouth and a screw arranged therein to receive the screwed shanks of the jaws, the whole being substantially as and to operate as specified.

2. The combination of the screw *C* with the head *B*, and the series of disks *D D'*, of leather or other proper material, screwed on such screw, as described.

3. The arrangement of the connection rivet or pin *b*, viz, within the conical shanks, and transversely through their screw, and with respect to the jaws *A A* as represented.

78,948.—ANDREW C. FLINT, Boston, Mass.—*Mosquito Bar for Window.*—June 16, 1868.—The parts are so constructed and arranged as to adapt the device to openings of different widths, and to fit closely against the parts of a window sash.

Claim.—1. A mosquito bar, made with rigid clamping uprights and elastic bands, and with netting clamped by the uprights and stitched to the bands, substantially as and for the purpose described.

2. The combination of the two elastic bands *b* and *m* with the uprights, when the bands are arranged in planes at angles to each other, substantially as and for the purpose specified.

3. The projecting arrangement of the lower band *c*, with reference to the lower ends of the uprights, for the purpose specified.

4. The wires *i*, in combination with the elastic bands and sockets in the uprights, substantially as and for the purpose specified.

78,949.—CHARLES FOLSOM, New York, N. Y.—*Ash Sifter.*—June 16, 1868.—In operation, the ashes, &c., are placed in the lower box and the whole apparatus is turned upside down, when the ashes will pass through the sieve into the pail or vessel below, assisted by the partitions or flanges.

Claim.—1. The sifting box *B*, having a wire gauze bottom, *F*, semi-circular flanges *E*, and flanged opening *C*, over which the pail *d* is fitted, said box *B* being adapted to fit over the box *A*, as herein shown and described.

2. The combination and arrangement of the sifting

box *B*, having open bottom *F*, flanges *E*, and flanged opening *C*, the pail *d*, provided with a rounded bottom, and the pan *A*, all constructed to operate in the manner and for the purpose herein shown and described.

78,950.—HENRY D. FORBES, Cambridge, Mass.—*Mosquito Killer.*—June 16, 1868.—The head-piece is made of thin board covered with cloth of a loose nap, and connected to a handle by a piece of flexible rubber.

Claim.—A mosquito killer, having a head block, *F*, flexible joint *D*, and handle *C*, substantially as described, and for the purpose set forth.

78,951.—OSCAR C. FOX, Georgetown, D. C.—*Gas Heater.*—June 16, 1868.—The generating pipe is made in sections, so that the parts directly acted on by the heat may be removed and new ones substituted. The burner is constructed with a cup to receive all waste oil, which latter is readily burned.

Claim.—1. A petroleum stove, having the detachable pipe *L*, burner *B*, cup *C*, and cylinder *E*, the upper edges of which are notched, all constructed and arranged substantially as shown and described.

2. A stove, having two or more compartments, provided with independent burners, and having an adjustable slide, for separating said compartments, whereby either may be heated and used independently of the other, when constructed and arranged substantially as herein set forth.

78,952.—WILLIAM H. FURMAN, Maspeth, N. Y.—*Pisciculture.*—June 16, 1868.—An artificially constructed spawning receptacle and receiver are prepared for the young fish, with a proper run of water through the receiver from a head or spring, the water being made to percolate through a properly graveled bottom, provided with a cover made to open and close at pleasure. The receiver is made to admit of the old fish from down the stream up through it to the spawning receptacle.

Claim.—1. The method, substantially as herein described, of breeding fish, by means of a structure composed of a spawning chamber or receptacle and receiver for the young fish, with the water introduced thereto, in an upwardly direction, through the gravelly bed or bottom, to the spawning chamber of the structure, and caused to flow or pass through the receiver, essentially as herein set forth.

2. The brook shanty or structure *A*, composed of a spawning chamber, *C*, and receiver, *D*, with flood gates *B E* and guard *F*, or their equivalents, and having the water introduced through the gravelly bed or bottom to the spawning chamber, to establish a stream or current through the structure, substantially as specified.

78,953.—RICHARD J. GATLING, Indianapolis, Ind.—*Priming Metallic Cartridges.*—June 16, 1868.—The priming or fulminate is placed within a small metallic cup, fitting within a recess or depression in the head of a cup, inserted in the shell of the cartridge to prevent the escape of gas through the back of the cartridge.

Claim.—The struck up metallic cup *B*, fitted within the shell *A*, without contact with the flanges of the latter, and recessed to form the anvil *a*, and to receive the cup *C*, fitting in close contact with the sides of said recess, for the purpose of preventing the escape of gas between the shell *A* and cup *B*, as herein shown and described.

78,954.—JOHN GIBBONS, West Troy, N. Y.—*Tool for Turning Cylinder Rings for Cotton Gins.*—June 16, 1868.—The object of this invention is to make the opposite edges of the rings of cotton gins perfectly parallel with each other, so that they will fit together and complete the cylinder without secondary adjustment.

Claim.—The chuck *A*, with its projecting face *a*, and arbor *k*, and recess for gauge rings, in combination with gauge rings *E*, and with the cutter head *B*, its cutter *C*, ring *e*, its recess, supporting rings *n*, and spiral springs *f, f*, and rings *g* and *t*, substantially as described, and for the purposes set forth.

78,955.—D. A. GILBERT, Morristown, Vt.—*Butter Tub.*—June 16, 1868.—The cover is placed on the tub and partially rotated, when the inclined portion of the rim catches under the hooks and secures the cover firmly upon the tub.

Claim.—The hooks C C upon the tub, when used in combination with the cover, provided with slots D D and the inclined surfaces, from *a* to *a*, as and for the purpose set forth.

78,956.—LEWIS GRANGER, Memphis, Mich.—*Spring Bed Bottom.*—June 16, 1868.—By shifting the position of the transverse bars, greater or less elasticity may be imparted to the head, center, or foot portions, as desired.

Claim.—The combination and arrangement of the slats D and E, and blocks F, with the transverse bar C, in connection with any proper bedstead, and operating substantially as described and for the purposes set forth.

78,957.—JOHN A. GREEN, North Waterford, Me.—*Horse Power.*—June 16, 1868.—Jointed arms are connected to a sliding ring, which moves up and down on the post, to allow the socketed arms to contract or expand for convenience in transporting the machine.

Claim.—1. The removable, portable, and collapsible wheel, composed of the arms *c*, set in sockets *b* on the post B, having ring *e* and arms *d*, all as and for the purpose set forth.

2. The combination of the said wheel, composed of arms *c*, with the shaft *k*, wheel *o*, and saw shaft *p*, by means of cords or bands *f* and *v*, as herein set forth.

3. The adjustable pulleys or friction rolls *j* and *u*, as and for the described purposes.

4. The combination, in the manner herein set forth, of the different parts described, in the manner and for the purpose of constituting a portable horse power sawing machine, capable of being taken apart and put together, as set forth.

78,958.—EDWARD GUILLOD, Titusville, Pa., assignor to BRYAN, DILLINGHAM & Co., same place.—*Construction of Drilling Jars.*—June 16, 1868.—The head or portion of the link which gives and receives the blow is made of solid steel; all the other parts of the link, which are subjected to a tensile strain, are made of wrought iron.

Claim.—The within-described drilling jars, constructed of wrought iron and steel, combined and applied substantially in the manner and for the purposes set forth.

78,959.—STINSON HAGAMAN, Weissport, Pa.—*Machine for Rounding Slate Frames.*—June 16, 1868.—A lever and two revolving bolts or centers constitute a press for holding the corner of the slate frame firmly, while it is gently turned from left to right, causing the frame to come in contact with the revolving cutter.

Claim.—The bolts or centers O O and lever F, in combination with the rocking tree H, connecting rod I, and lever J, all operating substantially as described, and for the purpose specified.

78,960.—JAMES E. HANGER, Staunton, assignor to himself and J. E. A. GIBBS, Rockbridge County, Va.—*Cross-Bar Lock for Doors, &c.*—June 16, 1868.—The curved rack is rigidly attached to the cross-bar and meshes with a pinion wheel by which the cross bar is operated. The latter is guided by a pin attached to the same, and moving through a curved slot in the outer plate.

Claim.—1. The combination of the curved rack H, constructed substantially as herein shown and described, with the cross bar E, and pinion wheel I, as and for the purpose set forth.

2. Giving to the cross bar E a longitudinal and swinging movement, by means of the pin M projecting from the cross bar, and working in the curved slot N of the case F, fastened substantially as herein shown and described, and for the purpose set forth.

78,961.—DAVID HARRINGTON, Worcester, Mass., assignor to himself and J. S. WHEELER & Co., same

place.—*Friction Clutch Pulley.*—June 16, 1868.—When the shaft is to be driven, one of the hubs is forced toward the driving pulley, thereby turning the screw shafts through the instrumentalities of the hinged connecting arms and crank arms, thus forcing out the friction pads against the inner surface of the rim of the pulley sufficiently to clamp the arms and pulley together.

Claim.—1. The combination, with the rim D of the pulley, hub E, and arms G G, of the screw shafts K K and friction pads J J, substantially as and for the purposes set forth.

2. The combination, with the screw shafts K K and hub M, of the crank arms I I and connections N N, substantially as and for the purposes set forth.

3. The combination, with the hub M, of the projections *g g*, substantially as shown and described.

4. The combination and relative arrangement, with the loose pulley A and shaft E, of the hub F, arms G G, with the projections H H, and steady pins *a a*, and screw shafts K K, substantially as and for the purposes set forth.

78,962.—RICHARD C. HARRINGTON, Newark, N. J.—*Door Lock.*—June 16, 1868.—The lock is provided with two key holes, and is so constructed that it cannot be unlocked from the side opposite to which it has been locked.

Claim.—The cam G, sliding plate H, and lug *g*, in combination with the bolt D, tumbler E, and the partition *c*, all made and operating substantially as and for the purpose herein shown and described.

78,963.—AARON B. HARRIS, Morrisville, Vt., assignor to himself, H. D. BRYANT, and H. H. GATES, Lamoille County, Vt.—*Butter Tub.*—June 16, 1868.—The lower edges of the hoops on the cover are bent inward and spring over notched and beveled flanges secured to the tub.

Claim.—The metal spring hooks *a a*, in combination with the flanged ratch-plates *b b*, for the purpose of fastening the cover to the tub, substantially as and for the purposes herein set forth.

78,964.—JOSEPH T. HASKINS, Rockport, Mass., assignor to himself and E. ROWE, same place.—*Warping Chuck.*—June 16, 1868.—Friction rollers prevent wear of the rope caused by the motion of the vessel. The lower journals of the rollers work in sockets formed in a plate fitting in a recess in the bottom of the chuck.

Claim.—The friction rollers A, when inserted in the chuck by being passed through the bottom, and secured in place by the plate C, in combination with the recesses in the jaws of the chuck, and in the plate C, as herein shown and described.

78,965.—AUGUSTUS R. HOBBS, Elizabeth, N. J.—*Fanning Attachment for Rocking Chairs.*—June 16, 1868.—The rocking motion of the chair communicates a rotating motion to fans so arranged as to fan the occupant.

Claim.—1. The grooved rod B, in combination with the shaft D and any fans G, substantially as shown and described, and for the purposes set forth.

2. The tube A and grooved rod B, or its equivalent, and spring I, by means of which a reciprocating rectilinear motion of the rod B is changed to a reciprocating rotary motion of the shaft D, and any fans, G, in combination with any rocking chair, M, substantially as shown and described.

3. The device for holding the shaft D in proper position with respect to the rod B, substantially as shown and described.

4. The collar K, in combination with the tube A, made in two parts, for adjusting the position of the fans G, substantially as shown and described.

5. A fanning attachment to rocking chairs, substantially as shown and described.

78,966.—ISAAC HODGSON, Indianapolis, Ind.—*Construction of Prisons.*—June 16, 1868.—This invention relates to a mode of securing the cell and other interior doors of prisons by which the jailor is enabled to unfasten one or more doors at pleasure.

Claim.—1. The hollow door post M, furnished

with the hooded shutters R, the cord ways L, and vertical tube or U-iron, *a*, substantially as set forth.

2. The hasp N and eye *g*, bolt *o*, and cords *c*, and stops *r* and *i*, constructed and arranged substantially as and for the purpose set forth.

78,967.—JOEL S. HOOD and JOHN H. HOOD, Washington City, D. C.—*Perpetual Register*.—June 16, 1868; antedated June 6, 1868.—This device consists of a changeable register and is designed for showing the number of articles of each kind sent to the wash, the price of each article on a bill of fare, or for other like purposes.

Claim.—1. The slides *m*, constructed with rearwardly projecting spurs *s* at one end, and knobs *n* on the front side of their opposite ends, arranged in combination with the slotted plates or cards A B for operation together, as shown and for the purposes described.

2. The disks D, in combination with the slotted plates A B and slides *m*, all arranged substantially as and for the purpose specified.

78,968.—AMBROSE L. HOUGHTALING, Philmont, N. Y., assignor to GEORGE W. PHILIP, same place.—*Drawing and Twisting Head for Spinning*.—June 16, 1868.—The improvement consists in mechanism connected with a revolving tube or hollow shaft placed in a stationary frame, whereby the operation of drawing the roving is continuous, and independent of spindles, which may be placed also in the same stationary frame to receive the roving, and spin a continuous thread or yarn.

Claim.—1. The combination of the independently adjustable drawing rollers *m m*, having straight parallel sides with the twisting tube *c*, to the axis of which they are always maintained in central relation, as and for the purposes herein described.

2. The combination of the drawing rollers *m m*, having straight parallel sides and adjustable independently on opposite sides of the axial line of the twisting tube *c*, with the positive gears *k k* and the tube, substantially as and for the purpose described.

3. The pair of adjustable sliding bearings *s s*, connected by the springs *t t* respectively, and fitted in the opposite recesses *p p*, in the box *n n*, in combination with the drawing rollers *m m*, having straight parallel sides, all constructed and operating substantially as and for the purposes described.

4. The combination of the adjustable take-up rollers *b b¹ b²*, or their equivalents, with the adjustable drawing rollers *m m*, and the twisting tube *c*, arranged and operating in connection therewith, substantially as and for the purpose specified.

78,969.—JONATHAN HUNSBERGER, Worcester Township, Pa.—*Horse Rake*.—June 16, 1868.—A foot lever and sliding toothed rack are combined with a cog wheel and spring clutches attached to the ends of the parts of the axle and with the levers by which the sliding rack is connected to the rake head so that the driver by a movement of the foot lever can cause the rake to rise and discharge the hay.

Claim.—1. Operating the rake teeth to discharge the collected hay, by means of a toothed rack and cog wheel connected with the axle of the machine, substantially as herein shown and described.

2. The combination of the foot lever L, toothed rack G, cog wheel D, sliding spring clutches E, and levers H and N, with each other, and with the axle A, frame C, and pivoted bar R, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the arms K and blocks J with flanges *g'*, formed upon the side edges of the toothed rack G, substantially as herein shown and described, and for the purpose set forth.

78,970.—JOHN MORRISON HUNTER, Morristown, N. J.—*Soles for Boots, &c.*—June 16, 1868.

Claim.—1. The sheet metal outer sole A A*, B, constructed with spurs or lips, *a b*, around its edge, for attachment to the boot or shoe, in the manner substantially as shown and described.

2. The combination of the sheet metal sole A B, constructed as described, the cork tread and heel filling *f* D, and leather strips E C*, with the welt of the boot or shoe, all arranged substantially as shown and specified.

78,971.—LOUIS HEINE, Philadelphia, Pa.—*Steam Bath*.—June 16, 1868; antedated June 13, 1868.—A gauze double bottom bed is combined with a steam-tight frame provided with a perforated cylinder, and an air-tight cover, for steaming invalids with steam from herbs.

Claim.—The frame or bedstead A A, in combination with the gauze bottoms C and D, cylinder B, and cover E, constructed substantially as described, operating as and for the purposes set forth.

78,972.—CHARLES KING, New York, N. Y.—*Time Piece*.—June 16, 1868.—The movement and the hand are made to revolve round a pivot by the action of a balance weight which revolves round the central shaft of the movement, so that by the action of a very small movement a hand of any desirable size can be made to revolve, and a time piece is obtained which shows the time at a considerable distance.

Claim.—The balance weight *c*, attached either to the arbor of the minute hand or to that of the hour hand of a watch movement A, and operating in combination with said movement, and with the index C, substantially in the manner and for the purpose set forth.

78,973.—LEOPOLD KLEE, Pittsburg, Pa., assignor to himself and CHARLES T. HERROSEE, same place.—*Mash Tub*.—June 16, 1868.—This apparatus is composed of two vessels one within the other, having a space between the two, and provided with a cover common to both, the latter so arranged as to hermetically seal the interior of the tub and the space between the two parts. Steam or other heating medium is introduced to the interior and to the space between the two parts for heating the mash.

Claim.—1. The combination of the tub A with the tub B, when constructed and arranged, substantially as and for the purpose described.

2. The combination, with the tubs A and B, of a cover, when arranged to hermetically close the openings to both tubs, substantially as and for the purpose described.

3. The combination, with the tubs A and B, of the heating pipe E, when arranged substantially as and for the purpose described.

4. The combination, with a hermetically closed mash tub, substantially such as herein described, of a means for compressing the air therein, as and for the purpose described.

5. The combination, with the mash tubs A and B, of a hinged cover D, when arranged to be hermetically secured to the tubs, substantially as and for the purpose described.

6. The combination, with the mash tubs A and B, of the cover, when arranged to hermetically close the same, as shown in Fig. 3, substantially as and for the purpose described.

7. The combination, with the tubs A and B, of the man-hole appliances F, pipes G and H, when all constructed and arranged substantially as and for the purpose described.

78,974.—C. M. LANE, Cincinnati, Ohio., assignor to himself and CHARLES GOOCH, same place.—*Combination Tool for Measuring and Marking*.—June 16, 1868.—The tool combines a pair of outside and inside calipers, dividers, a square, a centering square, and rule.

Claim.—The combination of the graduated and pointed legs B, having curved arms E, right angular arm F, and graduated arc G, said legs B being pivoted together by a thumb screw, C, substantially as described for the purpose specified.

78,975.—MOSES LEAVITT and AZARIAH FOSTER, Ottawa, Ill.—*Washing and Wringing Machine*.—June 16, 1868.—The smooth roller is used both in the operation of washing and also for wringing the clothes. The hinged slats serve to press the clothes against the roller.

Claim.—1. The smooth roller *f*, in combination with the bucket roller *g*, the arms *d d*, the springs *j j*, and the springs *k k*, substantially as described.

2. The hinged slats *n n n* and the springs *g*, in combination with the elastic board F, substantially as and for the purpose described in the foregoing specification.

78,976.—LEANDER LEHMAN, Harrisburg, Pa.—*Bottle Lock*.—June 16, 1868.—A metal top is locked upon the neck of the bottle by a band provided with a screw bolt to be operated by a key.

Claim.—1. A self-locking bottle stopper, when the cover is secured by means of a spring lock and hasp, substantially as described.

2. Securing the same to the bottle by means of the band *a*, the ends of which are fastened together by the protected screw bolt *g*, in the manner described.

78,977.—FRANKLIN LEONARD, Cleveland, Ohio.—*Die for Forging Eye Bolts*.—June 16, 1868.—The form of the eye of the bolt ring is sunk one-half the thickness in the face of each die, the two forming a matrix in which the ring is shaped.

Claim.—The dies B C, when constructed and arranged to operate in the manner as and for the purpose specified.

78,978.—HENRY M. WYATT, Somerville, Mass.—*Lamp Burner*.—June 16, 1868.—The upper bend of each supporter constitutes a catch to enter holes in the deflector, and the lower lip serves to hold the chimney in place.

Claim.—The chimney and air-deflector elastic supporters D D, made substantially as described and represented, that is, with the operative bends, the lips and the deflector rests arranged and formed in manner as represented and described.

78,979.—JOHN LEONARD, Basil, Ohio.—*Portable Fence*.—June 16, 1868.

Claim.—1. Securing the panels A and B to each other, and in an erect position, by the inclined braces C and G, short-notched posts or stakes E, and wedges F and D, substantially in the manner herein shown and described, and for the purpose set forth.

2. Strengthening the panels A and B in position by the inclined braces H, short-notched post or stakes I, and wedges J, substantially as herein shown and described, and for the purpose set forth.

78,980.—J. E. LINDSLEY, Goshen, Ind.—*Weather Strip*.—June 16, 1868.—Designed as an improvement on a patent to same inventor, June 19, 1866. The metal strip or cap is set over the sill and is allowed to rise and fall to a certain extent being forced by the lever against the lower edge of the door when the latter is closed.

Claim.—The metal plate E, applied to the outer portion or tread D of the sill, in combination with the metal strip or cap F and lever G, all arranged substantially as and for the purpose set forth.

78,981.—JOSEPH H. LITTLEFIELD, Cambridge, Mass.—*Combined Press and Strainer*.—June 16, 1868.—A strainer rests upon a grating in the bottom of a casing, and articles are pressed by a follower operated by a lever.

Claim.—The metal frame A, with grates *a a* and feet B B, in combination with the strainer O and bottomless case C, with standard D, lever E, bar G, and follower F, the several parts being constructed, arranged, and used substantially in the manner specified.

78,982.—EMILE LOUISEAU and CHARLES F. REGUIN, Nashville, Tenn.—*Artificial Fuel*.—June 16, 1868.—Composed of coal dust, clay, saleratus, shellac, made into a paste, formed in molds, and dried.

Claim.—A composition for fuel, consisting of the ingredients herein shown and described.

78,983.—JAMES G. LUCAS, Newark, N. J., assignor to himself and ARETUS L. SAWIN.—*Machine for Bending Wood*.—June 16, 1868; antedated June 4, 1868.—Designed for shaping the tops of trunks. A longitudinally recessed former is so combined with a presser die that the central parts of a trunk top may be pressed to the required shape. Side-presser stays are employed to bring the lateral portions of the tops upon the surface of the former.

Claim.—1. The longitudinally-recessed former, in combination with the presser die, constructed to operate substantially as and for the purpose specified.

2. The side-presser stays, in combination with the

former, constructed to operate substantially as and for the purpose specified.

78,984.—W. S. MACKINTOSH, Pittsburg, Pa.—*Axle Roller*.—June 16, 1868.—A pair of rollers, having grooves cut in their faces, of such form as to impart the proper shape to the heated iron when passed between the rollers.

Claim.—The rollers D, having grooves thereon, constructed and arranged substantially as shown and described, and for the purposes set forth.

78,985.—JOSEPH MARENGO and ALEXANDER MARENGO, Burlington, Vt.—*Machine for Making Cigars and Cigarettes*.—June 16, 1868.—The wrapper containing the filling is placed in a depression in an endless band surrounding roughened rollers. The endless bands are tightened by depressing the sliding frame. The motion of the rollers serves to shape the cigarette.

Claim.—A machine for manufacturing cigars and cigarettes, constructed and operating substantially as shown and described; that is to say, with the roughened rollers *f f*, the stands D D, and the arms E E, the sliding frame H, with the roller K, with their belts and connections, when arranged substantially as and for the purposes set forth.

78,986.—JOHN YOUNG, Jr., Sunapee, N. H., administrator of the estate of DELLAVAN D. MARSH, deceased.—*Invalid Bedstead*.—June 16, 1868.—This invention consists in mechanism attached to the floor or a platform on which the bedstead may be firmly secured, and against which the mechanism rests, by which an invalid may be raised either at the head or feet, or on either side, to any desired position, or removed from one bed to another.

Claim.—1. The combination of the resting bars *g g' g''* and sockets *d d'*, &c., the supporting lever D, the supporting arms E E' E'', the pulleys F F¹, the pulley frame I, and pulleys G G' G'', and circular revolving plate F², the bed plate B, the king bolt C, the supporting bars A A', the bed pieces U U', the cords Z Z', the ratchet wheels K K' K'', and cranks L L' L'', the cords J J', &c., and the axles *a a'*, and crank R, combined, arranged, and operating substantially as and for the purposes above described.

2. The combination of the resting bars *g g' g''* and sockets *d d'*, the supporting lever D, the supporting arms E E' E'', and the pulleys F F¹, the pulley frame I, and pulleys G G' G'', the circular revolving plate F², the bed plate B, the king bolt C, the supporting bars A A', the bed pieces U U', the cords Z Z', the ratchet wheels K K' K'', and cranks L L' L'', arranged and operating substantially as above described.

3. The combination of the resting bars *g g' g''* and sockets *d d'*, the supporting lever D, the supporting arms E E' E'', the pulleys F F¹, the pulley frame I, and pulley G, the circular revolving plate F², and bed plate B, the king bolt C, the supporting bars A A', the bed pieces U U', the cords J J', the axles *a a'*, and crank R, arranged and operating substantially as above described.

78,987.—PATRICK J. MCELROY, East Cambridge, Mass.—*Nursing Bottle*.—June 16, 1868.—Designed to be adapted for use both as a breast pump and a nursing bottle.

Claim.—The milk receiving and delivering bottle *a*, when combined with a breast-nipple tube, *d*, and having an outlet, *c*, flexible pipe *g*, mouth and nipple-attaching tube *h*, and artificial nipple *i*, all arranged to operate substantially as described.

78,988.—ALBERT C. MCKENDREE, Conneaut, Ohio.—*Ladder*.—June 16, 1868.—A frame containing a shaft and rollers is arranged to be fitted to the lower end of one side of the ladder, so that by raising the other side of the ladder the whole may be trundled to any desired place.

Claim.—The shaft O, roller *o*¹, and slotted bar *o*², when combined and arranged with the ladder A', as and for the purpose set forth.

78,989.—PETER H. MELLON, St. Louis, Mo.—*Quilting Frame*.—June 16, 1868.—Metallic plates, slotted to receive the roller journals, are attached to

the inner sides of the ends of the side bars of the frame, and between the two are sliding keys to prevent the rollers from working out of place.

Claim.—Securing the rollers E in the ends of the bars B by means of the slotted metallic plates D and slotted sliding plates F, as herein shown and described.

78,990.—ALBERT C. MINER, Philadelphia, Pa., assignor to himself and JAMES GUILD, Washington, D. C.—*Railroad Car Heater.*—June 16, 1868.—A steam box extends the entire length of the car floor and is provided with suitable pipes and stop-cocks or valves for regulating the supply of steam.

Claim.—The steam box E', having its upper face corrugated, and forming the floor of the car E, in combination with the pipes B B' B², and valves C C', when constricted and operating as herein represented and described.

78,991.—CHARLES MOSSANT, Bourg Du Péage, France.—*Felting Machine.*—June 16, 1868.—Designed for the felting of hat forms or cones by the combination of a rolling motion and a to-and-fro, or progressive and retrogressive longitudinal, motion. The progressive will be in excess of the retrogressive motion, whereby the cone or web will pass through and be delivered out of the machine, to be again entered at the point from whence it started, to undergo a second or third time the felting action of the machine.

Claim.—1. The hollow bed a' , in combination with the reciprocating platen, having vertically-sliding plates, i , and the endless chains x , bearing the cone rollers f , substantially as described, for the purpose specified.

2. The felting plates h , having attached thereto, by springs k , the laterally-yielding felting strips j , substantially as shown and described, and for the purpose specified.

3. The roller-carrying chains, constructed as described, with open links for the purpose of providing bearings for the cone rollers, substantially as herein set forth.

4. Imparting a to-and-fro travel to the rubbing platen, the cone rollers f , and hollow chains x , with a proportionately small excess of forward progression of the roller chains, by means of the eccentrics P Q K, and their connecting rods, the crank shaft U, and connecting rods M, the friction lever, and the pawl lever o , pawl v , and ratchet wheel N, all combined and arranged to operate in the manner herein shown and described.

78,992.—GERRIT V. ORTON, Cincinnati, Ohio.—*Hanger for Shafting.*—June 16, 1868.—On the lower half of the box or bearing is formed a spherical extension to fit into a corresponding socket in a supporting stem, the latter having a thread on its exterior, so that it can be revolved for adjusting the shaft in a vertical line. The box is retained in its seat by a through bolt.

Claim.—1. The convex projection a , in combination with the bolt c , for retaining the box in its seat, substantially as described.

2. The threaded stem b , when arranged to adjust the box by its own rotation, as herein set forth and described.

3. The screw bolt c , for retaining the box in its seat, in the manner and for the purposes specified.

4. The combination and arrangement of the convex extension a , revolving screw stem b , and screw bolt c , arranged and operated substantially as set forth and specified.

78,993.—GEORGE T. PALMER, Brooklyn, N. Y.—*Bottom for Boiler.*—June 16, 1868; antedated June 6, 1868.—A perforated plate or false bottom is placed on the bottom of a culinary boiler pot to prevent articles from being burned when boiled.

Claim.—A perforated plate, a b , with a depressed rim and handle, c , made substantially in the manner shown, and for the purpose set forth.

78,994.—ELIAS C. PATTERSON, Rochester, N. Y.—*Railroad Car Jack.*—June 16, 1868.—A jointed brace to be attached to the coupling pin of a car and

operated by means of a lever, whereby one man can move cars on the track.

Claim.—The jointed brace B and C, operated by lever A, substantially as described.

78,995.—BENJAMIN P. PENDEXTER, Minot, assignor to himself and GEORGE W. HORNER, Mechanics' Falls, Maine.—*Machine for Sharpening Saws.*—June 16, 1868.—The annular file is rebated out upon one of its inner edges, to receive the flange of an annular metallic washer upon the hub of the shaft. The upper metallic portion of the bearing of the opposite end of the shaft is provided with an upwardly projecting anvil to receive the teeth of the saw.

Claim.—1. The annular file a secured to the flanged wheel A, upon the arbor C, by means of the flanged washers H, as herein described for the purpose specified.

2. The anvil e , for the saw set, formed upon and with the journal box of the arbor C, as herein shown and described.

3. In combination with the anvil e formed with the journal box, the pivoted hammer arm S, operated by the toe a^2 , and spring S², as herein described for the purpose specified.

78,996.—L. H. PFLEEGOR, Milton, Pa.—*Safety Hook.*—June 16, 1868.—The long shank of the hook locks under a point of the lever, and the hook can be readily unlocked, if necessary, without slacking the draught.

Claim.—The combined construction and arrangement of the stock A, hook B, and lock lever C, substantially as and for the purpose herein specified.

78,997.—W. E. PHELPS, Elmwood, Ill.—*Corn Marker.*—June 16, 1868.—A frame provided with three wheels so arranged that, as the machine is drawn along, three furrows will be made, the wheels being allowed to conform to the inequalities of the surface.

Claim.—The frame A, provided with the two wheels C C, one at each end, in combination with the bar D, connected to the rear of frame A by a joint e , and provided with a wheel E, all constructed and arranged substantially in the manner as and for the purpose set forth.

78,998.—DAVID B. PLATT, Madison, Ind.—*Combined Harrow, Drill, Planter, and Roller.*—June 16, 1868.—A combined harrow, drill, planter, and roller so constructed and arranged that the drill and roller or planter and roller may be used together, or the roller and harrow may each be used alone.

Claim.—1. The combination of the rollers I with the removable seed box C, drill shaft E, wheels F, adjustable plows B, and frame A, all constructed, arranged, and operating substantially as described.

2. The combination of the removable seed box S, shaft T, planting rollers U, pinion W, toothed rack S, and lever Y, with the adjustable plows B and frame A, all constructed, arranged, and operating substantially as set forth.

3. The combination of the pivoted tongue L, bar M, connecting rod N, pivoted lever O, perforated standards P R, and frame A, substantially as described, and for the purpose specified.

4. The combination of the slides G, plates H, removable seed box C, roller E, and wheels F, substantially as described.

5. The frame K, when its front and rear cross bars, K¹ K³, are provided with teeth, in combination with the removable toothed cross bar K², substantially as set forth.

78,999.—FREDERICK POST, Plano, Ill.—*Scraper.*—June 16, 1868.—The scraper being lowered to contact with the surface of the ground, the disconnected earth is forced back, by the movement of the machine, into the cavity of the scraper, which latter, when filled, is elevated, and the load carried away and emptied.

Claim.—The combination of the scraper A, chains E, rollers M, ratchet wheel H, ratchet I, spur wheel F, pinion G, and crank D, all constructed substantially as described, and operating as specified.

79,000.—GEORGE RAFT, Erie, Pa.—*Device for Fitting Wrist Pin.*—June 16, 1868.—A tool shaft bearing a cog wheel, and having a long bearing in the frame plate of the machine, bores out the eye for the wrist pin, while the crank shaft is still on the centers of the lathe.

Claim.—The improved device herein described for boring out the eyes for wrist pins.

79,001.—SAMUEL REED, Rising Sun, Md.—*Cultivator.*—June 16, 1868.—The pointed or rudder teeth may be readily inclined to one or the other side by means of the long lever.

Claim.—1. The combination of the forked draught bar I, curved notched bar J, and sliding catch K, or their substantial equivalents, with each other and with the frame A of the cultivator, substantially as herein shown and described, and for the purpose set forth.

2. The pointed or rudder teeth C, removably attached to the pivoted shanks D, for the purpose of pivoting the said teeth to the frame A, substantially as herein shown and described.

3. The combination of the long lever F, short slotted levers E, pivoted shanks D, and pointed or rudder teeth C, with each other, and with the cultivator frame A, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the lever catch G, with the long lever F, and with the curved and notched rack H, attached to the cultivator frame A, substantially as herein shown and described, and for the purpose set forth.

79,002.—CHRISTIAN C. REESE, Attica, Ind.—*Churn.*—June 16, 1868.—The dashers are so formed that when rotated in one direction the cream will be thoroughly agitated, and when rotated in the opposite direction they serve to gather the butter.

Claim.—1. A churn dasher, consisting of the vertical shaft F, radial arms G H, dashers I i, J j, and gatherers K L, the whole being arranged and operating substantially as herein described and set forth.

2. In combination with the elements F, G, H, I, i, J, j, K, and L, of the preceding clause, the pinion D, spur wheel E, and winches e e', for the purpose specified.

79,003.—CHRISTIAN REINHART, New Haven, Conn.—*Escapement for Clock.*—June 16, 1868.—The crown wheel is made double, having two rims on which the teeth incline to each face. The verge collet is fitted on a vertical shaft to which a forked lever is secured. Above the verge collet is placed a stop plate provided with an open space through which the teeth of the crown wheel escape as the lever vibrates.

Claim.—1. The double-tooth crown wheel A, as constructed, in combination with the verge collet B and stop collet E, operating substantially as and for the purposes herein specified.

2. The verge collet B, stop plate E, as constructed and arranged, in combination with the forked lever D, pin h, arm k, and balance wheel H, as set forth.

3. The forked lever D, with its open space m, stop pin or stud n, when the lever is balanced on the verge shaft C, so as to distance the motion of the collet B and stop plate E, to allow the points a a to escape through the incline openings e e and opening f, as herein described.

79,004.—F. A. RICH and H. W. BASSETT, Wallingford, Conn., assignors to HALL, ELTON & CO., same place.—*Die for Cutting Spoon Blank.*—June 16, 1868.—A cutter on the die is so arranged as to divide the blanks upon one edge, while the die proper cuts a series of blanks from the other edge, the blanks on the opposite edge being formed by the space between the blanks upon the edge where the die operates.

Claim.—The arrangement of the cutter G on the one part, and the corresponding edge a on the other part, and combined with the die C and punch E, and in such relative position thereto that the whole will operate in the manner substantially as set forth.

79,005.—GEORGE RICHARDS, Richland Centre, Wis.—*Wagon Bolster.*—June 16, 1868.—The ends of the bolsters are provided with journals having metal

caps provided with sockets for holding the stakes. The caps are held in an upright position by springs, and can be turned down out of the way when desired.

Claim.—The combination, with the bolster A, of the cap B, spring d, and lug C, substantially as and for the purpose described.

79,006.—E. H. RIPLEY, North Chelmsford, Mass.—*Machine for Planing Moldings.*—June 16, 1868.—The machine is so constructed and arranged that by very simple adjustments the same cutter may be used for cutting moldings of many different designs.

Claim.—1. Pivoting or hinging the feed box J' to the plate F', attached to the upper end of the vertical shaft D', substantially as herein shown and described and for the purpose set forth.

2. The eccentric plate or frame V, constructed substantially as herein shown and described, in combination with the vertical shaft D', as and for the purpose set forth.

3. The combination of the adjustable connecting rod U, and weighted or balanced lever Q, with the cam O and pivoted eccentric plate or frame V, substantially as herein shown and described and for the purpose set forth.

4. The combination and arrangement of the slotted lever R, centrally pivoted to the vertically adjustable support X Y, the rod Z and step A', with relation to the cam P and vertical shaft D', all constructed and arranged to operate in the manner and for the purpose substantially as herein shown and described.

5. The combination of the adjustable arm V' and slotted rigid arm U' with the vertical shaft D' and pivoted collar E', through which said shaft passes, substantially as herein shown and described, and for the purpose set forth.

79,007.—WILLIAM ROBERTS, Farnham, N. Y., assignor to himself, AUSTIN ROBERTS, and WELCOME SPRAGUE, same place.—*Corn Sheller.*—June 16, 1868.—The roller journals are supported upon blocks and springs placed in recesses in the side of the frame to admit of the roller yielding upwardly and horizontally.

Claim.—Supporting the journals a' of the toothed roller A within the slots or recesses b', in combination with the blocks C and springs C', or their equivalents, when these parts are constructed and operating in the manner substantially as herein described.

79,008.—JAMES H. ROWE, Fort Wayne, Ind.—*Churn.*—June 16, 1868; antedated June 6, 1868.—The beaters are beveled and chamfered so that in passing through the milk to be agitated, converging and diverging currents are alternately formed without the tendency of throwing the milk into a spray.

Claim.—A churn dasher, constructed in the manner and for the purpose herein specified and described as an article of manufacture.

79,009.—WILLIAM F. RUNDELL, Genoa, N. Y.—*Harvester Reel.*—June 16, 1868.—Relates to an improvement upon a patent granted to the same inventor December 31, 1867, and consists in a modification of the elbows by which the beaters are secured to the arms, so that they may be tightened in the event of becoming loose by shrinkage.

Claim.—The constructing of the elbows E of two longitudinal parts, with bolts passing transversely through the two parts, and also through the arms and beaters, substantially in the manner as and for the purpose herein set forth.

79,010.—FREDERICK M. RUSCHHAUPT, New York, N. Y.—*Explosive Powder.*—June 16, 1868; antedated June 4, 1868.—Consists in the mixture of chlorate of potassa and naphthaline, the latter being purified by pressing and sublimation and pulverized, and to which is added a compound varnish.

Claim.—The use of naphthaline, in a manner as described, and for the purpose set forth.

79,011.—DANIEL SAGER, New York, N. Y.—*Corn-Husking Machine.*—June 16, 1868.—The picker is provided with a series of cutting edges running in a direction of its length, and formed on one side by straight radial lines and on the other by curved lines.

The husking rollers are provided with grooves and rotate in opposite directions.

Claim.—1. The picker B, when formed as herein described, and for the purposes specified.

2. The husking rollers D D, with their grooves *d d*, as and for the purposes set forth.

79,012.—N. C. SANFORD, Meriden, Conn.—*Auger.*—June 16, 1868.—The auger is formed with two or more cutting lips so arranged that the paths of the several lips will be different and distinct.

Claim.—Two or more cutting lips, *a b c*, of different radial distance from the axial center of the auger, and in different horizontal planes, all constructed to operate substantially in the manner and for the purpose as set forth.

79,013.—ELIHANAN W. SARGENT, Lowell, Mass.—*Mechanical Movement.*—June 16, 1868.—For converting reciprocating into continuous rotary motion. A cross-head is arranged to slide upon guide rods in sleeve bearings secured to the back plate of the cross-head. Pivoted nippers armed with needle points engage with an endless belt and move the latter as the cross-head is reciprocated.

Claim.—1. The cross-head K, constructed as described, and provided with nippers *n*, and combined with the guide rods *g* and belt H, in the manner and for the purpose substantially as described.

2. The combination of all the operative parts specified, arranged to operate substantially as and for the purpose set forth.

79,014.—JOHN W. SCHREIBER, New York, N. Y.—*Lamp Burner.*—June 16, 1868.—The chimney is supported upon springs projecting from the base of the burner so as to leave an open space for the air below the chimney. An outer wick tube extends above the upper end of the main wick tube, and rests on springs so that a horizontal circular plate projecting from it is held against a contracted portion of the chimney.

Claim.—1. The secondary tube D, arranged around the main wick tube B of a burner, and projecting above the same, when said secondary tube is, by means of springs *a a*, that fit under a plate, E, projecting from the tube, held up, and adjusted up and down, as set forth.

2. Closing the chimney of a lamp burner by means of a perforated plate, E, which is held up against a contracted portion of the chimney by means of springs *a a*, as described, so that all the air will have to pass to the flame through the said plate E.

3. A lamp burner, consisting of the body A, tube B, and base plate C, in combination with the secondary tube D, perforated plate E, springs *a*, cap G, and spring holders F F, or their equivalents, all made and operating substantially as herein shown and described.

79,015.—OTTO A. SCHULZ, Chicago, Ill.—*Tongue Depresser and Atomizer.*—June 16, 1868.—The atomizing tubes pass through the tongue-depressing holder to which are secured wires for the support of the bottle holder and the attachment of a handle. The guard prevents the ends of the tubes from coming in contact with the membranes of the mouth and pharynx.

Claim.—The combination of the atomizer and tongue depresser, provided with atomizing tube holder B, guard C, and bottle holder D, arranged and operating in the manner as herein described and specified, or in any other manner producing substantially the same result.

79,016.—WILLIAM FISHELY SERJEANT, St. Louis, Mo.—*Railroad Rail Tie.*—June 16, 1868; antedated June 4, 1868.—The ties are slipped upon the rail sections previously to securing the latter in place.

Claim.—1. The employment of a holding-down cross-tie, which is constructed with jaws upon its ends, which will embrace the rails, when said tie is secured to, or adapted for being secured to, the wooden bed of the track, by means substantially as described.

2. A metallic cross-tie, constructed of one piece of metal, with jaws, *a a*, upon its extremities, and with transverse perforations through it, as herein described and shown.

79,017.—S. SICHEL and S. FEUST, New York, N. Y.—*Ticket Register.*—June 16, 1868.—The tickets are arranged in a continuous roll and are withdrawn by rollers, one ticket at each revolution, so as to protrude beyond the converging edges of the plates. The delivery of a ticket is indicated by a bell.

Claim.—The combination of the rollers J, plates *g*, cam I, crank L, spool D, bell G, hammer H, with any suitable train of wheel work, connecting the rollers with the dials of any suitable registering apparatus, all substantially as shown and described, and for the purpose set forth.

79,018.—F. L. A. M. SMITH, Brooklyn, N. Y.—*Oven Rack for Ship Stoves.*—June 16, 1868; antedated June 4, 1868.—A device to be placed in the ovens of ships stoves or cabooses so as to retain the dish, containing the article to be cooked, in a horizontal position under the rolling of the vessel.

Claim.—1. The adjustable box E, containing a meat pan, F, suspended on journals *a*, to uprights A A, all constructed, arranged, and operating substantially as described.

2. The grooved uprights or standards A A, provided with a series of holes, through which a removable pin, *c*, is passed, for sustaining the journals or trunnions *a a*, of box E, substantially as and for the purpose described.

3. The application of the bars D to the frame in which the box E is suspended, to prevent the tilting or tipping over of the frame within the oven, substantially as set forth.

79,019.—ROBERT D. O. SMITH, Washington, D. C.—*Connecting Rod Adjustment.*—June 16, 1868.—By turning the screw sleeve the distance between the ends of the rod may be increased or diminished without detaching either end from its wrist connections.

Claim.—1. A connecting rod or pitman constructed in two parts, and united by the sleeve D with right and left screws, substantially as and for the purpose set forth.

2. A washer provided with an inward projecting tongue, M, to be placed between a main and cheek nut, in connection with a spline, N, cut in the screw, substantially as and for the purpose set forth.

79,020.—SIDNEY SMITH, Worcester, Mass.—*Hot Air Furnace.*—June 16, 1868.—The radiating surface of the furnace is formed with a series of corrugations, against which the moving currents of air are brought by means of deflecting plates.

Claim.—1. The shell A, corrugated horizontally, as described, in combination with the deflecting plates C C, substantially as and for the purpose set forth.

2. The flues E, constructed with corrugated walls *e*, and hollow cones *f*, substantially as and for the purpose set forth.

3. The deflecting plates C C, or their equivalents, to deflect the upward currents of air against the radiating surfaces of the furnace.

79,021.—JOHN SOUTHER, Boston, Mass.—*Steam Fire Extinguisher.*—June 16, 1868.—The weight that operates the lever attached to the steam valve is suspended from a line leading over a pulley and across a room or vessel. When the line is severed by a fire, the whistle is sounded and the escaping steam or other fluid serves to extinguish the flame.

Claim.—1. A self-operating fire alarm and extinguisher, consisting of the pipes A and H, whistle B, valve C, lever F, and weight E, or their equivalents, all constructed and arranged to operate substantially as herein described.

2. The pipes A and H, fusible plugs I and J, and valve stem K, constructed and arranged to operate substantially as herein described and for the purpose set forth.

79,022.—JACOB D. SPANG, Dayton, Ohio.—*Gas Stove.*—June 16, 1868.—The burner is constructed of two pieces, the one being screwed to the pipe and provided with a single hole at the center, and upon the end of which is screwed the other piece, provided with several holes arranged to throw jets of gas at

different inclinations from the vertical jet in the center.

Claim.—The burner, consisting essentially of the parts *m n*, constructed as described, and operating in the manner and for the purpose set forth.

79,023.—A. STEWARD, Plano, Ill.—*Thread Show Case.*—June 16, 1868.—Spools of thread are placed on shelves inclining from front to rear, and are prevented from rolling out by a cleat or stop in front. When a spool is removed its place is supplied successively by those in the rear.

Claim.—The show case for containing spools of thread, consisting of the ends A, top B, partitions D, stops E, and inclined planes G, substantially as specified.

79,024.—EUGENE SULLIVAN, New York, N. Y., assignor to the AMERICAN HORSE COLLAR COMPANY, Boston, Mass.—*Fabric for Covering Horse Collars.*—June 16, 1868.—The combination of some elastic fibrous fabric with a layer of vulcanized rubber or other elastic water proof substance.

Claim.—The within-described improved elastic water-proof covering for the bearing surfaces of horse collars.

79,025.—ABNER TAYLOR, New Hartford, Conn.—*Farm Gate.*—June 16, 1868.—The gate when unlatched assumes a vertical position, the rear portion of the extended upper rail being weighted.

Claim.—The gate A, posts B B', rail C, bar *d*, and rod *e*, the whole being constructed and arranged as and for the purpose described.

79,026.—WILLIAM A. TERRY, Bristol, Conn.—*Calendar Clock.*—June 16, 1868.—The wheel C, to which the disk is attached, is provided with a number of pins placed in such positions that, at the end of each month before one having less than thirty-one days, one end of the pawl when released will fall against the proper pin to regulate the position of the pawl, so as to be taken up by the pin at the proper time to give the right number of days in the following month.

Claim.—1. The use of thirty-two teeth in the month wheel, instead of thirty-one, substantially as herein specified.

2. The use of the month wheel with a year wheel, or four years' wheel, revolving together upon a common axis, and so arranged that the year wheel, or four years' wheel, shall change its relative position to the month wheel one tooth or division at a certain point in each revolution, substantially as herein described.

3. The combination of the disk A with the wheel C, the pawl *a a'*, the wheel D, and the pinion *g*, or its equivalent, constructed and operating substantially as described.

4. The disk A, in combination with the pointer B, so arranged that the same pointer shall indicate the month and the day of the month, substantially as described.

79,027.—AUGUSTUS THAYER, Albany, N. Y.—*Implement.*—June 16, 1868.

Claim.—The implement, consisting of the parts A A', having the head B, tack holder D, roughened surfaces *b b'*, *c c'*, *d*, *e*, *f*, notches *j l*, holes *k m*, cutters *i i*, grooves *o*, projections *n*, saw set *p*, serew-driver *h*, and claw *g*, all constructed and arranged to operate substantially as and for the purposes herein shown and described.

79,028.—MARX THODE, Mattoon, Ill.—*Subterranean Wall.*—June 16, 1868.

Claim.—In the formation of subterranean structures, the employment of double walls *e g*, with the space between them filled with pitch, *m*, or asphaltum or other impervious material, to be melted and poured therein, as the walls are built up, and a bottom, formed by the layers *b d*, with a layer of pitch or asphaltum *m* between them, all constructed and arranged as described for the purpose specified.

79,029.—W. R. THOMAS, Catasqua, Pa.—*Car Wheel.*—June 16, 1868.—A hollow enlargement surrounds the hub and communicates with hollow arms

having between them a thin webbing of metal also connecting with the rim and the said enlargement.

Claim.—A cast-metal car wheel, provided with the hollow enlargement A, hollow arms B communicating with the same, and the inturning thin metal webbing, all constructed and arranged substantially as and for the purpose described.

79,030.—JOHN A. THOMPSON, Auburn, N. Y.—*Machine for Grinding Mowing Machine Knives.*—June 16, 1868.—Improvement upon a machine patented to same inventor, March 17, 1868. The invention relates to certain details in the construction and means of adjusting the same.

Claim.—1. Providing the bar C with the rollers L, and the clamps K provided with the rollers J, substantially as described.

2. In combination with the bars C and C', connected by the jointed links *b*, the plates A and D, constructed and arranged to operate as set forth.

3. The bar C', connected to the index plate A by the jointed links *b*, and the levers E and E', substantially as represented in Figs. 7 and 8.

4. In combination with the apparatus, constructed as last above described, arranging the bar C to slide longitudinally thereon, for the purpose of moving the sickle along without changing the position of the frame, as set forth.

5. The auxiliary stone R, when arranged to be adjusted on either end of the shaft, for use in connection with the main stone P, substantially as and for the purpose set forth.

79,031.—JOHN A. THOMPSON, Bucyrus, Ohio.—*Machine for Cleaning the Intestines of Slaughtered Animals.*—June 16, 1868.

Claim.—1. The cleaning of the intestines of animals by revolving brushes, substantially as herein described.

2. The cleaning of the intestines of animals by machinery, which operates to draw the intestines through between contiguous revolving brushes, by means of contiguous rollers, substantially as herein described.

3. The driving wheel *a*, pinion *d*, grooved or flanged roller *c*, gear wheel *e*, gum roller *h*, fluted roller *i*, and brushes A A, when arranged, combined, and operated substantially in the manner herein shown and described, for the purpose set forth.

79,032.—DENNIS H. TIERNEY, New York, N. Y.—*Bevel and Tapering Gauge.*—June 16, 1868.—An angular bar and a slide bar, each furnished at one end with an adjustable blade, are combined with an adjustable slide fitted on the angular bar. An adjustable arm is so combined with the sliding bar as to readily adapt the gauge to the beveled portion of a cavity.

Claim.—1. The combination of the slide B, angular bar A, adjustable slide bar C, and adjustable blades *c e*, all arranged substantially as and for the purpose specified.

2. In combination with the subject-matter of the foregoing clause, the adjustable arm *g*, arranged substantially as and for the purpose specified.

3. The arrangement of the graduated scale plate *m*, adjustable blade *c*, and bar A, substantially as and for the purpose specified.

79,033.—Canceled.

79,034.—RICHARD UREN and JOHN WALKER, Houghton, Mich., assignors to themselves and JOHN UREN, same place.—*Stamp Mill.*—June 16, 1868.—Supplementary cylinders and pistons are provided at each end of the main cylinder, to act as cushions, against which the force of the stamp piston may be expended without damage whenever the piston may be forced against the ends of the steam cylinder.

Claim.—1. The supplementary cylinders H H' and pistons J J', in combination with the cylinder G, piston F, stamp C, and coupling D, substantially as described for the purpose specified.

2. The supplementary pistons J and J', in combination with the yokes K K' L, stamp C, and coupling D, substantially as described for the purpose specified.

3. The rock shaft *h*, adjustable cams *i*, fixed cam

x ; and arm y , in combination with the coupling D and stamp C, substantially as described for the purpose specified.

4. The crank shaft S, cam p , connecting rods W W', and valves O O', in combination with the rock shaft h , cams i x , coupling D, and stamp C, substantially as described for the purpose specified.

5. The bracket R', lever j , and floats l , in combination with the cam i , stamp C, and coupling D, substantially as described for the purpose specified.

6. The horizontal shaft a , cam b , valve \mathcal{V} , and valve-rod d , in combination with the coupling D, substantially as described for the purpose specified.

7. The combination of the spring bed 23, rod m , spring n , spring catch o^2 , tappet p , arms Y u , and spring t , substantially as described for the purpose specified.

79,035.—W. H. and L. WADDELL, Churchville, Va.—*Churn*.—June 16, 1868.—The rotation of the wheel imparts a reciprocating motion to the beam to which the dasher-rod is attached.

Claim.—The combination of the wheel, roller, and lever beam, as above described, for the purpose of operating the common churn.

79,036.—WILLIAM WALLACE, Ansonia, Conn.—*Machine for Forming Lamp Tubes*.—June 16, 1868.—By forcing apart the bars the tube is spread and stretched into proper form.

Claim.—The arrangement of the two bars a and b , their outer edges parallel to each other, or nearly so, so as to receive the cylindrical tube, and combined with a device to force the said bars, so as to flatten and form the tube substantially in the manner herein set forth.

79,037.—ENOS WATERBURY, Stamford, Conn.—*Sewing Machine*.—June 16, 1868.—Beneath the path of the shuttle and near to the needle is a vibrating hook, which enters between the needle and its thread, after the former has receded a short distance from its lowest position, so as to hold the loop and push aside or spread it open to allow the point of the shuttle to enter.

Claim.—The combination of the pivoted right-angular arm M, pin J, slotted carriage G, and shuttle driver K, substantially as described for the purpose specified.

79,038.—JACOB WEAVER, Jr., Elizabethville, Pa.—*Corn Planter and Seed Drill*.—June 16, 1868.—The ratchet wheel is made to engage with a toothed lever under control of the driver, to lock the axle and prevent its rotation when necessary.

Claim.—1. The seed tubes and cultivator bar or frame I, provided with the teeth J, in combination with the frame A, lifting lever L, and seed wheels or rings E, all arranged and operating as described.

2. The arrangement of the rag wheel or ratchet b on the axle, in combination with the toothed lever or brake b' , operating as described.

79,039.—ALFRED M. WEEKES, New York, N. Y.—*Lamp Shade*.—June 16, 1868.—The elongated projections serve to shade the eyes on one side.

Claim.—Providing the lamp shade with one or more elongated projections, a a , substantially as and for the purpose herein shown and described.

79,040.—FRANZ RUDOLPH WEGMAN, Saxony, assignor to himself and TOBIAS KOHN, Hartford, Conn.—*Wire Spring Mattress*.—June 16, 1868.—Patented in Saxony March 6, 1865.—The mattress is stretched in the frame by inserting struts which rest against the upper corners of the frame.

Claim.—1. A mattress or cushion, composed of spiral wire springs, braided or linked together in two or more series, so as to form one connected web of woven wire, substantially as herein described.

2. The combination of the struts H H with a mattress of wire springs, substantially as described, for the purpose of stretching it and rendering it more elastic.

79,041.—D. A. WHITE, Chagrin Falls, Ohio.—*Stove Pipe Damper*.—June 16, 1868.—Deflectors are formed on the edges of the disk so as to allow the

smoke to escape and throw the heat against the sides of the pipe.

Claim.—The herein-described stove damper, consisting of the convex disk A and deflectors B, constructed and arranged in the manner as and for the purpose specified.

79,042.—F. R. WILLSON, Columbus, Ohio.—*Harrow*.—June 16, 1868.—Designed as an improvement on a patent of the same inventor, of September 24, 1867. On the under sides of the inner and outer rails is a series of blocks formed with grooves in which are secured metal plates that constitute the harrow teeth.

Claim.—The arrangement of the outer rails A A and inner rails B B, and the grooved teeth-holding blocks K K, pivoted in the manner described, and the perforated bars D D, when the several parts are constructed and operated substantially as specified.

79,043.—GEORGE W. WOOD, Richmond, Ind., assignor to himself and JAMES W. SLATER, same place.—*Inking Apparatus for Color Printing*.—June 16, 1868.—Designed for printing in more than one color. Adjustable inking tablets are arranged in sets parallel with one another, each set receiving one color and disposed upon corresponding lines of type. In traversing the ways, each roller is brought in contact with the face of its own table, without touching the others.

Claim.—1. The combination of the reciprocating bed B, ways C, adjustable tablets D D¹ D², and rollers G G¹ G², substantially as described.

2. The combination of the reciprocating bed B and roller frame F, so connected by intermediate mechanism that the movement of the former shall communicate motion to the latter in an opposite direction, substantially as and for the purpose set forth.

79,044.—S. W. WOOD, Cornwall, N. Y.—*Pneumatic Grain Elevator*.—June 16, 1868.—The grain is drawn into and conveyed in a pipe or passage to the apparatus by atmospheric pressure produced by the continued partial exhaustion of the air therefrom, and then discharged.

Claim.—1. The combination and arrangement of the atmospheric conveying pipe or passage A, exhaust chamber B, and pump or blower C, substantially as and for the purpose herein specified.

2. In combination with the foregoing, the self-acting discharge valve D, operating substantially as and for the purpose herein set forth.

3. The additional chamber II, and discharge valve I, alternating with the valve D, substantially as and for the purpose specified.

4. The contracted aperture o of the receiving nozzle, for the purpose specified.

5. The combination of a pneumatic pipe or passage, for conveying grain, with a mechanical grain elevator, as herein specified.

6. The curved or bent discharge nozzle g , arranged in combination with the discharge pipe or spout, so as to distribute the grain by its own gravity, substantially as herein specified.

79,045.—CHARLES WULSTEN, Lafayette, Ind.—*Printers' Ink*.—June 16, 1868.

Claim.—An ink, for all the purposes for which printers' ink is used, in which the silicate of alumina, white clay, or Jersey clay, or kaolin, prepared with sulphate of zinc, and with or without dilute sulphuric acid, is partially substituted for lamp black, blue, green, or other coloring matters, with drying materials and varnish, prepared as and in the proportions substantially as shown and described, and for the purposes set forth.

79,046.—FRANCIS ZELL, Louisville, Ky.—*Sash Fastener*.—June 16, 1868.—When the sashes are closed the gravitating movement of the handle causes the projection to take into an aperture in the ease to prevent the bolt from being operated from the outside.

Claim.—1. The spring D, so attached to the spring bolt B, that when the latter is retracted it shall be retained in its retracted position, but be partially projected from its casing by the movement of the sash, so as to be brought against a projection, re-

leased, and thrown into the socket when the sash is closed, substantially as and for the purpose set forth.

2. The pivoted handle F, provided with a projection or finger, *f*, for locking the bolt, and operating in the manner and for the purpose explained.

79,047.—FRANCIS ZELL, Louisville, Ky.—*Shutter Fastening*.—June 16, 1868.—The shouldered head enters a recess and is secured in place by a partial turn. Two slotted and matched retaining plates are applied to the shank of the fastening device from opposite directions, and secured to the frame to prevent displacement by an outward or inward movement.

Claim.—1. The fastening device, consisting of the successive cylindrical portions C C¹ C², the thumb piece C³, and shouldered head C⁴, in combination with two matched retaining plates, substantially as and for the purpose set forth.

2. The plates D D, constructed with slots having diverging sides, and with corresponding projections *d d*, substantially as and for the purpose set forth.

79,048.—HENRY C. APPELBY, Conneaut, Ohio.—*Carbureter*.—June 23, 1868.—The arms being rapidly rotated with the tube create a partial vacuum, inducing a current of air which descends through the vertical tube and is discharged into the hydrocarbon liquid by the horizontal arms. The air ascends through the liquid and escapes into the gasometer. The valve prevents the escape of vapor through the tube. A horizontal serrated disk is placed above the arms in the tank to moderate the rotary motion of the liquid.

Claim.—1. Discharging a current or currents of air into hydrocarbon liquid by centrifugal force, substantially as and for the purposes described.

2. In combination with a carbureting apparatus, the valve *i*, operated by the weighted lever J, and the serrated disk H, substantially as and for the purpose described.

79,049.—DANIEL W. AYERS, Sheldon, Ill.—*Device for Grinding Tools*.—June 23, 1868.—The instrument when in use may be held like an ordinary bit stock, the main wheel being turned by hand. The device is especially designed for grinding sickle cutters but may be clamped to a table for general use, the tool being applied to either the circular grinding wheel or the conical grinding wheel, as occasion may require.

Claim.—An implement for grinding or sharpening tools, composed of a stock, gearing and grinding wheels, one or more, arranged to operate in the manner substantially as shown and described.

79,050.—LEWIS H. BAKER, Tarrytown, N. Y.—*Lounge*.—June 23, 1868.—Provision is made for forming a double bed, with space for the bed clothing when not used as a bed, and also for the addition of an adjustable washstand and drawer.

Claim.—In combination with a furniture lounge, an extension or folding washstand, arranged and operated substantially as described.

79,051.—E. H. BENJAMIN, Oak Hill, N. Y., assignor to GIFFORD, POTTER AND COMPANY.—*Self-Locking Shutter Hinge*.—June 23, 1868.—The eye of that part of the hinge which is attached to the shutter fits upon a pintle on the other part, which is attached to the casing, and the contiguous surfaces of the two parts of the hinge are so formed that when the shutter is opened to the full extent, it descends to a limited degree carrying its part of the hinge downward and thus causing a hole in the shutter part of the hinge to catch over a vertical stud on the other part so as to hold the shutter open. When the blind is to be closed it is necessary to raise it. The parts of the hinge are adapted to be used at either part of the shutter.

Claim.—1. The reversible pintle plate P, provided with a curved recess, the pintle F, and pin *f*, and adapted to be secured to the arm *b* of the right angular plate B by means of the tongue *i* and screw *k*, all constructed and arranged as described, for the purpose specified.

2. The perforated projection G cast upon the plate

A, and provided with the notched rib *z* and semi-circular extension *r*, in combination with the recessed pintle plate P and the right-angular plate B, having the stops S S', all constructed and arranged as described, to produce a reversible shutter hinge, as herein set forth.

3. The semi-circular rib *q*, or its equivalent, substantially as shown and described, in combination with the screw *k* and pintle plate P, for the purpose of holding the latter firmly, all as set forth.

4. The tongue *i* of the pintle plate P, or its equivalent, substantially as shown and described, in combination with the slotted projection *b*, for the purpose of permitting the firm attachment of the pintle plate, all as set forth.

79,052.—A. H. BLAISDELL, Newton Corners, Mass.—*Carpenters' Gauge*.—June 23, 1868.—The extremities of the fingers being moved along in contact with the curved edge of a board, adjust themselves by moving upon their pivot pins, so as to cause the marking point to move in a line corresponding with the edge of the board.

Claim.—The fingers E E, pivoted on the sliding block C, and operating so that their four ends will always remain in contact with a curved or straight edge, substantially as herein shown and described.

79,053.—T. W. M. CASTLE and J. B. CONNER, Adrian, Ind.—*Printing Press Frisket*.—June 23, 1868.—The frisket is operated by the raising and lowering of the tympan, the parts of the frisket being closed upon the tympan, so as to grasp the sheet, by the action of spiral springs, and turned outward, to permit the printed sheet to be removed and a blank sheet placed in position, by the contact of levers pivoted to the tympan with prongs attached to the rear end of the bed.

Claim.—Constructing the frisket of the parts D D, attached to the tympan A, substantially as shown, in combination with the pulleys or semi-pulleys F, springs E, levers G G, and the prongs *e e*, all arranged and applied to operate in the manner substantially as and for the purpose set forth.

79,054.—JOHN G. CROSS, Brattleboro, Vt.—*Railway*.—June 23, 1868.—The outer lip of the chair may be extended up to the top of the rails, or a separate piece may be applied so as to form a sub-rail for the car wheels to roll upon in passing from one rail to another, the object being to make a continuous rail.

Claim.—1. The rails A, formed with rounded heads and branched or arched bases, and having their ends halved vertically to overlap and fit upon each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination the two-tie chair B, having a sub-rail, C, formed upon or attached to it, with the overlapped ends of the contiguous rails A, substantially as herein shown and described, and for the purpose set forth.

3. The sub-rail C, made solid with and upon the chair B, substantially as herein shown and described, and for the purpose set forth.

4. The detachable sub-rail C, secured to the chair B by means of the lug *b*³, formed upon the outer lip *b*² of said chair, and entering a notch or opening in the lower edge of said sub-rail, substantially as herein shown and described.

5. The ends of the main rail A, having its ends secured to the sub-rail C and to the chair B by the bolts D and wedge keys E, substantially in the manner herein shown and described, and for the purpose set forth.

79,055.—ISAAC DAVIS, Brooklyn, N. Y.—*Connection for Soft Metal Pipes*.—June 23, 1868.—The object is to dispense with the use of solder in connecting the ends of lead pipes. The ends of the pipes are spread out to form flanges, and a washer being placed between the two ends of the pipe, the caps are screwed together until the washer is firmly clamped between the flanges.

Claim.—A lead-pipe connection, consisting of the screw clamps C D, applied over flanges *a a*, and packing, all substantially as and for the purpose set forth.

79,056.—CLAYTON DENN, Frankford, Pa.—*Gridiron*.—June 23, 1868.—The detachable cover of the gridiron may be used as a cake griddle, by turning it bottom side up and placing it over the stove hole. The gridiron proper is depressed at the part adjacent the handle, inducing the gravy to flow into the handle, where it is saved for use. For broiling small articles, such as oysters, a wire gridiron is placed within the main griddle.

Claim.—1. The gridiron A, constructed substantially as and for the purpose described.

2. The combination, with the gridiron A, of the cover F, substantially as and for the purpose described.

3. The combination of the gridirons A and L, and the cover F, substantially as and for the purpose described.

79,057.—HENRY F. W. DETERDING, Alton, Ill.—*Harvester Rake*.—June 23, 1868.—A variable motion is transmitted from the axle through gearing and shafts, to a chain which is reciprocated across the platform and gives a similar motion to the rake. The platform is slotted in a direction parallel with its front edge to admit of the rake teeth passing up through it and traversing its whole length, from right to left. In moving inward to discharge the grain, the rake teeth are held in a vertical position by the action of the spring fitted upon the end of the rake head, and in moving outward the teeth are depressed so as not to interfere with the falling of the grain upon the platform.

Claim.—1. The wheel I, rack J, gearing *c* K L, and the shafts M O Q, all arranged and applied as shown, or in an equivalent way, for the purpose of operating the endless chain V and rake, substantially in the manner as and for the purpose set forth.

2. The pivoted plate X and spring *n*, in connection with the recesses *o q*, in the inner edge of the plate of the metallic framing Q', and the bent rake tooth *hx* of the rising and falling rake, all arranged to operate with the slotted platform S, substantially as and for the purpose specified.

3. The coiled spring *j*, in combination with the rake head *i* and socket W, whereby the rake teeth *h* are held in a vertical position, as herein described, for the purpose specified.

79,058.—HENRY L. DOANE, Green Oak, Mich.—*Horse Hay Fork*.—June 23, 1868.—The operator holding the hinged tines in an extended position thrusts the fixed tines into the hay, whereupon the hinged tines are forced down to bring the corresponding points of each pair of tines in contact, and thereby inclose the quantity of hay to be elevated.

Claim.—1. The swinging tines E E G, constructed of one piece of metal, when the parts E E are crossed, as shown, whereby their points are brought obliquely across the points of the fixed tines, as and for the purpose herein set forth.

2. The two pairs of tines A A, B B, each formed on one continuous rod or bar of metal, and hinged together by the cross part G and bent eyes *a a*, all substantially as shown and described, and for the purpose set forth.

79,059.—JACOB EBERHARDT, Newark, N. J.—*Hat Blocking Machine*.—June 23, 1868.—As the dies are brought together to shape the hat body, the brim is held upon a yielding surface and hence preserves its shape.

Claim.—The brim preserver, consisting of the elastic annular plate E, between the metallic annular plate D and frame B, in combination with the elastic male die A, and metallic female die C, as herein described, for the purpose specified.

79,060.—JOHN ENRIGHT, Louisville, Ky., assignor to himself and JAMES R. DEL VECCHIO, same place.—*Passenger Register*.—June 23, 1868.—The mechanism by which motion is transmitted from the turnstile to the recording apparatus, is so constructed and applied that the register is not affected by the exit of a passenger.

Claim.—1. The combination of the doors or bars F, shaft B, radial arms G, having stop pins *g'*, or their equivalent, attached to them, spring pawl J, and

bent lever L, with each other when placed at the entrance of a car, boat, room, or other place, substantially as herein shown and described, and for the purpose set forth.

2. In combination with the above and with each other, the toothed wheel V attached to a shaft, S, having a single tooth or cog E', formed upon it, and carrying an index finger G', the toothed segment or wheel B', carrying an index finger, I', the dial plate H', lever or arm R, pawls W and A', connection P, lever O, rod J, and gong K', all arranged and operating as set forth for the purpose specified.

79,061.—R. H. FISHER, West Meriden, Conn., assignor to BEAVER FALLS CUTLERY COMPANY, Beaver Falls, Pa.—*Cutlery*.—June 23, 1868.—The bifurcated tang is formed at the end of the blade, and the edges of the prongs are flush with the sides of the handle, while their ends are bent in so as to take a firm hold in the handle. The bolster is fitted into recesses in the edges of the tang so as to be flush with the surfaces of the handle and tang.

Claim.—1. The bifurcated tang B, provided with hooks *c c*, fitting into the recesses in the handle C, and secured in position by means of the bolster D, fitting into the recesses *b b* and over the end of the handle, as herein shown and described.

2. Securing the bifurcated tang B to the handle C, by compressing the arms *a*, and slipping the bolster D into the recesses *b*, as herein shown and described.

3. Securing the bolster D to the handle by means of the rivet *d*, passing through the handle between the arms *a a* of the tang, substantially as herein shown and described.

79,062.—W. T. FISHER, Leuoir's, Tenn.—*Bevel Square*.—June 23, 1868.—The object is to combine within a single instrument several tools, which are generally used separately, namely, a bevel square, right-angle square, plumb, and level. The instrument is also designed to be used for determining angles and measuring distances.

Claim.—1. The arrangement of the fixed index, G, and movable index, H, with relation to each other, and the stock A, graduated blade B, and slotted protractor D, whereby the required angle of the blade with the stock is determined, as herein shown and described.

2. The described arrangement of the slotted stock A, graduated blade B, slotted protractor D, fixed index finger G, movable index finger H, and set screws E F, all operating as described, for the purposes specified.

79,063.—THOMAS J. FLAGG, New York, N. Y.—*Neck Tie and Watch Guard Combined*.—June 23, 1868.—The band or ribbon is passed round the neck, and the knot or bow is slipped up to its place under the chin. The elastic loop attached to the bow is passed over the front button of the shirt neck band to prevent the bow from slipping down. The guard ring of the watch may be permanently attached to the extremities of the neck band, or it may be attached by a snap, or otherwise.

Claim.—As a new article of manufacture, the combined neck-tie and watch guard A, consisting of the widened part *a*¹, and the narrow parts *a*² *a*², the latter being adapted to receive the slide *a*³, which is secured to the button of the shirt by its loop *a*⁴, thereby holding the neck tie in proper position on the neck of the wearer, the ends *a*² being also provided with a suitable means for attaching to the watch, the whole constructed and arranged as herein set forth.

79,064.—MARTIN GAYHART, Young America, Wis.—*Trace Buckle*.—June 23, 1868.—The buckle is made in two parts, pivoted together by a rod, and having corrugated surfaces between which the trace is pinched when strain is applied to the two parts, the object being to relieve the tongue of a portion of its duty.

Claim.—The parts A A A' A'' and B B B B', pivoted together by a rod, *a*, and provided with a rigid tongue, *e*, corrugated cross piece A' and B', all constructed and operating substantially as shown and described, and for the purpose set forth.

79,065.—JACOB GINTHER, Mier, Ill.—*Horse Rake*.—June 23, 1868.—The rake is attached to the axle by hinged bars, and revolves to discharge the load when its forward ends are made to encounter the ground. When the hay is to be discharged the rake is raised, together with its suspending frame, in order that the forward ends of the teeth may be depressed by the superincumbent weight, and the foot is lifted, at the same time, from the two central teeth upon which it rests to keep the rake from revolving, until a sufficient quantity of hay is collected. The trip stick has a pivoted stop rod, the lower end of which is in contact with a short stop tooth when the rake is gathering hay, the stop rod yielding when encountered by an opposite stop tooth at each semi-revolution of the rake. The rake may be sustained in an elevated position by the ratchet rack.

Claim.—1. The described arrangement of the trip stick *d*, having a ratchet handle, *g*, foot *b*, pivoted stop rod *e*, and spring brace *f*, with relation to the hinged bars *l*, carrying the rake *A*, said bars *l* being adapted to be elevated and lowered by means of the cord *a*, drum *o*, and lever *j*, all as and for the purposes herein shown and specified.

2. The combination of the ratchet rack and trip stick, substantially as described.

79,066.—J. H. GOODWIN, Scotland Neck, N. C.—*Hammer*.—June 23, 1868.—A screw driver is fixed in the end of the graduated handle, the head of the latter serving as a lever in using the screw driver. The groove in the inner side of the hammer head is intended to receive a nail, as shown, so that the nail may, preparatory to driving it, be thrust into the board. One of the prongs of the nail claw is notched to serve as a brad or tack claw.

Claim.—As an improved article of manufacture, the tool, consisting of the combination of a hammer with graduated handle and tack claw with a screw driver, constructed as described.

79,067.—JAMES GRAY, Newark, N. J.—*Sad-Iron*.—June 23, 1868; antedated June 13, 1868.—The cover is hinged or removable, and the perforated fire bed is fixed stationarily in the lower part of the hollow sad-iron. The interior communicates with the outside air by a hole in the side of the iron.

Claim.—1. The cover *D*, constructed as described, consisting of the plates *b c*, forming a cold air chamber, the upper plate being slotted for the passage of the arm *e* of the catch damper *G*, as herein shown and described.

2. The adjustable sliding damper *G*, when arranged below or near the mouth of the smoke pipe *C* of a hollow self-heating smoothing iron, substantially as and for the purpose herein shown and described.

3. A self-heating smoothing iron, when provided with a perforated cap fixed in the interior of the hollow iron, with a double cover, *D*, and with an adjustable damper, *G*, all made and operating substantially as and for the purpose herein shown and described.

79,068.—WILLIAM HACHENBURG, White Pigeon, Mich.—*Washing Machine*.—June 23, 1868.—The rubber is operated by a lever pivoted to an arm projecting from the upper part of the tub. The spring lever is attached to a shaft carrying arms, which pass between the ends of the rubber and the side walls of the box, and which may, by pressure applied to the spring lever, be made to bear down upon the journals of the rubber to exert the desired pressure upon the clothes.

Claim.—The combination of the curved sides *B*, bearing the rollers *C*, segmental rubber *E*, whose journals *e* are hung in vertical slots, slotted bar *F*, connecting bar *G*, lever handle *H*, shelf *I*, shaft *J*, bars *K*, and spring lever *L*, all arranged as described for the purpose specified.

79,069.—C. O. HANSEN, Memphis, Tenn.—*Bevel Square*.—June 23, 1868.—The slotted plate has a scale on which the sliding head of the set screw may be set, by tightening up the said screw, at certain points, to mark the proper angles for figures having various numbers of sides.

Claim.—The bevel square, constructed as described, and consisting of the graduated plate *B*,

longitudinally slotted, the pivoted arms *A*, links *C*, and sliding clamp nut *D*, all arranged to operate substantially as herein shown and described.

79,070.—JAMES T. HARRIS, Swampscott, Mass.—*Leather Roller*.—June 23, 1868.—When the wet leather adheres to the rollers it is detached by moving the guard or guards upon the pivoting points. The guards also stop the hand of the operator at a safe point as it moves forward with the leather.

Claim.—The guards *D* and *E*, either or both, and whether made separate or in one piece, in combination with the rollers of a leather-rolling machine, substantially as herein shown and described, and for the purposes set forth.

79,071.—DEXTER HEAD, Medusa, N. Y.—*Hoisting Apparatus*.—June 23, 1868.—The weight to be hoisted is attached to the lazy tongs, which are designed to accelerate the operation.

Claim.—The lazy tongs *C*, arranged to operate in connection with the derrick *A*, slotted frame *B*, the pulleys, cord *e*, and windlass, *f*, as herein described, for the purpose specified.

79,072.—SIDNEY HOLT, Baraboo, Wis.—*Hop Stripper*.—June 23, 1868.—The fixed and sliding bars have two series of teeth, a spring holding the movable bar in such position that its teeth occupy corresponding positions with those of the fixed bar; but the movable bar may be slidden laterally to remove the corresponding fingers from each other, and permit the vines to be inserted between the teeth of the different series, which being done, the handle is released and the bar restored to its normal position by the spring. The vines being then drawn outward from between the fingers, the hops are stripped off and fall upon the endless apron. The fine hops pass beneath the roller mounted above the apron, but clusters are caught by the curved fingers of the roller, and, being carried over the latter, are torn asunder by the action of said fingers and those fixed above them.

Claim.—1. The combination and arrangement, upon the frame *A*, of the fixed and sliding bars *E F* respectively, substantially as and for the purpose set forth.

2. The combination and arrangement, with relation to the toothed cylinder *J*, of the endless carrier *D*, rollers *B*, and vertically adjustable hangers *C*, as herein shown and described, for the purpose specified.

3. The toothed bar *L*, in combination with the toothed roller *J*, substantially as and for the purpose herein set forth.

4. The described arrangement upon one frame *A* of the hop-stripping device, consisting of the parts *E, F, G, H, I*, the breaking device *J K L M N*, and the endless carrier *D*, passing around adjustable rollers *B*, all constructed and combined to operate in the manner and for the purpose substantially as set forth.

79,073.—GEORGE E. HUTCHINSON, Cleveland, Ohio, assignor to himself and J. B. BROWN, Peckskill, N. Y.—*Toy Cannon*.—June 23, 1868.—The sliding barrel, in the enlargement at the rear of the bore, is retained in its retracted position, to keep the spring compressed, by the gravitating pin, which falls in front of said barrel when the latter is pushed back by a ramrod. An arrow or bolt is inserted in the bore to be discharged by the forward impulse of the barrel when the detaining pin is raised by the lever.

Claim.—A toy cannon, having an enlarged chamber, *r*, at the rear end of the bore, and having the front end of the spring confined in a sliding barrel, *E*, in combination with the lever *F* and pin *d*, all made and operating substantially as herein shown and described.

79,074.—JOSEPH H. KLEPPINGER, Cherryville, Pa.—*Horse-Power*.—June 23, 1868.—The pawl is pivoted to a disk to which the sweeps are attached. As the horses move forward the pawl catches against one of the teeth of the ratchet wheel and carries the shaft around. The fly wheel acquires momentum which is sufficient to continue the motion of the shaft

in case the progress of the horses be interrupted. When the duty devolves upon the fly wheel the pawl slips over the teeth of the ratchet.

Claim.—The wheel E, with the toothed face, and the loose wheel F, with the pawls b, all arranged as described, in combination with the shafts of a horse-power, and with the fly wheel H mounted on one of them, as specified.

79,075.—WILLIAM H. LEE and CHARLES M. HARDENBERGH, Minneapolis, Minn.—*Hot Air Furnace.*—June 23, 1868.—The air enters from below into the spaces within the annular drums and passes thence upward through the vertical tubes in the upper fire drum. By opening the damper the heat is allowed to escape directly into the discharge flue. By closing the damper the heat is compelled to pass down into the annular drums and thence upward through the pipes which conduct it into the chimney above the damper. The lower drums have partition plates which retard the products of combustion passing through the drums.

Claim.—1. The arrangement and combination of the furnace drum A, (with the vertical air tubes a.) the annular flue drums C, the smoke flues D and E, and the chimney flues F and J, substantially as described and for the purposes set forth.

2. The partition plates H and damper G, in combination with the furnace drum A, annular flue drums C, smoke flues D E, and chimney flues F J, as herein shown and described.

79,076.—E. O. LEERMO, Gold Hill, Nevada.—*Safety Guard for Mining Shafts.*—June 23, 1868.—A contrivance to be applied to the top of mining shafts to prevent the trucks from being accidentally run into them when the cage is not in proper position to receive the trucks.

Claim.—1. The combination, with a railroad track and the edge of a mining shaft, of the automatic safety-guard attachment, substantially as and for the purpose described.

2. The combination of the spring buffer H, spring lever E, and slide D, substantially as and for the purpose described.

79,077.—CARL MILLAR, Sandoval, Ill.—*Smut Machine.*—June 23, 1868.—The grain is fed to the upper screen to remove the straw and coarse material; thence it is delivered within the outer shell of the conical smutting device, which has at its base a fan; thence the grain is passed to the conical brushing apparatus, which also has a fan at its base; and finally it passes over a vibrating screen to the hopper for grinding.

Claim.—The smut machine C, with its screen B and blower E, in combination with the brusher G, blower H, and screen K, when constructed and arranged in the manner and to operate substantially as described.

79,078.—IRA PAGE, Adams, N. Y.—*Manufacturing Butter from Whey.*—June 23, 1868.—The whey remains in vats for twenty-four hours, and then the cream is skimmed off. Saltpeter is added to this cream and the cream is churned. The butter thus produced is washed and worked, and then salt and white sugar are added to it, after which it is again worked to render it fit for use.

Claim.—The improved mode of manufacturing butter from whey, substantially as and for the purpose described.

79,079.—GEORGE H. PIERCE and MARTIN T. GLIMSETAL, Mineral Point, Wis.—*Extension Trestle.*—June 23, 1868.—A portable trestle horse for seafolding and other purposes, the same being capable of vertical and longitudinal extension and contraction.

Claim.—1. The traveling boards B B', constituting the platform of trestle or horse, substantially as shown and described, in combination with the braces a a a' and their respective bolts r r r', all as and for the purposes set forth.

2. The screws G, in combination with the cross bar i and the hooks f, substantially as shown and described, and for the purpose specified.

3. The slotted girders D D', in combination with

the legs A, platforms B B', and bolt r', substantially as shown and described, and for the purpose specified.

4. The plates m, substantially as shown and described, in combination with the braces h and the slotted girders D D', all as and for the purpose set forth.

5. The cross bars i, substantially as shown and described, in combination with the legs A, braces h, and slotted girders D and D', all as and for the purpose set forth.

6. The cross bars i, substantially as shown and described, in combination with the screw G and legs A', all as and for the purpose set forth.

7. The brace a', when combined with a guide a'', and bolt r', all constructed and operating substantially as shown and described, and for the purpose specified.

8. The hooked and hinged cross bar i', substantially as shown and described, in combination with the legs A, slotted girders D D', and platform B B', all as and for the purpose set forth.

9. The chains g, in combination with the bolts r and legs A, all substantially as and for the purpose shown and described.

10. The notches in the legs A, in combination with a corresponding notch on the girders, and the screws G, all substantially as shown and described, and for the purpose specified.

11. The clamp device, consisting of the metallic strap k, and eccentric roller v, substantially as shown and described, in combination with the legs A' and supplementary legs A'', and strips p, all as and for the purpose set forth.

12. The tongue and its groove e', in combination with the girders D D', substantially as shown and described, and for the purpose specified.

79,080.—WILLIAM T. PORTER, Wilmington, Del.—*Device for Stopping and Starting Calender Rolls.*—June 23, 1868.—When the roll is to be started the clutch is drawn in contact with the friction flange by turning the hand wheel at the opposite end of the roll. When the roll is to be stopped, the hand wheel is seized and held, and the continued motion of the roll throws off the clutch from the friction flange, whereupon the roll ceases to revolve.

Claim.—The rod E, passing through the roll A, and connected at one end to the shaft D of the roller and friction disk, by a swivel joint, its other extremity fitting within the hub block H, provided with the hand wheel G, all constructed and arranged to operate substantially as and for the purpose herein set forth.

79,081.—A. C. RAND, New York, N. Y.—*Gas Burner.*—June 23, 1868.—The gas issues through a narrow opening which is adjustable in width for the purpose of varying the size of the jet.

Claim.—A gas burner, in which a movable cheek is adjustable toward or away from the stationary cheek, as herein described for the purpose specified.

79,082.—ISAAC ROUSH and JOHN W. TRUBY, Otto, N. Y.—*Organ.*—June 23, 1868.—The block moving in the grooves is attached to a jointed lever which is connected with a treadle and which operates a stop of the organ by moving with its end in contact with the curved surface of a pivoted plate.

Claim.—The grooves R, in a surface, in combination with a block moving in such grooves, substantially as and for the purpose described.

79,083.—WILLIAM SINNOTT and JOHN MC-NAUGHTON, Brooklyn, N. Y.—*Tailors' Measure.*—June 23, 1868.—Designed to aid tailors in taking correct measurements for gentlemen's coats.

Claim.—The adjustable quadrangular frame, composed of the metal bars, on each of which a graduated scale is marked, in combination with the vertical bar d, sliding upon the lower bar b of the quadrangular frame, and carrying the adjustable tape measure C, as herein described, for the purpose specified.

79,084.—JOSEPH SMALLWOOD, St. John, New Brunswick.—*Portable Stove.*—June 23, 1868.—A portable, diminutive stove for workmen and others, whereby they may heat their coffee and tea and

warm their dinners. When in use, the boiler is withdrawn, inverted and set upon the flange inside and near the top of the furnace.

Claim.—The furnace or part A, and the boiler or part B, when constructed so that they will slide or fold together, as seen in Fig. 2, and when used for the purposes set forth, or in combination with a lamp, substantially as described.

79,085.—S. L. STOCKSTILL and H. H. DILLE, Medway, Ohio.—*Meat Cutter.*—June 23, 1868.—The cutters and arms are set spirally around their respective rollers, so as to feed the cut meat toward one end of the machine, where, at a point below the cutters, it is discharged. Such pieces of meat as are not retained by the spikes or arms fall upon the slotted plate, and are thereon cut up into such small particles that they can fall through the slots.

Claim.—1. The inclined slotted plate E, attached to opposite sides of the shell A, below the spikes *a*, whereby, as the two halves of the shell are brought together, the inner edges of the plates fit against each other, to form a partition, as herein described, for the purpose specified.

2. A meat enter, consisting of two rollers, B and C, carrying spikes and cutters respectively, and working within a case A, that is, by means of a slotted partition, E, divided into two compartments, as set forth.

79,086.—MARTIN STREETER, New Haven, Conn., assignor to himself and ARTELL AUSTIN, Jersey City, N. J.—*Shutter Operator.*—June 23, 1868.—The pivoted lever is held rigidly by clamping it to the guard plate, the blind being thus retained in any desired position.

Claim.—Securing the blind C in any desired position, by means of the screw handle G, upon the screw shank of the lever D, acting upon the curved edge of the plate E, as herein shown and described.

79,087.—PETER THOMPSON, Sardis, Ohio.—*Shoe Laster.*—June 23, 1868.—The supplemental jaws close upon the outside of the main jaws. When the handles are pressed together, the movement forces the springs against the tails of the supplemental jaws, so that the four jaws close simultaneously.

Claim.—In combination with the pineers or parts A A', the jaws C C and springs *f f*, constructed, arranged, and operating substantially as shown and described.

79,088.—JAMES P. THORP, Southington, Conn.—*Thill Coupling.*—June 23, 1868.—The hook holds the thill in the event of the breaking or casual withdrawal of the thill bolt.

Claim.—The hook F, applied to the thill coupling, and passing through a hole in the thill wire, to operate in the manner substantially as and for the purpose set forth.

79,089.—ROBERT TYRRELL, Sumner, Ill.—*Tire Bending Machine.*—June 23, 1868.—The revolving disk is operated by the lever, the tire being drawn between the peripheries of the disk and roller bent and around the disk. The disk has two circular surfaces, suitable for the tires of fore and hind wheels. The roller is set up to the smaller circle of the disk when that circle is being used.

Claim.—The combination of the rotary disk A, having the two diameters *e f*, and provided with the lever B and clamping device *g h*, with the horizontally and vertically adjustable roller C, slotted arm D E, blocks *n o*, headed rod *h*, provided with the nut *j* and gudgeon *k*, all constructed and arranged to operate substantially as herein set forth.

79,090.—R. A. WEBSTER, Sandisfield, Mass., assignor to himself, JOHN DOWD, and R. J. DOWD, Lee, Mass.—*Inner Soles for Boots and Shoes.*—June 23, 1868.—An insole consisting of five layers of different material cemented together and arranged in the following order: cloth, gutta percha, or India-rubber, wood veneer, gutta percha or rubber, and cloth or paper.

Claim.—The inner sole A, constructed substantially as described, for the purposes set forth.

79,091.—J. M. WILSON, Lexington, Miss.—*Plow.*—June 23, 1868.—A plow for working ground containing young cotton plants. The point is shaped like an arrow head and is secured to the standard or formed as a part of it.

Claim.—1. A plow, consisting of the combination of the arrow C with the scraper D, all made and operating substantially as herein shown and described.

2. Providing the scraper D with notches *a b*, to facilitate its fastening to the standard A and arrow C, substantially as herein shown and described.

79,092.—KENELM JOHN WINSLOW, Montpelier Row, Twickenham, England.—*Apparatus for Converting Motion.*—June 23, 1868.—Communicating rotary motion to axles, especially applicable to sewing machines. The machine being put in motion, alternate action is given to the pawls, which, working on the ratchet wheels within the drums, impart continuous rotation to the axle. The pawls are suspended inside of hollow drums upon which the treadle bands act. Each pawl is kept in operative position by means of a link attached by a pin to the end of the pawl, the other end of the link being fastened to a ring or pulley working loosely upon the axle or bearings of the drum. Friction retards the movement of the ring. When the drum is moved backward the link, acting on the pawl, lifts it free of the ratchet. A cord from a pulley placed beside and attached to one of the drums is passed over the upper pulleys to a pulley attached to the other drum.

Claim.—1. The combination of the loose hollow drums C, hinged pawls D, link connections E E G, friction pulley H, fixed ratchet wheel B, and shaft A, all constructed and arranged to operate substantially as and for the purpose herein shown and described.

2. In combination with the above, the retarding rings K and spring L, and also the cord O and pulleys Q, all constructed and arranged to operate in the manner and for the purpose herein shown and described.

79,093.—C. A. WOODBURY, Woodstock, Vt.—*Thread Cutter.*—June 23, 1868.—Springs project axially from the center of the shield, which is attached to the cutter by inserting the springs in the eye of the cutter and bending the teeth of the shield over the edge of the cutter. The cutter, thus completed, is attached to the spool by inserting the springs in the axial hole thereof.

Claim.—The thread cutter, consisting of the disk A, having a sharp edge, the notched shield B, and springs *a*, substantially as herein set forth.

79,094.—JOHN ARMSTRONG, New Orleans, La.—*Steam Generator.*—June 23, 1868.—The inclined connecting flues conduct any deposit of sediment that may be made therein into the vertical tubes, from which it passes into the clearing pipes to be discharged by the blow-off valves or cocks.

Claim.—The central line or set of vertical tubes A, in combination with the outer lines or sets of tubes, and with the system of oppositely-inclined connecting flues B, arranged in the manner and for the purpose set forth.

79,095.—ALPHA A. ATHERTON, Waterbury, Vt.—*Washing Machine.*—June 23, 1868.—The lower washboard consists of rollers, in each of which a number of holes are bored at right angles to the axis upon which the roller turns.

Claim.—The combination of the board D with the knuckles, and the board E with rollers containing holes, which allow the water to flow freely through them, as and for the purpose specified.

79,096.—ALFRED M. BAILEY, Middlefield, Conn., assignor to METROPOLITAN WASHING MACHINE COMPANY, same place.—*Wringer.*—June 23, 1868.—The peculiar manner of arranging the bearings of the spring is designed to prevent the tilting or rising of the roller at one end, when the clothes to be wrung are inserted near such end.

Claim.—1. In clothes wringers, and other machines in which two rolls are required to operate at varying distances from each other, the employment of a spring, whose ends extend beyond the bearings of the upper or driven roll, in the manner

described, so that the ends of said roll shall bear against the spring, at points intermediate between the bearing points of said spring, as and for the purposes set forth.

2. In combination with a spring whose bearing points are located with relation to the points where it is in contact with the upper or driven roll, in the manner specified, the employment of screws, or equivalent devices, for regulating the pressure of the spring, arranged immediately above the points where the upper roll bears against the said spring, as shown and set forth.

3. The herein-described combination and arrangement of the spring with the upper roll, the frame, and the regulating screws, so that the said spring may be readily applied to or removed from the machine.

79,097.—NELSON BAKER, Alganssee, Mich.—*Cultivating Hops.*—June 23, 1868.—The smudge of saw dust, leaves, straw, weeds, pennyroyal, or other vegetable substance is prepared by mixing or moistening it with a diluted solution of sulphuric or maritic acid, paraffine, coal, gas, or other tar. The smudge being set on fire, the smoke and fumes are blown among the vines, destroying the insects.

Claim.—The herein-described method of destroying insects upon hop-vines in the open fields by subjecting the vines to the action of pyroligneous, sulphurous, hydrocarbon, or other similar vapors, in the manner specified.

79,098.—JOSEPH P. BALL, Lebanon, Ind.—*Medicine for Hog Cholera.*—June 23, 1868.—The ingredients of the composition are rosin, saltpeter, sulphur, ginger, bayberry, cayenne pepper, galls, flax seed, gentian, cream tartar, and anise seed.

Claim.—The improved and newly-discovered medicine, for the cure and prevention of hog cholera, compounded and prepared of the materials and substances in the manner and proportions and administered as herein set forth.

79,099.—SAMUEL BARRY, Dayton, Ohio.—*Saw.*—June 23, 1868.—The teeth have an angular groove in their sides into which the sides of the aperture in the saw blade enter as the teeth are driven into position. As the teeth are being forced in, the projections which proceed from the base of the said aperture bend the forked parts outward and thereby secure the teeth in the blade.

Claim.—The mode of attaching the teeth B and C to the saw plate A, substantially as shown and described.

79,100.—B. F. BEAN, Schuylkill, Pa.—*Implement.*—June 23, 1868.—A device intended to perform the functions of a pair of tongs and a monkey wrench.

Claim.—The combined implement herein described, consisting of the tongs B C and screw wrench C D E, the movable jaw of the latter being made adjustable upon the arm or handle C by a nut, H, which is fitted to a screw thread cut upon the arm C, the whole constructed and operating in the manner and for the purpose specified.

79,101.—EDWARD E. BREWSTER, Cleveland, Ohio.—*Washing Machine.*—June 23, 1868.—The clothes are rubbed between the corrugated boards and the brush. The soap drawers being under the perforated washboard, the water mixes with the soap and forms suds which reach the clothes through the perforations.

Claim.—1. The soap drawers J, in combination with the perforated washboard B, for the purpose specified.

2. In combination with the above, the arrangement of the frame D, brush H, and standards C, all arranged to operate in the manner as and for the purpose specified.

79,102.—DAVID S. BROWN, JR., New York, N. Y.—*Machine for Cutting Soap.*—June 23, 1868.—A slab of soap is placed upon the bench and in front of the transverse bar of the rack frame, which being moved forward presses the soap through a frame of parallel, vertical wires, cutting the soap into bars.

The bars, thus formed, pass under the stamps, which are depressed by a lever and raised by a spring.

Claim.—1. The combination and arrangement of the bar B', arms B B, racks C, wheels D, shaft E, wire frame H, and bench A, the whole being made and operated as shown and described.

2. The arrangement, on the frame I, of the stamping bar d, stamps c c c, toggle-jointed bar e, and lever h, for the purpose of stamping a number of bars of soap simultaneously, the whole being made as shown and described.

3. The combination and arrangement of the soap cutting and stamping devices herein shown and described.

79,103.—MOSES CALVERT, Marshall, Ohio.—*Churn.*—June 23, 1868.—The frame in which the driving mechanism is mounted is supported by inclined braces. The dasher has a vertical reciprocating motion imparted to it by the pulley and crank wheels, and is shown detached in the engraving.

Claim.—The construction and combination of the frame, gearing, and dasher, when arranged and operating as herein described, and for the purposes set forth.

79,104.—HENRY T. CARTER, Portland, Me.—*Car Truck for Changing Gauge.*—June 23, 1868.—The wheels of the car truck are mounted upon telescopic axles so that they may be moved laterally toward or away from each other. At the station where the car is to be transferred from a broad to a narrow gauge track, the truck is run upon an adjusting table consisting of two beams, each having guard rails in addition to the ordinary rails so as to retain the wheels upon the latter during the adjustment. One of the beams, with its rails, is adjustable in relation to the other, it being supported upon roller trucks and moved by a screw. The shoulders on the friction plate of the bolster preserve the proper relative position of the truck and bolster.

Claim.—1. The four shoulders d, d', d'', and d''', constructed on the bolster B, substantially as and for the purposes set forth.

2. The combination of the shoulders d, d', d'', and d''', with the transverse rods, substantially as and for the purposes set forth.

3. The lateral-moving rail o' with its guard rail h', in combination with the fixed rail and guard rail o and h, substantially as and for the purposes set forth.

4. The combination of the lateral-moving rail o' and guard rail h', with their bed or beam, and friction rollers or trucks, substantially as and for the purposes set forth.

79,105.—GEORGE P. TEW, Cranston, administrator of CHARLES W. CLEWLEY, deceased, assignor to AMERICAN EYELET COMPANY, Providence, R. I.—*Eyelet Machine.*—June 23, 1868.—The two subjects of invention for which letters patent of the United States, numbered 25,318 and 28,737, and dated September 6, 1859, and June 19, 1860, for improvement in machines for making watch rims, and improvement in devices for making the rims of watch and locket cases, respectively, were granted to the above-mentioned Charles W. Clewley, are incorporated under the present invention in a machine for making eyelets, together with certain additions whereby the combined devices are adapted for the purpose stated.

Claim.—1. The compound instrument B, composed of a male cutter, c, a die, a, and a female cutter b, in combination, constituting the moving instruments in the formation of an eyelet, substantially as described.

2. The combination of the above-described compound instrument B, with the stationary female cutter d, "former," e, male cutter h, and collar f, substantially as described.

3. The piston H, in combination with the die a, arranged and operated substantially as described, for the purposes specified.

79,106.—WILLIAM S. COFFMAN, Coldwater, Mich.—*Horse Hay Fork.*—June 23, 1868.—The bolt is held in its highest position, to lock the two parts of the fork together, by the spherical rubber spring; and the tripping cord, which is pulled in order to

discharge the load, is attached to a hook or ring at the lower part of the bolt.

Claim.—In combination with the two parts A E of the horse hay fork, hinged together as shown, the spherical rubber spring G and bolt *k* upon one part, and the keeper or recess *a* on the other part, the two acting together, substantially as and for the purpose described.

79,107.—EDWARD A. COOPER, Buffalo, N. Y.—*Harness Snap.*—June 23, 1868.—The sides of the hollow chamber in which the spring is centrally hinged are formed respectively of the main shank of the snap hook and the tongue or catch plate.

Claim.—The arrangement with the main body of the hook, constructed with a flat plate and inwardly projecting lug *g*, and an outwardly projecting thumb piece, *h*, and a flat spring, E, one end of which is secured to the lug, which receives the screw in the main body, and the other end bears against the lug *g*, and having an entirely closed chamber for the spring, as herein described.

79,108.—DAVID B. COX, Troy, N. Y.—*Extension Ring for Base of Cooking Stoves.*—June 23, 1868.—The extension ring rests upon the base, and receives upon it the body or upper part of the stove; said ring being removable and changeable in order to adapt stove bodies of different size to one base, or to bases of one size.

Claim.—An extension ring, A, applied between the base B and body C of a stove, substantially as and for the purpose herein specified.

79,109.—JONATHAN DAVID, East Enterprise, Ind.—*Farm Gate.*—June 23, 1868.—When the gate is to be opened the lever is moved forward, so as to draw the bolt from its socket, and at the same time raise the front stile and the forward ends of the rails sufficiently to clear obstructions, such as snow and freezing clods of earth. The cam in revolving acts against a pin in the post to which the gate is hinged. The gate and post when thus raised are sustained by check pins passing through the cam into the main post, the object being to allow small domestic animals to pass under the gate.

Claim.—1. The arrangement of the forked lever F and sheave *c* with the articulation of the said lever on the bar *a*, by means of which the front stile C is lifted simultaneously with the drawing back of the bolt G, in the manner and for the purposes substantially as described.

2. Hoisting the gate by means of the cam J and pin *b*, through the medium of the slotted supplementary post B and guide bolts or screws *n n*, or their equivalents, when used substantially in the manner and for the purposes as set forth.

3. The articulated arrangement of the bars *a a*¹ *a*² *a*³ in the stiles C and C' on the pins 1 2 3 4 6 7 8 9, by means of which the forward end of the gate may be lifted, and kept up by a pin inserted in the hole 5, over the upper bar D, in the manner as specified.

79,110.—GEORGE B. FIELD, New York, N. Y.—*Steam Generator.*—June 23, 1868.—The cast-iron sections are each analogous in form to a wheel having hollow hub, spokes, and rim. The enlargement in the water spaces of the arms and rim causes a drainage therefrom into the central cylinder formed by the succession of hubs, from which the sedimentary matter descends into the reservoir below the grate, said reservoir having a waste pipe and cock, whereby the contents of the reservoir and generator may be drawn off. The feed pipe extends into the hub of the central section and discharges the cold water in the center of the mass of hot water, and also within a central cylinder, the effect of either provision being to prevent the cold water from being discharged against the surface of the generator. The annular enlargement in the central cylinder of the generator serves to deflect the heated water rising at the sides of the generator toward the center of the descending column of cold water. The orifice of the safety valve is designed to afford the greatest space for steam escape.

Claim.—1. A steam generator, constructed of cast iron or other cast metal, with a hollow cylindrical hub, radiating hollow arms, and a hollow rim con-

necting the outer ends of said arms, substantially as set forth.

2. Constructing a cast-metal steam generator, as above described, with a continuous enlargement of the water space from a point between the arms, through the same, to the central hub, as described and shown.

3. The cylinder C, arranged as shown and described, and for the purpose set forth.

4. In combination with the sections A of a steam generator, such as described, a reservoir, E, standing under the main cylinder of said generator, and beneath the fire grate, as described.

5. In connection with the central cylinder or hub of a steam generator, such as described, and the enclosed cylinder C, the annular enlargement N, for the purpose and with the effect set forth.

6. In combination with a steam generator, composed of one or more sections, as herein described, the safety valve M, having an orifice as large as the interior diameter of the cylindrical hub or largest tube of the generator, as set forth and described.

7. The arrangement of the feed pipe B, in connection with the central cylinder or hub of the steam generator described, so that the feed water shall be discharged at the center of the descending current, as set forth and described.

8. A steam generator, composed of sections A, in the form of hollow rings, with hollow radiating arms connecting said rings with a central cylinder or hub, said sections being placed one above another, and so arranged as to fill the space within the chimney without being imbedded in the same, and with the radial arms so disposed as break joint with each other, all as set forth and described.

9. The tubular rods J J, arranged to secure the sections A to each other, and located outside of said sections, so as to increase the circulation and steam surface, as described.

79,111.—LAWRENCE F. FRAZEE, Jersey City, N. J.—*Life Boat.*—June 23, 1868.—The boat consists of two hollow metallic semi-cylinders, connected together by intermediate framework, and divided into water-tight compartments, into which the provisions are stowed. When the boat is thrown overboard either side is liable to be uppermost when she rights, and the hollow sheet-metal bow and stern are therefore so applied that after the boat reaches the water they may be drawn up by small chains and secured in the position favorable to the passage of the boat over the waves, through the surf, &c.

Claim.—1. The combination of a buoyant and adjustable bow and stern, so arranged that whichever side of the boat floats uppermost the desired form may be given to the ends thereof.

2. The adjustable bottom, so arranged that whichever side of the boat is uppermost it may be secured as low as possible, to give room to the feet and legs of the persons carried.

3. Connecting the adjustable bottom to the adjustable bow and stern in such a manner that when the latter are secured in the desired position the former is also fixed as required.

4. The provision for stowing bread and water in such a manner that whichever side of the boat comes uppermost it is all readily accessible to those on board, all for the purpose and in the manner substantially as described.

79,112.—GEORGE B. GARLINGHOUSE and CYRUS B. GARLINGHOUSE, North Madison, Ind.—*Harvester Pitman.*—June 23, 1868.—The pitman pivot enters a seat or socket in one side of the heel of the cutter bar, the opposite side of the heel having a socket to receive one end of the clamp, which, at its other end, is held to the pitman by a set screw.

Claim.—1. In the pitman connection with the cutter of a harvesting machine the single conical or conoidal pivot or point on the pitman, entering into a corresponding hole in one side of the knife heel, in combination with the clamp, or its equivalent, arranged to work on the opposite side of the heel, on a center coincident with the point of the pitman, for the purpose of affording free movement in turning on the centers, and to take up the slack caused by wear in working the machine.

2. In combination with the pitman and cutter bar

of a harvesting machine the separate, detachable holding device or clamp D, constructed as described, for the purpose of keeping the pitman in proper position with the knife heel, and to be easily removed.

79,113.—W. B. GUERNSEY, New York, N. Y.—*Box.*—June 23, 1868.—The cylindrical box is represented as composed of two counterparts, each of which has its body cemented in an annular groove in a head or end piece. One part fits within the other, the box being designed to hold butter and other produce.

Claim.—The improved box, made of veneer, with its sides fitted and cemented into perpendicular grooves in the heads thereof, as a new article of manufacture.

79,114.—WILLIAM HAGERTY, Monongahela, Pa.—*Hull of Steamboats.*—June 23, 1868.—The recess in the stem of the hull for the reception of a balanced rudder is constructed upon strictly geometrical principles, the object being to enable the timbers to be worked out in the yard and put up in a frame without the necessity of cutting them to the proper shape after being in place.

Claim.—The geometrical system or rule as illustrated in Fig. 1 of the drawings for draughting the cross timbers so as to form a segment of a conoid in the hulls of vessels, substantially as set forth and described.

79,115.—MARTIAL HAINQUE, San Francisco, Cal., assigner to himself and JOHN LOWTH, same place.—*Drill Stock.*—June 23, 1868.—The gib is a metallic block, whose concave side rests against the drill stock, while its straight side is acted upon by the lever. The lever being turned upon its fulcrum binds the gib against the drill stock, which binding prevents the further revolution of the lever around the drill stock, and causes the latter to turn with the lever as the motion thereof is continued.

Claim.—The combination of the drill stock A with the lever D, the plain or corrugated gib C, and the sleeve B, the said parts being constructed and arranged substantially as described.

79,116.—DAVID E. HALL, Detroit, Mich.—*Joint Clamp.*—June 23, 1868.—A thin plate of steel is bent as shown and has struck-up barbs. The clamp is used for staying the corner joints of boxes, picture frames, &c.

Claim.—The herein-described metallic clamp, when constructed in the manner as and for the purpose set forth.

79,117.—BERNARD HAVANAGH, New York, N. Y.—*Wash Basin Overflow and Discharge Pipe.*—June 23, 1868; antedated June 13, 1868.—The drip pan receives any leakage consequent upon the coupling of either cock becoming loose, and a pipe conveys it from the pan to a sewer. A box, constituting a stretch trap, is formed on the under side of the drip pan, said box being the chamber of communication between the hollow column supporting the basin and the sewer pipe.

Claim.—The trap *e* and pipe *f* below the drip pan *d*, in combination with the hollow column *g*, supporting the basin, and arranged to receive its discharge and overflow, as and for the purposes set forth.

79,118.—ANDREW B. HESTER, North Vernon, Ind.—*Sash Balance.*—June 23, 1868.—An improvement on the sash balance for which patent No. 44,866 was granted to same party November 1, 1864. The object, in the present case, is to have the parts of the sash-suspending cord move in parallel lines, to avoid friction.

Claim.—The sash balance, consisting of the plate A, with the pulleys 1 2 3 as arranged thereon, the pulley B, the cord K, the cap C, and the lever F, the whole constituted and arranged substantially as described.

79,119.—JUSTIN H. HILL, Clinton, Ill.—*Cultivator.*—June 23, 1868.—The inner frame is pivoted at its forward end to the forward end of the main frame, and is raised when the front end of the main frame is lifted by depressing the foot levers. The plows are thus raised clear of the ground. The

shovel handles are attached to arms upon which they swing laterally, and which are connected by a strap joint to the pivoted frame so as to have vertical play. The handles are connected together by an adjustable link or bar, whereby the relative position of the shovels may be varied.

Claim.—1. The frames A and C, and the lever F, combined and operating substantially as set forth.

2. The shovel handles G, arms H, and connecting bar I, arranged substantially as described, in combination with the frame C and its adjuncts, substantially as and for the purpose set forth.

79,120.—JUSTIN H. HILL and JOHN T. HAMMOND, Clinton, Ill.—*Corn Planter.*—June 23, 1868.—By the movement of the slide the tongue is made to close the side of the chute into which the seed is dropped, and to open the opposite side of the chute to permit the escape of seed deposited therein by the previous movement of the slide.

Claim.—The combination and arrangement of the slides H H and plates *a a*, with the tongue *h*, chute F, and plow E, as set forth.

79,121.—W. D. HILLIS, Elgin, Ill.—*Fence.*—June 23, 1868.—The picket is fixed in position by securing the flattened part of the rail in the corresponding part of the picket slot by driving a pin in the enlargement above or below it. The flattened and headed ends of the rails are passed up through a vertical slot in the plate, and the strain upon the rails draws their heads into recesses in the plate. The plate is secured to the post by a screw passing between the ends of the rails.

Claim.—1. The combination of wire rails E E', constructed as above-described, with the slotted pickets F F' and the pins *c' c'*, substantially as and for the purpose set forth.

2. The metallic plates D D, when constructed with the slots and recesses above described, and with the enlarged space *m m*, and used in combination with the screw *a* and the wire rails E E', substantially as and for the purpose specified.

79,122.—C. HOCHBRUNN, New York, N. Y.—*Flower Frame.*—June 23, 1868.—A frame representing an anchor, wreath, heart, star, or other object, is made by winding wire around moss, and strengthened by stay rods. The frame is embellished by flowers or plants.

Claim.—The frame for flower ornaments, constructed and arranged as herein shown and described.

79,123.—AMOS HOLBROOK, Jr., Lynn, Mass.—*Book Binding.*—June 23, 1868.—The different signatures are united by passing a parallel thread, within the fold of each, said thread passing from signature to signature at or near the end, and being connected at regular intervals by a single or double chain stitch. The object is to adapt the work to the operation of a book-sewing machine.

Claim.—1. Connecting two or more signatures of a book by a parallel thread passing within the fold of each signature, and through the slit in the end to the next signature, substantially as described, and for the purpose set forth.

2. Combining with the parallel thread, arranged as set forth in the first claim, a series of chain stitches, substantially as described, and for the purpose set forth.

79,124.—J. F. HOLLISTER, Plano, Ill.—*Globe Joint.*—June 23, 1868.—The pitman is attached by straps to the shanks of the globe, so that the axis of the latter is perpendicular to the line of motion of the pitman. An opening is made in the bar to receive the two-part box, whose concave surfaces are made to fadge upon the globe when the parts are put together. The fissure in the bar enables the prongs of the bar and the parts of the box to be drawn together by a screw bolt. The lips on the outer corners of the box bind the prongs of the bar and serve to secure the box in position.

Claim.—1. The mode of connecting the globe C, by means of straps on its poles, or their equivalent, substantially as set forth.

2. The concaves K K, and vibrating bar B, com-

bined with the globe C, and pitman A, the whole constructed and operating substantially as described.

3. The lips L L L L, for the purposes set forth.

4. The fissure M in bar B, for the purpose set forth.

79,125.—SAMUEL W. HUNTINGTON, Augusta, Me.—*Door Spring*.—June 23, 1868.

Claim.—A spring for closing doors, &c., consisting of a strip or cylinder of vulcanized India-rubber, and sockets, *m m*, in which the ends of the same are held, constructed and arranged as described, and applied to the edge of the door and jamb, to which the door is hinged, in the manner set forth.

79,126.—ALFRED FAUVIN JALOUREAU, Paris, France.—*Machine for Manufacturing Telegraphic Cables*.—June 23, 1868.

Claim.—1. The improved method of forming telegraphic cables by the application of successive layers of bitumen, separated and maintained by spiral bands of bituminized paper, and consolidated by coils of bituminized twine or yarn, the whole protected, when necessary, by an outer covering of metallic wire, substantially as above specified.

2. The improved combination of machinery, by aid of which the manufacture of the said cable may be effected with facility, certainty, and economy, substantially as herein set forth, and shown in the figures of the accompanying drawings.

79,127.—H. C. JOHNSON, Delavan, Wis., assignor to himself and C. H. JOHNSON, same place.—*Stove Pipe Shelf*.—June 23, 1868.—Articles placed on the shelf are kept warm by the heat of the stove-pipe.

Claim.—1. A stove-pipe shelf, when made in pieces B and B', with leaves C and C', secured to a stovepipe, substantially as described.

2. Loops D and E, in combination with hooks F, to secure leaves C and C' to the center shelf B and B', constructed as described, one loop being wide, and the other narrow, on each piece B, to provide for the parts B and B' being adjusted.

3. Forming hooks F straight on top, and with the semicircle projection on the bottom, as described, for the purpose of easing down the leaf and holding it in place.

79,128.—WILLIAM H. JONES, Boston, Mass.—*Quarter Boot for Horses*.—June 23, 1868.—A device to prevent injury of the fore foot of a horse from overreaching. The back rest supports the boot on the top of the heel, and the internal projection fits into the hollow of the heel to prevent the boot from turning or rising on the hoof. The boot is grooved to receive the fastening strap, whose outer surface is consequently flush with that of the boot. The groove holds the strap in place and prevents it from being torn off by the rear foot. The canvass prevents the quarters from being torn by the strap rivets.

Claim.—1. The quarter boot, as made with one or more grooves, arranged as described, in its outer surface, and especially about its heel, such being to receive the fastening strap or straps, as set forth.

2. The arrangement of the fastening strap within a groove going around the heel and through either or both the sides or quarters of the boot, in manner substantially as specified.

3. The boot, as made with a heel projection, *a*, and the back rest *k*, arranged as specified.

4. The arrangement of the canvass quarter facings with the shoe and the strap rivets, in manner as described.

79,129.—GILMAN JOSLIN, Boston, Mass.—*Elevator*.—June 23, 1868.—A series of carriages are hung upon two endless chains running upon separate sprocket wheels, between which the carriages pass. The guide near the top of the elevator assists in maintaining the vertical position of the carriage in passing between the upper sprocket wheels. The bottom bevel of the carriage acts in conjunction with the partition to guide the carriage into the descending well room. The trap door opens upward

if any part of the person of the passenger comes in contact with it. The guides which inclose the chain prevent it from falling in the event of breaking.

Claim.—1. The arrangement of the upper sprocket wheels and independent journals, leaving the space between the two wheels open for the passage of the carriages, substantially as described, and for the purpose set forth.

2. The guide S, operating in combination with the carriage, substantially as described, and for the purpose set forth.

3. Beveling the bottom of a chain-elevator carriage and arranging the top of the partition V, substantially as described, and for the purpose set forth.

4. The narrow trap door X, arranged and working substantially as described, and for the purpose set forth.

5. The endless chain or band inclosed within guides, substantially as described, and for the purpose set forth.

79,130.—HENRY KECK, Canaan, Ohio.—*Grain and Hay Elevator*.—June 23, 1868.—The two windlasses are employed to raise the platform with the hay or grain thereon. The load being elevated to the desired height, the ropes proceeding from the windlasses are passed under the double pulley and then tied to a hook. The rake is then operated by a crank, to clear the platform.

Claim.—The combination and arrangement of the windlasses B B, platform C, pulley and crank *c*, block and tackle E E, rake F, and double pulley *g*, when used in a barn, substantially in the manner and for the purpose as herein shown and set forth.

79,131.—JONAS KENDALL, South Framingham, and ADDISON HATHAWAY, Lenox, assignors to ANDREW T. SERVEN, Lenox, Mass.—*Machine for Grinding Glass Plates, &c.*—June 23, 1868.—The plate to be ground is held upon the reciprocating table under the rotary grinders, whose supporting frame is capable of vertical movement in guideways, an automatic downward movement being imparted to the grinders at the end of each movement of the carriage by the action of gearing upon the screws on which said frame is hung.

Claim.—1. In combination with the series of disks or grinders, rotating around a common axis and over a reciprocating table, giving to each disk or grinder a positive rotary motion on its own axis, substantially as described.

2. In combination with the rotary grinding disks, the mechanism for automatically effecting their downward movement as the grinding progresses, substantially as described.

79,132.—JONAS KENDALL, South Framingham, and ADDISON HATHAWAY, Lenox, assignors to ANDREW T. SERVEN, Lenox, Mass.—*Machine for Polishing Glass*.—June 23, 1868.—The plate to be polished is held upon a horizontal table, having a longitudinal reciprocating movement under a laterally traversing or reciprocating carriage, upon which is mounted a series of vertical rotary shafts, at the lower end of which is a polishing tool, fixed to and rotated by the shaft, the several polishers being pressed down to the surface of the glass by springs. Each polishing disk is connected to its shaft by a universal joint, permitting the polishing surface to rock freely in accordance with the unevenness or irregularity of the surface of the plate.

Claim.—1. The combination of the horizontally reciprocating table *c*, the laterally reciprocating carriage *l*, the rotary shafts *m*, and the polishers *n*, when arranged to operate substantially as described.

2. Giving to each polisher a capability of upward yielding movement by means of a spring, *z*, substantially as set forth.

3. Giving to each polisher a capability of rocking movement, substantially as described.

79,133.—ALEXANDER KIRKPATRICK, Newark, N. J.—*Implement for Shielding Plants from a Hoe*.—June 23, 1868.—The lower edge of the shield may be serrated for crusty earth, and plain for sandy ground. The handles project below the shield, steady-

ing and supporting the same when forced into the ground alongside of the row of plants.

Claim.—The shield, single or double, for protecting plants from injury by the hoe, constructed in the manner and for the purposes specified.

79,134.—ROBERT H. LECKY, Allegheny City, Pa.—*Lathe Dog.*—June 23, 1868; antedated June 6, 1868.—The object is to adapt the lathe dog to the different diameters of the various articles to be held in a fixed position in the turning lathe. The groove which receives the point of the serew gradually increases in depth, forming an incline, which causes the screw to increase its hold on the cam when any back movement of the latter occurs.

Claim.—The body A, cam B, thumb-screw f, and groove x, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

79,135.—ABRAHAM W. LOZIER, New York, N. Y.—*Hay Loader.*—June 23, 1868.—The "clevises" are bolted to the felloes, and are cast with projections which enable the wheel to obtain purchase on the ground, and they are also provided with the pins which adapt the wheel to act as a drum in raising the load as the wagon moves forward. The end of the hoisting rope is attached to one of the clevis pins by a hook, which is jerked from the pin when the ascent of the load is to be arrested, at which time the elevated position of the load is maintained by a spring catch operated by a rope.

Claim.—1. The detachable pin clevises k k, &c., in combination with the wheel B, constructed, arranged, and operating substantially as and for the purposes described.

2. The combination and arrangement of the clevises, the derriek, and the elevating forks, the whole constructed and operating as described, and for the purposes set forth.

79,136.—JOHN W. LYDER and HENRY SHREVE, Alliance, Ohio.—*Mode of Splicing Belting.*—June 23, 1868.—The ends of the belt are clamped between two plates; screws pass through the ends of the inner plate, thence through the belt, and thence into ridges on the outer plate. Prongs between the screws also project from the inner plate through the belt, and into the outer ridges.

Claim.—The four-lipped metallic belt fastener A, provided with the ridge c on its upper or outer side, and with or without the hinge C, arranged and operating substantially as and for the purposes herein set forth.

79,137.—C. K. MARSHALL, New Orleans, La.—*Metallic Horse Collar.*—June 13, 1868; antedated June 6, 1868.—The metallic plates are of a shape suited to the neck and shoulders of the animal, and they may be cast or formed of sheet metal, and united by riveting, brazing, soldering, or otherwise. The collar is tubular, and internal brace pieces are introduced at different points. The rein eyes and trace clips are attached directly to the collar, in order to dispense with hames.

Claim.—1. A metallic horse collar, constructed substantially as described and for the purpose specified.

2. Bracing the metallic plates of which the horse collar is formed, substantially as described, and for the purpose specified.

3. The combination of the plates A A, "rein eyes" c c, and trace clips d d, when the same are constructed and arranged substantially as described.

79,138.—JOHN E. MARSHALL and JACOB W. SCHROEDER, Baltimore, Md.—*Hoisting Apparatus.*—June 23, 1868.—A horse turns the sweep on the shaft of the master gear-wheel, and the movable clutches are alternately locked upon the drum or spool shaft to cause it to reverse its motion, the buckets attached to the two ropes being in motion simultaneously—one ascending while the other is descending.

Claim.—1. The revolving cranes E E, in connection with the rope a and spool C, arranged and operating substantially as and for the purposes above set forth.

2. The combination of the beveled gear e, beveled pinions c c, clutches g g and b b, spool C, with brake h revolving on the shaft d, and the rope a, revolving cranes E E, braces F F, and buckets G G, arranged and operating substantially as and for the purposes above set forth.

79,139.—JAMES E. MCBETH, New Orleans, La.—*Pocket Knife.*—June 23, 1868.—One of the flanges being inserted under the nail, prevents the cutting of the flesh or quick in paring. The concave adapts the blade to the shape of the end of the finger.

Claim.—The blade B, with the upper part a only sharpened, flanges C and concave c, arranged and operating substantially as and for the purposes herein set forth.

79,140.—JOSIAH MCFARLAND, Clinton, Ill.—*Fire Kindler.*—June 23, 1868.—The bowl is filled with sawdust, plaster, or other porous material, which is saturated with benzine or petroleum, poured through the burner. The kindler is lighted by applying a match to the burner.

Claim.—The within-described fire kindler or torch, having a hollow bowl, A, filled with porous material, and a perforated burner, B, as set forth.

79,141.—WILLIAM MCFARLIN, Jackson, Ill.—*Fence for Crossing Streams.*—June 23, 1868.—The fence is hinged to the foundation post, and held upright by a breakable pin above the pivot. The force of the water or drifting matter breaks the pin, and prostrates the fence, but the pivotal attachments hold the fence to its moorings.

Claim.—The construction and arrangement of the devices described, substantially as and for the purposes set forth.

79,142.—CHARLES E. MILLER, Indianapolis, Ind.—*Wash Boiler.*—June 23, 1868.—The pits enter the boiler openings of a stove, and the directing plates cause the heated water to ascend in the conduits at the sides of the boiler, from which conduits the water is discharged upon the clothes through the adjustable spouts. A vacuum is induced below the perforated bottom, and the heated water consequently forced downward through the clothes by atmospheric pressure.

Claim.—A portable wash boiler, having the elevated and perforated bottom B, from which depend pits C, having the oblique and perforated directing plates D, in combination with pipe E and adjustable spout or spouts F, substantially as set forth.

79,143.—GEORGE F. NUTTING, Randolph, Vt.—*Pump.*—June 23, 1868.—The lower end of the barrel is immersed in a bucket or cistern, and the suction pipe conducts water from a well. The piston is attached to a cage which straddles the barrel, and is suspended from the operating lever.

Claim.—The combination of the open-bottomed barrel A, plunger B, upper removable part, containing the valve chamber H, eduction pipe G suction pipe I, and valve d, all arranged in the manner and for the purpose herein described and represented.

79,144.—CHARLES T. PALMER, Norwich, Conn.—*Spice Can.*—June 23, 1868.—In preparing the cans for transportation, the perforations in the cover are closed by a disk of tin, over which a strip of paper is secured to hold the disk in place.

Claim.—A spice can or powder box, as not only made with holes or perforations a a a in its cover, but as having a cavity, b, and an annular bead, c, arranged therewith, and with the periphery d d of the top of the cover, substantially in manner as explained, and for the purpose of receiving a disk or plate to cover the perforations, the whole being substantially as specified.

79,145.—A. E. ROBERTS, Des Moines, Iowa.—*School Seat and Desk.*—June 23, 1868.—The lid has a slate surface on top, and a portfolio underneath, and is slidden down in grooves in the inside of the frame when not in use. Behind the grooves on the frame are pins entering grooves in slats fastened to the desk lid, which is steadied thereby. The notched ends of the slats and flange on the top strip serve to

make a close joint between said strip and the lid, and aid in supporting the latter when in use. The seat is for two scholars, and has a box for books standing upright between them.

Claim.—The arrangement of the slate-surfaced folding lid E, with its notched and grooved slats I, in combination with the grooved frame P, its flanges *n*, stationary seat A, and book-holding partition B, the several parts being constructed and used substantially as and for the purposes set forth.

79,146.—ALBERT H. RUSSELL, Adrian, Mich.—*Stock Pump.*—June 23, 1868.—The animal seeking water steps upon the pivoted platform, at either side, and by depressing the same raises the pump rod, together with the bottom board of the bellows. Water is thus forced into the tub from which animals drink. The flow continues until the bellows is depleted or the animal steps off the platform; in the latter case, the platform being raised by the weight, and the bottom board sinking so as to again fill the bellows.

Claim.—A stock pump, in which are combined and arranged the rod U, running through the bore of the pump-log A, the hydrostatic bellows Z, and the pivoted platforms C, B, and D, substantially as described.

79,147.—JOHN J. RYMAL, Rochester, Minn.—*Automatic Swing.*—June 23, 1868.—A child's swing to be supported on the floor, screwed to the ceiling, or hung upon wall brackets. The connection between the driving clock mechanism and the rock shaft which vibrates the swing is adjustable in order to vary the sweep or degree of oscillation.

Claim.—1. The projecting flanges C C on top of case A, whereby it can be attached to the ceiling, substantially as and for the purposes herein set forth.

2. The angle and curve E in the bottom of case A, forming bearings, to hang it on brackets attached to a wall, substantially as and for the purposes herein set forth.

3. The adjustable legs D, to set it up or take it down at will, substantially as and for the purposes herein set forth.

4. The adjustable connecting rod I, attached to shaft G by means of hook J, and which can be lifted off and on at pleasure, substantially as and for the purposes herein set forth.

5. The movable arm *d* on the bottom on lever F, fastened by means of the thumb screw *e*, substantially as and for the purposes herein set forth.

6. The combination of lever F, arranged on the side of case A and cam wheel B, producing a noiseless vibrating motion, substantially as and for the purposes herein set forth.

79,148.—LUCRETIA E. SALLEE, Peoria, Ill.—*Leather-Work Ornaments.*—June 23, 1868.—Leather, gutta percha, or analogous flexible material is pressed in molds so as to receive the form of doll heads, carved work, flowers, &c. The material thus molded is supplied with a coating of dissolved isinglass and shellac, thickened with pulverized sand, which upon hardening gives a fixed or rigid character to the form of the object.

Claim.—The combination of the cement with the leather, untanned hide, gutta percha, and other flexible material, when formed substantially in the manner and for the purposes as herein described.

79,149.—AMBROSE H. SASSAMAN, Lebanon, Pa.—*Car Brake.*—June 23, 1868.—A brake designed to check the speed of cars when in descending grades they crowd toward the locomotive. The conductor pulls the bell rope, and withdraws the lock from its shoulder on a bumper-bar, which is then forced forward while an adjacent bumper is forced rearward, the combined action of the two, in conjunction with the levers, arms, chains, and pulleys, serving to force the wedges against the brakes and the brakes against the car wheels.

Claim.—A brake for railway cars, having lock F, wedges V, arms G and H, levers K K and L L, chains D E, *h h*, *o o*, and Y, and rods P, M, and O, constructed, combined, and arranged, substantially as specified.

79,150.—ANDREW H. SCHOLFIELD and DE WITT C. STERRY, Worcester, Mass.—*Pump.*—June 23,

1868.—Upon disengaging a pawl from a ratchet wheel, the weight of the lower tube devolves upon the diaphragm, causing the water to pass upward through the pipe. The diaphragm is restored to its normal position by turning the ratchet wheel.

Claim.—The diaphragm pump, having a hollow rod with telescopic connections, and operating substantially as described.

79,151.—PETER SEEBALD, New York, N. Y.—*Compound for Destroying Bed Bugs and other Vermin.*—June 23, 1868.—A compound of water, potash, lime, lard, and mercury.

Claim.—1. In preventive for bed bugs, a compound, which is used as a whitewash for walls, substantially as and for the purpose herein set forth.

2. The compound, composed of the ingredients herein described, or substantially the same, and for the purpose herein shown.

79,152.—LORENZO SIBERT, Mt. Solon, Va.—*Manufacture of Iron and Steel.*—June 23, 1868.—A compound of manganese and common salt is employed in connection with the usual lime flux. Epsom salts are stirred into the molten metal in the crucible. They are employed as a purifying agent. As a means of securing uniformity in the metal produced, the blast is increased or diminished without changing the binder of the furnace.

Claim.—1. The use of manganese, in combination with common salt, substantially in the manner and for the purposes herein set forth.

2. The use of Epsom salts in the treatment of iron in the furnace, for the purpose of purifying the iron.

3. The method of treatment herein described for reducing and purifying the ores and the metal, and for securing uniformity in the quantity of the metal produced.

79,153.—WILLIAM SMEAD, Rochester, N. Y.—*Universal Joint Coupling.*—June 23, 1868.—The pivoting points enter recesses cast in the clamping iron, which is made in two parts, held together by a bolt.

Claim.—The pivoting points C, cast on the jaws of an ordinary universal-joint coupling, in combination with the clamping iron B, constructed substantially as herein described, and for the purposes set forth.

79,154.—GREENVILLE CARTER STAMPER, Pella, Iowa.—*Animal and Bird Trap.*—June 23, 1868.—The animal being pushed into the trap by the revolving wheel is dumped through a trap door into a box and drowned. A modification renders the trap suitable for catching birds. A weighted, graduated lever adapts the trigger to heavy and light game. The pull upon the bait aids to spring the trap if the weight of the animal be insufficient.

Claim.—1. The combination and arrangement of the fixed part A, and removable half A', of the case or shell of the trap, with the wheel B and platform C, as and for the purposes set forth.

2. The box E, when constructed with foraminous top, trap-door bottom, and trap guard *f'*, and used in connection with the chamber D, in which the animal is caught, and the box G, in which he is drowned, in the manner and for the purposes set forth.

3. The employment of the underground box G, in connection with the bottomless chamber D, and for the purposes set forth.

4. The combination of the platform C and bait hook *c'*, with the lever N and beam O, as and for the purpose set forth.

5. The combination of the platform C and weighted lever M, substantially as and for the purpose set forth.

79,155.—G. CARTER STAMPER, Pella, Iowa.—*Wagon.*—June 23, 1868.—The force of the springs may be made to rotate the wheels, in order to afford assistance to the team when upon a grade. Provision is made for strengthening the axles, and reducing friction upon the parts of the running gear.

Claim.—1. The springs B, when attached directly to, and arranged to act directly upon, the wheels of a wagon or other carriage, substantially as and for the purposes specified and set forth.

2. The anti-friction rollers *s s'*, when arranged

upon the connecting-rods O O, substantially as and to operate as described.

3. The spring brace *m*, as combined with the rear axle and the spring braces *n* and *n'*, for the front, substantially in the manner illustrated, and for the purposes set forth.

79,156.—ANDREW STUMP, Bodega, Cal., assignor to himself and CHARLES COLBY.—*Churn.*—June 23, 1868; antedated June 6, 1868.—The box revolves upon spindles at either end, and a shaft, arranged axially, carries the beating arms, and is turned in a direction opposite that of the motion of the box, but held by the clasp against independent motion when the butter is formed, the box being then revolved so as to mass the particles.

Claim.—In combination with the revolving box A, the interior revolving shaft F and arms *c c*, together with the clasp H and pin I, the whole constructed and operating substantially as and for the purpose herein described.

79,157.—JOHN M. STURGEON, New York, N. Y.—*Postage Stamp.*—June 23, 1868; antedated June 10, 1868.—The stamp is attached to the paper by a mucilage composed of glue, saccharine matter, and acetic acid. The colorless ink is composed of tannic acid, sulphate of iron, gallic acid, starch, and balsam Riga. The colored vegetable printing ink is adapted for printing stamps to which the colorless ink is applied, and consists of scarlet, crimson, or other lake, sap green, indigo, or other coloring-matter, flour, starch, and balsam copaiba.

Claim.—1. Attaching stamps to papers or other surfaces by means of an insoluble mucilage or cement, prepared substantially as herein described, for the purpose set forth.

2. Printing upon the face or back of the stamp with the colorless and invisible ink above described, or its equivalent, any canceling mark or device, which will become visible on being dampened by water or steam, as and for the purpose set forth.

3. As an article of manufacture, the insoluble mucilage or cement above described.

4. As an article of manufacture, a stamp coated with the insoluble mucilage or cement above described.

5. As an article of manufacture, a stamp having a canceling device printed upon its face or back in the above-described colorless ink, or its equivalent, as and for the purpose described.

6. As a new manufacture, the colored vegetable printing ink, prepared substantially as described.

79,158.—PETER SWEENEY and JOHN BRADBURN, New York, N. Y.—*Platform for Rock Drills.*—June 23, 1868.—The platform is adjusted to a level position by means of its screw-threaded supporting legs. The lower ends of the tubular guides are brought to bear upon the surface to be acted upon, and enable the drills which work through them to accurately strike the points to which they are directed.

Claim.—In a drill stand, rendered adjustable by means substantially as shown, the adjustable guides C C, constructed and operating substantially as and for the purpose set forth.

79,159.—JEROME B. SWEETLAND, Pontiac, Mich.—*Hook.*—June 23, 1868.—A chamber in one hook admits the other hook at the point where the two are pivoted together. The instrument may be used as a rafter hook or as an ice hook, under an obvious mode of adaptation.

Claim.—1. The hooks A A, when cast with a chamber and with pins, *a* and *b b*, substantially as and for the purposes herein set forth.

2. The triangular plate B, provided with hook D and slots *c c* and *d*, substantially as and for the purposes herein set forth.

3. The combination of the hooks A A, triangular slotted plate B, ring C, and hook D, constructed and operating substantially as and for the purposes herein set forth.

79,160.—DERK A. TER HOEVEN, Philadelphia Pa.—*Manufacture of Fertilizers.*—June 23, 1868.—The horns and hoofs are placed in a chamber and steamed; they are then transferred to the floor of a

drying kiln, and upon reaching a brittle state are placed in a grinding pan and reduced to a powder.

Claim.—The process of making horn dust as a fertilizer, by the combination of steaming, drying, and crushing, as a whole operation, in the manner substantially as described.

79,161.—ELBERT TERRIL, Cold Water, Mich.—*Cultivator.*—June 23, 1868.—The handles, by which the implement is guided, serve as shanks for the outer cultivator blades, which are held in their normal working position by the lateral pressure of the springs upon the handles, which may be vibrated laterally in order to guide the outer blades without moving the beam or inner cultivator blades.

Claim.—1. The arrangement, herein described, for connecting the handles C C and cultivator blades F F with the beam A and stationary cultivator points E E, so that the whole may be operated substantially as and for the purposes herein set forth.

2. The round pieces D D, with their shoulders *c c* and springs *f f*, in combination with the handles C C, for controlling the action of the outside cultivators, as herein specified.

79,162.—LANCASTER THOMAS, Philadelphia, Pa.—*Bottle Mold.*—June 23, 1868.—The mold has an opening into which is inserted a plug whose inner face conforms to the interior of the mold and bears the design or stamp. It is connected to the mold by a hinge. Different designs or stamps can thus be used without necessitating the construction of new molds.

Claim.—The application of a plug or die of any device to bottle molds, when the same is arranged in the manner and for the purpose above set forth and described.

79,163.—SAMUEL C. THORNTON, Moorestown, N. J.—*Railway Signal.*—June 23, 1868.—The racks are respectively provided with projecting arms, against which a yielding bumper on the cow-catcher strikes, an appropriate interval occurring between the times at which the respective arms are acted upon. The effect is to move the racks in opposite directions so as to lower the signal curtain, and then reverse the motion of the racks in order to raise the curtain.

Claim.—1. Frame, composed of C P, P, and P', roller C R, and curtain C, bevel-gear wheels B V, B V', arm A, shaft S, arm A', bevel-gear wheels B V'' and B V''', arm A'', shaft S', pinion P N, arm A''' racks R and R', all constructed, arranged, and operating in the manner as above set forth and described.

2. Racks R and R', with their arms D and D', said racks arranged with or without bearings, and operating in the manner and for the purpose above set forth.

3. Bumper H, with its toggle joint and spring S P, arranged and operating on arms D and D', in the manner as above set forth and described.

4. A railway signal, composed of the above-described parts, all combined, constructed, and operating in the manner as above set forth and shown.

79,164.—H. M. VIETS, Carlisle, Ohio.—*Making Cheese Hoops.*—June 23, 1868.—A piece of cloth large enough to cover the bottom and periphery of the cheese is placed upon and snugly adjusted within a hoop, the edges of the cloth lapping over the outside of the hoop. Another hoop is then forced over the first, binding the cloth thereto. The curd is put in the hoop and on the cloth and pressed, after which the cheese is removed, the edge of the cloth folded down upon the upper side thereof, and the naked face of the cheese covered by a disk of cloth.

Claim.—The hoop C, in combination with the hoop A B, in the manner as and for the purpose specified.

79,165.—SMITH D. WACKMAN, Auburn, N. Y.—*Axle for Vehicles.*—June 23, 1868.—The ends of the plate forming the trough-like axle are bent in the form of tubes to constitute the journals. The latter are shown as having oil ducts.

Claim.—1. A trough-shaped axle for vehicles, substantially as set forth.

2. The combination, substantially as set forth, with a trough-shaped axle, of tubular bearings.

79,166.—R. WARRINER and J. H. BAKER, Saratoga Springs, N. Y.—*Corn Husker, Straw and Stalk Cutter*.—June 23, 1868.—The rollers strip the husks from the ear after it has been broken from the stalk, the wool brushes serving to keep them clean and prevent their clogging with the silk or husks of the corn. The rotary brushes operate to turn and agitate the ear when it is passed down upon said rollers.

Claim.—1. The arrangement of the brushes E E upon the sides of the leather-covered rollers D D, in the manner and operating as and for the purposes set forth.

2. The brushes T T in the plate *m*, on the under side of the lid S, to operate upon and with the rollers D D, as specified.

79,167.—GARDNER WATERS, Cincinnati, Ohio.—*Lubricator*.—June 23, 1868; antedated March 31, 1868.—The metallic socket protects and strengthens the reservoir at the opening therein, and connects the same with the conducting tube.

Claim.—An automatic lubricator, the glass bulb of which is provided with a soft metal socket or guard, cast not only around but also within the lower portion of said bulb or reservoir, so that the metal shall form a button against the enlarged or bulging part of the reservoir, substantially as and for the purposes herein set forth.

79,168.—SETH WHEELER, Albany, N. Y.—*Shaft Coupling*.—June 23, 1868.—Shafts which deviate from a right line and which are required to rotate, are coupled by means of a spherical enlargement fitted into a socket and connected thereto by a rolling driving pin, so applied as to allow the shaft's free articulation.

Claim.—1. A ball-and-socket, or other analogous closed coupling, having an anti-friction pin, stud, or roller applied to it, substantially as and for the purpose described.

2. Constructing the socket C with recesses in or through it, adapted for receiving a pin, *a*, which is applied to an enlargement, D, of a spherical or other shape, substantially as described.

3. Fitting the driving pin *a* into a flaring hole *b*, made through an enlargement, which works in a socket, C, and covered by means of caps *c c*, or their equivalents, substantially as and for the purpose described.

4. An articulating coupling, with a pin, stud, or roller, which is free to roll on its impinging surfaces, and also to vibrate, substantially as described.

5. The combination of the flaring or oblong pin-hole or slot in the ball of the coupling with the oblong slots of the socket, substantially as described.

79,169.—WILLIAM O. WHEELER, Deposit, N. Y.—*Street Lamp*.—June 23, 1868.—A lighting torch is admitted to the lantern through an opening, to uncover which the torch is pressed against a lug to move a valve having pivotal attachment to the burner and being connected to a sleeve upon the burner, which sleeve, upon being turned with the valve, opens the gas vent of the burner. An additional valve is provided for closing the lantern opening when the gas is lighted.

Claim.—1. A tube of a street lamp, of the described construction, when provided with a diaphragm and openings, and having communication effected or cut off by means of an inclosing sleeve, all as described, and for the purpose set forth.

2. In combination with the above devices, the valves, constructed and operated as described, and for the purpose set forth.

3. A street lamp, so constructed that the gas may be turned on or off by moving the valve which closes the orifices of the lamp, substantially for the purpose set forth.

79,170.—WILLIAM N. WHITELEY, Springfield, Ohio.—*Harvester Rake*.—June 23, 1868.—The rake is of the kind which have independent arms jointed to a revolving shaft head, and guided by a cam-way having a switch so arranged that when said switch is not opened the rake or reel arms pass above the platform at such distance that the cut grain is not removed therefrom. The guide frame has an opening which obviates the accumulation of clogging matter

and the consequent impeding of the switch in its operation.

Claim.—A guide frame B, constructed with an orifice, H, over which the switch D, or its equivalent, must move in opening and closing, substantially as and for the purpose set forth.

79,171.—WILLIAM N. WHITELEY and THOMAS HARDING, Springfield, Ohio.—*Harvester Driving Wheel*.—June 23, 1868.—The spindle of the driving gear wheel is adjustable upon a center, eccentric to said spindle, so that by turning the spindle upon said center the axis of the spindle may be changed in position, and the mesh of the gear wheel with its pinion adjusted accordingly.

Claim.—The eccentric hollow axle C, provided with the stud I, or its equivalent, and the notched flange E, in connection with a pin, H, socketed coupling arm F, and bolt D, substantially as and for the purpose set forth.

79,172.—ROBERT WILDE, Philadelphia, Pa.—*Steam Generator*.—June 23, 1868.—The longitudinal partition plates of the boiler are perforated to afford steam and water communication between the several divisions. The transverse partition plates prevent surging of the contained water. The lower boiler is fed by overflows from the upper boiler. The float shifts a band from a fast to a loose pulley to turn the feeding cylinder.

Claim.—1. In a steam boiler or generator, the perforated dividing partition plates *a''* or *b''*, substantially as and for the purpose described.

2. In combination with a steam boiler or generator, the vertical transverse partition plates *a'''* or *b'''*, the same being constructed and arranged substantially as and for the purpose described.

3. The vertical overflow pipes G G, constructed and arranged substantially as and for the purpose described.

4. In combination with two or more steam boilers or generators A and B, arranged with one directly above another, and connected together by means of the open vertical overflow pipes G G, as described, the employment of the float I in the lower boiler, and the feeding cylinder C, with its case D, on the upper boiler, the same being connected together by the lever K, pulleys H H', and any suitable moving "band," and the whole being arranged to operate together, substantially as and for the purpose described.

79,173.—HENDERSON WILLARD, Grand Rapids, Mich.—*Horse Hay Fork*.—June 23, 1868.—The lower cross bar being movable is forced down as the screw is turned, and forms a binder at the top of the hay. By pulling upon the trip lever when the hay is raised to the desired point, the handle is released and the screw turned by the weight of the hay, which is thereby detached from the fork.

Claim.—The arrangement of the horizontal bars A and C, and tines B B, with the worm screw D, levers *g* and *h*, and cords *f* and *j*, when used as and for the purpose herein fully set forth.

79,174.—TORWALD WINTER, Boston, Mass.—*Recumbent Chair*.—June 23, 1868.—The parts of the chair move with the person so that the whole length of the body is supported, whether leaning back or lying in a nearly horizontal position. The chair is likewise adapted for an erect posture.

Claim.—1. The combination of the stationary base and seat frame *a*, tipping back *b*, jointed arms *c*, levers *d*, leg rest *i*, spring rack bar *n*, and its foot piece *g*, when all are arranged to operate together, substantially as shown and described.

2. In combination with the above, the foot piece *k*, arranged to swing down against or up from the arms *l*, substantially as shown and described.

79,175.—W. S. WINTERBOTTOM, Philadelphia, Pa.—*Combined Square and Miter*.—June 23, 1868.—The angular extension, in connection with the square stock, forms a suitable instrument wherewith to mark miter lines.

Claim.—The angular continuation *b*, of the blade of a square, beyond the rear edge of the stock, for the purpose specified.

79,176.—SANFORD ADAMS, Boston, Mass.—*Machine for Making Wire Screens, &c.*—June 23, 1868.—The jaws hold the screen while being laced. The lacing wire is coiled about the transverse wires to fasten the longitudinal wires thereto at the points of intersection. The jaws, when brought together, force the longitudinal wires into notches on the guides, in order to hold the wires in place while being laced and rolled. The lacing wire, after being applied, is bent down between the longitudinal wires by the crimper, whose teeth depress the coils, while the spurs pass between the wires to guide the teeth.

Claim.—1. The revolving crimper G, provided with teeth *n n n*, either with or without spurs *x x*, when arranged and operated substantially as described, and for the purpose set forth.

2. The jaws B and C, when arranged to hold the parallel wires into the guides F F', substantially as described and set forth.

3. Connecting the guides F F' together by the connecting pieces I I, to keep them in position substantially as and for the purpose set forth.

79,177.—WILLIAM ADAMSON, Philadelphia, Pa.—*Manufacture of Leather.*—June 23, 1868.—The hides are treated with dilute phosphoric acid for the purpose of "abating" them, or rendering them soft and porous after they have been depilated and fleshed.

Claim.—The treatment of hides or skins with the material and in the manner described for the purpose specified.

79,178.—WILLIAM ADAMSON, Philadelphia, Pa.—*Preparation of Glue Stock.*—June 23, 1868.—This invention consists in treating raw hide clippings, for the purpose of producing glue therefrom, with the dilute phosphoric acid which remains after the treatment of bones and horn pith in the manufacture of glue from the last mentioned materials.

Claim.—The treatment of raw hide with the material and in the manner substantially as described, for the purpose specified.

79,179.—J. K. ALWOOD, Delta, Ohio.—*Machine for Shearing Sheep.*—June 23, 1868.—The movable member of the shears is operated by the rotating wheel within the shear case, said wheel being driven by a cord from a pendent cone pulley mounted upon bars suspended from a universal swivel joint, through the thimble of which works the cord, whereby motion is communicated from an elevated driving wheel to the suspended pulley, so that the shears, while being operated, may be moved forward or backward or vibrated in any desired plane. The upper driving wheel is operated by a treadle.

Claim.—1. The combination and arrangement of the pendant wheel F with the tension rods H, bars G, hook bars N, spring *d*, screw *p*, and cylindrical boxes, substantially as described for the purpose specified.

2. The slotted vibrating arm W in the shear case S, when operated by the cord *g g'* and wheel Y, as herein described for the purpose specified.

3. The universal swivel joint E, constructed as described, of the hinged joint ring *a*, spiral spring *d*, encircling the central tube, the bar *n*, and slide swivel *c*, as herein set forth.

4. The construction of the swivel holders or guides D, as herein described for the purpose specified.

5. The combination of the universal thimble joints E, tension rods H, bars G, pulleys B F, and shear case S, substantially as described, for the purpose specified.

6. The portable sheep-shearing device, operated by means of the treadle *t*, pivoted to the rod I of the driving mechanism as herein described, for the purpose specified.

79,180.—R. B. ANDERSON, Oneida, Ill.—*Securing Buckles and Rings to Harness.*—June 23, 1868.—The end of the strap is passed through the ring or buckle and reflexed. The tapering box is then slipped over the strap, thus doubled, and pressed toward the ring or buckle till it fits tightly; screws or rivets are then passed through the box and strap to hold the parts together.

Claim.—Securing buckles or rings to leather straps

by means of a tapering metallic box, B, secured by screws *d d*, whereby the end of strap is inclosed, as specified.

79,181.—FREDERICK T. ANDREWS, Charlottesville, Va.—*Instrument for Testing Shoe Soles.*—June 23, 1868.—An instrument for detecting paper filling in shoes; the same consisting of a stock having a screw and cutter at one end, whereby a hole may be cut in the inner sole and the core removed. The core is returned to its place, it being secured by paste and smoothed down by a hammer.

Claim.—The instrument for testing boots and shoes, constructed substantially as herein shown and described, as a new article of manufacture.

79,182.—E. H. ASHCROFT, Lynn, Mass.—*Steam Safety Valve.*—June 23, 1868.—The auxiliary valve closes the lower valve seat and prevents the escape of steam in the event of the breaking of the spring of the primary valve. The diaphragm overcomes the tendency of the valve to draw or lift a quantity of water when suddenly opened. Water of condensation collects in the lower groove of the main valve and serves as a packing. The ledge upon the valve forms an inclosure within which steam accumulates until it acquires power to raise the valve. The ledge of the valve seat prevents undue lateral spreading of the escaping steam.

Claim.—1. The combination of the diaphragm *c*, valve *e*, valve *g*, stem *d*, with the base *b*, and spring *i*, substantially as herein set forth.

2. The construction of the valves *g* and *e*, and the arrangement of the recesses *n* and *m*, ledges *k* and *l*, valve *e*, opening *f*, spring *i*, and diaphragm *c*, substantially as herein set forth.

79,183.—ROBERT ATKIN, Brooklyn, N. Y.—*Propeller.*—June 23, 1868.—Screw propellers are applied to the sides of a sailing vessel, and raised and lowered from the bulwarks by a lifting chain and windlass. The frames of the propellers are held by supporting chains from the bulwarks, the lifting chains being hung from the davits. The propellers are driven by endless chains passing through the sides of the vessel and worked by steam power.

Claim.—The application of the helical propellers B B to the sides of a vessel, by means of a hinged frame C C, in combination with a suitable mechanism for actuating said propellers, the latter having no connection with the vessel below the water line, and the entire apparatus being made capable of being elevated and turned up against the side of the vessel, and out of water when not required for use, substantially as and for the purpose specified.

79,184.—JOHN G. BAKER, Philadelphia, Pa., assignor to HENRY DISSTON, same place.—*Swage for Circular Saws.*—June 23, 1868.—The forked foot of the adjustable bar rests upon the edge of the central washer or collar of the circular saw. The tooth is set by giving the swage several blows with a hammer. The swage is hung loosely to the bar, and its independent movement is limited by a pin entering a hole in the bar. The plate resting against the face of the saw blade prevents lateral twisting of the bar.

Claim.—1. A bar, A, adapted at its lower end to or arranged to embrace the collar, washer, or spindle of a circular saw, in combination with the swage D, hung loosely to the said bar, but having its movement on the same limited, all substantially as and for the purpose herein set forth.

2. In combination with the said bar, a plate, *n*, for fitting against the face of the saw blade, as described.

79,185.—JOHN GULICK BAKER, Philadelphia, Pa., assignor to himself and HENRY DISSTON, same place.—*Saw.*—June 23, 1868.—The object is to avoid the straining and warping of the saw, which result from the use of rivets.

Claim.—A hard metal block, adapted to an opening formed in the blade of a saw, and having projections which fit notches in the detachable tooth, in combination with a soft metal packing, fitting the said opening at one side of the block, and maintaining the latter in its place, all being constructed and operating in the manner substantially as described.

79,186.—WILLIAM BALLARD, Lapeer, N. Y.—*Carriage Brake*.—June 23, 1868.—When the vehicle crowds toward the team the rod is turned axially, and the brakes are forced against the wheels. The consequent rearward movement of the sliding plates upon the reach forces the pendent brake against the ground.

Claim.—1. The bent honnd bolt or crank, as described, and fastened to honnds and tongues by means of iron straps *j j* and *o*; also the said manner of fastening, as herein described, and for the purposes set forth.

2. The rod *f*, connected with the slides *k k*, (slots or slides,) and with rod *l* and brake *m*, in four parts, *m*, *t*, *p*, and *r*, with slides, slots, and spiral coil springs, in combination with crank-hound bolt *g*, and other parts herein mentioned and claimed, substantially in the manner and for the purposes herein described and set forth.

79,187.—STEPHEN J. BATCHELDER, Manchester, N. Y.—*Lamp Extinguisher*.—June 23, 1868.—The flanged cap is constructed to fit closely upon the wick and vapor tubes, to prevent the escape of vapor and gas. The flat spring, by pressing upon the spindle crank, keeps the cover firmly in place when closed over the tubes.

Claim.—The flanged cap or extinguisher A, so constructed as to cover the wick and vapor tubes F and G, in combination with the flat spring or band C, embracing the wick tube F, and operating in connection with the spindle crank B.

79,188.—JOSEPH BEAUMONT, Chambersburg, Pa.—*Mangle*.—June 23, 1868.—A cloth is tacked along one edge to the surface of the middle cylinder. This cloth being spread upon the surface of a table hinged to the frame, the fabric to be smoothed is laid thereon, and rotation given to the central cylinder, so as to draw the attached cloth together, with the fabric between the lower and middle cylinder, and wind them around the latter.

Claim.—The rollers *a c c'*, in combination with the enveloping cloth *e*, table A, adjustable brackets *d d'*, and springs *e'' e'''*, as and for the purpose described.

79,189.—SANFORD BECKWITH, Oshkosh, Wis.—*Seeding Machine*.—June 23, 1868.—The shaft, rotating in the bottom of the hopper, has at certain intervals delivery screws, directly beneath which are cups, from which the seed falls into the conducting or scattering tubes. Above the screws are semi-cylindrical caps, attached to a sliding frame, whereby the discharge of seed may be regulated or entirely cut off. The vertical adjustment of the movable part of the conducting tube contracts or enlarges the discharge opening thereof.

Claim.—1. The screw cylinder *d*, cup *m*, and adjustable cap *e*, arranged relatively one to the other for joint action, substantially as and for the purposes set forth.

2. The screw cylinder *d*, in combination with cap *m*, as herein described, for the purposes set forth.

3. The semi-elliptical tube or scatterer *k l*, as and for the purposes set forth.

4. The slots *n n*, as a means of adjusting the part *l* relative to the part *k*, as and for the purposes set forth.

79,190.—JOHN BENSON, Yonkers, N. Y.—*Basin Faucet*.—June 23, 1868.—The object is to render the coupling between the cock and water pipe easily accessible, for the purpose of being repaired, or for the removal of obstructions without involving the necessity of first taking away the basin slab. The shell incloses the coupling and imparts a symmetrical appearance to the faucet.

Claim.—1. The combination of the coupling tube A, having nuts *b* above and below the slab, with the stock C of the cock and locking nut D, all arranged and operating substantially as shown and described.

2. In combination with the above, the cap or shell E attached to the stock C, and inclosing the coupling joints, substantially as shown and described.

79,191.—GEORG BERGNER, Washington, Mo.—*Shears*.—June 23, 1868.—A projection in the under blade enters an aperture in the bolt, the latter being

secured by a nut when in place. The coil spring is passed through an opening in the head and wound around the same, its outer end acting against a projection on one of the blades, so as to hold the shears open.

Claim.—The slotted bolt *b*, with its cap *e*, spring *o*, shoulder *n*, all in combination, when arranged in relation to each other and the blades of the shears, substantially as and for the purpose specified.

79,192.—E. W. BINGHAM, Williamsport, Pa.—*Brick Drying Kiln*.—June 23, 1868.—The furnaces are situated at the ends of a kiln divided into longitudinal apartments, having arched entrances which are closed by vertically sliding gates after the bricks are introduced. The flues of the furnaces run alongside of the entrances and communicate with the apartments of the kiln through laterally-branching flues guarded by valves. The main flues at points between the entrances may be closed by valves to cause the heat to traverse the flues successively.

Claim.—The combination and arrangement of the drying kiln A with its apartments, arched entrances *a a*, gates *b b*, side flues *d d*, and the valves *e e*, and the furnaces B B, with flues C C and valves *c c*, substantially as and for the purposes herein set forth.

79,193.—CHARLES BISHOP, Trumbull, Conn.—*Shears*.—June 23, 1868.—The flange and recess, fitting together, form the bearing for the two blades, while the screw or rivet which passes through the two has only to hold the two blades together, it being thus relieved from strain.

Claim.—Shears, the joint of which is constructed in the manner described, that is to say, the one blade constructed with a circular flange, *d*, the internal diameter of which is less than the rivet or screw, the other blade with a recess corresponding to the said flange *d*, and so that a portion of the recessed blade will enter, fill, and fit the space within the circular flange on the other blade, and through the center of which a screw or rivet, *i*, is placed to secure the two blades together, substantially in the manner and for the purpose set forth.

79,194.—CHARLES C. BLAKEMORE, Washington Court-House, assignor to GEORGE C. ROBINSON and HENRY A. MANNING, Cincinnati, Ohio.—*Card or Ticket Case*.—June 23, 1868.—The spring, when the case is filled and closed, presses the pack against the cover of the case. The lips close up the ends of the case when the cover is down, and only give way when a card is pressed out at either end by the fingers of the operator, to admit which an opening is made in the lid.

Claim.—The case A, hinged open-faced cover C, rectangular spring D, and elastic lips B, combined, arranged, and operating in the manner and for the purpose specified.

79,195.—EDMOND BOSDEVEX, Philadelphia, Pa.—*Grate*.—June 23, 1868.—The space for containing the fuel may be enlarged or contracted, so that the upper surface of the fuel may be always maintained in close proximity to the culinary vessels above the fireplace.

Claim.—The combination of a permanent grate, B, and a grate, D, hung to the rear side of a fireplace, and capable of such adjustment that its front edge may be brought to any desired position on the grate B, for the purpose described.

79,196.—H. W. BRADLEY, Binghamton, N. Y.—*Paint Compound*.—June 23, 1868.—The materials enumerated are arsenic powder, sulphide of zinc, vinegar, litharge, borax, acetate or nitrate of lead, glue, tannin, or a decoction of white-oak bark, linseed or other oil, and turpentine.

Claim.—A paint, produced by combining the oxide of lead or zinc, or other pigment or pigments, with the materials hereinbefore named, mixed and treated in or about the proportions and substantially in the manner described, for the purpose specified.

79,197.—JOSEPH W. BRADLY and GEORGE H. JORDAN, Rocheport, Mo.—*Churn*.—June 23, 1868.—The agitator or dasher attached to the rotary shaft has perforations, in which are secured knives for the

purpose of cutting the cuticle which confines the cream. The butter is removed from the churn by means of the strainer.

Claim.—1. The perforated agitator D, when provided with knives *x*, and operated as and for the purpose specified.

2. The strainer E, when used in combination with a churn, and constructed as and for the purpose herein set forth.

79,198.—JOHN BREWER, Philadelphia, Pa.—*Expanding Mandrel.*—June 23, 1868.—An expanding tap, especially intended for the manufacture of gas and steam fittings. The cutters move radially within slots at the lower end of the tubular stock, and are arranged in grooves of the conical head or holder, (shown by detached plan view,) which is connected with the swivel and slotted stock, and serves to contract and expand the cutters by an ascending and descending movement within said stock.

Claim.—The cutter head E, in combination with the screw rod D, cap C, swivel B, slotted stock A, and the rod G, as shown.

79,199.—JESSE BROWN, San Francisco, Cal.—*Sewer.*—June 23, 1868.—A mode of draining privy vaults by the use of a protective cap, to prevent sewers from clogging up, and a substitute for the grates or screens generally used for the purpose.

Claim.—The protective cap, when constructed and arranged as described, so as to secure the upper and lower drains of privies, as set forth.

79,200.—THOMAS BROWN, Alleghany City, Pa.—*Hydrant.*—June 23, 1868.—By turning the spout the valve is partially rotated and elevated, whereupon the water passes from the lower inlet pipe into the reservoir, whence it passes into the hollow valve and ascends in the vertical eduction tube leading to the spout.

Claim.—1. The spout D and pipe E, with the inclined slot B and movable cap C, combined, arranged, and operating substantially as described.

2. The hollow valve H and hollow-screwed stem G, with the nut L, pipe E, and spout D, combined, arranged, and operating as and for the purpose set forth.

79,201.—JOHN A. BURCHARD and RICHARD TATTERSHALL, Beloit, Wis.—*Gate.*—June 23, 1868; antedated February 12, 1868.—A downward pull upon one of the cords causes the pawl on the double pulley to engage with the ratchet on the shaft, and turn the latter. The cranks and pitmen being actuated raise the ends of the inclined planes, thus sliding the gates upward, freeing them of the latches and winding up the weight. The gates then freely open. On releasing the cord the weight rotates the pulley to its normal position.

Claim.—1. Broadly, the employment of the double pulley D d, pawl E, ratchet *e*, weight G, and cords *h h*, when constructed, arranged, and operated for the purpose of operating a gate or gates.

2. Broadly, the circular inclined plane J, when constructed and arranged substantially as herein set forth and described for the purpose specified.

3. The latches *n n* and stops *p p*, in combination with the inclined planes J J, shaft C C, cranks *e e*, pulley D d, cords *h h*, weight G, gate standards B B, rods *b' b'*, and rollers I I, when the whole is constructed and arranged to operate substantially as herein described.

79,202.—W. W. BURSON and JOHN NELSON, Rockford, Ill.—*Knitting Machine.*—June 23, 1868; antedated June 12, 1868.—A continuous tubular fabric is knit on two straight parallel rows of loop supporters, whose stock or carrier slides in the longitudinal guideway of a horizontal frame to which is joined the vertical frame which affords attachment and support for the yarn carrier, loopers, &c., which parts derive motion from a vertical reciprocating gate operated by a crank.

Claim.—1. The combination and arrangement, with the supporting frames A D, of the gate E, vibrating yarn carrier H, and plates B B, provided with loop carriers *e e e e*, and feed rack N, the whole operating as and for the purpose set forth.

2. The two parallel plates B B, carrying the loop carriers *e e e e*, constructed and arranged to move in the groove C, substantially as described.

3. The combination of yarn carrier H, with looper bearer K, groove *n*, and pin *m*, constructed and operating substantially as set forth.

4. The combination of yarn carrier H, constructed in two parts as described, with releasing lever P, loopers *a a'*, and loop hooks *e e*, arranged to knit irregular work, as set forth.

5. The reversing crank L, in combination with the looper bearer K, operating substantially as described.

6. The combination of the stop blocks *t t'*, reversing rods *o o*, and loop hooks *e e e*, when constructed and operating substantially as specified.

7. The combination and arrangement of reversing rods *o o*, cams *s s'*, and trip plate T, when constructed and operating substantially as described.

8. The combination and arrangement of the feed lever M, toothed rack N, and cam opening V, constructed and operating substantially as described.

9. The combination and arrangement of spring Y, feed bar M, and crank L, operating substantially as set forth.

10. The combination and arrangement of releasing lever P, looper bearer K, and crank L, when constructed and operating substantially as described.

11. Constructing and arranging a knitting mechanism, substantially such as herein described, so that the reciprocating motion of the gate E shall impart the proper motions to the different parts, substantially as set forth.

79,203.—F. BUXTON and GEORGE CROSBY, Lake Village, N. H.—*Edge Plane for Boots, &c.*—June 23, 1868.—The edge of the guard plate projects beyond the face of the plane and protects the upper of the boot or shoe from injury by contact of the cutter; it also bears against the cutter to keep it in place. The purpose of the bolster, against which a portion of the hand rests, is to allow the hand to be as near the cutter as possible in operating the instrument.

Claim.—1. The adjustable guard plate E, constructed substantially in the manner and for the purpose described and set forth.

2. Constructing edge planes with a bolster or part, L, substantially as described and for the purpose set forth.

79,204.—ISAAC CHURCH, Jr., Norwalk, Conn.—*Operating Slide Valves.*—June 23, 1868.—The piston operates directly upon the stems of the supplemental valves which admit the steam whereby the main valve is operated, an interior valve-operating arrangement being thus provided.

Claim.—The arrangement of the puppet valves I I' with relation to main valve D, steam passage H, and piston B, in such manner as to dispense with all outer connection therewith, substantially as shown and described.

79,205.—JAMES B. CLARK, Plantsville, Conn.—*Whiffletree Plate.*—June 23, 1868.—The device for attaching the whiffletree to the bar consists of three separate plates of cast metal, the first being provided with a circular bearing upon which is fitted the second which is held in place by the third.

Claim.—A whiffletree plate, with its shaft B, tenon C, bearings E and F, and third plate G, all constructed and operating substantially as described.

79,206.—LYMAN CLARK, Pine Island, Minn.—*Car Brake.*—June 23, 1868.—When the friction rolls are lowered or brought in contact with the revolving truck wheels, the shafts to which the rolls are attached are rotated, thereby winding up the rope or chain and drawing the brakes in contact with the car wheels.

Claim.—The friction wheels or rolls C and shaft F, combined with the wheels of a railroad car, and with the brakes controlling the same, when operated by a chain or cord winding upon a horizontal rod or shaft beneath the car, substantially in the manner and for the purpose herein set forth.

79,207.—ABRAM CLOW, Port Byron, N. Y.—*Thread-Guiding Plate for Filling Tatting Shuttles.*—June 23, 1868.—The metal disk is provided with slots

to receive the points of one side of the shuttle, and presents a suitable face for guiding the thread between the points as it is wound upon the shuttle.

Claim.—As an article of manufacture, the guide plate A, constructed and slotted as herein shown and described, and for the purpose set forth.

79,208.—AUGUSTUS COOKE, Orange, N. J.—*Toy Head for Canes.*—June 23, 1868.—The head of the cane is hollow and has the form of the head of a bird or animal, the eyes, tongue, and jaw being moved and a bell sounded by pressing the fingers upon knobs in the cane.

Claim.—1. Forming the top of a cane in the shape of an animal's or bird's head, the features of which can be moved by pressing upon knobs in the cane.

2. The combination of the wires *b*, *g*, and *d* with the eyeball plate *a'*, tongue *e*, lower jaw *f*, and springs *a'*, *f'*, and *e'*, when arranged and operating substantially as described.

79,209.—CHARLES CORLISS, Haverhill, Mass.—*Instrument for Adding Figures.*—June 23, 1868.—A secondary pawl engages with a ratchet connected with the hand that designates the units and is so arranged in relation to the gearing operating the indicators which register the amounts added, that by releasing the said pawl, the spring which is wound up in the act of adding, is also released, causing the indicators to return to their original position.

Claim.—1. Operating the indicator that designates the figure or number to be added, by means of a sliding rod or bar, in such a manner that the said indicator will return to its original position upon each retraction of the rod or bar to its projected position.

2. The simultaneous resetting of the several indicators, substantially as specified.

79,210.—ABEL J. CROSS, Greenport, N. Y.—*Clasp for Hoop Shirts.*—June 23, 1868.—The clasp is a zig-zag strip of sheet metal, the points being bent so as to secure the hoops to the tapes.

Claim.—A clasp for uniting the tapes to the hoops in skeleton skirts, the same being formed of a series of alternate diagonal metallic bars, extending from the penetrating points on one side to the penetrating points on the other side of the clasp, as specified.

79,211.—CHRISTIAN CUSTER, Philadelphia, Pa., assignor to himself and CHARLES K. BULLOCK, same place.—*Flour Packer.*—June 23, 1868.—As the packing progresses, the cylinder and the rotary shaft and propellers rise, and when the barrel is packed the strap-bar is actuated so as to throw the driving belt from the fast to the loose pulley in order to arrest the movement of the shaft and propellers, the cylinder being prevented from descending by depressing the retaining pawl. An empty barrel being mounted for filling, the pawl is raised and the cylinder and propellers permitted to descend. The upper propeller collects the loose flour as it descends from the hopper and forces it below the cross bar to the lower propeller, which packs it into the barrel.

Claim.—1. The combination in a flour-packing machine of a stationary cylinder, G, with a sliding cylinder, H, within which operate the devices for propelling and packing the flour.

2. The within-described propelling device, consisting of two propellers, *f* and *f'*, attached to a shaft, I, one on each side of a cross-bar *e'*, having inclined arms, the whole being combined with the sliding cylinder H, substantially as specified.

3. The sliding cylinder H and strap bar N, so connected that the said bar will be operated by the movement of the cylinder, substantially as described.

79,212.—D. W. CUTTING, Cambridge, Vt.—*Stove Drum.*—June 23, 1868.—Cold air enters and traverses the drum and is discharged in a heated condition. The pipes are adjustable in order that the air may be heated to a greater or less degree.

Claim.—The arrangement of the drum C over the fire box of a cooking or box stove, when said drum is provided with an opening near each side, from which project two pipes B B, that lie parallel to each other in the stove, and are provided with elbows, that pass through openings in the side of the stove,

opposite to each other, for receiving and transmitting air, as and for the purposes set forth.

79,213.—HENRY DISSTON, Philadelphia, Pa.—*Device for Holding Rotary Cutters While Being Ground.*—June 23, 1868.—This device has bearings in which the spindle of a rotary cutter is mounted so as to be properly held while being applied to the grindstone. The teeth are ground successively, and the cutter is held against rotation, while under the action of the grindstone, by an elastic plate catching against one of the teeth.

Claim.—The frame A, arranged for the reception of the spindle of a rotary cutter, as set forth, in combination with the rear rollers *f*, and the vertically adjustable roller *e*, substantially as and for the purpose specified.

79,214.—D. FRANK DODGE, Lowville, N. Y.—*Mail Bag.*—June 23, 1868.—When the jaws are brought together, projections on one jaw enter openings in a shield attached to the other jaw, and inclosing a bolt, which being moved longitudinally causes locking tongues to enter apertures in the above-mentioned projections; a loop on the end of the bolt is by the same movement passed through the two contiguous end flanges of the jaws and a padlock is applied to this loop to secure the fastening.

Claim.—The construction of the mouth frame A B, with its several parts, as herein constructed and set forth.

79,215.—EDWARD DUNSCOMB, Boston, Mass.—*Steam Generator.*—June 23, 1868; antedated May 7, 1868.—The generator is shown as duplicated. Each consists of an external shell, containing water, and an internal drum, having large perforated and small imperforate disks united by a range of vertical water pipes and giving a circuitous route to the heat and products of combustion which are admitted at the lower and discharged at the upper end of the drum.

Claim.—A steam generator, constructed and arranged as shown and described.

79,216.—JOHN E. EARLE, New Haven, Conn.—*Corkscrew.*—June 23, 1868.—The handles by which the corkscrew is operated may also serve as handles to cutters for cutting the wire which secures the cork.

Claim.—The combination of the two handles B and D with the corkscrew E, pivoted together so as to operate in the manner shown and described, and with or without the cutters A and C.

79,217.—CHARLES F. EASTLACK, Mantua, N. J.—*Pump.*—June 23, 1868.—The weight of an animal upon the platform depresses the plunger and forces water up into the drinking trough, the platform and plunger being restored to their elevated position by the lever and weight.

Claim.—A pump, having cylinder A, plunger B, piston C, pipe D, platform E, lever G, trough K, constructed, combined, and arranged substantially as and for the purposes specified.

79,218.—JOHN T. EWAN and JAMES R. GLENN, Hillsboro, Ill.—*Smut Mill.*—June 23, 1868.—The grain is distributed between the inside jacket and steel files and is scoured. It is then acted upon by wire polishing brushes, the wheat being delivered into the lower ends of the suction legs, the light matter leaves it, and passes upward. The chaff strikes and descends from the check board and is discharged, the other light matter passes around the board and out through the air trunk and drum. The dust descends into a chamber whence it is carried by spouts into the upper part of the suction legs.

Claim.—The arrangement, upon the frame A, in the manner described, of the suction legs K K, chambers M M, check boards L L, air trunk D, and its valves R R, dust chamber O, and spouts S S, with the cylinder F, its wire brushes J, staves I, plates G H, fan P, and shaft C, with their various parts, all constructed and operating substantially as and for the purposes set forth.

79,219.—ROBERT FARIES, Indianapolis, Ind.—*Supplemental Jaw for Wrenches.*—June 23, 1868.—The supplemental jaw is tapered and curved in the

direction of its length and has teeth to make it take an effective hold upon the pipe or other round object to be wrenched. It may be compelled to keep company with the wrench by a chain attaching it to the stationary jaw.

Claim.—The applicable wrench jaw, when made substantially as described, as an article of manufacture.

79,220.—JAMES B. FORSYTH, Boston, Mass., assignor to himself and JOHN H. CHEEVER, New York.—*Lining Flexible and other Hose and Tubes with India-rubber, &c.*—June 23, 1868.—A lining of vulcanized rubber is applied to the hose by means of a coating of gum, interposed between the two, steam, hot air, or hot water being introduced within the tubular lining for the purpose of softening the gum and forcing the same into the meshes or interstices of the article to be lined.

Claim.—1. Water-proof hose or tubing, composed of a tube of woven fabric, or other material, and a vulcanized India-rubber lining, the two being held and cemented together by interposed non-vulcanizable gum, as and for the purposes herein set forth.

2. The method of lining hose, or other tubular articles, by inserting in the article to be lined the vulcanized rubber, or equivalent lining, with its coating or exterior layer of unvulcanizable gum, and then expanding said lining, and forcing the said gum or cementing material into the meshes or pores of the article to be lined, by means of steam, hot water, or hot air introduced within the lining, as set forth.

3. A lining for hose, and other tubular articles, composed of a tube of vulcanized rubber, with an exterior coating or layer of unvulcanizable gum or cement, with or without one or more plies of cloth or other fabric, combined and united with the lining, as herein set forth.

4. The method herein described of coating the hose or tubing with vulcanized rubber, both internally and externally, as and for the purposes set forth.

79,221.—EDWARD A. GALBRAITH, Boston, Mass., assignor to himself and PAUL P. TODD, same place.—*Lamp Burner.*—June 23, 1868.—The wick is divided at top by a tube or a pair of plates so arranged as to admit the combined air and vapor to the interior of the flame.

Claim.—1. The combination, with the conduit for supplying air to the flame, of a vapor-conducting pipe; leading from the fluid reservoir of the lamp, and communicating with the said air conduit, substantially as and for the purposes herein shown and set forth,

2. A lamp burner in which the divided wick tube with its double wick, the air-supplying pipe or conduit, and the vapor conduit are combined and arranged for joint operation in the manner herein shown and described.

79,222.—CHARLES P. GORELY, Boston, Mass.—*Letter Box.*—June 23, 1868.—An improvement on the letter box for which the same party received United States Letters Patent, December 17, 1867. In the present invention the pivoted bars serve not only to ring the bell when the lid is opened, without interfering with the operation of the ordinary bell-pull, but operate to hold the lid firmly open when raised to a certain height, and to keep it securely closed when shut.

Claim.—1. The combination and arrangement of the lid B, bars D, E, F, wire or chain G, and spring S, all constructed and operating substantially in the manner and for the purpose specified.

2. The introduction of the chains H and G into the length of the bell wires, for the purpose of allowing either of two modes specified to be used in ringing the bell, without interfering with the other, as set forth.

79,223.—JACOB HARDING, Schoolcraft, Mich., assignor to HENRY I. ALLEN & Co., same place.—*Hames Fastener.*—June 23, 1868.—The metallic straps connect the ends of the hames and are connected by a lever which, being turned horizontally to a position the reverse of that in which it is shown,

draws the hames together and acts as a spring catch to hold the parts in the desired position.

Claim.—1. The straps A and B, connected by the lever C, as and for the purposes set forth.

2. The projecting feather E and groove 3, when operated in connection with lever arm C and strap B, substantially as described and for the purposes specified.

79,224.—GEORGE W. HECKART, Columbiana, Ohio, assignor to himself and CHRISTIAN KRAMER, same place.—*Hames Coupling.*—June 23, 1868.—The ends of the hames are attached to the hooks on the case and ratchet bar sliding therein. The finger pieces are pressed together and the ratchet bar forced into the case, to draw the hames into the desired position, in which the parts are retained by the engagement of the spring pawls with the ratchet bar.

Claim.—A hames coupling, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

79,225.—H. HEINE, New York, N. Y.—*Steam Generator.*—June 23, 1868.—The boiler is formed of two distinct parts, one inside of the other. The steam dome of the inner part extends upward through the center of the outer annular water space, and the water and steam spaces of both parts, respectively, communicate with each other through pipes. In the combustion chamber the draught is downward, so that the fire comes in contact with the outer surface of the water jacket surrounding the fire box as well as with the inner surface thereof. Water pipes situated in the combustion chamber connect at their lower ends with the lower part of the water space of the central part and from their top ends siphons extend into the water legs. The heated gases pass from the combustion chamber through tubes in the annular water space.

Claim.—1. A steam generator, composed of an internal main or central part, M, and of an outer annular water space, G, said internal part being provided with a water space, D, and fire flues, *a*, and communicating with the outer annular water space by pipes *e* and *g*, all as shown and described.

2. The steam dome E, rising through the center of the bonnet I, which covers up the annular water space G, said water space and steam dome being connected by pipes *g*, substantially as and for the purpose set forth.

3. The water pipes II, situated in the combustion chamber F, between the central part and the annular water space, substantially as and for the purpose set forth.

4. The siphons *b*, connecting the pipes II and the water legs C, substantially as and for the purpose described.

79,226.—WILLIAM HIGHTON, Malden, assignor to MOSES POND & Co., Boston, Mass.—*Hot Air Register.*—June 23, 1868.—The auxiliary journals of the shutters of the register enter slots in a slide bar whose motion, produced by the turning of a wheel, effects the opening and closing of the register. The recesses in the projecting ribs at the ends of the frame serve as guides for the location of holes for receiving the screws by which the grato is fastened to the frame.

Claim.—1. The arrangement and combination of the wheel with the grate, the sliders, and the series of shutters applied to the frame A, as set forth.

2. The combination of the frame A and the ribs F with their recesses *r r*, as and for the purpose specified.

79,227.—A. L. HILL, Decatur, Ill.—*Fastening Check Hooks and Terrets.*—June 23, 1868.—The check hook and terrets are secured to, or have cast on them, loops which fit over and embrace the saddle strap. The loop of the check hook has a slot through which passes the back strap, which is thereby secured to the saddle strap.

Claim.—Providing the terrets B B and check hook A with loops *h h*, as and for the purpose specified.

79,228.—ALFRED HOUGHTON, Seville, Ohio.—*Horse Hay Fork.*—June 23, 1868.—The checks con-

stitute abutments for the pin on the slide, in the open and closed conditions of the fork.

Claim.—The cheeks E F, springs G, in combination with the slide C, in the manner as and for the purpose specified.

79,229.—WILLIAM H. JACKSON, Salem, Mass.—*Manufacture of Gunpowder.*—June 23, 1868.—This mode of manufacture is by solution and evaporation instead of grinding and pressing.

Claim.—The manufacture of gunpowder by mixing a solution of nitrate of potash, or a known equivalent thereof, with a soluble vegetable extract, such as extract of logwood, or with other soluble organic matter, and by subsequently evaporating to dryness, with or without the addition of sulphur or of pulverized charcoal, substantially as hereinabove described.

79,230.—WILLIAM JONES, Chelsea, Mass.—*Gas Heater.*—June 23, 1868.—The invention is shown as applied to the heating of a calender roll, within which the burner is situated. The gas flows into the chamber of the plug in fine streams and mingles with the atmospheric air present in said chamber. As the mixture, which is lighter than air, moves into the pipe to supply the flame, a new supply of air enters the chamber of the cock.

Claim.—1. For the purpose of mixing air and gas to be burned, a plug cock, having a long, open, chambered plug, with inlets *k k* and outlet *j*, arranged to operate substantially as described.

2. In connection with a burner, arranged within a confined space, provision substantially as shown and described, for supplying fresh unvitiated atmospheric air, to be mingled with the gas passing to the flame, as set forth.

79,231.—BENJAMIN JOSEPH, Philadelphia, Pa., assignor to himself and WILLIAM MCNIECE, same place.—*Pessary.*—June 23, 1868.—The oval body of the instrument is introduced into the rectum after the prolapsed portion of the anus has been returned to its normal position. The short end of the base is placed toward the coccyx, while the long end occupies the perineum and prevents the body of the instrument from ascending above the proper point of support.

Claim.—1. The hollow vertical shaft *e*, in combination with the body A, as and for the above described purpose.

2. The combination of the base B, shaft *c*, and universal joint *d*, as and for the above-described purpose.

79,232.—ROBERT JAMES KELLETT, San Francisco, Cal.—*Ticket Punch.*—June 23, 1868.—The instrument cuts a coupon from the ticket and punches the same at one operation, and the improvement is represented as applied to the ticket punch for which United States letters patent were granted to the same party May 28, 1867.

Claim.—A small auxiliary punch, so arranged as to punch a hole in the coupon or portion so removed, at the same operation which removes or punches the coupon or portion of the ticket, thus providing a convenient means for stringing said coupons or portions for preservation and reference, as described.

79,233.—ISAAC KLING, Seymour, Ind.—*Billiard Register.*—June 23, 1868.—Two slides, inclosed in a case, are operated by the rod which carries the points, and an index rod, furnished with dies numbered to record the games, is so arranged that the movements of the slides cause a die to be protruded from the case for every game that is played.

Claim.—1. Operating the index rod, which shows the number of games played, by the movement of the points to mark the games, as set forth.

2. The combination of the slotted slides B and C, doors I I, index rod D, and spring *e*, with the bar E and wire E', when arranged and operating substantially as described.

3. The pivoted plates *d*², and spring *d*³, in combination with the notches H, for preventing the index rod from being raised from the outside of the case.

4. The spring *b*² and inclined plane B³, for operat-

ing the connection and disconnection of the slider and bar E, as set forth.

5. The cheeking points *e*², provided with springs *e*⁴, and latches *e*³, in combination with the notch *e*⁶ and depression *f*³, for preventing the points from being moved backward and re-marked without counting a game, as set forth.

79,234.—FREDERICK A. CRAFT, Philadelphia, Pa.—*Zincing Iron.*—June 23, 1868.—The iron vessel to contain the molten zinc is lined with copper, or equivalent material, for preventing the formation of a dross from the iron and zinc.

Claim.—A zincing bath, composed of an outer casing of iron, containing an inner lining or casing of copper, or its equivalent, as set forth.

79,235.—EZRA B. LAKE, Bridgeport, N. J.—*Ships' Fender.*—June 23, 1868.—The interposition of one or more of these fenders between a wharf and vessel prevents injury to either when the vessel surges, as either the vertical or transverse rollers revolve freely according to the direction in which the vessel moves.

Claim.—The within-described fender, composed of a strip of wood and of vertical and transverse rollers, the whole being constructed and arranged substantially as and for the purpose herein set forth.

79,236.—CHARLES L. LEE, Fitchville, Ohio.—*Combined Cultivator and Planter.*—June 23, 1868.—The frame is suspended from the axle by screw bolts whereby it may be adjusted vertically. A lever is provided to enable the operator to control the working depth of the shovels, and another lever is employed to reciprocate the laterally-moving seed slide. When the machine is used as a planter only, the shovels are detached.

Claim.—1. The adjustable frame A, platform K, lever B', axletree B, and wheels D, all constructed and arranged to operate in the manner substantially as set forth.

2. The slide boxes J, groove *a*, slide G, and lever H, as constructed and arranged to operate, in the manner and for the purpose specified.

79,237.—WILLIAM J. LEWIS and HENRY W. OLIVER, Jr., Pittsburg, Pa.—*Manufacturing Bolster Plates.*—June 23, 1868.—A continuous series of wrought-iron blanks wherewith to make bolster plates for wagons, are produced by rolling.

Claim.—A new article of manufacture, viz, iron bars rolled to the shape of a connected series of blanks for bolster plates, substantially as herein described, and for the purpose set forth.

79,238.—I. STONE LISTER, Philadelphia, Pa.—*Axle Box.*—June 23, 1868.—On removing the screw plug the reservoir may be supplied with oil through the opening occupied by said plug. A screw in the plug serves as a valve, to wholly or partially open or close the air passages at their point of communication, in order to control the flow of oil from the reservoir.

Claim.—1. A bearing, arranged within an axle box above a journal, and having a chamber and channels leading from the same, through which oil may flow by its own gravity to the journal, all substantially as and for the purpose described.

2. The combination of the said chambered bearing with the oil reservoir G.

3. The plug I, with its air passages *p* and *p'*, and regulating valve *q*, in combination with the reservoir G.

79,239.—THOMAS SALEM LIVERMORE, Leicester, Mass.—*Belt Coupling.*—June 23, 1868.—The outside of both head and nut is designed to be flush, or nearly so, with the surface of the belt when the screw is inserted and secured. If the point of the screw projects, it is filed off to the face of the head.

Claim.—The above described coupling, consisting of the screw, with its conical head, in combination with a nut, of similar form, capable of being drawn into the belt, when constructed and operating in the manner and for the purposes above set forth and described.

79,240.—WILLIAM S. LOUGHBOROUGH, Rochester, N. Y.—*Water-Proof Leather Cement.*—June 23, 1868.—Gutta percha is reduced to the consistency of cream by benzine or bisulphuret of carbon; sweet oil is then added to it. A small quantity of musk or rosemary is added for the purpose of counteracting the odor of the gutta percha. Isinglass glue may be employed in connection with the above for cementing materials other than rubber.

Claim.—The compound composed of the ingredients above set forth.

79,241.—JOHN MABREY, Jefferson City, Mo.—*Fever and Ague Medicine.*—June 23, 1868.—Composed of chinoidine, cider vinegar, Orleans molasses, lemon oil, and oil of peppermint.

Claim.—A remedy for the fever and ague, and other bilious diseases, compounded of the ingredients, in the proportions and in the manner herein specified, substantially as described.

79,242.—R. M. MANSUR, Augusta, Me.—*Carpet Stretcher and Tack Holder.*—June 23, 1868.—The plate has notches for extracting tacks, and slits for holding tacks to be driven when the carpet has been pushed into place by the instrument. The rubber bands hold the tacks upright in the slits.

Claim.—The construction of the three-pronged plate, with the elastic rubber rings F F, as a tool for the purposes set forth and herein described.

79,243.—JACOB McDONALD, Buffalo, Ohio.—*Bee Hive.*—June 23, 1868.—The hive is primarily a double hive, consisting of two similar parts, resting one upon the other. It rests upon the alighting board, causing the bees to enter at two sides only. To divide or colonize the bees the top section is placed on the alighting board by the side of the bottom section. The bottom section is then provided with a cap and a small board placed between the sections to cut off communication between them.

Claim.—The guiding board A, with the side strips g g, the two sections C C, and the cross board i, for the use and purpose as specified and herein set forth.

79,244.—JAMES H. MONCE, Hopkinsville, Ohio.—*Churn.*—June 23, 1868.—By means of the spring and gearing the verge, with its adjusting and regulating arm, together with the pitman balance wheel and churn dasher, are operated.

Claim.—1. The arrangement and combination of the adjustable arm K, pitman L, and reversible balance wheel M, as herein described and for the purposes set forth.

2. The combination of the pitman L and reversible wheel M, when constructed and operated as herein described, for the purposes set forth.

79,245.—BENJAMIN MONROE, Bristol, R. I., assignor to himself, WILLIAM E. CHADWICK and NATHAN N. COLE, same place.—*Car Coupling.*—June 23, 1868.—The device is self-operating in coupling A pin and a shoulder limit the upward and downward movements of the draw pin.

Claim.—1. The combination of the draw pin B, constructed as described, with the slotted draw head H, having an inclined or funnel-shaped orifice, as described.

2. The combination of the head H, pin B, and link L, all constructed and operating as and for the purpose specified.

79,246.—MELVIN M. MORSE and M. V. COLLINS, Buffalo, N. Y.—*Shears Sharpener.*—June 23, 1868.—The blade of the shears to be sharpened is passed under the pressure roller, with the edge against the stops. The spring presses against the back of the blade to keep it engaged with the grinding wheel.

Claim.—1. The adjustable gauge plate D, provided with stops e e, arranged and operating with the grinding wheel B, substantially as set forth.

2. In combination therewith, the self-adjusting pressure roller F, substantially in the manner and for the purpose set forth.

3. The spring h, arranged with a pressure roller F, and gauge stops e, substantially as and for the purpose specified.

79,247.—JOHN M. MOYER, Pittsburg, Pa.—*Brick Drier.*—June 23, 1868; antedated December 23, 1867.—The turn-table is situated above a furnace in a drying house, and has a number of radiating tracks to receive cars loaded with bricks to be dried. Each car has a set of supporting leaves which are capable of being raised and lowered upon hinges for convenience in loading and unloading. The cars are transferred from the brick machine to the drying house and thence to the kiln, by the endless claim.

Claim.—1. The turn table, with car tracks, with heater beneath, in combination with the grooved pulley wheels, arranged and operating substantially as and for the purpose herein described.

2. The car, with upright center plate, and hinged folding leaves, constructed and operating in manner and form as described, to and for the purpose intended.

79,248.—HENRY NORTH, New Britain, Conn.—*Sash Fastener.*—June 23, 1868.—This device not only prevents the opening of the sashes from the outside, but holds them in any desired position in the window frame when open. By turning the key so as to make the bit point upward, the bolt may be moved entirely away from the sash.

Claim.—1. The combination of the bolt D, pivoted at f, with the shoulder k and the leaf or bit i, for the purpose of locking the sash down when the lock is placed in the casing, or locking the sash up when the lock is placed in the sash, substantially as herein described.

2. The spring G, operating in combination with the bolt D, to press the sash laterally against the casing and prevent rattling when the bolt is locked into the recess L, substantially as described.

3. So constructing and arranging the several parts of the lock described, that the bolt D, which locks into the recess L to secure the sash in the manner described, when closed, shall turn upward when the sash is opened, and act as a pawl or stop, under the influence of the spring E, to hold the sash in any desired position, and which can be raised to release the sash by the same leaf or bit i which locks it down, substantially as herein specified.

79,249.—GERRIT V. ORTON and JOHN RICHARDS, Cincinnati, Ohio.—*Mortising Machine.*—June 23, 1868.—The frictional device, by offering a steady resistance to the rotation, in either direction, of the shaft to which it is applied, prevents vibration in the radial links when the chisel bar is operating, or being thrown into operation. The table for supporting the piece to be operated upon has adjustments which admit of what is known as "hand feed" or "carriage feed." The bent stops keep the stuff down upon the table, and prevent it rising by the action of the chisel. A clamp screw passes through a radial swinging nut piece and is adjustable by moving the nut piece, so that it can be made to bear in the center of a large or small piece, placed upon the table, to be mortised. The clamp piece swings on a screw, carrying with it the table support and table.

Claim.—1. The fractional device p and q, for controlling the action of the treadle and chisel bar, substantially as herein described.

2. Adjusting the table support a' laterally upon the stud b', in the manner and for the purposes shown.

3. The bent stops n' n', when arranged to swing and adjust to different points on the stuff, in the manner herein set forth and shown.

4. The adjustable nut piece h', arranged with a clamping screw, to act on stuff of different thickness, in the manner and for the object as specified.

5. The rotating clamp piece i, for adjusting and holding the table support a in different positions, as shown, and for the objects described.

79,250.—EDWIN A. PALMER, Clayville, N. Y.—*Cheese Curd Rake.*—June 23, 1868; antedated June 12, 1868.—The rake is used to stir the cheese curd while it is scalding and being prepared for the press; also to raise the curd after it is checked.

Claim.—The upper head C, and the braces D D, or their equivalent, for the purpose therein described and set forth.

79,251.—HIRAM PARKER, Salem, assignor to H. W. PERSING, Marion County, Ill.—*Wagon Box*.—June 23, 1868.—The side boards are hinged to the bottom, so that when the end gates are removed, after disengaging the hooks extending from the eccentrics on the end gates, the side boards may be turned inward and made to rest upon the bottom.

Claim.—The combination and arrangement of the eccentric *a*, working on the studs *f*, the rods *b b*, working in the staples *d d*, the pawl *y*, attached to the handle of the eccentric *a*, so as to work in the ratchet *g*, substantially in the manner shown and described, and for the purposes above set forth.

79,252.—WILLIAM P. PARROTT, Boston, Mass., assignor to N. F. BRYANT, same place.—*Railway Truck*.—June 23, 1868.—The wheels are rendered capable of relative lateral movement by the telescopic construction of their axles or otherwise, in order to be transferred from a narrow to a broad gauge, or *vice versa*.

Claim.—The combination and arrangement of a car truck with laterally moving wheels, as described.

79,253.—FREDERIC PASSY, Paris, France.—*Andiron and Fireplace*.—June 23, 1868.—Registers may be placed at the points where the air enters the andirons and where it leaves them, and an urn, or other receptacle for water, may be placed at the upper end of the andiron, so that the air, before leaving the andiron, shall heat its contents.

Claim.—1. An andiron, having channels or passages, arranged substantially as described, so that a current of air from the lower portion of the apartment in which the andiron is placed shall pass into and through the andiron, and be discharged into the apartment in a heated state, as specified.

2. The combination of the above and a water receptacle, arranged upon the upper end of the andiron, as and for the purpose described.

79,254.—ABRAM PERRIN, Cleveland, Ohio, assignor to himself, CHARLES L. ROWAND, GEORGE S. SELDEN, and MARMADUKE MOORE, Philadelphia, Pa.—*Car Coupling*.—June 23, 1868.—The arrow-head of the draw bar has a twist, which causes it to turn and enter when brought into contact with the bumper, after which it is turned to its original position by the attached weight so as to be retained within the draw head. The other end of the draw bar draws against a vertical abutment, has a lug entering a groove to prevent the bar from rotating, and is retained within the draw head by a pin closing the lateral opening.

Claim.—The construction of the draw head *A*, with its open side, and pin *h*, and having stops *c*¹, *c*², and *c*³, of the form shown, in combination with the link or connecting irons *D* and *H*, the former being provided with a head, *d*¹, and lug *z*, and weight *G*, all substantially as and for the purpose set forth.

79,255.—AMZI P. PLANT and AMOS SHEPARD, Plantsville, Conn.—*Machine for Forging Nuts*.—June 23, 1868.—A machine for feeding the nut blank from the cut-off mechanism to the dies for basilling its corners, punching the hole, and swaging the edges. The blanks, as they are cut off, are conveyed one to the right and one to the left, in alternate succession, the machine being of a duplex character, but having only one cut-off.

Claim.—1. The right and left hand conveyer *u*, when so constructed as to convey a nut blank from the cut-off mechanism, whether moving from the right or left, and slotted plate *A*, in combination with the cut-off device, and a forging mechanism on the right and left of it, substantially as described.

2. The swinging conveyers *u*¹ *u*² *u*³, in combination with the forging, punching, and finishing mechanism, all constructed, arranged, and operating substantially as described.

79,256.—Canceled.

79,257.—ALBERT RAKESTRAW, Peoria, Ill.—*Cherry Stoner*.—June 23, 1868.—The movement of the slide delivers the cherries, one at a time, into the chamber traversed by a fork which carries a cherry forward to an opening through which the stone is

forced, the pulp remaining in the fork until the latter is retracted to an opening whose shoulders disengage the pulp.

Claim.—A cherry stoner, having sliding beam *D*, openings *B*, *C*, *E*, *H*, and *K*, fork *O*, and block *Q*, constructed, arranged, and operating substantially as herein specified.

79,258.—T. C. RICE, Worcester, Mass.—*Tubular Axle*.—June 23, 1868; antedated June 9, 1868.—The clips are bolted to offsets, which are brazed or otherwise secured to the axle, the object being to firmly secure the axle to its wooden bed.

Claim.—The square-shouldered offsets *C C*, on the axle *A*, for securing it to the wooden bed *B*, with the clips *a a*, which fit over such shoulder, as herein shown and described.

79,259.—JESSE B. RUMSEY, Sturgis, Mich.—*Coat Rack*.—June 23, 1868.—The frames may be opened outward, away from the partition, and held at any desired angle for use. They lie folded against the wall, so as to be out of the way when not in use.

Claim.—1. The form or construction of the butterfly-wing frames *A A*, with their series of overhanging coat hooks *a a a a*, as arranged and combined with the socket chairs *B B'*, substantially as described, for the purpose specified.

2. The combination of the connecting bar *D*, and the chairs *B B'*, with one or more hinged frames, having each a series of overhanging coat or clothes hooks, to be placed and secured in any desired position, substantially as and for the purposes herein set forth.

79,260.—D. SAVALLE, Paris, France.—*Apparatus for Distilling*.—June 23, 1868.—The crude liquor is placed in the lower compartment of the heater, steam is admitted thereto, and the resulting vapor rises to the upper apartment of the heater through the column of perforated partitions and passes thence to the condenser. The vapor being condensed, flows back into the column, over the plates of which it passes successively until it falls into the upper apartment of the heater, where it is brought into contact with the vapors from the lower apartment, which are thus partially condensed before entering the column. The non-condensed vapor passes from the condenser to a cooler, where it is condensed and from which it is drawn off. By graduating the openings and the length of the tubes a rapid passage of the liquid through the column is effected. The throttle valve and float, together with the pipes and casing communicating with the heater, are employed to maintain a uniform steam pressure and temperature.

Claim.—1. The combination, with the column *B*, of a casing, *A*, divided into two compartments, *A'* *B'*, the lower containing a heating pipe, *m*, and the upper a perforated pipe, *a*, or its equivalent, substantially as and for the purpose described.

2. Graduating the size of the openings in the perforated plates of the column, and the length of the tubes which extend above said plates, substantially as and for the purpose specified.

3. The casing *O*, communicating with the heater *A*, or with its column, in combination with the casing *O'*, its tube *s*, and float *o*, connected to the throttle valve *m*², the whole being arranged and operating substantially as and for the purpose described.

4. The arrangement, in respect to the heater *A* and column *B*, of a cooler, *F*, consisting of a casing divided by partitions and pipes into two compartments, one communicating with the column, and the other with the water pipe *c*¹, as set forth.

79,261.—CHARLES A. SEELY, New York, N. Y.—*Solidified Collodion*.—June 23, 1868.—The purpose of the nitro-glucose, which is dissolved in the liquid collodion and left incorporated with the hardened collodion after the evaporation of the solvent, is to increase the flexibility and toughness and counteract the brittleness of the ordinary hardened collodion.

Claim.—The compound of collodion and nitro-glucose, prepared and compounded substantially as described.

79,262.—JOSEPH SHALKENBACK, Chicago, Ill.—*Sad Iron.*—June 23, 1868.—The iron may be turned and held so that the operative face shall be either curved, flat, or angular, to suit the work to be done.

Claim.—The revolving sad iron A , constructed with flat and curved faces, as described, and adjusted in its handle, F , by means of the spring latch G and the disk S , in which are the notches K , arranged to correspond with the desired position of the sad iron, substantially as set forth.

79,263.—HENRY F. SHAW, West Roxbury, assignor to JAMES A. WOODBURY and SOLOMON S. GRAY, Boston, Mass.—*Steering Apparatus.*—June 23, 1868.—The rudder being turned in either direction is firmly held in position without the necessity of holding on to the wheel, regardless of any force that may be brought to bear upon the rudder or post below the operative parts. Springs are attached to the ends of the chains or rods fastened to the arm of the oscillating internal gear wheel, for the purpose of avoiding undue strain upon the gears and rudder post.

Claim.—1. The combination, with the rudder post C , of the sleeve G , provided with the eccentric g , and the gears D and E , substantially as and for the purpose specified.

2. The combination of a spring with the arm of the oscillating gear E , substantially as and for the purpose specified.

79,264.—HENRY F. SHAW, West Roxbury, assignor to JAMES A. WOODBURY and SOLOMON S. GRAY, Boston, Mass.—*Pulley Block.*—June 23, 1868.—The differential gear, described in United States patent No. 75,304, granted to same party March 10, 1868, is here applied in the construction of a pulley block, the object being to render it capable of sustaining a weight at any desired height, and to dispense with a lower or secondary sheave.

Claim.—The combination, in a pulley block, of the winding wheel D , the differential gear, pulleys E F , and an eccentric sleeve, substantially as and for the purpose set forth.

79,265.—C. LATHAM SHOLES, CARLOS GLIDDEN, and SAMUEL W. SOULE, Milwaukee, Wis.—*Type-Writing Machine.*—June 23, 1868.—By means of this invention, writing an ordinary communication, for example, is effected by mechanically-operated types instead of by hand. The types are arranged in a radiating series, and are pivoted to a disk, at whose center each type is made to act upon the paper through an opening, against a platen, under which an inking ribbon is automatically impelled. The paper to be written upon is confined upon a duplex frame, which has a regular intermittent feed motion, under an impulse derived from the operating keys, in order to properly space the consecutive letters upon the paper. One part of the carriage has an independent motion, in order that the position of the paper may be changed so as to space the lines.

Claim.—1. The key levers L , vibrating on the fulcrum M , with the inner ends or fingers u reaching under the type bars, so that the keys will act directly on the types, substantially as and for the purpose described.

2. The spacer or ratchet I , combined with the bifurcated lever II , connected with the bar T , pivoted at s , and resting on and across the arms of the keys L , behind the fulcrum M , so that striking the faces of the keys will work the teeth of the forks of the lever up and down and into the notches of the spacer, and give a certain uniform and regular space movement to the paper carriage, in line of the types, when made substantially as described.

3. The pins e , fastened to the table A^1 , combined with the pawl h , and the spring l' , to give the paper carriage a certain and regular cross-line movement at a right angle to the space movement, from line to line when made substantially as described.

4. The clasps or springs b , attached to the bars C and C' , on a line through the middle of the platen G , combined with the springs a , attached to the bar E , to hold the paper to the carriage, and press it down smooth and tight, in passing under the platen, when made substantially as described.

5. The spools m , combined with the gudgeon s' , the shaft l , the pulleys k and R , the band e' , the cord

v , the weight W , the ratchet-wheel V , the pawl t , and the bar P , pivoted to the back of the case A^2 , to feed a fresh part of the inking ribbon under the platen, to each type successively, when made substantially as described.

79,266.—J. D. SIBLEY, Middletown, Conn.—*Spirit Level.*—June 23, 1868.—Movable sights are attached to the ends of a common spirit-level frame, which revolves upon a pivot in the center of a disk, whose periphery is marked to indicate degrees of angles. The pivot is hollow, in order that a plummet line may be suspended therefrom.

Claim.—The combination of the revolving sighted level with the disk A , when arranged, and operating as herein described, and for the purposes set forth.

79,267.—SIDNEY SKILLMAN, Jersey City, N. J.—*Car Truck.*—June 23, 1868; antedated June 16, 1868.—The boiler and the end of the car are mounted upon the truck in such a manner as to admit of a reasonable degree of oscillation in every direction, as in passing over obstacles or uneven parts of the road.

The hole in the roof is somewhat larger than the stack, and the hooks of the braces are strong enough to sustain the stack under ordinary jars and concussions, but when, on account of an unusual occurrence the stack is struck against the roof with such force as to be deflected, the hooks break or straighten to permit the deflection of the stack without other injury.

Claim.—1. The swiveling of the truck on a center coincident with the center of the boiler, by means of the swiveling ring II , arranged substantially as herein described.

2. In connection with the above, the tilting ring G , turning on the centers g^1 g^2 and h^1 h^2 , arranged substantially as and for the purpose herein specified.

3. In combination with the boiler D , located at or forward of the center of the truck, the employment of a bearing, I , in rear of the center of the truck, so arranged as to support or aid in supporting the weight of the car in such manner as to throw more of its weight upon the rear than upon the front axle of the truck, substantially as and for the purposes herein set forth.

4. The within-described arrangement of the hole P , stack d , boiler D , and weak braces M , or their equivalent, adapted to operate together in the manner herein specified.

79,268.—H. JULIUS SMITH, Boston, Mass.—*Electric Fuse.*—June 23, 1868.—Designed to obviate the objections to such fuses as have two wires separately insulated, and not continued into the cap, but soldered to wires which proceed therefrom. The salt used as a flux in soldering attracts moisture, which interferes with the operation of the fuse.

Claim.—An electric fuse, in which the end of a single insulating cord, containing two insulated wires, is introduced directly into the cap containing the fulminate to be fired, in the manner described.

79,269.—WILLIAM SMITH, New York, N. Y.—*Book Binding.*—June 23, 1868.—Through each of two slits, punched at or near the back edge of the leaves, are passed two tapes, between the loose ends of which the cover boards are placed, and which are secured to said covers.

Claim.—A book when it has its covers secured to its leaves by tapes, or their equivalents, that are passed through the leaves, and then their loose ends fastened to both the outer and inner sides of the covers, substantially as described.

79,270.—GEORGE B. SNOW and THEODORE G. LEWIS, Buffalo, N. Y.—*Automatic Dental Plugging Instrument.*—June 23, 1868.—The operator presses the plugging tool against the filling of the tooth, causing the tool holder to pass within the case, and the lifting bar to pass over the incline of a wedge and release its hold upon a catch; whereupon the hammer is driven down by the force of its spring, and strikes a blow upon the head of the tool holder.

Claim.—A plugging instrument, having all its automatic operating parts contained within the case forming the handle of the instrument, substantially as described.

79,271.—P. A. SPARRE, Stockholm, Sweden.—*Transmitting Signals.*—June 23, 1868.—Signals are transmitted by means of a column of air, acting upon a disk or diaphragm. The air is contained in a pipe, and is compressed and forced against the diaphragm by means of a cylinder of caoutchouc, or other elastic substance. At each compression the elastic diaphragm of the receiving apparatus is raised, and it re-assumes its former shape on the cessation of the pressure. It is this alternate elevation and depression of the diaphragm which is here made available as a means of transmitting signals.

Claim.—1. The disk *d*, in combination with the stop *e*, stand *f*, and bolt *g*, as described.

2. The rack *i*, in combination with the pinion *j*, connected with the gear *k*, by means of the ratchet wheel *l*, in connection with the catch *m*, escapement *n*, and spring *o*, as described.

3. The plate *p*¹, affixed to the cylinder *p*³, in combination with the lever *q*, spring *r*, hook *s*, and spring *s*¹, as described.

4. The plate *t*, hinged to its case, as shown at *t*¹, in combination with the rack *i*, square *u*, pin *u*¹, and spring *u*², as described.

5. The stop *v*, mounted on the disk *d*¹, in combination with the inclined planes *v*¹, *v*², *v*³, hook *s*, and spring *s*¹, as described, to operate substantially as herein set forth.

79,272.—NELSON SPOFFORD and CHARLES CORLISS, Haverhill, Mass., assignors to CHARLES CORLISS.—*Instrument for Adding and Registering Numbers.*—June 23, 1868.—By pressing in the projecting end of the graduated bar, the line or mark denoting the figure on the bar that coincides with the end of the casing will be indicated and registered on the dial.

Claim.—1. The graduated sliding spring bar *b*, when applied and operating substantially in the manner and for the purpose set forth.

2. The sliding graduated bar *b*, in combination with ratchet *f*, and toothed-wheel *e*, as and for the purpose specified.

3. The combination with the bar *b*, and spring *d*, of the system of gearing, and the indicators, as set forth.

4. The combination of graduated bar *b*, casing *a*, and head *c*, substantially as and for the purpose specified.

5. The method of adding a series of figures or numbers, by means of a sliding bar, operating a system of gearing or watch work, substantially as set forth.

79,273.—EDWARD L. STEVENS, Houlton, Me., assignor to ISAAC BARKER, same place.—*Sled.*—June 23, 1868.—The sled is guided by means of the cords or ribbons attached to the rudder. The slotted bar allows the rudder to move back and forth, and is, together with the spring, designed to aid in steering, and facilitate the passage of the sled over obstructions and uneven places.

Claim.—1. The slotted bar *G*, in combination with the spring *D*, when constructed and operating substantially as and for the purposes described.

2. A coasting sled, having rudder *A*, bell holder and bell *C*, spring *E*, slot *H*, chains *K*, ribbons *O*, and stirrups *S*, constructed, arranged, and operating substantially as specified.

79,274.—DAVID STODDART, San Francisco, Cal.—*Reciprocating Steam Engine.*—June 23, 1868.—The arrangement of the passages and small pistons is such that the latter are acted upon by escape steam from the cylinder, and effect the reversal of the valve. The auxiliary passages prevent a change of valve while the piston is passing across either of the main openings.

Claim.—1. The arrangement of the pistons *B*¹, *B*², small pistons *D*¹, *D*², valve *C*, and the passages *H*¹, *H*², communicating to the cylinder, substantially as described.

2. The arrangement of the auxiliary passages *K*¹, *K*², substantially as described.

79,275.—DAVID STUART and LEWIS BRIDGE, Philadelphia, Pa., assignors to STUART, PETERSON & Co., same place.—*Base Burning Fireplace Stoves.*—June 23, 1868.—The object is to provide a stove of comparatively small dimensions, which shall present

an extended heating surface for the air admitted thereto.

Claim.—1. The base of the stove, inclosing the passages *E*, *F*, and *G*, arranged and communicating with the pipes *P* and *P*¹, substantially as described.

2. Two or more pipes *P* and *P*¹, arranged within the outer casing of a fireplace stove, for conveying the products of combustion to the chimney, and for heating the air admitted to the space within the said outer casing, all substantially as and for the purpose herein set forth.

3. The pipes *P* and *P*¹, in combination with the compartments *k* and *k*¹, and the valved partition between the same.

4. The double cover, consisting of plates 2 and 3, one for fitting to the top of the stove and the other to the top of the feeder, and so arranged that products of combustion can pass between them.

79,276.—EDWARD SULLIVAN, Pittsburg, Pa.—*Reamer.*—June 23, 1868; antedated June 6, 1868.—The cutters can be adjusted so as to bore holes of different diameters.

Claim.—The combination and arrangement of the cutters and blank head *C*, collar *e*, sleeve *D*, cone *f*, rod *A*, and the cutters and blanks, the whole being constructed, arranged, combined, and operating substantially as herein described, and for the purpose set forth.

79,277.—MICHAEL SWEENEY, Wheeling, W. Va.—*Lamp Chimney.*—June 23, 1868.—The lens-like portion of the chimney is designed to concentrate the rays of light, and produce a more complete illuminating effect.

Claim.—As an article of manufacture, a lamp-chimney, constructed with an oval bulge, regular in form, and with a uniform curvature, except as to the rounded lens-formed projection *B* on the sides, substantially as set forth.

79,278.—B. B. TAGGART and C. W. BROWN, Watertown, N. Y.—*Hat.*—June 23, 1868.—The paper is rendered soft and pliable by moistening, after which it is shaped upon a form or block and allowed to dry; it is then placed upon a block and pressed into the form which it ultimately preserves.

Claim.—As a new article of manufacture, a hat or bonnet-body, molded or pressed from a continuous sheet of formed paper, substantially as and for the purposes herein shown and specified.

79,279.—HIRAM TAYLOR, Cincinnati, Ohio.—*Lubricator.*—June 23, 1868.—The cast-metal band or collar is designed to constitute an air-tight and strong attachment for the supporting stem. The rod is made somewhat smaller than the aperture in the stem, or is formed with a flat side to allow the oil to flow from the reservoir to the shaft to be lubricated.

Claim.—1. A metallic band or collar, *I*, cast around and within the neck of the reservoir *G*, for the purpose of attaching the supporting stem *E* thereto, as specified.

2. In combination with the band or collar *I*, of soft or fusible metal, applied as set forth, the threaded tube or bushing *F*, of harder metal, for the reception of a screw on the upper end of the stem *E*.

3. The rod *D*, formed with a projection or enlargement, *d*, on its upper end, to support it out of contact with the journal, substantially as described.

79,280.—L. D. TAYLOR, Granville Center, Pa.—*Combined Land Roller, Fertilizer, and Seed Sower.*—June 23, 1868.—When the machine is in motion the two-part main roller serves to give motion to the friction or crank wheels which operate the elbow levers through the medium of pitman rods and thereby reciprocate the perforated plates of the hoppers.

Claim.—The combination of the front and rear hoppers *I* *I*, and their respective plates *K* *K*, pitmen *P* *P*, levers *L* *L*, rollers *M* *M*, and cylinders *A* *A*, all constructed and operating substantially as specified.

79,281.—DANIEL G. TERRELL, Wakefield, Pa.—*Brake for Horse-Power Machines.*—June 23, 1868.—A long lever carrying a brake is sustained while the

machine is in operation by a latch attached to a pivoted arm carrying a tightening drum which rests upon the belt. Should the belt break or slip off a pulley or wheel, the tightening drum falls, liberates the brake lever from the latch, throws the upper end of the pivoted arm against the brake, and thereby applies the brake to the driving wheel with sufficient force to stop its revolution.

Claim.—The arrangement in horse-powers, of the mechanism herein described, whereby the brake will be self-acting when the belt breaks or flies off, and also serves the purpose of a hand brake to stop the machine when the belt is on in running order, substantially as and for the purposes herein set forth.

79,282.—DANIEL J. TITTLE, Albany, N. Y., assignor to ALBI M. TITTLE, same place.—*Horse-Power.*—June 23, 1868.—The outside rows of cogs work on the front and rear carrying wheels. A gear wheel on the front carrying wheel shaft works into a gear wheel fixed to the axle of the drive wheels, and is adjustable laterally so as to be thrown into and out of gear. The center cogs work directly on the drive wheels when held in gear therewith by a lever operating one or more rollers beneath the tread apron which press said cogs into the drive wheel gear. Holding clamps, having set bolts and nuts, retain the tread apron at the required degree of inclination. The pan receives the animal excrement.

Claim.—1. The endless tread, composed of the pieces *e e*, and furnished with the links *f f*, outer cogs *g*, and middle cogs *h h h*, and all in combination with the said tread pieces *e e*, substantially as and for the purpose set forth and described.

2. The gear wheel *K*, working on the shaft of the carrying wheels *c*, in combination with the levers *i* and *n*, and connecting bar *o*, or their equivalents, as and for the purpose set forth and described.

3. The gear wheel *M*, in combination with the drive wheel *D*, or its equivalent, and the gear wheel *K*, substantially as and for the purpose set forth and described.

4. The rollers *r r*, with their supporting bars *t t*, or their equivalents, in combination with the lever *S* and its link *w* and connecting ear *v*, or their equivalents, as and for the purpose set forth and described.

5. The holding clamps *x x'*, and binding bolt and nut *y*, or its equivalent, as and for the purpose set forth and described.

6. The pan *Z*, arranged as and for the purpose set forth and described.

79,283.—E. R. WHITNEY, Plattsburg, N. Y.—*Car Coupling.*—June 23, 1868.—When the coupler enters the chamber it strikes the lower vertical arm of the cross and moves it backward, the rear horizontal arm lifting the dog until it becomes the upper vertical arm, when the dog falls and locks the cross. By raising the handle and placing the pawl in the notch, the cross may be revolved freely in either direction.

Claim.—The arrangement of a four-armed cross or wheel *B*, dog or lever *C*, with spring *D*, pawl *E*, handle *F*, and notch *a*, all made and arranged in the coupling box *A*, and operating substantially as and for the purposes above set forth.

79,284.—FRANK WICKS, Upper Sandusky, Ohio.—*Horse Rake.*—June 23, 1868.—In order to discharge the gathered hay from the rake, the operator, having hold of the upper round of the handles, slightly lifts the heel of the gatherer; this causes the points of the teeth to catch in the ground when the teeth and handles are turned over. The teeth and handles are restored to the former position by the catching of the handle dogs in the ground.

Claim.—1. The runners *E E*, constructed substantially as described, with the curved part extending from the front extremity to the rear of the line of the points of the teeth *P P*, for the purpose set forth.

2. Locating the post *G*, or its equivalent, back of the points of the teeth *P P*, substantially in the manner and for the purpose specified.

3. The construction and arrangement of the rods or braces *N O*, with the handles and cross bar *I*, and nuts *t t*, for the purpose of bracing the handles to the cross bar *I*, substantially in the manner described.

79,285.—NEWIEL J. WILLIS, Boston, Mass., assignor to the BOSTON SPRING BED COMPANY, same place.—*Spring Bed Bottom.*—June 23, 1868.—Each of the slats has two transverse notches or grooves to receive the middle straight portion of the bent wire springs, across which are turned the fastening buttons.

Claim.—1. The improved spring bed bottom, as composed of the frame *B*, the two round bars *A*, the two series of springs *C*, (of the kind described,) and the series of slats *D*, arranged and applied together substantially as described.

2. The construction and arrangement of the two buttons with the grooved slats and their springs, arranged and applied to such slats and round bars in manner substantially as explained.

79,286.—PUTNAM WILSON, Newport, assignor to R. M. MANSUR, Augusta, Me.—*Cheese Press.*—June 23, 1868.—The bed piece upon which the cheese rests is made to rise by the force exerted upon the levers by the wheel and axle, the force being communicated to the bed piece by the loose end bars. Under this arrangement there is an upward as well as a downward pressure.

Claim.—The construction and arrangement of the levers *E E*, uprights *D D*, movable bottom *B*, upright standard *F*, and follower *G*, all operated by the rope *I*, drum *J*, and lever *K*, substantially as herein set forth.

79,287.—GEORGE F. WRIGHT and WILLIAM ORR, Jr., Clinton, Mass.—*Tag.*—June 23, 1868; antedated June 5, 1868.—The thickness of the piece of pasteboard corresponds with the diameter of the string, so that when the string is looped around it and the two pasted between the tag and its heading piece a smooth external surface is presented.

Claim.—The use of a circular or otherwise-shaped piece of pasteboard, or its equivalent, when inserted between the two thicknesses of the tag or label, around which the string, or its equivalent, is looped, in the manner substantially as herein shown and described.

79,288.—JOHN HARTZELL ZINN, Harrisburg, assignor to himself and T. B. WEAKLEY, Dauphin County, Pa.—*Line Holder.*—June 23, 1868.—The tops of the arms of the lever are grooved out so that when a rope is placed in the depressions and under the flange it can be stretched away at any desired angle without slipping off its holding points.

Claim.—The arrangement of the lever *D*, with central arm *a*, pivoted on the frame *A*, and arm *C*, in connection with the arch-shaped flange *B*, all made of iron, brass, or other suitable material, for the holding of rope or wire, substantially as herein set forth and described.

79,289.—S. G. MONCE, Marathon, Ohio.—*Apparatus for Motive Power.*—June 23, 1868.—The main spring, being wound up, impels a train of wheels, including the verge wheel, which, acting upon the verge, oscillates the lever which imparts motion to the shaft carrying the fly wheel.

Claim.—The combination of the verge *g*, arm or lever *i*, connecting rod *k*, and fly wheel *o*, all as shown and described.

79,290.—CHARLES BENJAMIN WILLOUGHBY, Uhricksville, Ohio, assignor to himself and W. A. BOVEY, same place.—*Carburetter.*—June 23, 1868.—Gas is produced by forcing air into the oil in the oil tank, from which the gas passes to the gas chamber to be conducted thence through a pipe into the water in the tank. The gas rises through the water into the gasometer, the weight of which forces it into the pipe which supplies the burner.

Claim.—1. The combination of the oil tank *B*, gas chamber *D*, pipes and valves *d*, all as shown and described, and for the purpose specified.

2. The combination of the gas chamber *D*, gas pipe *E*, and valves *f*, substantially as shown and described, and for the purpose specified.

3. The combination of the oil chamber *B*, the air-supply pipe *C*, and valve *c*, substantially as shown and described, and for the purpose set forth.

79,291.—WILLIAM MORGENSTERN, Hartford, Conn., assignor to HERMAN FUNKE.—*Breech Loading Fire Arm.*—June 23, 1868.—The hammer and lock mechanism are contained in and move with the swinging breech piece. The cam at the under side of the breech, actuated by a spring, throws the cartridge case clear of the gun, by a sudden movement, after said case has been retracted by an ordinary extractor on the forward end of the breech piece.

Claim.—1. In combination with a hinged breech-block, the firing pin, main spring, and sear, arranged within said block, substantially as described, for the purpose set forth.

2. Making the firing pin and dog, or handle, all in one piece, substantially as described, for the purpose set forth.

3. In combination with a swinging breech and firing pin or hammer, the projecting portion E, the whole arranged to accomplish the locking down of the breech, substantially as described.

4. The employment, in combination with an extractor, of an ejector, composed of a spring cam or flipper, such as herein described.

79,292.—JAMES H. LAMENT and D. A. LAMENT, Troy, Pa.—*Fruit Picker.*—June 23, 1868.—The fruit is detached by the fingers and is caught by the receptacle below.

Claim.—The combination, in a fruit picker, of the vessel A and fingers *a a a a*, all substantially as shown and described.

79,293.—PATRICK ADIE, of the Strand, England.—*Machine for Clipping Horses' Hair.*—June 30, 1868.—A number of cutters are so arranged on a comb that the length of hair left, in clipping, may be regulated, and the cutters are guarded by said comb so that the skin of the animal cannot be injured.

Claim.—The combination of the toothed plates A and B, screws I and I, handle A H, with handle or lever L K D H, the whole constructed and operated in the manner and for the purpose above set forth and described.

79,294.—JAMES ALBEE, Boston, Mass., assignor to MOSES POND and Co., same place.—*Hot Air Furnace.*—June 30, 1868.—The air heating pipes are arranged in a nearly vertical series. Two pipes, leading downward into a flue resting upon the throat of the ash chamber, conduct the products of combustion to said flue, when the direct draught is closed, in order to heat the contents of a pan which rests upon said flue, the pan being introduced and withdrawn through a throat in the case between the two pipes. The draught through the two pipes to the escape flue is equalized by a damper or perforated partition.

Claim.—1. The arrangement and combination of the flue N with either or both the pipes M, the fire pot A, the drum F, the conduit *f*, the escape pipe O, or its branch pipe *h'*, provided with a damper, as described, the case I being furnished with a throat or opening for the passage of the evaporating pan P to and from the top of the flue N, as set forth.

2. The arrangement and combination of the deflector H with the case I, the fire pot A, the drum F, the series of pipes G, and their extensions G', arranged with the drum and the fire pot, as specified.

3. The combination of the damper, or the partition *n*, having a hole, *o*, as described, with the two pipes M M, and the flue N, arranged with the fire pot, the drum, and the case, and combined with the conduit *f* and the escape pipe O, as set forth.

4. The arrangement of the evaporating pan and its throat with the flue N and the fire pot.

79,295.—J. S. ALLEN and A. P. WILKINS, Allen's Grove, Wis.—*Key Board for Pianos, &c.*—June 30, 1868.—Two or more rows of short keys are placed immediately behind the longer, ordinary keys, in the same plane therewith. By means of said short keys a tone, an octave higher or lower than the key directly in front of it, may be sounded.

Claim.—A key board to a piano forte or other musical instrument, in which additional keys, whether one or more series, are employed and ar-

ranged for operation upon the ordinary keys of the key board, substantially as and for the purpose described.

79,296.—A. Q. ALLIS, Dayton, Ohio.—*Treadle for Sewing Machines.*—June 30, 1868.—A coil spring is applied to the sewing machine as the moving power, for ordinary domestic use. A friction roller and a brake, governed by a foot lever, are employed to adapt the motion of the machine to the work.

Claim.—The arrangement, upon the frame A, of the spring F on shaft *b*, the ratchet wheel *c*, pawl *d*, and gear wheels *e g*, *e' g'*, *e" g"*, driving shaft B, pulley E, fly wheel D, friction pulley *h'*, brake *h*, rod *k*, spring *m*, treadle *n*, and rack *p*, as herein described, for the purpose specified.

79,297.—ROBERT ATHERTON and GEORGE SINGLETON, Paterson, N. J.—*Spinning Machinery.*—June 30, 1868; antedated June 19, 1868.—The bobbin receives motion from an endless cord on the pulley, and as the silk is unwound from the bobbin it receives the proper degree of torsion from the retarding effect of the traveler of the thimble cap. The object in imparting motion to the bobbin alone is to enable the same to be run at a higher degree of speed than usual.

Claim.—In silk spinning machinery, the combination of the stationary pin B, stationary thimble cap K, and thread-guide traveler W, with the movable tube E, and bobbin H, constructed and arranged substantially in the manner described and for the purpose set forth.

79,298.—J. S. ATTERBURY and T. B. ATTERBURY, Pittsburg, Pa.—*Manufacture of Glass Ware with Handles.*—June 30, 1868.—By successive operations in the same mold the body of the article is blown and the handle produced and permanently attached thereto.

Claim.—A glass lamp, or other article in glass, having a molded or cast handle, and a blown body, produced substantially as described.

79,299.—DEXTER AVERY, Westfield, Mass.—*Whip.*—June 30, 1868.—The threads of the covering of the whip are interwoven like regular fabric, instead of being braided as usual.

Claim.—As a new article of manufacture, a whip having its covering woven with a weft and warp, as herein described, for the purpose specified.

79,300.—DARIUS BABCOCK, Warsaw, Ill.—*Harvester.*—June 30, 1868.—Motion from the carrying wheels of the machine is communicated through the gearing inclosed in the dome-like frame to the cutters in the flexible bar, which is raised by a lever and prevented from rolling over by a hook.

Claim.—1. The dome-shaped frame A', in combination with the dome A, and in combination with any mowing and reaping machinery, substantially as shown and described, and for the purposes set forth.

2. The annular frame P, in combination with the frame A' and the axle M, substantially as shown and described, and for the purposes set forth.

3. The combination of the axle M, gear wheel D, pinion C, shaft B, crown wheel *a*, pinion E, and shaft H, with the frame P, all constructed, arranged, and operating substantially as and for the purposes set forth.

4. The frame *f*, in combination with the lever L', and chain, and arm *i*, substantially as shown and described, and for the purposes set forth.

5. The hook *g*, in combination with the arm *i*, and any flexible bar R, substantially as shown and described, and for the purposes set forth.

79,301.—ALFRED B. BEAUMONT, Grand Rapids, Mich.—*Broadcast Sower.*—June 30, 1868.—The cone guides the seed to the openings of plates situated at the bottom of the hopper and made adjustable to regulate the flow of seed. Through these plates the grain is delivered to the interior of a rotating wheel, consisting of two disks, separated by ribs, and from which the grain is discharged at the rear of the machine by centrifugal action.

Claim.—1. The adjustable disks *k'' k'''*, for regu-

lating the discharge of the grain, substantially as and for the purposes shown and described.

2. The stop *S'*, in combination with the disk *k'''*, substantially as and for the purpose shown and described.

3. Arm *m''*, substantially as and for the purposes shown and described.

4. Arm *m'''*, substantially as and for the purposes shown and described.

5. The slot *v* on the arm *m'''*, substantially as and for the purposes shown and described.

6. The spring *v'* on the arm *m'''*, substantially as and for the purposes shown and described.

7. Operating the disk *k''* by means of a rod, *M*, spring *S'*, lever *P*, and hook *t*, or other equivalent devices, substantially as and for the purposes shown and described.

8. The guiding cone *K*, substantially as and for the purposes hereinbefore shown and described.

9. The arms *m* and *n* of the cone and hopper, substantially as and for the purposes shown and described.

10. Constructing a scattering wheel, *i*, with a central opening, *k*, and channels *o*, whereby the grain can pass into a portion of its said channels, substantially as and for the purposes specified and shown.

11. The cylindrical slides *p* of the disk *k''*, for the purpose of retaining the latter in the throat of the hopper, whereby the said disk is permitted to partially rotate, substantially as and for the purposes hereinbefore described.

12. The bevel wheel *F* on the axle *x*, and connected with an independent ratchet disk *f*, substantially as and for the purposes hereinbefore shown and described.

13. The hollow pulley *H*, with its bevel wheel *G* within it, in combination with a grain sowing machine, substantially as and for the purpose shown and described.

14. The coupling devices *f''' b'*, in combination with a grain sowing machine, substantially as and for the objects shown and described.

15. The disk *k'* attached to the cone *K*, and provided with openings for dropping the grain or plaster, substantially as and for the purposes shown and described.

79,302.—HENRY BEYRODT, Louisville, Ky.—*Bed Spring*.—June 30, 1868.—The lower end of the cylinder containing the spring is pointed, so that it may be secured in position by pressure upon projections of the bedstead rails. A frame, traversed by strips of webbing, rests upon the "pressers," which project from either side of their respective cylinders, and move vertically in the slots, while they bear directly upon the springs. Each cylinder has at top a perforated ear, whereby it is secured to the rail.

Claim.—The combination and arrangement of the outer cylinder, No. 3, the spiral spring and its covering, No. 4, and the presser, No. 6, constructed and operated in the manner as shown and described, and for the purpose set forth.

79,303.—J. B. BLAIR, Philadelphia, Pa.—*Gilding and Ornamenting Glass Signs*.—June 30, 1868.—This invention consists in the adaptation of the process of chromo-gelatin photography to the execution of ornamental gilding and painting, especially as applied to the manufacture of glass signs which require a number of duplications.

Claim.—The production of duplicates in plain or ornamental gilding or painting, substantially as and for the purposes set forth.

79,304.—A. R. BLOOD, A. HATHAWAY, and V. R. BEACH, Independence, Iowa.—*Cultivator*.—June 30, 1868.—Devices for elevating and depressing the teeth, and regulating the quantity of seed to be sown.

Claim.—1. The levers *J J*, strips *a a*, bar *L*, and pivoted frame *I*, when all are arranged and operating substantially in the manner and for the purpose set forth.

2. The set screw *H*, seed slide *b'*, levers *J J*, strips *a a*, bar *L H*, pivoted frame *I*, all combined and arranged as and for the purpose described.

79,305.—A. E. BOWEN, Baltimore, Md.—*Crutch*.—June 30, 1868.—The crutch can be adjusted to suit

the height of the person using it. A piece of rubber, covered with cloth, is secured over the arm-piece by screwed metallic plates. The movement of the yielding plug at the lower end of the crutch is limited by a pin traversing a slot.

Claim.—1. An adjustable crutch, constructed in the manner and for the purpose herein set forth.

2. The combination of the legs *A A* and *B B*, the thumb screws *i i*, the elastic top or arm-rest, and the elastic bottom of the crutch.

79,306.—WILLIAM BRADSHAW and CHARLES LYON, Delphi, Ind.—*Wrench*.—June 30, 1868.—The movable jaw does not encompass the shank, but is hinged by its arm to the sliding saddle and held against the shank by a spring. When the wrench is turned in the effective direction, the jaw takes a firm hold upon the nut, but when turned in the contrary direction, the jaw is thrust out, permitting the wrench to be turned on the nut, and obviating the necessity of removing the wrench at each turn.

Claim.—The open-backed jaw *E*, in combination with the links *b* and shanks *C*, substantially as described, for the purpose specified.

79,307.—J. B. BREATHITT, Cooper County, Mo.—*Nail Extractor*.—June 30, 1868.

Claim.—The fulcrum, *B*, of the nail extractor *A*, when pointed at its lower end, and adapted to be adjusted longitudinally of the extractor *A*, to increase or decrease the leverage of the latter, as herein described, for the purpose specified.

79,308.—ASA T. BROOKS, New Britain, Conn.—*Door Bell*.—June 30, 1868.—The object of this arrangement is to produce a double and accelerated action of the hammer at each pull or vibration of the spindle.

Claim.—1. An oscillating arm *k'* and vibratory cam *u*, secured and oscillating both upon the same stud-pin *n*, in combination with the arms *d h*, substantially as described.

2. In combination with the above, the angle-lever *v*, oscillating upon the pin *v'* all arranged and operating substantially as and for the purpose described.

79,309.—R. M. BROOKS, Griffin, Ga.—*Railroad Rail*.—June 30, 1868.—The object is to add strength to the rail by corrugating the flanges of the hollow bar or cap, and adapting the same to similar notches or corrugations in the flanges of the bottom part.

Claim.—The combination of the railroad rails *A* and *B*, provided with corrugated flanges *a a* and *b b*, and fitting together, substantially as and for the purpose set forth.

79,310.—STEVEN BUYNITZKY, St. Petersburg, Russia.—*Wash Boiler*.—June 30, 1868.—As the clothes are raised by the accumulation of steam within their folds, the plate also rises and lifts the cover from the sides of the boiler, so as to admit cold air.

Claim.—A loose plate *C*, provided with the guides *E*, or their equivalents, substantially as described, to be placed on the top of the clothes in the wash boiler, for the purposes set forth.

79,311.—MATTHEW M. CARR, Ringwood, Ill., assignor to himself and THOMAS S. CARR, same place.—*Wagon Body*.—June 30, 1868.—The hinged sections constituting the bottom may be swung down to dump the load.

Claim.—The combination of the hinged sections of the bottom *C D E*, the bars *F*, pivoted, as described, at *H*, the springs *J*, latches *I*, levers *K*, cords or chains *G* and *N*, and levers *L* and *M*, all arranged and operating in the manner set forth.

79,312.—GARDINER CHILSON, Boston, Mass.—*Stove Grate*.—June 30, 1868.—The peculiar arching of the grate and the truss form of its side bars are designed to render it so strong as to prevent sagging in the middle when the grate is overheated. The elbow on the arm is to carry the latter out of the way of the drawer or ash pan.

Claim.—1. The square or rectangular grate as arched or curved, both longitudinally and laterally,

and having its side bars trussed or made deeper at their middles than at their ends, as represented.

2. The combination and arrangement of the elbow of the grate arm, with such arm and the grate, constructed and disposed relatively to each other, substantially as specified.

79,313.—THOMAS J. CHUBB, Williamsburg, N. Y.—*Apparatus and Process for Making Steel.*—June 30, 1868; antedated December 30, 1867.

Claim.—1. The construction of a series of deoxidizing and carbonizing retorts or chambers, A A A, arranged so as to prevent the gases from the heat-producing fuel from coming in contact with the ore or the materials in the retort, in combination with a melting chamber, for the purposes set forth.

2. The arrangement of the melting chamber B B' with openings and doors at both ends, in such a manner as to facilitate the manipulation of the ore or metal under treatment from both ends, substantially as described.

3. Making provision for feeding loose ore and metallic and other substances in at one end of the melting chamber or furnace B', and tapping the molten metal at the other end, substantially as described.

4. Making provision for conducting heated air and gases over the ore or molten metal, said air and gases entering at one side or end of the said melting chamber or furnace, and passing out at the sides or other end thereof, for the purpose of reducing said ore, metal, or metallic substances therein into a liquid or molten mass, substantially as described.

5. Making provision for shielding the ore, metal, and other substances from the direct action of the gases of the fuel by arches T.

6. Making provision for shielding and protecting the molten metal in a melting chamber from the direct action of the air, flame, and gases of the fuel by floating shields, or an equivalent refractory substance or substances floating on the top of the metal, as described.

7. Making provision for skimming off the surface of molten metal by floating scrapers, or their equivalent, substantially as described.

8. Effecting a separation of the cinder or upper layer of substances floating on molten metal, by the means herein specified and described.

9. The construction of a vessel or melting chamber of a furnace, so arranged as it may be sufficiently heated solely from above, by which means the metal therein becomes fully melted into a liquid state previous to skimming, tapping, and drawing off the same, substantially as herein described.

10. Making provisions for and effecting the melting of metals by heat applied solely from above the metal, when said heat is derived from a gas-regenerative apparatus or furnace.

11. The arrangement of a furnace or of a vessel or vessels in a furnace for melting metals therein, in combination with and heated by the flame produced by the mingling together of the air and gas rising from and having passed through an air-heating and gas-heating or reheating furnace, chamber, or apparatus, in separate currents.

12. Providing for keeping the under side of the melting chamber, or chambers in which the melting chamber or vessel is placed, cool, or from melting or leaking, by the arrangement of a cold-air chamber or space below the same, C.

13. The employment of slabs or arch pieces T T, for the purpose set forth.

14. The employment of scrapers or skimmers S S, or their equivalent, for the purpose set forth.

15. The employment of floating fire shields and heat conductors S S, for the purpose set forth.

16. Constructing slabs, arches, and shields with an uneven or irregular surface on one or both sides thereof, for the purpose set forth.

17. The method or process of refining metals and separating the dross and other extraneous matter from the surface of melted metal by mechanical power and appliances, or of inserting of refractive or infusible colder substances than the dross and scum, cooling and congealing them, that they may be skimmed or removed from off the surface of the molten metal, substantially as set forth.

18. Making provisions in the construction of a melting chamber of a furnace for reducing iron into

such a liquid state by igneous fusion that highly-carbonized iron ore or pig iron, cast iron, or steel, and natured iron ore, or wrought iron, may fuse and mix with each other, and that impurities and surplus carbon, silicon, and other matter that is not essential to the production of good cast steel, may be flooded and removed from the surface of the molten steel, refining and running the same into vessels or molds, substantially as described.

19. Obtaining cast steel or products of any degree of malleability or ductility by melting together in a vessel or chamber in a furnace, combinations of pig iron and wrought iron, or of natured or partly natured iron and cast iron, and fusing, mixing, refining, and running the same into molds, substantially as described.

20. The production of cast steel by melting together, in a fixed or stationary melting vessel, chamber, or furnace, cast iron and iron ore, when such iron ore has been previously reduced, or natured, or partly natured, or carbonized in a separate vessel, retort, or furnace, and when mixed with manganese or titanium, or the ores or compounds thereof, and fusing, mixing, and running the same into molds.

21. The production of cast steel by first melting the iron or metal containing the most carbon in a stationary vessel, and adding the metal or ore containing the least carbon to the molten metal, and, when the whole is reduced to the proper consistency of cast steel, running the same into molds.

22. Effecting a continuous process of reducing or melting and refining ores and metals by mechanical appliances, and at one heating, and in one furnace chamber, substantially as described.

23. Effecting a continuous process of making cast steel from iron ore by submerging it into a bath of molten cast iron or highly-carbonized iron, whereby the whole will be liquefied and brought to the consistency of cast steel, and refined and run into molds.

79,314.—THOMAS J. CHUBB, Williamsburg, N. Y.—*Making Steel Direct from the Ore.*—June 30, 1868; antedated January 15, 1868.

Claim.—1. The arrangement and employment of fuel supporters *a a* and *d d'*, for the purpose set forth.

2. The arrangement and employment of stirrers and conveyors *b b b*, for the purpose set forth.

3. The process of decomposing mineral substances by currents of heated gas or gases passing through and among finely-divided particles of the same, substantially as described and herein shown, and for the purpose set forth.

4. The carbonization of iron or iron sponge, or the metallic particles therein, by a current or currents of heated gas or gases, as herein described, passing through and among finely-divided particles of the same, substantially as described.

5. The steel-melting chamber C, in combination with a heat-reclaiming apparatus, or a gas-regenerative, or an air and gas-heating apparatus or furnace.

6. The process of making cast steel, in combination with a heat-reclaiming and regenerative apparatus or furnace.

7. The employment of aluminous substances, such as fire-clay crucibles, as a substitute for plumbago crucibles, for making or melting steel therein, in combination with a gas-generative furnace and a heat-reclaiming apparatus.

8. The employment of a stationary melting chamber, vessel, or furnace, in combination with the apparatus employed in the process of decomposing or deoxidizing iron ore, and carbonizing the metallic particles thereof.

9. The employment of a stationary melting chamber, vessel, or furnace, in combination with the process or processes of decomposing or deoxidizing iron ore, and carbonizing the metallic particles thereof.

10. The process, herein described, of decomposing or deoxidizing iron ore and carbonizing the metallic particles thereof.

11. The process, herein described, of making cast steel direct from the ore.

12. The employment of coal tar, rosin, petroleum oil, or the gas or gases thereof, for the purpose set forth.

13. The employment, in the deoxidizing chamber, in

combination with carbon, of ammonia or some ammoniacal compound, or of fusible compounds of cyanogen, or the gas or gases therefrom, to facilitate the conversion of iron ore, or iron or steel sponges, into molten or cast steel, substantially as described.

14. The employment of the chamber A A' in the manner described, and the appurtenances and process employed therewith, for the purpose set forth.

15. Deoxidizing and carbonizing iron ores in a chamber separate from and previous to melting the same in a cupola or a blast furnace, substantially as described.

16. The combination of the process or processes of deoxidizing and carbonizing iron ores with the process of reducing and melting the metallic particles thereof, in a cupola or a blast furnace.

17. The arrangement of a melting or remelting and refining chamber, as described, in combination with a cupola or a blast furnace, (Figs. 3 and 4.)

18. The combination of the process of reducing iron ores, and melting the metallic particles thereof in a cupola or a blast furnace, with the process of melting or remelting and refining, substantially such as herein described.

19. Producing refined iron or steel by the process of deoxidizing and carbonizing the ore in a separate chamber, and melting the metallic particles thereof in a cupola or a blast furnace, substantially as described and shown, (Figs. 4 and 6.)

20. Producing refined iron or steel by the process of reducing the ore, and melting the metallic particles thereof in a cupola or a blast furnace, and reheating and refining the same in a melting or remelting and refining chamber, substantially such as is herein described.

21. The arrangement or employment of an air-heating and gas-heating or reheating apparatus, in combination with a cupola or blast furnace, for the purpose set forth.

22. The arrangement or employment of an air-heating and a gas-heating or reheating apparatus, in the process or processes of deoxidizing and carbonizing iron ore, substantially as described.

23. The employment of the chamber C, in the manner described, and the appurtenances and process employed therewith, for the purpose set forth.

79,315.—ROBERT CLARKE, Mount Vernon, Ohio. *Car Standard.*—June 30, 1868.—The slot, through which the attaching bolt passes, adapts the standard to be raised out of its box or socket in order that it may be turned to a horizontal position so as to be out of the way in unloading.

Claim.—The box A, provided with the side supports G G, and confined to the ear by means of the stirrup B and the pin E, when used in combination with the standard D, which is provided with a slot, *a*, through which the pin E passes, as and for the purpose set forth.

79,316.—HENRY M. CLOSE, Chariton, Iowa.—*Implement for Sharpening the Calks of Horse Shoes.*—June 30, 1868.—By this instrument the calks may be sharpened without detaching them.

Claim.—1. The jaw D, with the block E and the upright F substantially as specified.

2. The combination of the cutter H, block or rest E, and set screw G, substantially as and for the purpose described.

78,317.—L. O. COLVIN, New York, N. Y.—*Cow-Milking Machine.*—June 30, 1868.—The part of the apparatus (not here shown) to be applied to the teats is connected to the pipes leading from the cylinder, which has a variable oscillating motion in order that the udder may be affected vigorously when required. The invention provides means to facilitate the placing of the cows in position, and prevent the apparatus from being injured or detached from the teats by the motions of the animal.

Claim.—1. A pump cylinder, for actuating a cow-milking apparatus, having a variable oscillating movement imparted to it, substantially as and for the purpose described.

2. The combination, with a pump having a variable oscillating movement, substantially as and for the purpose described, of the tubes E and E¹, for supporting the milker, and communicating the various

motions to the same, as herein described and for the purpose set forth.

3. The combination of the tubes E and E¹ of the caps *d* and *d*³, bracket *a*¹, set screw *d*⁴, and pin nut, when constructed and arranged substantially as and for the purpose described.

4. The combination, with a pump piston-rod, of the bent arm *c*, pivoted to the end of a bent hand lever, D, and oscillating joint *a*, substantially as and for the purpose described.

5. The stall, constructed as described, in combination with the cow-milking device, as herein set forth and for the purpose specified.

6. The combination, with the oscillating cylinder A, of the pipe E, when jointed to the same in the manner described, as and for the purpose described.

7. A pump cylinder for cow-milking apparatus, to which the same is connected, as described, provided with a swivel joint, *d*, whereby the cylinder may be susceptible of oscillation on its axis, substantially as and for the purpose described.

79,318.—GEORGE CONRON, New York, N. Y.—*Water Closet Automatic Supply Regulator.*—June 30, 1868.—A float ball is placed within a water chamber which communicates with the discharge pipe of the water closet bowl, the float ball being connected with the supply-pipe valve by means of a lever, and so arranged that when the water from the bowl is drawn off by lifting its proper valve, the water in the chamber will, in subsiding, lower the float ball, and bring its weight upon the lever, thereby relieving the supply valve, permitting it to rise and admit a quantity of water for cleansing the bowl and its connections.

Claim.—The combination and arrangement, with relation to the bowl A and discharge pipes B L, of the chambers E, C, *h*, valve G, float D, lever A, rod *b c*, valve *d*, and box I, having the shoulder *j* and openings *e f* adapted to communicate with the supply pipes J K, substantially as herein shown and described, for the purposes specified.

79,319.—RICHARD CROCKER, Marshalltown, Iowa.—*Horse Shoe Calk Sharpener.*—June 30, 1868.—A device for sharpening the calks of iron-shod animals while the shoe remains secured upon the hoof. By moving the lever up and down a thin shaving is cut from the calk.

Claim.—The device consisting of the lever B, provided with the cutting edge *a*, the lever D, provided with the abutment *c* and face *b*, said lever B, with cutting edge *a*, lever D, with abutment *c* and face *b*, being combined, operating as described, and for the purpose set forth.

79,320.—STEPHEN H. CUMMINGS, Norway, Me.—*Sad Iron Handle.*—June 30, 1868.—The object is to have such a length of rod or wire that the heat cannot be conducted through it to the hand piece.

Claim.—As a new article of manufacture, the handle B, formed of a single piece of wire, which is bent and coiled to form vertical columns, the horizontal central portion being left plain, for the application of the part C, said handle being also provided with the shield D, all as herein shown and described for the purpose set forth.

79,321.—C. N. CUTTER, Worcester, Mass., assignor to DAVIS, HILL & COMPANY, same place.—*Metallic Reed for Musical Instruments.*—June 30, 1868.—An elastic packing is inserted between the attached part of the tongue and the frame, for the purpose of obviating the imperfect sound commonly incident to such reeds as have the tongue attached directly to the frame, owing to the escape of air between said parts.

Claim.—A metallic reed for musical instruments, in which the tongue of the reed and frame, or part to which the same is attached, are combined with an interposed rubber or other elastic packing, substantially as and for the purposes shown and set forth.

79,322.—C. N. CUTTER, Worcester, Mass., assignor to DAVIS, HILL & COMPANY, same place.—*Metallic Reed for Musical Instruments.*—June 30, 1868.—The projections of the elasp are passed through holes in the frame of the reed and are clinched at

the lower side. The clasp holds the base of the tongue to the bridge of the frame, and forms a box or cover, preventing dust and air from passing between the contiguous parts at the point of attachment.

Claim.—1. The combination, with the base *a*, of the tongue B and the main or frame part A, of a holding staple, clasp, or loop, substantially as and for the purposes set forth.

2. The combination, with the tongue B and frame or base A, of the clasp C, having projections *b b* and shoulders *d d*, substantially as and for the purposes set forth.

79,323.—JOHN HENRY DALLMEYER, Middlesex County, England.—*Compound Lens for Photographic Use.*—June 30, 1868; patented in England, September 27, 1868.—The denser or higher refractory medium, *i. e.*, the flint-glass lens, occupies the exterior position in both combinations, that is to say, the convex surface of the flint part of the front combination is exposed to the view or landscape, and that of the back or posterior combination to the screen of the camera. The posterior combination is also of smaller diameter than the anterior.

Claim.—1. The double combination lens, composed of two positive achromatic or actinic combinations, each having the higher refracting denser material at the exterior.

2. The construction of the double combination lens, with the denser higher refracting material at the exterior, and with the posterior achromatic combination of smaller diameter than the anterior combination.

79,324.—P. DAVIS, Newport News, Va.—*Letter Pouch.*—June 30, 1868.—An oblong paper bag, closed at the end by a flap, and having its exterior surface ruled off for addresses and numbers. The letters placed in the pouch correspond with the addresses, and as the letters of each address are taken from the pouch the corresponding address on the pouch is obliterated.

Claim.—A letter pouch, having its exterior lined or ruled off, with addresses printed or written thereon, substantially as shown and described.

79,325.—REES DAVIS, Utica, N. Y.—*Car Replacer.*—June 30, 1868.—Wood is combined with iron in order to associate lightness with strength; the difference in the length of the frogs is designed to insure the replacement of the cars by preventing them from running to the opposite side of the track in the act of replacing, and a toe or projection on the forward end of each frog is pressed into the tie by the weight of the car, the frogs being thereby held in place.

Claim.—A railroad car replacer, constructed of wood and iron, with the frogs of different lengths, arranged and adapted to the rails, substantially as described, and for the uses and purposes mentioned.

79,326.—LUCIUS A. DODGE, Keeseville, N. Y.—*Lubricator for Nail Machines.*—June 30, 1868.—A means for lubricating a forging roller, which is arranged to move rapidly around an axial support, and which, when in contact with the iron to be wrought, is also caused to rotate rapidly upon its own axis. The centrifugal action tends to create an undue flow of oil through the wicking of the lubricator, but set screws are forced against the wicking to limit the flow.

Claim.—The stock A, provided with the chamber C, the wick chambers C' and C', passages *d d*, and the set screws *a a*, substantially as and for the purpose described.

79,327.—N. B. DOUGLASS, Cornwall, Vt.—*Hay Loader.*—June 30, 1868.—The discharger consists of a series of inclined plates with intermediate spaces to admit of the passage of the teeth. The hay, being disengaged from the teeth, falls into the wagon. On freeing the springs from the stops, the rake may be turned backward and upward, out of the way.

Claim.—1. The removable frame G, attached to a frame, F, hung on the rear axle of the wagon, in

combination with the toothed belts *o*, and the discharger A^x, all arranged to operate in the manner substantially as and for the purpose set forth.

2. The rake head *s*, hung to the frame G in such a manner that by freeing the springs *u* upon the head, from the stops *w* upon the frame, the rake J can be turned up and rendered inoperative, as herein shown and described.

79,328.—JAMES DRINKWATER, Adams, Ohio.—*Horse Hay Fork.*—June 30, 1868.—The elevating teeth, when inserted into the hay, are turned to a horizontal position by raising the handle and thereby the sliding frame and rods to which said teeth are attached. By pulling the trigger the latch is pressed from a notch, whereupon the sliding frame falls and the teeth close so as to drop the hay.

Claim.—The combination of the handle G, latch H, spring I, notch L, and trigger K, with the hay fork, as herein described, for operating substantially as set forth.

79,329.—STAFFORD A. DU BOIS, Chicago, Ill.—*Skate.*—June 30, 1868.—The two-part skate is screwed to the boot in the manner shown, the larger diagram being an under side view of a boot with the skate applied.

Claim.—1. A skate, made in two separate and distinct parts, one to be attached to the heel of the boot, and one to the sole thereof, substantially as herein set forth.

2. In combination with the plates H and F of the skate, the flanges M and I, and the thumb screws L, when constructed and operating substantially as described.

79,330.—CHARLES DURANT, Jersey City, N. J., assignor to GEORGE F. DURANT, same place.—*Relay Magnet.*—June 30, 1868.—The machine rests upon elastic supports, which prevent the jarring and vibration of the table or desk, due to the operation of the sounder, from being communicated to the relay magnet. The shield is merely intended to cover and protect the conducting wire.

Claim.—1. The application of a spring or springs, a cushion or cushions, or other elastic substance, to the electro-magnetic relay machine, substantially as and for the purpose herein shown and described.

2. The shield or protector S, for the conducting wire I, substantially as and for the purpose herein shown and described.

79,331.—CHARLES DURANT, Jersey City, N. J., assignor to GEORGE F. DURANT, same place.—*Relay Magnet.*—June 30, 1868.—The fork of the armature serves to move the shifting bolt through the bent post for the purpose of opening and closing the local circuit. The jaw of the post insures steadiness by affording wide bearings for the bolt in its movements. The weight applies friction to the sliding post in order to secure firm writing.

Claim.—1. The jaws or fork in the armature or armature lever of an electro-magnetic relay machine, substantially as and for the purpose herein shown and described.

2. The jaws or fork in the post B, substantially as and for the purpose herein shown and described.

3. The weight T, applied substantially as and for the purpose herein shown and described.

79,332.—GEORGE ESTERLY, Whitewater, Wis.—*Broadcast Seeder and Cultivator.*—June 30, 1868.—A shaft, carrying the seed cylinder, derives motion from the axle, through gearing which may be thrown into and out of gear by means of a clutch lever; and said shaft is also provided with a lever whereby it may be moved longitudinally for the purpose of regulating or stopping the flow of seed.

Claim.—1. The construction of the cap F, with an upwardly-flaring throat, *d*, with a hollow projection, *d*², for receiving a packing, *f*, and also with a discharge passage, *f*¹, substantially as described.

2. The construction of the bearing G with discharge openings *h* and *f*² through its bottom, and with a recess on one side of it, over opening *h*, for receiving the circular flange S, said bearing being applied to the cap F, and adapted to serve, in conjunction therewith, as a receptacle for the rotary

distributor J and cylindrical cut-off J', substantially as described.

3. The flange S, with segmental projections S', in combination with the distributor J and cut-off J', arranged to operate substantially as and for the purpose described.

4. Applying the distributor J and cut-off J' loosely upon its shaft K, in combination with the cap F and bearing G, substantially as described, and for the purposes set forth.

5. Constructing conical scatterers I for seed-discharging tubes, with circular ribs or corrugations upon their surfaces, substantially as described.

6. The combination of the driving wheel N, pinion K¹, clutch *n n'*, and lever P, with the device K² K³, for regulating the discharge of seed, substantially as described.

7. The construction of the plate E, with the lateral offset *c*, serving as an end-bearing for the rod D², for carrying drag-bars D, substantially as and for the purposes described.

8. The adjustable clamp stops, pivoted to hoe standards D¹, when such stops are so constructed as to resist ordinary backward pressure against the hoes, and also to allow the standards to slip backward when subjected to an extraordinary pressure, substantially as described.

79,333.—MANDANA D. FENNER, Rochester, N. Y.—*Pump for Oil Wells.*—June 30, 1868.—The downward pressure of the liquid in the auxiliary tube assists in raising that within the main tube. An agitation is produced in the bottom of the well by the working of the plunger, and the erevices are thereby kept clear.

Claim.—An apparatus for washing or producing an agitation in a well, consisting of a tube opening directly into the liquid of the well, and having a solid plunger, in combination with an elevating tube, having a valvular piston, when the plunger and piston have an inequality of leverage, substantially as described.

79,334.—E. R. FERRY, New Haven, Conn.—*Bridle.*—June 30, 1868.—On drawing the reins gently, the check strap is pressed against the jaw by the action of the levers. The springs and stops prevent sudden action upon the check strap, and cause the latter to quickly relieve the jaw when the reins are slackened. The pulley arrangement enables the bit to be actuated with great power.

Claim.—1. The levers *f f*, fitted loosely on or permanently attached to the bar *e* of the bit, and having a curb strap or chain, *j*, attached to their upper ends, in connection with the reins D D, passing through the outer ends of the levers *f*, and passing over pulleys *c* at the upper part of the bridle, and down to the bit, all arranged to operate in the manner substantially as and for the purpose set forth.

2. The springs E E and stops *k*, applied to the reins D D, in connection with the levers *f f* and pulleys *c c* on the bridle, all arranged substantially as and for the purpose specified.

3. The application of the pulleys *c*, with or without the pulleys *h*, in connection with the reins D D, arranged substantially as and for the purpose set forth.

79,335.—CHARLES C. FOOTE, West Meriden, Conn., assignor to MERIDEN BRITANNIA COMPANY, same place.—*Enameled Metallic Ice Pitcher.*—June 30, 1868.—The enamel, being very hard, prevents the ice from injuring the metal of the pitcher, and obviates corrosion.

Claim.—Coating the inside of metallic ice pitchers with enamel, by applying the enamel in a liquid state to the metallic inner surfaces, substantially as herein shown and described.

79,336.—HENRY FORNCROOK, F. J. SHEPPERD, and ANDREW GARTON, Watertown, Wis.—*Hop Picker.*—June 30, 1868.—The branches are stripped from the vines and passed into the machine between the feed rollers, when they encounter the teeth of the picker, which detach the hops from the vines and pass both through the trough into the screen, wherefrom the hops drop into the shaker, whence they are conveyed by the elevator to sacks.

Claim.—1. The manner of adjusting the ineline of

the bolt F, by means of the movable strip *a*², in combination with the jack *g*², suspended to the frame by one screw upon each side, substantially as herein shown and described.

2. The combination and arrangement of the picker B, cleaner D, bolt F, shaker H, and feed rollers O O and P, in the manner and for the purpose substantially as herein set forth.

3. In combination with the above, the elevator M, arranged substantially as herein specified.

79,337.—N. A. FRANK, Chicago, Ill.—*Composition for Calcimining Walls, &c.*—June 30, 1868.—In addition to the materials ordinarily used in the preparation of calcimine, this composition embodies tallow, lye, whiting, plaster of Paris, and glycerine.

Claim.—A calcimine, composed of the ingredients herein named, and compounded substantially as specified.

79,338.—WILLIAM E. GORGE, Wrentham, Mass.—*Machine for Pressing Hats.*—June 30, 1868.—Under this invention a variety of hats may be produced by the use of one steam chest and pressing mechanism and a plurality of molds; the effect being to avoid the expense involved in providing pressing machinery for each form of hat.

Claim.—1. The combination and arrangement of the socket piece *m*, the head G, the diaphragm *k*, the elastic covering *l*, and flanged ring *q* of the die, the said socket piece *m* and flanged ring *q* being connected, substantially as described.

2. And for use with the steam chest C, when combined with a mold and die, and mechanism for forcing the die into the mold for the purpose of pressing a hat, I claim the combination, substantially as described, for fastening a mold, B, to the mouth of the steam chest, the same consisting of the flange *a*, the annulus F, the clamp ring E, the screws *g*, the projections *e*, (of the flange *d*,) and notches *f* of the said ring, the whole being arranged in manner and to operate substantially as described.

3. The combination of the presser or elastic die with the head G, by the tenons *s*, their pins and holes, the same being so arranged as to enable the said presser or die to be readily removed from the head G, without disturbing the connection of the diaphragm and the elastic covering of the presser.

79,339.—P. S. GERHART, Philadelphia, Pa.—*Register for Railroad Cars.*—June 30, 1868.—The arms of the turnstile are attached to its head by horizontal hinges or pivots, a circular rib on the turnstile always causing one or another of said arms to extend across the entrance horizontally, while the other or others hang down.

Claim.—The combination of a turnstile, with pending arms, with any car or other vehicle, the whole constructed, arranged, and operated in the manner as and for the purpose above set forth and described.

79,340.—EDMUND W. GILLMAN, Hunter's Point, N. Y.—*Mode of Repairing Barrels.*—June 30, 1868.—Device for binding and preserving the integrity of the barrel when the hoops are removed, in order to replace a broken or decayed stave, without removing the contents.

Claim.—The hoop B, slotted to receive the adjustable gripes C D, and provided with lugs adapted to be drawn together by means of the screw E, substantially as and for the purpose set forth.

79,341.—ANTON HAEUPEL and JOHN REINHARDT, Philadelphia, Pa.—*Locomotive Steam Engine.*—June 30, 1868.—The stroke of the valve is made variable by means of a wheel which is mounted upon the driving shaft, actuates the connections through which motion is imparted to the valve rods, and may be turned to any degree of obliquity in relation to said shaft; it being locked, released, and adjusted by a lever and trigger operated by the engineer.

Claim.—1. A valve-regulating wheel or disk, M, in combination with the shaft D, having notches *d'*, movable collars P Q, key S, and bar T, all arranged and operating substantially as herein set forth.

2. The combination, with the movable collars P Q,

of the releasing trigger O, lever N, and forks *n o*, with their described connections, substantially as herein set forth.

3. The slides L L, friction rollers L² L², and vibrating levers K K, in combination with the wheel M, for communicating motion to the valves, substantially as described.

79,342.—WILLIAM S. HAIGHT, Waterford, N. Y.—*Apparatus for Hopping Beer.*—June 30, 1868.—The hops to be treated are placed upon the false bottom, and the liquor is then introduced, and steam let into the lower compartment. Pipes are provided for drawing off the liquid, preventing its overflow, and conducting the aroma. The stirring device is removable to allow the false bottom to be taken out.

Claim.—1. Arranging a rotary stirrer, F *f*, in a hopping apparatus, between two perforated shelves D and E, substantially as herein shown and described.

2. The arrangement, in a beer-hopping apparatus, of the discharge pipe H and overflow pipe L, both arranged substantially in the manner herein shown and described. the overflow pipe entering the discharge beyond the tap *g* in the latter, as set forth.

3. A beer-hopping apparatus, consisting of the box A, air-tight cover B, perforated false bottom D, and perforated false cover E of the stirrer F *f*, discharge pipe H, overflow pipe I, and aroma conductor J, all made and operating substantially as herein shown and described.

4. Making the stirrer shaft F removable, by suspending one end upon the pin or arbor *c* of the driving crank or pulley, substantially as herein shown and described.

5. The application of the plug L, or its equivalent, through the real and false bottoms of the box A, for the purpose of facilitating the discharge of the spent hops, as set forth.

79,343.—WILLIAM HAMILTON, Chicopee, Mass.—*Hose Coupling.*—June 30, 1868.—When the parts are put together the lip of each fits over the rim of the other, and thus a locking is effected, which prevents the parts being forced asunder in the same line. The parts are clamped in this position by the slotted pins, so as to secure the joint.

Claim.—The combination of the two parts of the coupling, each having a lip B, and rim A, with the fastening pin D, with spiral slot H and eccentric face J, the parts being constructed and arranged together substantially as herein given.

79,344.—Major E. HANOVER and DAVID D. BAILEY, Lamoille, Ill.—*Cultivator.*—June 30, 1868.—The middle part of the axle is elevated and the frame so constructed that the machine may pass over the plants without injuring the same. The relative positions of the forward part of the frame and the hounds may be changed to regulate the working depth of the plows. Provision is made for equalizing the draught and removing the downward pressure from the necks of the horses.

Claim.—1. The frame C, constructed and arranged substantially as herein shown and described, in combination with the axle B, as and for the purpose set forth.

2. The combination and arrangement of the pivoted oblique beams P, connecting bars U, levers V, and connecting rods W, with each other, and with the frame C and hounds D, substantially as herein shown and described, and for the purpose set forth.

3. The combination and arrangement of the hounds D, frame C, lever hooks or catches E, coiled or equivalent spring F, and operating rod G, with each other, substantially as herein shown and described, and for the purpose set forth.

4. The combination of the angular or bent brace bars T with the pivoted plow beam P, axle B, and frame C, substantially as herein shown and described, and for the purpose set forth.

5. The bent levers A', pivoted at their angle points to the axle B, in combination with the connecting rod B' in rear of the axle B, draught rods C', horizontal bar E', hounds D, and slotted vertical arms D', all operating as described for the purpose specified.

79,345.—ALFRED HATHAWAY, Charlestown, Mass.—*Paper Shears.*—June 30, 1868.—The function of this device is to prepare sheets of blank checks for being torn on straight lines between the checks, by means of rows of perforations.

Claim.—1. The mechanism for securing the cutting action of the blade E, by means of wrist pins, acting in slots F and G, shaped as set forth, and located in arms attached to the lever D, substantially as described.

2. Shear blades, when one or both are denticulated upon the edge, and they are united by self-adjusting fulera, substantially in the manner and for the purpose set forth.

3. The combination of the stationary block B and lever D, with adjustable blocks C C', and levers *d d*, the latter being so connected with the lever D, by intermediate levers and rods, that they may be operated simultaneously with the latter by a single movement, substantially as and for the purpose set forth.

4. The combination of the lever D and denticulated shearing blade E, substantially as and for the purpose set forth.

79,346.—PETER C. HAVELY and WILLIAM W. COGGSHALL, Rensselaerville, N. Y.—*Hammer.*—June 30, 1868.—The nail-holder is a recess in which a nail may be placed, in order to be started in by a slight tap of the hammer, after which it is driven home in the usual way. By means of the notches and the set screw the jaw may be retained at any desired point, said jaw in conjunction with the hammer-head constituting a wrench.

Claim.—The implement herein described, consisting of the hammer B, adze E, nail-holder *a*, claw F, movable jaw G, notched socket C, graduated handle A, and removable screw-driver D, all constructed and arranged to operate in the manner as herein set forth.

79,347.—DANIEL HAYES, Cambridge, Mass.—*Clasp Hook.*—June 30, 1868.—The clasp or bar is passed over the point or nose of the hook, and there secured by the spring catch.

Claim.—The application to iron hooks of a clasp or bar, attached to said hook as aforesaid, and a spring attached to the outside of aforesaid hook, in the manner above set forth.

79,348.—HARVEY HERRICK, Dixon, Ill.—*Combined Stove Pipe, Oven, and Water Heater.*—June 30, 1868.—This device is connected with a stove pipe, and may be used as an oven or a warming closet, or, under a simple change, as a boiler or water heater, the oven or boiler, as the case may be, forming a part of the heat-flue.

Claim.—1. Constructing a heater, C, without an inner wall, so that the oven or boiler forming the inner wall thereof may be exposed to the direct action of the heat in the flue, substantially in the manner and for the purposes herein specified and shown.

2. In combination with a heater, constructed substantially as described, an oven, D, arranged to operate as and for the purposes set forth.

3. In combination with a heater, constructed as described, a boiler, F, constructed so as to form the inner wall of the heater, substantially as and for the purposes specified.

79,349.—CHARLES HIGLEY, Port Byron, N. Y.—*Churn and Ice Cream Freezer.*—June 30, 1868.—The curved spout is suspended in such a position as to take the cream as it rises along the sides of the receptacle, and discharge it upon the bottom thereof. The apparatus has a rapid rotary motion.

Claim.—The receptacle F, constructed as described, with double walls and bottom, forming a water or ice chamber, H, having no communication with the interior of the receptacle, and closed at the top by means of the annular flange I, beneath which, within the receptacle, upon one side, the curved spout L is suspended, as herein described, for the purpose specified.

79,350.—THEODORE HIMES, New Albany, Ind.—*Dress Protector.*—June 30, 1868.—A water-proof covering or dress for ladies, in which the lower portion

of the ordinary dress and skirts may be inclosed and protected against mud and water.

Claim.—The dress protector, consisting of the drawers D, leggings E, double covering, A B, attached to the drawers and skirt I, all held up and suspended by straps from waistbands *f g*, substantially as and for the purposes set forth.

79,351.—MILLER J. HINE, Equality, Ill.—*Shingle Machine.*—June 30, 1868.—The circular carriage runs upon a track on the circular bed-plate. A cogged rim fixed to the under side of the carriage is acted upon by a pinion deriving motion, through a pawl, ratchet, and shaft, from the main driving shaft. The curved saws are attached to the arms of a rock shaft, and act upon the bolt as it is fed to their action by a screw, turned by a winch or handle.

Claim.—1. The combination of the circular toothed wheel F, pinion wheel G, vertical shaft H, ratchet wheel P, pawl O, arm N, rock shaft M, arm L, connecting bar K, and crank wheel J, with each other, and with the carriage D and driving shaft I, all constructed and arranged to operate substantially as herein shown and described, and for the purpose set forth.

2. The combination of the swiveled screw B', and sliding bed-plate C', with the carriage D and blocks A' substantially as herein shown and described, and for the purpose set forth.

79,352.—A. J. HOBBS, Van Wirt, Ga.—*Medical Compound.*—June 30, 1868.—A remedy for venereal and other disorders. A strong decoction of the following roots and barks is obtained by boiling equal weight quantities, and adding thereto rum or whisky in the proportion of one part of the latter to three parts of the decoction; the roots are white ash, thorn ash, red shank, snmach, sarsaparilla, silk weed, blackberry briar, shoe string, sassafras, may apple, sweet shrub; and the barks are cherry tree, dogwood, and butterfly.

Claim.—The medicinal compound, substantially as above set forth.

79,353.—ALFRED HOYT, New York, N. Y.—*Match Safe.*—June 30, 1868.—As the top of the box is drawn forward or opened, as shown, the pawl is drawn back over one or more teeth of the ratchet; and when the box is returned to its case the ratchet and cylinder are turned by the pawl, and thus a new surface on the cylinder is presented, on which to rub a match every time the box is opened.

Claim.—A match safe, formed of the parts A, B, and C, constructed, arranged, and operating substantially as herein shown and described.

79,354.—JOSEPH G. HUMES, Gravios Mills, Mo.—*Flour Bolt.*—June 30, 1868.—The function of this device is to stretch the bolting cloth uniformly at the inner sides of the ribs of the reel, and the effect of the arrangement is that the interior of the bolting cloth presents an unobstructed surface, so that the meal is sifted through, but not lifted and dropped by the ribs.

Claim.—The construction and arrangement of the radial arms *b*, affixed to the bosses *a*, the adjustable screw bolts B, and adjustable eye bolts *c*, whereby the bolting cloth is strained radially and longitudinally, as herein described, for the purpose specified.

79,355.—D. P. JORDAN, Chicago, Ill.—*Letter Box.*—June 30, 1868.—The letter box is situated inside of the main box, which is a receptacle for newspapers, the latter being introduced over the letter box, and removable without disturbing the letters. The letter box is hinged to the bottom of the main box, and provided with a lock.

Claim.—The letter box C, in combination with the box A, when constructed and operating substantially as shown and described for the purposes set forth.

79,356.—JOHN B. JORDON, Aurora, Wis.—*Cleaning and Boring Device.*—June 30, 1868.—An apparatus for boring and cleaning out wells, consisting of an iron cylinder placed upon a shaft which is provided with contrivances for boring and loosening the earth, and allowing the same to enter the cylinder, so that it may be readily removed from the well.

Claim.—1. An apparatus for boring and cleaning wells, consisting of the metallic cylinder A, shaft D, with anger-lips E, provided with flanges F and valves *c*, constructed and arranged to operate substantially as herein described.

2. In combination with the cylinder A, shaft D, with the anger-lips E, provided with flanges F and valves *c*, the scraper G, with its adjustable wings or curved arms *e*, when constructed and arranged to operate substantially as herein described.

73,357.—F. L. KATHAN and E. D. RUMMER, Roseoe, Ill.—*Boot Crimp.*—June 30, 1868.—The grippers hold the leather in place upon the crimper, while drying. The crimper is composed of three sections, the front and back being united by a hinge at top. By turning the screw so as to retract the tapering gripper through which it passes, the sections are forced apart and the leather drawn tightly to the crimper.

Claim.—The combination of the hinged crimp A A, block and screw D, with the gripes C C C, when arranged, constructed, and operating as herein described, and for the purposes as set forth, as an article of manufacture.

79,358.—JOHN LAWRENCE KLEIN, New York, N. Y.—*Making Soap.*—June 30, 1868.—This process involves the use of three different kinds of lye, together with tallow, grease, palm oil, potash, salt, rosin, and cocoa oil. In lixiviating the water employed in making the lye, the materials for producing the several kinds are, respectively, barilla, with unslacked lime; caustic soda; and sal soda, with unslacked lime.

Claim.—A new and improved process for making soap, as herein described, using for that purpose the aforesaid ingredients or compositions of matter, or any other substantially the same, and which will produce the intended effect.

79,359.—AZEL LANE, Addison, N. Y.—*Machine for Dressing Millstones.*—June 30, 1868.—The pick handle is arranged to slide loosely on the shaft upon which it vibrates, and is operated by the hand of the operator applied to the shank of the pick. While one hand is employed to vibrate the pick and move it laterally, the other hand rotates the shaft to draw the pick over the face of the stone in the opposite direction.

Claim.—The combination, with the platform A, provided with the rack bars B, of the shaft C', provided with the sliding blocks C C and pinions F, substantially as and for the purpose set forth.

79,360.—WILLIAM H. LEACH, Uxbridge, Mass., assignor to BRADFORD STETSON, same place.—*Machine for Rolling Leather.*—June 30, 1868.—The journals of the lower or pressure roller are mounted in a movable lever frame, which is provided on the under side of either end with projections resting upon joints which are supported upon the central portion of a cross-piece in the main frame, in such manner as to operate, with the lever frame like a toggle joint, in addition to the usual compound lever employed for moving the pressure roller.

Claim.—1. The arrangement of the lever frame C, provided with the projections *c*, and the compound lever C', D, T, when the parts are constructed and made to operate the roller B', as and for the purpose set forth.

2. The flanges *d d* on the bearings *b* of the lever frame C, as and for the purpose set forth.

79,361.—ROBERT H. LECKY, Allegheny City, Pa.—*Pipe Wrench.*—June 30, 1868; antedated June 13, 1868.—The instrument is converted from a pipe wrench into a pipe cutter by detaching the tongue or clamp and substituting the center therefor. The diagram shows the instrument as adapted for cutting, with the serrated clamp detached.

Claim.—A pipe wrench and cutter combined in one instrument, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

79,362.—WILLIAM O. LESLIE, Philadelphia, Pa.—*Brick Machine.*—June 30, 1868.—The brick molds are in a horizontally rotating wheel, and the novel devices employed are for feeding the prepared clay from the hopper to the molds, and for pressing the clay into the molds.

Claim.—1. The combination of the hopper having the inclined bottom, with the screw E located therein, with the spout F and box I, all constructed and arranged to operate substantially as shown and described.

2. In combination with the box I, the plunger R and shaft J, having the cam K and wheel P mounted thereon, for rotating the mold wheel continuously, and operating the plunger intermittently, substantially as herein described.

79,363.—HOMER LEWIS, Bennington, Vt.—*Spirit Level.*—June 30, 1868.—A spirit level and plumb level are combined in one instrument, both being readily readjusted when deranged by shrinkage or other cause.

Claim.—1. Making a level vial adjustable in its block by securing one end of the box C, in which the vial is held, to a spring, D, and the other end, by means of a screw, b, to a plate, E, or its equivalent, substantially as herein shown and described.

2. An adjustable plumb vial, F, when secured in a box, G, which is by means of screws c c connected with a plate, H, or its equivalent, all being arranged within a slot, cut through the block A, the ends of the slot being covered by means of plates d d, as set forth.

79,364.—H. L. LOWMAN, New York, N. Y.—*Machine for Forming Eyes of Pickaxes.*—June 30, 1868.—Improvement on the dies described in United States letters patent granted same party November 27, 1866. Under the mode of operation here claimed, the blank when delivered from the first pair of dies is but partially formed, the principal object of this part of the operation being to give the required projection to the eye of the tool. The function of the second pair of dies, in combination with the internal swage with its cutting edge, is to complete the form of the die, both inside and outside.

Claim.—1. The second set of dies and inside swage, in combination with the first set of dies and inside swage, substantially as and for the purpose specified.

2. Forming the second pair of dies with that part of the cavity toward the inside swage with an outward bevel or curve, substantially as herein described, in combination with the inside swage, the forward end of which is wedge-shaped, and with a cutting edge, substantially as and for the purpose specified.

79,365.—JAMES MACADAM, Little Falls, N. Y.—*Curd Mill.*—June 30, 1868; antedated February 28, 1868.—Portions of curd being placed in the hopper and the crank turned, the teeth on the revolving cylinder tear off pieces of the same, carrying them down through the grate beneath, the bars of which aid in breaking up the curd and comminuting it to the degree required.

Claim.—The combination and arrangement of the hopper, provided with a grate of straight bars beneath, and the toothed cylinder turning in said hopper, and having its teeth to pass down between said bars, substantially as described, and for the purposes set forth.

79,366.—O. C. MACHLETT, St. Paul, Minn.—*Lathing Machine.*—June 30, 1868.—An instrument to facilitate and expedite the attachment of laths to the studs or joists.

Claim.—1. The combination of the frame A, cross head or hook pins B, short levers C, and vertical bars D, with each other, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the adjustable sliding blocks F and pivoted dogs G with each other, and with the top bar of the frame A, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the frame H and adjustable sliding gauge I with the frame A, substantially as herein shown and described, and for the purpose set forth.

79,367.—R. M. MANSUR, Augusta, Me.—*Washboard.*—June 30, 1868.—The projections and cam fasten the washboard to the tub, and the prop supports the lower end thereof.

Claim.—The combination, with the washboard B, constructed as described, of the pivoted props I, the projections O and cam H, arranged and adapted to operate as herein represented and described, and for the purpose specified.

79,368.—ELI J. MANVILLE, Waterbury, Conn., assignor to BLAKE & JOHNSON, same place.—*Stop-Motion for Revolving Shafts.*—June 30, 1868.—A latch stop is fitted so as to be slidden laterally and parallel with the revolving shaft, and employed in connection with a clutch-key passing crosswise of the shaft, and connecting the same with the pulley or other motor, so that when the latch stop is moved, its end operates upon the key to disconnect the same from the pulley, and the latch becomes a stop to prevent the turning of the shaft by momentum after the power is disconnected.

Claim.—1. The key d, sliding across the shaft to be moved, to couple or uncouple the same, with the motor, substantially as set forth, in combination with a latch stop, moved laterally, substantially as specified, to operate upon said key and stop the revolution of the shaft, as set forth.

2. The latch stop g, mounted upon a hollow axis, in combination with the cam lever n and key d, substantially as and for the purposes set forth.

79,369.—GEORGE A. MASON, Chelsea, Mass.—*Lamp Burner.*—June 30, 1868.—The object of the arrangement of the spring-carrying ring is to prevent it from becoming heated suddenly. The guide piece and socket enable the wick tube to be readily inserted without bringing the wick in contact with any part of the burner.

Claim.—1. The arrangement of a chimney sustaining spring intermediately between the deflector or cone C and the base, A, of the lamp top, substantially as and for the purpose set forth.

2. In a burner having an elevated deflector, the guide piece G and socket D, in combination with the base plate A, and wick tube B, when said guide piece and socket are constructed as and for the purpose herein specified.

79,370.—SAMUEL MASON, Beaver Falls, Pa., assignor to the BEAVER FALLS CUTLERY COMPANY, same place.—*Cutlery.*—June 30, 1868.—Each of the bolster pieces is attached to the tine by its own pin, and for each pin a hole is made in the tine. The pin is a projection from and forms part of the bolster piece.

Claim.—Attaching each bolster piece to the tine of knives and other articles of cutlery by means of a pin or pins on the bolster piece, upset into the countersink of the pin hole in the tine, in the manner hereinbefore described, and for the purpose set forth.

79,371.—WILLIAM CHARLES MASON, Beaver Falls, Pa.—*Cutlery.*—June 30, 1868.—The scales are attached to the handle by means of the bolster pieces, no rivets, pins, or other fastenings being passed through the scales.

Claim.—Securing the scale to knives, forks, and other articles of cutlery, by beveling and indenting the edges of the bolster pieces, and fitting the edges of the scale into such bevels and indentations, the bolsters being attached to the handles by rivets in the ordinary manner, substantially as described.

79,372.—THOMAS C. MATHEWS, Yates City, Ill.—*Hedge Trimmer.*—June 30, 1868.—The bent finger bar is designed for cutting one side and half the top of a hedge at the same time, and any inclination of the sickle bar may be obtained by sliding the boot or sleeve in or out on the axle, by means of a lever attached to the cross-beam, and securing the boot in any position by a stop.

Claim.—1. The curved arm d, to support finger bar and carry crank pinion, substantially as shown, as and for the uses and purposes herein set forth.

The sleeve l, connected so as to support the finger bar, the stop n, the mortise to admit stop, the grooves in axles b, and the levers m and o, all ar-

ranged and in combination substantially as shown, as and for the uses and purposes hereiu set forth.

3. The attachment straps *r r*, fastened to finger bar, and pivoted to arm *d*, near crank pinion.

4. The arrangement of the crank-connecting rods *j* and *k*, the sickles and bent finger bar, substantially as shown and described.

5. The construction of a finger bar, bent in or near the middle, at any desired angle, and carrying a short sickle bar in each end, substantially as shown.

79,373.—JOHN G. MATTINGLY and BENJAMIN F. MATTINGLY, Louisville, Ky.—*Whisky Still*.—June 23, 1868.

Claim.—The water jacket, and the use of water around the boiler, in order to prevent the beer from burning or inerusting on the bottom of the boiler, when used for distilling purposes, when arranged, constructed, and operating as set forth.

79,374.—D. C. McNEIL, Osceola, Mo.—*Sympathetic Ink*.—June 30, 1868.—Sulphuric acid, water, and sugar.

Claim.—An ink composed of the ingredients and in about the proportions, substantially as herein named and described.

79,375.—JAMES MCPHERSON, Brooklyn, N. Y.—*Steam Engine Cut-off*.—June 30, 1868.—Devices for connecting the variable cut-off of steam engines with the governor, whereby an automatic adjustment of the cut-off is effected whenever the pressure of steam goes above or below the desired degree.

Claim.—1. The arrangement and combination, with each other, of the rotating wheels *F*, (fitted around the tubes or loose axles *e*.) and of the spindles *j*, connected eccentrically with the axles *e*, and also with the wheels *F*, and with the cut-off slides *D* and *E*, substantially as herein shown and described.

2. The movable sleeve *I* of the governor, levers *i h*, and rack *g*, with the tubes or axles *e e*, arranged substantially as herein shown and described, whereby to vary the cut-off with the motion of the engine, as set forth.

3. The construction and arrangement of the eccentric spindle *j*, whereby to convert the rotary motion of the wheel *F* into the reciprocating motion of the cut-off, and which is adjustable in and by the axle *e* of the wheel *F*, that turns loose in the wheel, as set forth.

79,376.—EDMUND H. MEIGS, East Berlin, Conn., assignor to ROYS AND WILCOX COMPANY.—*Tin-smiths' Stake*.—June 30, 1868.—The use or purpose of this stake is similar to that of an anvil, sheet metal being formed or worked upon it. The invention consists in casting the stake hollow, so as to render the instrument light and convenient to handle.

Claim.—As a new, improved article of manufacture, a tinsmith's stake, constructed substantially as and for the purpose described.

79,377.—JOHN D. MURPHY, Baltimore, Md., assignor to JULIUS S. BOHRER & Co., same place.—*Reversible Ordinance*.—June 30, 1868.—An additional chamber or bore is situated in the rear of the main bore, and communicates with it by a vent, said bores being mutually capable of use as the recipient of the charge, and the one not thus employed serving to contain a body of air, which, on being expanded by the explosion of the charge, is made to fill the bore, and thus prevent the occurrence of a vacuum, and the consequent recoil of the gun.

Claim.—A gun, having two communicating bores, *B C*, of different calibers, arranged as represented and described, and adapted to be mutually employed as the charge and air chamber, by removable plugs or stoppions *D E*, substantially as set forth.

79,378.—C. E. MURRAY, Sugar Valley, Pa.—*Horse Rake*.—June 30, 1868.—Contrivances for holding the rake and revolving the same at proper intervals, to discharge the load; also a provision for vertical play of the teeth, to permit them to conform to irregularities in the surface over which they pass.

Claim.—1. The rake, provided with two sets of

teeth, *E E'*, and hung at the rear of the axle *A*, as shown, in combination with the ratchet *F*, pawl *G*, rod *H*, arm *I* on shaft *J*, spring *h*, and the rod *N*, and slotted plate *M*, all arranged to operate in the manner substantially as and for the purpose set forth.

2. The resting of the front end of the foot board *K* on spiral springs *f*, which rest on the thills *L L*, substantially in the manner as and for the purpose set forth.

79,379.—DAVID MYERS, Chicago, Ill.—*Car Brake*.—June 30, 1868.—The power which operates the brakes is a spring inclosed in a drum, the invention having reference to the class of brakes known as safety brakes, and the devices being attached to each car in such a manner that while the brakes may be applied in the usual way they can all be operated to apply the brakes simultaneously.

Claim.—1. The combined lever and pawl *V*, and pawl and pawls *g* and *T*, in combination with the drum *H* and spring *F*, when constructed and operated substantially as set forth.

2. The shafts *D* and *J*, and tumbling rod *o*, when arranged and operating substantially as and for the purposes above described.

3. The lever *P* and bevel wheel *I*, in combination with the pawl *N* and ratchet wheel *L*, when arranged and operating substantially as herein set forth and described.

4. The bar *Z*, in combination with the lever *P*, provided with the pointed arm *S*, for the purpose of releasing the dog *T*, when constructed and operated substantially as and for the purposes herein described and specified.

79,380.—BARNUM B. NEWELL, Centerville, Mich.—*Capstan for Grubbing Machines*.—June 30, 1868.—The intention is to stake the machine in a given spot and cause the capstan rope to operate upon small stumps, &c., within a radius of several hundred feet. The diameter of the cylinder may be increased by setting a series of staves in its grooved bottom flange and securing them at top by a band or strap.

Claim.—The construction of a capstan, combining the frame *A*, center plate *B*, cross tie *C*, shaft *D*, sweep *E*, cylinder *F*, loosely sleeved upon the shaft *D*, flange and groove *C*, lever and clutch *H*, ratchet clutch *I*, ratchet teeth *J*, upon the top of the cylinder *F*, when arranged, constructed, and operating substantially as herein described.

79,381.—CYRUS NEWHALL, Hinsdale, N. H.—*Tool Rest for Engine Lathes*.—June 30, 1868.—The object is to easily adjust the cutting tool of an engine lathe to the work, and to compensate for the wear of the working parts of the tool rest.

Claim.—1. The combination, substantially as set forth, of the slide plate *E* with the rocking block *F*, rocking on a central hinge directly underneath and parallel with the slot in which the tool post traverses, for the purposes specified.

2. The combination, substantially as set forth, of the slide plate *E* and rocking block, with the adjusting screw *J* and its pivoted sockets *i i'*.

3. The combination, as set forth, of the slide plate *E*, the rocking block, the bearing *e*, the hinge *e'*, the eye bolts, and the jam nuts, whereby the wear of the joints is compensated.

4. The combination, with the brackets *F' E'*, of the tapering spindles *I I'*, constructed, arranged, and operating as described.

5. The combination of the adjusting screw *J* with the swivelling spindles *I I'*, wedge blocks *k* and pinch screws *k'*, all constructed and arranged for joint operation, as described.

79,382.—JOSEPH NIXON, Altoona, Pa.—*Flanging Forge and Furnace for Boiler Heads*.—June 30, 1868.—A forge for flanging metallic sheets, and which may be used also for blacksmith's work. The tubular hearth is filled with water, and for the passage of the blast there are numerous openings which can be closed by plugs so that the blast may be distributed over the whole or any desired portion of the sheet to be flanged.

Claim.—The tubular and chambered hearth *A*, in

combination with air chamber C and water and air orifices, all constructed and arranged substantially in the manner and for the purpose set forth.

79,383.—ENOS PAGE, Streetsboro, Ohio.—*Sheep Table, &c.*—June 30, 1868.—A shearing table in which the legs are adapted to be folded up to afford convenience in transportation and storage.

Claim.—Hinging the legs B and E to the table or top A, in the manner as and for the purpose set forth.

79,384.—SAMUEL PAGE, McAllisterville, Pa.—*Horse Hay Fork.*—June 30, 1868.—The cross bar falls with the tines and assists in detaching the hay from the fork; it also serves as a brace for the two outer or side tines.

Claim.—The arrangement of the cross bar J with the tines F F and D; the clip A, and the bar B, provided with teeth *c c*, constructed and used as and for the purpose herein set forth.

79,385.—HORATIO O. PERRY, Buffalo, N. Y.—*Feed Water Heater for Boilers.*—June 30, 1868; antedated June 16, 1868.—The heater is an upright vessel, having a vertical axial flue. Cold water is introduced into the annular water space of the heater, near the bottom, and the water, after it is heated, is forced by the feed pump into the boiler. A pipe conveys to the steam dome the steam generated in the heater.

Claim.—The heater C, constructed and arranged within the smoke box and chimney, substantially as shown and described.

79,386.—J. B. PETERSON, Brooklyn, N. Y.—*Machine for Mixing Flour, &c.*—June 30, 1868.—The flour, or other material to be mixed, is fed to the hopper and falls upon the grate whereon it is stirred by the arms and whence it passes to the rotating disk, from which it is thrown off in minute quantities by centrifugal force.

Claim.—A mixing machine, consisting of the rotary shaft B', on which the arms *e* and the disk *g* are mounted, the arms working over a perforated stationary plate, *f*, or its equivalent, and the disk throwing the particles to be mixed off, substantially as described, all working in a case or box, A, in the manner specified.

79,387.—EDWARD PHIFER, Trenton, N. J.—*Cultivator.*—June 30, 1868; antedated June 16, 1868.—The devices here claimed are concerned in varying the distance between the wheels as well as the width of the space cultivated, and in regulating the draught of, and turning and guiding, the machine.

Claim.—1. The skeleton frame E G, constructed as described.

2. The combination, substantially as described, with a tongue pivoted by a king bolt to the axle of a rock shaft, arranged parallel with the axle, to which it is connected by setors.

3. The combination, substantially as described, with the tongue pivoted to the main axle by a king bolt, of a transversely-slotted plate bolted to the skeleton frame, whereby the tongue can turn laterally without moving the frame.

4. The combination, substantially as described, with a tongue pivoted to the main axle, of the rock shaft or skeleton frame, the treadles J, and the driver's seat, for the purpose of steering the machine, as set forth.

5. The combination, substantially as described, of the tongue and driver's seat with the detent lever C' and the slotted plate *e*, whereby the driver can release the tongue or hold it rigidly as required.

6. The crank arms G, constructed and arranged for joint operation, as described.

7. The combination, with the crank arms, of the drag bars and removable sleeves *h h'*, for the purpose set forth.

8. The combination, with the crank arms and sleeves, of the adjustable coupling arms G', for the purpose set forth.

9. The combination, with the sleeves *h h'*, of the looped drag bars H, and adjusting clamps I, for the purpose set forth.

10. The combination, with the skeleton frame E

G and adjustable drag bars H, of the adjustable link bars L and slotted cross bars M on the lifting levers, for the purpose set forth.

11. The combination, with the tongue of the whiffle-trees, connected directly with the cranks G, as and for the purposes set forth.

12. The combination, with a tongue pivoted to the axle by a king bolt, of a skeleton frame carrying plows adjustable in pairs, with the wheels also adjustable on the axle, substantially as described.

79,388.—OLIVER E. PILLARD, New Britain, Conn., assignor to FREDERIC H. NORTH, same place.—*Permutation Lock.*—June 30, 1868.—The object is to prevent any indication of the position of the interior parts by a movement of the knob or spindle in any direction, and thus render it impossible to tell, by feeling, when the relative positions of the parts are such as to admit of the opening of the lock.

Claim.—1. The ineline *n* at the inner end of the spindle, with an irregular surface, in combination with the dog *f*, and series of tumblers *e*, as and for the purposes set forth.

2. The ring *n* fitted loosely upon the inner end of the spindle, so that it may be stopped by contact with the dog *f*, as and for the purposes set forth.

3. The disk *x*, with an irregular periphery, in combination with the spindle *c* and ineline *n*, substantially as and for the purposes specified.

79,389.—Z. V. PURDY, Washington, D. C.—*Horse Shoe.*—June 30, 1868.—The beveling of the calk and shoe is designed to give the shoe a tendency to expand, and spread the hoof, in order to prevent such hoof diseases as result from contraction. The position of the calks throws a preponderance of the horse's weight upon the center and forward part of the hoof.

Claim.—1. Beveling the inner side of the calks B B and the upper side of the heel of the shoe A, as and for the purposes herein set forth.

2. Placing the calks B B upon the shoe at a point beneath the forward portion of the quarter of the foot, for relieving and protecting the same, substantially as herein specified.

79,390.—ALONZO C. RAND, New York, N. Y.—*Coal Stove.*—June 30, 1868.—This invention is especially applicable to stoves and furnaces wherein bituminous fuel is used, its effect being to check or retard combustion, and maintain only sufficient heat in the fire box to produce decomposition of the fuel, thereby liberating the gases, which, before being ignited, are united with air in order to make the combustion perfect.

Claim.—1. In stoves, grates, or furnaces, the cone A, when used alone, or in combination with the air passages D D, or an equivalent device or means of retaining, supplying, or mixing air with the inflammable gases before final combustion of the fuel takes place in such stoves, grates, or furnaces, substantially as herein described and for the purposes herein set forth.

2. In combination with the cone A and passages D D, the slide or slides B and E, for regulating the admission of air, the decomposition of the fuel, and consequent production of gas according to the amount of heat required, substantially as herein described.

79,391.—CHARLES S. RANKIN, Cincinnati, Ohio.—*Fireplace Grate.*—June 30, 1868.—The purpose of the arrangement of the grate bars is to more effectually support the fuel, and, at the same time, increase the radiation of heat by presenting a larger incandescent surface. The summer front and blower, when not desired for use in either of its capacities, may be folded up and laid aside.

Claim.—1. A grate, constructed with two series of "front" bars, one arranged alternately with and in the rear of the other, substantially as described.

2. The hinged and perforated summer front and blower, substantially as set forth.

79,392.—WILLIAM RESOR, Cincinnati, Ohio.—*Stove Door.*—June 30, 1868.—The enamel protects the metallic surface from dirt and oxidation, and is

a comparatively poor conducting substance, permitting the knob to be handled.

Claim.—A stove door having an enameled iron knob or handle, for the purpose set forth.

79,393.—HENRY REYNOLDS, Bristol, R. I.—*Sewing Machine for Button Holes.*—June 30, 1868.—In this machine an upper and a lower needle are employed; both have slotted or open eyes, and the upper needle only goes through the cloth. The thread employed is of the length required for the button hole, not being fed from a spool as usual. The function of the devices is to work a button hole similar to that ordinarily produced by hand. The several operations cannot be briefly explained.

Claim.—1. The adjustable frame L, carrying the reciprocating needle bars, in combination with the lever P, and cam upon the shaft A, substantially as described for the purpose specified.

2. The combination of the lower needle bar with the right angular spring arm *a* and cam C, substantially as described for the purpose specified.

3. The combination of the lower needle bar, arm *a*, pinion *b*, rack D, spring arm E, and cam F, substantially as described for the purpose specified.

4. The combination of the cam G, rod H, arm J, upper needle bar, having the curved slot, and pin *o'*, substantially as described for the purpose specified.

5. The cam wheel S and hook *t'*, in combination with the spring slide *v*, spring hook *t*, and upper and lower rotating needles, substantially as described for the purpose specified.

6. The slide *v*, adapted to raise and hold the thread in a button-hole sewing machine during the formation of the stitch, substantially as described for the purpose specified.

7. The method herein described of threading the needle, by means of the spring hook and the movement of the cloth.

79,394.—ALBERT W. ROBERTS, Hartford, Conn.—*Device for Securing Eye Glasses.*—June 30, 1868.—When the glasses are not in use the tape or cord is taken up, to prevent the glasses from dangling about the person.

Claim.—The combination of the case and pin B B', spring and ratchet wheel L F, pawl and tape M H, or their mechanical equivalents, for fastening eye glasses to a garment, substantially as described.

79,395.—E. L. ROBERTS, New York, N. Y.—*Ventilator.*—June 30, 1868.—Whatever may be the condition of the atmosphere without, the forced exhaust secures a copious flow of fresh air throughout the room. The fresh air is admitted at the upper part of the room, and the vitiated air is allowed to pass off through the floor, or its discharge in a downward direction from the apartment is induced or accelerated by a heater in the exhaust flue.

Claim.—1. In combination with means for effecting a distributed exhaust, as above described, means for effecting a forced exhaust, substantially as and for the purpose described.

2. Mixing heated air, for heating rooms, with the inflowing distributed supply of fresh air, at or near the top of the room, by means substantially as and for the purpose described.

3. The combination with the supply passages F or F', at or near the top of the room, of the vertical tube D, substantially as and for the purpose described.

4. The combination with the tube D, of the tube E, substantially as and for the purpose described.

5. The combination, with the supply passages through the ceiling, or near the same, and the vertical supply tube D, of the exhaust passages through the floor, substantially as and for the purpose described.

6. The combination, with a floor arranged as described, for effecting a distributed exhaust, of the fine H, provided with a heater, substantially as and for the purpose specified.

79,396.—EDWARD T. ROBINSON, Nashua, N. H.—*Valve Gear.*—June 30, 1868.—For reversing steam-engines and regulating the cut-off of steam from the cylinder with great accuracy, and providing a means by which the steam is entirely shut off from the cyl-

inder and the engine stopped by the reversing lever, in case the throttle valve should become inoperative.

Claim.—Connecting both the valve rod *a* and the lifting rod *d* to the sliding block *c*, and the arrangement of the rock shaft D, arm *j*, and eccentric *k*, for giving an equalized motion to the link C, when said parts are combined with the tumble shaft G, rod F, and lever E, substantially as and for the purposes herein set forth.

79,397.—JUNIUS ROGERS, Sterling, Ill., assignor to himself and FREDERICK W. PRATT, Chicago, Ill.—*Lock Nut.*—June 30, 1868.—One side of the face of the nut has a projection, or one side or corner is made thicker than the other portions, so that when the nut is turned up against the surface which it is to hold, the thicker part or projection binds against said surface and warps the nut upon the bolt, preventing loosening or accidental detachment.

Claim.—A self-locking nut, constructed and operating substantially in the manner and for the purposes specified.

79,398.—GUSTAVE H. ROTH, Boston, Mass.—*Hand Coal Sifter.*—June 30, 1868.—In using this invention, a pair of the sifters are employed, one for each hand, the hand being passed through the loop, with the fingers and palm resting against the guard. By scooping up the ashes with both sifters, and giving them quick lateral reciprocating motions, the finer parts of the mass are sifted through the spaces between the teeth.

Claim.—The arrangement and combination of the hand loop B, the guard C, and the scoop A, made and provided with teeth, the whole being substantially as and for the purpose described.

79,399.—ROBERT ROWAN, Parnassus, Pa.—*Scaffold and Ladder.*—June 30, 1868.—The ladder may be moved laterally, either way, from the middle of the bar, the apparatus being employed to facilitate the painting of buildings and other similar operations.

Claim.—The bar A and the traversing frame D, in combination with a ladder or scaffold, when arranged and operated substantially as and for the purposes herein shown and described.

79,400.—A. J. SALISBURY, San Buenaventura, Cal., assignor to himself and THOMAS R. BARD, same place.—*Reamer for Wells.*—The branches of the well reamer are expanded by a positive downward thrust of the superincumbent shafting by which the reamer is actuated in the operation of reaming.

Claim.—The combination of the branches A, cross bar B, toggle bars D, shank C, and spring S, substantially as and for the purpose set forth.

79,401.—THOMAS H. B. SANDERS, Philadelphia, Pa.—*Rocking Swing.*—June 30, 1868.—The uprights afford a means of suspending a swing when the device is not used as a rocker. One of the seats is removed from its usual position to the upper ends of the uprights, and from this seat depends the rope, while the other seat is used as a swing seat. The seat-backs of the rocker are hinged, so that they may be folded down out of the way of the feet of the swinger.

Claim.—The arrangement of the uprights *z* and *z'*, their stays T and T' and X and X', movable seats S and S', their swinging backs S B and S' B', rope *w*, with a rocker, A A', of any size or shape, the whole constructed and operated in the manner and for the purpose above set forth and described.

79,402.—HORACE SARGENT, Chelsea, Mass.—*Machine for Cutting Soap.*—June 30, 1868.—Forming soap into bars after it has been run into boxes. The carriage is advanced by a feed screw or other device, and the cutter plates are driven through the block of soap, the strippers serving to retain the soap as the blades are withdrawn.

Claim.—1. The combination, with a box supporting frame, of a cutter carriage, provided with a series of parallel cutting blades, to operate substantially as described.

2. Combining with the blades *i* the plates *g h*, for

supporting the blades and cutting the soap at the side surfaces of the box, substantially as described.

3. In combination with the blades *i*, the stationary strippers *n*, substantially as set forth.

4. Cutting soap in boxes by sliding a cutter carriage successively into the box, the box being changed in position relatively to the carriage after the first operation of the cutters, the operation first cutting the soap into slabs and from two sides of the box, and then subdividing the slabs and cutting the soap from the adjacent sides of the box, substantially as described.

79,403.—ANDREW H. SMITH, Charlton, N. Y.—*Compensating Fly-Wheel*.—June 30, 1868.—The object is to employ the surplus power of a reciprocating engine, when the crank is in a position at right angles to the center, to elevate a weight, which descends as the crank approaches the centers and thus aids it to pass those points.

Claim.—1. The compensating weight P, arranged to make two revolutions to every revolution of the crank F, substantially as and for the purpose set forth.

2. The pivoted or swinging arm L, in combination with the compensating weight P, for reversing it from side to side.

3. Providing the compensating weight P with radial adjustment, to vary its effect as required, substantially as herein described.

79,404.—WILLARD H. SMITH, New York, N. Y.—*Vapor Burner*.—June 30, 1868.—The receptacle below the junction of the oil pipe with the burner, arrests impurities and solid matter, and prevents them from clogging the passages. The small passages in the air tube emit gas jets, which, being ignited, supply extra heat, which is conducted downward by the flanges, and causes a more thorough evaporation of oil.

Claim.—1. In burners for light oil, the receptacle C, connected with the feed-pipe and burner, substantially as and for the purposes set forth.

2. Providing the air tube E, between the air-passages F F and the base of the flame, with heaters consisting of the passages *x x*, on a heat-conducting flange or flanges K K, substantially as and for the purpose herein stated.

79,405.—ALFRED W. STEPHENSON, Kensington, Conn.—*Balancing Polishing Wheels*.—June 30, 1868.—The plate has pins which protrude through openings in the cap, and enable the plate to be adjusted in such a manner as to readily balance the wheel.

Claim.—The adjustable balance-plate *i*, or its mechanical equivalent, in combination with the cap *h*, and flange hub *b*, and nut *d*, constructed and operating substantially as and for the purpose described.

79,406.—W. W. STEVENS and JOHN PATCHEN, Jr., Fontogany, Ohio.—*Horse Hay Fork*.—June 30, 1868.—The rod being drawn up, the point of the fork is thrust into the hay, which movement depresses the rod and extends the tines, and enables the bent end of the spring to catch the top of the rod; the tines are thus held until the load is raised, when, by drawing on the cord, the spring is pressed back by the bell crank, and the load discharged.

Claim.—The combination and arrangement of the stem A, rod B, tines C, spring D, bell crank E, and cord F, substantially as and for the purpose set forth.

79,407.—ALFRED A. STIMSON, Boston, Mass.—*Bung for Casks*.—June 30, 1868.—The tube and its appendages allow the gases to escape when the contents of the barrel are in a state of fermentation, and prevent insects and dirt from entering the barrel.

Claim.—The bung A, constructed with tube D, cap C, reservoir B, for holding water, all constructed to operate substantially in the manner described, and for the purposes set forth.

79,408.—M. W. ST. JOHN, Leonardsville, N. Y.—*Ball and Socket Joint*.—June 30, 1868; antedated June 18, 1868.—The cap is secured on to the top of the socket, and presses down the elastic piece, which

keeps the joint tight and clean, and adapts the parts to work freely and noiselessly.

Claim.—The combination of the socket *a*, ball E, concave plate *b*, rubber *d*, and cap F, when connected to the parts, substantially in the manner and for the purposes specified.

79,409.—SAMUEL S. STOKES.—Westboro, Ohio.—*Churn*.—June 30, 1868.—The two distinct series of triangular slats, with their accompanying arms and shafts, are rotated by the gearing in opposite directions.

Claim.—1. The outer dasher, consisting of blades N N, annulus *n*, and shafts M, connected at the bottom to the central shaft J, in combination with the inner dasher, consisting of blades P P mounted upon arms O O, deriving rotation from the hollow shaft L and sleeve I, all substantially as herein described,

2. In combination with the described elements of the preceding clause, the detachable tripod frame C C' D, *c c' d*, and screw E, for the object explained.

3. The triangular construction of the dashers N and P, when said dashers are applied and employed substantially as and for the purposes specified.

79,410.—THOMAS STONE, Plainfield, Ind., assignor to himself and VIRGIL H. LYON, same place.—*Cars, Wagons, and other Vehicles*.—June 30, 1868.—The object is to facilitate the dumping of sand, coal, &c. The bottom of the box is formed of transverse shutters or leaves, journaled in the sides of the wagon box, and connected together, and with the leaves that actuate them, by a rod and staples and rings, the mode of operation being similar to that of window blinds.

Claim.—1. A wagon box, A, having the pivoted leaves *a a a*, &c., in combination with the rods *e e*, and rod *b*, cleats *p p p*, and lever devices for operating the said rods and leaves, all substantially as shown and described, and for the purpose set forth.

2. The levers *j c c*, rods *e e*, links *k k*, substantially as shown and described, in combination with the leaves *a a a*, and box A, all substantially as and for the purpose shown and described.

3. The levers *j j*, in combination with the rod *b*, leaves *a a a*, and box A, substantially as and for the purpose shown and described.

79,411.—COE SWARTHWOUT, Joliet, Ill.—*Salve*.—June 30, 1868.—Extract of bitter-sweet, turpentine, salt butter, beeswax, and balsam of fir.

Claim.—1. The use of the ingredients, in the proportions and manner described, as and for the uses and purposes set forth.

2. The said salve, as a new article of manufacture.

79,412.—OLIVER C. SWEET, Albany, N. Y.—*Machine for Drying Tubular Fabrics*.—June 30, 1868; antedated June 19, 1868.—Machine for drying, stretching, brushing, heating, and calendaring knitted or other tubular fabric. The fabric is completely finished and wound upon a roller, after having passed through the machine, provision being made for retaining the meshes in straight lines, and preventing the fabric from being twisted spirally.

Claim.—1. The heating devices, consisting of the chambers *c d*, and spiral chamber *e*, passage *p*, and tube F, in combination with the brushing and pressing apparatus, substantially as herein shown and described.

2. The spreader G, when consisting of the parts *s, t, u, v*, and *w*, all made and operating substantially as herein shown and described.

3. The vertical tube F and adjustable cap *l*, as described, in combination with the spreader G, made as set forth.

4. The arrangement of the revolving platform B, hinged arms C, annular cloth support S, and tube F, as herein described for the purpose specified.

5. The heating cylinders D and E, constructed and arranged as described, the spiral chambers *e*, cloth support S, tube F, spreader G, heating and ironing rollers *g* and *r*, and brushes L, all made and operating substantially as and for the purpose herein shown and described.

79,413.—HENRY TAYLOR, Middletown, Wis.—*Hop Press*.—June 30, 1868.—The posts are provided

with removable side planks, and are jointed to the bed plate or beam in such a manner as to allow them to be spread out after the bale has been formed, to facilitate the removal of the same.

Claim.—The press, consisting of the posts B B', bed plate A, upper cross-beam A', serews F, follower, G, keys I, side rails C, and side planking b, all constructed and arranged to operate substantially as herein shown and described, for the purpose specified.

79,414.—EDWARD TRUSLOW, New York, N. Y.—*Bag Tie.*—June 30, 1868.—A tie or fastening for bales, &c., consisting of a rectangular plate with its corners bent toward the center, so as to form points of attachment for the band or rope.

Claim.—The lock or bale tie, formed by bending the corners of the plate A over, as shown at a¹ a² a³, substantially as and for the purpose set forth.

79,415.—PETER B. TURNER, Quincy, Mass.—*Bracket for Shingle Roofs.*—June 30, 1868.—The sharp end of the wedge block is pushed underneath the shingles which have been fastened to the roof, and the wedge-like head of the bar is then driven against the upper surface of the shingle, so as to clamp about a third of the length of the shingle between the bar and the wedge block. Spurs are then forced into the shingle for further protection against slipping.

Claim.—1. The block E, constructed as described, in combination with the adjustable bar A, as set forth.

2. The combination of the block E, adjustable bar A, bar B, standards C C', and movable bar D, substantially as and for the purpose set forth.

79,416.—THOMAS EDWARD VICKERS, Sheffield, England.—*Machine for Rolling Tires.*—June 30, 1868.—The hoop to be rolled or the work to be acted upon may be placed and confined between collars or flanches, of which only one is upon each roll, and which flanch, from its position, may pass, if required, up to or beyond the center of the other roll.

Claim.—So arranging a rolling mill that the parts of the rolls between which the work is performed shall overhang their bearing, and the remaining parts of the rolls be extended in opposite directions, as described, when the rolls are provided with flanches, the whole constructed to operate as and for the purposes set forth.

79,417.—GEORGE D. WALCOTT, Jackson, Mich.—*Machine for Making Horse-Shoe Nails.*—June 30, 1868.—The machine forms the nails complete from rods, the introduction of which constitutes the only handwork involved in the operation. The heater or furnace is simply a metallic box provided with a fire grate, and having apertures in it, through which the nail rod passes into the machine. The furnace admits of the nail rod being kept in a properly heated state during the whole of the operation.

Claim.—1. The combination of the tongs P and supplemental grippers r t with the furnace, all constructed and arranged substantially as shown and described.

2. The tongs P, constructed and arranged as shown, when said tongs are placed in such a relation with a heater or furnace, C^x, that they will grasp the nail rod between the fire and the working parts of the machine.

3. The supplemental grippers or jaws r t, in combination with the grippers n n of the tongs P, all constructed and arranged substantially as described.

4. The plate l, to which the tongs P are attached, when said plate is operated in a vertical and longitudinal direction, for the purpose of actuating or moving the nail rod during the formation of the nails, in the manner and by means substantially as shown and described.

5. The cam ring Q on wheel E, roller p, and spring q, in combination with plate l and lever V, spring a^x, arm W on shaft w, and the arm T on shaft B, all arranged as shown, for the purpose of operating the plate l, as set forth.

6. The pendent anvil D, fitted in an overhanging block, C, and the devices for lifting and holding the nail blank thereto, in combination with the adjustable rollers f, so arranged that the nail rod will be

operated upon at the under side of the anvil, as shown and described.

7. The rollers f, fitted in adjustable arms F applied to the wheel E, substantially as shown, in combination with the anvil D, all arranged substantially as and for the purpose specified.

8. The edgers G G, fitted in pendent, oscillating bars H, hung on the anvil block C, combined and arranged to operate in connection with the rollers f and anvil D, substantially as and for the purpose set forth.

9. The edgers G G—each provided with two dies, h^x h^{xx}, constructed and arranged substantially as shown and described, so that the upper dies h^x will serve as working dies, and the lower ones, h^{xx}, as bumpers, to prevent the upper dies coming in contact.

10. The cam wheels K K', in combination with the bell-crank lever, rollers, arms, and other devices for giving motion to the edges, substantially as shown and described.

11. The two cutters c^x f^x, applied respectively to a swinging bar, V', and a vertically-sliding bar, W', connected with the bars X Y, the former of which is on the rock shaft J, and all arranged so that the two cutters will be operated by a single cam or arm, U, on driving shaft B, and the finished nail cut off at the spot where it was made, substantially as shown and described.

12. The combination of the cam Z, lever V, and plate l, arranged and operating substantially as described.

13. The spreader S, in combination with the wheel E, tongs P, and grippers n n, all arranged in the manner substantially as and for the purpose specified.

14. The combination of the wheel E, provided with the rollers f, the anvil D, plate l, with tongs P attached, and the edgers G, all arranged and operated in the manner substantially as and for the purpose set forth.

15. The combination of the two cam wheels with varying radii, one the counterpart of the other, with the bell-crank lever, the rollers attached thereto, and other devices, or their equivalents, as shown and described.

16. The cam Z, lever A^x, and graduated bar B^x, in combination with the lever V, and the other parts necessary for adjusting the feed of the nail rod, substantially as herein shown and described.

17. The lever R, having jaw r, the fixed jaw t in the bearing s, and the pin u upon the wheel E, in combination with the grippers n n, all arranged substantially as described.

18. The combination of the cutters c^x f^x with the cam wheels K K' and edgers G G, with their intermediate mechanism, whereby the force of the blows of the edgers is increased for the first blow upon the nail, and the time required for such increase of force made available for the operation of the cutters, substantially as herein shown and described.

79,418.—FRANCIS H. WALKER, Boston, Mass.—*Button-Hole Cutter.*—June 30, 1868.—The anvil is constructed with a number of steps, beyond the edges of which the knife cannot cut the fabric. The object is to so construct the anvil that it shall present surfaces of different lengths on both sides upon which to cut. The anvil is held in place upon one of the jaws of the jointed levers, by means of a thumb screw and a fixed center pin, about which latter the anvil can be adjusted when released from the set screw.

Claim.—1. A stepped anvil or cutter bed G, adapted for use in conjunction with a knife, E, for cutting button holes, substantially as described.

2. A reversible stepped anvil or cutting bed, G, combined with retaining pivot pin c, set screw h, and cutter E, substantially as described.

3. A reversible stepped anvil or cutting bed, G, substantially as and for the purpose described.

79,419.—C. T. WARREN, Linden, N. J.—*Mosquito Bar for Windows.*—June 30, 1868.—The cords are attached to screws fixed to the easing, and are passed once around the pulleys, so that the act of raising or lowering the sash revolves the roller and rolls up or unrolls the bar or netting.

Claim.—1. Rolling and unrolling the mosquito

netting by the movement of the sash carrying the roller *d* upon the cord *i*, substantially as described, for the purpose specified.

2. The mosquito bar or netting, operated as described, by means of the rollers attached to the sashes, the pulleys *g*, cords *i*, and screws *j*, substantially as described, for the purpose specified.

79,420.—**NEHEMIAH WATERMAN** and **ALFRED T. PERKINS**, Toledo, Ohio.—*Paper Cap.*—June 30, 1868.—This cap is made of paper, paper parchment, or paper and cloth combined, and may have a lining of oil skin and be rendered impervious to water by a coating of water-proof varnish. It has also a strengthening band of stiff paper.

Claim.—As a new article of manufacture, the paper cap or hat herein described, formed of paper or analogous material, with a number of sectors, *a a a*, secured at the center by a seal, *B*.

79,421.—**ELISHA WATERS** and **GEORGE A. WATERS**, Troy, N. Y.—*Boat.*—June 30, 1868.

Claim.—The building of the entire shell or skin, and the decks, (where used,) of paper, as hereinbefore set forth, and thus forming a new article of manufacture.

79,422.—**JEREMIAH M. WATSON**, Sharon, Mass., assignor to himself and **WILLIAM B. WICKES**, same place.—*Plant Protector.*—June 30, 1868.—The stake is driven into the ground, close to the plant, deep enough to admit of the hoop being pressed to nearly its depth into the earth, about the plant. The gauze prevents access of bugs, insects, birds, and worms, to the plants or planted seed.

Claim.—A plant protector, in which a screen, of gauze, netting, or equivalent, woven and pliable fabric, is combined with the hoop or ring *A* and the supporting stake *D*, in the manner and for the purposes shown and set forth.

79,423.—**ARNEL WEEKS**, Syracuse, N. Y.—*Machine for Making Cigars.*—June 30, 1868.—A filling long enough to form two cigars is placed between the fixed rollers, and the compressing roller is lowered upon it, the edge of the binder is then placed between the front and upper roller, and the machine is started. The binder being applied, the operator inserts the edge of the wrapper, which is, like the binder, applied by the continued rotation of the rollers, after which the compressing roller is raised and the cigar removed. The operator presents first one end and then the other of the double cigar to the heading dies which finish the ends.

Claim.—1. The combination, in a cigar machine, of the three peculiarly formed elastic rollers *C E F*, mounted in rigid bearings, and driven by a band, with the similarly formed elastic compressing roller *G*, mounted in the vertically vibrating frame *H*, and rotated by frictional contact merely with the other rollers, whereby I am enabled to apply both the binders and wrappers to two cigars simultaneously by one continuous operation of the same machine, as set forth.

2. The combination, substantially as set forth, with the driving roller *C*, of the heading dies *D*, arranged at a distance apart greater than the length of the two finished cigars, whereby one end of each cigar may be finished by its respective die.

3. The combination of the peculiarly shaped rollers, the flanges *f*, and the interposed fixed head blocks *J*, these parts being arranged, as set forth, for joint operation.

79,424.—**WILLIAM S. WILDER**, New York, N. Y.—*Paper-Ruling Machine.*—June 30, 1868.—By the conjoint operation of the cylinder, rollers, endless apron, and guide bands, the paper is conducted over the cylinder, whereon it is ruled by the pens. In feeding the paper to the machine, it is pushed forward against a stop, but the rear edge of the feed plate being raised, the forward edge of the paper is lifted above the stop and grasped between the feed rollers.

Claim.—1. The wheel *N*, having the adjustable and removable cam *P*, for operating the pivoted feed plate *Z* through the medium of the pivoted lever *V*, carrying the friction roll *W*, the connecting-rod *X*,

and pivoted lever *V*, all constructed and arranged to operate substantially as herein shown and described.

2. The combination of the wheel *N*, having one or more adjustable and removable cams or lifters, *O P*, attached to it, and projecting from each side, the friction wheel *T* and lever *R* with each other and with the cylinder *B* and pen beam *S*, whether said lever *R* is connected with the front or rear edge of the said pen beam *S*, substantially as herein shown and described, and for the purpose set forth.

3. The extension belt *D'*, adapted for the application to it of the lifters *O P*, in combination with the adjustable roller *E* and levers *V R*, by means of which a sheet may be ruled with lines which are not continuous, substantially as herein shown and described.

79,425.—**ASHBEL B. WINEGAR**, San Francisco, Cal.—*Machine for Kiln Drying.*—June 30, 1868.—Over the furnace is placed a drying bed or disk, surrounded by a rim with the necessary discharge opening. A vertical driving shaft, having its step in the center of the disk, is suspended by framework above the furnace, and serves to rotate a series of radial arms and stirring hoes. A feeding hopper is attached to the frame above the disk.

Claim.—1. A machine for drying salt and other substances, composed of the furnace *A*, pan or disk *B*, the radial arms *G G*, spindles *H H*, with the hoes or stirrers *I I I* attached to them, with the movable bar *J*, for turning them in different directions, so as to continually stir and turn the salt in the pan or discharge it at will from the periphery, the whole constructed and arranged to operate substantially as herein described.

2. The sliding board or plate *O*, at the bottom of the hopper, operated by the spring *P*, cords *S*, lever *T*, and beveled pinion *U*, substantially as and for the purpose specified.

79,426.—**HENRY M. WOODFORD**, Kensington, Conn.—*Match Safe.*—June 30, 1868.—This article is composed of three pieces or castings of metal adapted to each other by lid hinge pins and bearing depressions, and secured together by heading down the fastening rivet. It has a match receptacle, a waste box, and a roughened match-igniting surface.

Claim.—A match safe, constructed substantially as shown and described, as an article of manufacture.

79,427.—**HOWELL W. WRIGHT**, Taunton, Mass.—*Electro-plating and Plated Ware.*—June 30, 1868.—Based upon the discovery that white metal (commonly called Britannia) may be easily polished before electro-plating, and that the silver deposited on the surface so polished is in a very fine state of division, so that when the ware is taken out of the plating bath, it retains its original brilliant surface, and may be finished on a cotton buff, the use of a burnisher being obviated. The article thus finished is improved by a second plating of pure silver.

Claim.—1. The art of electro-plating polish-ware at once, without dipping in acids or other dips that affect the polished surface.

2. As my invention, the process of electro-silver-plating the previously polished electro-plated article, with a protective transparent layer of pure silver, all substantially as and for the purposes set forth.

79,428.—**JOHN A. WRIGHT**, Keene, N. H.—*Combined Mop and Wringer.*—June 30, 1868.—The handle is revolved so as to liberate its locking pin from the lower jaw, when the handle is allowed to slide down until its lugs are brought against the bight of the cloth; then, by applying slight pressure and revolving the handle, the cloth is twisted and the water expelled therefrom.

Claim.—The sliding and revolving handle *A*, with the device for locking it in place, and the device for catching the mop cloth, in combination with the jaws *B C*, substantially as and for the purpose described.

79,429.—**ELIPHALET H. ADAMS**, Detroit, assignor to himself and **CHARLES F. GARDNER**, Pipestown, Mich.—*Fifth Wheel for Carriages.*—June 30, 1868.—The renewable filling, in the channels in which the *V*-shaped flange of the fifth wheel works, is de-

signed to reduce friction, render oiling unnecessary, and adapt the main parts to remain intact under constant use.

Claim.—The construction of a circle or “fifth wheel” for land carriages, as above described, with the ring C working in Babbit metal, or other suitable material, confined in the circular channeled disk A, when arranged and operating substantially as and for the purposes herein set forth.

79,430.—FRANCIS ARNOLD, Haddam Neck, Conn.—*Wagon Jack.*—June 30, 1868.—The collar is fixed to the post by a set-screw or otherwise, and its movable tongue and lever are employed to raise wagon axles.

Claim.—1. The adjustable collar B, with hole to fit post A, and provided with journals *a a* and lugs *b b*, arranged substantially as and for the purposes herein set forth.

2. The movable tongue C, with corrugations on its upper side, and the rims *d d* on its lower side, substantially as and for the purposes herein set forth.

3. The combination of the adjustable collar B, movable tongue C, and movable lever D, arranged and operating substantially as and for the purposes herein set forth.

79,431.—JEARUM ATKINS, Washington, D. C.—*Low Water Alarm for Boilers.*—June 30, 1868.—In this apparatus the limited power of a float, dependent for its operation upon the quantity of water in the boiler, is employed merely to unlock, as it were, the mechanism which is afterward put in motion by steam at boiler pressure, to turn a cock and thereby cause the steam whistle to sound an alarm.

Claim.—1. The combination of the following devices in a low water alarm for steam generators, viz, the box H, passages I and V, each with a cock, float K, valve S, port R, cylinder G, piston F, connected to the lever of the alarm cock, a discharge port from cylinder G, closed or opened by cock U, discharge port L, and detachable cover *a*, or the equivalents of these parts.

2. The construction of the cock J, with the ports I and L, as described, in combination with the box H, substantially as set forth.

3. The tubular piston rod T with the cock U, substantially as set forth.

79,432.—FRANCS T. BAKKER, Chicago, Ill.—*Fluid for Exciting Galvanic Chains.*—June 30, 1868.—The fluid includes water, sulphuric acid, vinegar, and salt; and is employed to saturate the flannel of the links of a portable galvanic chain, wherewith to produce physical reaction.

Claim.—The fluid, consisting of herein stated ingredients, mixed in proportions as described, to be used, in combination with galvanic chains, in treating diseases by galvanism.

79,433.—EDWIN L. BARNETT, El Dorado, Ark.—*Cotton Planter.*—June 30, 1868.—While the plow breaks the ground, the forward wheel makes a furrow, into which the seed drops through the shield or funnel, from the hopper, in quantities regulated by the cogged wheel. The furrow is covered with loose ground by the teeth at the rear.

Claim.—The cotton planter, consisting of the main frame A, standards D, handles E, breaking plow B, furrowing wheel K, cogged wheel I, hopper G, provided with a shield, *g*, and teeth *b*, all arranged, combined, and constructed substantially as described.

79,434.—THOMAS BARRETT, Charlestown, Mass.—*Machine for Forming Rings on Carboys and Bottles.*—June 30, 1868.—The bottle or carboy is placed over the plug or center and held in contact with the face of the frame. The expanding fingers fill the opening, and retain the bottle in its concentric position. The bottle is rotated on the plug while melted glass is placed thereon, and when sufficient has been applied, the rolls are brought into contact with the bottle and so held until the proper form is imparted.

Claim.—1. The rolls, of any desired shape, having a simultaneous motion toward a central plug, whether

operated by the mechanism herein described, or any other substantially the same, for shaping or forming the rings of carboys or bottles.

2. The expansive plug C, constructed and operating substantially in the manner and for the purpose herein specified.

79,435.—GEORGE F. BEARDSLEY, Ithaca, N. Y.—*Curtain Fixture.*—June 30, 1868.—The cord or tape is attached to the cylinder within the case, and extends thence to a spool on the end of the curtain roller. The knob on the operating crank, aided by the friction on the cylinder bearings, sustains the curtain at any degree of elevation.

Claim.—The construction and arrangement of the described parts, viz, the winding cylinder F, crank D, weighted knob E, and case or frame B, supporting and holding the same, so as to make a fastening or fixture for the cord or tape of curtains, substantially as set forth.

79,436.—W. H. BECHTEL, Philadelphia, Pa.—*Steam Safety Valve.*—June 30, 1868.—This valve is constructed with a view of dispensing with the usual weighted lever, and employing a weight bearing directly upon the valve; the said valve and weight being so effectively guided that they can be used on locomotive and marine boilers without liability of derangement and injury in consequence of agitation and jarring. The spindle enables the engineer to raise the tube at pleasure.

Claim.—1. The weighted tube D, with its two valves, *e* and *h*, in combination with the base A, its chamber *a*, hollow cross-piece *d*, the within described valve seats *f*, and the casing B, the whole being constructed and arranged as and for the purpose herein set forth.

2. The webs or ribs on the tube D, adapted to the opening *b* of the casing B, as and for the purpose herein set forth.

3. In combination with the tubular valve D; the spindle G, rod I, and the arms H and K, for the purpose specified.

79,437.—SAMUEL S. BENT, Port Chester, N. Y.—*Apparatus to Prevent Horses Cribbing.*—June 30, 1868.—This device is designed to frustrate attempts at cribbing by preventing the horse from obtaining a satisfactory hold with his teeth, or repulsing him by the effect of a ribbed surface upon the mouth.

Claim.—The metallic roll for the edges of feeding troughs or mangers, formed substantially as specified, for preventing horses biting or cribbing, as set forth.

79,438.—M. L. BEST, Canton, Ohio, assignor to himself and J. F. HESS AND BROTHER, Massillon, Ohio.—*Machine for Forming Bread Pans.*—June 30, 1868.—The forming plates are hung on suitable axes, and so combined with each other that the turning up of the principal plate causes a simultaneous turning up of all the other plates, these plates turning up the several sides of the pan at the same time, while the sheet metal of which the pan is formed is held in position by clamps.

Claim.—1. The plate A, with cam face *n* and connections *m o*, when constructed and used in connection with the plate C, substantially in the manner and for the purpose herein specified.

2. The peculiar arrangement and combination of the principal plate B with cam faces *k k* and working lever L, the plates A A, with cam faces *n*, the plate C, the block D, and die clamp E, the several parts being constructed and arranged substantially in the manner and for the purpose herein specified.

3. The peculiar arrangement and combination of the frame K with block D and arms *a* and *c*, the die clamp E, with arms F and G, and the clamp lever H, with slot I, the several parts being arranged in the manner and for the purpose herein specified.

79,439.—JOHN W. BLODGETT, Three Rivers, Mich.—*Potato Digger.*—June 30, 1868.—The engraving is an underside view. The potatoes are taken from the hill by the shovel and pass thence on to the endless belt, whereby they are transferred to the vibrating sieve. The earth being separated from the

potatoes, the latter are deposited upon the ground at the rear end of the machine.

Claim.—1. The endless bolt G, constructed as shown and described.

2. The sieve M, in combination with the disk *a*, shown and described, arm O, elbow lever P, standard S, and connecting rods R and L, all constructed, arranged, and operating substantially as specified.

79,440.—EDMUND BLUNT, Jr., Bay Ridge, N. Y.—*Electro-Magnetic Burglar and Fire Alarm.*—June 30, 1868.—In carrying out this invention, if an attempt be made to open the door or window of the building in which the apparatus is employed, a connection is made between a battery, an alarm, and an annunciator. In case of fire breaking out in the room in which the fire alarm is placed, the air contained in the hollow drum expands and moves the corrugated surface of the drum into contact with the spindle of the disk; a circuit is thus established between the alarm battery and fire indicator, and an alarm is sounded. The annunciator is also employed in connection with the fire alarm, its function being to indicate the point of danger.

Claim.—1. Combining with the armature F the springs G, substantially as and for the purpose specified.

2. The circuit breakers J, formed of one or more strips of metal, secured substantially as described.

3. Combining with the slab, provided with the openings and screw cups 6 and 7, the arms 11, armatures 10, coils 8, switch 12, and buttons 13 and 14, when the same shall be combined and operate substantially as shown, for the purposes indicated.

4. Combining with the door the spring 2, plate of metal 3, and regulating screw 4, connected and operating substantially as described.

5. Combining with the drum 15 the disk 18, when the same shall be combined, constructed, and operate substantially as described.

6. In combination with the subject-matter of the third claim, the door and alarm, when the same shall be combined and operate substantially as and for the purpose specified.

7. In combination with the subject-matter of the third clause of claim, the window and alarm, when the same shall be combined and operate substantially as and for the purpose specified.

8. In combination with the subject-matter of the third clause of claim, the drum 15 and disk 18, when the same shall be combined and operate substantially as described.

79,441.—JOHN W. BOUGHTON, New York, N. Y.—*Paper File.*—June 30, 1868.—Incisions extending from the edge to the elongated holes which receive the bands, enable the latter to be readily applied and detached by bending the portions between the holes and the edge. The small elastic bands shown are employed to separate different papers in the same file.

Claim.—A paper file, consisting of one or more pieces of pasteboard or other suitable material, having notches or recesses cut in its edge for the reception of ordinary elastic bands, with the bands applied thereto, all substantially as described.

79,442.—JAMES D. BRYSON and ALONZO POTTER, New Castle, Pa.—*Spike Machine.*—June 30, 1868.—In this machine a peculiar device is employed for cutting off the rod before the point of the spike is formed, and an attachment is used to automatically guide and carry the end of the rod to the die.

Claim.—1. The sliding plate K, when provided with the arms *m* and *n*, or their equivalents, in combination with cutter F and guide O, all arranged and operating in the manner and for the purpose set forth.

2. A slide or sliding arm *n*, arranged on the bed of the machine, as described, in combination with its operative mechanism, for the purpose of moving the rod to position, substantially as described.

79,443.—ERASTUS BUCK, Vincennes, Ind.—*Belt Shipper.*—June 30, 1868.—The shipper has inclined arms with friction rollers, together with a projection which actuates a lever whereby the loose

pulley is pressed against the fixed one, while the belt is being shifted.

Claim.—The combination of the shipper H, pivoted lever G, and pulleys D' E, when arranged and operating substantially as described.

79,444.—C. THURSTON CHASE, Albany, N. Y.—*Inkstand.*—June 30, 1868.—A small opening only is exposed for dipping, and this is covered by a pivoted cap when not in use; but the cover closing the large opening may be readily removed for the purpose of filling or cleaning the reservoir.

Claim.—In combination with an ink well, having a rim D, and catch *d*, the pivoted cover E, when constructed, attached, and operated substantially in the manner and for the purposes specified.

79,445.—WILLIAM CHISHOLM, Cleveland, Ohio.—*Dumping Car.*—June 30, 1868.—The car is secured to the tilting track by chains, and by turning a windlass the car and track are turned as upon a horizontal, longitudinal axis so as to dump the car load *en masse*. When the apparatus is at the end of a side track, the tilting track can be turned around by means of the turn table so as to bring the side of the car transversely to the track and thus discharge at the end of the road. The platform on which the turn table stands being provided with rollers, the whole apparatus may be transferred from one side track to another.

Claim.—1. The construction and arrangement of a section of a railroad track by means of trunnions or bearings to support the track, and thereby allow a longitudinal and transverse tilting and vibrating of the same, substantially as and for the purpose set forth.

2. The segments J K, in combination with the section of a track A and trunnions or bearings, as described.

3. The combination of the sectional tilting track A with the turn table L, for the purposes set forth.

4. The combination of the sectional tilting track A, turn table L, with a transfer table M, in the manner as and for the purpose described.

79,446.—JOHN B. CHRISTIAN, Mount Carroll, Ill.—*Fish Hook.*—June 30, 1868.—The ends of the grooved plate are bent in opposite directions so that the plate, together with the hooks, shall revolve as it is drawn through the water.

Claim.—The revolving grooved plate B, the artificial worm A, the hooks *c c c*, and the wire D, as arranged in relation to each other, substantially as herein described.

79,447.—WILLIAM H. COLE, Quincy, Mich.—*Tucking Device for Sewing Machine.*—June 30, 1868.—An adjustable device attached to the sewing machine foot for folding the goods in form for tucking before being sewn.

Claim.—The combination, with the foot A, of plates C, E, and G, the latter provided with stop F, slotted arm B, screw 2, indicator D, and screw H, all constructed, arranged, and operating as herein described and shown.

79,448.—DEWITT C. CREGIER, Chicago, Ill.—*Dredging Machine.*—June 30, 1868.—This apparatus is especially adapted for dredging in contracted spaces and to definite points, as in preparing the foundations for piers for bridges, sinking shafts in a soft or diversified bottom, dredging in angles of docks, and the like.

Claim.—1. The guides *d* and screws *f* with the shaft K and beveled pinion *k* and their connections, in combination with the vertical frame work E and its connections, adapted to transmit the power at any elevation, as and for the purposes herein set forth.

2. The inclined frame work E', mounted on the upright frame E, as represented, and adapted to be adjusted in the several directions, and operating the dredging mechanism H *h* in an inclined position, while the rising and lowering motion may be vertical, as and for the purposes herein specified.

3. The guides *m*, formed and arranged as represented on the revolving parts G¹, G², and adapted to guide the pitch chains H, and consequently to con-

trol very exactly the working paths of the buckets *h*, or their equivalents, as and for the purposes herein specified.

79,449.—SAMUEL DARLING, Bangor, Me.—*Railroad Car Heating and Ventilating Apparatus.*—June 30, 1868.—A positive motion is imparted to the fan wheel, as, for instance, by a gear connection with the car axle; the function of the fan being to impel the hot air forward and insure a steady circulation. The construction of the heating apparatus is such that the fire is extinguished and the smoke pipe closed in the event of the upsetting of the cars.

Claim.—1. In combination with an endless pipe for conveying a heated fluid, a blower, operated substantially as described, to cause a continuous circulation of the fluid in the pipe.

2. The combination, in a stove or furnace, and beneath the fire chamber, of a water vessel, and an intermediate non-conducting chamber, having a ball valve, or its equivalent, substantially as and for the purpose described.

3. The combination, with the smoke pipe, of a conical chamber and a ball valve, or its equivalent, substantially as and for the purpose described.

79,450.—JOHN H. DAVEY, Rockford, Ill.—*Cultivator.*—June 30, 1868.—The frame carrying the cultivator teeth is connected to the axle by a chain, and adjustably attached to the rear end of the main frame by pins passing through holes in the standards. The tooth-bearing frame may also be raised and lowered by a lever and chain.

Claim.—The frames B and C, the standards D D, pins E, the chains F F, the lever K, the chain K', all constructed, combined, and operating substantially in the manner and for the purposes set forth.

79,451.—DANIEL DEAN, Brighton, Mich.—*Cultivator Tooth.*—June 30, 1868.—By loosening the screw bolt which attaches the tooth to the standard the tooth may be reversed in position, it having two points and a broad and a narrow side, either of which may be presented to the corn, according as it is young, requiring the formation of small hills, or old, requiring large hills to be upturned.

Claim.—The reversible cultivator tooth A, when constructed substantially as shown and for the purposes described.

79,452.—CHARLES DENTON, Decatur, Ill., assignor to "AMES PLOW COMPANY," Boston, Mass.—*Harvester.*—June 30, 1868.—Relates to reaping machines of the class known as headers, in which the tops only of the grain stalks are cut with the grain heads, leaving the remainder of the stalks standing, to be plowed in. The improvements have reference principally to the construction of the inclined spout, through which the conveyor travels to discharge the cut grain into a wagon running with the header; also to the arrangement of the mechanism for driving the sickle bar.

Claim.—1. Fulcruming the lever which actuates the sickle bar at or near its center, by means of a movable lever, and driving it by a link, connected at the rear of the frame with the driving mechanism, which is located outside of the frame.

2. Pivoting the sickle-bar lever to a laterally-movable or vibrating lever, substantially as and for the purpose set forth.

3. The combination of the floored offset *k*¹ and its side board *i*¹, with the auxiliary belt and main belt of the spout.

4. Combining with the conveyor rolls *a*¹ the clearers *s*¹, substantially as set forth.

5. Combining with the reel *i* the truss wires attached to a central ring, and to disks or hubs at the opposite ends of the axle, substantially as set forth.

6. Combining with the frame or carriage lever *k*², and with the post *l*², the box *m*², with its spring bolt *o*², springing into the holes *n*² of the post *l*², and withdrawn therefrom, substantially as described.

79,453.—THOMAS W. DRESSER, San José, Cal.—*Furnace and Condenser for Reducing Quicksilver and other Ores.*—June 30, 1868.—A furnace for treating ores containing volatile substances. The upright furnace has a vapor-tight hopper and a continuous-

discharging opening, with a suction pump or pumps leading from it for drawing the vapor from the heated ore, and forcing or drawing it under water, where it may be condensed and saved.

Claim.—1. The vapor-tight hopper J and siphons U U, in combination with this or other smelting furnaces, substantially as described.

2. The division plate H H, and the endless carriage F, constructed and arranged to operate substantially as and for the purpose described.

3. In combination with a vapor-tight furnace, A, provided with a hopper, J, either of the pumps Q R S, substantially as and for the purpose specified.

79,454.—WILLIAM J. ELVIN, North Madison, Ind.—*Bee Hive.*—June 30, 1868.—The brood boxes of the hive may be lifted out at the top when the cover of the hive is taken off, and the base of the hive is constructed in the form of a trough, with an opening at the bottom throughout its length, for the purpose of allowing dead bees or refuse to fall out.

Claim.—The bee hive herein described, when its several parts are constructed, combined, and arranged as set forth.

79,455.—RALPH EVANS, Brant, N. Y.—*Fruit Picker.*—June 30, 1868.—The edges of the flange around the notch are sharpened, the better to cut the stem and detach the fruit; and the band or casting has a stem or projection, by which it is attached at an angle to the handle.

Claim.—The metallic casting B, having a flange on its under side, and slotted so as to form a knife, and provided with an angular stem, as and for the purposes set forth.

79,456.—A. L. CHUBB, Grand Rapids, Mich.—*Field Roller.*—June 30, 1868.—The feet of the weight box, one in front and the other in rear, are confined to the yoke by means of the straps, which are fastened to the legs of the weight box, and embrace projections on the yokes.

Claim.—The yokes B B, cast with projections for sustaining the weight box or driver's seat, in combination with straps *e e*, all arranged as herein described.

79,457.—AUSTIN E. CLEMENT, Wapakonetta, Ohio.—*Chimney Cowl.*—June 30, 1868.—When the wind blows against one of the wings, it forces the lower portion thereof against the end of the cylinder, preventing the wind from entering, and the smoke escapes from the opposite end of the cylinder, as well as at the top of the wing against which the wind acts. The spring restores the wing to its perpendicular position when the wind ceases. The bolts determine the degree of motion of the wings.

Claim.—Hanging the wings C C' by the bent springs D D', in the manner and for the purpose set forth, in combination with the cylinder B, bolts E E', and pipe A, substantially as described.

79,458.—Canceled.

79,459.—CHARLES L. DAYTON, North Buffalo, N. Y.—*Row Lock.*—June 30, 1868.—The oar is provided with a pivoted block or eye, mounted in a yoke. The eye fits over a pin in the gunwale of the boat, and is supported by a shoulder on said pin. The oar turns on the pivots of the eye in dipping and rising, and around the pin in making the strokes.

Claim.—The combination of the yoke A, bed-plate C, pivoted eye D, and pin E, all employed and operating in the manner described, for the purpose specified.

79,460.—C. H. DENISON, Springfield, Mass., assignor to himself, J. W. RAY, and V. N. TAYLOR, same place.—*Machine for Applying Cloth Patches to Paper Collars.*—June 30, 1868.—A machine for applying cloth patches to the button holes of paper collars. Cloth, such as is commonly used, is prepared by applying an adhesive coating to one side, and then drying it. The prepared cloth is cut into long strips of suitable width, to be made into patches as it passes through the machine. A resumé of the main operation is given in the last clause of the claim.

Claim.—1. The combination of the plunger or plate

D⁶, with the bar F¹ attached thereto, the stamps *e*, and sponge tubes *d*⁵, all constructed and operating substantially as herein described and for the purposes set forth.

2. The combination of the plunger or plate D⁶ with the bar F¹ attached thereto, the stamps *e*, the sponge tubes *d*⁵, and the water-pipe *g*¹, and box *g*, when constructed and operating substantially as described and for the purposes specified.

3. The stamps *e*, having the dies *e*⁴, counter-dies *x*³, and passage *x* therein, all constructed substantially as herein described and specified.

4. The combination of the stamps *e*, having the dies *e*⁴, counter-dies *x*³, and the passage *x* therein, with the platen *x*¹, when constructed and operating substantially as described and in the manner set forth.

5. The combination of the wheel *a*¹ with the projection *i* thereon, vibrating arm *a*², rock shaft *a*³, lever *a*⁶, rod *a*⁸, arm *a*⁹, ratchet wheel and pawl *e*³, *i*⁶, and rolls *h*⁸ *h*⁹, for the purpose of moving the strips under the dies *e*⁴, substantially as described.

6. The bar F³, having the slot F⁴ therein, in combination with the stamps *e*, having the projection *e*⁶, thereon, all constructed and arranged substantially as herein described and set forth.

7. The sponge tubes *d*⁵, in combination with the water pipe *g*¹, having outlets *g*³ therein, all constructed and operating substantially as herein described, and in the manner specified.

8. The combination of the sponge tubes *d*⁵, adjustable rod *o*⁸, and valve and valve arm *m*⁴, when constructed substantially as described, and operating in the manner set forth.

9. The sponge tubes *d*⁵, having the side pans *d*⁷ thereon, and the adjusting projection *o*⁵ and its nut *o*⁶, all constructed and operating substantially as described and in the manner set forth.

10. Applying cloth patches to paper or paper collars, as herein described, that is to say, by first dampening the paper or collar at the places where the patches are to be applied, and then pressing said patches thereon by means of a punch or die, which, in its descent, cuts the patch from the cloth which has been previously made adhesive upon one side by a suitable preparation, and then dried, said prepared cloth being fed or moved automatically to or under the dies, all substantially as described.

79,461.—MAJOR H. FISHER, Bridgeport, Conn.—*Machine for Making Rasps.*—June 30, 1868.—The cutter is so applied to the holder that while it is held firmly it is allowed to turn up at its point as it enters the steel, so as to throw up the tooth of the rasp. The arrangement is such that the cutter is nearer the supporting shaft of the holder at the terminus of its movement than at the time of starting, but as it is desirable that the line of teeth be at right angles to the edge of the rasp, provision is made for giving the blank such a movement relatively to that of the cutter as will secure the object stated.

Claim.—1. Attaching the cutter D to the holder B, by means of the stirrup E and spring *f*, when the said stirrup is arranged to support the cutter, and at the same time to allow the point to turn up, substantially in the manner and for the purpose set forth.

2. In combination with the holder B, arranged and operated as above, the blank holder G, and mechanism, substantially as described, for imparting to the said holder a movement relatively to the movement of the cutter across the blank, so that the teeth cut in each row shall be at right angles to the edge of the rasp, substantially as herein set forth.

79,462.—J. L. FOUNTAIN, New Milford, Ill.—*Hoe.*—June 30, 1868.—The shank is made sharp-edged, to prevent the dirt from collecting on and about the same.

Claim.—1. Forming the curved shank B, on its inner side or curve V-shaped or sharp-edged, as and for the purpose set forth.

2. The forward projecting curved shank B, having an acute angle on its inner side C, in combination with the blade, substantially as and for the purpose specified.

79,463.—JOSEPH FOWLER, Allegan, Mich.—*Three-Horse Clevis.*—June 30, 1868.—Under this ar-

angement, should the two horses attached to the lever draw more than their proportion, the lever would elevate the outer end of the parallel bars, by acting on the friction wheel and thereby compel the one horse attached to the bars to perform his share of the work.

Claim.—1. The bars D and friction wheel F, or its equivalent, in connection with any suitable clevis A, when attached and operating substantially as and for the purpose specified.

2. The bar or lever E, when attached to the upper end of the clevis A, and provided with any suitable device G, to which to attach a team, when constructed and operating substantially as and for the purposes set forth.

3. The combination and arrangement of the clevis A, the bars D D, the lever E, the friction roller F, hook H, and ring G, or their equivalent, when constructed and operating substantially as and for the purposes herein described.

79,464.—HORACE P. GALE, Washington, Vt.—*Manufacture of Sugar.*—June 30, 1868.—A longitudinal partition divides the main flue, so as to cause the products of combustion to traverse in opposite directions beneath the evaporating pan before passing off at the front smoke stack. The evaporating pan has a series of short pipes and a series of long pipes, which are also traversed by the products of combustion. The saccharine liquid is drawn from the evaporating pan into a graining pan, and the arrangement of dampers is such that the heat may be diverted from the main flue and made to pass directly through the flue of the grainer and out at the smoke stack at the rear.

Claim.—The peculiar construction of the inside of my arch, arrangement of smoke stacks, the application of flues in my pan, and the combination of dampers and stop coeks, to produce the advantages herein set forth.

79,465.—C. L. GILPATRICK, Boston, Mass.—*Meat Chopper.*—June 30, 1868.—The hollow shaft attached to the top of the supporting standard extends to a point above the center of the rotary tray which contains the meat, and is there provided with arms, having guide-ways for the vertically reciprocating frame which carries the cutter.

Claim.—The arrangement of the cutting or chopping knife K in the frame I, and working in the arms H H, by means of wheels G, E, and D, and a shaft through a hollow shaft F, substantially as and for the purposes herein set forth.

79,466.—FRANCIS GREENE, Troy, Pa.—*Door Key.*—June 30, 1868.—When the key is introduced into the key hole, with the guard, it will turn freely therein, while the guard remains stationary. Hence if the key be turned so as to place its wing out of coincidence with the guard, it cannot be forced out of the lock and no picking instrument can be introduced.

Claim.—The guard C, in combination with the arm *f*, for closing the key hole, constructed and attached to the key, substantially as shown and described, and for the purpose specified.

79,467.—GEORGE W. GREER and FRANK F. LANDIS, Lancaster, Pa.—*Grain Thresher and Separator.*—June 30, 1868.—This arrangement is designed to not only free the grain from chaff, &c., but prevent the unthreshed heads or portions of the same from falling down with the grain and lodging in the meshes of the sieve. The rakes in conveying the straw from the machine thoroughly agitate it so as to shake out the grain.

Claim.—1. The double-chambered fan casing or flues *f*¹ and *f*², made substantially in the manner and for the purpose specified.

2. The arrangement of the double shoe *s*¹ *s*², in combination with the regulating board R, made substantially in the manner and for the purpose set forth.

3. In combination with the regulating board R, and inclined board *r*, the appendage of the wire rack *r* *r* to the same, made substantially in the manner and for the purpose described.

4. The raking device, when constructed with parallel beams *m* and toothed slats or rakes *n*, revolving

over each other in the manner and for the purpose specified.

79,468.—CHARLES F. HARLOW, Boston, Mass., assignor to himself and DEXTER S. KING.—*Machine for Cutting and Trimming Bristles, Felt, Fur, Wool, &c.*—June 30, 1868.—The untrimmed brush is adjusted between the jaws or curved bars, with the back of the brush between said jaws and the feed shaft. The machine being put in motion, the action of the teeth or projections upon the back of the brush moves the latter along in line with the curved bars or jaws, and thereby feeds the bristles up to the vertically reciprocating cutters.

Claim.—1. The combination of the stationary toothed knife *g* and movable toothed knife *g*, with the guide *S* and slide *E*, when constructed to operate as set forth.

2. The combination of the sliding table *R*, guide *S*, slide and cutters *g g*, with the slotted arm of the beam *D* and table *A*, for the purpose of adjusting the cutters *g g* at any desired distance from the jaws or bars *X X*, as specified.

3. The feed shaft *p*, adjusted in the slotted bars, and held by the springs *q*, in combination with the cutters *g g*, arranged upon the sliding table *R*, to operate substantially as set forth.

4. The curved or bent horizontal bars *X X*, when made adjustable on the posts *C C*, and arranged as and for the purpose specified.

79,469.—THEODORE HEERMANS, Pleasant Hill, Mo.—*Coffee Roaster.*—June 30, 1868.—The outer cylinder is provided with a window, through which the progress of the roasting may be witnessed from without.

Claim.—The wire cloth or perforated cylinder *E*, when arranged eccentrically within the outer cylinder *D*, as described and for the purpose set forth.

79,470.—WARREN HILL, Springfield, Mass.—*Ticket Punch.*—June 30, 1868; antedated May 5, 1868.—The spiral spring, which is placed under the projection of the die spindle, forces said spindle out of the female die, and said spring may be of sufficient strength to force the levers apart.

Claim.—The construction and arrangement of the spindle *C*, projection *e*, and the spiral spring *f*, in combination with the lever *A*, recessed at *c'*, and the slotted lever *B*, substantially as described.

79,471.—JAMES S. HOOTON, New Carlisle, Ind.—*Bee Hive.*—June 30, 1868.—The objects are to render all parts of the hive easily accessible, effectually regulate ventilation during warm and cold seasons, prevent molestation of bees or honey by the miller or vermin, and enable persons to remove honey from any part of the hive, in small quantities, without interfering with other portions of the hive.

Claim.—1. The device for entrapping the worms, as specified.

2. Supporting the racks by the metal staples *S*, as shown and specified.

3. Supporting and holding to their places the racks by means of the metal pins *X''*, as specified.

4. Supporting the racks solely upon metal bearings, by means of the pins *X* and staples *S*, as set forth.

5. The hive *R*, when its several parts are constructed, combined, and arranged as set forth.

6. Board *B*, when constructed as specified.

7. The combination of the metal strip *I''*, the screw *Z*, the aperture *V*, openings *P* and *T* through the board *B*, with the wire cloth, as set forth, and for the purposes specified.

79,472.—CARLETON B. HUTCHINS, Ann Arbor, Mich.—*Compound for Covering Roofs and other Structures.*—June 30, 1868.—Rosin, leached ashes, whitening, salt, red lead, and linseed oil.

Claim.—The compounding of ingredients, as herein described, to make a composition for roofing, and for various other purposes, as before described.

79,473.—MOSES JOHNSON, Three Rivers, Mich.—*Potato Digger.*—June 30, 1868.—The tops or vines of the potatoes are removed by a device which operates in advance of the shovel. The shovel scoops

up the potatoes and causes them to fall upon the endless apron which sifts the earth from the potatoes and deposits them into a box at the rear. The box has a hinged bottom which may be opened by a lever to permit the potatoes to fall in a heap.

Claim.—A potato digger having wheel *A*, grooved wheel *B*, roller *D*, arms *C*, shovel *E*, arms *F*, belt *G*, box *H*, lever *K*, bar *M*, spring *O*, and pulley *S*, constructed, combined, arranged, and operating substantially as set forth.

79,474.—WILLIAM JOHNSON, Appleton, Wis.—*Clothes Drier.*—June 30, 1868.—The pivoted arms being of different length, suitable spaces are left between the clothes-suspending bars when dropped forward to a horizontal position to receive the clothes to be dried.

Claim.—1. The movable metallic arms *H*, folding into each other and oscillating upon a common fulcrum, operating in the manner described and for the purposes set forth.

2. The combination and arrangement of the bracket, sides *A A*, and the frame rod *B C*, with the fulcrum rod *F*, the metallic movable arms *H*, and the bars *E E E E*, with the slot *I* and rivet *J*, when operating in the manner specified and for the purposes set forth.

79,475.—HORACE K. JONES, Kensington, Conn.—*Balancing Polishing Wheels.*—June 30, 1868.—When, from any cause, the wheel becomes heavier upon one side of its axis than upon the other, the weights are moved toward the light side until the wheel is balanced.

Claim.—1. The use, for the purpose of balancing wheels, of two or more weights, swinging upon pivots located between the axis and periphery, and capable of being fixed at any point upon the side of the wheels, within the limit of their motion, by a screw or other suitable means.

2. The combination of the movable weights *B B* with the fixed weights *D*, for the purpose specified.

79,476.—ISAAC KELLER, Randolph, Ohio.—*Horse Power.*—June 30, 1868.—All of the multiplying gear is placed in a solid metallic box, which protects the gear from dirt when the power is placed upon the ground. The gears are prevented from binding during any rocking of the frame, by being mounted upon the two axles which run in boxes on the sides of the solid box. The lipped iron maintains the engagement of the master wheel and the first wheel.

Claim.—1. The solid metallic box *G*, with hole *g* therein, when used to contain the speeding gear *P J K* of a horse-power, substantially in the manner and for the purpose set forth.

2. The iron, *N*, with lip *n*, when used in combination with the box *G*, with its gear *P J K*, and the master wheel *A B B*, substantially as and for the purpose herein specified.

3. The peculiar arrangement and combination of the box *G*, axles *H* and *I*, with gear wheels *P, J, and K* thereon, iron *N*, with lip *n*, and master wheel *A B*, the several parts being arranged in the manner and for the purpose herein specified.

79,477.—G. H. KIDNEY, Cleveland, Ohio.—*Washing Machine.*—June 30, 1868.—The clothes are placed in the open or grated cylinder which rotates within the boiler. Perforated tubes traverse the cylinder longitudinally, and are supplied with water by the cups which dip it from the boiler. As the cylinder rotates, streams of hot water from the tubes fall upon the agitated clothes.

Claim.—1. The cups *H*, perforated tubes *G*, cylinder *C*, and boiler arranged and operating in the manner and for the purpose substantially as described.

2. The rotary cylinder *C*, provided with interior perforated tubes *G*, in combination with the cups, substantially as and for the purpose specified.

79,478.—WILLIAM N. KINGTON, Bowensburg, Ill.—*Saw Clamp.*—June 30, 1868.—The hooks are attached to a bench or other stationary object, and the saw being placed in the clamp, the operator stands on the platform or sits on the scaffold to per-

form the necessary manipulation. The weight of the operator is thus made to hold the saw firmly in position.

Claim.—A saw clamp, having clamps A, jaws B, scaffold C, upright bars D, platform J, plank H, and hooks G, constructed, combined, and arranged substantially as specified.

79,479.—Canceled.

79,480.—JAMES KNIGHT, Philadelphia, Pa.—*Indicator for Street Railway Cars.*—June 30, 1868.—An indicator operated partly by clock work and partly by the revolving wheel or axle of the street railway car, to which it is applied. The said indicator determines at the end of a trip whether the car has been running regularly, and, if not, at what points on the road improper stoppages have been made, or where the speed of the car has been increased or retarded.

Claim.—1. The minute hand G and its pin, *j*, turned by clock work, as described, and moved toward or from the dial plate by a cam wheel H, in combination with loose indicating hands *h*, which are turned by the minute hand, and released at certain determined points on the dial plate, all substantially in the manner and for the purpose specified.

2. The wheel J, having adjustable blocks *r'*, and being operated through the medium of the gearing described by a wire *l*, connected with the wheel or axle of the street railway car.

3. The above, in combination with the arms *s'*, *t*, and *u* of a spindle K, and with the arm *w* of a spindle, L, for starting and arresting the motion of the cam wheel H, as described.

4. The cam wheel H, operated by a coiled spring *g*, or its equivalent, for imparting a longitudinal sliding motion to the portion *c* of the spindle F, for the purpose specified.

5. The manner, substantially as herein described, of securing the indicating hands *h* to the stem *b*, so that they may be turned either separately or together upon the said stem.

79,481.—PH. KNOBLOCK, Wyandott, Kansas.—*Car Coupling.*—June 30, 1868.—The levers are pivoted to the movable jaw and serve to raise the same when turned so as to act at their lower ends upon inclines on the sides of the draw head. The slotted frame is raised with the upper jaw in order to release the coupling pin from the shoulder of the stationary jaw.

Claim.—A car coupler, having jaws A and B, slotted frame K, cross bar H, with cord attached as described, levers G, and hook M, constructed, combined, and arranged substantially as specified.

79,482.—A. KOMP, New York, N. Y.—*Eyeletting Machine.*—June 30, 1868.—The guide pin within the punch takes the eyelets from the mouth of the feeding chute, said pin being subjected to the action of a spring having a tendency to force it out of the punch. When pushed in, the guide pin is retained by a spring catch which is automatically released as often as the punch reaches its highest position. The friction spring retains the eyelets on the guide pin till the punch forces them off. The anvil has a projecting point and is surrounded by an elastic tubular bed, so that the material to be eyeleted, on being forced over the point, is pierced, and then supported by the elastic bed, which offers sufficient resistance to permit the eyelet to be forced through the hole.

Claim.—1. The friction spring *n*, on the guide pin *e* in the punch D, substantially as and for the purpose described.

2. The self-acting dog *h* and cam *k*, in combination with the guide pin *e* and punch D, substantially as and for the purpose set forth.

3. The yielding rest J, in combination with the anvil I and punch D, substantially as and for the purpose set forth.

79,483.—PERLEY LAFLIN, Warren, Mass., assignor to himself and JOHN J. SPRAGUE.—*Shuttle.*—June 30, 1868.—The projecting lip facilitates the threading of the shuttle, and prevents the thread from flying out during the operation of weaving.

Claim.—The combination, with the shuttle, of a

threading and guide piece or lip, constructed as described and for the purposes set forth.

79,484.—DENNIS LANE, Montpelier, Vt.—*Head Block for Saw Mills.*—June 30, 1868.—The wheels or rollers can be raised from or lowered onto the carriage, according as the head block is to remain stationary or be run from one position to another. The head blocks are automatically moved back upon the carriage during the gig-back motion of the latter.

Claim.—1. The rollers or wheels C, supporting the head block, and mounted on shafts eccentric to them, by which the wheels are forced upon the carriage or released from bearing thereon, constructed and operated as described.

2. The scrapers H, hinged to the head block, for the purpose of clearing the face of the carriage side from saw dust, constructed and operated substantially as described.

3. The chain connection E², attached to the upright supports, and operated by means of a friction pulley, G², upon a bar, I⁴, through a treadle, M⁴, by which, as the carriage is giggered back, the supports will be drawn back on the carriage, constructed and operating substantially as described.

79,485.—C. B. LOVELESS, Syracuse, N. Y.—*Vapor Burner.*—June 30, 1868.—The cup below the burner holds alcohol or other fluid, which is burned in order to initiate the formation of gas from the oil. The retort receives oil from a supply pipe, and converts it into vapor, which is conveyed through a pipe to the argand burner, whose flame heats said retort. The jacket and deflector concentrate the heat upon the retort and hold in position the upper part of the chimney.

Claim.—The pipe *a*, retort *m*, cap *j*, jacket *k*, gas pipe *c*, burner *g*, and chimney *h*, constructed and arranged substantially in the manner and for the purposes set forth.

79,486.—HAMMOND MARSHALL, Atlanta, Ga., assignor to himself and T. W. CHANDLER, Fulton County, Ga.—*Plow.*—June 30, 1868.—The wings, shovels, and mold boards may be of any desired style, but are all adapted to fit the same shank, so that they may be easily substituted for each other.

Claim.—1. The shank A, constructed as described, with a sharp cutting edge, *d d*, at the top, curved at the bottom, and provided with slotted projections B B, substantially as and for the purposes herein set forth.

2. The slotted and flanged projections B B on the shank A, in combination with the lugs *i i* and grooves *h h* on the wings, for the purpose of fastening the same together, substantially as and for the purposes herein set forth.

3. The pin *b*, on the point C, in combination with the hole *c*, on the shank A, for the purpose of fastening the same together, substantially as and for the purposes herein set forth.

79,487.—PATRICK MCELROY, Cambridge, Mass.—*Medicine Dropper.*—June 30, 1868.—The tube is to be attached to the bottle cork or stopper; it is closed at top and contracted at bottom, and has a minute air hole through its side near the top. The tube being withdrawn from the bottle and held over a spoon or cup, the liquid escapes from its lower orifice in drops.

Claim.—A tube, for dropping medicine or other liquid, constructed substantially as and for the purpose described.

79,488.—RUFUS S. MERRILL, Boston, Mass., assignor to himself and WILLIAM CARLETON, same place.—*Lamp Burner.*—June 30, 1868.—To the air-distributing plate of the upper section is secured a sleeve, of such shape and form as to fit loosely around the bearing of the lower section; upon the sleeve are formed guides, corresponding in position to the guides on the bearing, so that when the sleeve is pressed down over the cap, the sections will be adjusted and maintained in their proper relation to each other.

Claim.—1. In a burner, in which the upper section, consisting of the deflector, air-distributing plate, and chimney holder, with its chimney, is removable from

the lower section, composed of the base and wick tube, a sleeve united with the air-distributing plate, and shaped in the manner herein described, so that, while entirely removed from contact with the wick tube, it shall fit the cap of the lower section and maintain the upper or removable section in position, substantially as and for the purpose specified.

2. In combination with the parts arranged as claimed in the preceding clause, guides, or their mechanical equivalents, formed upon the cap and the sleeve, as described, so that the upper section of the burner may be readily adjusted upon the lower section, as set forth.

79,489.—ELISHA METS, Rochester, N. Y., assignor to himself and A. CRAM.—*Wood Bending Machine*.—June 30, 1868.—The wood to be bent into a table rim is forced between the concave and inner circle by rollers, and the follower liberates and expels the bent rim.

Claim.—1. The combination of the annular rolled concave B with the inner circle D, and the feed rollers R and R', for the purposes herein shown and described.

2. The arrangement of the follower G, with the inner and outer circles B and D, constructed and operating substantially in the manner and for the purposes set forth.

79,490.—JAMES A. METCALF, Lawrence, Mass.—*Shuttle*.—June 30, 1868.—The upright guide wire placed within the cavity at the delivery end of the shuttle is so shaped as to enable the operator to readily guide the thread to a narrow slit in the side of the shuttle, and thence to the eye.

Claim.—1. A threading guide or guide wire, constructed and disposed relatively to the walls of the shuttle, so as to guide the thread directly to the slit, substantially as set forth.

2. The combination of the threading guide, constructed substantially as shown and described, with a shuttle having a slotted eye.

3. A thread guide, substantially as described, which performs the double duty of guiding the thread to the eye when "threading" the shuttle, and also of insuring the proper line of draught from the bobbin.

79,491.—DAVID S. MILLER, West Alexandria, Ohio.—*Churn Dasher*.—June 30, 1868.—The dasher is reversible upon its handle, so that the external inclined surfaces may be presented either downward or upward.

Claim.—The reversible dasher, *a b c d*, in combination with the deflector board *g*, when the parts are constructed, arranged, and operated in the manner and for the purposes described.

79,492.—SIMON MINGES, Rochester, N. Y.—*Wear Plate for Boots and Shoes*.—June 30, 1868.—The cross-connections and dovetailed bearing are fitted between the soles, and secured there to hold the wear plate in place. The wear plate has a downward projecting rim for covering and inclosing the sole, and an upward projecting shield for protecting the upper leather at the toe.

Claim.—1. The combination, in the wear plate B, of the rim *a*, covering or inclosing the sole, and the shield *x* protecting the upper, as herein set forth.

2. The combination, with the wear plate B, of the curved cross-connections *b' b'*, for expanding the rim, and the dovetailed bearing or bearings *b*, for shielding the toe, as herein set forth.

79,493.—HIRAM B. MORRISON, Le Roy, N. Y.—*Revolving Hose Nozzle*.—June 30, 1868.—The rotary motion of the nozzle adapts it to more effectually deluge a room when inserted through an opening in the wall. The tightening nut, in connection with the adjusting ring, holds the wings in position against the varying pressure of the water.

Claim.—1. The arrangement, inside the bent nozzle D, of the spiral wings F F, adjustable to different positions across the water-way, and capable of being fixed in place, and operating to impart a rotary motion to the nozzle by the current passing through, in the manner and for the purpose specified.

2. The arrangement, in connection with the spiral

wings F, of the elbow-arms *d i*, resting in the turning ring *l*, which is tightened in position by nut *n*, the whole as herein set forth.

79,494.—T. B. MORSE, New Haven, Conn.—*Carriage Shackle*.—June 30, 1868.—This invention is designed to admit of the employment of a rubber block packing of greater thickness than usual, the object being to obviate the cracking of said block. The web in the angles serves to hold the block in place, so that it is not liable to drop out when the shafts are removed.

Claim.—1. A shackle, constructed with the recesses *a a* in each of the internal angles, so as to receive the block H, substantially as and for the purpose specified.

2. The block H, formed from India rubber, and with projections *d* upon each angle, corresponding to the recesses *a a* in the shackle, substantially as and for the purpose specified.

79,495.—JAMES NEVISON and THOMAS NEVISON, Jr., Morgan, Ohio.—*Carriage Wheel*.—June 30, 1868.—The spokes are double, each extending from the hub to the felloe, and thence back to the hub; and their ends are bent, so as to form a hook or lip which adapts them to be secured in the mortises of the hubs by keys. The spring leaf, placed upon the spoke at its junction with the felloe, is designed to impart strength and elasticity.

Claim.—1. The return or hook *b*, and spring spokes B, in combination with the key F, and hub C, substantially as set forth.

2. Spring leaves E, bolted to and in combination with the spring spoke, substantially as set forth.

79,496.—JOHN OLIPHANT, Springhill Furnace, Pa.—*Metallic Hub*.—June 30, 1868.—The object is to so construct metallic hubs that one or more spokes may be removed from the wheel and replaced without removing the tire or felloe, or displacing any of the other spokes. The boxes may be driven from the hub, and their places supplied with new ones when desired.

Claim.—1. The combination of the disk I, divided into the sectors or caps J J J', the annular groove L, the projections M M M², and the recesses N N¹ N², as and for the purpose set forth.

2. The bevells H H and T T, as and for the purpose set forth.

3. The combination of the boxes B B, tube A, mud-bands C C, and screws D D, substantially as and for the purpose specified.

79,497.—ELIAS C. PATTERSON, Rochester, N. Y.—*Grain Separator*.—June 30, 1868.—The positions of the pivots and eccentric, relative to the extremities of the arms, effects the desired inequality as to the extent of the motion of the two sieves. The wedge on each side of the lower sieve gives the latter a side motion, in addition to its longitudinal movement.

Claim.—1. The arms E, upon pivots F, operated by eccentric G, and operating upper and lower sieves, substantially as described.

2. The wedge H on the lower sieve, for the purpose set forth.

79,498.—WILLIAM J. PHELPS, Springfield, Mass.—*Ticket Punch*.—June 30, 1868.—The punch, in general construction, is similar to that for which letters patent were granted to same party September 17, 1867. The die here claimed is designed to cancel tickets or paper, without cutting out or destroying the legibility of the letters, characters, or figures.

Claim.—In a ticket punch, a die and counter-die, consisting of a group or series of projections *o o*, and corresponding perforations *o' o'*, said group or series of projections and perforations being formed into any desired letter, figure, or character, all constructed and operating substantially as described, and for the purposes herein specified.

79,499.—JULIUS POLLOCK, Morrisania, N. Y.—*Purifying Wood Spirits*.—June 30, 1868.—The crude spirit is diluted with water and agitated so as to disengage the fixed oils, which rise to the surface and may be removed by skimming. The spirit is

then filtered through chareoal and coneentrated by distillation.

Claim.—The process of purifying pyroxylic spirit, substantially as herein described.

79,500.—AMOS RANK, Salem, Ohio.—*Harvester.*—June 30, 1868.—A method of combining with a harvester a cut-off rod for separating the cut and falling grain from the gavel being discharged from the platform.

Claim.—1. A vertically adjustable separating rod or cut-off, vibrating in a circular horizontal path, substantially as set forth.

2. A separating rod or cut-off vibrating horizontally in a curved path, and adjustable horizontally relatively to the finger beam, substantially as set forth.

3. A separating rod or cut-off, vibrating horizontally, and capable of adjustment at an angle to the finger beam, substantially as set forth.

4. The combination, substantially as set forth, of a reel with a separating rod, vibrating horizontally over the platform.

5. The combination, substantially as set forth, of a dropping platform with a separating rod, vibrating horizontally over the platform.

6. The combination, substantially as set forth, of an overhung reel, a dropping slatted platform, and a horizontally vibrating separating rod.

7. The combination of a horizontally vibrating separating rod, supported at one end only with a finger beam hinged to the main frame.

8. The combination, in a harvester, of a laterally projecting hinged finger beam, a reel, a platform, and a horizontally vibrating cut-off, when the three latter are mounted on the finger beam and shoe only.

9. The combination of a dropping platform with a horizontally vibrating cut-off, when so arranged that the dropping of the platform interposes the cut-off, and the raising of the platform withdraws it.

79,501.—JAMES RICHEY, Cincinnati, Ohio.—*Lubricator.*—June 30, 1868; antedated April 10, 1868.—A device for lubricating journal bearings. The glass windows enable the amount of oil in the reservoir to be ascertained at a glance.

Claim.—A lubricator, with its oil reservoir A cast in one piece with the stem B, and furnished with windows C C', all substantially in the manner herein described and for the purposes specified.

79,502.—JOHN G. ROTH, New York, N. Y.—*Clothes Pin.*—June 30, 1868.—The quadrangular form of the rubber spring block serves the purpose of maintaining the two levers parallel with each other, both when the spring is compressed in action and when at rest. The recesses in the jaws diminish from the diameter of a large clothes-line to that of the smallest line which may be employed, the shoulders enabling the clothing to be held upon a small line, and preventing the line from slipping between the jaws of the clamp.

Claim.—1. In a clothes-line clamp formed of two jointed levers, provided with parallel or nearly parallel contiguous bearing planes, the quadrangular self-retaining rubber spring block, arranged and operating substantially as and for the purposes set forth.

2. In a clothes-line clamp formed of two jointed levers A A, the abruptly terminating jaw recesses $a^2 a^2$, arranged and operating substantially in the manner and for the purposes set forth.

79,503.—JAMES SEE, Mitchell, Ind.—*Mechanical Movement.*—June 30, 1868.—The power, applied to the main shaft, is transmitted through the associated gearing to operative machinery, the object of this interposed movement being to readily control and regulate, and largely augment the power before its ultimate application.

Claim.—The apparatus above described, consisting essentially of the shaft C, wheel E, shaft F, wheels *f* G, shaft H, wheels *h* I I, cord or chain J, pulleys K M, levers L N, weights W W', dogs Q Q', ratchet wheels O P, and shaft D, when the several parts are constructed and combined as above described, and for the purpose set forth.

79,504.—JOHN CARRINGTON SELLARS, Birkinhead, England.—*Metal-Founders' Blacking.*—June 30, 1868.—In preparing the residue or coke for the intended use it is reduced to a finely divided state. It is designed as a substitute for the powdery substance known as blacking, and used for coating the inner surfaces of molds to contain liquid iron.

Claim.—Utilizing the residue or coke left from mineral oils and other like substances in stills, after the distillatory process, by employing it for metal-founders' blacking, substantially in the manner hereinbefore described.

79,505.—S. B. SEXTON, Baltimore, Md.—*Base Burning Stove.*—June 30, 1868.—The coal magazine is exposed, or not inclosed by a casing or jacket; heat is consequently radiated therefrom.

Claim.—1. The exposed cylindrical coal magazine D, sustained upon the jacket A by means of an illuminating ring, C, in combination with a fire pot which is inclosed within the jacket, so as to leave a space around it for the descent of the products of combustion on their way to the escape flue, substantially as described.

2. An exposed coal magazine, D, an illuminating ring, C, an annular flue chamber, A', and a hollow base, B, arranged and combined substantially as described.

3. The combination of a cylindro-conic coal-supply magazine, the cylindric portion being exposed, an inclined illumination ring, C, furnished with mica or other transparent windows or doors, and a fire pot, all in the manner and for the purpose described.

4. An escape pipe, leading into the flue K from an exposed magazine, D, when this magazine is arranged over a fire pot surrounded by a descending flue, and supported upon a hollow base, B, substantially as described.

79,506.—E. B. SMITH, Marietta, Ohio.—*Animal Trap.*—June 30, 1868.—The box-like platform is raised by a weight to prevent the escape of the animal by the way of entrance, and again depressed by the animal in making its way to the final imprisoning receptacle.

Claim.—The box A A', with platforms B C, constructed as described, spring catches D E, flat spring *e'*, passage *f*, and trap door *f'*, the whole being combined and arranged substantially as described.

79,507.—EDGAR M. SMITH, New York, N. Y., assignor to Mitchell, Vanece and Company, same place.—*Harvester Rake.*—June 30, 1868.—These improvements relate to the method of adapting the rake to sweep a platform that is not merely an arc of a circle but much longer than such, so that the grain is delivered behind the machine; also to the manner in which the rakes are caused to roll in their bearings to pass the ground wheel and put themselves in position to act as beaters, or to roll back and become rakes to clear the platform.

Claim.—1. In revolving, rising, falling, and rolling rakes, the elongating and shortening of said rakes by sliding them in their bearings, so that they will sweep an irregular-shaped platform, substantially as described.

2. Locking and unlocking and moving of the rakes out and in by devices, substantially as herein described, that are self-acting and require no attention on the part of the operator, substantially as described.

3. The combination of the trigger *i* and sliding lever *k*, for moving the rake out, so that it can roll in its bearings and thus become a rake instead of a beater at the will of the operator, substantially as described.

79,508.—EDWIN C. SMITH, Brandon, Vt.—*Stove Polish.*—June 30, 1868.—Roasted and ground wheat, dissolved glue, gum tragacanth, finely-sifted iron filings, roasted and ground coffee, and alcohol.

Claim.—A stove polish, composed of the ingredients set forth substantially as described.

79,509.—NORMAN SMITH, Hartford, Conn.—*Guide for Screws.*—June 30, 1868.—The short tube has interior side springs which clasp the shank of the screw and hold it in place while the tube is sup-

ported by the screw driver, the whole being thus held together with sufficient firmness to admit of the screw being turned into the wood without other support.

Claim.—The combination of the tube A B and two or more springs E, for the purpose of a guide for starting screws, substantially as herein specified.

79,510.—JAMES SPEAR, Philadelphia, Pa.—*Cooking Stove and Range.*—June 30, 1868.—The inner doors above the grate may be withdrawn and the fire thus supplied with a greater quantity of air for the purpose of consuming the gasses. In handling or shipping, the stove rests upon the knobs which thus protect the edges of the top and bottom plate.

Claim.—1. The application of double doors to a cooking stove or range, above the fire grate, constructed in the manner and for the purpose substantially as herein described.

2. The application of raised or ornamental knobs on the back plate of a cooking stove, for the purpose substantially as herein described.

79,511.—A. C. SPENCER, Bridgeport, Conn., assignor to himself, E. B. JONES, and WILLIAM H. FRENCH, same place.—*Combination of Wood and Paper for Cabinet Purposes.*—June 30, 1868.—Several sheets or layers of paper or pasteboard are glued, gummed, or otherwise secured together and covered with wood veneer. The invention is particularly applicable in the manufacture of sewing machine table tops, which are finished by gluing wood moldings to the edges.

Claim.—The herein described process for combining wood and paper for cabinet and other purposes.

79,512.—GEORGE H. STROUGH, Watertown, N. Y.—*Horse Hay Fork.*—June 30, 1868.—The mode of locking the tines in position for supporting the load is designed to relieve the actuating rod of undue upward pressure. The springs within the point retract the tines and at the same time force upward the actuating rod, so as to release the load from the fork. The latch and releasing devices are protected and guided in such manner that they are not liable to become casually disengaged while the load is being elevated.

Claim.—1. The tines G G', constructed substantially as described, arranged to work in a recess, V, constructed as described, within the sheath or case constituting the body of a pointed fork, and attached to the central rod F by means of pivoted links t t', all substantially as herein described.

2. The manner of locking the shanks of the tines G G' between lips v v and shoulders u, substantially as described.

3. Effecting the retraction of the tines by means of a spring or springs, applied within the pointed portion D of the fork, substantially as described.

4. The arrangement of the pivoted spring catch c, nose e, tripping latch b, and cross head E, substantially in the manner and for the purpose described.

79,513.—D. STURGIS, Byron, Mich., assignor to himself and M. THATCHER, Shiawassee, Mich.—*Straw Cutter.*—June 30, 1868.—The cutters extend diagonally along the cylinder, being secured at their ends to the rims of the cylinder heads. A sheet iron band forms the periphery of the cylinder.

Claim.—The arrangement of the cylinder, as constructed with the frame A, box J, and feed rollers K and N, connected together and operating as and for the purpose set forth.

79,514.—FREDERICK SULTER, St. Paul, Minn.—*Steam Boiler Furnace.*—June 30, 1868.—The contracted passage conducts the products of combustion along the under side of the boiler and discharges the same into a chamber at the rear, whence they pass into the boiler flues, and in which the sparks and cinders are deposited. The openings in the side of the passage admit air to effect the consumption of the gases.

Claim.—The construction of the inclined and horizontal surfaces of the semicircular hearth D, with its side air passages C C, and spark and

draught chamber E, when arranged and combined as herein described, and for the purposes set forth.

79,515.—JAMES H. SWETT, Birmingham, Pa.—*Railway Joint.*—June 30, 1868.

Claim.—In combination with the abutting ends of two railroad rails, the divided jaws B, and the divided clamp C C; said clamp being drawn up tight against the jaws, and the jaws against the rails, by a through-bolt and nut, for the purpose of strengthening the joint, substantially as described.

79,516.—JAMES H. SWETT, Birmingham, Pa.—*Machine for Making Rivets.*—June 30, 1868.—The plunger, after shearing the blank from the rod, follows it to the bottom of the box and holds it firmly while the advancing rod pushes it from under the plunger into the die in the die wheel. The blank is thus fed to the die in a direct line.

Claim.—1. The combination of the header, die, and rod c, all arranged and operated substantially as described.

2. In combination with the header, die, and rod c, the holder T, for keeping the blank straight while being pushed up to the header, substantially as described.

79,517.—ROBERT SYMES, St. Charles, Mo.—*Device for Ventilating Millstones.*—June 30, 1868.—The mill being put in motion, the natural suction of the runner is assisted by the blower, which sends a blast of cold air through the dress of the runner, and out into the "meal-hoop," whence it passes up a pipe into the condenser, taking with it the hot air and dust, which last is deposited in the condenser and removed therefrom through hand holes.

Claim.—The blower M, cold blast tube h, fans e e' e'' e''', tube D, and condenser E, all arranged substantially as shown and specified.

79,518.—C. R. TABER and J. OSCAR TABER, Salem, Ohio.—*Harvester.*—June 30, 1868.—These devices are concerned in changing the vertical position of the cutting apparatus and drag plate, in order that the machine may be adapted for cutting either grain or grass; also in raising the drag bar to avoid obstacles.

Claim.—1. The arrangement of the lever D', shaft E', and arm F'', in combination with the stay J and drag plate I, for the purpose set forth.

2. The lever I', cheek lever L', and jointed arm C', all constructed and arranged to operate as and for the purpose specified.

79,519.—SPENCER P. TAYLOR, Oxford, Ohio.—*Harness Buckle.*—June 30, 1868; antedated June 24, 1868.—The object is to equally divide the strain of the strap between the tongue and spur.

Claim.—The buckle E, constructed with bridge A and spur d, in combination with tongue C, when said tongue is formed in the manner specified.

79,520.—CARL C. T. THOMAS and FREDERICK A. S. RAYMOND, Beverly, Mass.—*Ladder.*—June 30, 1868.—The foot enables the limb of the ladder to be lengthened, thereby adapting the ladder to uneven or sloping ground.

Claim.—The movable foot B, constructed and attached to the side of the ladder, substantially as and for the purposes herein set forth.

79,521.—SAMUEL B. H. VANCE and EDGAR M. SMITH, New York, N. Y., assignors to MITCHELL, VANCE AND COMPANY, same place.—*Composition Clock Case.*—June 30, 1868.—The composition may be made in imitation of marble of various colors; it consists of sulphate of lime, alumina, carbon, potassa, and silicic acid, hygroscopic water and water in chemical combination.

Claim.—1. A clock frame, made of the composition herein described, made plastic by diluted alum, and colored and molded into shape or form, as herein described and represented.

2. In combination with a composition clock case, made in imitation of marble, a metallic ring, embedded or cemented thereto, which ring serves as a seat for the clock gear and other attachable or removable parts, as described and represented.

79,522.—ETHAN P. VAUX, Washington City, D. C.—*Metallic Roofing*.—June 30, 1868.

Claim.—A corrugated metal roof that will allow of expansion and contraction in all directions, when the same is constructed and arranged substantially as herein described.

79,523.—A. H. WALKER, Oswego, N. Y.—*Water Heater for Steam Boilers*.—June 30, 1868.—The internal water space of the drum is connected by pipes with the steam boiler, and also with the reservoir, so that the water from the reservoir can be repeatedly passed through the water chamber, which is heated by exhaust steam from the boiler.

Claim.—The arrangement of the pipes C, C, and C', chambers *h h*, partitions *a*, annular chamber *b*, drum A, and pipes E and D, substantially as herein set forth.

79,524.—J. R. WATKINS, Maine Prairie, Minn.—*Clothes Drier*.—June 30, 1868.—The plate is screwed to a wall, and the rod supports the radiating arms upon which the clothes are hung.

Claim.—1. The plate A, having the concave rear side, and provided with the cruciform slot C, screw holes D D, and the lug B, substantially as and for the purpose set forth.

2. In combination with the above, the screw rod G, nut H, and lug F, having the head *m* and shank *n*, substantially as described.

79,525.—JOHN N. WATROUS, West Meriden, Conn.—*Sash Supporter*.—June 30, 1868.—By turning the armed hub in one direction, the spring of the lower sash will be drawn in, and made to relieve said sash, and by turning the hub in the opposite direction the spring of the upper sash will be drawn in, in like manner.

Claim.—The two spring frames A and B, combined in a single case, provided respectively with springs A¹ and B¹, and bolts A² and B², the yoke of each bolt extending back to the follower or armed hub D, which has its bearings in the side projections C and C', and operating by the rotation of the spindle H, so as to withdraw either of the bolts, substantially in the manner herein set forth.

79,526.—GUSTAV WEDEKIND, Philadelphia, Pa.—*Lamp Shade*.—June 30, 1868.

Claim.—A lamp shade clasp, stamped out in a disk form, in one piece, and with radial arms, which are bent into position to hold the shade to itself, and itself to the glass chimney, substantially as herein described and represented.

79,527.—JAMES WILSON, Chester, Pa., assignor to A. H. SIMON, Philadelphia, Pa.—*Check Valve*.—June 30, 1868.—The valve has a projecting arm, terminating in a sphere, which rests in a socket formed by two projections cast in and constituting a part of the casing.

Claim.—The valve B, hung to projections *h*, in the casing, confined thereto by the screw cap *d*, and arranged for introduction into and withdrawal from the said casing, all substantially as and for the purpose herein set forth.

79,528.—SAMUEL BENSON, Centralia, Ill., assignor to himself, JAMES BENSON, and JOHN F. BENSON, same place.—*Regulating Device of Millstones*.—June 30, 1868.—The springs are contracted by the action of the motive power when it exerts its greatest force in the more rapid revolutions of the driving shaft, and are expanded while the engine is passing the dead centers, thus applying the accumulated force to the propulsion of the spindle, when the speed of the driving shaft is slackened.

Claim.—The combination of the springs E E, the disk sections D D', the pinion C, and the spindle A, arranged and operating substantially as and for the purpose herein described.

79,529.—IRA N. BEVANS, Thomaston, Conn., assignor to himself, JOHN H. ALCOTT, and GEORGE G. GRISWOLD, Plymouth, Conn.—*Car Starter*.—June 30, 1868.—The draught bar acts upon a ratchet wheel keyed on the axle, to which the carrying wheels are made fast, the starting of the car being thus facili-

tated. A spring catch, movable by the driver's foot, secures the fixedness of the draught rod after the vehicle has started.

Claim.—The lever B', so constructed and applied as to act directly upon the ratchet wheel D, and employed in combination with the lugs E, sliding draught rod or bar H, chain F, pulley G, and catch *m*, arranged and operating in the manner and for the purpose explained.

79,530.—JOHN B. VAN HORN, Trenton, N. J.—*Clamp for Wood Bending Machines*.—June 30, 1868.—The wedge is forced by hand or driven under the flanges so as to clamp and hold the ends of carriage bows or felloes. The straight side of the wedge lies contiguous to the article to be bent.

Claim.—The clamp A, having angular flanges *e e*, in combination with the wedge B, when the same is constructed as described, and the whole operated substantially as described and for the purpose specified.

79,531.—G. W. WALTERS, Tiffin, Ohio.—*Clothes Sprinkler*.—June 30, 1868.—When it is desired to fill the sprinkler the drum is immersed in water, and the rod pressed on in order to open the valve and allow the air to retire before the water entering at the holes in the head.

Claim.—As a new article of manufacture, a clothes sprinkler, constructed as described, and consisting of a vessel A, having a perforated head, and provided with a hollow handle B, valve *c*, stem E *h*, and springs *s*, all arranged and operating as set forth.

79,532.—CHARLES WILLIAMS, Jackson, Miss.—*Attaching Handles to Mold Boards of Plows*.—June 30, 1868.—The lugs are cast upon the mold board, and are either cast around wrought-iron rods, which are threaded to receive the nuts, or cast solidly and drilled to receive bolts.

Claim.—The lugs *a a*, bolts *d d*, nuts *c c*, and handle *e*, the whole combined, arranged, and operated substantially in the manner herein shown and described, and for the purpose set forth.

79,533.—GEORGE ALLEN, Winchester, Mass., assignor to B. W. CONROY, Port Huron, Mich.—*Spoke and Felloe Connection*.—June 30, 1868.—The pin or tenon relieves the felloe of the pressure of the tire at the point where said pin extends through the tire from the metallic connecting device.

Claim.—The within described device, consisting of the tubular socket A, the transversely concave seat or rest B, the attaching arms C C, and the tenon or projection D, the latter being formed or cast with the metallic connection, and extending entirely through the felloe, in order to cause the tire to be supported by the said tenon D, substantially as and for the purpose set forth.

79,534.—GEORGE H. MELLE, Chicago, Ill.—*Baby Jumper and Cradle*.—June 30, 1868.—The doors of the bottom openings may be turned down so as to form a seat for the infant. When the doors are turned up and fastened the cradle is in condition to receive bedding.

Claim.—1. The cradle A, provided with the openings in the bottom *a a'*, made substantially in the manner and form and for the purposes described.

2. The cradle A, provided with openings in the bottom *a a'*, in combination with the adjustable slides *e e'*, and spring or springs B, constructed and made in the manner and form and for the purposes described.

3. The cradle A, and openings *a a'*, combined with the slides and adjustable spring or springs B, and movable platform C, constructed and made in the manner and form and for the purposes described.

79,535.—HENRY A. ALDEN, Matteawan, N. Y., assignor to the NEW YORK RUBBER COMPANY, New York City.—*Manufacture of Vulcanized India-Rubber Balls*.—July 7, 1868.—A shot is imbedded in one of the sections of the ball before putting them together, and pressed into the material from the inside. The shot is then covered by a piece of India-rubber on the inside. When the whole is vulcanized the

shot is cut out and a slit made in the piece of rubber underneath.

Claim.—1. The method of forming the valve for the admission and discharge of air into and from rubber balls, or other hollow articles requiring to be distended by inflation, substantially in the manner herein shown and described.

2. A vulcanized India-rubber ball, or other like hollow article, the aperture or opening in which, for the passage of air, is closed by an elastic valve piece, provided with a slit or valve opening *d*, and applied to the interior surface of the ball, substantially as herein set forth.

3. The employment, in connection with the chamber or opening formed in the ball, and the elastic valve piece, for closing said chamber, of a shot, or its equivalent, inserted in said chamber, so as to close the valve tightly, and prevent the entrance of dirt, as set forth.

79,536.—JOSEPH BELL ALEXANDER, Washington, D. C.—*Bottle Stopper.*—July 7, 1868.—Improvement on his patent of June 18, 1867. The staff is solidly vulcanized into the body of the stopper, the disk being firmly fixed at the top, and the hooks are so imbedded as to prevent the turning of the staff.

Claim.—1. The combination of the staff *A* and disk *D* with the rubber body *F*, when united by the process of vulcanization, substantially as described, and for the purpose set forth.

2. In combination with the above, the device composed of the button *G* and the string *H*, for attaching the stopper to the neck of the bottle, substantially as described, and for the purpose set forth.

79,537.—THOMAS ALSOP, Elkhart, Ill.—*Mill Spindle Spring.*—July 7, 1868.—A pinion wheel is united to the spindle by means of a coil spring, one end of the same being held by a stump or projecting pin on the upper face of the pinion, and the other by a removable bolt passing through the spindle, the object being to prevent injury from the "backlash."

Claim.—The spindle *C* and pinion *D*, in combination with the spring *C'*, when the same is connected with the spindle and pinion by means of the projecting pin *c'* and removable bolt *c''*, and the whole is constructed and arranged substantially as and for the purpose specified.

79,538.—JOHN R. ANDERSON, Brooklyn, N. Y.—*Fog Alarm.*—July 7, 1868.—A trumpet arranged within a hollow cylinder is acted upon by compressed air by means of a hollow plunger operated by a crank and pitman.

Claim.—The arrangement of the trumpet or horn *B* and hollow plunger *C*, relatively to each other and with the cylinder *A*, substantially as herein described and for the purpose set forth.

79,539.—CHARLES J. ARLINGTON, Auburn, N. Y.—*Harvester Rake.*—July 7, 1868.

Claim.—1. In a combined "reel rake," the arms of which are hinged to a head, moving around an axis nearly perpendicular to the platform, the rake heads so hinged to their arms, and combined with springs, that their teeth shall be retained in a position nearly parallel to the platform in reeling, in combination with mechanism under the control of the operator, so that he can bring their teeth to a vertical position at pleasure, for the purpose of raking, substantially as described.

2. The combination, substantially as described, of a continuous, fixed cam way for guiding the rake and reel arms, and a second movable cam, which, when raised by the attendant, forms a guide way outside the first track for controlling the rakes.

3. The spring *L*, in combination with the arms *I*, for the purpose of keeping the wings *M* in proper working position, substantially as described.

4. The spring *P*, as combined with the rake *N* and wing *M*, for the purpose of keeping the rake out of the way of the grain in the process of reeling, substantially as described.

79,540.—JAMES ARMSTRONG, Bucyrus, Ohio.—*Garden Implement.*—July 7, 1868.—The handle enters an eye in the frame and is held by a wedge, and

when used as a rake the handle is placed through the eye in the frame, so as to lock the lower roller.

Claim.—The sliding of the handle *A* through the eye of the frame *B*, so as to lock the lower roller *C*, by coming in contact with the teeth of said lower roller, in combination with all the other devices aforesaid, as herein described for the purposes set forth.

79,541.—G. W. R. BAYLEY and JOHN MCCLUSKEY, Algiers, La.—*Railroad Car Ventilator.*—July 7, 1868.—For opening or adjusting at any desired angle, or closing, by one motion, all the raised roof windows of railroad cars, &c.

Claim.—The arrangement of the connecting rods *D* and *D*² with the connecting rods *F* and *F*², forming a series of operating mechanism for opening and closing the windows, in the manner and for the purposes described.

79,542.—S. BESSER, Dorchester, Ill., assignor to himself and JAMES DRAPER, St. Louis, Mo.—*Churn.*—July 7, 1868.—The spiral groove, in connection with the guiding pin, imparts a combined rotary and reciprocating motion to the dasher.

Claim.—The dasher rod *C*, when provided with a spiral groove, *c*¹, and combined with the wheel *A* and connecting rod *B*, and engaged by the pin *c*², so as to produce a combined motion, as set forth.

79,543.—THEODORE F. BIGELOW, Boston, Mass.—*Vegetable Server.*—July 7, 1868.—A stand for holding dishes, and capable of being rotated.

Claim.—The apparatus above described, consisting of the base *A*, the top *B*, the rollers *C*, and a journal, arranged and operating substantially as described, when the same is made portable so as to be used on an ordinary table.

79,544.—WILLIAM BRANAGAN, Burlington, Iowa.—*Steam Generator.*—July 7, 1868.

Claim.—1. The fire chamber *A*, terminating in a gas chamber *A'*, and with a curved top plate, in combination with the horizontal flues *a a*, and with the bent or angular water pipes *D*, and with the outer case or water jacket *C*, the said pipes *D* being inserted into the jacket by horizontal branches at points below the gas chamber and below the first horizontal flue *a*, and the several parts being constructed and arranged together, substantially as described.

2. The angular water pipes *D*, arranged directly in line with the flues *a a*, and inserted into the outer case or jacket *C*, and applied in the space *G* all around the case *C*, and below the crown sheet *A'* of the fire box or chamber, all substantially in the manner and for the purpose described.

3. A double-wall air-heating jacket, *E*, applied to a steam boiler, substantially as and for the purposes described.

79,545.—J. S. BRIDGMAN and EDWIN G. WELLMAN, Brockport, N. Y.—*Gas Burner.*—July 7, 1868.—The several currents of air are caused to impinge on each other, and concentrate so as to expand laterally at right angles to the plane of the nipples in a broad thin sheet.

Claim.—The branched burner *A A*, provided with the vertical nipples *a a*, and horizontal nipples *a' a'*, arranged as described, and operating in the manner and for the purpose specified.

79,546.—EDWIN G. BULGIN.—Vienna, N. J.—*Cheese Safe, Gauge, and Cutter.*—July 7, 1868.—A device for the use of retail dealers, to facilitate the cutting up of the cheese and estimating more accurately the weight of the piece to be cut off.

Claim.—1. The sliding doors *G* and *H* as arranged and combined with a rotary bottom and a cutting apparatus, for the purposes set forth.

2. The arrangement and combination of the cutting knife *K*, hand lever *d*, regulating screw *f*, with a cheese safe, as described, for the purposes herein set forth.

3. The graduated scale or index plate *L*, the sliding plate *M*, with its index finger *e* and the marker *i*, as connected with a cheese safe, for the purpose set forth.

79,547.—WILLIAM D. BURGESS and GEORGE W. ZEIGLER, Maumee, Ohio.—*Plow*.—July 7, 1868.—The standard is hollow, and provided with side flanges on the top to receive the beam, and an eye in front for attaching the draught rod, and also with a tapering point for receiving and holding a shovel blade and two laterally projecting wings.

Claim.—1. The standard C, constructed with a draught eye, *e*, parallel flanges *e'*, lugs *g g*, and a point C', adapted for receiving and having secured to it the shovel plate J, and laterally projecting hilling wings G G, substantially as described.

2. The clevis E, constructed with an eye *e*, upon its front end, and also with a flanged slotted segmental portion *i*, upon its rear end, substantially as described.

3. The stand K, constructed with a slotted foot-piece, and a segmental elevation, the latter having recessed flanges formed upon it, substantially as described.

4. Securing the handle-support K to the beam A by means of the screw or bolt *o*, which is used for securing the standard to said beam, substantially as described.

79,548.—S. E. CHUBBUCK, Boston, Mass., assignor to J. H. CHADWICK, same place.—*Machine for Making Tin-Lined Lead Pipe*.—July 7, 1868.—An annular partition made stationary with reference to the cylinder, divides the space within the cylinder and around the mandrel proportionately to the required relative thickness of the two metals to compose the pipe. The two parts of the ram or follower are firmly secured to each other while the partition is secured to the cylinder.

Claim.—1. The combination of the annular fixed partition D with the cylinder, ram, and die, when all are arranged in relation one to another, as and so as to operate in the manner described.

2. The construction and adaptation, one to the other, and to the mandrel, of the ram and annular partition D, as shown and described.

79,549.—S. E. CHUBBUCK and J. H. CHADWICK, Boston, Mass., assignors to J. H. CHADWICK.—*Machine for Making Tin-Lined Lead Pipe*.—July 7, 1868.—The fused metal for the exterior of the pipe is poured into the cylinder, and forms around the casing; the latter is then drawn out and the metal for the interior of the pipe is poured in, after which pressure is applied.

Claim.—The combination of the annular reciprocating casing *d*, with the ram, cylinder, and die, when all are arranged, relative one to the other, as and so as to operate in the manner described.

79,550.—E. C. COCHRANE, Buffalo, N. Y., assignor to himself and J. B. WHITE, same place.—*Guard Fastener for Doors*.—July 7, 1868.—Attached to the door, and engaging with a rod or bar hinged to the jamb, is a bracket arm so arranged that when the arm shall have traversed the length of the bar, the same will act as a stop to prevent the further opening of the door.

Claim.—1. The combination of a hinged bar attached to the jamb, and an arm attached to the door for engagement with each other, substantially as and for the purpose set forth.

2. The slot *c*, of the hinged bar, enlarged at its inner end, to permit the disengagement of the arm from the rod only when the door is closed.

79,551.—JOHN F. CODDINGTON, Bound Brook, N. J.—*Harvester*.—July 7, 1868.—The sickle-driving system of gearing is arranged wholly in front of the axle, for greater compactness and efficiency in operating the sickle. The sickle is prevented from slipping longitudinally from the finger bar when the latter is in a vertical position by a transverse sliding piece in a guide at the inner end of the finger bar.

Claim.—1. The arrangement of shaft *e'*, carrying the bevel-pinion *e**, and spur-wheel *d*, and the shaft *f*, furnished with the spur-pinion *d**, and crank *f'* at that part of the main frame in front of axle, and between the wheels B*, and operating in connection with the bevel-wheel *c*, on the axle, and the pitman *f** of the sickle, substantially as and for the purpose specified.

2. The elbow-lever *m*, constructed with a spring or yielding arm, *m**, for operating the sliding-clutch wheel *d*, substantially as set forth.

3. The arrangement of the elbow lever *m*, circumferentially-grooved hub *i*, of the bevel-wheel *c*, lever *r*, and standard *s*, substantially as and for the purpose specified.

4. The transverse sliding piece *z*, arranged at the inner end of the finger-bar *e**, and in relation with the sickle C, substantially as and for the purpose specified.

79,552.—MRS. LOIS A. COLLARD, Plainview, Minn.—*Quilting Frame*.—July 7, 1868.—The sides and legs of the frame are provided with hinges to enable it to be compactly folded when not in use.

Claim.—The combination of the hinged sides A A and their cogs with the four hinged legs B B, having two staples on each, through which passes a pin, as and for the purposes set forth.

79,553.—BENJAMIN P. CRANDALL, New York, N. Y.—*Velocipede*.—July 7, 1868.—Designed as an improvement on patent of Crandall and Conover, dated April 2, 1861. The tubular supports are secured to the seat by a flange. The lever is hung on the support, so as to be free from wearing or rubbing. The handles are held in position by a screw passing through the tubular support.

Claim.—1. In velocipedes, the combination, with the operating lever J, of the tubular support K, constructed of a hollow tube, K, having flanges R and the independent screw L, as applied to the seat I, in the manner and for the purpose specified.

2. As an improvement in the mode of operating the steering apparatus of velocipedes, the parallel rods E, having one end pivoted to the axle of the forward wheels D, and the other end to the yoke F, whereby the said yoke and axle always move parallel to each other, substantially as described.

79,554.—CHARLES M. CRESSON, Philadelphia, Pa.—*Preserving Wood*.—July 7, 1868.

Claim.—1. The employment of heated air or other heated fixed gas, for the purpose of volatilizing or assisting in the volatilization of coal-tar, resin, or other oleaginous or volatile substances, or of carrying or transferring the vapors of coal-tar, resin, or other oleaginous or volatile substances, when thus or otherwise produced, to a chamber or receptacle, in order to be used therein in expelling the moisture from timber or wood, or seasoning the same, or in saturating the same with vapors as a preservative against decay or rot, substantially in the manner and for the purposes above set forth.

2. The seasoning or preparatory treatment of wood or timber by the method above described, in which the temperature of the vapors is elevated to a point above the temperature of the chamber containing the wood or timber, and the temperature of the wood or timber is, in cooling, allowed to fall more rapidly than that of the vapors, substantially in the manner and for the purposes hereinabove mentioned.

3. The treatment of railroad-ties, piles, and other timbers, by vapors, as above mentioned, in combination with the subsequent application of a hot bath of carbolic acid, or of petroleum oils, or of paraffine or other protecting substance, or as a preparatory treatment for the application of metallic or earthy solutions, substantially in the manner above described.

4. The arrangement and combination of the coil, distilling-vessel, and wood-chamber above mentioned, the whole being constructed and operating substantially in the manner and for the purposes aforesaid.

79,555.—ROWLAND CROMELIEN, Washington, D. C.—*Car Axle*.—July 7, 1868.—The axle is made in two parts, which inclose a bolt or rod secured by nuts on the inside, the bolt being surrounded by a spring, so as to admit of the wheels running around sharp curves.

Claim.—The construction of the swelled axles A A' when made hollow, and with inner shoulders and nuts *a a'*, and inclosing the bolt D, with its spring E E, all as arranged, and combined with the outer clamps as and for the purpose set forth.

79,556.—ALEXANDER H. DAMON and JAMES WHITAKER, Lowell, Mass., assignors to EATON & AYER, Nashua, N. H.—*Shuttle for Looms.*—July 7, 1868.—The top of the shuttle around the cavity is countersunk to receive the curved plate, sufficient room being left to allow the passage of the filling thread, and leaving a space for the projecting arm of the forked stud. The bushing allows the curved plate to be turned to adjust the stud for regulating the tension on the filling without raising or lowering the plate.

Claim.—1. The forked stud, constructed substantially as described, and combined with a plate, *a*, and applied to the slotted-eyed shuttle, for the purpose set forth.

2. The slotted curved plate *a*, in combination with the screw 10, the forked stud, the bushing *v*, and the shuttle, for the purpose and substantially as described.

79,557.—ALEXANDER M. DAMON and JAMES WHITAKER, Lowell, Mass., assignors to EATON & AYER, Nashua, N. H.—*Shuttle for Looms.*—July 7, 1868.—The eccentric stud and its plate are to be used when changes in the tension on the filling are required. The plate is slotted on a curve, and with the eccentric stud connected may be turned round a greater or less part of a revolution, and by the eccentricity of the stud the line of draught is changed to increase or diminish the tension on the filling.

Claim.—1. In combination with the guide pins at the sides of the eye of the shuttle, the concentric plate, supporting stud *b*, and plate *a*, which covers the slot *c* in the side of the shuttle, in the manner and for the purpose described.

2. The plate *a* and eccentric supporting stud *b*, when arranged and combined with the slotted-eyed shuttle for the purpose and substantially as described.

3. The combination, with the slotted-eyed shuttle, of the plate *a*, the plate being arranged over and serving as a cover for the slot.

79,558.—ALBERT LUDWIG GEORG DEHNE, Halle-on-Saale, Prussia.—*Machine for Filtering and Refining Sugar.*—July 7, 1868.—A combination of devices whereby the juice or semi-fluid is made to enter the chambers of the filtering press at their lowest parts by means of a canal formed by pockets and apertures in the frame. A canal in the lower part of the frames serves to introduce the juice and also to draw off what remains of the latter when filtration ceases.

Claim.—1. The combination, with the filtering chambers or spaces formed by and between the frames *C C'*, of the inlet-pipe *A*, arranged by or in connection with pockets *B* and canal *r*, formed by apertures, *a*, in the sides of the pockets and holes in the frames, to introduce the juice or fluid at or to the lower parts of the chambers *m*, substantially as specified.

2. The swinging or movable pockets *B*, having apertures, *a*, through their sides, in combination with the frames *C C'*, having holes therein to form a continuous channel, *r*, essentially as shown and described.

3. The canal *r*, in the lower part of the frame of a filtering apparatus, formed by the pockets and holes in the frame as described, in combination with the cocks *f'* to the spaces *e* of the frames, cock *g*, water-cock *h*, canal *v'*, with its branches *k*, substantially as and for the purpose or purposes herein set forth.

4. The combination to form a filtering cloth between the frames of the press, of adjacent sheets or layers of cotton cloth and linen trellis, as herein set forth.

79,559.—WILLIAM B. DURANT, Cambridge, Mass.—*Water Meter.*—July 7, 1868.—The inventor says: "The principle on which my invention is based consists first in dividing the water, so as to obtain a certain aliquot portion of the whole, and next measuring that part. The part taken for measurement we will consider to be one-sixteenth of the whole which may pass through the meter."

Claim.—1. The combination of the receiving chamber *B*, provided with a series of discharging tubes, *b*, as described, the pan *C*, the chamber *F*, the

discharging tube *h*, the receiver *E* provided with a pipe to discharge into the chamber *F*, and one or more tilting vessels, *H*, placed underneath or below the tube, and to operate as described.

2. The combination of the above, and mechanism, substantially as described, for effecting the intermittent rotary motion of the receiver *E*, as and for the purpose described, such mechanism being the projections *p q*, the shaft *l*, scape-wheel *m*, escapement *n*, and arm *r*, the whole being substantially as specified.

3. The combination and arrangement of the box *I*, provided with an orifice, *s*, with tilting vessels *H* and *K*, combined and to operate with the chamber *B*, its tube *b*, the pan *C*, the chamber *F*, and the receiver *E*, in manner substantially as described.

3. The combination and arrangement of the auxiliary tilting vessel *G* and its induction tube *g*, with the vessel *H*, the pan *C*, the space or chamber *F*, the receiver *E*, and the chamber *B* provided with the series of discharge tubes *b*, to operate as described, the vessels *G* and *H* being fastened together, so as to move simultaneously and in the same manner, as and for the purpose explained.

79,560.—GEORGE W. EMERSON, Chicago, Ill.—*Temporary Binder.*—July 7, 1868.—A strip of steel-tempered hoop-skirt wire is attached to the back edge of each lid of a common music port folio, and pressed upon the papers by means of a needle and cord.

Claim.—The steel-tempered hoop-skirt wire *C*, or other suitable material, in combination with the fastenings *D*, one or more, or equivalent, the needles *F*, and the cords *E*, one or more, substantially as and for the purpose set forth.

79,561.—JAMES EMERSON, Lowell, Mass.—*Dynamometer.*—July 7, 1868.—The rim of the pulley is connected to the indicating arm by means of chains, a collar and screws. The chains pass over sheaves or the end of a spider which is rigidly secured to the shaft and acts as a fulcrum for the connection of the rim of the pulley to the indicating arm. A piece above the index is made to swing out to hold up the ball when necessary. A spring at the lower end of the index prevents the arm from passing by unless pressed back. The amount of power used is obtained by multiplying the amount shown by the indicator by the speed of the pulley, to give the foot-pounds per minute.

Claim.—1. Connecting the rim of the pulley *C* to the automatic indicating arm *h*, when constructed substantially as described for the purpose named.

2. The arrangement of the stop *o*, in connection with the forked ends of the spider *E*, so that the pulley *C* will be clutched to the spider when the arm *h* is raised as described, for the purpose of taking the end pressure from the shaft, and to save the dynamometer from useless wear.

3. Making the collar *d* oval in form, to prevent its resting on the neck of the collar *f*; also chambering it as shown, to hold packing for the purpose of constantly lubricating the neck of the collar *f*.

4. The arrangement of the screws *j j* and *x* with nuts, each side of the eye bolt *k*, and the holders *t*, that the connecting chains may be properly adjusted in length.

5. The spring *v*, for the purpose named.

6. Pivoting the eye bolt *h* in the arm *J*, in the manner and for the purpose substantially as described.

79,562.—JAMES EMERSON, Lowell, Mass.—*Dynamometer.*—July 7, 1868.—The invention consists in applying the principle of the platform scale to the driving pulley of a machine in such a way as to enable any one to weigh the power used thereby, the pulley being the platform; the power used, the load.

Claim.—1. Connecting the rim of the driving pulley *C*, placed loosely upon the shaft *E*, to the weighing scale, in the manner and for the purpose as set forth.

2. Supporting the driving pulley *C* upon the shaft by means of the screws *d d*, as and for the purpose set forth.

3. The connecting links *I*, supported upon the knife edges *i i*, as and for the purpose as set forth.

4. The spring *t*, connecting the fulcrum bar with the driving pulley, when used as and for the purpose described.

5. In combination with the driving pulley *C*, fulcrum bar *D* and weighing scale, when connected and operating as and for the purpose described.

79,563.—HARRIE EVERTT, New York, N. Y.—*Hydrocarbon Burner*.—July 7, 1868; antedated February 8, 1868.—The upper segment of the combustion chamber forms a hollow longitudinal chamber into which is conducted either steam or atmospheric air, which, becoming superheated, is discharged through openings into the burning mass below. The burner plate is formed with corrugations or hollow ribs, open wider at the bottom than the top so as to serve as air channels and alternate burner grooves.

Claim.—1. A liquid-fuel furnace, constructed substantially as described, and as and for the purposes specified.

2. The combustion chamber *B*, in the form of an elongated semicircle, constructed of fire-proof material, and supplied with the rarefying chamber *b* and the pipe or pipes *c*, for admitting air or steam thereto, the whole forming the upper portion of a liquid-fuel furnace, in combination with the corrugated and slotted burner plate *A*, forming the base thereof, the whole arranged substantially as and for the purposes specified.

3. The refractor *e*, for dividing and distributing the jets of steam or currents of air, arranged substantially as and for the purposes set forth.

4. The mode, herein described, of admitting and employing liquid fuel, air, and steam through and upon the burner plate *A*, together with superheated air or steam admitted through the rarefying chamber *b*, for the purpose of facilitating the combustion of said fuel, the whole arranged substantially as described.

79,564.—MICHAEL G. FAGAN, Troy, N. Y.—*Construction of Sheet Metal Coal Hods*.—July 7, 1868.—The sides of the hod taper to the front in somewhat a wedge form, and the rear end is circular. A separate opening is made in the top to fill the hod.

Claim.—A coal hod or scuttle, made in the manner and for the purpose set forth in this specification.

79,565.—ORLANDO V. FLORA, Madison, assignor to himself, GEORGE SHANNON, and D. C. ROBINSON, Jefferson County, Ind.—*Carpenters' Vice*.—July 7, 1868.—The enlarged vertical opening in the rear of the brace permits the ready engagement and disengagement of the ratchets. The brace is pivoted to the saddle piece and attached also to the lower end of the movable jaw.

Claim.—The combination of the saddle piece *G* with the short ratchet on the end of the brace *H*, having the vertically slotted opening in the said ratchet brace, thus rendering the disengagement of the ratchets *c* and *d* automatic, when the article clamped is released, substantially as specified.

79,566.—ORLANDO V. FLORA, Madison, assignor to himself, GEORGE SHANNON, and D. C. ROBINSON, Jefferson County, Ind.—*Vise*.—July 7, 1868.—The screw passes loosely through a washer supported on journals in the loose jaw and turns in a box or nut in the fast jaw. The lugs or journals on the lower end of the loose jaw admit of the ready adjustment of the latter to pieces with either parallel or beveled sides.

Claim.—1. The combination of the jaw *B*, vibrating washer *E*, and screw *D*, all constructed and arranged substantially as described.

2. The jaw *B*, with lugs *G*, on the lower end of its shank, in combination with the supports *F* and gib *n*, all constructed and arranged substantially as described.

79,567.—ALFRED C. GARRATT, Boston, Mass.—*Galvanic Battery*.—July 7, 1868.—The frames of two or more series of bars are hinged together, and the two series are connected by a chain, so as to enable the whole to be easily folded for transportation.

Claim.—1. The said battery as constructed with the bars so arranged that there shall be a narrow open space, as described, on each side of every bar,

and with the bars of each pair of dissimilar metals insulated by means as described, and the several pairs connected by metallic connections at their ends, the whole being substantially as hereinbefore explained.

2. The formation of one of the bars of each pair, with projections or abutments extended from it at or near its ends, such being substantially as and for the purpose described.

3. The combination of two batteries by hinges and a chain, or its equivalent, as described, the whole being as and for the purpose specified.

79,568.—BENJAMIN F. GRAVES, Groton, Mass.—*Teat Cup for Milking*.—July 7, 1868.—The upper portion of the teat cup, embracing the udder, and the under portion of the same, are made of some inelastic material, while the middle portion, embracing the teat, is of an elastic or compressible material.

Claim.—A teat cup, to be used in milking cows, constructed and operating substantially as above described.

79,569.—ELIAS J. HALE, Foxcroft, Maine.—*Lantern*.—July 7, 1868.—The lantern case is made with two doors, one above the other, the chimney or the air deflector being supported on the inside of the upper one.

Claim.—1. The combination of the glass chimney and air deflector, or either, with the door, so as to be capable of being moved with and by it, with respect to the lamp, in manner as described, when such lamp is in the case.

2. The lamp as made quadrantal in form, and hinged at its radial centre to the lantern case, as set forth.

3. With the lamp and its chimney, applied to separate doors of the lantern case, the arrangement of either door so as when closed to lap on and keep the other closed, as specified.

79,570.—WILLIAM HARVEY, Volga City, Iowa.—*Sulky Cultivator*.—July 7, 1868.—An arrangement of parts by which the shovels are capable of being dodged, elevated, and adjusted by the driver while in his seat, the inner shovels being adapted to throw the dirt either toward or away from the plants.

Claim.—1. The combined arrangement of the shovels *F F'*, supporting chains *I I'*, perforated straps *J J'*, and wooden pins *j*, the rock bar *K k k'*, elevating chains *L L'*, and treadle *M m'*, and the dodging chains *O*, and treadles *N*, all as represented and described, for the purpose set forth.

2. The hooks *P P'* employed, in combination with the inner shovels *F F'*, to adjust said shovels relatively to the row, substantially as and for the purpose specified.

79,571.—JOHN W. HEWITT and GEORGE R. LYNCH, Alleghany City, Pa.—*Furniture Caster*.—July 7, 1868.—Caster wheels attached to supports passing through fixed guides attached to the legs of the frame are raised by cams operated by levers and connecting links to raise the frame from the floor.

Claim.—The combination of the eccentric cams *G* and connecting links *I* with the supports *D*, guides *E*, wheels *C*, and frame legs *S*, when arranged and operating as and for the purpose set forth.

79,572.—ALONZO HITCHCOCK, New York, N. Y.—*Treadle for Machinery*.—July 7, 1868.

Claim.—1. The use of two connecting rods, for driving sewing machines or analogous machines, when the two connection rods form the two legs of a triangle, the crank pin being the apex of said triangle, and when the two other ends of the connection rods that form the legs of the triangle unite with two separate treadles or levers, to operate substantially as set forth.

2. The use of two independent treadles or levers to revolve a crank shaft or wheel, when the two treadles are connected to the same crank pin by two connection rods, substantially as herein set forth.

79,573.—GEORGE W. ILGENFRITZ and MICHAEL SCHALL, New York, N. Y.—*Oil Tank Car*.—July 7, 1868.—The car bed which receives the oil reservoir is so arranged that the weight of the liquid will be

brought in close proximity to the road in order to lessen the danger of the car running off from the track.

Claim.—1. A metallic tank B for railroad oil cars, formed by bellying a cylindrical tube midway between its ends and on its lowest side, and furnishing this tube with heads, a small filling gauge, passage or passages, a safety dome and discharge passage, which latter is at the convergent point of the bellying or lowest portion of the tank, all substantially as described and for the purpose set forth.

2. The construction of the car bed or platform, so as to receive the tank or reservoir B between its sills G and upon chairs *g g*, which are located below the top of said bed or platform, substantially as described.

3. A railroad oil tank car bed, having a depressed tank B upon it, and inclined brace and stay pieces C C applied to its ends, substantially as described.

79,574.—C. A. JOHNSON, Des Moines, Iowa.—*Culinary Vessel.*—July 7, 1868.—Steam is conducted from the lower pot to the top of vegetables or other articles in the upper.

Claim.—The pots A and B, fitted together, and connected by means of the spout F, pipe E, and covers C and D, when used substantially as and for the purpose set forth.

79,575.—SAMUEL JOHNSTON, Syracuse, N. Y.—*Harvester.*—July 7, 1868.—Relates to a mode of adjusting and sustaining the platform of reaping machines for different heights of cut.

Claim.—1. The combination of the grain wheel, bracket, ratchet, and spring pawl, for raising and lowering the outer end of the platform.

2. The combination of the bent lever, slotted wedge, and hinged tongue, for tilting the platform and cutting apparatus.

3. The combination of an adjustable grain wheel, a platform, and gear frame, movable perpendicularly up and down on the main axle plate, and a hinged tongue and lever for tilting the platform and cutting apparatus.

4. The employment of a double cam way or track provided with a movable switch, adapted to be moved by the revolving rake and reel arm for changing the path of said arm.

5. The eccentric lever *x*, or its equivalent, for operating the movable cam way, substantially as described.

79,576.—HARRIS KEENEY, Danville, and CHARLES H. SEE, New Florence, Mo.—*Corn Planter.*—July 7, 1868.—The holes in the bottom of the hopper are opened and closed by the reciprocating motion of a sliding bar operated by means of a lever, spring, and lugs, the latter being attached to one of the wheels. The easter wheel serves to regulate the depth of the plows.

Claim.—1. The combination and arrangement of the devices D D' *d d*¹ *d*² *d*³, for dropping the seeds, substantially in the manner herein shown and described.

2. The easter wheel B¹, the lever F, and rack *f*, when arranged with reference to each other and to the frame A, as herein described, for the purpose of turning and elevating the front end of the machine.

79,577.—JOSEPH KOHLER, Cincinnati, Ohio.—*Animal Trap.*—July 7, 1868.—The trap is elevated when set and imprisons the animal when it falls. The improvement relates to devices for maintaining the trap in its elevated position and allowing it to fall readily.

Claim.—The arrangement of the base or foot A and shaft B, with the sliding cage E, slotted sleeve D *d*, bearing point G, bait hook H *h*, and pivot I, or their equivalents, substantially as herein described, and for the purpose set forth.

79,578.—WILLIAM KROEGER, Alleghany City, Pa.—*Spring.*—July 7, 1868; antedated June 24, 1868.—A flat bar of steel, having its ends welded together and formed into two equal arcs of equal circles, connected at their extremities by two parallels.

Claim.—A spring, constructed and operating sub-

stantially as herein described, and for the purpose set forth.

79,579.—HENRY P. LAMSON, Lowell, Mass.—*Sewing Machine.*—July 7, 1868.—Relates to an improvement upon a machine for which a patent was granted to H. J. Hancock August 6, 1867. A spring guide is secured to the under side of the cloth bed and serves to hold the thread and properly direct it, and also to close the hook upon the thread so as to prevent its point from catching in the cloth as the needle ascends.

Claim.—1. The guide piece *p*, formed with a spring thread-guide to yield against the pressure of the needle, and then to carry the thread athwart its path, and also with another guide piece serving to govern the path of the thread as well as to close the needle barb.

2. The spring guide *p*, in combination with the cloth table of a sewing machine, and with a flexible barbed needle, operating substantially as and for the purpose set forth.

79,580.—J. D. LEACH, Penobscot, and E. S. WARDWELL, Bucksport, Me.—*Cloak and Coat Suspender.*—July 7, 1868.—The device is of a shape to conform to that of the upper part of the human shoulders.

Claim.—The coat and cloak suspender E, when constructed of iron or other suitable material, and formed with its upper convexity of line, its backward horizontal curve from the ends to the center, its vertical curve, and the hook or loop *e*, formed relative to the body of the suspender, so that the center of gravity of the suspender and the garment hung thereon shall coincide, all substantially as described and shown.

79,581.—ALPHEUS LEWIS, Virginia City, Montana.—*Quartz Mill.*—July 7, 1868.—The stamps are designed to be revolved at the instant of impact with the ore, so as more effectually to triturate and comminute the latter.

Claim.—The train of gear wheels E E E, in combination with the series of stamps D D D, whose stems, C C C, pass up through the eyes of the gear wheels E, and derive a constant rotation therefrom, substantially as and for the purposes set forth.

79,582.—HIRAM G. LOOMIS, Hartford, Conn.—*Level.*—July 7, 1868.—The level is provided with sights at the ends of the frame, one of which can be raised and lowered, so that the sights will look in a line at a given inclination to a level line.

Claim.—A carpenters' or masons' level, having a folding leaf, A, furnished with a sight, *m*, at one end of the frame, and at the other a graduated slide, B, furnished with a sight, *n*, sliding vertically in grooves, to adjust it to different elevations, substantially as herein described.

79,583.—C. C. LYMAN, Edinboro, Pa.—*Scale.*—July 7, 1868.—Designed for weighing one half of each car of a train separately on a short platform while in motion, and registering the same automatically, whereby the entire weight of the train is obtained without the necessity of stopping the same.

Claim.—1. The short platform B, when so arranged in relation to the weighing apparatus and car that the scale will be at rest and free when the wheels are not upon the platform, and so operating that each end of a car will be weighted and registered automatically while in motion over the platform, substantially as and for the purpose set forth.

2. The series of counter weights I and lifting shaft J, in combination with the beam D, substantially as and for the purpose set forth.

3. The lifting shaft J, slide and block N, in combination with the loops *a* and *b*, arranged and operating substantially as and for the purpose set forth.

4. The index wheels H G and lug wheel I, in combination with the cheek or lock A', arranged in relation to each other, and operating substantially as and for the purpose set forth.

5. The loops *a' b*, in combination with the index wheels G H, slide block N, and lifting shaft J, substantially as and for the purpose set forth.

79,584.—JAMES R. MADISON and MILAN THOMAS, Oneida, Ill.—*Wagon Pole*.—July 7, 1868; antedated June 30, 1868.—In an opening in the outer end of the ferrule is pivoted a ball into which passes a bolt through the center of the neck yoke, by which means the latter is made susceptible of several motions.

Claim.—1. Connecting the neck yoke E to the ferrule by means of the bolt H and the ball G, substantially as and for the purpose set forth.

2. The combination of the ferrule B, with its hook C, yoke E, ball G, and nut H, substantially as and for the purposes set forth.

79,585.—SETH W. MARSH, Rochester, N. Y.—*Water-Wheel*.—July 7, 1868.—The chutes of the case are so arranged as to render the sides elastic, in order to prevent their breaking; and the expansion and contraction of the chutes are regular, being in such proportion as best to concentrate the water upon the buckets.

Claim.—The partitions C, attached to the case B, and the portions D of the gate C, forming the vertical sides of the chutes *k*, when both are flexible, and free to yield at their inner ends, to allow the escape of obstructions, substantially as set forth.

79,586.—A. J. MARTIN, Catskill, N. Y.—*Hay and Manure Fork*.—July 7, 1868.—The shank attached to the tines is inserted in the handle in two or more detached parts. A screw thread is cut on the shanks so as to hold the fork firmly in the handle.

Claim.—The combination of the handle A, ferrule B, adjustable tines C C, screw *o*, and nut *a*, substantially as and for the purposes herein set forth.

79,587.—IRA W. MEAD, Bridgeport, Conn., assignor to himself and EDWIN W. HANFORD, same place.—*Spike Drawer*.—July 7, 1868.—The parts are so arranged that the purchase or power is greatest at the beginning, and gradually diminishes, the length of motion being largely increased to expedite the drawing of the spike.

Claim.—The lever A, with the lifter B, the pair of levers C, and the spring *b*, constructed to operate substantially as herein described and set forth.

79,588.—HENRY MITCHELL, Osborn, Ohio.—*Corn Planter*.—July 7, 1868.—Within the corn box or hopper is an endless belt revolving vertically on rollers, having elevators for picking up the corn in any desired amount or number of grains, and a valve for compelling the elevators to discharge the corn through the tube beneath. Provision is made for regulating the operation of dropping the corn, and of the plows and roller.

Claim.—1. The construction of the belt H, elevators G G, rollers J and Q, and valve K, when arranged, combined, and operating as herein described and for the purpose set forth.

2. The shape and construction of the corn box A, with its chamber, B, in front, and discharge pipe C at the bottom of the chamber, substantially as set forth.

3. The rollers P, U, and S, belt R, shifting lever T, rollers Q and J, when arranged and operated as herein described and for the purposes set forth.

4. The arrangement of the plow V, with its adjustable lever W, brace chain X, scraper Y, and roller Z, when regulated and operated on the under side of the machine, as herein described and for the purpose set forth.

79,589.—GEORGE MOHLER, Yates City, Ill.—*Sieve*.—July 7, 1868.—The feeder consists of a piece of hoop iron, or other similar material, attached at the lower ends to the sides of the box, the upper ends forming a point which projects into the bottom of the hopper to act as a feeder and regulator.

Claim.—The combination of the swinging and adjustable sieve H, and the conical-shaped feeder P, whose apex extends up into the slotted bottom of the hopper J, and operates with the box H' in the manner set forth.

79,590.—ELI MONEUSE and LOUIS DUPARQUET, New York, N. Y.—*Stove Grate*.—July 7, 1868.—A locked lever is made to operate the catch that holds

up the grate, in order to prevent the grate from falling in the operation of raking the fire.

Claim.—The lever *h* and catch L, applied substantially as specified, for sustaining the swinging grate.

79,591.—GEORGE W. NEILL, Boston, Mass.—*Piano Forte*.—July 7, 1868.—The object of the invention is to so construct the metallic frames for supporting the strings that the bars may not come between them, to interfere with any desirable arrangement of them, and also to cover from view the main portion or bars of the iron frame.

Claim.—The combination of the wooden back frame B, the sounding-board C, and flanged plate D, with a separate metallic frame, A, arranged between the back frame and sounding-board, and made with flanges, to support the latter, and having no metallic bars or auxiliary frame to extend between the strings, the whole being substantially as described.

79,592.—W. H. PAIGE, Springfield, Mass., as signor to himself and L. O. HANSON, same place.—*Device for Connecting Dissimilar Hose Couplings*.—July 7, 1868.—Relates more particularly to a coupling for which patents were granted to Perkins and Hovey, September 10, and December 31, 1867.

Claim.—A connection for hose couplings, said connection consisting of a tube, terminating at its ends in devices corresponding with and adapted for attachment to dissimilar hose couplings or connecting devices, substantially as described.

79,793.—OSKER S. PERKINS and JOHN R. RICHARDS, Mount Joy, Pa., assignors to themselves and JOSEPH H. FERGUSON.—*Clothes-Line Holder*.—July 7, 1868.—The rim of the pulley wheel is formed into hooks, by taking circular or angular sections from it, and is used in connection with a notched eccentric.

Claim.—1. A pulley wheel, with hooks formed of its outer rim, or equivalent, in the manner shown, and for the purpose specified.

2. A hooked pulley wheel, all combined and arranged in the manner shown and specified, and for the purpose set forth.

79,594.—JOHN S. PERRY, Albany, N. Y., assignor to JOHN S. PERRY, trustee and executor, and NATHAN B. PERRY, same place.—*Base Burning Stove*.—July 7, 1868.—An enlarged chamber is formed which will allow of any required amount of draught, and an increased capacity of coal magazine with a comparatively narrow flue space surrounding said magazine. A portion of the heated products may be made to pass through and across the oven to the escape flue when desired.

Claim.—1. In a base burning magazine stove, wherein the products of combustion are carried directly upward from the fire pot, the flue chamber N, extending partly around and beyond the body of the casing I, substantially as described.

2. The laterally projecting flue chamber N, constructed with side divisions *p' p'*, bottom division *p*, and deflecting plates *s'*, and applied to a stove which is constructed upon the principle herein described.

3. An elevated oven, S, applied on top of the coal magazine H, in combination with a flue chamber, N, which projects beyond the body of the casing I, substantially as described.

4. Providing for exposing the outer portion of the bottom of the elevated oven S to the heated products of combustion, in combination with an extended flue chamber, N, and in a stove constructed substantially as described.

5. Providing an oven, S, with a register, *r'*, and opening *r*, when employed in combination with an extended flue chamber, N, arranged as described.

79,595.—FIELDER POWER, St. Louis, Mo.—*Brick Kiln*.—July 7, 1868.—A series of long narrow chambers, arched over the top with brick walls and floored with iron plates, beneath which are smoke passages in all but one compartment, which is to be used as the kiln proper, while the others are only drying chambers. Turn tables are arranged to pass the platforms from one chamber to another.

Claim.—1. The kiln A, and drying chambers A'

$A^2 A^3$, when combined and arranged as herein shown and described.

2. The turn tables $F F^1 F^2$, when combined with the drying chambers and kiln, as described and set forth.

79,596.—WILLIAM H. PROUTY, Hanson, Mass.—*Combined Card and Brush.*—July 7, 1868.—An ordinary brush with one-half of the bristles removed and metal teeth or card in place of the same, for grooming and cleaning animals.

Claim.—The combination of the card or comb and brush in one instrument, to be used together at the same time, for the purposes specified.

79,597.—SILAS S. PUTNAM, Dorchester, Mass.—*Attaching Door Knobs to their Spindles.*—July 7, 1868.—A screw passes through the outer end of each knob into the end of the spindle, serving to unite the knobs together, and also to adapt the same to the thickness of the door.

Claim.—The regulating screw b , in combination with the knob A and spindle B , substantially as described, for the purpose set forth.

79,598.—N. A. RAND, Winslow, Ill.—*Cultivator.*—July 7, 1868.

Claim.—The arrangement of the pivoted bars $C C$ (that connect with the cultivator beams DD) and the movable seat bar K , between the axle and the frame piece I , whereby the operator can shift the shovels by the action of his feet, the several parts being constructed to operate substantially as set forth.

79,599.—JOHN REAKIRT, Philadelphia, Pa., assignor to himself, DANIEL PHREANER, and TRYON REAKIRT, same place.—*Putting up Alkalies.*—July 7, 1868.—The inner surface of the jar or case and the disk or plate is glazed. The cement is composed of beeswax, rosin, powdered brick, and German Burgundy pitch.

Claim.—Packing caustic alkalies in a glazed jar or case, A , having a shoulder or flange, a , to support the disk or plate B , when the whole is hermetically sealed with the cement herein named, substantially as described, and for the purpose specified.

79,600.—CHRISTIAN F. RILEY, Philadelphia, Pa., assignor to himself and JACOB P. DAVID, same place.—*Track Clearer for Railroads.*—July 7, 1868.

Claim.—A life and limb protecting track clearer for railway cars, consisting of a foot, A , and leg a' , constructed and applied in front of the wheels, so as to move upward and downward in the vertical direction described, from any unevenness of the track during the forward motion of the car, and so that its forward end may underrun and turn aside the limbs or body of a person fallen or lying upon the track, substantially in the manner described.

79,601.—FREDERICK O. ROGERS, Niles, Mich.—*Preserving Composition Roofs.*—July 7, 1868.—A ledge or barrier is formed on the outer edge of the roof containing the composition, and roof and composition are then covered with some porous material saturated with water.

Claim.—The within-described method of preserving cement and composition roofs, substantially as set forth.

79,602.—THEODORE SALORGNE, St. Louis, Mo., assignor to JACOB WOODBURN.—*Wagon and Carriage Wheel.*—July 7, 1868.—Screw wires, of an unchanging diameter throughout their length, are passed through the felloe at either side of the spoke to prevent the felloe from splitting when the spokes are inserted into the mortises.

Claim.—The felloe, perforated transversely at one or both sides of each spoke mortise, and the screw-protecting wires inserted in these perforations, when constructed as herein described and for the purpose set forth.

79,603.—SYLVANUS SAWYER, Fitchburg, Mass.—*Callipers.*—July 7, 1868.—Improvement upon his patent dated April 9, 1867. The joints of the legs are so constructed as to be slightly yielding toward and from each other, and the sector gears are forced

inward upon the screw, so that the parts will be rigidly held together.

Claim.—Constructing the joints which connect the legs with the stock, so as to yield in the direction toward and from each other, in combination with the geared sectors, the worm or rack, and the clamping rod, spring, or other suitable means for clamping the parts together, substantially as described.

79,604.—AUSTIN D. SHAVER, Belleville, N. Y.—*Riding Attachment to Harrow.*—July 7, 1868.—Relates to a mode of attaching a sulky to harrows by which it is rendered adjustable, so as to accommodate it to harrows of different sizes, and by which the bearing on the harrow can be regulated.

Claim.—A riding attachment for harrows, made with adjustable seat H and pole B , curved downward at the forward end, and secured to harrow by swivel link a , and to frame by bolt and thumb screw d , and ropes E , friction rollers $i i i i$, with counter rollers beneath, as combined, arranged, and attached, for the use and purpose as specified and herein set forth.

79,605.—ALDEN SIBLEY, Pawtucket, R. I.—*Gearing.*—July 7, 1868.—Designed for use in a calico printing machine, provided with a series of printing cylinders each of which is to have placed on its shaft one of the pinions or a screw sleeve, to receive the shaft. By means of adjusting screws and nuts the pinion may be moved laterally with respect to the gear, in order to prevent “back-lash,” as the teeth wear away.

Claim.—1. The pinion B and its gear A , as made with tapering teeth, as described, in combination with the pinion and its cylinder shaft, and means by which the pinion may be moved and adjusted lengthwise of the said shaft, and with respect to the fellow gear A , as and for the purpose of preventing “back-lash,” as specified.

2. The arrangement and combination of the endless screw f and the worm gear e with the pinion B and its shaft.

3. The combination of the sleeve D with the pinion B , and the adjusting screw or screws $m n$ and nuts $k l$ thereof, for moving said pinion longitudinally of the sleeve, as set forth.

4. The combination and arrangement of the pinion B , the shaft C , the sleeve D , the adjusting screws $m n$, and nuts $k l$, and the worm f and its gear e , the whole being substantially as described.

79,606.—ROBERT A. SMITH, Philadelphia, Pa.—*Railroad Track Cleaner.*—July 7, 1868.—The cone on the foot of the king bolt serves to operate and give more or less mold to the plow. A pinion standard is applied to the axle, its upper end being kept in position by guides, so as to conform to the springs of the car. Side guards are so arranged as to prevent snow, dirt, or ice from being thrown on the opposite track or upon passing vehicles.

Claim.—1. The combination of an adjustable main plow, composed of parts P and P' , and the mechanism for operating the same, so that the snow, dirt, or ice can be thrown to the right and left by one operation, or thrown entirely to the right or to the left, as occasion may require.

2. The king bolt $K B$ and cone C , arranged substantially in the manner and for the purpose specified.

3. Arranging on the foot and back of the parts P and P' , constructed and operating as described, a series of brooms $M M$, with a forward inclination of the beard, for the purpose specified.

4. In combination with the brooms $M M$, arranged as set forth, the application of the springs S , for the purpose of keeping the broom beard constantly in position.

5. The arrangement of the standard Z and the guides $G D$, substantially in the manner and for the purpose set forth.

6. The mode of fastening the broom beard to the stay board $S B$ of the broom cylinder, by means of a continuous hollow strap $S I$, as described.

7. The side guards $S G$ and $S G'$, with their rods r, r^1, r^2 , and r^3 , for the purpose as described and represented.

8. The within railroad track cleaner, composed of

the above described parts, all combined, constructed, and operating in the manner and for the purpose specified.

79,607.—AMBROSE SPITZMILLER, Buffalo, N. Y., assignor to JOHN S. PERRY, trustee and executor, and NATHAN B. PERRY.—*Oven in Base Burning Stoves.*—July 7, 1868.—An oven is constructed over the coal magazine so that a portion of the bottom as well as the side wall of the oven shall be exposed to the action of the heated products of combustion on their way to the escape pipe. The oven is provided with openings through its side walls, one of which has a damper applied to it to conduct a portion of the heated products of combustion through the oven when desired.

Claim.—1. In a base burning stove, having an oven arranged over the coal magazine, providing for exposing a portion of the bottom of such oven to the action of ascending currents of heat, substantially as described.

2. An oven S, in combination with ascending flue *f*, and a coal magazine having its upper end contracted, substantially as described.

3. An oven S, in combination with the flue *f*, when used as a drum or dead chamber, and a coal magazine having its upper end contracted, substantially as described.

4. Providing the elevated oven S of a base burning stove with openings through its side wall, one of which openings has applied to it a damper *h'*, substantially as described.

79,608.—SIDNEY STANTON, Syracuse, N. Y.—*Machine for Sawing Stone.*—July 7, 1868.—A hollow standard is provided with a chamber in which is a beveled pinion. In the standard is a shaft having a universal joint at its lower end for connecting with a rubbing disk or a circular saw. The machine is pushed over the face of the stone as the work progresses, the operator turning the crank with one hand.

Claim.—The frame A, hollow standard B *b k*, gears E *e*, C *c*, shaft F *f g*, water box L, and chute *n*, all constructed, arranged, and operating in the manner shown, and for the purpose described.

79,609.—NATHAN STONECIPHER, Cambridge City, Ind.—*Track Clearer for Harvester.*—July 7, 1868.—Attached to the back of the dividing point is a crooked arm provided with a socket and cone-shaped tail piece, having at its small end a projection which fits into recesses at the front end of the sockets. The dividing point is also provided with an upright knife for cutting the tangled grass.

Claim.—The combination of the revolving cone D and socket C, when used as a track clearer, in combination with a grain or grass cutter, the whole being constructed, arranged, and operated substantially as above described.

79,610.—JOHN BLAKE TARR, Fair Haven, Mass.—*Machine for Polishing Spherical Shot and Shell.*—July 7, 1868.—The balls are retained, with emery or other suitable polishing substance, between cups which are applied to vertical shafts whose axes coincide and which revolve at different rates of speed, so that the balls will receive irregular or oscillating motions about their axes.

Claim.—1. The within described machine, which is adapted for polishing spherical shot and shells, substantially in the manner described.

2. The capped polishing and centering devices G G', constructed, arranged, and operating substantially as described.

79,611.—JOHN BLAKE TARR, Fair Haven, Mass.—*Cast-iron Car Wheel.*—July 7, 1868.

Claim.—As a new article of manufacture, a car wheel, made of cast iron, condensed by pressure while in a molten state within a mold, substantially as and for the purpose described.

79,612.—E. P. TAYLOR, St. Louis, Mo.—*Apparatus for Hardening Stone.*—July 7, 1868.—The mixture of sand and silicate composing artificial stone is placed in a strong air-tight vessel, from which the air is then exhausted. The cylinder is then charged with the impregnating fluid, and to

effect more perfect penetration a force pump is afterwards applied.

Claim.—The force pump D, with weighted piston *d'*, in combination with cylinder A, air pump B, and tank C, the whole being operated in the manner described.

79,613.—J. C. THAYER, Dunton, Ill.—*Milk Cooler.*—July 7, 1868.—A series of tanks are arranged one within the other, the inner one having openings communicating with the outer and inner tanks. The inner tank is made removable for cleaning. The pipe which conveys the milk to the can is closed by means of a drop valve, operated by a lever, in connection with a float attached to a stem.

Claim.—1. The combination of the tanks A B C, the latter tank being removable, and having a pipe, F, for the stem of the valve G to operate in, substantially as and for the purpose set forth.

2. The combination of the valve G, pipes F and P, lever H, and float K L, substantially as herein set forth and shown.

3. The combination of the tanks A B C, pipes F P, valves G, lever H, and float K L, constructed and arranged to operate as and for the purpose set forth.

79,614.—WILLIAM TRIPPS, Epsom, N. H.—*Wood Saw Horse.*—July 7, 1868.—An adjustable clamp arm is secured to its bar by means of notches fitting on a pin, and by a wedge. A pressure on the treadle causes the arm to hold the log securely while being sawed.

Claim.—1. The adjustable clamp arm *i*, as applied to the bar *h* by means of the notches *l*, fitting on the pin *m*, and as secured by the wedge *n*, substantially in the manner described.

2. The combination of the treadle *g*, rock shaft *k*, bar *h*, and arm *i*, constructed to operate as and for the purposes set forth.

79,615.—JOSEPH VALE, Beloit, Wis.—*Bake Oven.*—July 7, 1868.—The hearth is rotated by means of a spike or poker inserted in perforations adapted for the purpose.

Claim.—1. The rotating disk or hearth H, secured to and turning upon the shaft H, and the mode herein described of rotating the same, whereby expensive gear and pinions are dispensed with.

2. The crown plate or disk E, in combination with the fire grates C C, covers *b d*, flues *b b*, regulating damper *g*, fine or chimney *a a*, and ash boxes D D, when the whole are constructed and arranged substantially as herein set forth and described, to operate as specified.

79,616.—W. P. VALENTINE, Buffalo, N. Y.—*Refining and Purifying Spirituous Liquors.*—July 7, 1868.—Currents of cold and hot air are forced alternately through the liquor, so as to subject the same to agitation and to changes of temperature, the object being to obtain the advantages supposed to result from a sea voyage to spirituous liquors.

Claim.—1. The process of ripening, mellowing, and purifying spirituous liquors by the use of hot and cold air alternately, substantially as herein described.

2. The apparatus consisting of the tubs A and B, the chamber D, with pipe I, blower C, and pipe F, with its connecting or branch pipe G, for heating air, and pipes *e* and *e*, with concave disks *d* and *f*, for delivering air, whether hot or cold, near the bottom of the tubs A and B, the whole constructed and arranged to operate substantially as herein described, and for the purpose set forth.

79,617.—LEMUEL T. WELLS, St. Louis, Mo.—*Printing Press.*—July 7, 1868.—Relates to an improvement upon his patent dated March 20, 1855, and consists in adding a set of balancing springs to the movable platen, in order to counterbalance its increased weight, and so adapt the machine to large as well as small presses.

Claim.—The springs D, when arranged upon a rocking bar, *d*, and combined with the platen A', as herein described, and for the purpose set forth.

79,618.—MARTIN WELLS, New York, N. Y.—*Pointed Bracket for Lightning Rod.*—July 7, 1868.

Claim.—The new article of manufacture of brack-

ets, by combining the discharging point with the bracket which secures the rod to the building, so that the discharging point is continuous with the bracket, substantially as described.

79,619.—MILTON WOOLLEY, Brooklyn, N. Y.—*Cooking Stove.*—July 7, 1868.—The oven is divided into two compartments which can be made to communicate with each other or the communications be closed, according to the different operations of cooking to be performed. Provision is also made for warming apartments adjacent to that in which the stove is located.

Claim.—1. The flue casing B C, provided with a direct draught damper, *i*, and inclosing oven chambers, which are separated by a horizontal plate, E, having a furnace, D, and valve openings applied to it, substantially as described.

2. Oven chambers, which are inclosed by a flue casing, B C, and doors C¹ C², and provided with a furnace, D, valves *e e*, and means for conducting off the vapors and gases rising in said oven chambers, substantially as described.

3. The outer jacket A, in combination with a furnace, D, and division plate E, arranged with a double wall flue casing, substantially as described.

4. The water heater *d*, applied within a furnace, D, which is sustained by a division plate, E, within a double wall flue casing, B C, substantially as described.

79,620.—WILLIAM E. WYCHE and YOUNG P. DICKSON, Brookville, N. C.—*Hopper Shoe for Grist Mills.*—July 7, 1868.—Two vibrating sieves of different textures hung above an inclined apron, for cleaning the grain before it passes to the millstones.

Claim.—The shoe D, formed of two sieves *m* and *n*, in combination with the apron E, substantially as shown and described, and for the purpose specified.

79,621.—ALBERT A. YOUNG, Boston, Mass., assignor to himself and FRANCIS MCLAUGHLIN, same place.—*Brush and Comb Combined.*—July 7, 1868.

Claim.—1. A hair brush, having a space in its stock and handle, or either of them, for a comb, the comb being detachable from the stock and handle when in use, and said space opening at the extremity of the handle or the end of the stalk, substantially as described.

2. The combination and arrangement of the brush A and the comb B, whereby the comb is protected in the stalk of the brush when not in use, substantially as described.

79,622.—W. H. YOUNG and L. YOUNG, Boston, Mass.—*Cabinet Bedstead.*—July 7, 1868.—The spring bed frame is made in three parts, and different portions of the case are made to serve for ornament when closed, and for use when opened.

Claim.—1. The turn-down legs *a a*, serving the purpose of moldings and fastenings to the closed cabinet, and legs to the bedstead, together with the method of fastening the same, substantially as described and for the purpose set forth.

2. The foot board B, as combined and arranged with the case A and the bed frame, substantially as described.

3. The combination and arrangement of the spring bed frame and the several parts thereof, viz, the parts *f*, *g*, and *j*, together with the method for fastening the slats to the cross supports, substantially as described.

4. The combination and arrangement of the imitation drawer *c* with the springs *e' e' e' e'*, &c., and their supports, whereby, when the drawer is turned down, the parts of the spring frame *g j* are elevated, together with the method of elevating the same, substantially as described.

79,623.—E. H. ASHCROFT.—Boston, Mass.—*Drier.*—July 7, 1868.—Relates to machines for drying various articles, chiefly wool, and to means for extinguishing fire which may accidentally take place in such machine from spontaneous combustion or other cause.

Claim.—1. In combination with the machine for drying various materials or substances, a tank of water, when the discharge of water from such tank

is effected by the action of fire accidentally taking place in such machine, for the purpose substantially as before described.

2. Operating the valve and opening the discharging orifice of the water tank, or of regulating the flow of water to the structure, by means of a fusible plug connected therewith by any suitable means which accomplish the desired result.

3. The combination and arrangement, with the structure D and water tank H, of the discharging orifice I, valve *b*, rods *c* and *e*, and fusible plug *f*, the whole being combined, arranged, and operating as before described.

4. A rod pipe, or its equivalent, combined with the discharging orifice I and valve *b*, in such manner that upon expansion of such rod, or its equivalent, by reason of fire within the structure, the valve shall recede from and open the orifice to the discharge of water to the structure, essentially as hereinbefore described.

5. The general combination and arrangement of the blower A, air chamber C, with the structure D, and its perforated or foraminous floors E and G, and steam coil or pipe F, the water tank H, and the apparatus for discharging water therefrom, the whole being arranged and operating substantially as hereinbefore described.

79,624.—JOHN AUGSPURGER, Trenton, Ohio.—*Portable Fence.*—July 7, 1868.—A reversible portable board fence so constructed as to enable it to be used upon undulating ground or upon side hills.

Claim.—The clamping cleats *e f*, screw bolt and nut *g*, in combination with the adjustable panels I or I I, constructed and used in the manner and for the purpose substantially as described.

79,625.—BENJAMIN F. AVERILL, Dunkirk, N. Y.—*Weather Strip.*—July 7, 1868.—A movable plate is provided with mechanism by which it is made to shut downward and close the space between the door and sill, and to rise again when the door is opened.

Claim.—1. The weather strip constructed as described, of the strip C, fluted along its upper edge to work under and in contact with the reversely-fluted plate D, secured to the door, the plate C being hung upon the headed pins *a*, affixed to the levers E E' beneath the plate, which levers are pivoted to the door at *b b'*, and held up at their inner ends by the springs *f f*, all arranged as described for the purpose specified.

2. The arrangement of the screw *d*, projection *n* upon the lever E, the pivoting pin *b'* upon the lever E', the arm *g* and the incline *h*, all operating as described, to depress the fluted plate C against the tension of the springs *f*, as herein described for the purpose specified.

79,626.—ISAAC BANISTER, Newark, N. J.—*Buckle.*—July 7, 1868.—Improvement upon his patent dated November 8, 1864. A wire loop is attached to the holding bar to allow the buckle to oscillate when fastened to the shoe, so as to prevent chafing of the strap.

Claim.—The tubular bar B, in connection with the oscillating loop C, when used in the manner and for the purposes set forth.

79,627.—LAFAYETTE BARNUM, Bridgeport, Conn., assignor to himself, LEVI BARNUM, and CHARLES H. ENSIGN, same place.—*Machine for Cutting and Dressing Stone.*—July 7, 1868.—A sliding bed moves on a platform fitted on two ways to feed the stone to the cutters; near each corner of the platform, and centrally on each side, are standards which hold two adjustable frames and contain all the cams, hammers, cutters, &c. Two or more shapes of cutters are used for rough cutting on flat surfaces, wedge-shaped for smoothing, serrated, &c.

Claim.—1. The combination of the adjustable frames with the cams, hammers, cutters, and feeding apparatus, when the whole is constructed, arranged, and fitted to operate substantially as herein described and set forth.

2. The apparatus for feeding the stone longitudinally, with the method or swinging it on its center, so as to form a curvilinear edge, and the edge cut-

ters, when constructed, arranged, and fitted to operate substantially as herein described and set forth.

3. The combination of the double-edged cutters (Fig. 3) with the rotary hammers, when they are constructed and used substantially as and for the purpose herein described and set forth.

79,628.—ADAM BAUERSCHMITT, Rochester, N. Y.—*Bridle*.—July 7, 1868.—By pulling hard upon the reins, the nose piece will be drawn tightly over the horse's nose, and the bit drawn back into the horse's mouth. When slackened up all the parts readily adjust themselves to their proper places.

Claim.—The India-rubber strap *c*, short round *e*, short strap *f*, and pulley ring *d*, when constructed and operated in connection with a bridle, as herein described and set forth.

79,629.—BENJAMIN S. BENSON, Baltimore, Md.—*Machine for Making Cores*.—July 7, 1868.—Relates to the manufacture of cores for casting metallic pipe, and consists in a device by which such cores are held and rotated while receiving their outer coating of loam, and are then dropped gently upon elastic receivers in such a manner as to leave the surface of the core perfectly smooth.

Claim.—1. Rotating the core or core spindle E by means of two shafts D D', between which it is held in the manner described, and by which it is applied to a blade, K, substantially as and for the purpose specified.

2. The sockets *d d*, by which the core is held while applied to the scraper, when connected by a rod I, and levers H H', so constructed and operating that the sockets are caused to approach or recede from each other simultaneously, for the purpose specified.

3. Operating the shafts D D' by means of arms F F', slides G G', rod I, levers H H', and spring J, in connection with pawls *n m*, substantially as and for the purpose specified.

79,630.—JAMES BINGHAM and ROBERT COWARD, Pittsburg, Pa.—*Rock Crusher and Tempering Machine*.—July 7, 1868.—Below two fluted rollers are two smooth-faced rollers of different diameters. Underneath the above is a spout leading to a sludge pan supported by a hollow annular cylinder. To a vertical shaft are attached three or more sets of knives placed at right angles to each other and which revolve with the cylinder.

Claim.—The two pairs of rollers J and JJ and K L, the spout M, the sludge pan X, the spider Y, having knives Z, the annular cylinder AA, and their operative mechanisms, when constructed, combined, and arranged as described, and to operate in the manner substantially as set forth.

79,631.—HENRY BRINER and EMIL BRINER, Manhattanville, N. Y.—*Steel Shank for Boots and Shoes*.—July 7, 1868.—The steel shank is tipped with some material which shall not spring with the steel, but accommodate itself to the form of the pieces of leather between which it is confined.

Claim.—An improved article of manufacture, the steel shank for boots and shoes, when its free end is provided with an elastic case C, for the purpose of preventing injury to the sole of the boot or shoe by the longitudinal motion produced by the action of the spring, as herein shown and described.

79,632.—O. BROWN and T. F. BERRY, Capron, Ill.—*Carpenters' Gauge*.—July 7, 1868.—A polygonal stem has fitted in one side a mortise gauge provided with two metallic slides arranged to be set for gauging any common mortise without moving the head.

Claim.—The combination of the slides D C, head A, and stem B, substantially as and for the purpose herein set forth.

79,633.—RUFUS CAMPBELL and ALBION P. CAMPBELL, Hillsdale, Mich.—*Brick Machine*.—July 7, 1868.—The clay, as it passes from the mill, falls directly into the jack mold, and upon which the weight is made to fall by treading upon the lever, which will bring the weight down upon the clay, forcing it down through the jack mold, into the mold immediately below.

Claim.—The wheels M, chain N, lever J, and

beam H, constructed and arranged to operate in combination with the weight F, in the manner as and for the purpose set forth.

79,634.—E. S. CAPEN, Worcester, Mass., assignor to himself and P. BLAISDELL, same place.—*Loose Pulley*.—July 7, 1868.—A diamond-shaped opening is cut or bored out through the bearing part of the pulley so that the oil will be forced from both ends toward the center of the hub.

Claim.—In a pulley, having the hub combined with a lubricating chamber, as described, providing the said chamber with an opening *b*, extending the length of the hub, and shaped in the manner herein specified, so that the oil discharged from the chamber upon the journal shall be forced from the ends toward the center of the hub, as set forth.

79,635.—GEORGE J. CAPEWELL, West Cheshire, Conn.—*Glass-Pressing Machine*.—July 7, 1868.—To the back part of the plunger or upper die is attached a crooked lever. A grooved arm also extends back from the lower die. In this groove moves a slide that carries the pin, which latter is kept across the face of the die by a spiral spring, one end being attached to a lever, the other to a plunger.

Claim.—1. The lever *j*, in combination with the arms *h* and *l*, the spring *n*, and slide *t*, the whole producing the automatic movement of the pin *i*, as and for the purposes specified.

2. Forming glass beads or ornaments with the desired openings or holes, made by pressing the glass around the pin and nipple, the nipple serving as a support for the pins forming said holes, substantially as described.

79,636.—LUMAN B. CLARK, Bainbridge, N. Y.—*Hop Pole*.—July 7, 1868.—A tapered post of scantling is driven into the ground and forms a base, to which the poles may be attached or readily detached.

Claim.—The hop pole, consisting of the wedge A, lateral staples B, and poles C, all constructed as described, whereby it can be driven into the ground, and reset, when loosened by the frost, or from other causes, without disturbing the vines, as herein shown and described.

79,637.—JAMES E. CONNOR, Brooklyn, N. Y.—*Press*.—July 7, 1868.—Designed to be used in the manufacture of tin ware. The bed is attached to the plate or arms in such a manner as to admit of its being rotated, and the lower die perfectly adjusted to the upper die, so as to insure smooth cutting and swaging.

Claim.—The arrangement of the bed *a* upon the plate *b* of the machine, and the mandrel *h* in the upper and lower heads, with the levers for operating the mandrel as herein set forth.

79,638.—WILLIAM COOPER, JR., and WILLIAM D. RUMSEY, Howell, Mich.—*Snap Hook*.—July 7, 1868.

Claim.—The snap hook A, when provided with the opening B and pin D, having a shoulder F, a spring E, a thimble G, and a head I, all constructed and arranged to operate substantially as described.

79,639.—GUSTAVUS A. DAVISON, San Leandro, Cal.—*Gang Plow*.—July 7, 1868.—The axle is jointed near one end and provided with a socket in which the opposite end is placed, the same being bent at right angles where it is held and regulated by a screw. The arrangement of the rigid arms and lever admits of great leverage power in operating the plows.

Claim.—1. Regulating the level of the machine by the device O O', and set screw P, or their equivalents, substantially as set forth.

2. The rigid arms H H' and G, attached to the axle, and connecting the lever or sweep J, either directly to the arm G, or by the link I, substantially as and for the purpose specified.

79,640.—GEORGE DRYDEN, Worcester, Mass.—*Machine for Boring Wood*.—July 7, 1868.—The mechanism that drives the auger is pivoted to a plate or frame sliding on the base of the machine, and is

operated by a rack and pinion to adjust it for boring the different holes successively.

Claim.—1. The connecting of the driving and carrying mechanism to a sliding plate or frame moving on the base by means of a rack and pinion, for the purpose of boring the holes of mortises successively, as above set forth.

2. The central elevating gear, when permanently in mesh with a stationary rack attached to a standard, and operated by a sliding clutch, substantially as set forth and described.

79,641.—WILLIAM M. DU BOIS, Poughkeepsie, N. Y.—*Cathartic Lozenge.*—July 7, 1868.—Aqueous extract of the *Cortex frangula* saturated in gum tragacanth.

Claim.—The medicinal compound, composed of the ingredients in the manner and proportions herein described.

79,642.—JAMES M. EVARTS, New Haven, Conn.—*Pipe Tongs.*—July 7, 1868.—The walls or sides of the elongated slot are inclined on each side and serrated, and a stud fitted to the axial pin is also provided with corresponding angular serrated sides, and with a rectangular portion to fit into the rectangular portion of the slot.

Claim.—The jaw A, provided with the elongated slot B, having tapered and serrated walls, in combination with the nut D, provided with corresponding inclined and serrated faces, the jaw C, nut E, and the axial pin E, substantially as and for the purpose described.

79,643.—JAMES M. EVERHART, Pittston, Pa.—*Car Coupling.*—July 7, 1868.—The outer ends of the connecting rods are connected by a right and left screw coupling, so that no play or slackness is allowed between the two frames.

Claim.—The right and left screw-threaded coupling F, in combination with the spring rods D, as herein described for the purpose specified.

79,644.—E. J. FENN, Medina, Ohio.—*Horse Hay Fork.*—July 7, 1868.—The lower end of the central bar is provided with teeth which engage with teeth on the inner ends of the tines. The pressure of the right angular lever upon a projection of the central bar serves to open the tines.

Claim.—The arrangement of the right angular lever D, adapted to press at its angle point upon the projection *b'* formed upon the central rack bar B, to spread the tines D, and upon being raised by the cord F, permitting the hay to discharge itself from the tines H by gravity, as herein shown and described.

79,645.—LORENZO D. FERGUSON, Dansville, N. Y.—*Roofing Compound.*—July 7, 1868.—Composed of quicklime, plumbago, oxide of iron, plaster of Paris, powdered sulphur, and common sand, mixed with coal tar, with the addition of resin.

Claim.—The combination of the ingredients herein specified, when used in the manner and for the purpose set forth.

79,646.—B. G. FITZHUGH, Ellicott City, Md.—*Car Platform Bridge.*—July 7, 1868.

Claim.—A safety bridge for the platforms of railroad cars, which is made of a plank or board, or of a single piece of metal, and which is supported on and elevated by its ends slightly above the platforms, and united thereto at one or both ends by a flexible or yielding connection that will prevent it from slipping off endwise, substantially as and for the purpose described.

79,647.—LAVINIA H. FOY, Newton Centre, Mass.—*Corset.*—July 7, 1868.—Two gores only are inserted, the other pieces being cut to fit the person.

Claim.—As a new article of manufacture a corset, in which the hip gores or pieces E are combined with the front, back, and side pieces of the corset, cut in the form and united in the manner described and illustrated in the drawings, so as to fit the person without the insertion of further gores.

79,648.—PETER J. FULLER, Clarksville, N. Y.—*Hop Vine Support.*—July 7, 1868.—A short pole is

provided with a series of arms pivoted to its upper part, which arms can be secured in an upright position, or swung down for the removal of the vines.

Claim.—1. A hop-vine protector, consisting of the post A, and of the arms B, which are pivoted thereto, so that they can be swung up or down at will, substantially as herein shown and described.

2. The swinging arms B, when pivoted to a post, A, and when fastened in their upright position by means of hooks *b c*, or their equivalents, substantially as herein shown and described.

79,649.—SAMUEL GARBER, Beaver, Pa.—*Lock Nut.*—July 7, 1868.—A lock piece or bolt is placed between the nuts to be locked and held in place by a rivet-headed nail or screw passing through said block, and a piece or plate behind it.

Claim.—The lock block E, placed between two adjacent nuts, D, outside the fish plates, and held in position by means of the perforated or recessed fish plates B, or metal strip G, and the reversed bolt and nut F, all arranged and operating as described, for the purpose specified.

79,650.—S. W. GIBBS, Albany, N. Y.—*Base Burning Stove.*—July 7, 1868.—The feeding cylinder extends from the top of the stove downward in an inclined position and rests on the top of the fire pot. The perforations allow the gas to escape into the combustion chamber. The lower end of the feeder is surrounded by a circular perforated tube.

Claim.—1. In combination with a stove, the reservoir or feeder D, constructed and arranged substantially as described, for the purposes set forth.

2. The circular tube G, in combination with the feeder D, arranged substantially as and for the purposes described.

79,651.—JOHN GREENWOOD, Rochester, N. Y.—*Machine for Cutting Staves.*—July 7, 1868.—A double set of rollers is combined with the curved ribs in such a manner as to sustain the stave bolt without coming in contact with the ribs themselves, thereby leaving a narrow space between the said bolt and ribs to allow chips and splinters to pass through without displacing the bolt.

Claim.—The alternate arrangement, on the face of ribs *a a*, of the double set of rollers *g h*, operating relatively with the swing bed B and center C, substantially as and for the purpose described.

79,652.—JOSEPH H. GREER, Rochester, Pa.—*Cooking Stove.*—July 7, 1868.—The object of the invention is to economize the consumption of fuel, by concentrating the heat to the desired heating surface, and also to insure perfect uniformity in the temperature of the oven.

Claim.—The reverberating flues A A, chamber B, reverberating flues C C, C' C', C'' C'', damper D, register R, in combination with orifices or perforations Z, grate L, rack J, door knob M, sliding door knob P, lift hole N, all constructed as herein set forth, or in any other manner essentially the same, and for the purposes as specified.

79,653.—JESSE E. GUSTIN, Elmira, N. Y.—*Self Detaching Pulley.*—July 7, 1868.—The pulley is attached to a frame, one side of which is jointed, the jointed part being held in position by a spring.

Claim.—The pulley B, so arranged in a frame or block by joints and hinges that it is made self-detaching, substantially as and for the purposes herein shown and described.

79,654.—GEORGE HANLON, WILLIAM HANLON, ALFRED HANLON, EDWARD HANLON, and FREDERICK HANLON, New York, N. Y.—*Velocipede.*—July 7, 1868.—The seat is made adjustable on the inclined perch, and the foot rests on the front axle are also adjustable lengthwise, so that the apparatus may be used by either large or small persons. The rear axle is so arranged in the forked rear end of the perch that either one or two wheels may be hung upon it.

Claim.—1. The seat E, when secured upon the end of a spring, I, and when adjustable on the perch C, substantially as described for the purpose set forth.

2. The extension crank C, on the front axle A, of the velocipede, when arranged as described, for the

purpose of making the velocipede adjustable, as set forth.

3. Providing the perch or connecting frame C with a forked rear end, for the purpose of allowing the use of the wheel G within, or of two wheels H H without, the fork, as specified.

4. A velocipede, consisting of the bifurcated perch C, carrying the axles A B, of the front wheel D, and rear wheel G, or wheels H, of the adjustable spring seat E, and of the extension cranks *e*, on the front axle, all made and operating substantially as herein shown and described.

79,655.—WILLIAM HANNAH, Middlefield Centre, N. Y.—*Horse Hay Fork*.—July 7, 1868.—Attached to a cross-bar are tines moving up and down within two metallic tubes. To the inside of the arms of the tines are pivoted two or more curved hooks to each tine, said hooks passing through slots in the tubes so that by moving the tines upward in, the hooks will be drawn wholly within the tubes.

Claim.—1. The tripping plate H, substantially as shown and described, in combination with the rigid cross-bar A', of the tines *a*, and the hook *h*, affixed to the cross-bar D of the tubes C C', all as and for the purpose set forth.

2. The discharge orifice *l*, substantially as shown and described, in combination with the tubes C of a two-tined hay fork for the purpose of permitting the escape of the dust or hay seed, all as set forth.

79,656.—EDSON HARTWELL, Hubbardstown, Mass.—*Rocking Chair*.—July 7, 1868.—The curved projections on the lower ends of the standards prevent the latter from being displaced from the plates. The curved side pieces serve for back legs as well as top pieces for the chair frame.

Claim.—1. The combination of the arms or standards E, having curved projections *b b* with the slotted plates F, substantially as and for the purposes set forth.

2. The combination, with the lower ends of the standards E, of the plates F and G, substantially as and for the purposes set forth.

3. The combination, with the seat supports or standards E and chair frame, of the curved pieces D, substantially as and for the purposes set forth.

4. The combination of the seat A with the springs *g g*, standards E, and chair frame, substantially as and for the purposes set forth.

79,657.—ROBERT HUNTER, New York, N. Y.—*Propeller*.—July 7, 1868.—A hollow tapering bucket so made as to offer the least possible resistance to the water while moving in the line of the vessel's motion, and the greatest possible resistance when moved by a lever in the opposite direction.

Claim.—The propelling apparatus herein described, consisting of a hollow tapering bucket, C, vibrated by a lever, B, under the stern or run of the vessel, substantially as specified.

79,658.—SAMUEL W. HUNTINGTON, Augusta, Me.—*Scissors and Shears*.—July 7, 1868.—For cutting a piece of whalebone, wire, or other hard substance.

Claim.—The formation of auxiliary shear-blades, *f*, upon the inner and opposite edges of that portion of the arms or blades of scissors and shears between the pivot and handle, or in rear of the pivot, as shown and set forth.

79,659.—ISAAC JENNINGS, Fairfield, Conn.—*Paper Making Machine*.—July 7, 1868.—A dove-tailed tapering groove is formed in the side of each of the rollers, in which are fitted wedge-shaped blocks. The rollers are journaled in the slotted arms of a frame, and take the place of the single roller that receives the pulp upon the ordinary machine.

Claim.—1. Diminishing the size of the roller after the paper has been formed in any convenient manner, so as to admit of the papers being removed without cutting, substantially as and for the purpose herein set forth and described.

2. The system of rollers B, constructed and arranged substantially as herein shown and described, when used in connection with the other parts of a

paper machine, in place of the ordinary single roller, as and for the purpose set forth.

79,660.—CLARK JILLSON, Worcester, Mass.—*Mold for Making Strawberry Ripeners*.—July 7, 1868.—Molten glass is placed in the matrix of the lower portion of the mold, when the piston is depressed and the proper form is made. The glass ripener is elevated by the movable cams ascending the inclined faces of the stationary cams so as to loosen it from the stem.

Claim.—1. The combination, with the base A, stem C, and series of cams D, of the concave and perforated part B, and series of cams E, substantially as and for the purposes set forth.

2. The combination, with the parts lettered A, B, C, D, and E, of the convex and recessed piston F, said parts being constructed and arranged for operation substantially as and for the purposes set forth.

79,661.—RICHARD P. JOHNSON and ELI J. SUMNER, Wabash, Ind.—*Lumber Drier*.—July 7, 1868.—Improvement upon a patent granted to the same inventors on July 9, 1867. The furnace is constructed in two chambers, so that fire made in the upper one will generate steam, and when made only in the lower one hot air only will be created. The curtain causes the hot air to pass under the same so as to maintain the same temperature near the floor as at the top.

Claim.—1. The double furnace A and B, separated by a horizontal partition, and provided with a common escape flue, in the manner and for the purposes set forth.

2. The providing the ears with curtains, or like device, in the manner and for the purposes as set forth.

79,662.—JOHN LAMB, Jeffersonville, N. Y.—*Washing Machine*.—July 7, 1868.—Strips of India-rubber are secured longitudinally and endwise in the cylinder and used in connection with a vibrating beating-rod.

Claim.—The cylinder B, when provided with strips of India-rubber, in the manner set forth, in combination with the fluted vibratory rod *i*, arranged and operated as and for the purpose set forth.

79,663.—HENRY A. LEE, Worcester, Mass.—*Molding Machine*.—July 7, 1868.—The upper feed rolls are so arranged that both rise and fall independently of each other, while at the same time their gears continue to mesh with the gears of the stationary central shaft. The cylinder or cutter head is supported in bearings which are fitted to slide up and down on the faces of the stands, and combined with the said bearings are two adjusting screw shafts supported at their lower ends in boxes and having shoulders which rest on the flanges of the stands, by which the cutter cylinder can be readily adjusted.

Claim.—1. The combination, with the lower feed rolls B, the upper feed rolls B', the adjustable pieces D, and their concentric slotted arms C, and the central shaft C', of gears 2, 3, 4, 5, 10, 11, and 12, and links 8, 9, constructed and arranged for joint operation, as and for the purposes set forth.

2. The combination, with the stands F and the sliding bearings E, held to said stands by bolts *n* of the elevating and depressing shafts G, with their shoulders 23, the parts being constructed and arranged with relation to each other as and for the purposes set forth.

3. The combination, with the presser bar H, arms I, and screw rods *p*, of the peculiarly constructed holding and swivel bolts *o*, the parts being constructed and arranged with relation to each other as and for the purposes set forth.

4. The combination, with the upper end of each or either of the shafts K, and the slotted bar N', of the peculiarly constructed bearing piece N, in the manner and for the purposes shown and set forth.

79,664.—LOUIS J. LECOCQ, Argenteuil, France.—*Car Coupling*.—July 7, 1868.—The locking bolt is operated by a bent lever, the handle of which is held in position by means of a spring. The free end of the spring is provided with a knife edge which

presses against the angle of the lever. Safety chains attached to the coupling eyes by hooks are employed to hold the cars together in case the coupling should break.

Claim.—1. The parts B and C and the locking bolt D, the spring H, and angle g' on the bearing part G, all constructed, combined, and operated substantially as described, as and for the purposes specified.

2. The compound eyes I J, connected to and opened and closed by the motion of the locking bolt D of the coupling, so as to confine the safety chains K so long as the coupling is connected, and to liberate the safety chains simultaneously with the attachment of the coupling, substantially as and for the purposes herein specified.

79,665.—JOHN MADDEN, Cleveland, Ohio.—*Wrench.*—July 7, 1868.—The pallet is fitted in the roof of the supplementary jaw, and is made slanting on the lower side from the inner end outward, so that in pulling the wrench in one direction, a stronger grip will be had upon a pipe to which it may be applied.

Claim.—The pallet E, supplementary jaw B, as arranged in combination with a wrench, in the manner and for the purpose substantially as set forth.

79,666.—FRANK W. MARVIN, Sacramento, Cal.—*Marking Can.*—July 7, 1868.—The marking ink is kept in the reservoir which surrounds the can, and is discharged into the can through a valve, as required for use. The reservoir is supplied through the tubular handle.

Claim.—1. In combination with a marking can, the reservoir C, substantially as and for the purpose set forth.

2. The valve D and tubular handle G, in combination with a marking can or pot, arranged substantially as and for the purpose described.

79,667.—WILLIAM MAROT MARSHALL, Philadelphia, Pa.—*Air Carbureter.*—July 7, 1868.—The carbureter is connected with a blower, by means of a coiled metal tube of a conical or other form so as to present a large beating surface to a flame of carburated air burning within its folds. A globular chamber with sufficient fluid for one feeding and provided with stop-cocks and a funnel, may be attached to the carbureter.

Claim.—1. The coiled copper or other metallic pipe E, substantially as described and for the purpose set forth.

2. The coiled pipe E, in combination with pipe F and flame S, and with the blower A and carbureter B C, when connecting the blower with the carbureter, substantially as and for the purpose set forth.

3. The feeder R O, with its chamber O, funnel R, stop-cocks N and T, and its pipe, substantially as and for the purpose set forth.

79,668.—C. E. MASON and G. F. BELL, Wellington, Ohio.—*Feather Renovator.*—July 7, 1868.—A cylinder of wire gauze or netting is hung within a box, in the bottom of which latter and below the cylinder are arranged steam pipes.

Claim.—1. A cylinder, constructed of wire gauze or netting, substantially as and for the purpose set forth.

2. The cylinder B, in combination with the box A, in the manner as and for the purpose described.

3. The pipes D E, as arranged in relation to the cylinder B and box A, substantially as and for the purpose set forth.

79,669.—HENRY MATHES, Cambridgeport, Mass.—*Steam Gauge.*—July 7, 1868.—The disk is made of an alloy composed of 5 parts of eighteen carat gold, 4 parts silver, and one part of copper. The center of the disk presses against a rod which operates the indicating mechanism.

Claim.—1. The arrangement of the cap B, the disk A, and washer a , substantially as and for the purpose specified.

2. A flexible disk for steam gauges, when constructed of the materials and in the proportions substantially as described.

79,670.—S. T. McDUGALL, Brooklyn, N. Y.—*Partitioned Steamer.*—July 7, 1868.—Designed for

boiling and steaming a number of different sorts of food with the same vessel simultaneously.

Claim.—As an article of manufacture, a boiler divided into several compartments by vertical partitions, and provided with a depression in the bottom of each compartment, in combination with a steam cooking vessel on one or each compartment, constructed and arranged in the manner and for the purpose herein described.

79,671.—S. T. McDUGALL, Brooklyn, N. Y.—*Clothes Pounder.*—July 7, 1868.—The pushers are so arranged as to crowd forward the clothes to be pounded, and so that they shall be brought beneath the pounder just before the descent of the latter.

Claim.—1. The pushers M, connected to the arms K, and operated substantially as described, for the purposes set forth.

2. In combination with the same, the pounder E, when the same shall be constructed and operated substantially as described, for the purposes set forth.

79,672.—DAVID MCFARLAND, New York, N. Y.—*Low-Water Indicator and Steam-Pressure Alarm.*—July 7, 1868.—The filling of hemp or other fibrous material is designed to prevent any space for the reception and expansion of steam therein.

Claim.—1. The float D, constructed of a hollow cylinder, filled with hemp or other suitable fibrous material, substantially as and for the purpose set forth.

2. The float D, in combination with the weighted lever G, valve I, and pipe e , substantially as herein shown and described.

79,673.—DAVID MCFARLAND, New York, N. Y. assignor to JOHN JOHNSTON, same place.—*Low-Water Detector and Steam-Pressure Alarm.*—July 7, 1868.—When the lower orifice of the more elevated pipe is below the water level in the boiler, the lower compartment will be filled with water, owing to the pressure of the steam on the surface of the water in the boiler, and the tilting box being in a state of equipoise, the alarm valve will be kept closed. When the water in the boiler descends below the lower orifice of the said pipe, the steam will rush into the compartment, and the water in the same will descend, passing through the lower pipe into the boiler, until the water level in the same is reached. The box will then tilt and cause the valve to open and sound the alarm.

Claim.—1. The tilting box G, fitted within a compartment, B, which communicates with the steam boiler below the water level by pipes E F, and is connected with the valve J of a steam whistle or alarm, K, all arranged to operate in the manner substantially as and for the purpose described.

2. The safety valve M, connected with the valve J of the steam whistle or alarm by means of the lever O and the stem d of valve J, arranged with a steam compartment, C, as shown, to admit of a movement of said valve independent of the rod I and box G, and the simultaneous opening of the safety valve M and whistle or alarm valve J, when the steam within the boiler exceeds a certain desired pressure.

79,674.—DUNCAN MCKENZIE, New York, N. Y.—*Wooden Pavement.*—July 7, 1868.

Claim.—The wooden pavement, constructed, as described, of the blocks A, secured together by means of the beveled strips attached to the opposite sides of said blocks A, in the manner substantially as herein shown and described.

79,675.—JOSEPH H. MCPHEETERS and PHILIP P. GROSS, Palmyra, Mo.—*Corn Sheller.*—July 7, 1868.—The cars of corn in passing between the revolving cylinder and the bars are turned over by the points on the cylinder, and the grain is taken off by contact with the edges of the bars, while the cob is carried forward by the cylinder points and thrown out.

Claim.—1. Making the shelling bars flattened, with rounded edges or flat oval in a cross section, substantially as described.

2. Making the shelling bars with corresponding opposite edges, and arranging them in such a manner that the edge of any bar presented toward the

cylinder, or the place of the bar in the bar frame, may be readily changed, substantially as described, and for the purposes set forth.

3. Making the bar frame adjustable in its position relatively to the cylinder D, substantially in the mode and for the purposes described.

4. In combination with the cylinder D and adjustable bar frame J J, the endless apron or eob carrier H.

5. The guides T T, substantially as and for the purposes described.

79,676.—ANDREW J. MOORE, SAMUEL BLEISTEIN, and SAMUEL S. SHIRK, Lebanon, Pa.—*Method of Cutting Boots.*—July 7, 1868.—An adjustable pattern, with scales of figures marked upon it corresponding to the several measures required to be taken to fit a boot to the foot, so that the pattern can be adjusted and set for marking off and cutting from one piece of leather the entire upper and leg of a boot.

Claim.—1. The pattern, composed of the several parts herein shown, said parts being constructed and arranged and operating as herein described, for producing the upper and leg of a boot in the form shown in Fig. 2 of the drawings, or in an equivalent form, as set forth.

2. The piece G, in combination with the pieces D F of the pattern, substantially as described.

3. A boot upper and leg, T T', V V¹ V², made in one piece, produced as described.

79,677.—WILLIAM MORGEY, Wilmington, Del.—*Bending Fifth Wheel.*—July 7, 1868.—The heated clip is placed on the turn-table against the forming plate, when the sizing and lining lever is forced down in the clip. The "moon-shaped" lever is then drawn up, and the circle is forced against the forming plate, when a binding ring is slipped upon the levers to form a firm handle. The clip is then hammered up to the sizing lever.

Claim.—The combination of the turn-table *d*, leveling plate *b*, circle plate *e*, the levers *m*, F, *g*, *h*, and O, rollers *i* and *j*, and slotted slide *k*, constructed and arranged as hereinbefore described, as a circle or elliptic bending machine, for bending fifth wheels and clip circles of carriages, and sizing and lining clips.

79,678.—HENRY OBRECHT, Mahanoy City, Pa., assignor to SAMUEL REINHART and JOHN C. KNAPP, same place.—*Meat Cutter.*—July 7, 1868.—The cutters have a vertical reciprocating motion and at the same time a slow rotary motion.

Claim.—The bar D, when swiveled to the up and down reciprocating bar or plate C, and when passing through and connected with the revolving wheel or disk G, all made and operating substantially as herein shown and described.

79,679.—RALPH G. PACKARD, Brooklyn, N. Y.—*Globe Valve.*—July 7, 1868.—A pin projecting on each side at the end of the valve stem fits within a cavity in the valve proper, so that the valve is free to turn with the stem or rest on the material below without turning, but is compelled to rise with the stem. The packing piece and chamber above are made many sided to prevent the valve from turning.

Claim.—1. The within described mode of connecting the valve proper with the valve stem C, that is to say, by the employment of the pin *c* and cavity *e*, arranged relatively to each other, and to the other parts, substantially as and for the purpose herein specified.

2. The elastic packing piece G, arranged, as represented, relatively to the stem C and top casing D², to prevent the escape of steam or other fluid around the stem C, being packed or fitted with increased tightness in proportion as the pressure of the fluid is increased, substantially as and for the purposes herein specified.

79,680.—WESLEY PEARCE, McLean County, Ill.—*Sponge and Dough Raiser.*—July 7, 1868.

Claim.—The introduction of steam in coils of pipe, between a sponge trough and outer box, for the purpose of raising the sponge and dough before baking, substantially as described.

79,681.—JOHN PLAYER, New York, N. Y.—*Manufacture of Iron from Titaniferous Iron Ore.*—July 7, 1868.

Claim.—The smelting of titaniferous iron ores with blast furnace slag, or scoria, or basalt rock, as a flux, or other equivalent, in the manner and substantially as herein described.

79,682.—FRANK J. PLUMMER, Worcester, Mass., assignor to R. BALL & Co.—*Circular Saw Mill.*—July 7, 1868.—The construction of the machine is such that after one roll has been moved to the desired position by a screw shaft the cams can be disconnected, when one feed roll will remain in a fixed position, while all the varying movements caused by the inequalities of the material being fed in will be indicated by the other roll. When the cams are connected the motion of the feed rolls will be uniform in both directions, whereby the cut will be central throughout.

Claim.—1. The combination with the shafts B B, or either, of the cams 8 8, or either, and friction rings 6 6, constructed to operate substantially as and for the purposes set forth.

2. The combination with the shafts B B of the cams 8 8, friction rings 6 6, and balls *d d*, substantially as and for the purposes set forth.

3. The combination with the adjustable feed rolls, the lower ends of whose shafts are received in balls *d d*, mounted in the machine as described, of the sliding gears for driving said rolls, and the balls *m* and stem *n*, for connecting the gears with the shafts of the rolls, under the arrangement and for operation as herein shown and set forth.

4. In combination with the parts claimed in the preceding clause, the dogs *c*, collars *p*, wings 4, and pins 5, mounted upon the hubs of the gear wheels and feed roll shafts, in the manner and for the purposes shown and specified.

5. The combination with the cams 8 8 of the handle or arm J and fastening screws 11, for the purpose of allowing one to be operated independently of the other, substantially as and for the purposes set forth.

79,683.—J. MORTON POOLE, Wilmington, Del., assignor to himself, WILLIAM T. PORTER, and THOMAS S. POOLE, same place.—*Machine for Turning Cylinders.*—July 7, 1868.

Claim.—An arrangement of one or more pairs of cutting or grinding tools, or one or more pairs composed respectively of a cutting or grinding tool and a rest, upon a frame which is free to move laterally or transversely to the object which is being turned or ground, the tools constituting a pair being capable of adjustment and fixation thereon, in relation to one another, and dependent for their movements to and from the surface of the object placed between them to be turned or ground by their contact with the surface or surfaces of said object at opposite points thereof, substantially as herein described.

79,684.—WILLIAM PRATT, Providence, R. I.—*Tool Holder.*—July 7, 1868.

Claim.—A tool holder, carrying an independent cutter, for engine lathes and planing machines, in which the bar or stock A is slotted transversely to the vertical line of the cutter, dividing the mortised end of the bar A into an upper and lower limb, and the fastening of the cutter by drawing these limbs together with a screw bolt and nut, or by spreading them apart by means of a set screw passing through one limb and abutting against the other, all made and operating substantially as described, or their mechanical equivalents.

79,685.—DANIEL R. PRINDELL, East Bethany, N. Y.—*Agricultural Boiler.*—July 7, 1868.—The cover is made of wood and is kept immersed in water to prevent it from shrinking. The elbow connecting the steam discharge pipe with the flexible pipe is screwed upon the former so as to enable it to be turned in any direction. A small groove around the barrel of the elbow, in connection with a clip, serves to attach the flexible pipe to the elbow.

Claim.—1. The combination of the caldron A and cover B, so constructed as to enable the cover to be kept immersed in water, substantially as and for the purpose herein specified.

2. The revolving elbow H, in combination with the stationary steam pipe G, and flexible shifting pipe I, for the purpose set forth.

3. The mode of attaching the flexible pipe to the elbow H, substantially as herein specified.

4. The metallic band *d*, on the edge of the wooden cover, in combination with the fastening clamps, for the purpose set forth.

79,686.—SAMUEL S. RAIN, Lowville, N. Y.—*Animal Trap*.—July 7, 1868; antedated June 27, 1868.—The cage is held suspended by a coiled spring and catch upon a standard. The bait hook is arranged to disengage the catch and the spring, by its recoil, draws down the cage and entraps the animal.

Claim.—The use of the within described combination of devices for the object and purpose here set forth.

79,687.—W. H. RAMSDELL, Lowell, Mass., assignor to himself and H. J. SAWYER, same place.—*Bobbin*.—July 7, 1868.—From the two bearings of the bobbin, to the ends of the same, the hole is enlarged sufficiently to allow of a thick piece of felt cloth to encircle the spindle between the bearings and two metallic riugs, which latter are cut open to render them elastic.

Claim.—A bobbin, constructed as described, in combination with the spring rings E, and felt or suitable absorbent packing, as and for the purpose described.

79,688.—CAROLINE M. ROLFE, Laconia, N. H., administratrix of the estate of CHARLES F. ROLFE, deceased.—*Hog Trough*.—July 7, 1868.—The cover is arranged to be adjusted so as to expose the trough at the outer or inner side of the frame. The frame is held in place by means of cleats and keys.

Claim.—1. The detachable frame B, provided with the trough C and cover D, constructed and arranged substantially in the manner as and for the purpose set forth.

2. The securing of the frame in the side of the pen or sty by means of the cleats *b d*, and keys E, substantially as shown and described.

76,689.—ANTONIO ROTTANZI, M. D., San Francisco, Cal.—*Cup for Effervescing Drinks*.—July 7, 1868.—The cup is divided into two separate compartments to contain the different powders which effervesce on being poured out in solution simultaneously. A series of stops in the spout cause the mixture to become more fully incorporated.

Claim.—In combination with the partition B, the stops or gates *a b c*, or equivalent device, and the lid or cover E, substantially as and for the purpose described.

79,690.—GEORGE ROWE and S. W. NELSON, Worcester, Mass.—*Cutter Head*.—July 7, 1868.—Attached to the molding cutter is a clamping piece which is recessed upon the under side, leaving two flanges, one of which fits into a recess in projections on the cutter head while the other rests upon the outer surfaces of the said projections.

Claim.—The combination of the cutter holding or clamping piece B, having flanges C and D, with the head part A, and its projections *b e*, and bolt I, substantially as and for the purposes set forth.

79,691.—REUBEN V. SALLADA and GEORGE A. PEARSON, Philadelphia, Pa.—*Carriage and Riding Whip*.—July 7, 1868.—The whip is made in two parts so constructed as to be readily convertible into a riding whip and walking cane if desirable.

Claim.—The construction and combination of a carriage whip, when made and arranged in the manner and for the purpose specified, as a new article of manufacture.

79,692.—THOMAS SCANTLIN and JAMES M. SCANTLIN, Evansville, Ind.—*Coal Scuttle*.—July 7, 1868.—The horizontal fluting assists the lapped edge to hold the bottom firmly affixed to the body. The legs are a continuation of the bottom flange, and diagonal ribs are cast on the bottom.

Claim.—A coal scuttle having the body A formed with a fluting *e*, and the edge or border just below

this fluting lapped over a conical flange of the bottom B, the said bottom being formed with legs *a a a a*, *b*, and ribs *e e e e*, all substantially as described, and for the purpose set forth.

79,693.—DAVID W. SHAW, Baltimore, Md.—*Milk Can*.—July 7, 1868.—Designed for making the cover air tight and locking the same.

Claim.—The combination of the anchor C, having stem B and radial arms *d*, the follower *e*, lever screw nut *f* and packing *g h*, when the upper portion of the stem B is provided with an opening, *o*, to receive a lock, whereby cover J may be secured, as herein shown and described, for the purpose specified.

79,694.—ALBA F. SMITH and JOHN H. VICKERS, Norwich, Conn., assignors to NORWICH LOCK COMPANY, same place.—*Padlock*.—July 7, 1868.—The inclined projection on the rear face of the front plate throws the key backward in the lock, at the proper position to depress the catches, and the inclined projection or the back plate of the casing throws the key forward again as soon as it has turned the disk to a sufficient extent to liberate the shackle.

Claim.—1. The incline *a*³, arranged as herein specified, and adapted to throw the key forward out of the holes *c* so soon as the unlocking movement is completed, substantially as and for the purposes herein specified.

2. The within described inclined projection *a*⁴, on the back face of the front plate A², arranged as represented relatively to the key E *e* and catches *d*, for the purpose herein specified.

79,695.—WILLIAM SPALDING, Port Clinton, Ohio.—*Application of Steam to a Propeller*.—July 7, 1868; antedated June 18, 1868.—Steam being forced into the water reservoir causes a vacuum to be formed therein, and the water is forced into and through the propeller blades thus causing the latter to rotate. A valve within the tubular shaft provided with spiral grooves serves to reverse the rotation of the propeller.

Claim.—1. The arrangement of the water reservoir B, perforated rotating shaft E, water supply pipe D, steam pipe C, valve rod H, reversing lever I, valve G, having spiral grooves *d*, and propeller F, as herein set forth for the purpose specified.

2. The valve G, when constructed as described, with spiral grooves *d d*, as herein shown and described, for the purpose specified.

79,696.—JAMES SPEAR, Philadelphia, Pa.—*Base Burning Stove*.—July 7, 1868.—The grate is arranged to be dumped without opening the base of the stove, thus preventing the escape of dust. The reservoir is constructed in three sections, by which it is made lighter for transportation and as durable as if wholly of cast iron. Above the mica windows is a register for the purpose of admitting air to the fire.

Claim.—1. The revolving grate S, in combination with the dumping apparatus, consisting of the pivot bar T, arms W W, lever *v*, rod *t*¹, so constructed that it can be dumped without opening the stove.

2. The reservoir N, constructed with a lower cast-iron ring *n*¹, sheet-iron section *n*², upper cast-iron riugs *n*³ *n*⁶, so connected as to form a reservoir for the purpose shown and described.

3. The register H, for the purpose of admitting air between the outer section G and reservoir N, in combination with the revolving windows *d*², arranged and operating substantially as shown and described.

4. The combination and arrangement of the revolving and dumping grate S, with the fire pot B, revolving windows *d*², reservoir N, register H, and swinging urn M, substantially as described.

79,697.—HERMAN SPIRO, Knoxville, Tenn.—*Elevator*.—July 7, 1868.—The object of this invention is to elevate bricks and mortar for building purposes and to present the same in a position conveniently accessible to the builders upon the scaffolding.

Claim.—1. The drums A A, belt *g g g*, *f f f*, boxes I and J, and hooks *a b*, all substantially as shown and described, in combination with the uprights B, all as and for the purpose set forth.

2. The links *d*, having rollers *i i*, and eyes, sub-

stantially as described, in combination with the drum A and its belt of boxes, all as and for the purpose set forth.

3. The ropes K, pulleys I, links N, and windlass S, substantially as described, in combination with the uprights B, drums A A, and belt of boxes all as set forth.

4. The shoulders P, substantially as described, in combination with the uprights B, links *d*, drums A, and belt of boxes, all as and for the purpose set forth.

79,698.—CHARLES W. SPROULL, Rome, Ga.—*Panel Fence.*—July 7, 1868.—The ends of the horizontal boards project beyond the outer uprights of each panel and lap alternately in a contrary direction so as to bear against each other and be held in place by friction.

Claim.—The combination of the projecting ends *b'* of fence panel, the triangular uprights *a*, and feet *h*, all substantially as shown and described, and for the purpose shown and described.

79,699.—WILLIAM STANDING, Cairo, Ill.—*Grain Drier.*—July 7, 1868.—The apparatus consists of a steam chamber containing grain cylinders through which the grain is passed, and around which cylinder is a steam space. In the lower openings of the cylinders are valves for regulating the passage of the grain. Air passes through perforated tubes within the grain cylinders to assist in drying the grain, and bear away the moisture expelled from the same.

Claim.—1. A grain drier composed of a series of cylinders for the passage of the grain, each surrounding a central perforated air tube, and all inclosed by a metallic case, forming a close steam chamber, substantially as herein described, for the purpose specified.

2. The grain drier constructed as described, of the annular chamber B, inclosed between the heads *a b*, and each containing a central perforated tube *c*, supported by radial arms *d*, and extended in imperforate pipes *i*, above the head *d*, for conducting the moisture to the chamber G E, the cylinders B being surrounded by the case A, to form the steam chamber, all constructed and arranged as described, and supported upon the perforated conical base N, as herein set forth, for the purpose specified.

2. The arrangement of the valves *h*, supported upon the ring K, and adjusted by means of the bifurcated plate *l*, pivoted lever L, screw rod S, and burr K, as herein described for the purpose specified.

3. The arrangement of the close steam chamber, the grain cylinders B, and the perforated air tubes C, having extended imperforate ends *i*, whereby the grain is heated by steam around the cylinders B, and the moisture discharged through the centre of said cylinders by the tubes C, as herein described, for the purpose specified.

79,700.—JOHN STARK, Thomasville, Ga.—*Pruning Hook.*—July 7, 1868.—The hook is formed in two parts, secured together by screws, so that they may be separated for grinding or sharpening.

Claim.—1. A harvesting or pruning hook, formed of two or more cutting edges, when the same are united and arranged substantially as described for the purposes set forth.

2. Attaching the hook D and blade A together, as described, whereby they are rendered detachable for sharpening, as herein shown and described.

79,701.—CHASE A. STEVENS, New York, N.Y.—*Treating Ores, Metals, and Minerals.*—July 7, 1868.—The ores are treated by smelting in a crucible or furnace with the application, as a flux, of the residuum obtained from the manufacture of soda and other chemicals from the mineral cryolite.

Claim.—The within described process of treating auriferous and argentiferous, and other ores, clays, carths, and metallic iron, by the application of the residuum obtained from cryolite, substantially in the manner and for the purpose set forth.

79,702.—G. R. STEVENS, Chicago, Ill.—*Churn.*—July 7, 1868.—An inverted frustum of a cone forming a part of the dasher rod causes the cream, when forced through diagonal holes in the hinged dashers,

against the said cone as the rod is pressed downward, to pass outward against the sides of the churn.

Claim.—The cone E, in combination with the rod D and winged dasher B C, the latter having holes *d d*, made diagonally through it, substantially as and for the purpose herein set forth.

79,703.—GEORGE E. STEWART, East Saginaw, Mich.—*Corn Husker.*—July 7, 1868.—Designed to protect the hand in breaking an ear of corn from its stalk, and consists of two plates, having each a sharp edge, pivoted together at one end and applied to the hand by means of curved hooks and straps.

Claim.—The protecting device described, consisting of the pivoted metallic plates A B, secured to the index finger and thumb of the wearer by means of the curved strips D G I, and straps E F, all constructed and operating as herein described, for the purpose specified.

79,704.—ANTHONY B. SWEETLAND, Fitchburg, Mass., assignor to himself and JAMES DALEY, same place.—*Refrigerator.*—July 7, 1868.—The refrigerator is formed of an outer cylindrical casing, which is made in two parts, the upper part containing the ice, and the lower portion inclosing a revolving frame provided with a grated partition and a grated bottom.

Claim.—1. The ice shelf B, carrying, by the central pivot *d*, the pendant metallic disk C, and supported by the curved strips *f* from the lugs *e* upon the interior of the upper removable part A', all arranged above the inclined flange G, which forms the channel *h*, and supports the vertical tube *i*, as herein described, for the purpose specified.

2. The construction of the ice shelf B, supporting strips *f*, pendant disk C, and inclined flange G, forming the channel *h*, and supporting the pipe *i*, all arranged as described in the upper case A', and adapted to be removed with said part from the lower case A, bearing the revolving frame J, as herein described, for the purpose specified.

3. The combination of the ice shelf B, pendant disk C, supporting strips *f*, inclined flange G, pipe *i*, with the cases A A', and revolving frame J, all constructed, arranged, and operating as herein described, for the purpose specified.

79,705.—SALMON E. TYLER, Beloit, Wis., assignor to himself and WM. S. STEPHENS, same place.—*Spring Bed Bottom.*—July 7, 1868.—The elamps, in connection with the eccentrics, serve to hold rubber springs firmly to the ends of the slats. The rubber springs are secured to the head and foot boards by a elasp and screws.

Claim.—The clamps B and corrugated eccentrics *b*, as and for the purpose herein set forth and described.

79,706.—THEOPHILUS A. WAINWRIGHT, Wilson, N. C., assignor to himself and ALBERT FARMER, same place.—*Cotton Plow.*—July 7, 1868.—The frame is cast in one piece, ready to receive the double moldboard and the point, each of the same being secured to the upright by a single bolt.

Claim.—The construction of the frame A B C, it being cast from one pattern complete, and the manner of securing thereto all of the necessary parts, as above described, by a single bolt or key each, substantially as and for the purposes herein set forth.

79,707.—W. P. WALLING, Swartz Creek, Mich.—*Water Elevator.*—July 7, 1868.—An arrangement of devices for conveying water from a spring or brook to any convenient distant point. The bucket is filled and carried by means of a rope and pulleys to a point over a water receiver where a valve in the bottom of the bucket is automatically opened, and the water discharged.

Claim.—1. The projection Cx, in combination with the ring C', rope P, pulley *b*, and ear C, as herein described, for the purpose specified.

2. The bucket K, provided with the discharge spout *a*² in its bottom, and containing the angular valve lever *e'*, the valve *e* of which is held closed by the spiral spring, and opened to discharge the water by means of the projection N upon post A, fitting

beneath the arm a' of said lever, as herein shown and described.

3. The angular pivoted valve lever, in combination with the coiled spring, bucket K, ear C, and projection N, as herein described, for the purpose specified.

4. The grooved vibrating link I, in combination with the slotted ear C, curved bar H, curved arms b' , and bucket K, as herein described, for the purpose specified.

79,708.—CHARLES S. WATSON, Philadelphia, Pa.—*Low Water Indicator.*—July 7, 1868.—An oscillating vessel divided into two parts by a central partition, is placed within a stationary spherical receiver that is provided with a whistle, and has an open communication with the water in the boiler, so that the water runs out of the pipe and the receiver, and steam takes its place when the water in the boiler descends below the end of the pipe.

Claim.—1. The combination of the oscillating vessel C, constructed substantially as described, with the receiver A, lever D, and valve E, substantially in the manner above set forth, and for the purpose specified.

2. The construction of the part 2 of the oscillating vessel C with the valve F, to provide for the escape of air from the same, so that water may ascend into and fill it, as above described.

3. The combination and arrangement of the valve G with the part 1 of the vessel C and the bar H, substantially as and for the purpose set forth.

79,709.—GEORGE WEARE, Fitchburg, Mass.—*Surface File Handle.*—July 7, 1868.

Claim.—1. A surface file handle, composed of the bent or curved handle A F I, in combination with a clamping device for grasping the file shank in the manner described, so that the bent part I of the handle shall rest or bear upon the file in front of the point at which the handle is attached to the file, as and for the purposes set forth.

2. The combination of the base F, of the curved handle, and the clamp and its adjusting or tightening screw and nut held in said base, and covered by the horn or projection C, the said parts being constructed and arranged to operate as herein shown and specified.

79,710.—SAMUEL K. WELLMAN, Nashua, N. H.

—*Hydraulic Crane.*—July 7, 1868.—At the base of the revolving crane post is a projection, to the top of which is fitted a cylinder provided with a piston, which is fastened to the husk case or shell. The husk case is fitted to slide up and down the crane post. When the crane arm is to be used, water is pumped into the cylinder, thereby forcing up the piston, together with the husk case, crane arms, and the mass or bar of metal supported by the windlass.

Claim.—1. The combination, with the revolving post e , of the projection b , and the cylinder e , substantially as shown and described.

2. The combination, with the crane post and its husk case or shell, of the piston H and cylinder e , substantially as and for the purposes set forth.

3. The combination, with the tube B, attached to the lower end of the crane post, of the nuts 1, 4, knee a , and leather packing 5, said parts being arranged in relation to each other substantially as described, and as shown in Fig. 4 of the accompanying drawings, and for the purposes set forth.

4. The combination, with the part 11 of the carriage n and windlass S, of the cushion O' , as shown and described.

79,711.—E. I. WHITE, Locke, N. Y.—*Horse Hay Fork.*—July 7, 1868.

Claim.—The construction of the shank A, consisting of the cross bar a^1 , whose reduced ends are fitted rigidly in the tines D, and turn freely in the tines E, and whose arc, a^2 is provided with a slotted extension, a^3 , carrying the hoisting and tripping pulleys B C, all arranged as described for the purpose specified.

79,712.—JOHN H. WILLIAM, Essex, Conn., assignor to himself, THOMAS N. DICKINSON, and WILLIAM E. BEAMES.—*Manufacture of Floor Cloth.*—July 7, 1868.—The cloth after passing beneath the

roll is drawn between two sets of spring plates successively, the one set for scraping and evenly distributing the paint, while the other set serves to smooth and finish the surface.

Claim.—1. The spring plates C C, or their equivalents, for distributing the paint evenly over the surface of the cloth, and also remove the extra amount of the same, substantially in the manner and for the purpose specified.

2. The spring plates D D, or their equivalents, as a smoothing device, for the purpose of finishing the cloth, substantially as herein described.

3. The peculiar curve of the plates herein described, when in operation, constructed of springs, or their equivalents, to give the smooth and polished surface to the cloth as it passes through the machine, in the manner described and for the purpose specified.

79,713.—DEXTER B. WINGATE, Natick, assignor to NEEDHAM C. MILLETT, Salem, Mass.—*Apparatus for Printing on Glass.*—July 7, 1868.—A movable type block made of some firm elastic material is combined with suitable mechanical devices for printing upon unyielding irregular surfaces.

Claim.—Forming a type block of an elastic yielding material, and its use in combination with the adjustable ways H, adjustable gauge E, and lever L, operating in connection with the movable support C, for the purpose substantially as described and set forth.

79,714.—AURIN WOOD, Worcester, Mass.—*Machine for Threading Bolts.*—July 7, 1868.—The invention does not admit of a brief description.

Claim.—1. The arrangement, with the spindle B, head B' , and case F, of the cam ring G, arms G i , locking pieces I, and dies H, the parts being constructed and operating in connection with each other, substantially as and for the purposes set forth.

2. The notched stop or flanged collars $d e$, in combination with the cam ring D and arms i and G, the said parts being constructed and arranged in the manner set forth, to open and close threading dies, substantially as described.

3. The combination of the rod o with weighted lever t , arm 5, cam 29, and lever P, provided with arms x and 30, said parts being arranged for operation to stop and release the notched or flanged collars $d e$, substantially as and for the purposes described.

4. The cam 23, on the wheel 24, and the rod 22 working in the sleeve P'' , in combination with the spring stop, said parts being arranged to throw back the blank carriage after the threading dies are opened, substantially as described.

5. The rod o , weighted lever t , arms 5, cam 29, and lever P, with its arms x and 30, in combination with the connection P' , sleeve P'' , and notches or flanged collars $d e$, substantially in the manner and for the purpose set forth.

6. The combination of the spring 27, lever R R', wheel N, with rack, pinion, and the blank carriage, said parts being constructed and arranged substantially as and for the purposes set forth.

79,715.—DANIEL S. YEAKEL, Dillingersville, Pa., assignor to HENRY DEER and SOLOMON DEER, same place.—*Grain Separator.*—July 7, 1868.—To supports at the discharge end of the framing are attached a horizontal and a vertical spring, the upper end of the vertical spring being connected by a rod to the bottom of the screen.

Claim.—The swinging screen C, hung or suspended as shown, in combination with the springs D \times E \times , all arranged and applied in the manner substantially as and for the purpose set forth.

79,716.—JOHN H. YOCUM, Ashland, Pa.—*Stove Grate.*—July 7, 1868.—An aperture is made in the front edge of the grate, of sufficient size to admit of the passage through it of slag, slate, &c. Coal is prevented from falling through the aperture by means of a shield adapted to the purpose. Over the aperture is arranged a tube or flue to carry off the dust.

Claim.—1. The provision, in a flat or horizontal grate, or in a grate bottom, of one or more apertures e , as and for the purpose set forth.

2. The combination, with the aforesaid aperture or

apertures *e*, of one or more shields F, as and for the purpose specified.

3. Constructing a grate having one or more apertures *e*, with bars converging toward said aperture or apertures, for the purpose described.

4. In combination with a grate having one or more slag apertures *e*, the dust flue D, arranged and employed substantially as and for the purpose specified.

79,717.—PETER ZIMMERMAN, Delaware Water Gap, Pa.—*Device for Hanging Mill Stones.*—July 7, 1868.—To the bail, which is secured in the usual manner to the stone, is pivoted an auxiliary bail provided with bent arms having set screws at their lower extremities, by which the amount of oscillation on the main bail may be adjusted.

Claim.—The improved adjustable mill-stone hanging device, substantially as herein shown and described, and for the purpose set forth.

79,718.—F. S. ZUMSTEIN, Evansville, Ind.—*Heating Stove.*—July 7, 1868.

Claim.—An improved stove or heater, formed by the combination of the outer case A, having a close-fitting cover, B, upon its upper end, and an ingress draught opening in its bottom, air pipes E, interior furnace F, having a close-fitting cover, H, with an egress draught opening in it upon its upper end, and ingress draught openings, at its lower end, the egress-draught pipes M, L, and N, or their equivalent, and the water receiver, O, with each other, said parts being constructed and operating substantially as herein shown and described, and for the purpose set forth.

79,719.—HENRY A. ALDEN, Matteawan, N. Y., assignor to the NEW YORK RUBBER COMPANY, New York City.—*India-Rubber Base Ball.*—July 7, 1868.

Claim.—1. A base ball or other like ball having a center or core consisting of one piece, or of several pieces of cork, cemented together, said core being surrounded with the compound substantially such as is described in letters patent of the United States, No. 72,355, and the whole being united and vulcanized as set forth, the said ball being either provided or not with a cover of suitable material.

2. In a base ball formed of a vulcanized compound such as herein specified, the use of a wire-bound or twine or cord-wrapped cork core, substantially as and for the purposes set forth.

3. The combination, with a cork and rubber compound base ball, of a rubber covering or coating, united and vulcanized with the body of the ball, substantially as herein set forth.

79,720.—WILLIAM BALDWIN, Plymouth, Conn., assignor to himself, JOEL BLAKESLEE, of Plymouth, and E. BLAKESLEE, New Haven, Conn.—*Grain Rake.*—July 7, 1868.—A series of teeth, combined with a clamp, collect the grain in bundles so that the rake may be inverted, and the grain be put in a convenient position for binding.

Claim.—The combination of several teeth, C, and prongs G, arranged so as to gather the grain, with the supports E, extending above said teeth, the whole constructed and arranged so as to operate substantially as specified.

79,721.—T. D. BASSETT, Charlestown, Mass.—*Lathe for Screw Cutting.*—July 7, 1868.—To the end of the arbor which carries the burr cutter is coupled, by means of a universal joint, a splined shaft supported in bearings in a piece which is capable of yielding to the amount required by the movements and position of the cutter arbor. The cutter arbor has its bearings in a pivoted piece so as to give the proper inclination to correspond with the angle of the pitch of the screw threads to be cut.

Claim.—1. The combination of the jointed shaft *h*, burr cutter *e*, and its swinging frame *f*.

2. The combination of the elements last above mentioned with the weighted and sliding tool rest.

3. Arranging the dead center in the edge of the tail stock in the manner and for the purpose described.

79,722.—THOMAS L. BAYLISS, Richmond, Ind., assignor to THE AMERICAN PATENT CHROMATIC PRINTING PRESS COMPANY.—*Inking Apparatus for*

Printing Presses.—July 7, 1868.—Supply rollers attached to oscillating bars are arranged to be moved so as to permit the proper intermediate inking rollers to be brought into contact with their own supply roller, each one receiving its own peculiar color to be transferred to its own set of color strips, from which the colors are taken in bauds upon a type-inking roller and transferred to a single form from which the job is printed at a single impression.

Claim.—In combination with the oscillating slotted arms F, rollers B C D, springs *e*, and tripping collars I I', the rollers B' D', upright bars N, projections *u*, and spring *e'*, arranged in relation to one another, so as to operate substantially in the manner and for the purpose set forth.

79,723.—EDGAR B. BEACH, West Meriden, Conn.—*Oil Can Tube.*—July 7, 1868.—A valve is so arranged as to close the tube when the can is not employed for pouring the oil, in order to prevent evaporation.

Claim.—The herein-described tube, as an article of manufacture, consisting of the tube A, spout B, valve C with the head E, the said valve arranged in the tube A, in such relative position to the spout B as to open and close the spout, and all constructed and arranged in the manner set forth.

79,724.—JAMES R. BROWN, Boston, Mass., assignor to E. H. ASHCROFT, same place.—*Pipe Tongs.*—July 7, 1868.—An improvement upon his patent of Nov. 30, 1858. The tooth-jaw lever extends through a slot in the hook-jaw lever and abuts against the adjusting screw, and is provided with one or two shoulders to rest against the hook-jaw lever, a center pin for the tooth lever being dispensed with.

Claim.—The arrangement and combination of the hook-jaw lever A and the tooth-jaw lever B, when constructed as shown and described, and the latter is controlled by its shoulders *d*, the pin *f*, and the screw C.

79,725.—GEORGE H. BUCKIUS, Canton, Ohio., assignor to himself, C. AULTMAN, A. C. TONNER, and P. H. SOWERS, same place.—*Harness Ring.*—July 7, 1868.—The arms are designed to be sewed in between the rows of stitches at the sides of the leather, to which the ring is attached to prevent sliding of the leather around the ring.

Claim.—A ring, A, having one or more arms B arranged on its periphery, substantially as and for the purpose specified.

79,726.—HENRY BULLARD, Middletown, Conn.—*Handle for Tea and Coffee Pot.*—July 7, 1868.—The handles are so formed that the tips may be attached thereto without the intervention of any other material.

Claim.—Handles for tea and coffee pots, formed from hard rubber or similar material, and so as to be attached to the tips B and C, substantially in the manner herein set forth, as a new article of manufacture.

79,727.—WM. L. BURLINGAME, Leslie, Mich.—*Ladder.*—July 7, 1868.—Two ladders of ordinary construction are hinged at their upper ends so as to be convertible into a long extension ladder. A platform is so connected with the two parts as to admit of adjustment of the ladder to any required angle.

Claim.—1. The ladders B C, so arranged in relation to each other as to be able to be formed into one continuous ladder, by means of the rounds 2 and hooks 3, in the manner and for the purpose herein set forth.

2. In combination with the above, the removable platform A, when provided with hooked projection E, slots 4, and locking button D, all arranged and operating substantially as set forth.

79,728.—WILLIAM S. CARR, New York, N. Y.—*Water Closet.*—July 7, 1868.—The construction allows of a broader seat for the flange of the basin, and also for the introduction or removal of the swinging pan, whereby one joint is dispensed with, and the putty or packing needs to be applied only below the flange of the basin.

Claim.—1. The hopper or container *a*, contracted

at its upper end and adapted to receive the flange of the basin, in combination with the movable ring that forms a sufficiently wide bearing for the said basin flange, and allows for the introduction or removal of the swinging pan of the closet, substantially as set forth.

2. The ring *f* and hopper *a*, in combination with the swinging pan *d* and lug 7 upon said hopper *a*, and below the ring *f*, as specified, so that the concussion of the pan *d* in closing will be taken on said lug 7 and the ring *f* relieved, as and for the purposes specified.

79,729.—JUDSON A. CLEVELAND, La Fayette, Ind.—*Tool for Turning Shafting, &c.*—July 7, 1868.—Improvement upon a screw-cutting tool, for which a patent was granted to G. H. Wells, April 2, 1867, and consists in the adaptation of the stock to ordinary lathes either for cutting serews or turning shafting, each of the cutters being provided with set serews which, acting independently, may be used for adjusting the cutters separately, while the whole are fed simultaneously by a screw acting upon the rest.

Claim.—1. The combination of the rest D, stock B, and jaw C, the cutters G, and the set serews I, and lugs I', by which the cutters may be independently regulated in relation to one another, while the rest is adjustable, so as to move all the cutters simultaneously, substantially as described.

2. The stock B, when constructed as described, in combination with the rest D, adjusting serew E, and a series of cutters, G G, substantially as and for the purpose set forth.

79,730.—EDWARD R. COLE and HENRY S. COLE, Pawtucket, R. I.—*Steam Fire Engine.*—July 7, 1868.—The piston forms a movable partition between the top, bottom, and one side of the interior of the main cylinder, and the bottom and opposite side of the same. The suction or supply pipe is constructed in one piece with the eduction pipe between the air chamber and the pump. The suction pipe is elevated above the pump and continued so as to form a siphon, by which means the pump, after being started, is continually charged, and "pounding" is prevented.

Claim.—1. The pump cylinder A, constructed substantially as described, forming the chambers A A¹ and A A² by the interposition of plunger B.

2. The elevated induction pipe D D and eduction pipe C, connected substantially as described, for the purposes specified.

3. The arrangement of the siphon-formed induction pipe D D² in relation to the air chamber C C, water way D D, and operative parts A B and A A² and B B, all substantially as shown and described.

79,731.—J. M. COOK, Lake Village, N. H.—*Water Wheel.*—July 7, 1868.

Claim.—The water wheel B, having independent buckets L L, secured to the upper plate by inclined flanches *p p*, and formed with inwardly-curved discharge edges *l l*, downwardly-curved discharge edges *m m*, and curved connecting edges, substantially as and for the purpose herein specified.

79,732.—FRANKLIN A. CURTIS, East Saginaw, Mich.—*Water and Fire-proof Roofing Compound.*—July 7, 1868.

Claim.—The roofing compound, when composed of coal tar, wheat or rye flour, water-lime, and sand, mixed in a cold state, as herein described.

79,733.—HENRY T. DAGGET, South Braintree, Mass.—*Siding Boots and Shoes.*—July 7, 1868.—A sliding gauge is combined with mechanism for throwing it back while the sewing is progressing to a determined distance, corresponding to the difference between the distance at which the stitches on the counter should be run and that at which it is desirable to place the stitches between the top of the boot-leg and the counter.

Claim.—The combination of the gauge *f* with the mechanism for changing its position, substantially as and for the purpose set forth.

79,734.—OWEN DAVIS, Newton, Iowa.—*Bee Hive.*—July 7, 1868.—Over the inner box are ar-

ranged two "surplus" honey boxes. The larger comb frame is provided with pins or flanges on its sides to prevent the bees from mixing them together.

Claim.—1. The combination of the boxes A and D, boxes I I, and comb frames K, when the several parts are constructed and used as herein specified.

2. A comb frame whose sides are provided with vertical grooves, within which are inserted small frames L, that are provided with comb guides *e* and braces *c c*, substantially as shown and described.

79,735.—FREDERICK S. DE WITT, Rochester, N. Y.—*Swaging Machine.*—July 7, 1868.—On the inside of the dies are placed two rings, the lower one of which is beveled on its inner edge to contract or increase the size of the edge of the pipe. The other ring has a rim on its inner edge beveled to correspond with the bevel of the other ring. A transverse adjustable guide is placed between the swaging rings and the frame.

Claim.—The beveling sections D and D' of the swaging rollers C of tinners' tools, in connection with a gauge, H, arranged and operating substantially in the manner and for the purposes herein shown and described.

79,736.—ANDREW DIETZ, New York, N. Y.—*Process of Treating Glue.*—July 7, 1868.—The object of the invention is to render the cheaper and inferior kinds and qualities of glue equal to the better and higher grades or qualities.

Claim.—1. Treating glue with rosin or other proper resinous substance and petroleum or hydrocarbon or fixed oils, substantially as and for the purposes set forth.

2. Combining with glue, so treated and prepared, carbolic or wood acid, substantially as and for the purposes set forth.

79,737.—HIRAM DILLAWAY, Sandwich, Mass.—*Glassware Mold.*—July 7, 1868.—A hook piece on each section of the mold acts on the pipe to keep the bottom of the mold in a central position relatively to the side sections when they are fully opened.

Claim.—1. A sectional glassware mold-body, when constructed with a hollow hinge pin, so that water can flow from one section to another through said pin, substantially as described.

2. In combination with the bottom and side sections of a mold body, the hooks *i*, arranged to operate substantially as described.

79,738.—HIRAM DILLAWAY, Sandwich, Mass.—*Cooling Glassware Molds.*—July 7, 1868.—The water reservoir is attached to the body of the mold in such a manner that both will move together to and from the press, and so that the mold and reservoir may together be inverted without causing the water immediately to leave the reservoir.

Claim.—1. The combination, with a glassware mold body, of a water reservoir, in such a manner that the reservoir forms a part of the mold body, and moves therewith, without making and breaking the connection between the reservoir and the mold body at each impression obtained from the mold, substantially as described.

2. The combination, with a glass mold body, of a close reservoir, made with the coiled air tube, substantially as described.

3. A mold body, made with drilled passages *e d o*, connected by the trough-like passage *c*, substantially as described.

79,739.—GEORGE H. DOW, Freeport, Ill.—*Churn.*—July 8, 1868.—Angular beaters are so arranged as to throw the cream upward and downward, as they revolve. A saucer placed below the pinion serves to catch the dirt falling from the gearing.

Claim.—The beaters D as arranged, in combination with the shaft B, saucer J, and case, in the manner as and for the purpose set forth.

79,740.—JOSEPH J. DUCHESNE, Lacon, Ill.—*Harvester.*—July 7, 1868.—A curved slotted bar is arranged between a serew head and the end of the ferrule on the draught-pole, which may be clamped at any point to compensate for any lateral strain

upon the animals. A chain attached to the tongue may be employed for attaching a second pair of animals.

Claim.—1. The screw *a'*, in combination with the ferrule *a* and the slotted bar *b*, as and for the purpose set forth.

2. The chain *c*, in combination with the bar *b* and tongue *A*, as and for the purpose described.

79,741.—BENJAMIN F. EDMANDS, Boston, and JAMES HAMBLET, Jr., Charlestown, Mass.—*Escape-ment for Dial Telegraph Instrument.*—July 7, 1868.—Relates to a particular construction and arrangement of double escapement wheels actuated by suitable rigid and resilient pallets, in connection with an armature, so that the resilient pallets are relieved from strain, and the rigid pallets supersede the necessity of independent pawls or detents. The device is designed more particularly as an indicator for electro-magnetic telegraphs.

Claim.—1. An escapement, consisting of an escape wheel, having two rows or series of teeth, as described, and an arbor, which carries also an index impelled by a double set of pallets, one set being rigid and the other set resilient, or their equivalents, substantially as described.

2. The double pallet anchor, or its equivalent, with its suspension arbor, its attached pallets and armature or lever, as described.

3. The combination of the anchor pallets and pawl pallets, with the double escape wheel, as described.

4. The combination of an escapement, constructed as herein described, with a magneto-electric machine, or an electro-magnetic apparatus, or other motor, having the effect of causing a vibratory motion of the armature or lever *M*, substantially as herein set forth.

79,742.—MATTHEW FALCON, M. D., Bloomington, Ill.—*Syringe.*—July 7, 1868.—The inner end of the permanent nozzle is beveled and provided with a barb shoulder, which catches against and behind a shoulder formed in the elastic bulb.

Claim.—The piece *B*, made convex on its inner end, forming a shoulder, *a*, and provided with a flange on the outer part, which covers the neck of the bulb *A*, when arranged and used substantially as specified.

79,743.—ADDISON C. FLETCHER, New York, N. Y.—*Grate Bar.*—July 7, 1868.—The upper edges of the grate bar are constructed with points or rests by means of transverse recesses or air ducts communicating at their base with channels or ways of a reversely-tapering or diminishing form in the sides of the bars.

Claim.—1. The reduction of the fuel-bearing portions *a* of a grate bar by the formation of air ducts, *f*, therethrough, having communication with the main ducts *b* for the more thorough cooling and equalizing of the expansion of such portions, and increasing the air-heating surfaces, substantially as shown and described.

2. The combination of the passages *f*, the channels or ways *e*, and air ducts *b*, with the fuel points or rests *a*, all arranged substantially as shown and described.

79,744.—A. L. FLEURY, New York, N. Y.—*Apparatus for Dissolving Quartz and Extracting Metals.*—July 7, 1868.—The liquefier consists of an iron vessel mounted on a furnace and provided with a stirring apparatus, operated by a shaft and gearing. A steam electric apparatus is connected by its negative pole with the shell of the liquefier, and by its positive pole with the liquid and materials in the liquefier. The resulting gases escape by a pipe into an absorbing apparatus.

Claim.—1. The above-described apparatus for dissolving quartz or silicates, consisting of the furnace *A*, liquefier *K*, electric apparatus *Z*, tanks *f f*, and absorber *V*, arranged and operating as described.

2. The furnace *A*, with its fireplace *B*, furnace *P*, and trap *D*, when used for the purposes specified.

3. The liquefier *K*, as above specified.

4. The combination of the electric machine *Z* and the liquefier *K*, in the manner and for the purpose set forth.

79,745.—ORLANDO V. FLORA, Madison, Ind., assignor to himself, J. E. WITWER, and J. S. BOYLE.—*Single Harness.*—July 7, 1868; antedated June 28, 1868.—For attaching single harness to the thills of a vehicle and releasing the same in a simple and rapid manner. The attachment to the thills is made at or near the point where the hold-back strap is usually fastened, thus getting two bearings on the thills.

Claim.—1. So arranging the circular opening in the draught plate *E*, with a notch, extending forward at an angle of about forty-five degrees, that the draught bolt *C* may be passed through by rotating the plate vertically, and, when passed through, will form a fastening, for the purpose and in the manner as set forth.

2. Placing the draught plate *E* at or near the point where the hold-back strap is usually fastened, so as to allow an elastic bearing at that point on the shaft, while the other bearing of the shaft is arranged in the usual manner, for the purposes as described.

79,746.—M. B. FOOTE, Northampton, Mass.—*Fastening for Gloves.*—July 7, 1868.—A metal chain is attached to buttons, springs, and screws for fastening gloves to the wrist, and arranged in such a manner that the whole can be taken off one pair of gloves and applied to another.

Claim.—1. The combination of the button *B*, spring *C*, and screw *D*, arranged and operating substantially as and for the purposes herein set forth.

2. The combination of the buttons *B B*, metal chain *E*, and lever *F*, when the several parts are constructed, arranged, and used substantially as and for the purposes specified.

79,747.—CALEB FOSTER, Wappinger's Falls, N. Y.—*Enamelled Metal Comb.*—July 7, 1868.—The object is to provide, for the requirements of trade, a cheaper article, "which, though not so serviceable, still answers a purpose of commerce."

Claim.—A comb, of any other sheet metal than steel, and enamelled all over, so as to represent or imitate a material of which it is made, but of which combs generally are made, as herein described and represented.

79,748.—GEORGE GEER, Galesburg, Ill.—*Cherry Stoner.*—July 7, 1868.—An octagonal, rotating carrier receives the cherries in a single row from a trough, whence they are carried under a fork, a stripper holding the cherry in the recess until the fork rises out of it. The stones are pushed through holes in recesses of the receiver, and drop into a box.

Claim.—1. The rotating octagon carrier or receiver *D*, made and arranged and operating substantially as and for the purposes above set forth.

2. The stripper *L*, arranged with the cross piece *M*, and operating substantially as and for the purposes above set forth.

3. The arrangement of the spring *G*, receiver *D*, and stone carrier *F*, with the fork *E*, when constructed and operating as specified.

4. The arrangement of the cross piece *M*, fork *E*, and latch *H*, when constructed and operating as set forth.

79,749.—A. B. GLOVER, Birmingham, Conn.—*Nut Machine.*—July 7, 1868.—A combined forming and punching die cuts the blank from the bar, punches and partially forms the same, and combined with a crowner, operating independently of the punching dies, automatic fingers being employed to transfer the partially-formed nut to the crowner, whence it is transferred to combined rollers, which, as the nut is passed between, rolls all the edges, and is thence transferred by similar fingers to another crowner, which completes the nut.

Claim.—1. In combination with the hollow punch *f*, punch *h*, and die *a*, the crowner *g*, and the transfer finger *e*, all arranged and operating in the manner described.

2. In combination with the above, two or more rolls, *m* and *n*, with the follower *L* and guide pin *l*, arranged with the transfer finger *i*, so as to operate in the manner described.

3. In combination with the above, the crowner *g'*, arranged with the transfer finger *r*, so as to operate substantially as described.

4. In combination with the transfer fingers *cir*, the holding fingers 1 2 3, when constructed and arranged so as to transfer and hold the blanks, substantially as herein set forth.

79,750.—WILLIAM W. GOFF, Eagle Harbor, Mich.—*Channel Buoy*.—July 7, 1868.—Convex reflectors are placed upon the tops of buoys, which reflect the head light of a vessel passing into or out of a harbor.

Claim.—The reflectors B, when attached and operating substantially as and for the purposes herein described and shown.

79,751.—H. M. HALL and GEORGE W. ESPEY, Moore's Hill, Ind.—*Printing Press*.—July 7, 1868.—A movable clamp is connected with the platen in such a manner as to present the paper to the type and withdraw it when printed. A cam shaft, extending across the box, engages with hooks attached to the platen, to effect the pressing movement.

Claim.—1. The movable paper clamp G, when arranged as described, so as to receive the necessary movement from the raising and lowering of the platen.

2. The combination of the clamp G and fingers H, when arranged as described, for the purpose of holding the paper.

3. The combination of the cam shaft F and hooks E', for giving the impression to the paper, as set forth.

4. The combination of the clamp G, rod *h'*, and standard L, with the slotted hinged platen B, when arranged and operating substantially as and for the purpose described.

79,752.—DAVID HARRINGTON, Worcester, assignor to himself and S. A. WOODS, Boston, Mass.—*Lubricating Pulley*.—July 7, 1868.

Claim.—1. In combination with the hub of a loose pulley, an annular chamber, extending continuously around the hub, and opening all around into the bearing surface thereof, this chamber being cored out in casting, and being narrow at the bearing surface, and enlarging back therefrom, substantially as shown and described.

2. In combination with the oil chamber *c*, the lateral ducts, made shallow at their outer ends, and deepening and widening toward and into the main chamber *c*, substantially as described.

3. In combination with the main annular chamber *c* and the lateral duct or ducts, and end groove *h*, connecting with the lateral duct or ducts, substantially as shown and described.

79,753.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Elevated Railroad*.—July 7, 1868.—The track is supported on a column composed of two or more cylinders or tubes, by means of a frame fastened by draw bolts and keys, the ends of the transverse portion of the frame being turned up to clasp the rails.

Claim.—1. The construction and arrangement and adjustment of a supporting column, composed of two or more independent cylinders or tubes, substantially as described.

2. The combination of the several cylinders or tubes of the combined column, the frame J, in which the track rests, and the bolts or keys that connect said tubes and frame together, substantially as described.

3. The method of connection of the cylinders or tubes of the combined column to the base plate, by means of bolts or keys, substantially as described.

4. The construction and arrangement of the ends of the frame J upward or over the flanges of the track, to serve as a guard to confine the latter in place, with or without the wooden keys M, substantially as described.

79,754.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Elevated Railroad*.—July 7, 1868.—A frame composed of iron beams is placed below the sidewalk, (or embedded in the same,) the outer ends being deflected so as to pass under the curb stone, the object being to provide a support for the columns of elevated railroads over vaults, cellars, &c.

Claim.—The combination of a supporting column of an elevated railroad with beams E, to which it is

secured, and with the pavement or cover D, in such a manner that the column is supported above or over vault A, substantially as and for the purpose described.

79,755.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Mode of Propulsion and Construction of Elevated Railways*.—July 7, 1868.—The periphery of the driving drum is composed of a series of compressing cams hinged to the solid portion of the drum, the adjacent parts of the said cams overlapping each other, and so constructed to form a groove for the cable.

Claim.—1. The construction and arrangement of a driving drum having elastic ribs across its face, in combination with a propelling cable.

2. The construction and arrangement of a driving drum having compressing cams, in combination with a propelling cable operated by any stationary motor for railway or analogous purposes, substantially as described.

3. The construction of a driving drum with a central elastic cushion for receiving the impact of and imparting motion to a propelling cable for railway or canal transportation purposes, substantially as described.

4. The construction of the opposing surfaces of the compressing cams B with a series of corrugations or depressions for obtaining greater adhesion, substantially as described.

5. In combination with a driving drum for railway or analogous purposes, the construction and arrangement of intermediate adjustable frictional attachments to the stationary motor, substantially as described.

6. The open cable guide Q, substantially as described.

7. The arrangement of cable guides, and combining the same with a double track of a railway and a driving drum in such manner that an endless cable running therein will propel cars in opposite directions on the different tracks, substantially as described.

8. The construction and arrangement of anti-friction pulleys or rollers in the sides of a cable guide at points where the cable diverges from a straight line, substantially as described.

9. The flanges U, on the periphery of a driving drum, substantially as and for the purposes above mentioned.

79,756.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Railroad Car*.—July 7, 1868.—The car body is supported directly upon girders which are connected by saddle bars at each end of the truck frames, so as to allow the car body to be supported between the trucks instead of above them. A coupling arm is hinged to a collar which slides upon the coupling shaft, so as to yield when the car is pushed backward, but is prevented from swinging the other way by a shoulder.

Claim.—1. The arrangement of the coupling arm V of a car in such a manner that it will be automatically disengaged from the cable when the arm is moved beyond a certain point, substantially as described.

2. The construction and arrangement of car trucks or running gear of a car in such a manner as will admit of the placing or hanging of the car body between the trucks, substantially as described.

3. The combination of the girders, saddle bars H, and trucks, substantially as described and shown.

4. Hinging the coupling arm V in such a manner that it will swing upward, and allow the car to be moved in a reverse direction to the motion of a propelling cable, substantially as shown.

79,757.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Car Wheel*.—July 7, 1868.—A series of radial wooden blocks is arranged around the hub, the whole being held together by a flange projecting from the hub. The blocks are connected to each other and to the flange by means of bolts.

Claim.—1. The combination, with the wooden central body of a car wheel, of a removable metallic flange or flanges, substantially as described.

2. In combination with the above, the removable metallic tire *i*, substantially as described.

3. The combination of the central body of a car

wheel, as described, and the removable metallic tire *i*, with the elastic packing *k*, as and for the purposes set forth.

79,758.—JOSEPH HEALEY, Jr., Detroit, Mich.—*Stove Pipe Damper*.—July 7, 1868.—The damper is constructed with a central plate provided with side openings, by which the heat is impelled against the walls of the pipe to increase radiation.

Claim.—As a new article of manufacture, the stove pipe damper herein described, the same consisting of the central open plate *A*, the disks *F*, having an annular space *G*, and the columns *H*, when the parts are cast in one piece, substantially as specified.

79,759.—JOHN HIBELL, Neshells, England.—*Annealing Pot and Saucer*.—July 7, 1868.—The object of the invention is to avoid the production of scale on the surface of articles during the process of annealing, and also to heat the annealing pot rapidly and uniformly.

Claim.—1. The improvements in annealing pots for annealing iron and steel wire, sheet metal, and other articles hereinbefore described, and illustrated in the accompanying drawing; that is to say, making the said annealing pots of two concentric hollow cylinders, of different diameters, the space between the said hollow cylinders constituting an annular chamber in which the articles to be annealed are placed, the said annular chamber being exposed to the fire and heat, both on its outer and inner sides, substantially as described and illustrated.

2. The improvement or improvements in the saucers used for supporting annealing pots in the furnaces or muffles in which they are heated, hereinbefore described, and illustrated in the accompanying drawing; that is to say, making the said saucers with a double flange, by means of which the bottom of the annealing pot is protected from the injurious action of the fire, substantially as described and represented.

79,760.—LEWIS G. HOFFMAN, Albany, N. Y.—*Parlor Ice Creeper*.—July 7, 1868.—Made detachable so as to be easily removed on entering the house, to avoid injuring carpets, floors, &c.

Claim.—A detachable spur for an ice creeper, in combination with the plate *A*, or its equivalents, substantially in the manner and for the purpose above described.

79,761.—DAVID B. HOWELL, New York, N. Y.—*Means for Hanging Swords*.—July 7, 1868.—The tubular slide, to which the sword plate is pivoted, moves freely upon the suspending chain, and allows adjustment of the sword and scabbard to the motions of the body.

Claim.—The tubular slide *C*, pivoted to the frog or plate *D*, in combination with the suspending chain *B*, substantially as shown and described, for the purpose specified.

79,762.—WILLIAM W. HUBBELL, Philadelphia, Pa.—*Quartz Mill*.—July 7, 1868.—The pot, sections, and revolving nuts are so constructed as to adapt them to prepare and supply the hard quartz of gold and silver for two sets of reducing stones; the object being to economize the wear and expense of the material in the pot, in its reduction of the quartz by sections and increasing velocities.

Claim.—1. The opposite apertures *g g* and revolving arms *i'* operating in the lower part of the pot *e*, containing the nuts *c c'*, *d d'*, and plates *k j*, in combination with the two sets of stones *a a*, *b b*, and the opposite inclined conduits *p p*, elevators *s s*, *v v*, *r r*, hoppers *y y*, all constructed and arranged one with the other, as and for the purpose set forth.

2. The combination of the grinding plates *k j*, with concave interiors and angular exteriors, ribbed or thickened backs, and the pot *e*, when so secured together, by means of the saddles *l* and bolt *l'*, as to leave the angular spaces *x*, substantially as herein described.

79,763.—ROBERT H. JONES, San Francisco, Cal.—*Fireman's Extension Ladder*.—July 7, 1868.—Consists of a series of frames sliding vertically one within

the other, each frame being provided with a section of ladder. At the center of the frames is a series of vertical metallic telescopic tubes, the lower one of which is connected with a reservoir to be supplied with water from hydrants. Upon the upper platform is a rotating platform, so that any portion of the same may be brought in front of a window; to this platform is attached a metallic sliding drawbridge.

Claim.—1. The combination, in a fireman's extension ladder, of the sliding frames *A A*¹ *A*², with the sliding telescopic tube *I I*¹ *I*², substantially as above described.

2. In combination with the extension tube *I I*¹ *I*², the reservoir *J*, provided with several supply pipes *M M M*, substantially as and for the purposes specified.

3. The rotating platform *N*, when used in connection with a fireman's extension ladder, substantially as and for the purposes described.

4. The sliding bridge *V*, operated by the wheels *T Y*, when used in combination with a revolving platform *N*, substantially as and for the purpose specified.

5. The combination of the carriage *e* with the screws *z z*, by which it is adjusted to a level when standing upon inclined ground, substantially in the manner described.

79,764.—HENRY KRAUT, St. Louis, Mo.—*Apparatus for Atomizing Liquids*.—July 7, 1868.—Inside of a metallic vessel two tubes are arranged in such a manner that the pointed and pierced ends meet at right angles.

Claim.—The arrangement of the tubes *B* and *C* inside of the vessel *D*, so as to be protected from all external influences.

79,765.—ROBERT M. LAFFERTY, Three Rivers, Mich., assignor to himself, J. E. PRUTZMAN, and J. P. PRUTZMAN, same place.—*Preparing Cotton Seed for Planting*.—July 7, 1868.—The furze of the cotton seed is removed by instantaneous combustion effected by the ignition of gunpowder, or other similar explosive preparation, sprinkled among the cotton seed confined in any suitable vessel, after which the seed may be coated with any proper glutinous solution.

Claim.—The method of cleaning and preparing cotton seed for planting, substantially as hereinbefore described.

79,766.—CHARLES T. LAMPHERE, Greenfield, Mass.—*Eye Protector or Chip Arrester for Lathes*.—July 7, 1868.—A glass secured in a metal frame, arranged to turn in any direction, is attached to the lathe in such a manner that the chips cut from the metal will be prevented from flying into the face of the operator.

Claim.—An apparatus, constructed and arranged for use substantially as described, for protecting the eyes from chips or metal shavings and similar substances.

79,767.—J. P. THEODORE LANG, Washington, D. C., assignor to himself, E. H. ASHCROFT, Boston, Mass., and S. S. FAHNESTOCK, Washington, D. C.—*Screw Cutting Lathe*.—July 7, 1868.—Fastened to the carriage and gearing into the feed screw is a worm wheel connected by a stud with the governor. A slotted lever is pivoted to the carriage, having a hooked end which catches into notches in the governor, by which means mistakes in chasing over the same thread, and at the same operation, and also accidents, are prevented.

Claim.—The lever *L*, governor plate *H*, and worm wheel *G*, in combination with the feed screw *E*, as and for the purpose set forth.

79,768.—C. K. MARSHALL, New Orleans, La.—*Draw Bridge*.—July 7, 1868.—Movable cars or platforms are suspended by rods and form traveling trucks, which run upon rails laid on the top of metal tubes supported upon pillars, and which serve also as viaducts, by which means the crossing of streams is afforded to traffic and travel. The tubes are to be elevated sufficiently to allow vessels to pass under the same.

Claim.—The construction and arrangement of the

traveling trucks *a a*, with suspended platforms *E E*, when the same are supported, braced, and guided, as herein described, and combined with the tubular bridges *A A*, the whole supported on piers, in the manner and for the purpose herein described.

79,769.—JOHN H. MCGOWAN, Cincinnati, Ohio.—*Tobacco Press.*—July 7, 1868.—The band which surrounds the box casing is secured at its ends by a hinged bolt which passes into slotted ears, and is secured by a wedge-shaped key.

Claim.—The ears *D D*, provided with the slots *e e*, in combination with the swing bolt *E* and key *I*, or swing bolt *F* and collar *H*, connected, arranged, and operating substantially as described.

79,770.—BENJAMIN F. MILLER, New York, N. Y.—*Pavement.*—July 7, 1868.—Prismatic sleepers are laid with their angles forming ridges, between which the lines of blocks are placed, so that each block may have a bearing upon two sleepers.

Claim.—The prismatic sills, laid as specified, and receiving the block superstructure, substantially as set forth.

79,771.—WILLIAM S. OBORNE, Marion, Ohio.—*Cider Mill.*—July 7, 1868.—The plunger rods are connected to a press beam which is raised and lowered by means of screw posts operated by suitable gearing, together with appliances for elevating the platens, end gates, and sleepers.

Claim.—The press beam *D*, plunger rods *b'*, screw posts *E*, screws *E²*, and swivel nuts *D'*, all arranged and operated substantially as herein set forth.

79,772.—WILLIAM M. PALMER, Middlebush, N. J.—*Water Elevator.*—July 7, 1868.—The lower cylinders are loose upon the shaft and are made to turn alternately with it by means of a shifting clutch, so that by turning the winch continuously in one direction and shifting the clutch from one cylinder to the other, the buckets will be drawn alternately to the top of the well.

Claim.—The combination of the cylinders *D* and *D'*, the shaft *G*, and clutch *H*, with the cylinders *E* and *E'*, and shaft *L*, and clutch *K*, and ropes *F* and *F'*, for alternately raising and lowering the buckets *B* through a distance that may be adjusted as required, by the continuous revolution of the shaft in one direction, substantially as set forth.

79,773.—PHILIP PENINGTON, Union City, Ind.—*Churn.*—July 7, 1868.—Two horizontal arms having upright staves with horizontal semi-circular dashes attached to them are made to revolve in opposite directions, and are arranged to be taken out and put in at pleasure.

Claim.—The combination of the dashers *E F* on the movable arms *D D*, having recesses *c e*, and slides *e e*, for securing to the journals *d d* in the churn *A*, to operate as set forth.

79,774.—D. H. PRIEST and H. S. WOLCOTT, Boston, Mass.—*Fastening the Lining to Soles of Boots and Shoes.*—July 7, 1868.—Upon the outer surface of the last at the edge of the sole is a yielding facing or rim supported by springs or otherwise. Attached to the side brace is a lever provided with an adjustable gauge so that when brought down upon the rim the latter is pressed down even with the surface of the sole.

Claim.—1. The automatic facing or rim *e*, operated by the springs *d, e*, and *f f*, or their equivalents, in combination with the last *b*, for the purpose of protecting the lining, substantially in the manner specified.

2. The combination and arrangement of the lever *g*, with its adjustable plate *j*, and the parts *i h*, and *B*, for the purpose of operating upon the rim *e*, substantially in the manner specified.

79,775.—EDMUND W. QUINCY, Lacon, Ill.—*Corn Harvester.*—July 7, 1868.—Consists of a mechanism for gathering ears of corn from stalks in the field, and shucking the same at one operation.

Claim.—1. The brace board *k*, applied to a corn-harvesting machine, substantially as and for the purpose described.

2. The elevating and gathering apparatus, constructed as described, when applied in combination with the brace board *k* to a corn-harvesting machine, substantially as and for the purpose described.

3. The combination of the shucking with the gathering apparatus, the former consisting of the spout *m* with its endless apron, said apron having prongs *m'*, and the plate *u*, with its stripping orifice *n'*, said orifice being made capable of accommodating itself to ears of different sizes, as and for the purpose set forth.

4. The buckets *h*, when constructed with their front sides higher than their rear sides, as and for the purpose described.

5. The vertical rollers *l*, in combination with the brace boards, as and for the purpose described.

79,776.—A. C. RAND, Westfield, Mass.—*Whip Holder.*—July 7, 1868.—A base of wood or other material is provided with bows of whalebone or other elastic material so arranged as to grasp and securely hold the lash of a whip when struck against the same.

Claim.—The combination of the base with the springs bent in the form of bows, as described and secured therein, all constructed and operating substantially as described, and for the purposes herein set forth.

79,777.—JOSIAH M. REED, Boston, Mass.—*Boot Crimper.*—July 7, 1868.—Designed as an improvement upon a device patented to J. Copeland, January 20, 1844. The sides of the pyramidal block are formed with teeth instead of making such teeth upon the clasp, in order to prevent injury to the leather.

Claim.—A boot crimper, composed of the jawed clasp, the screw, and the pyramidal block, with the retaining teeth formed upon the latter, essentially as herein shown and described.

79,778.—ALMON ROFF, Southport, Conn.—*Adjustable Spring.*—July 7, 1868.—To increase or diminish the tension of the spring, a central pin and bolt are moved through a partial revolution, and the spring is held by ratchet and dog under greater or less tension as may be desired.

Claim.—The adjustable spring *A*, provided with a ratchet and dog, for increasing or diminishing its tension, substantially in the manner and for the purpose set forth.

79,779.—ISAAC RORABACK, South Bend, Ind.—*Harness Buckle.*—July 7, 1868.—The tongue is secured between the sides by a roller, the sides being connected to each other by cross plates, upon which latter is introduced a filling which serves to clamp the tug and trace more tightly.

Claim.—The sides *D*, provided with inclined slats *E*, cross plate *F*, and filling *C'*, as arranged, in combination with the tongue *G*, and roller *H*, in the manner as and for the purpose specified, as a new article of manufacture.

79,780.—LEWIS ROTH, Newark, N. J.—*Umbrella.*—July 7, 1868; antedated July 2, 1868.—An additional brace is arranged above the usual brace for additional strength.

Claim.—The arrangement of the brace *B*, extending from the thimble *E* to the arm *A*, above the regular brace *I*, in the manner and for the purpose named.

79,781.—STEPHEN P. RUGGLES, Boston, Mass.—*Rotary Fluid Elevator.*—July 7, 1868.—The float wheels are so arranged that one of the floats of one of the series shall act as a cut-off at or in the space between the float wheels, so that no communication is had between the under and upper portion of the box or case, except what is had by the floats themselves.

Claim.—The combination, in one case or box, of two float wheels that move one before the other and then both together, for the purpose of passing air, gas, or water through the case in one direction only, and prevent it from flowing back, substantially in the manner and for the purpose set forth.

79,782.—EMILY S. RUSSELL, Plymouth, Mass.—*Toy House.*—July 7, 1868.—A doll may be slid be-

tween the sheets, and by means of a wire or a strip of card attached to it may be made to move from room to room.

Claim.—A toy house, made of two thin sheets of material secured together, the outer sheet having swinging doors and blinds, concealing or disclosing representations of apartments on the inner sheet, and the space between the sheets being adapted to the movements of a doll, *n*, substantially as described.

79,783.—JAMES M. SEYMOUR, Newark, N. J., assignor to himself and DANIEL WHETLOCK, same place.—*Mitering Machine.*—July 7, 1868.—Attached to the frame are two additional arms projecting back of and parallel to the knives. A double clasp slides upon the arms, through which passes the stem of an adjustable support, the foot of which is adjusted to the under side of the rebate of the molding, and on a line with the knife.

Claim.—1. The adjustable foot *b*, stem *H*, double clamp *G*, and the arms *F F*, when combined with a miter machine in the manner and for the purpose specified.

2. The adjustable foot *b*, when constructed to move on the line of the edge of the knives, and close thereto, as specified and shown.

79,784.—EDWARD SNYDER, Slatington, Pa.—*Machine for Polishing Slate.*—July 7, 1868.

Claim.—1. The smoothing machine herein described, having two or more pairs of polishing wheels, revolving in opposite directions, and mounted one above the other, so that the slates may feed through the series by gravity, all substantially as and for the purposes herein set forth.

2. In such machine, automatically increasing and diminishing the distances apart of the polishing surfaces, so that the machine is self-adjusting for each thickness of slates, substantially as and for the purposes herein set forth.

79,785.—GEORGE B. STEVENS, Pluckemin, N. J.—*Sleigh Brake.*—July 7, 1868.—Two pieces of iron fitting over the cross brace are turned up in front to form sockets, in which the rod that holds the drag bar turns. Metal plates are secured to the uprights and side pieces, against which the bar bears when the brake is in operation.

Claim.—1. The combination, with the turning rod *D*, of the open bearings, constructed and applied to the cross brace *B*, as and for the purpose set forth.

2. The arrangement of the open bearings, the flanged turning brake rod, and the plates *G* beneath the side pieces, as described.

79,786.—MICHAEL SWEENEY, Wheeling, W. Va., assignor to SWEENEY, BELL & COMPANY, same place.—*Glass Pressing Machine.*—July 7, 1868.—Strong blasts of air are applied to the plunger, and also to the surface of the molds, for the purpose of keeping them at a uniform temperature, preventing the formation of a shell, and effecting the easy delivery of the glass.

Claim.—1. The combination of a machine for pressing glass and a pressure blast, the tubes leading from which are so arranged that cold-air currents, generated by the blast, shall be directed against the surfaces of the pressing mechanism, substantially as and for the purpose set forth.

2. So arranging the pipes *M* and *N*, leading from the pressure blast *I*, as to direct the currents of air to the mold *G*, and against the plunger *C*, substantially in the manner set forth.

79,787.—OTIS A. TEFFT, Plattsburg, assignor to JOSEPH FRAZIER, Clinton County, N. Y.—*Sharpening Saws.*—July 7, 1868.—The device is composed of two frames, one oscillating upon trunnions, and the other adjustably connected to it, so that it may be partially rotated backward and forward, the latter frame being provided with a grindstone or polishing wheel.

Claim.—The rod or shaft *M*, provided with crank *Q* and spiral spring *N*, in combination with bar *P* and frames *B* and *G*, all constructed and arranged to operate as described, and for the purposes specified.

79,788.—E. LAWRENCE TEVJS, Philadelphia, Pa.—*Shoe Hook.*—July 7, 1868.—For buttoning shoes. A bifurcated jaw takes hold of the button underneath, and lifts it through the button hole without exerting any strain upon the button hole or the button itself.

Claim.—A shoe hook, constructed and operated for the purpose and in the manner above described and set forth.

79,789.—ORISON TWOMBLY, Holderness, N. H., and WILLIAM NOYES, Jr., Newburyport, Mass.—*Knitting Machine.*—July 7, 1868.—The needle cylinder is provided at its base with a screw thread fitting within the bed plate, and on the inner side of the shell gear is a cam so arranged that by screwing the needle cylinder in and out from the bed plate, the former will be raised or lowered, causing the needles to form longer or shorter stitches in the work as desired.

Claim.—1. The needle cylinder *D*, provided with a screw thread, *D'*, in combination with the cam *C*, screw *S'*, and bed plate *A*, constructed and operating substantially as and for the purpose specified.

2. The needle cylinder *D*, provided with a screw thread, *D'*, in combination with the reversible cam *C*, slotted thread-guide *E*, screw *S'*, and bed plate *A*, substantially as and for the purpose set forth.

79,790.—GEORGE W. WAITT, Philadelphia, Pa.—*Manufacture of Desiccated Cocoa-Nut.*—July 7, 1868.—Designed as an improvement on the process of Maltby and Smith, patented June 25, 1866. The rasped or grated kernel of the cocoa-nut is first deprived of its moisture and the heated granules are then coated with pulverized white sugar.

Claim.—The improvements in the mode of desiccating and preparing the meat of the cocoa-nut, substantially as described, and for the purposes set forth.

79,791.—R. WARD, Edinburg, Ind.—*Smut Mill.*—July 7, 1868.—A triple suction separator is combined with a smut mill and riddle, by which the separated grain passes through one suction pipe into the smut mill, thence through a second and third suction pipe, and out of the machine.

Claim.—The smut mill, with drum *L*, constructed as described, with chamber *M*, suction pipes *N* and *O*, and the fan in the drum *R*, with their various parts, all constructed, arranged, and operating substantially as and for the purposes specified.

79,792.—THOMAS WATSON, Brooklyn, N. Y.—*Device for Operating Shutters.*—July 7, 1868.—A sliding lever with one end inside of the window is pivoted in a circular block fitted in a recess in the window, and connected with a vibrating lever pivoted to the window sill, the said latter lever being attached to a rod or guide on the shutter, so that the shutter may be readily opened or closed from the inside of the window.

Claim.—1. The combination of the sliding lever *d*, the turning socket *e*, locking pin *f*, and the vibrating lever *c*, with the guide *b* on the shutter and window sill, all arranged and operating substantially as shown and described, and for the purpose specified.

2. The combination with a window shutter or blind, of the stop-pin *f*, with the sliding lever *d*, and the turning socket *e*, substantially as and for the purpose specified.

79,793.—SAMUEL WEHRLY, San Francisco, Cal.—*Spur.*—July 7, 1868.—Attached to the sides of the band which encircles the heel and holds the spur is a sliding plate provided with a slot. By means of graduated holes and a pin attached to the end of a spring, the spur may be readily adjusted to the boot of the rider.

Claim.—The graduated holes *b b b*, or their equivalents, in the sides of the band *A*, and the pin *c* near the end of the spring *E*, for adjusting the spur to the heel, substantially as described.

79,794.—SAMUEL WHITMARSH, Northampton, Mass.—*Composition for Forming Molded and Coated Articles.*—Antedated June 27, 1868.

Claim.—1. The combination of blood with asbes-

tos, for the production of a composition applicable either in a liquid or solid form, substantially as described.

2. A composition, made up of blood and mineral or earthy matter, mixed or ground together, and afterward exposed to a temperature of 350° Fahrenheit, or thereabouts, to give to it a hard and water-proof character, essentially as herein set forth.

79,795.—H. B. WILLOUGHBY, Ottawa, Ill.—*Mop Wringer*.—July 7, 1868.—The levers are so arranged that the rollers of the wringer may be opened sufficiently to remove the vessel from between them. The wash vessel is held in a hoop a short distance from the floor.

Claim.—The combination of the levers J K E, braces H G, supports F F, treadle D, frame A, hoop B, with rollers L L', the latter being arranged to open and close over the top of a wash vessel, as and for the purpose herein shown.

79,796.—ELIAS WOODWARD, Brooklyn, N. Y.—*Fastening for Neck-Tie*.—July 7, 1868.—A detachable fastening for a bow, &c., is formed with penetrating points that hook into the material of which the bow is formed, in combination with an elastic connection between such a hook and a hook that is adapted to connect the scarf to the collar.

Claim.—The detachable fastening for a bow or scarf, formed with penetrating points *a*, elastic connection *d*, and hook C, combined and arranged as described.

79,797.—WILLIAM YATES, Canton, Ohio, assignor to C. AULTMAN, A. C. TONNER, P. H. SOWERS, and GEORGE H. BUCKIUS, same place.—*Harness Ring*.—July 7, 1868.—The base is designed for rendering the ring ornamental, and the arms prevent the straps, which are attached to the ring, from slipping around.

Claim.—A ring, A, having a base, B, arranged in its interior by means of one or more arms, C, substantially as and for the purpose herein specified.

79,798.—W. H. YOUNG and L. YOUNG, Boston, Mass.—*Caster for Trunk*.—July 7, 1868.

Claim.—The revolving shank *e*, with its head *d*, the shoulder *c*, and the roller *f*, combined and arranged with socket *b*, the serew *g*, and the strip *h*, substantially in the manner and for the purpose above set forth.

79,799.—JOSEPH I. BEAUMONT, St. Paul, Minn.—*Air Escape Funnel*.—July 7, 1868.—A small funnel is arranged within a larger one and a space left between the two, closed at the top of the inner funnel. Small holes are made in the outer funnel above and below, to permit the escape of air from the vessel being filled.

Claim.—The combination of the inner funnel B, having thereon the wire rods *b*, with the outer funnel A, containing the apertures *c* and *d*, the whole being constructed and arranged in the manner and for the purposes substantially as herein described and set forth.

79,800.—ANDREW A. ABBOT, Boston, Mass.—*Fastening for Boots*.—July 14, 1868.—The shoe or garment to which the spring button and eyeleted button-hole are applied may be readily fastened or unfastened, as the button yields to permit the eyelet to pass over it, and expands to retain the eyelet.

Claim.—The within-described fastening, consisting of the spring button C, in combination with an eyelet, B, or its equivalent, substantially as described.

79,801.—ALONZO WHITNEY ADAMS, New York, N. Y.—*Self-Locking Bolt for Meter Safes*.—July 14, 1868.—This bolt, with its expanding catches, is intended to afford a means of securing the meter within the safe, and prevent it from being tampered with, until the proper authorities shall render it accessible by opening the safe, which is done by the employment of the necessary violence.

Claim.—1. The bolt A and the devices attached thereto, or equivalents, as shown and described.

2. The safe or guard casing, with its devices

thereto attached, or equivalents, as shown and described.

3. The combination of the bolt A with the safe or guard casing, as represented in the specifications and in Fig. 4 of the drawings, or any equivalent for the same.

79,802.—WILLIAM ATWOOD, Cape Elizabeth, Me.—*Machine for Separating Light from Heavy Particles of Litharge, Paint, &c.*—July 14, 1868.—The hollow rotating drum is somewhat inclined, so that while the light particles are blown through the opening near the feed spout, the heavy particles are discharged through a second spout at the lower end of the drum.

Claim.—1. The combination of the fan wheel *f*, tube *g*, and rotating drum *b*, as and for the specified purposes.

2. The combination of the spout *a* with the rotating drum *b*, as and for the purposes set forth.

3. In combination with the fan wheel *f*, tube *g*, and drum *b*, all operating as described, the deposit chamber *h*, for the purposes described.

4. Separating the finer from the coarser particles of litharge, &c., by means of a current of air forced through a rotating drum, &c., and carrying the said finer particles into a deposit chamber, substantially as described.

79,803.—JOHN S. BARDEN, Providence, R. I., assignor to himself and DANIEL N. PICKERING, Boston, Mass.—*Rotary Steam-Engine*.—July 14, 1868.—A semi-rotative engine, the shaft of which has an axially-reciprocating movement, so as to work the two pistons of a double-acting pump. The stems of the valves extend down into the sectoral chambers, so as to be raised alternately by the oscillating pistons, for the purpose of opening and closing the induction and eduction passages and reversing the movement of the parts. The purpose of the faucet and its branch passages is to free the piston chambers of the water resulting from the condensation of steam.

Claim.—1. As my invention, the combination consisting of the two sectoral chambers *c c*, the oscillating pistons C D, the shaft D, the cylinder *d*, the reciprocating valve-piston G, its cylinder F, and tapped or stemmed valves *b¹ b¹*, arranged and provided with steam passages of induction and eduction, the whole being substantially as and so as to operate as described.

2. The arrangement of the steam passages *f g* with the pistons C D, the cylinder *d*, and the shaft B.

3. The arrangement and combination of the faucet E, and its branch passages *k k*, with the steam chambers *c c*.

4. The arrangement of the valves *b¹*, the rods *c¹* thereof, and their passages *a³ b³*, so as to effect "cushioning" of the valve piston G by the steam, under circumstances as set forth.

5. The valve piston G, constructed of the shell *r* and body part *q*, made and arranged together as set forth.

79,804.—JOHN L. BEERS, MeAlisterville, Pa.—*Scroll for Water Wheels*.—July 14, 1868.—By means of the tongue the throat may be made larger or smaller, according to the amount of water required. In shutting off the water the gate is first closed, thereby relieving the tongue of pressure, so that the inner bar may be closed.

Claim.—The arrangement of the gate D and bar C with the adjustable tongue B and the throat A, as and for the purpose specified.

79,805.—WM. P. BLADES, Baltimore, Md.—*Car Brake*.—July 14, 1868.—This mode of suspending the brake is designed to cause the entire breaking surface of the shoe to press equally upon the wheel.

Claim.—The brake block B, constructed with the slotted cavity, in combination with the supporting bolt D, made with a neck or bolt to pass through brake bar, and when pivoted to the block by the same link which supports the whole, substantially as described.

79,806.—GEORGE W. BOWLSBY, Monroe, Mich.—*Revenue Stamp*.—July 14, 1868.—The stamp is divided up into sections of different colors, and for

different purposes, more or less related to each other, and used at different times and places, by different persons, for the collection of revenue on commodities, said sections of the different colors and other varying features (though used at different times and places) being used upon the same individual parcel, cask, or package.

Claim.—1. A blank stamp, having no fixed value while in the hands of the government, until the inspector has estimated the tax, through the proper means, and has entered the amount upon the face of the stamp, for a specific package, the value of the stamp depending mostly upon said estimate, and partly upon the class name of the stamp.

2. A stamp made, and the value fixed by the government, for a particular individual package, as shown in Figs. 2, 3, 4, 5.

3. A stamp made in separate and independent sections, mechanically, substantially as described, for the purposes named, or for other similar purposes.

4. A stamp, the mechanically independent sections of which are of different colors, for the purposes named.

5. Making the different sections or portions, as described, of the same stamp vehicles for the necessary entries of inspection and reinspection, and continuing and carrying a history on their face of the movements, ownership, duty, proof, weight, measure, and (or) other matters of record pertaining to the article taxed, as an ever present means of detection, an auxiliary in reinspection, and also a partial cancellation.

6. A stamp whose sections have duplicate and corresponding entries upon their faces, to be separated, substantially as and for the purposes described.

7. The numbering of the different stamps, and also the sections of the same stamp, by various series, for further means of detection, reference, cancellation, record, and identification.

8. The entry of official countersignatures upon the face of the stamp and its sections in successive series, or by intermediate steps, for the purposes named.

9. The continuous cancellation of the stamp by the process described.

10. The final resumption of the stamp coupons, and then of the stamps proper, by the government.

11. A stamp whose face history is connected with an official book record at the home office, and also with the inspectors or assessors' book, for the purposes specified.

79,807.—ALBERT BROWN, Troy, N. Y.—*Hot Water Tank on Cooking Stoves.*—July 14, 1868.—The division plate in the horizontal flue of the reservoir has a damper, the closing of which diverts the direct draught in a downward direction through the descending flue of the reservoir, which has also an ascending flue leading to the exit.

Claim.—1. A hot water reservoir, having a descending or driving flue therein, substantially as and for the purpose herein specified.

2. The projecting horizontal flue E, for forming a connection between the stove and reservoir flues and exit pipe thereof, substantially as set forth.

3. The suspension of the reservoir by the stove-pipe projection or thimble, substantially as described and as represented in Fig. 1.

4. The boiler hole or holes *g* over the flue space E, in combination with the hot water reservoir, substantially as set forth.

79,808.—H. H. BRYANT, Boston, Mass.—*Fire-proof Safe.*—July 14, 1868.—Water or other liquid is employed within the door and walls of the safe for the purpose of preventing the place of deposit from becoming heated to such a degree as to injure anything contained therein. The improvements provide for the escape of steam, under a certain pressure, to obviate explosion; also for the entrance of air to prevent a vacuum.

Claim.—1. The combination of one or more vessels, adapted for containing a liquid suitable for generating steam, with a safe which has its chamber of deposit made steam-tight against the steam which is generated from the water in said vessels, substantially as and for the purpose herein described.

2. The arrangement of water or fluid vessels with steam valves, applied either within the door of the

safe, or immediately around the receptacle E, or both within the door and around said receptacle, substantially as and for the purpose described.

3. Providing the water vessels with air valves, substantially in the manner and for the purpose described.

4. The combination of both air and steam valves with the water vessels applied to a safe, substantially as and for the purpose described.

5. The arrangement of the valves in or on the water vessels or chambers in such a manner that some of the valves will operate, in whatever position the safe may assume during a fire, substantially as described.

6. The combination of water or other fluid with a solid absorbent substance, as a filling for a vessel or a chamber used in a safe or other similar fire-proof structure, substantially as and for the purpose described.

79,809.—HEZEKIAH H. BRYANT, Boston, Mass.—*Fire-proof Structure.*—July 14, 1868.—The pipes are so arranged as to conduct off the steam from the liquid receptacle, be the latter in any position whatsoever.

Claim.—In combination with a safe or other structure of a similar nature, the use of one or more vessels or chambers, used as steam or vapor generators, that are provided with a suitable number of pipes, arranged substantially as and for the purpose set forth.

79,810.—ALBERT CARTER, Forrestville, Conn.—*Machine for Attaching Spangles to Hoops of Skirts.*—July 14, 1868.—Conductor for supplying machines which apply to tapes the small clasps or spangles whereby the tapes are held to the hoops of skeleton skirts. The devices claimed effect the separation of the clasps, which may be presented in the wrong position, from those which are properly presented, and thus obviate obstructions to the operation of the machine.

Claim.—The swinging gate *c*, with its end inclined upward, in combination with the inclined assorting plate *a*, opening *e*, and fence *b*, substantially as and for the purposes specified.

79,811.—BENJAMIN I. CREW, Philadelphia, Pa.—*Mustard Plaster.*—July 14, 1868.—By the preparatory removal of the fixed oil, the active principle of the mustard is retained in a condition which does not induce fermentation and rotting. Prior to application the plaster is steeped in water to develop the active properties of the mustard.

Claim.—A plaster, composed of mustard deprived of its fixed oils, and mixed with a solution of India-rubber, or other material insoluble in water, as set forth.

79,812.—JAMES DAMPMAN.—Lebanon, Pa.—*Railroad Switch.*—July 14, 1868.—Under this construction and arrangement the switch cannot endanger a train passing over it, whether it be adjusted for the main track or siding.

Claim.—1. The bent switch-rail C¹ C², and straight rail C, in combination, when the former has the tapering section N applied to it by means of rods *f f* and springs *e e*, and the latter has the frog P' and pointed rail extension P applied to it, all substantially in the manner and for the purpose described.

2. The frog P', and pointed rail extension P, constructed and adapted to serve the purposes substantially as described.

3. The switch rod *b*, constructed with removable shoulders *j j*, and with removable gripping-jaws *j'*, and screw threads and retaining nuts, substantially as described and shown.

79,813.—LEVIS H. DAVIS, Newark, Del., assignor to CASHO & COMPANY, same place.—*Grain Separator.*—July 14, 1868.—The shaking screen in its backward movement descends closely to the grain board, thus causing the rakes to draw the grain forward to the opening, through which it is discharged into the shoe. The heavy and light grain, respectively, pass into the two troughs to be conducted into separate receptacles.

Claim.—1. The longitudinally vibrating stair-

shaped screen F, provided with rectangular perforations *f* in the riser of the stair, as and for the purpose set forth.

2. The combination, as set forth, of the longitudinally vibrating, stair-shaped, rectangularly-perforated screen, with the ratchet ribs *c*, whereby the straw escapes backward and the grain forward.

3. The combination, substantially as set forth, of the stair-shaped perforated screen with reciprocating rakes G, which return the grain to the front of the machine after passing through the screen.

4. The combination, substantially as set forth, of the threshing cylinder, longitudinally vibrating, rising and falling stair-shaped perforated screen, and reciprocating rakes, with the fan and second longitudinally vibrating shaking shoe, for the purposes specified.

5. The combination, as described, with the fan, of the shoe H, troughs *k*¹ *k*², and adjustable back board K, for the purposes set forth.

79,814.—GEORGE DICKERSON, Harveysburg, Ohio.—*Corn Planter*.—July 14, 1868.—The seed-dropping mechanism is operated by one of the wheels of the machine, and the invention has reference to the devices for actuating the seed-slide, and to the means by which the covering shares, covering roller, and seed tube are properly secured and adjusted.

Claim.—1. The general arrangement of the bracing and adjusting bolts P *c* *e'* and S, sheath B, tube K, covers D D, and roller E, all constructed and employed as described.

2. In combination with the above parts, the relative arrangement of the horizontal trigger L, retracting spring N, and cam-wheel H *h* *h'*, when constructed as specified.

79,815.—EDWARD P. DICKIE, Morristown, N. J.—*Picks and Pick Axes*.—July 14, 1868.—The point of the pick is twisted, that its effect in loosening the earth may be increased.

Claim.—The twist-pointed pick or pickaxe herein described.

79,816.—HORACE M. EDSON, Mount Vernon, Ohio.—*Closing Vulcanizing Flasks*.—July 14, 1868.

Claim.—The screw, of brass or other suitable metal, which screwed down through a nut in the top of a vulcanizer, will close the flasks inside of the vulcanizer, as above described, and the steam-tight packing box around the screw, to prevent the steam from escaping from the vulcanizer during the process of vulcanizing.

79,817.—LEVI S. ENOS, Almond, N. Y.—*Stove Pipe Damper*.—July 14, 1868.—The serrated latch, by engagement with the plate through which it passes, holds the oval plate damper in position as desired.

Claim.—The serrated latch C, as constructed and arranged, in combination with the oval plate damper B, substantially as and for the purposes herein set forth.

79,818.—SAMUEL FARRENBURG, Taylorsville, Ind.—*Tool Sharpener*.—July 14, 1868.—The movement of the cranks and pitman rods gives to the grindstones a horizontal reciprocating motion upon metallic bed plates.

Claim.—1. The arrangement of the wheel E, cranks F F, pitmen G G, stones H H, slides I I, rests L L, and binders M M, upon the table A, and operating as set forth.

2. The adjustable rest L and binder M, for supporting the tool to be sharpened, substantially as and for the purposes above set forth.

3. The rest N, against which the person working the machine may lean, substantially as and for the purposes above set forth.

79,819.—A. L. FLEURY, New York, N. Y.—*Electric Machine*.—July 14, 1868.—In this apparatus a current of steam rushes upward through the holes in the plates and impinges upon the points. The particles of water resulting from condensation descend and collect on the points, where the friction, occasioned by the rushing of steam in opposite directions against said particles of water, develops electricity,

which is collected by the points and conveyed by proper conductors to the place where the effect is desired.

Claim.—1. The above-described electric machine, composed of the non-conductor casing A, isolated plates C and D, and battery of plates *f f f f*, &c., arranged substantially in the manner set forth.

2. The battery of plates *f f f f*, with perforations and exciting points *g g g g*, connected together, or any other perforated plates, wire cloth, or equivalent, when arranged together and operating in the manner and for the purposes specified.

79,820.—J. W. FORD, San Francisco, Cal.—*Chimney Cowl*.—July 14, 1868.—This device, while affording ventilation for ships, buildings, cars, &c., is designed to prevent the entrance of the rain through the ventilator.

Claim.—The ventilator, composed essentially of the pipe A and cowl C, united by the connection-pipe B, the cowl having the expanded end *c*, to receive the air to create the current, and the elongated cylindrical or parallelepipedon discharge-end *c'*, for the purpose described, all the said parts being constructed and arranged to operate together, substantially in the manner specified.

79,821.—J. C. GILBERT, Galesburg, Ill.—*Churn*.—July 16, 1868.

Claim.—The revolving box B, with perforated dashers H H K, and small lid F on the main lid, when the several parts are constructed, arranged, and used to operate substantially as shown and described.

79,822.—GEORGE D. GILLETT, Meriden, N. Y.—*Attaching Pad Hooks to Pads*.—July 14, 1868.—The shank of the harness-pad hook has a system of shoulders and hooks for embracing the pad, so that but little other fastening is required.

Claim.—In combination with the pad hook B, the hook *c* and shoulder *b'*, with or without the shoulders *b b*, as herein shown, and for the purpose described.

79,823.—FREDERIC NEWTON GISBORNE and HERBERT ALLMAN, London, England.—*Lamp Chimney Attachment*.—July 14, 1868.—The movement of the valve, to regulate the admission of atmospheric air to the flame, is produced by the action of the heat of the flame upon a compound bar attached to the ring or some portion of the valve.

Claim.—1. Our improved apparatus for regulating the supply of air to the flame of a lamp or burner, when constructed and arranged substantially as herein described and set forth.

2. The combination of a disk or button, F, with an opening or valve placed above it, substantially as described and herein set forth.

3. The combination of the compound bar *d*, the hinged valve *e*, and perforated rim *a*, the whole used in connection with a lamp or gas chimney, substantially as herein described, and for the purposes specified.

79,824.—HUBBARD S. GOFF and FRANKLIN M. GOFF, Middletown, Conn.—*Dish Cover*.—July 14, 1868.—The springs sustain the cover when it is unlocked, but when the cover is forced down it is so held by the figure on its top, said figure springing under the top cross wire, which rests in a notch in the head of the figure.

Claim.—1. The arrangement of the cover B of the dish, upon one or more vertical pieces A, so that it slides up or down, and can be fastened up or down upon the dish at pleasure, substantially in the manner described and shown.

2. The arrangement of the figure hinged at the top of the cover, and operated by the spring G, so as to form a lock, substantially as shown.

79,825.—A. D. GOODELL, Florence North Hampton, Mass.—*Bit Stock*.—July 14, 1868; ante-dated July 3, 1868.—Has reference to the method of holding the bit in the brace, and attaching the head of the brace to the shaft of the crank.

Claim.—1. A bit brace, in which the clamp is formed of the two pieces D and D', operated by a collar B, arranged and constructed substantially as shown.

2. The adjustable socket C, operated by the collar A, substantially as shown.

3. The device for attaching the head, consisting of the split screw E, set around a neck formed in the journal, and screwing into the head, substantially as shown.

79,826.—CHARLES C. HALL, Portland, Me.—*Steam Heating Apparatus.*—July 14, 1868.—Water is supplied in limited quantity to the receptacle at the bottom of the apparatus, and is converted into steam by the heat applied thereto. The steam rises in the central pipe and passes into the radiators, whose perforated tops permit sufficient steam to escape thereat to impart humidity to the atmosphere. Hot-air conductors are also employed.

Claim.—1. The open boiler *b*, constructed and operating as herein set forth and for the purposes described.

2. Combining the air and steam heat within the boiler, by the means of the pipe *n*, as and for the purposes herein set forth.

3. The minute perforations *i* in the tops of the radiators, as and for the purposes described,

4. The arrangement of the radiators *e* and connecting tubes *f*, for the purpose of distributing the steam therein, as described.

5. The steam heating apparatus, as herein described, in which the liability to accident or explosion is obviated, by the prevention of steam pressure, as herein described.

6. The steam heating apparatus, as herein described, which is automatic, that is, when the supply of water and the pressure of steam are regulated by the apparatus itself, without the necessity of any care, as herein described, by means of outlet *h*, regulator *p*, pipe *c*, and waste pipe *m*.

79,827.—O. COURT HAMILTON and HARVEY MCKINNEY, Turtle Creek, Pa.—*Fruit Gatherer.*—July 14, 1868.—The jaws are held open by the spring which encircles the handle, but may be closed by means of the pull cord, so as to cut or pull the fruit from the tree. The edges of the jaws have knives secured to them.

Claim.—1. The combination, substantially as set forth, with a partly open box, of jaws, hinged near the edges of the opening, which jaws, when closed, complete the box, and thus prevent the spilling of the fruit.

2. The combination, substantially as set forth, with the receptacle and jaws, of the rounded internal strips, to prevent the crushing of the fruit or the clogging of the jaws.

79,828.—CALEB HARRISON, Milwaukee, Wis.—*Rotary Steam Engine.*—July 14, 1868; antedated June 27, 1868.—The two ports in conjunction with the valve, adapt the notched wheel to be turned in either direction, as the steam, issuing from said ports, acts directly upon the wheel to impart motion thereto. The worm and cog wheel reduce the velocity sufficiently to admit of the application of the power to useful purposes.

Claim.—An engine, consisting of the serrated disk B, mounted in a case provided with the two steam passages L L, and valve H, and having the shaft D, provided with the endless screw P, engaging in the wheel F, all constructed and arranged to operate as shown and described.

79,829.—ANTHONY HOCHSTEIN, Williamsville, N. Y.—*Harrow.*—July 14, 1868.—The cross beams are adjustable by means of set screws, so that the teeth may be used at different degrees of inclination.

Claim.—The combination of the adjustable teeth-supporting beams B, independent of each other, and the set screws *b' b'*, substantially as and for the purpose described.

79,830.—R. H. HOOPER, West Roxbury, Mass.—*Working the Pedals of Piano Fortes, &c.*—July 14, 1868.—A device to be attached to the lyre or pedal standard to enable short-limbed persons to control the pedals.

Claim.—1. The pedal levers and treadles, when constructed substantially as shown, and used with the pedals of a piano, or other similar musical in-

strument, all substantially as and for the purpose described.

2. The pedal levers and treadles, in combination with the fixed foot stool A, all constructed and used substantially as described.

3. The pedal levers and treadles, in combination with the stool bar B, when constructed and used substantially as described.

79,831.—JACOB W. HORST, Annville, Pa.—*Manure Fork.*—July 14, 1868.—The operator having thrust the tines into a heap of manure, draws back the handle and at the same time forces the catch bar forward until it engages the shoulder of the handle, which operation raises the load and elevates the points of the tines above the ground, so that the combined sled and fork may, without obstruction, be drawn to the place where the manure is to be discharged.

Claim.—1. The fork D G E, pivoted to runners A A, and provided with latching bar C, substantially as described.

2. The use of sled runners A A, constructed substantially as described, and adapted for sustaining a fork, and also a latching bar, C, which passes through the handle of the fork, substantially as set forth.

79,832.—ADOLPHUS HOWARD, Wellsville, N. Y., and GEORGE F. HOWARD, Chicago, Ill., assignors to GEORGE F. HOWARD.—*Machine for Washing Leather.*—July 14, 1868.—These improvements, having reference to the use of splint brooms, and to the manner of applying them to a rotary shaft, are designed to be applied to the leather-washing machine for which letters-patent were granted same parties May 28, 1867.

Claim.—1. In a machine for washing leather, the application and use of splint brooms, substantially as and for the purposes herein described.

2. In a machine for washing leather, the clamps D D', or their equivalent, in combination with the radial arms or disks C upon the shaft G, for the purpose and substantially as described.

79,833.—WILLIAM H. HOYT, Bethel, Conn., assignor to himself and NATHAN SEELEY, same place.—*Machine for Sizing Hat Bodies.*—July 14, 1868.—The elastic support of the corrugated bed sustains the lower end of the latter above the surface of the liquid, so that the roll of hats may be adjusted upon the bed without exposing the hands to the hot water. The handle, pivotal shaft, and impelling springs enable the machine to be operated by hand when power cannot be conveniently applied.

Claim.—1. The combination of the vibrating or swinging segment D, and the correspondingly-formed bed *a a*, hinged or pivoted at N, it being elastically supported by the spring O, substantially as herein described, and for the purpose set forth.

2. The handle R, shaft E, springs S S, and swinging segment D, when arranged as described, and for the purpose specified.

79,834.—ABRAM C. JACQUES, Leavenworth, Kansas.—*Plow.*—July 14, 1868.—The roller and its frame are attached to the plow beam by a brace. The roller, by moving in the furrow last made, serves to guide the plow in making the next furrow.

Claim.—1. The adjustable frame F and roller G, to determine and guide the width of the furrow, substantially as herein described.

2. The projecting horizontal blade E and the vertical spur cutter *d* on the plow point, as and for the purposes herein set forth.

79,835.—JAMES GRAY JEWELL, Washington, D. C.—*Window Sash Stop.*—July 14, 1868.—The disk sustains the sash at any height, and locks it when closed.

Claim.—1. The combination of the metallic socket nail *g* with the tooth F, the socket nail to be made with a sharp point where it penetrates the wood, so that it may be driven into its proper place like a nail or tack, having an angular groove in its head, in which the tooth F rests when the window is locked down.

2. The corrugated groove *i* in the disk or wheel A,

in combination with the rubber ring or band B, so as to prevent the rubber from slipping when in use.

79,836.—JOHN JOHNSON, Atkinson, Ill.—*Stove Pipe Damper.*—July 14, 1868.—The damper when closed affords ventilation and prevents the collection of soot, but does not admit of the ascent of fire and sparks in the pipe.

Claim.—A stove damper, consisting of one center plate A, made of a circular rim, *a*, and fine wire sieve *b*, with arms *c c*, and two outside perforated plates B and C, of oval shape, arranged and fastened together as described, substantially as and for the purposes herein set forth.

79,837.—C. P. KIMBALL, Portland, Me.—*Car Seat.*—July 14, 1868.—The rack and pinion turn gears rigidly attached to the revolving posts of the chairs, which are consequently reversed by being turned in horizontal planes.

Claim.—1. Locking or securing the seats of cars so that they cannot be turned or reversed, either separately or all together, without operating the lever or brake *c*, in the manner and by the means substantially as set forth.

2. Operating or reversing in horizontal planes the seats of cars by means of a rack and lever, or brake and gears, substantially as and for the purposes herein set forth.

3. Reversing all the seats on one side of a car simultaneously by one lever or brake, as and for the purposes set forth.

4. Arranging the seats of cars so that each one of the separate chairs or seats will turn independent of the other, substantially as and for the purposes herein set forth.

79,838.—FRANCIS L. KING, Worcester, Mass.—*Machine for Dressing Stone.*—July 14, 1868.—The invention has reference to the arrangement for adjusting the stones to be dressed so as to hold them steadily in the proper relative position to insure a perfectly plane surface; the method of supplying sand and water; a peculiarly-shaped scroll grinder; a self-adjusting frame, and manner of raising and lowering the same at will; and an arrangement for relieving the grinders of all weight in excess of that required for grinding purposes.

Claim.—1. The arrangements of the grinder blocks U U, so as to leave a hollow space in the center, and the conveyance of sand and water to the hollow space left by this arrangement of the stone in the grinder boxes by means of the upright hollow shafts D D and their hoppers M M, or their equivalent.

2. The collars O O, or their equivalent.

3. The slots in the shafts D D, with the set screws in the gears C C, or their equivalent, when combined with the shafts D D, gears C C, self-adjusting frame L, rotary grinder boxes N N, and reciprocating carriage I.

4. The sectional grinder boxes N N, the inner frames *g g'*, the knobs *d d'*, the set screw *e'*, or its equivalent, arranged and operating substantially as and for the purpose described.

5. The cutters *e e'*, combined with the rotary grinder boxes N N and the carriage I, arranged and operating substantially as and for the purpose specified.

6. The self-adjusting frame I, the shafting R R, the gears S S and T T, racks P P, the slide bearings *b b'*, arranged and operating substantially as and for the purpose described.

7. The hoisting chains X X, pulleys, shaft Y, ratchet wheel W, intermediate gears *p p'*, pawl *r'*, arranged and operating substantially as described, when combined with the grinder boxes N N, self-adjusting frame L, collars O O, and shafts D D.

8. The chains *v v'*, pulleys *k k'*, weights *m m'*, used for the purpose described, when combined with the self-adjusting frame L, grinder boxes N N, collars O O, and shafts D D.

9. The scroll grinder, with its hollow cone in the center, as represented in Figs. 6, 7, and 9, made and operating substantially as described.

79,839.—B. F. KINGMAN and M. V. B. SHEPARD, Chicago, Ill.—*Spring Bed Bottom.*—July 14,

1868.—The metallic strap is long enough to extend around the slat, and hence the fastener may be readily adjusted at any part of the slat by passing it over the end thereof, or opening it and securing it around or upon the same.

Claim.—A bed spring fastening, consisting of the metal strap C and loop D, the former having a nib, E, for holding the spring in place, and a slot, H, through which said loop passes, and the latter having projecting flanges F G fastened to the end of the strap C, and bearing against the inside of the same, substantially as and for the purpose herein specified.

79,840.—ALEXANDER M. KNOWLSON, Troy, N. Y.—*Suppository Machine.*—July 14, 1868.—This device forms or shapes the suppository while the material is in a cold, solid state, and the medical agent equally distributed throughout said material.

Claim.—1. The mode or manner herein contained, described, and set forth, for the manufacture or formation of suppositories from the medicated material, while in a cold or solid state or condition, substantially as herein described and set forth.

2. The combination of the plunger B with the suppository molds *a* and *G'*, each being arranged with the supply tube or cylinder A, in the manner and for the purposes substantially as herein described and set forth.

3. The employment of the frame H, having combined therewith the mold or die *G'*, the supply channel *c*, and the cap I, containing the vent *e*, each being arranged in the manner and for the purposes substantially as herein described and set forth.

4. The arrangement and combination of the die or mold *a* with the cap E, in the manner and for the purposes substantially as herein described and set forth.

79,841.—J. A. LAKIN, Thompsonville, Conn.—*Radiator.*—July 14, 1868.—These radiators rest upon the small ledges of the stove holes, where they are placed in order to adapt an ordinary cooking stove to subserve the purposes of an air heater.

Claim.—The peculiarly shaped radiators herein shown, open at the lower ends, and connected in pairs by means of the pipes B and B', substantially in the manner and for the purpose herein shown.

79,842.—GEORGE G. LOBDELL, Wilmington, Del.—*Cast Iron Car Wheel.*—July 14, 1868.—The flanged side of the hollow rim is straight, instead of curved or depressed, and continued beyond the internal strengthening ribs, at right angles to the latter, so as to increase the strength of the hollow rim and facilitate the casting of the same with the strengthening rib.

Claim.—A cast-iron car wheel, having a hollow rim with transverse strengthened ribs *a*, where the flanged side of the said hollow rim is made straight, and at right angles, or nearly so, to the said internal ribs, as set forth, for the purpose specified.

79,843.—WILLIAM A. LODER, Rochester, N. Y.—*Fruit Jar.*—July 14, 1868.

Claim.—A sealing ring for fruit jars formed from a strip or strips of paper, or other flexible material, coated on the inside with gum or wax, for covering the joint between the cover and jar, as herein set forth.

79,844.—C. K. MARSHALL, New Orleans, La.—*Hot Air Flues in Stoves.*—July 14, 1868; antedated July 4, 1868.—The internal fire-clay pipe is acted upon directly by the fire. Its lower elbow pipe supplies it with air, which, being heated, is discharged by the upper elbow pipe, which may have an extension pipe to conduct the air to the point where it is to be made available. The contraction of the heating pipe at top prevents the too rapid transit of the air through the same.

Claim.—1. Constructing the pipe D of fire-clay, soapstone, or other like material, with a tapering flue, substantially as described, and for the purpose specified.

2. Constructing the stove A with openings *a b*, in combination with the pipe, having elbows *d* and *d'*, when the same are constructed of fire-clay, soap-

stone, or other like material, and arranged so as to operate substantially as described, and for the purpose specified.

79,845.—C. K. MARSHALL, New Orleans, La.—*Coal Grate and Stove.*—July 14, 1868; antedated June 27, 1868.—The supply pipes and grooves are for supplying the interior of the rear tile of the grate with fresh air, which, being heated, is discharged into the room. The damper enables the course of the air to be changed, so that it may be directed into the flue instead of into the room. The triangular tile also serves as an air heater.

Claim.—1. The tile C, with its internal grooves *ce*, in combination with the pipes E and F, or their equivalents, and the grate B, when the same are constructed and arranged substantially as described and for the purpose set forth.

2. The tile C, with its internal grooves *ce*, in combination with the pipes E and F, and damper G, when the same are constructed and arranged substantially as described and for the purpose set forth.

3. Arranging, in the bottom of an open fire grate, a hollow triangular tile D, when the same is connected with openings in the side of the grate, substantially as described.

79,846.—WILLIAM MAROT MARSHALL, Philadelphia, Pa., assignor to himself and J. B. ALEXANDER, Washington, D. C.—July 14, 1868.—Glass tubing is prepared by silvering, gilding, or painting the inside surface and filling it with plaster or other suitable substance to strengthen it, and combined with open work metallic coverings, and ornamental mountings of metal, wood, or plaster, in relief, to be employed as stair rods, mountings for sash, &c.

Claim.—1. The use of glass tubing, when supported by metal or other casing, mountings in relief, of metal or other material, or the rabbeted supports, of metal or other material, substantially as described and for the purpose set forth.

2. The filling of silvered or gilded glass tubes with plaster, cement, or their equivalents, combined with wood or metal rods, substantially as described, and for the purpose set forth.

79,847.—BENJAMIN K. MALTBY, Cincinnati, Ohio, assignor to CHARLES R. FOSDICK, same place.—*Eye Cup.*—July 14, 1868.—By this device it is designed that the eye shall be called into healthful exercise instead of being inactive and kept in darkness while the compression, by exhausting the air around it, is going on.

Claim.—The use of tubes that serve as receivers for exhausting the air around the eye, in combination with spectacles, with or without magnifying power, designed to elongate the eye, and by proper use to prevent and also to cure long sightedness.

79,848.—JAMES P. MCLEAN, New York, N. Y.—*Refining and Smelting Ores.*—July 14, 1868; antedated July 3, 1868.—By this process pure, dry hydrogen is introduced into the ore chamber in a free state. Coming in contact with the decomposing ore it unites with the oxygen and operates to desulphurize and precipitate the metal and assist combustion.

Claim.—1. The dry gas or gases, prepared and applied to smelting or refining ores, substantially as above set forth, or otherwise prepared, to suit the exigencies of the time and place.

2. The retort B, cleanser C, drier D, gas chamber E, neck V, with pipes G G' G'', and cocks *m, n, o, p, u,* and X, prepared and arranged in the manner and for the purpose set forth and shown in the drawings or otherwise arranged, substantially as described.

79,849.—JOHN MEYER, Portland, Me.—*Machine for Separating Iron from Sugar.*—July 14, 1868.—The bars of the sieve are magnetized iron, and so arranged that the charcoal introduced at the top of the vat must come in contact with them. The particles of iron adhere to said bars, and hence the charcoal is freed therefrom before passing into the vat.

Claim.—As an improvement in the process of filtering sirup in manufacturing sugar, the improved filtrator herein shown and described, having the me-

tallic sieve, for the purpose of eliminating the particles of iron which have become mixed with the charcoal in the process of preparing the same.

79,850.—GEORGE MUNRO, Philadelphia, Pa.—*Instrument for Stretching Boots and Shoes.*—July 14, 1868.—By turning the handle the two sections may be drawn together, so as to adapt the instrument to be readily inserted in the boot or shoe. They are likewise forced apart to stretch the toe.

Claim.—1. The combination of the sections A B, block C, screw spindle D', nut G, bevel wheels *h* and *h'*, and spindle D, the whole being arranged and operating substantially as and for the purpose herein set forth.

2. The block C, consisting of two parts, *e* and *e'*, secured together by screws *ff*, and arranged for the reception of the bevel wheels *h* and *h'* and spindles D and D', as described.

79,851.—PATRICK O'CONNOR and MORRIS COLLINS, Decatur, Ill.—*Ditching Machine.*—July 14, 1868.—When it is desired to increase the working depth of the ditching apparatus, the pin fastening the mold-boards and the pins holding the several braces are removed, the screw turned to a lower position, and said pins inserted into higher holes.

Claim.—In combination with the beam A and the plow C, the mold-boards D, knives K and L, screw G, and guides I, so that the whole may be moved and adjusted by said screw, substantially as specified and for the purpose set forth.

79,852.—GEORGE OERLEIN, Utica, Minn.—*Horse Power.*—July 14, 1868.—The horse power is mounted and put in operation upon the wheels, which are used for moving it from place to place. Power can be applied from both sides and both ends at the same time, or from either point alone, as desired.

Claim.—1. A horse power, arranged on wheels, substantially as described.

2. Master wheel C, supporting frame Q, step R, arms S, center shaft T, and draught levers U, in combination, substantially as described.

3. Draught levers U, chains V, toothed wheels, shafts, and dogs, W, in combination with master wheel C, substantially as described.

4. Tumbling-rod shafts O, M, and K, arranged and combined substantially as described.

5. Wheels D and G and master wheel C, with their connections, arranged and combined substantially as described.

6. Braces X and Y, in combination with frame A, substantially as and for the purpose described.

79,853.—JOHN W. PATTEE, Thornton, N. H., assignor to himself and EPHRAIM ELLIOTT, Lowell, Mass.—*Painter's Hook.*—July 14, 1868.—This hook is for suspending painters' buckets, and may be used in three different ways, which will readily suggest themselves in practice.

Claim.—The combination and arrangement of the arms *e* and *d*, with their projections *e* and *f*, eye hook *g*, or its equivalent, and main hook *i*, with or without the projection or barbs, when arranged substantially as described, and for the purposes fully set forth.

79,854.—ELIAS C. PATTERSON, Rochester, N. Y.—*Wire and Picket Fence.*—July 14, 1868.

Claim.—A wire and picket fence, in which each picket is provided with two or more pairs of oblique slots or notches for wires, at different heights, the notches of each pair in the same picket being also at different heights on opposite sides, and inclined, the one upward and the other downward, the pickets being so arranged that each wire of a pair shall alternate from a high to a low notch and *vice versa*, in the successive pickets, and the two wires of each pair being tightened by being seized together at their crossings, substantially as described.

79,855.—DAVID PHILIPS, Cordova, Ill.—*Wagon Brake.*—July 14, 1868.—The handle being seized and drawn backward, the chains are wound upon the roller bar, and, inasmuch as the chains are attached to the axle or other fixed part, the roller bar is con-

sequently moved backward, and the shoes applied to the wheels.

Claim.—The brake, consisting of the roller bar B, having the blocks *d* pivoted thereon, with the lever D, supports C. and chains F, when said parts are constructed and arranged to operate substantially as described.

79,856.—HIRAM PLUMMER, Brooklyn, assignor to himself and WILLIAM E. DOUBLEDAY & CO., New York City, N. Y.—*Sewing Machine.*—July 14, 1868.—This machine is especially adapted to the sewing of straw and other braids for bonnets and hats. The strip of material that is to be sewed is made to lap upon the body of the material, the positions of the parts being determined by gauges, and both thicknesses pass beneath the folder, so that the needle will pass through the two thicknesses while held down by the folder, and, as the needle recedes, a loop of needle thread remains in the hole, in consequence of the shuttle with its thread having previously passed through the loop of needle thread. The raising of the folder relieves the material, which is moved along and again crimped by the folder into form for the needle to pass through it again.

Claim.—1. The combination of a reciprocating perforating needle with the folder *o*, constructed and operating substantially as described, and shuttle *r*, or its equivalent, for the purposes and as set forth.

2. A feeding mechanism, acting in the direction of the needle's length, in combination with a folder and reciprocating perforating needle, substantially as specified.

3. A perforating needle, reciprocating in a plane parallel to that on which the fabric to be sewed is placed, in combination with a shuttle moved in a race way in the bed, and with mechanism for presenting the material to the needle in a folded condition, substantially as set forth.

4. The swinging plate *l*, carrying the folder *o*, in combination with the feeding point *s* and mechanism, substantially as specified, for giving motion to the parts.

79,857.—JEROME POTTER, Pierceton, Ind.—*Gate.*—July 14, 1868.—The bar over the roadway may be removed to permit high loads to pass.

Claim.—A sliding gate, having a long stile, I, and a short stile, J, in combination with a stationary bar, D, and movable bar, E, the whole being constructed and arranged substantially as and for the purpose set forth.

79,858.—REUBEN RAMSDELL, Rindge, N. H.—*Machine for Making Wooden Boxes.*—July 14, 1868.—An instrument to be used in the manufacture of fig and other similar wooden boxes. The wood is wound around and directly against the metallic surface of the former-block whose grooves serve to deflect the points of the nails, which are driven into the box, across the grain. The jaw piece is for gripping the end of the stock and holding it securely against a spring, while the band of wood is drawn around both blocks and lapped: The jaw is moved by a treadle and its motion is limited by the adjusting screw.

Claim.—1. In combination with the former-block or its equivalent, the groove or grooves *d*, for turning the nail points, substantially as set forth.

2. In combination with the block *c*, the jaw block *e*, with its clamping or gripping jaw *g* and the spring *h*, substantially as set forth.

3. Combining with the jaw *e* and the block *c* the adjusting screw *k*, substantially as and for the purpose set forth.

79,859.—DAVID F. RANDALL, Chicopee, Mass.—*Padlock.*—July 14, 1868.—The opening for the key extends through the solid lock body at right angles to the key socket. The lock consists of six parts, to wit, the body, bolt, spring, shackle, pivotal pin of latter, and small screw constituting detent.

Claim.—1. The arrangement of the detent O in the curved depression beneath the heel of the shackle, so that the detent cannot be removed without detaching the shackle from the body of the padlock, as set forth.

2. The combination of the padlock body, formed as described, slotted and serrated bolt B, spring H, de-

tent O, and shackle C, with the elongated and ridged key shank T, the whole constructed and operating substantially as described.

79,860.—EZRA RIPLEY, Troy, N. Y., assignor to himself and W. C. DAVIS AND COMPANY, Cincinnati, Ohio.—*Tea Kettle.*—July 14, 1868.

Claim.—1. A tea kettle or other culinary vessel, having a hinged bail and an edgewise swinging cover, so hinged or pivoted, and made flat, or so shaped on top, that the cover forms a convenient shelf for supporting and warming other culinary vessels of larger diameter than the cover.

2. In combination with a cover formed and hinged as specified in the preceding clause, so constructing and applying the bail or lifting handle and the rear bail lug, that when the bail is turned down, it will permit the cover to swing over it, as described.

3. In connection with a flat topped swinging cover, the lug or handle G, projecting horizontally, in such a manner as to offer no obstruction to placing a vessel upon said cover.

79,861.—SYLVESTER H. ROPER, Roxbury, Mass., assignor to the ROPER REPEATING-RIFLE COMPANY, Amherst, Mass.—*Detachable Muzzle for Shot Guns.*—July 14, 1868.—The detachable muzzle being slightly contracted at its forward end, has the effect, when attached to the gun, of adapting the latter to throw the shot in an aggregated instead of a scattered state.

Claim.—A contracted ring or ferrule, substantially as described, attachable to and detachable from the muzzle of a shot gun by means of a screw joint, for the purpose of diminishing or increasing the scatter of the shot, substantially as shown and described.

79,862.—O. C. ROSS, Penfield, N. Y.—*Door Straightener.*—July 14, 1868.—The lugs are first fixed in position above and below the warp, and the sections are then applied so as to form a toggle, whereupon the screw at the junction draws the door into form and clamps the parts firmly in contact.

Claim.—The device for straightening doors, consisting of sections D D, connecting intermediately at *b*, and engaging at the extremities with lugs C C, by means of angles *f g*, and ribs and slots *h i*, substantially as herein set forth.

79,863.—W. G. SAVAGE, Knoxville, Iowa.—*Steam Engine.*—July 14, 1868.—The shaft, which is parallel with the cylinder and derives motion from the piston, has a groove in which is secured a small spring, which catches in a notch in the eye of the cog wheel to cause the latter to turn with the shaft. A lever secured to the head holds the spring out of the notch long enough to allow the shaft to turn half way round without the wheel, whereupon the spring catches in another groove in the opposite side of the wheel and starts it forward, so as to give motion to the valve and reverse the engine.

Claim.—1. The arrangement of the lever S and spring *x* with the shaft F and wheel G, by which means the motion of the engine is reversed, substantially as set forth.

2. The combination of the valve C with the head A, having a hub, *b*, and the cylinder D with its steam spaces B *a*, constructed and operating substantially as specified.

79,864.—CHARLES SAYWARD, Gloucester, Mass.—*Gudgeon for Booms.*—July 14, 1868.—A method of attaching the boom to the mast, so that it can move freely in any direction about its attachment.

Claim.—The arrangement of the swivel, hinge, yoke, and bolt, the swivel intervening between the boom and the hinge, substantially as and for the purpose specified.

79,865.—HENRY SHAW and WILLIAM D. LEAVITT, New Orleans, La.—*Grinding Plate for Grist Mills.*—July 14, 1868.—The thinness of the grinding plate, together with the non-conducting packing, prevents the accumulation of enough heat to operate injuriously upon the meal.

Claim.—The combination and arrangement of the cast-iron grinding plate B, having diamond-shaped projections A, the unyielding, non-conducting paper

packing C, and back plate D, all constructed and secured together in the manner and for the purpose herein described.

79,866.—WILLIAM SHEA and L. D. HARVEY, Harvey, Mich.—*Furnace for Melting Metals.*—July 14, 1868.—The plates contain pipes which receive and discharge water, to protect the jambs and cool the brick-work around the crucible. The hearth is protected in like manner.

Claim.—The putting of pipes into cast-iron plates, substantially as and for the purposes above set forth.

79,867.—WILLIAM SHERBURNE, Charlestown, Mass.—*Journal Box.*—July 14, 1868.—The object of this arrangement is to facilitate the removal of the bearing from the journal of the axle, for the inspection of the journal, or the renewal of the bearing, while the oil box remains in its place. Also to so combine the oil box with the axle and jaw, that the oil box may be easily removed therefrom, for the purpose of renewing the packing in the rear end, &c.

Claim.—1. The bolt E, constructed as and for the purposes above described.

2. The bolt E, in combination with the jaw *m* and oil box B, substantially and for the purpose above specified.

79,868.—C. LATHAM SHOLES, CARLOS GLIDDEN, and SAMUEL W. SOULÉ, Milwaukee, Wis.—*Type Writing Machine.*—July 14, 1868.—The disk has a peripheral groove to hold, support, and guide the pivots of the type bars, which are worked by rods, levers, and keys. Provision is made for moving the paper carriage vertically and laterally, the paper to be written upon being held fast to the carriage by rods and clamps.

Claim.—1. A circular annular disk C, with radial grooves and slots, or grooves alone, to receive and guide the type bars or hammers, so that they inevitably and necessarily will strike the central point with perfect accuracy, when made and operated for the purpose, and as described.

2. The combination of a circular, annular, radially-slotted or grooved disk, with type bars fitted therein, and pivoted thereto, when made and operated for the purpose, and as described.

3. The combination of a ratchet, of regular and equidistant teeth or cogs, with rods and levers to the keys, so that the paper carriage will be moved a certain and exact distance every time a key is struck, when made and operated for the purpose, and as described.

4. The clamp or rod *u*, in combination with the hinges *h*, and the catches or buttons *m*, for holding the paper securely down on the carriage, when made and operated for the purpose, and as described.

79,869.—J. R. SMITH, Springfield, Mass.—*Bridge Block.*—July 14, 1868.—This arrangement of the block and lock of the wrought-iron chords, enables the latter to be connected firmly together without reducing their sectional area, as is commonly done by bolt holes.

Claim.—In combination with the wrought-iron locks D D, connecting the heads *a a* of the chords, the cast-iron block, fitting in closely around the joints, substantially as and for the purpose herein described.

79,870.—HERVEY D. SNOW, Bennington, Vt.—*Water Wheel Regulator.*—July 14, 1868.—The device remains inoperative while the speed is normal, but is brought into action by a change of speed, to admit more or less water to the wheel. Adjustable stops are applied, to prevent the supply of water being entirely shut off, or the gate opened too wide.

Claim.—The adjustable stops *g g'*, in combination with the pawls *r s*, ratchet wheel *f*, and flange *t*, moved by a connection to the governor, substantially as set forth.

79,871.—WELCOME SPRAGUE, Farnham, N. Y., assignor to himself and BERNARD H. MUEHLE.—*Harvester.*—July 14, 1868; antedated June 30, 1868.—The grain being twisted into the shape of a continuous rope, is left in the track of the reaping ma-

chine, supported on the stubble, where it may be allowed to dry.

Claim.—So constructing a reaping machine that the grain, after it is cut by the knives or cutters, will be collected and formed into a rope, or equivalent, and in that shape be left, in the rear of the machine, upon the ground.

79,872.—JOSEPH M. STONE, North Andover, Mass., assignor to himself, GEORGE L. DAVIS, and JOHN A. WILEY, same place.—*Card Cylinder.*—July 14, 1868.

Claim.—A card cylinder, formed of a thin shell, with three or more spiders or sets of arms in the same, all cast in one piece, substantially as described, as a new manufacture.

79,873.—GEORGE STOWE, Braceville, Ohio.—*Hoisting Grate.*—July 14, 1868.—One of the supporting bars is slotted so as to give play to the trunnion of the grate, and allow that end of the grate to be hoisted. The grooves in the ends of the fire box receive the trunnions and constitute guides for the grate during its vertical movements.

Claim.—1. The supporting bars B and C, constructed with a slot, and operating substantially as described and specified.

2. The grooves D and E, in the ends of the fire box, constructed and operating as herein described.

3. The bottom grate H, provided with a nib or guide I, or its equivalent, for the purpose of guiding the grate, and constructed and so arranged as to be hoisted and dumped, substantially as shown and described.

79,874.—W. H. TAYLOR, Baldwinsville, N. Y.—*Harness Buckle.*—July 14, 1868.—The frame of the buckle constitutes the loop.

Claim.—The combination of buckle and loop, substantially as and for the purpose specified.

79,875.—ENOCH THOMAS, Craigsville, Va.—*Oil, Tobacco, and other Presses.*—July 14, 1868.—Under this arrangement the toggle levers are made alternately to exert their power upon the follower.

Claim.—1. The combination and arrangement of the double-acting toggle levers E E' and F F' with the follower frame D and the reciprocating frame I, substantially in the manner herein described, and for the purpose specified.

2. The combination and arrangement of the sectors J J and J' J', rocking shafts H H', shaft K, and eccentric wheels L L, in relation to each other and to the reciprocating frame I, toggle levers E E' and F F', substantially as herein described, and for the purpose specified.

79,876.—JAMES H. THOMAS, Lynn, Mass.—*Weather Strip.*—July 14, 1868.—The roll, being made in sections, is free to bend, and thus accommodate itself to irregularities of the threshold.

Claim.—The combination of the flexible elastic roll D, with the short cylinders K K' K'', &c., and the spindle H, arranged substantially as described, and for the purpose set forth.

79,877.—WILLIAM THOMPSON, Worcester, Mass.—*Lathe Rest.*—July 14, 1868.—The object in attaching the nut to the block through the side of the rest instead of through the top, as is usually done, is to obviate the accumulation of trash and chips within the screw chamber.

Claim.—Connecting the nut E to the poppet block C by means of a screw passing through a slot in the side of the rest B, in the manner herein described.

79,878.—THOMAS E. THURSTON, Newark, N. J., assignor to himself and JAMES KEARNEY, same place.—*File Cutting Machine.*—July 14, 1868.—These improvements are designed to be embodied in the construction of various parts of file-cutting machines of the kind for which a patent was granted E. O. Potter, November 8, 1864.

Claim.—1. Plate A, having the part *e* cast or forged therewith, in combination with parts *a b*, and B and E, all combined and arranged in the manner and for the purpose set forth.

2. The improved adjustable stem D, the improved

parts E and F, the improved part G, and the adjustable roller *u*, when arranged and used in a file-cutting machine, which has thereon the improved part *e*, all constructed substantially as hereinabove set forth.

79,879.—GEORGE WASHBURN, New York, N. Y.—*Lock Bolt.*—July 14, 1868; antedated June 27, 1868.—This locking mechanism for a slide bolt enables the bolt to be operated by a key from the outer side of the door.

Claim.—1. The combination and arrangement of the slide bolt C, provided with the rack E, the case G, pinion F, and shaft H, provided with the bolt *f* and collar *e*, all operating as described, for the purpose specified.

2. The key J, provided with the thumb lever I, having the pin *g* attached, in combination with the shaft or arbor H of the pinion F, said shaft having the hole *f*, substantially as and for the purpose specified.

79,880.—JAMES T. WATKINS, Santa Clara, Cal.—*Gang Plow.*—July 14, 1868.

Claim.—1. The plows H H, in combination with the blocks E E', the holding screws I I, by which the plows are adjusted, and the wedges *a a*, constructed and arranged substantially as described.

2. The blocks E E', mounted upon the axles C C', and the bent arms J J', with the set screws K K', for regulating the depth of the furrows, substantially as described.

3. The bent arm N, and connecting rod O, with the handle M and the catch P, for disengaging the plows, substantially as described.

4. The bent axle R, with the nut R' and the screw S, for raising and depressing the furrow wheel, substantially as described.

79,881.—CYRENUS WHEELER, Jr., Auburn, N. Y.—*Harvester Rake.*—July 14, 1868.—Relates to the means for mounting, regulating the movements of, and driving the revolving rake and reel arms.

Claim.—1. The construction and arrangement of the chain sheave or pulley, whereby it is adapted to serve as the rotating head to which the rake and reel arms are pivoted.

2. The arrangement of the endless chain and the driving and guide pulleys, for driving the rake, arranged on one side of the drive wheel, from a pulley or sheave on the opposite side of said wheel, substantially as described.

3. The rake cam or track, made in one piece with the base plate or yoke, and attached to the rake stand, substantially as described.

4. Mounting the friction rollers that traverse the guiding cam in detachable boxes or stands, located in recesses or chambers formed in the rake and reel arms.

5. Linking the rake and reel arms together in pairs, in such manner that the angle of relation of said arms may be varied by adjusting the point of connection of the links therewith at either end.

6. The rake and reel arms, provided with lugs or ears, having set screws for adjusting the height of said arms in passing over the platform.

7. The guiding sheave or pulleys in front of the drive wheel, around which the rake-driving chain passes, made adjustable for the purpose set forth.

8. The main frame, or arm A' thereof, extended in the rear of the drive wheel, and affording a point of support for the seat bar, substantially as described.

79,882.—H. K. WHITE, Conneant Township, Pa.—*Washing Compound.*—July 14, 1868.—Dissolved yellow bar soap, sal-soda, saleratus, borax, and salt-peter.

Claim.—The above described composition, for washing and cleansing clothing and other goods, compounded in about the proportions specified.

79,883.—CHARLES WHITTAKER, Milwaukee, Wis.—*Apparatus for Moving Heavy Bodies.*—July 14, 1868.—As the screws are turned the supporting beams are raised, together with the straps which pass beneath the weight or load; the latter being thus raised and supported may be wheeled by the same apparatus to any desired point.

Claim.—The portable hoisting apparatus, consist-

ing of a frame, A, mounted on wheels, with a series of vertical screws E, with the bars F, and stirrups G, arranged to be operated by bevel gear attached to the horizontal shafts H, all substantially as described.

79,884.—HENRY WILLARD, Ripon, Wis.—*Portable Fence.*—July 14, 1868.

Claim.—The adjustable braces C C, the mortised posts A, the hook, D, and the pin B, the whole arranged and combined with the fence, in the manner substantially as and for the purposes shown and described.

79,885.—GEORGE L. WOODS, Newburyport, Mass.—*Windlass.*—July 14, 1868.—The object is to produce a continuous motion of the windlass. The turning of the capstan causes the revolution of two wheels, upon which are cranks, connected by links with ratchets, which actuate the windlass. The cranks are upon independent wheels, so arranged that both the links cannot, during the operation, be simultaneously at rest.

Claim.—The arrangement of the capstan *c*, shaft *d*, gears *f f'*, and the bevel gears *g h h'*, in connection with the windlass *r*, when constructed and operated as and for the purpose set forth.

79,886.—MORGAN WORKMAN, Washington Township, Ohio.—*Feed Rack.*—July 14, 1868.—The troughs are secured to the main standards by tongue-and-groove joints, so as to be readily slid into and out of place. The hinged covers exclude filth while the animals are not feeding.

Claim.—In the construction of a feed rack, the arrangement of the removable troughs B, and hinged covers *b*, substantially in the manner and for the purpose as herein shown and described.

79,887.—FERDINAND ADT, Wolcottville, Conn., assignor to himself and ELISHA TURNER, same place.—*Lamp.*—July 14, 1868.—A plurality of wicks and wick tubes is employed. The deflectors are slotted, dome-like plates, which direct the air to the base of the flames. The air tube supplies air to the upper part of the flames. The reflectors are vertical plates, polished on both sides and situated between the flames.

Claim.—A reflector placed between two or more deflectors, and within the chimney, so as to reflect the light from the flames, in the manner specified; and in combination with such deflectors and reflectors, the air tube *f*, for the purposes set forth.

79,888.—THOMAS L. BAYLIES, Richmond, Ind., assignor by mesne assignment to the AMERICAN PATENT CHROMATIC-PRINTING-PRESS COMPANY.—*Inking Apparatus for Color Printing.*—July 14, 1868.—The arms, to which are pivoted the bars, whereby the inking bars are held, are firmly secured in position at the ends of the cylinder by screws and lugs. The interposed rubber compensates for any variation that may occur as to the length of the inking bars. The cams actuate the inking roller frames, bringing the roller in contact with the set of bars of corresponding color, while holding off the roller of different color.

Claim.—1. The combination of the central hub B, a series of adjustable inking bars, D E, and a clamp for securing the bars at the ends without the intervention of any intermediate lateral supports, substantially as set forth.

2. Interposing rubber, or other yielding material, between the inner surface of the hooks or bars D and E and their point of contact with cylinder B and longitudinal bars *e* and *e'*, for the purpose set forth.

3. The cams *b* and *b'*, in combination with bars I and I' and rollers C and C', substantially as described, and for the purpose set forth.

79,889.—CHARLES BECKER, JOHN A. ROSS, and JACOB STEUERNAGEL, Alleghany City, Pa.—*Fruit Can.*—July 14, 1868.—The recess receives the sealing cement.

Claim.—The arrangement of the corrugated lip D, shoulder *o*, flange *i*, and recess *s*, constructed, arranged, and operating as herein described, and for the purpose set forth.

79,890.—CHARLES BECKER, JOHN A. ROSS, and JACOB STEUERNAGEL, Alleghany City, Pa.—*Manufacture of Fruit Can.*—July 14, 1868.—The inner flange is for supporting the lid, and is formed upon the can by means of grooving or swaging tools.

Claim.—The method herein described for forming and providing fruit cans with an inner flange, for the purpose set forth.

79,891.—HENRY M. BEECHER, Plantsville, Conn., assignor to H. D. SMITH, & Co., same place.—*Thill Coupling.*—July 14, 1868.—The lips or lateral projections receive the screws, whereby the base of the coupling is secured to the carriage.

Claim.—The improved shaft connection, as made with the lips *a a* to its base, and in other respects, substantially as described and represented.

79,892.—LÉON BÉMELMANS and LAURENT DE GIVE, Atlanta, Ga.—*Manufacture of Glass.*—July 14, 1868.—In this machine the melted glass is spread by pressure until it reaches the sides of a frame, which determines the size of the plate thus formed.

Claim.—1. The process, broadly, of manufacturing window and mirror glasses, of whatever thickness and size, by pressing the melted glass between two parallel and polished plates, whatever may be the mode of pressing employed.

2. The machine to carry said process in operation, called window and mirror glasses manufacturing machine, heretofore described, or any other substantially the same, and which will produce the intended effect.

79,893.—LÉON BÉMELMANS and LAURENT DE GIVE, Atlanta, Ga.—*Manufacture of Glass.*—July 14, 1868.—The melted glass is spread within a limited space under the influence of its own weight, as well as by pressure applied to the inclosing plates.

Claim.—A machine, called window and mirror glasses molding machine, heretofore described, or any other substantially the same, and which will produce the intended effect.

79,894.—WILLIAM J. BIGGAR and JOHN C. BLOOD, Conneaut, Ohio.—*Circuit Closer.*—July 14, 1868.—This device is actuated by the heat of a fire that may occur at the place where it is situated, and gives alarm through the agency of the magnetic signal.

Claim.—The combination of the board *A*, the brass and iron strips *m n*, the sliding bolt *e*, the spring lever *c*, and the posts *b b'*, with the insulated wires *a a'*, arranged and operating substantially as and for the purpose herein described.

79,895.—WILLIAM J. BIGGAR, JOHN C. BLOOD, and DEL M. GRISWOLD, Conneaut, Ohio.—*Electro-Magnetic Burglar Alarm.*—July 14, 1868.—Copper wires running through the house are connected with a battery, and have circuit connections attached to the doors and windows, so that when a door or window is opened the armature is released from the magnets, and causes a bell to strike, and lights a fluid lamp or candle.

Claim.—The combination and arrangement of the magnets *B B*, armature *C*, pivoted frame *D*, wheel *E*, provided with pins *d*, and catch *r*, hinged lever-catch *b*, bell *K*, hammer *H*, handle *m*, spiral springs *s e*, catch *p*, swinging holder *N*, rubber *O*, stand *M*, lamp *L*, weight *F*, cord *j*, shaft *G*, wires *g*, and circuit connections and breakers, all substantially as and for the purpose herein shown and described.

79,896.—SAMUEL C. BISHOP and WILLIAM W. MARKS, New York, N. Y.—*Apparatus for Insulating Telegraph Wires.*—July 14, 1868.—By this arrangement a plurality of wires may be simultaneously coated and insulated, within the same core, without any tendency on the part of the incoming insulating material to bring the wires in contact.

Claim.—The combination of the dies *B C* with the feed orifice *a*, when the back or male die *B* is perforated for the passage, in a separated manner, of duplicate wires, and so arranged, relatively to the feed of the insulating material through the orifice *a*, as that the wires, in their passage to and through the front die *C*, are caused to travel in a plane which is

transverse or at right angles to the feed orifice *a*, substantially as and for the purpose herein set forth.

79,897.—CHARLES W. BLAKESLEE, Watertown, Conn., EBENEZER B. BEECHER, Westville, and ANTHONY G. DAVIS, Watertown, Conn.—*Knitting Machine.*—July 14, 1868.—Relates to the class of knitting machines in which two straight rows of needles are used, the same yarn or thread being delivered first to one row and then to the other, for knitting tubular goods. The arm which is combined with the cam-operating belt or chain, reciprocates the yarn-delivering guide. One of the ways or guides which supports the traveling cam, also serves to keep the needles in position within the grooves in which they reciprocate. The narrowing and widening stops perform the additional duty of intermittently connecting and disconnecting the thread guide and its actuating arm. The thread guide, spool and stops, with their supporting bar, may be removed without disturbing other parts of the mechanism, so as to give access to the needles in setting up the work. A removable attachment automatically lessens, stitch by stitch, the length of the courses in knitting a stocking heel, or similar portion of work.

Claim.—1. The combination, with the needle-actuating cam, of an endless belt or chain for driving it, substantially as set forth.

2. The combination, with an endless chain or belt, of an arm, which, whether revolving continuously or reversing its movements around the machine, substantially as set forth, will impart a reciprocating motion to the thread guide.

3. The combination of the traveling needle-operating cam with the guide bars *M M*, with which it engages and disengages, substantially as set forth.

4. The narrowing and widening stops, constructed with cam surfaces, as described, for insuring the connection of the thread guide with its driver, and its disconnection therefrom, substantially as set forth.

5. The combination of the thread guide, spool, and stops with the removable bar which supports them, constructed substantially as and for the purpose set forth.

6. The combination, with a knitting machine, of a detachable automatic traveler for narrowing and widening, actuated by a traversing finger or projection substantially as described.

7. A narrowing and widening device, constructed and operating substantially as set forth.

79,898.—ERASTUS S. CLAPP, Montague, Mass., assignor to himself and ISAAC CHENERY, same place.—*Spectacles.*—July 14, 1868.—A supplemental frame, with glasses, is attached to a main frame which has no glasses, so that the glasses may be raised above the eyes without removing the main frame from the nose.

Claim.—In combination with a spectacle frame, the rod *D*, with glass rings and glasses attached thereto, and made adjustable, substantially as and for the purposes herein shown and described.

79,899.—NATHAN F. CLARK, Lawrence, Mass., assignor to himself and GEORGE H. COOK, same place.—*Machine for Making Rovings.*—July 14, 1868.—An anti-friction tube of brass encompasses the spindle, and extends through the bolster. It supports the bobbin gear on the bolster, and serves as a bearing for the spindle, while giving support to the bobbin, and preventing the latter from being worn by the spindle.

Claim.—The combination and arrangement of the tube *F* and bobbin-rest *D*, constructed as described, with the bolster *A*, the tube *F*, having the oil passages *b* and *c*, for conveying the oil to the surface of the spindle and to the interior of the bolster, substantially as and for the purpose set forth.

79,900.—RICHARD COLBURN and GEORGE W. GOULD, Norwich, Conn.—*Journal Box.*—July 14, 1868.—Designed as a means for uniformly lubricating the entire bearing part of the shaft.

Claim.—1. The combination, with the bottom *A*, and top *B*, of the box, of the end grooves *C C*, longitudinal grooves *b g*, cross grooves *c c*, and the wicks *m h*, with or without grooves *4 4*, substantially as and for the purposes set forth.

2. The combination, with the parts *A* and *B*, of

the end grooves $C C'$, longitudinal groove b , cross grooves $c c'$, and wick m , substantially as and for the purposes herein set forth.

3. The combination, with the metal part e and groove b of the box, of the groove covering and Babbit supporting plate 1, substantially as and for the purposes set forth.

79,901.—JACOB EINHORN, New York, N. Y., assignor to himself and JACOB EUGSTER, same place.—*Embroidering Machine.*—July 14, 1868.—The machine is for embroidering gauze, or other suitable fabric, the devices by which the stitches are made being fitted in a swinging frame, and the fabric to be embroidered being stretched on a sliding carriage, so that the stitches can be made to follow any desired pattern. The invention refers also to the arrangement of the needle and hook which produce the stitches, and the devices for operating and adjusting the same.

Claim.—1. The arrangement of embroidering mechanism, substantially as described, in a jointed swinging horizontal frame, $D E$, so that ornamental designs may be produced without moving the fabric after each stitch, substantially as herein shown and described.

2. The longitudinally adjustable frame B , in which the fabric is held, in combination with the jointed swinging needle frame $D E$, made as set forth.

3. The rotating cam M , rod k , and lever l and hook L , in combination with the tube J , and with a spring on or within the same, all made and operating substantially as herein shown and described.

4. The oscillating lever $n o$, in combination with the crank shaft I and reciprocating holder N , all made and operating substantially as herein shown and described, for the purpose of operating the needle in the manner specified.

5. The longitudinally adjustable oscillating lever n , in combination with the levers $P P$ and the spring catch Q or its equivalent, all made and operating so as to allow the needle to be easily thrown in or out of gear.

6. The application of the hook L and needle O , operated by the mechanism described for working a chain stitch, for the purpose specified.

79,902.—C. A. FOSTER, Fitchburg, Mass., assignor to himself and HARLAN P. DERBY.—*Meat Cutter.*—July 14, 1868.—By this arrangement the turning of the crank imparts to the knife the desired concomitant motions, to wit, forward, upward, backward, and downward.

Claim.—1. The combination of the chopping knife, its slotted arm H , and sliding blocks 4, with the grooved wheel, in which said blocks move, and the pin, upon which the said arm is hung, substantially as and for the purposes shown and set forth.

2. The combination of the chopping knife, its vibratory arm, and the grooved or slotted wheel for actuating the same, with their supporting frame arranged to overhang or extend across the revolving meat tub, substantially in the manner and for the purposes shown and described.

3. The combination with the cross-piece C and stands $B B'$, and F' , of shaft B , wheel G , stand D , stud e , and arm H , substantially as and for the purposes set forth.

79,903.—CHARLES GAUDIN, Zoé GRANIER, and JULES GRANIER, San Francisco, Cal.—*Fire Kindling.*—July 14, 1868.—A ball of sawdust, mixed and saturated with inflammable materials, is rolled or formed upon the end of a wick impregnated with camphene.

Claim.—Forming a fire-kindling ball upon the end of an inflammable wick for the purpose of ready ignition, as herein shown and described.

79,904.—WILLIAM HAYWARD and JOHN LEES Danville, Pa.—*Fagot or Pile for Manufacturing Railroad Rails.*—July 14, 1868.

Claim.—The "pile," as represented in the drawing, either with or without the part A , substantially as shown, and for the purposes set forth.

79,905.—EMIL T. HERTLE and RICHARD THOMPSON, New York, N. Y.—*Machine for Making Wire*

Heddles.—July 14, 1868.—The cylinders and jaws, which grasp the heddle at each side of the pincers that form the warp eye, are caused to move toward the pincers while the operation of twisting the wires and forming the eye is going on, the object being to avoid subjecting the wires to longitudinal strain.

Claim.—1. Arranging the head stocks $b' b'$, which support the inner or adjacent ends of the cylinders $a a'$, in the manner described and for the purpose set forth.

2. The combination of the movable cylinders $a a'$, the rods $i i'$, bars $h h'$, and cam pieces $g g'$, substantially as described and for the purpose set forth.

79,906.—LEANDER HOTCHKISS, Torrington, assignor to ELISHA TURNER, Wolcottville, Conn.—*Fruit Picker.*—July 14, 1868.—This device is designed to dispense with the pull-wire or cord of fruit pickers.

Claim.—A fruit gatherer formed of a jointed segmental ring, that closes upon the fruit in the act of pulling or cutting the same off, substantially as set forth.

79,907.—GEORGE A. HUGGINS, Mannsville, N. Y., assignor to himself and H. W. SHEPARD, same place.—*Milk Can.*—July 14, 1868.

Claim.—The sheet-metal body A , and cast or malleable bottom B , when the latter is grooved so as to form a seat for the former, and at the same time furnish an outer rim for the protection of its lower edge, when the same are combined and attached, substantially as described as and for the purpose specified.

79,908.—JOHN P. HUMASTON, New York, N. Y., assignor to himself and HAMILTON E. TOWLE, same place.—*Loom.*—July 14, 1868.—The shuttle carriers are operated about a vertical axis, having a central position in relation to the curve of the shuttle race. The jogs come in contact with each other, and promptly start the receiving carrier by an impulse from the delivering carrier.

Claim.—1. The combination of the lay and the pivoted and vibratory shuttle carriers with connecting rods and levers, receiving and imparting their movement from a single revolving cam shaft directly to said lay and shuttle carriers, substantially as herein shown and described.

2. The construction of the two shuttle carriers, vibrating on an axis common to both, when the same are provided with shoulders or jogs, acting in the manner and for the purpose set forth.

79,909.—ALMON HUNT and C. C. CHAPMAN, Macomb, Ill.—*Wagon Seat.*—July 14, 1868.—The hooks of the lower springs rest upon the sides of the wagon. The upper springs are fastened to the cross pieces of the seat by the headed pins, whose upper ends are threaded, to receive fastening nuts.

Claim.—The springs $B B'$, cross pieces $b c$, hooks b^1 , pins d , and seat C , the whole being combined and arranged as described.

79,910.—JOSHUA HUNT, Richmond, Ind., assignor by mesne assignments, to the AMERICAN PATENT CHROMATIC PRINTING-PRESS COMPANY.—*Inking Apparatus for Color Printing.*—July 14, 1868.

Claim.—The combination of the type bed B , the two forms, and the type-inking rollers $E' G'$, and the adjustable cam tracks $I I'$, when so constructed and arranged in relation to the ink-distributing rollers, that different colored inks, first disposed in bands on the type-inking roller, or on part thereof, shall be transferred simultaneously to the lines of type, and a single color be also transferred to the other form, so that by two impressions, the sheet or the form being reversed, two completed jobs may be printed in which the letter press is printed in more than two colors, and the border in one color, substantially as set forth.

79,911.—THOMAS S. HUNTINGTON and A. FULTON, Bellefontaine, Ohio.—*Passenger Register.*—July 14, 1868.—The levers are raised by their inner ends coming in contact with the fixed cam, each lever being held up by it until moved far enough to

allow a person to pass in, when it falls and assumes the position of the other levers. Devices are employed to register the movements of the levers, and cause a hammer to strike a bell.

Claim.—1. The hinged or pivoted levers or arms D, when used for operating a register or indicator, in connection with the rotating disk C, and cams d d' , substantially in the manner and for the purpose herein set forth.

2. The combination of the revolving disk C, the fixed cam F, and the levers or arms D, substantially in the manner and for the purposes set forth.

3. The combination of the cap E, and the fixed cam F, for the purpose of operating the arms D, in the manner and for the purpose set forth.

4. The combination of the cams d and the disk C, for the purpose set forth.

5. The combination of the levers J K L, the spring M, and the register, substantially in the manner and for the purposes set forth.

6. The register ring g , with its cylinder k and slot l , when constructed in the manner and for the purpose specified.

7. The combination of the register rings, the slot l , and the pawls $g' k' i'$, in the manner and for the purpose specified.

8. The arms D, when constructed and operated by means of the fixed cam F on the cylinder E, in the manner and for the purpose specified.

9. The register rings, so constructed that, on their outer surfaces, figures, letters, &c., may be placed, and on their inside a ratchet and flange, as and for the purpose herein described.

10. In combination with the rotating rings, the reciprocating shaft I, and pawls $g' h' i'$, when constructed and operated substantially as described.

79,912.—MICHAEL A. LANAGAN, Brooklyn, N. Y., assignor to himself, JOHN DAILEY, ROBERT RUSSELL, and ANDREW MERCIEN.—*Machine for Punching and Shearing.*—July 14, 1868.—For punching and trimming the edges of boiler plates. The plate is intermittently fed forward along with the bed to which it is clamped, and made to pass under the punch; subsequently, as it moves forward, the edge of the plate is trimmed by a pair of shears working in connection with the punch.

Claim.—1. In combination with the punch C, the plate-carrying bed A, arranged to slide crosswise of the punch, and provided with racks or teeth $i j$ on opposite edges of it, reverse pawls $g h$, connected by arms $g^1 h^1$ with a vibrating shaft H, slotted levers $g^2 h^2$, in connection with said pawls, and beam lever g^3 for throwing either pawl in gear with the bed, or disconnecting both therefrom, to reverse or stop the motion of the bed without changing or arresting the movement of the punch, essentially as specified.

2. The combination, with the punch C, of the intermittently-fed bed A and shears M N, arranged, as described, for operation together automatically to punch the plate in a regular or uniform manner, and to trim or dress its edge as it is passed through the machine, substantially as herein set forth.

3. The combination, with the shears M N and intermittently-fed bed A, of the double pawl m^3 and accompanying mechanism for giving a reverse action to the bed, or arresting its motion without changing or stopping the shears, essentially as specified.

79,913.—SAMUEL LEWIS, Brooklyn, N. Y., assignor to WILLIAM H. CAMMEYER, same place.—*Snow Plow.*—July 14, 1868; antedated July 6, 1868.—Apparatus for clearing snow from the surface of skating ponds and ice lakes. The device is drawn by a horse, and the handle and axle enable the driver to raise the body so as to deposit the gathered snow in a pile.

Claim.—The combination of the lever 9, axle 10, gearing 7 8, chains 11, 12, 13, pulleys 6 6 6 6, legs 14 14 15, and guides 17 18 19, as set forth, to the body of a "snow plow," as ordinarily constructed, all as explained and specified.

79,914.—JOHN G. McCORMICK, Louisville, Ky., assignor to himself and M. W. FERGUSON.—*Apparatus for Feeding Fuel to Furnaces.*—July 14, 1868; antedated July 3, 1868.—An apparatus for carrying coal, saw-dust, and other fuel from a bunker to the furnace, and feeding it regularly and evenly upon the

grate under the boilers. It is worked by the engine.

Claim.—1. The arrangement of the double-acting serew e'' within cylinder C', when constructed and used substantially as and for the purpose specified.

2. The arrangement of the concaves $e' e'$ and wheels $e e$ within the spout E, through which fuel is fed to a furnace, substantially as and for the purposes indicated.

3. The arrangement of the bifurcated spouts E E astride of the boilers A A, substantially as and for the purposes described.

4. The instrument i , when used in a feeding spout for the purpose of directing the fuel to its proper destination, and constructed and operated as above described.

5. The vibrating plates $m m$, substantially as and for the purpose specified.

6. The arrangement of the vibrating grate G with the horizontal boilers A A, in such a position that it vibrates back and forth transversely under them, for the purpose of levelling the fuel beneath them, substantially as described.

79,915.—GABRIEL NATCHER, Sidney, Ohio, assignor to himself and I. MARKS & Co.—*Railroad Telegraph Alarm.*—July 14, 1868.—The spring guards cover and protect the tappets. The train not only sounds the gongs in passing the posts having signal boxes, but compels the hand on the indicator to move one degree, thereby indicating to the attendants at the station the location of the train.

Claim.—1. A telegraphic alarm for railroads, which is capable of indicating at each station the progress of the train along the track, and also of giving a suitable alarm along the entire track both in front and rear of said train, by means of the signal boxes F, gongs G, hammers H, levers J, tappets K K', and rods O, or their mechanical equivalents, the whole being arranged and operating substantially as herein described, and for the purpose set forth.

2. In combination with the elements F, G, H, K, K', and O of the preceding clause, the spring guard L, for the object set forth.

3. In combination with the elements F, G, H, J, K, K', and O of the first clause, the indicator P, for the purpose herein described.

79,916.—BENJAMIN M. PEARNE and LEROY COVILLE, Oxford, N. Y.—*Axle Box.*—July 14, 1868.—The bands are of leather or other material suitable to prevent noise and avoid friction.

Claim.—The combination of the metallic box B and bands C C with the axle A, when said box has a central depression, and is enlarged at each end for the bands, as set forth.

79,917.—JOHN F. PORTER and ALONZO NORTON, Tidioute, Pa.—*Gang Plow.*—July 14, 1868.—The colters of the adjustable plows serve to sever roots, weeds, &c., and afford points of attachment for the draught chains.

Claim.—1. The hinged colter I, attached to the plow, and operating as described.

2. A plow so constructed and operating that the draught is mainly or wholly upon the point, as herein set forth.

3. The combination of the hinged standards K K' with the plow D, substantially as described.

4. The combination of the rack n , socket S, cam o , lever p , standard K, and plow D, substantially as described, and for the purpose set forth.

79,918.—AUGUSTUS POTOTSKY, New York, N. Y., assignor to FISK, CLARK and FLAGG, same place.—*Buckle for Suspenders.*—July 14, 1868.—The pantaloons may be disconnected from the shoulder strap of the suspenders without unbuttoning the short straps or tags. The device also affords a ready means of varying the effective length of the shoulder strap.

Claim.—1. The combination, in a buckle, of the two members thereof with a spring stud upon one member, and with the slotted stop plate upon the other member thereof, substantially as before set forth.

2. The combination of the stock of the buckle, constructed with a toothed slot, with a turning bar clamp, substantially as before set forth.

79,919.—PETER RINK and JAMES DOCHERTY, Wertsville, N. J.—*Adjustable Barrel Head*.—July 14, 1868.—The head may be secured in a barrel and removed therefrom without disturbing the hoops, and in ease of shrinkage the head may be expanded.

Claim.—The beveled wedge C, grooved upon each side to receive the edges of the parts *a b* of the barrel head, the short beveled wedge D, rebated upon its under side to fit between the said parts and rest upon their upper sides, both wedges secured together and tightened in the head by means of the beveled wedge E, all constructed, arranged, and operating as herein described, for the purpose specified.

79,920.—JOHN K. SAX and GEORGE W. KEAR, Kingston, Pa.—*Railroad Car Stove*.—July 14, 1868.—This construction of the stove is intended to prevent the egress of fire therefrom in case of accident. Provision is made for readily discharging the ashes.

Claim.—1. The door M, provided with the eccentric spring latch O, and snaked in from the surface to protect it from breaking in time of accident, substantially as and for the purposes above set forth.

2. The combination of the base A, pan B and its valve, revolving grate F and its cog gearing, perforated cylinder C, and its perforated dome N, and the door M, all constructed and forming a cylindrical stove for railroad cars, and operating as specified.

79,921.—BERNARD SMITH, Cincinnati, Ohio, assignor to AMERICAN BURIAL CASE COMPANY, same place.—*Coffin*.—July 14, 1868.—The upper part of the body is set in so that the flange by which the body and lid are united shall not project outward farther than the sides of the body, compactness and durability being the purposes thus subserved.

Claim.—Constructing a burial case substantially in the manner herein described, with the outer edge of the flange D flush, or nearly so, with the sides B B' of a body, A, whose upper portion is set in, as and for the objects designated.

79,922.—E. J. SMITH and F. B. PERKINS, Chicago, Ill., assignors to E. J. SMITH.—*Scoop and Sifter*.—July 14, 1868.—The sifter is moved in one direction by means of the rod and retracted by a metallic spring.

Claim.—The combination of the sifter J, rod E, coil spring H, and curved rod G, substantially as and for the purpose herein set forth.

79,923.—JOHN C. SMITH, Chicopee, assignor to himself and L. D. HILLS, Amherst, Mass.—*Loom for Weaving Palm Leaf*.—July 14, 1868.—The leaf is first split and cut into thin strips, of uniform width, thickness, and length, those composing the woof being of length equal to the width of the web to be woven. This machine obviates the placing of said strips in the shed by hand, provision being made for introducing them automatically.

Claim.—1. In combination with a reciprocating weft carrier, the feed trough and oscillating box, constructed substantially as and for the purpose set forth.

2. In combination with the feed trough and oscillating box, the sliding weights D', substantially as and for the purpose described.

3. In combination with the feed trough and weft carrier, the hooks *e e*, operating substantially as and for the purpose specified.

4. In combination with the feed trough, weft carrier, and hooks *e e*, or their equivalents, the sliding bar *v*, substantially as and for the purpose set forth.

5. The mechanism, substantially as described, for causing the cloth beam and harness to stop when the pickers fail to make a successful pick.

6. The slotted arm *y*, attached to the lay to receive the strip of palm leaf, and prevent it from turning or twisting, substantially as described.

7. The lever N, so arranged that it will bear against the lower side of the strip of woof while the same is being drawn into the shed, and thereby tend to prevent it from twisting or turning.

79,924.—DAVID M. SMITH, Orange, N. J., assignor to BENJAMIN F. SMALL, New York City.—*Lamp*.—July 14, 1868.—The tube is wound into a

conical coil, one of the ends being turned up in the interior, to form the wick chamber and receive the burner. The object is to retain contents when overturned, present a large surface to be cooled by the air, and secure superior strength.

Claim.—The safety lamp body, formed of a tube, and constructed substantially as hereinbefore set forth.

79,925.—CHARLES E. STONE, Amesbury, and ALFRED HERBERT, Salisbury, Mass.—*Tool for Fitting Bands on Hubs*.—July 14, 1868.—A clamping lever is combined with the ordinary tool in such a manner that a continuous shaving may be pared from the hub by turning the wheel on its axle and holding the instrument properly upon the hub.

Claim.—The handle B, curved at *c e c*, and adjustably pivoted to the extension C of the handle A, by means of the set screw *a* fitted into either one of a series of holes, *b b b*, formed in said arm C, substantially as and for the purpose herein shown and described.

79,926.—HIRAM VAUGHN, THOMAS CHADWELL, E. H. CHILDRESS, and G. A. WEBBER, Nashville, Tenn.—*Apparatus for the Manufacture of Whisky*.—July 14, 1868; antedated July 2, 1868.—This arrangement of stills, pipes, pumps, hydrometers, &c., has been devised with a view to enable the distiller to regulate the quality of the whisky or spirits manufactured, without infringing the restriction which renders the same inaccessible in order that the quantity manufactured may be ascertained by government officers.

Claim.—1. The process hereinbefore described of manufacturing whisky, or any kind of spirit whatever, by the employment of pipes, pumps, hydrometers, gauges, padlocks, substantially as described.

2. The manner herein described of employing pipes, pumps, hydrometers, gauges, padlocks, as set forth.

3. The method of working said pumps, pipes, hydrometers, either by steam or other power whatever, and using them in combination with gauges and padlocks, in the manner and for the purposes set forth.

79,927.—CHARLES F. WEST, Boston, assignor to J. F. TAPLEY & Co., Springfield, Mass.—*Paper Ruling Machine*.—July 14, 1868.—Mechanism for determining the length of lines ruled upon the paper, by automatically moving the pens into and out of contact with the surface of the paper at proper times.

Claim.—1. Combining, with a ruling mechanism, the wheel *o*, provided with lifter surfaces or pieces, for effecting the rise of the pens at the proper times, when the wheel is arranged in relation to the ruling cylinder, substantially as described.

2. Making the lifter pieces *w* adjustable within the circular grooves *v*, when held in position, substantially as set forth.

3. Arranging the wheel *o* with its axis at right angles to that of the ruling cylinder or bed, so as to be driven by frictional contact therewith, substantially as set forth.

4. Combining, with the wheel *o* and cylinder *b*, arranged in relation to each other, substantially as described, mechanism for arresting the rotation of the wheel, and for effecting its release, substantially as and for the purpose specified.

79,928.—JOHN B. WILDER, Mansville, N. Y., assignor to himself, H. W. SHEPARD, and GEORGE A. HUGGINS, same place.—*Clinching Nippers*.—July 14, 1868.—The cutters and jaws are respectively employed for cutting off and clinching the ends of nails, bolts, or rivets; and the instrument is particularly serviceable in shoeing horses.

Claim.—1. The cutters *b* and *b'*, when the same are so applied to a pair of clinching nippers that they can be operated substantially as described, as and for the purpose specified.

2. The cutters *b* and *b'*, jaws *a* and *a'*, and shoulder *c*, when the same are arranged substantially as described, as and for the purpose specified.

79,929.—CHARLES WINTERBURN and WILLIAM KENT, Cincinnati, Ohio.—*Electrical Bath*.—July 14,

1868.—The object in exhausting the air is to induce energetic capillary action.

Claim.—The application of electricity to the human body while the latter is *in vacuo*.

79,930.—A. B. WOODWARD, Alfred Centre, N. Y., and SAMUEL A. WOODWARD, Hornellsville, N. Y., assignors to themselves and ORSON MOSHER, Hornellsville, N. Y.—*Hames Fastener*.—July 14, 1868.—The bodies of the hooks or straps which connect the ends of the hames are formed with apertures to receive the locking catches, provision being made for maintaining the relative positions of the parts when locked.

Claim.—An improved hame fastener, formed by the combination of the strap A, strap B, lever catch D, lever catch C, and spring E, or equivalent, with each other, said parts being constructed and arranged substantially in the manner herein shown and described.

79,931.—JOHN AGATE, Pittsford, N. Y.—*Beer Cooler*.—July 14, 1868.—The beer flowing through the tanks successively is cooled by water flowing through the apartments in an opposite direction.

Claim.—Box B, divided into several compartments H, in combination with the tanks C, and connecting pipes *f*, operating conjointly, substantially as and for the purposes shown and described.

79,932.—C. M. ALEXANDER, Washington, D. C.—*Check and Driving Line*.—July 14, 1868.—The bit pertaining to the driving rein is drawn backward thereby, but the reining rein, which is a continuation of the other, draws in a direction at about right angles to the driving rein and may have a special bit, so that two bits may be made to act simultaneously.

Claim.—The cheek lines A and A', made continuous, and connected to or forming a part of the driving line B, and operating upon the mouth of the animal with one or two bits, substantially as specified.

79,933.—GEORGE M. ALLERTON, New York, N. Y.—*Inflated Rubber Goods*.—July 14, 1868.—The covering supports the rubber, and sustains the same against the internal, inflating pressure.

Claim.—The separate covering of cloth, felt, or similar material, in combination with the inclosed India-rubber article, as and for the purposes set forth.

79,934.—GEORGE M. ALLERTON, New York, N. Y.—*Life Preserver*.—July 14, 1868.—A tubular, annular, elastic life preserver, which being put on over the head and shoulders, clasps the person sufficiently to retain its place.

Claim.—An annular inflatable elastic rubber life preserver, substantially as specified.

79,935.—J. E. ANDREWS, Coeyman's Hollow, N. Y.—*Machine for Washing Paper Stock*.—July 14, 1868.—The stock is drawn into the water from the hopper by the floats of the agitating wheel, and then delivered to the elevating apparatus. Means are provided for supplying fresh water and discharging foul water, without carrying off the stock. A screen is employed to separate grain, gravel, &c., from the stock.

Claim.—1. The combination, with the tank A, of the wheel C, provided with the floats C', screen C², and hub *a'*, substantially as and for the purpose described.

2. The combination, with the tank A, of the chute E, cylinders D and D', and endless chains, provided with the rakes, substantially as and for the purpose described.

3. The combination, with the endless chains, provided with rakes, of the guides or ways F, substantially as and for the purpose described.

4. The combination, with the water tank A, chute E, and rakes *b*, of the screen G, substantially as and for the purpose described.

79,936.—WILLIAM H. ANDREWS, New Haven, Conn.—*Rose for Door Knobs*.—July 14, 1868.—Relates to the plate upon which the neck of the knob rests, and which is commonly called the "rose."

Claim.—The combination of the plate *d*, con-

structed with the flange *a*, with the plate A, formed from tin, or similar hard metal, as described, and when the flange *a* extends up through the central perforation of the plate A, substantially as and for the purpose set forth.

79,937.—B. T. BABBITT, New York, N. Y.—*Propelling Vessels*.—July 14, 1868.—The expanding air or gas in rushing out of the jet orifices of the smaller tubes drives the body of water in the larger tubes toward and out of one end of the latter, and establishes a suction or draught from the opposite open end thereof. The effect of this action in the longitudinal tubes is to propel the vessel, while that in the transverse tubes is to steer or turn the same.

Claim.—The combination of the tubes *c b*, open at both ends, with the jet tubes *d*, arranged to project within the former intermediately of their length, and with their jet orifices facing either open end of said larger tubes, substantially as shown and described.

79,938.—B. T. BABBITT, New York, N. Y.—*Gas Explosive Engine for Condensing Air*.—July 14, 1868.

Claim.—1. A motor or power generator, operating to compress or force air or gas by the reciprocating action, in an automatic manner, of a weighty and independent piston or projectile, free from constant connection with outside working parts, the same being started or set in motion by any suitable explosive force or expansion of gas or vapor under heavy pressure, within a tube or cylinder provided with suitable openings for producing the necessary explosion or starting impetus to the piston, and for reception and discharge of the fluid which it serves to compress, substantially as specified.

2. The combination of intermittently revolving or other equivalently operating many-chambered magazines at opposite ends of the tube or cylinder A, suitable powder-feeding vessels or chambers thereto, and wires or conductors *s s'*, for operation in connection with the wire or wires from a battery, to explode the charges at opposite ends of the cylinder alternately, essentially as and for the purpose or purposes herein set forth.

3. The combination, with the loose or independent piston E, operating as described, of rods I I, or their equivalents, and suitable mechanism for giving in an automatic manner, or by the action of said piston, the necessary impetus to the latter at starting, by gaseous expansion or explosion, substantially as specified.

79,939.—B. T. BABBITT, New York, N. Y.—*Gas Explosive Engine for Condensing Air*.—July 14, 1868.—On the closing of the abutment a spring-actuated pawl urges a ratchet wheel forward so as to temporarily open a valve for the admission of the impelling fluid or gas, or rotate a cylinder, having powder chambers, thus bringing one of the latter opposite the inlet passage, in which position it is fired by an electric current, or otherwise.

Claim.—1. A motor or power generator, operating to compress air or gas by the rotary travel or action, within a cylinder or annular chamber, provided with one or more abutments and suitable inlet and outlet passages, of a loose or detached and independent piston, having imparted to it at intervals power to establish and continue its momentum by any suitable explosive force or expansion of gas or vapor, substantially as specified.

2. The combination of a loose or independent piston operating within a cylinder or annular chamber, substantially as described, with a sliding abutment or abutments in such manner, and said parts or devices being so constructed, as that the piston in its rotation is caused to open and operate the abutment or abutments by contact with the same, essentially as and for the purpose or purposes herein set forth.

79,940.—GILBERT L. BAILEY, Portland, Me.—*Switch for Street Railroads*.—July 14, 1868.—In passing from one track to another, the friction rollers and levers act in conjunction with the car wheel and a guide rail, said levers being depressed by the foot of the driver.

Claim.—The construction and arrangement of the

spring S, levers 7 and 8, friction rollers 5 and 6, and treadle 11, all substantially as and for the purposes described.

79,941.—AUGUST BERTRAM, New Albany, Ind.—*Boot and Shoe Shank.*—July 14, 1868.—The piece of hickory or other elastic wood imparts the desired curve to the shank. It does not blunt the awl during the process of manufacture.

Claim.—The right and left shoe shanks A B, of the form shown, when the same are made entirely of wood, and are inserted between the upper and lower surface of the sole, so as to be embedded in the leather, substantially as herein described and for the purpose specified.

79,942.—BENOIT BLOCH, Soultz, France.—*Aniline Dye.*—July 14, 1868.—Aniline oil and arsenic acid are mixed and boiled, after which the mixture is purified by adding muriatic acid, and again boiling, then filtering and washing in water; the dry mixture is then dissolved in alcohol and sulphuric acid, boiled in a water bath and passed through a filter.

Claim.—A dye, composed of the ingredients herein named, and treated in the manner substantially as set forth.

79,943.—BENJAMIN BOARDMAN, Malden, Mass.—*Coffee Pot.*—July 14, 1868.—When the coffee has nearly reached the boiling point, the surmounting chamber is filled with cold water, so as to condense the vapor and save the aroma.

Claim.—The cup or condensing chamber D, constructed and applied to an ordinary coffee pot A, in the manner substantially as and for the purpose herein set forth.

79,944.—WILLIAM H. BOUSER, Paris, Ill.—*Snap Hook.*—July 14, 1868.—A leather shield is applied to the snap to protect the spring. The thumb piece, which is a part of the shield, enables the spring to be readily bent backward.

Claim.—A snap hook for harness, having hook A, spring B, shield D, and thumb piece E, constructed, combined, arranged, and operating substantially as specified.

79,945.—JAMES BRAGDON, Boston, Mass.—*Glue Pot.*—July 14, 1868.—The object is to adapt the glue pot to the use of kerosene and similar oils, it being impracticable to use the same under the common construction of glue pots on account of the smoke, and the heating of the cap of the lamp from confinement of the blaze, and consequent drawing up of the oil, causing it to overflow and inflame upon the top and sides of the lamp.

Claim.—1. In combination with the glue pan or vessel *d*, the water-containing vessel *e*, made with the conical bottom *i*, and the steam chamber *j*, and having beneath it the inclined flue *l*, for escape of the smoke from the lamp, all substantially as shown and described.

2. In combination with the conical bottom *i* and flue *l*, the vertical flue *m*, substantially as shown and described.

3. In combination with the conical bottom *i*, and flue *l*, the lamp *b*, having a packed tube, *g*, substantially as described.

79,946.—JAMES L. BRANSON, Cincinnati, Ohio.—*Hand Loom.*—July 14, 1868.—As the batten is drawn forward the dog falls and the latch drops below a tooth in the ratchet wheel. As the batten is thrown back the outer end of the dog is raised, the ratchet wheel moved and one of the trips brought in contact with the trigger on that side of the batten, thus releasing the picker. The wire operates to throw back the picker block as the picker is retracted.

Claim.—1. The swinging dog E, in combination with the ratchet wheel and trips, substantially as and for the purpose described.

2. The rigid connecting wire S, combined with the strap O, and picker block T, substantially as and for the purpose described.

79,947.—ISAAC N. BUNKER, Weymouth, Mass.—*Steering-Wheel Stop.*—July 14, 1868.—When the bracket is thrown against the wheel its notch fits

around one of the spokes, and thus the wheel is locked. The springs hold the bracket to the post when not required to lock the wheel.

Claim.—1. Arranging a notched, hinged bracket D, in combination with the steering wheel A, substantially as and for the purpose herein shown and described.

2. Providing the bracket D, when the same is made and operating as described, with springs *ee*, substantially as and for the purpose herein shown and described.

3. The bracket D, when provided with a lip, *d*, substantially as and for the purpose herein shown and described.

79,948.—EDWIN L. BUSHNELL, Poughkeepsie, N. Y.—*Harvester-Cutter Sharpener.*—July 14, 1868.—Differs from the ordinary rifle or whetstone in that the sides meet one another at acute angles.

Claim.—As a new and improved article of manufacture, the rhomboidal-shaped cutter sharpener, substantially as described, and for the purposes set forth.

79,949.—W. P. CALLAHAN, Dayton, Ohio.—*Force Pump for Hydraulic Presses.*—July 14, 1868.—A small pump is provided for each press and a large one for all, so that a number of presses may be used at the same time. The water can be forced from the large pump to any one of the presses under the check valves of the other presses, while the pressure is on them.

Claim.—1. The combination of the pumps, as shown, with check blocks and valves, arranged to operate in connection with hydraulic presses, substantially in the manner set forth.

2. The pump F, in combination with the pumps D and E, the stop valve J, and the check valves P P', substantially as and for the purposes described.

79,950.—JAMES H. CARKEET, Montgomery, Ala.—*Double-Acting Hinge.*—July 14, 1868.—The bar or arm may be raised and lowered and the clutches clasp the respective wings to the plate and prevent the unfolding thereof when required.

Claim.—The pivoted arm *h*, provided with two clutches, J J, so arranged that either one side or the other of the hinge may be clasped, while the opposite side is free to operate, thus allowing the door or shutter to swing in or out as may be desired, substantially as described.

79,951.—A. H. CASTLE, Ann Arbor, Mich.—*Insulator.*—July 14, 1868.—The projections of the notch prevent the rain from running down on to the hook which supports the wire.

Claim.—The insulating bracket A, with a core, E, formed solidly, with said bracket, and the angular transverse notch B, by which the hook is covered by the projections C D, in the manner as and for the purpose specified.

79,952.—ROBERT A. CHESEBROUGH, New York, N. Y.—*Elevated Railway.*—July 14, 1868.—The car is raised from the foot of one inclined plane to the head of the next, and progresses under the sole influence of gravity.

Claim.—An elevated railway, composed of inclined planes or sections, arranged substantially as described, in combination with the elevating platforms at the junctions of the sections, and operated by stationary motive power to establish continuity of the sections, as herein set forth.

79,953.—WILLIAM CLINE, Boston, Mass.—*Luggage Supporter for Saddles.*—July 14, 1868.—An arm is attached to the bow of the saddle tree, and adapted by a folding joint or otherwise, to be contained within convenient compass when not in use. Packs may be so secured to said supporting arm that they shall not touch the horse's back or neck.

Claim.—In combination with a saddle, an adjustable supporting arm, substantially as and for the purpose set forth.

79,954.—JOHN A. COLLINS, Virginia City, Nevada.—*Ore Crusher, Grinder, and Amalgamator.*—July 14, 1868.—The ore is crushed in the annular

trough of the bed plate by the wheels which encircle the barrels or cylinders, into which the crushed ore, after passing through screens, is introduced, for the purpose of being ground and amalgamated by the action of the rollers therein.

Claim.—1. The combination and arrangement of the cylinders C, crushing wheels D, axle E, and central plate F, with arms projecting downward, and supporting said axle, substantially as described.

2. The combination and arrangement of the driving plate G, on the shaft H, the friction rollers N, on the arms of the revolving plate L, and the stationary plate K, above it, substantially as described.

3. The combination and arrangement of larger rollers S with smaller S', within the cylinders C, the former rolling upon the latter and upon the cylinder, but the latter or smaller rubbing and grinding against the cylinder, as described.

79,955.—ELIZABETH A. COMBS, Monroe, Wis.—*Bleaching Apparatus.*—July 14, 1868.—Brimstone is introduced through a cap guarded tube, and a pipe carries off the vapors from the close box containing the articles to be bleached, the object being to prevent the diffusion of the noxious fumes.

Claim.—The fire pot or furnace D, in combination with the box described, all constructed substantially as and for the purposes specified.

79,956.—GEORGE W. COOK, Mason, Ill.—*Cultivator.*—July 14, 1868.—An arrangement whereby the attendant may ride or walk while operating the shovels and managing the team.

Claim.—The connecting of the standards F F of the plow beams E E, by cross bars c c, as shown, in combination with the crank shafts I I, chains d, pulleys f, and treadles H H, all arranged and applied to mounted frame A, substantially as and for the purpose set forth.

79,957.—JOHN COWELL, Ansonia, Conn.—*Toothed Wheel.*—July 14, 1868.—The teeth are inserted after the wheel is cast. The key firmly secures the tooth in the mortise.

Claim.—1. The combination of a detachable tooth with the corresponding mortises in the rim of the wheel, when constructed with a recess in one face of the tooth, so as to lock on to the corresponding face of the mortise, and secured by the key d, substantially as set forth.

2. The combination of the plate C and its set screw f with the key or keys d, so as to secure the keys, substantially in the manner herein set forth.

79,958.—ROBERT R. CROSBY, Boston, Mass.—*Lamp Chimney.*—July 14, 1868.—The enlargement of the chimney produces an expanded flame, and causes the light to shine downward around the cone.

Claim.—The abrupt or nearly right-angled enlargement of the chimney, as represented in Fig 3, arranged in relation to the lamp burner, substantially as and for the purpose herein specified.

79,959.—RUFUS W. CROUSE, Westminster, Md.—*Pump.*—July 14, 1868.—A double-acting cylinder pump, having an arrangement of valves designed to economize available power and simplify construction.

Claim.—The combination and arrangement of the cylinder A, plunger D, induction I, and eduction E, when connected by the apartments C C¹ C² C³, and the passages F F', provided with the valves c c' c' c''', all the said parts being constructed, arranged and operating together, substantially in the manner and for the purposes set forth.

79,960.—JAMES P. CUMMINGS, Newport, Ky.—*Fire Plug.*—July 14, 1868.—The valve has four legs connected at top by a ring. It is depressed and opened by turning the nut at the top of the stock. The stuffing box, guide, &c., maintain the rod in vertical position and prevent it from turning. The stop and waste hole at the bottom admit of the escape of the water remaining in the stock after the valve has been closed, but prevent the escape of water at the waste hole while the valve is open.

Claim.—1. The stuffing box, guide, and stop k, in combination with the block n and rod g, substantially as described.

2. The stop d and waste hole e, formed in one of the legs of the valve in the manner explained, and arranged relatively to the waste opening f in the stock, and the valve seat b, to operate in the manner and for the purpose specified.

3. The stuffing box, guide, and stop k, and block n, as arranged in relation to the valve c, substantially as described.

79,961.—MILTON DAY, Baltimore, Md.—*Corn Sheller.*—July 14, 1868.—The palms are ribbed metallic plates between which the ear of corn is introduced while the device is rotating.

Claim.—The combination, in a corn sheller, of two palms, B B, each having three or more fingers or tines, b b, to embrace the cob, with the springs C C and shanks d d, when the latter are permanently secured to the rim, all constructed and arranged substantially as described, and for the purpose specified.

79,962.—MILTON DAY, Baltimore, Md.—*Corn Sheller.*—July 14, 1868.—The ribs of the expanding and collapsing plates constitute, in their combined relation, a screw, whose action is to feed the ear of corn through the device as well as to detach the grains from the cob.

Claim.—A corn sheller, having a series of palms, B B, each having feeding threads, b² b², on their inside, when the same are so arranged that they afford projecting tines, b b, to receive the cob, and are in combination with the fingers and springs C, and the whole are made to operate substantially as described.

79,963.—JACOB J. DETWILLER, Greenville, N. J.—*Rocket Signal Device.*—July 14, 1868.—The cups are constructed so as to be interchangeable at will, for exhibiting various colored lights in any consecutive order desired.

Claim.—1. A metallic signal cup, A¹, grooved spirally for attachment to a staff or suspension cup, as and for the purpose set forth.

2. The combination of two or more cups, A¹ A² A³, tapered and grooved, as herein described, to make them relatively interchangeable, for the purposes specified.

3. The spiral socket C', constructed and adapted to receive and hold the cups A¹, as and for the purposes described.

79,964.—ISAAC ESTELL, St. Louis, Michigan.—*Saw Set.*—July 14, 1868.—Attachable, removable, and adjustable parts adapt the instrument for setting saws of different sizes, whether straight or circular.

Claim.—The arrangement of the slotted bottom plate A, arm H, screws I and G, gauge D, and rod e, constructed as described, and operating substantially as and for the purposes herein set forth.

79,965.—ALVIN J. FELLOWS, New Haven, Conn.—*Tape Measure.*—July 14, 1868.—Relates to the manner of fitting the spring click which holds the main or primary spring to the central part of the main-spring barrel, so as to hold the tape at any desired point.

Claim.—The combination of the ease A with the plate b', click spring d d', and the arm e, and knob f, when the whole is constructed, arranged, and fitted for use, substantially as herein described.

79,966.—RICHARD FLYNN, West Brookfield, Mass.—*Steak Masher.*—July 14, 1868.—The top roll tends to roll the steak in one direction, while the other roll acts upon it in like manner in the opposite direction; the fibers are thus twisted and rolled while being mashed.

Claim.—The employment, in a steak-mashing machine, of the rolls A A, the teeth of which are arranged so as to form a continuous spiral from one end to the other of each roll, the said rolls being geared together so as to move in opposite directions, while their spirals run in the same direction, as shown and set forth.

79,967.—JAMES S. FOWLER, Davenport, Iowa.—*Discharging Apparatus for Harvester.*—July 14, 1868.—As the grain is cut by the reaper it falls upon the slatted gates until sufficient has accumulated to form a gavel, when by the action of a sliding bar it is thrown upon the rack, whence it is delivered upon the stubble so as to be out of the way of the reaper in making the ensuing trip.

Claim.—1. The slatted gates G G G, constructed and operating substantially as and for the purposes set forth.

2. In combination with the slatted gates G G G, the rack H, sliding bar K, and levers F and I, constructed and operating substantially as specified.

79,968.—MARSHALL N. FREDERICK, Elgin, Ill., assignor to himself and CHARLES S. MOSELY, same place.—*Watch.*—July 14, 1868.—The stud or post is held by means of a screw, the end of which is so shaped that when it is screwed into the stud, it draws it down and tightens the drive wheel. The double, auxiliary wheel, which gears with the drive wheel, is also geared by its finer set of cogs with the wheel that turns the hand post. The hollow spindle of the spur wheel receives the stem key, and is mounted in such a manner that when the box is removed from the post plate, the spur wheel can be lifted out of said box.

Claim.—1. The stud or post B, having a bearing through the plate C and box D, thereby holding the drive wheel A firm and steady, substantially as described.

2. In combination with the stud or post B and drive wheel A, the screw T, constructed substantially as described.

3. The double wheel K, in combination with the wheels A J, and the vibrating bar E, provided with spindles b, arranged to operate substantially as specified, and for the purposes set forth.

4. The spur wheel H, in combination with the box D and post plate C, when arranged so that the bearing of the spur wheel is partly in the box and partly in the plate, substantially as set forth.

5. The plate R, in combination with the wheel L and main-spring arbor, when arranged substantially as specified.

79,969.—FRANK H. FULLER, South Boston, Mass.—*Lamp Burner.*—July 14, 1868.—By connecting the cap with the perforated ring, jets of air are caused to pass upward around the flame, affording an extra supply of oxygen.

Claim.—1. The wick tube D made in two sections, when the upper section is fitted over the lower, as at i, whereby the separation of the parts of the burner for cleaning is facilitated, as herein set forth.

2. The lamp burner, constructed as described, and consisting of the perforated conical ring B, and cap A, supported on stands C, projecting from the upper section of the wick tube, and the concave perforated disk F, rim E, and part G attached to the lower section of the wick tube, all arranged as herein shown and described, for the purpose specified.

79,970.—WILLIAM WALKER GIBSON, Edinburg, North Britain.—*Apparatus for Decorticating and Cleaning Cereals.*—July 14, 1868.—As the grain passes between the surface of the drum and wire gauze casing, the triturating action to which it is subjected decorticates and cleans it, the husks and cleanings being blown out through the meshes of the gauze.

Claim.—The employment of a revolving drum for decorticating cereals, upon the surface or periphery of which strips or blades of glass, porcelain, or like material are fixed and arranged, substantially in the manner shown and set forth.

79,971.—EZRA GOULD, Newark, N. J.—*Screw Threading Machine.*—July 14, 1868.—The bolt to be cut, or the nut to be tapped, is secured in a sliding head, which is forced toward the chuck containing the dies or the tap by a clutch lever. The two concentric spindles are caused to turn together by the engagement of their respective projections, but the inner spindle is allowed a limited independent motion, in order that the dies may be thereby gradually forced toward the common axial center of the spindles or moved outward therefrom.

Claim.—1. The arrangement, herein described, of the driving wheel F, concentric spindles G C, and projections a b, for the purpose set forth.

2. The combination of the lever K and slide L, secured one to the other by a pivot, h, which moves in a slot, l, with the lever jaw m, frame A, and head block J, all constructed, arranged, and operating substantially as and for the purpose described.

79,972.—JOHN H. GUEST, Brooklyn, N. Y.—*Electro-Magnetic Temperature Alarm.*—July 14, 1868.—The spring axis throws the armature off of the electro-magnet when the circuit is broken. The circuit breaker is adjustable to suit the length of the current. The thermometer closes the current and causes an alarm to be sounded when the temperature rises to a certain extent.

Claim.—1. The spring axis, on which the armature swings, in combination with the hammer and bell, as and for the purposes set forth.

2. The spring circuit breaker i and adjusting screw n, provided with a head or button, in combination with the armature and spring axis h, for the purposes and as set forth.

3. The alarm thermometer, formed with the horizontal circuit closer and its adjusting arm, in combination with the case inclosing the adjustable parts, as set forth.

79,973.—JOHN H. GUEST, Brooklyn, N. Y.—*Electro-Magnetic Burglar and Fire Alarm.*—July 14, 1868.—The apparatus is arranged upon the general plan of giving an alarm by a bell whenever the circuit of a galvanic battery is closed, by the movement of anything that should remain stationary, thus indicating the occurrence of a fire or a burglarious attempt.

Claim.—1. A pair of magnets and armatures, arranged and acting in the manner specified, in combination with a hammer and bell, the former being attached to the lever of the armature, for the purposes and as set forth.

2. An expansive, corrugated disk and hinged arm, forming a thermal circuit closer, substantially as set forth.

3. The adjusting screw 7, in combination with the thermal circuit closer, as and for the purposes set forth.

4. The pendulum and spring, in combination with the circuit wires and notched sash or slide, to close the circuit, as specified.

5. The two springs 13 14, connected with the circuit wires, in combination with the pusher q, for the purposes and as set forth.

6. The plates r, screw studs s, and nuts t, constructed substantially as specified, in combination with the circuit wires, to form a designating or disconnecting apparatus in a fire or burglar alarm, substantially as set forth.

79,974.—JACOB W. HASKELL, Boston, Mass.—*Tool Holder.*—July 14, 1868.—The boxes which fit upon the tool holder are clamped by a screw in the rectangular hole of a lathe slide. The spline and feather prevent the tube from turning in the boxes. The boring arbor can be set with the cutting tool projecting as far from the post on the lathe slide as may be required.

Claim.—The combination of the tube e, bearing the mortise-headed bolt d, with half boxes h i, when the tube and boxes are connected with a feather and spline, and are otherwise arranged, substantially as and for the purposes set forth.

79,975.—CHARLES E. HENDRICK, Chicopee, Mass.—*Feather Renovator.*—July 14, 1868.—The valves are opened by turning the nut on the connecting rod, when steam is admitted to the box containing the feathers. When the valves are closed the steam receiver radiates heat to dry the feathers. The valves may be modified.

Claim.—1. Three or more valves D D D, rod E, nut N, in combination with the receiver C, the whole arranged and operated substantially in the manner herein shown and described, for the purpose set forth.

2. The swinging valve D, with the spiral spring i, substantially as described and for the purpose set forth.

79,976.—LEVI HEYWOOD, Gardner, Mass.—*Machine for Shaving Rattan.*—July 14, 1868.—A knife or scraper planes down the joint portion of the rattan after it has been cut into strips. Knives are also employed for shaving the strip on the inner side, together with a pair of knives against which the edges of the strip are brought after being shaved on the under side.

Claim.—1. The arrangement of the knife M, constructed and operated substantially as described.

2. The arrangement of the knives *d*, in combination with the presser rolls I I' and operating screws *h*, all constructed and operating substantially as set forth and for the purpose stated.

79,977.—A. L. HILL, Decatur, Ill.—*Breast Strap.*—July 14, 1868.—A breast strap is attached to the hames of each collar, the hooks being fitted in the harness rings, and the ring of the neck yoke encircling the metallic plate which connects the leather straps. The ribs sink into the leather and relieve the rivets of strain.

Claim.—1. The breast strap, constructed as described, and consisting of the strap C, to which the plate D, having ribs *d*, is rigidly secured, when said strap is provided at each end with a hook, B *b*, all arranged and operating as and for the purpose described.

2. The ribs *d* on the exterior surface of the bar D, when used in combination with and applied to the strap or straps C, for the purpose substantially as set forth.

79,978.—HENRY HISE, Chicago, Ill.—*Trace Buckle.*—July 14, 1868.—Employed to attach traces to harness, one part being secured to the end of the trace, and the other fixed adjustably upon a strap connected with the hames or passing around the breast of the horse. The device dispenses with the loops commonly employed to retain the hanging ends of the trace.

Claim.—1. The combination of the plate B, provided with one or more inclines, *a*, with a clasp, C, arranged and operating substantially as set forth, and for the purposes specified.

2. A plate, B, when constructed so as to be secured upon a trace, and provided with one or more inclines *a*, in the manner described.

79,979.—CHARLES W. HUBBARD, Pittsburg, Pa.—*Saw Handle.*—July 14, 1868.—The back end of the saw blade is fitted in a groove in the forward part of the handle. The bolt is made to occupy a slot of the saw blade, and the nut is turned so as to cause the bolt to draw and hold the handle and blade firmly together.

Claim.—A new article of manufacture, to wit, a saw handle, consisting of the part J, provided with a recess, *f*, for the nut of the bolt B, and with a groove adapted to the end of the saw blade, said handle and its part J being made substantially in the form herein described and represented.

79,980.—CHARLES W. HUBBARD, Pittsburg, Pa.—*Machine for Grinding Saws.*—July 14, 1868.—The metallic apron, in connection with the feed rollers, moves the saw blade to the action of the grindstone with a force that does not exceed the grinding capacity thereof. The flange or collar at the eye of the grindstone may be set in position, or at an inclination corresponding with that of the side of the grindstone.

Claim.—1. Providing a saw-grinding machine with an unjoined thin metallic belt or endless apron, substantially as herein described and for the purpose set forth.

2. Pivoting the bearing roller A' so that it can be deflected to correspond to the desired taper of the saw blade, substantially as herein described and for the purpose set forth.

3. Providing the shaft of a grindstone with a flange provided with a socket joint, substantially as herein described and for the purpose set forth.

79,981.—S. UNDERS HUBBELL, Jr., West Salem, Ohio.—*Catch for Money Drawers.*—July 14, 1868.—The outer lever being depressed by the foot lowers the remote end of the inner lever, which carries with it the vertical rod, and thereby disengages a

catch from the money drawer. The spring on said rod throws the latch to fasten the drawer.

Claim.—The combination and arrangement of the levers A and B, the fulcrum support C, and spring *m*, or its equivalent, in the manner substantially as described and for the purpose specified.

79,982.—FREDERICK A. HULL, Belvidere, Ill.—*Car Coupling.*—July 14, 1868.—The draw bars are tubular, and inclose springs to the inner end of which the forward draught of the car is applied. When the cars are backed said springs act as buffers. Auxiliary links may be employed.

Claim.—The combination of the tubular draught-iron B, the bars D E, the spring S, and the link *l*, and pin *b*, arranged and operating substantially as specified and shown.

79,983.—GEORGE M. ISBELL, Torrington, Conn.—*Needle for Sewing Machines.*—July 14, 1868; antedated July 3, 1868.—A needle for use in machines for sewing boots and shoes. The object of the improvement being to so shape the needle that it shall, while possessing the needed strength, pierce as small a hole as possible.

Claim.—A sewing machine needle, formed as specified, with the flattened body, the circular edge to the hook, the lengthened opening in the hook, and the curvature or swell at the back of the hook, as and for the purposes set forth.

79,984.—HORACE K. JONES, Kensington, Conn.—*Attachment for Balancing Polishing Wheels.*—July 14, 1868.—The weights are movable and may be fastened at any desired point in a groove which is at the side of the wheel and concentric with the latter.

Claim.—The combination of the ring A and weights *a*, constructed and arranged as herein described, with a polishing wheel, for the purpose of balancing it, substantially as specified.

79,985.—WILLIAM J. KEIM, New York, N. Y.—*Spiral or Winding Stairs.*—July 14, 1868.—The steps are perforated at the center and secured upon a central post, so that the respective ends of the steps belong to separate adjacent staircases, at opposite sides of said central post.

Claim.—An arrangement of winding steps, constructed in such a manner as to give two or more flights within the same space, substantially as described.

79,986.—L. J. KNOWLES, Warren, Mass.—*Belt Shipper for Looms.*—July 14, 1868.—These devices adapt the loom to be conveniently started and stopped by the attendant while standing at either end of the same.

Claim.—1. The combination with the shipping lever D, applied to one end of the shipping rod C, of the inclined guide rod *c*, substantially as and for the purposes set forth.

2. The combination with the shipping lever, and slotted and notched guide piece in which it moves, of the dog and ears for actuating said lever, and the rotating and longitudinally sliding rod upon which the same are mounted, together with the spring *f* and lever D, the said parts being arranged for joint operation, as herein specified, so that the movement of the lever D shall cause the shipping lever to be drawn in either direction, as required.

79,987.—A. T. LATTI, Camden, S. C.—*Animal and Bird Trap.*—July 14, 1868.—The weighted door and hinged platform are nearly balanced, and connected by a cord passing over a pulley. The animal's weight springs the trap, and peculiar resetting devices are applied.

Claim.—1. The weighted and pivoted door *e*, cord *d*, pulley *c*, platform *a*, and catch *f*, all constructed as described, and combined and operated in the manner set forth.

2. In combination with the above, barrel *g*, arm *h*, bent lever and catch *f*, the whole being operated in the manner and for the purpose set forth.

79,988.—CHARLES H. LAWRENCE, New York, assignor to himself and N. P. TYLER, Barrytown, N. Y.—*Printers' Galley.*—July 14, 1868.—The wooden

frame is cut along the center from the inner side, to receive the metallic tongue, which is soldered to the lining. The screws which secure the bottom pass through the tongue. The object is to prevent the galley from shrinking.

Claim.—The lining *e*, having the metal tongue *b*, in combination with the frame *a*, bottom *d*, and serew *e*, applied in the manner and for the purpose substantially as herein shown and described.

79,989.—H. Y. LAZEAR, New York, N. Y.—*Gas Heater.*—July 14, 1868.—The double-walled upright cylinder is arranged over a gas stove containing a wire contrivance for supporting the steak. The heated air or gas ascends in the inner chamber, passes through the upper orifices into the annular chamber, descending in which it escapes at the lower orifices.

Claim.—1. The V-shaped trough *E* and the filling *E'*, by which the flame is divided, and the grease protected from burning, and smoke thereby prevented, substantially as described, in combination with a gas steak broiler.

2. The annular space *B* and the orifices *h* and *i*, substantially as and for the purposes set forth.

3. An apparatus for broiling steak by gas, whereby the steak is broiled or cooked simultaneously on both sides, or where the sides are equally exposed to the flame and heat, substantially as shown and described.

79,990.—PHILIP LEONARD, Sharon, Pa.—*Machine for Dressing Grindstones, Minerals, &c.*—July 14, 1868.—The tool stock may be moved in a direction parallel with the axis of the stone to be dressed, as well as toward and away from the stone.

Claim.—The adjustable frame *B*, fitted in a frame, *A*, as shown, in combination with the sliding frame *C*, provided with the tool stock *C'*, arranged for a lateral movement, substantially as and for the purpose set forth.

79,991.—THOMAS J. LINDLEY, Medora, Ind.—*Truss Pad.*—July 14, 1868.—The central prominent part of the pad is of lead, and hence may be of greater or less diameter to suit the size of the rupture.

Claim.—The wooden pressure pad *B*, having an inserted lead center, *C*, and attached to the strap *A*, all arranged substantially as and for the purpose set forth.

79,992.—JAMES C. LOUP, Galveston, Ind.—*Stove Pipe.*—July 14, 1868.—A plate of cast iron or other fire-proof material is suspended from the rafters and forms a base upon which to build the flue, and supports the appliances for connecting the stove pipe therewith.

Claim.—The sliding pipe *B*, for making connection of stove pipes to the flue, and shutter *H*, for closing the aperture in the rest, when the pipe is not in use below the rest, as described.

79,993.—ELIJAH LUCAS, Winslow, Ind.—*Grain Separator.*—July 14, 1868.—A fan and smut cleaners revolve inside of the sieve. The grain can be discharged at either side of the machine by means of the reversible chute. The metallic strips act as a fan to blow cockle, cheat, &c., through the wire sides. The rows of wire projecting at right angles from the shaft operate in conjunction with similar wires on the adjacent slats to remove the smut.

Claim.—1. Polygonal-shaped wire sieve *B*, provided with shafts *d d*, metal strips *e e*, and wires *i i*, constructed and operating substantially as and for the purposes herein set forth.

2. The reversible chute *F*, in combination with the rod *f* and the lever *G*, substantially as and for the purposes herein set forth.

79,994.—WILLIAM J. LYMAN, East Hampton, Mass.—*Portable Chamber Closet.*—July 14, 1868.—Designed as improvements on the chamber closet for which letters patent No. 74553 were granted same party February 18, 1868.

Claim.—The arrangement and combination, with each other, of the box *A*, cover *B*, seat *C*, platform *E*, vessel *F*, additional seat *H*, and receptacles *I*, all made and operating substantially as herein shown and described.

79,995.—JAMES M. MAYHEW, Providence, R. I.—*Chafing Roller for Wagons.*—July 14, 1868.—The concave iron roller constitutes a means for protecting the sides of wagons from chafing or wearing when the front wheels are turned.

Claim.—The construction of the concave chafing roller *C* upon the longitudinal rod *a*, having its bearings in the ends *C'* of the side pieces *A*, which are recessed to receive the elastic cushions *e e*, bearing against the ends of said roller, all operating as described for the purpose specified.

79,996.—JOHN W. MAYHEW, San Francisco, Cal.—*Shackle Bearer.*—July 14, 1868.—The object is to afford a rest whereby to relieve a criminal of the constant weight of his gyves.

Claim.—The manner of supporting and bracing the bearer ring *A*, by means of the back brace *C*, formed and shaped as herein described, and secured to the tread of the shoe in the manner set forth, in combination with the side braces *D*, of the particular shape and construction described, having forked-shaped ends.

79,997.—S. B. McCORKLE, Greenville, Tenn.—*Horse Collar Stuffing Machine.*—July 14, 1868.—This machine places the straw in the collar in such manner that its elasticity is preserved and utilized.

Claim.—1. A machine for stuffing horse collars, so constructed and operating that as the plunger enters the collars, its fork, *a*, will have its prongs in a horizontal plane, for the purpose described.

2. A machine for stuffing horse collars, so constructed and operating that the plunger partially rotates as it moves back and forth, in order that its prongs, *a*, may lie in a vertical plane as it catches the straw, and in a horizontal plane as it delivers the straw into the collars, substantially as described.

3. The combination of the plunger *A*, having the fork *a*, with the arm *e*, and bent guide rod *H*, when the several parts are constructed to operate in the manner described.

79,998.—WILLIAM McLUCAS, Reinersville, Ohio.—*Double Corn Planter.*—July 14, 1868.—The seed-dropping mechanism within the hopper consists of a tube and an inclosed arm or roller having a lever actuated by projections on the driving wheel. By depressing a lever the hind part of the machine is raised and the weight thrown upon casters to facilitate turning.

Claim.—1. The tube *H*, when the same is constructed with angular openings and supplied with a plug *h*, in such manner that the same can be actuated by the driving wheel *D'*, or controlled by the upright lever or needle *h'*.

2. The foot lever *G'*, when in combination with suitable mechanism, and the universal casters *f' f'*, when the same is so constructed and arranged substantially as described and for the purpose specified.

79,999.—N. H. MEAD, Waterport, N. Y.—*Tire Frame Attachment.*—July 14, 1868.—The wheel may be detached and turned readily, and reclamped upon the frame before the tire can cool.

Claim.—The combination of the pivoted lever *C*, adjustable toothed bar *E*, slotted cap plate *F*, and toothed bar *G*, with each other and with the frame *A*, substantially as herein shown and described, and for the purpose set forth.

80,000.—CYRUS MILNER, Des Moines, Iowa.—*Washing Machine.*—July 14, 1868.—A screw adjusts the pivoted, corrugated board, to vary the space between it and the roller, in conformity with the bulk of material to be washed.

Claim.—The box *A*, cylinder *D*, and adjustable board *E*, when said cylinder is provided with a series of corrugated staves and brushes, as described, and the board *E* with corresponding brushes, to operate substantially as set forth.

80,001.—DAVID MORRIS, Bartlett, Ohio.—*Churn Motion.*—July 14, 1868.—The dasher plunges and rises twice at each revolution of the wheel.

Claim.—The frame, consisting of the upright *A*, foot *B*, and screw-threaded stem *a*, the latter serving the double purpose of a guide for the dasher shaft,

and means of attachment of the frame to the lid of the churn vessel, in combination with the grooved wheel G, slides *g g'*, pitman F, and dasher shaft D, the whole arranged and operating in the manner and for the purpose specified.

80,002.—C. E. MURRAY, Sugar Valley, Pa.—*Horse Hay Fork.*—July 14, 1868.—When the pivoted teeth are turned inward and upward, they are made to sustain the load by turning upward the arm of the eccentric, which is also pulled down by the trip cord when the load is to be discharged.

Claim.—The frame, composed of the diverging prongs *a a* and head *b*, in combination with the pivoted or jointed teeth *e e*, rods *f f*, and eccentric *h*, all arranged for joint operation, substantially in the manner as and for the purpose set forth.

80,003.—BENJAMIN W. OGBURN, Whittle's Mills, Va.—*Calculating Balance.*—July 14, 1868.—Indicates either the weight of an article or its gross price, and may be made to indicate how many pounds, at any given price, it will take to amount to any given sum.

Claim.—The combination of the sliding fulcrum M and pea L, when working upon a graduated beam I, in connection with a balance frame B, the parts being constructed and arranged as described, so as to operate together in the manner and for the purpose set forth.

80,004.—PAUL A. OLIVER, New York, N. Y.—*Powder for Blasting and other Purposes.*—July 14, 1868.—The blasting powder is made of common peat, instead of charcoal, combined with saltpeter, sulphur, and chlorate of potash. The gunpowder is made of peat, sulphur, and saltpeter or nitrate of soda.

Claim.—1. The use of peat in the manufacture of gun and blasting powder, substantially as set forth.
2. As an improved article of manufacture, the powder, made substantially as herein described.

80,005.—THOMAS PAYNE, Detroit, Mich.—*Railroad Station Indicator.*—July 14, 1868.—These devices are for indicating to passengers the names and distances of stations, and the movement of the parts, necessary to effect the changes in the position of an indicating ribbon or drum, is caused by the projecting arm on the car coming in contact with an arm on a post which is planted a little beyond each station.

Claim.—1. The arms N N, arranged as described, on the roof of a car, and provided with ears *r r*, to guide them along the circular rods *s s*, in combination with the spiral springs *h h*, on said rods, to prevent any wobbling or lost motion, substantially as and for the purposes herein set forth.

2. The slotted bars E E, forming a frame, and placed on the shaft *a*, on each side of the circular disk B, in combination with the shoes *b b* and levers F F, for the purpose of turning the shaft in either direction, substantially as and for the purpose herein set forth.

3. The arms I I, pivoted at one end, one having a weight or spring, L, attached to the other end, and the other attached to a bell or alarm, M, by means of a spring, *c*, and both provided with adjustable corrugated clamps K K, in combination with the cog wheels *c c*, when arranged and operating substantially as and for the purposes herein set forth.

4. The slotted stays H and T, when arranged so as to regulate the movement of the cog wheels *c c*, substantially as and for the purposes herein set forth.

5. A drum, constructed as described, for the purpose of indicating names, figures, or characters, suspended in a car, and operating substantially as set forth.

6. The cylinder *d* and roller *a*, in combination with the spring *p* and ribbon *e*, when arranged as described, so that when said cylinder is revolving in one direction, the spring winds up the ribbon on the roller, and when revolving in the opposite direction, the ribbon unwinds from the roller and winds up the spring, substantially as and for the purposes herein set forth.

7. The arms S S, when attached to the posts R R in the manner described, with spring *n n*, to soften or lessen the blow, and used for the purpose of mak-

ing the station indicator self-operating from any station or direction, substantially as herein set forth.

8. The arrangement of the circular disk B and its cog wheel C, the bars I D, lever F, bars E E, and shoes *b b*, when constructed and operating substantially as set forth.

9. The arrangement of the arms N N, and their springs, when operated by the arms S S upon the posts R R, substantially as specified.

80,006.—C. C. PEIRSON and GEORGE F. PEIRSON, Philadelphia, Pa.—*Apparatus for Condensation of Vapors in Lard Boiling, &c.*—July 14, 1868.—A constant shower, through the shower pipes, is produced whenever the process of boiling is going on, and hence offensive vapors from the substance boiling become condensed and united with the water that passes off through conduits.

Claim.—1. The shower pipes R and S, constructed and operating substantially as and for the purposes specified.

2. A condensing and deodorizing apparatus, having cover B, condensing boxes D and E, shower pipes R and S, chimney K, and conduit pipes, as described, constructed, arranged, and operating substantially as described.

80,007.—SAMUEL PIERCE, Boston, Mass.—*Base-Burning Stove.*—July 14, 1868.—The drum forming the lower part of the radiating drum constitutes a receptacle for any ashes, dust, &c., that may be brought over from the furnace and deposited.

Claim.—1. In base-burning stoves, making the walls, which divide the coal receptacle from the ignition chamber, double, and inclosing water, said water serving to preserve the said walls, and also for heating purposes.

2. The combination of the radiating drum C with the ash receptacle D, arranged and operating as described.

80,008.—NATHANIEL F. POTTER, Providence, R. I.—*Clay Mill.*—July 14, 1868.—The connection between the driving shaft and the mechanism which causes the wheel to traverse its axle, may be readily thrown into or out of gear, and when the disconnection is made the tempering wheel continues to travel in one track so as not to interfere with the scraper. Means are employed for connecting the main line of shafting with the special machinery for tempering the clay, whereby the latter may be started gradually.

Claim.—1. Combining the rack and pinion mechanism *k b* (for giving a radial movement on its axle to the tempering wheel) with its driving gear, L, by means of the adjusting screw *c*, or equivalent device, for breaking the connection between the two at pleasure, substantially as herein described.

2. Combining the driving shaft, D', of a tempering mill with the driving gearing by means of the friction strap P, applied and operating in the manner substantially as shown and described.

80,009.—L. A. POWERS, Meriden, Conn.—*Table Fork.*—July 14, 1868.

Claim.—Making the socket for the guard of a carving fork solid with the bolster, or with a portion of said bolster, and independent of the tang or body of the fork, substantially as and for the purpose set forth.

89,010.—DAVID R. REED, Tekonsha, Mich.—*Apple Corer and Slicer.*—July 14, 1868.—The apples are successively placed on the cutters and cored and quartered by depressing the hand lever, the quarters falling into a pan, and the cores being forced through the tube into the box.

Claim.—The arrangement and combination of the flange coring-tube, C, presser P, hand lever D, arm E, with the receiving box A, substantially in the manner and for the purpose specified.

80,011.—THOMAS REESE, St. Louis, Mo.—*Steam Engine.*—July 14, 1868.—An arrangement for supporting the cross head and pitman of horizontal engines, and producing a parallel motion without employing the ordinary guides or ways.

Claim.—The cross head G suspended by links J

from a rock shaft I mounted in pivoted standards K, said standards being so connected with the reciprocating cross head as to receive an oscillating motion therefrom, in the manner and by the means substantially as herein described, for the purpose specified.

80,012.—HENRY SEYMOUR ROBBINS, Newton Falls, Ohio.—*Device for Strawberry Culture.*—July 14, 1868.—These plates form an earthen covering or pavement for the strawberry bed, obviate weeding and prevent creepers from taking root. Holes are provided for the upward passage of the plant and for ventilation, and the projections support the plate above the ground.

Claim.—A plate for strawberry culture, constructed in the form herein shown and described, and having apertures B and C, and projections D, combined and arranged substantially as specified.

80,013.—WILLIAM H. RODEHEAVER, Miamisburg, Ohio.—*Machine for Dressing Fellos.*—July 14, 1868.—The inside of the felloc is dressed as it is fed along over the convex rest.

Claim.—The convex and flanged rest or bed V, adjustable in height in the manner described, in combination with the cutter head D and adjustable feed and pressure rollers P, or their mechanical equivalents, the whole being arranged and adapted to operate substantially as set forth.

80,014.—ISAAC ROGERS, West Chehalem, Oregon.—*Apple Corer and Slicer.*—July 14, 1868.—The apple is placed upon the fork, the coring apparatus is forced forward by the foot bar, the tube perforates the apple, the knives are forced about half-way through the same, and the coring device is then withdrawn, carrying the apple with it. Another apple being then placed upon the fork, the coring apparatus is advanced, the first apple is divided by the pressure of the second, into which latter the knives are forced.

Claim.—1. The combination of the slide bars F, cross-bar H, tube M, knives N, and rim O, with each other and with the guides or slides G and parer fork Q, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the adjustable guide P with the rim O and slide bars F, substantially as herein shown and described, and for the purpose set forth.

3. The combination of the cross or foot bar J and levers I with the bottom board A and cross-bar H of the sliding bars F, substantially as herein shown and described, and for the purpose set forth.

80,015.—A. P. ROUTH, Liberty Mills, Va.—*Cultivator.*—July 14, 1868.—A device attached to the plow standards for the purpose of eradicating weeds and grass between the rows.

Claim.—1. The instrument, consisting essentially of the standard M, loop s, point m, and blades n n, having sharp front cutting edges, when the several parts thereof are constructed and arranged as above described, and for the purpose set forth.

2. The combination of said instrument with the plow standard B B and wedge W, substantially as described.

80,016.—ABRAHAM K. SANDERS, Brooklyn, N. Y.—*Base Burning Stove.*—July 14, 1868.—The object is to have a circulating current of air warmed upon one side of nearly every plate and pipe, with the other side of which the products of combustion are in contact, insuring the warming of the air and cooling of the products before ultimate escape.

Claim.—1. The descending smoke flue between the casing m, opening into the base of the heater, in combination with the air flues 3, 5, and 6, arranged and acting substantially as specified, so that the air to be heated comes in contact with one side of the flue plates or tubes, and the products of combustion on the other side, as set forth.

2. The magazine g, supported by the cylinder f' and top plate f, in combination with the fire pot a and combustion chamber formed between the said magazine g and the casing e, in which chamber are the air heating pipes 5, as and for the purposes set forth.

3. The doors 8, between the plates d and n, and at the end of the air flue 5, for the purposes and substantially as set forth.

4. The doors 9, between the cylinder f', top plate f, and grate or mantel frame t, and opening into the hot air inclosure, for the purposes and as set forth.

5. The descending flue m, conveying the products of combustion from the fire chamber to the base of the heater, in combination with the air flue 3 5, that exposes the air to be heated to the wall of the ash pit, the fire pot, and said descending flue m, substantially as specified.

6. A fireplace heater, in which the magazine for the fuel extends to the top of the heater, and is provided with an opening in front of the mantel frame for the introduction of fuel, substantially as set forth.

80,017.—AARON C. SANFORD, Plymouth, Conn.—*Renovating and Dressing Feathers.*—July 14, 1868.—When the feathers within the cylinder have been washed and cleansed by the direct flow of the steam from the inner tube, the valve is shifted, cutting off steam from the inner tube and admitting it to the outer, its action within the latter being to dry the feathers.

Claim.—The combination and arrangement of the outer tube D with the inner tube E and respective openings f and g, provided with the valve d, and having tubes a leading from the inner tube into the cylinder, and constructed so as to operate in the manner and for the purpose herein specified.

80,018.—CHRISTIAN SCHMITZ, Philadelphia, Pa.—*Machine for Stretching and Softening Skins.*—July 14, 1868.—The hide is laid upon the edges of the blades and stretched by depressing the rollers between said blades while the ends of the skin are held.

Claim.—1. An instrument having a set of parallel, or nearly parallel, stationary blades or supports, and a set of parallel rollers, operated by a lever or otherwise, for the purpose of stretching leather, as set forth.

2. The arrangement of the blades D D D upon the supporting head C, so as to adapt them for adjustment by means of the set screws c, substantially as set forth.

80,019.—JOSEPH SEAMAN, Chicago, Ill.—*Mangle and Ironing Machine.*—July 14, 1868.—A device for actuating the lower roller upward to exert the requisite pressure upon the clothes between it and the upper roller.

Claim.—The combination of the rollers A A', levers D, eccentric disks E, pillow block wheels F, and weight W, or their equivalent devices, substantially as shown and described, for the purpose specified.

80,020.—JOHN W. SHAEFFER, Red Wing, Minn.—*Furnace for Roasting and Smelting Gold and other Ores.*—July 14, 1868.—The furnace is provided with lofty domes into which the gases ascend, and which prevent them from again uniting with the matrix, so that the formation of a sulphuret is obviated.

Claim.—A furnace for smelting and reducing gold, silver, copper, and other ores, constructed substantially as herein shown and described.

80,021.—EUGENE F. SHAW, Wyoming, Mich.—*Churn.*—July 14, 1868.—The wound-up weight and the gearing constitute a power for swinging the churn back and forth.

Claim.—The oscillating vessel D, provided with the cross-bar E and dasher F, in combination with the gear wheels K M O, and their shafts and pinions, and the spool I, cord G, and weight W, all arranged and operating substantially in the manner specified.

80,022.—GEORGE V. SHEFFIELD, Worcester, Mass.—*Manufacturing Screws.*—July 14, 1868.—By the operation of this machine the screw thread is gradually formed by a drawing process, in contradistinction to cutting the metal out to form the thread, as in the common mode.

Claim.—1. The combination, with the reciprocating

ing rods H H, the frame marked I, J, and K of the shafts L L, and wheels 5 and 6, pins 8 8, and arms M, for operating the same, as and for the purposes stated.

2. The combination, with the reciprocating frame I J K and shafts L, of the sliding boxes of the wheels 5 and 6, hinged connections *f*, arms M, and pins 8, substantially as and for the purposes set forth.

3. The combination, with the stationary frame A, tubular shaft B, spindle F, and jaws *b* of the reciprocating frame, the rods H, cross piece G, wheels 5, 6, connections *f*, arms M, and pins 8, the said parts being arranged for joint operation, as and for the purposes set forth.

80,023.—THOMAS J. SLOAN, New York, N. Y.—*Mode of Operating Shutters.*—July 14, 1868.—The geared hinged sectors, together with the sliding and rotating spring shaft and the button and rim, form a means of operating the shutters from within, and retaining them in the desired position. A mechanism is also employed for locking the shutters at their point of juncture when closed.

Claim.—1. The bevel gears K H, in combination with the spring shaft F, retaining button *i*, and rim *m*, when the said shaft is arranged to drive the gear K, and slide longitudinally through it, as and for the purpose set forth.

2. The employment, in connection with a mechanism for opening and closing blinds from the inside of the window, of a positive lock mechanism, composed of the locking shaft O *r* and spring-retaining mechanism *q R s t*, all as specified.

80,024.—H. K. SMITH, Norwich, Conn.—*Friction Clutch Pulley.*—July 14, 1868.—The pin and nut are made to raise the end of the lever and force outward and in opposite directions the segmental ends of the friction pieces, thus causing them to bear firmly against the inner periphery of the pulley rim, and effect the simultaneous rotation of the pulley and shaft.

Claim.—1. The pin E and nut J, in connection with the levers D.

2. The friction pulley, constructed and arranged substantially as described and for the purpose specified.

80,025.—SAMUEL STANTON, Newburg, N. Y.—*Cut-Off Valve Gear.*—July 14, 1868.—When the fly-wheel shaft increases its speed by reason of a diminution of duty, or from other cause, the governor arms are thrown out, and the flange and ring turned so as to cause the valves to be more quickly closed, and the speed reduced to the standard.

Claim.—1. The combination of the bent levers H H, rollers upon the pins *j*, and the cams *g g'*, for opening and closing the valves, as herein shown and described.

2. The sleeve G, wheel F, flange *c*, and ring *e*, in connection with the governor and the valve levers H H, all arranged to operate in the manner as and for the purpose set forth.

80,026.—D. M. STEWARD, Dayton, Ohio.—*Car Coupling.*—July 14, 1868.—The tongue of the T-shaped pin falls into a slotted bar, and engages the coupling link.

Claim.—The pin C, with handle D, fastened by the eye bolts *a a*, in combination with the slotted bar B, which forms the coupling chamber, all constructed and arranged substantially as described and for the purposes specified.

80,027.—JAMES SWAN, Seymour, Conn.—*Manufacture of Auger Bits.*—July 14, 1868.—The formation of the point, lips, and spurs is accomplished by means of a pair of dies, an ordinary drop press being used. One of the dies is formed with recesses or cavities, which preserve the material of which the spurs are formed, and leave the blank, when pressed, with the lip and the cutting edge between the latter and the screw point.

Claim.—1. As my improvement of the dies B and C, the cavities *e c*, for preserving the material for the spurs *c c*, as described.

2. As my improvement in auger blanks, the projecting portions *b c d'* of metal of which to form the

lip and spur of the form, and arranged relative to the screw point and cutting bit, as described.

80,028.—W. H. TEAL, Weyauwega, Wis.—*Machine for Forming Sheet-Metal Pans.*—July 14, 1868.—The dies grasp the metal plate, and the formers bend it so as to form square corners. A single movement of the apparatus produces a square metal pan.

Claim.—A machine for forming sheet metal pans, consisting of an upper die, H, hinged to a lower die, E, provided with formers *g*, so that both dies may be firmly locked together, and the whole operated simultaneously with the lever B and actuating guides D C, substantially as herein described.

80,029.—H. M. TEASDALE, Dansville, N. Y.—*Compound for Roofing.*—July 14, 1868.—Coal tar, sand, ashes, plaster of Paris, white lead, and salt.

Claim.—The combination of the within-specified ingredients, when compounded in or about the proportions described, for the purpose set forth.

80,030.—WILLIAM R. THOMAS, Catasauqua, Pa.—*Steam Pump.*—July 14, 1868.—An arrangement whereby the steam is made to actuate the valve without the intervention of valve gear.

Claim.—The arrangement of the ports *e e'*, with relation to the cylinder A, the chambers *a a'*, valve G, induction ports *b b'*, and the eduction ports *d d'*, all operating as described, for the purpose specified.

80,031.—NATHAN THOMPSON, Brooklyn, N. Y.—*Cutting Nippers.*—July 14, 1868.—The supporting pieces applied to the jaws, which effect the double connection between the jaws and the handle, and enable wire to be cut without twisting or fracturing the nippers.

Claim.—Constructing cutting nippers, so that the cutting edges thereof shall be as close as possible to the knuckle which surrounds the pivot on which the jaws turn, or shall be even closer to the pivot, with the knuckle projecting between the divided edges, as described, and so also that there shall be a double connection between the jaws and the handles, one part of each connection being embraced by the parts of the other, in the manner substantially as herein described.

80,032.—CHARLES TIFUS, Union, Me.—*Dressing Barrels.*—July 14, 1868.—This machine is intended to chamfer and croze, at one operation, an entire set of staves, when set up and hooped to form a barrel. The series of staves is placed endwise in the guide ring, to be acted upon successively by the chamfering, hollowing, and crozing cutters.

Claim.—The arrangement and combination of the separate levers or treadles *r s*, the collars *p q*, and bent levers *n n'*, with one another and the shaft B, the cutter head A, and the cutter carrier E G, such head and carriers being provided with cutting and a guide ring, D, as set forth.

80,033.—JOHN S. TOAN, King's Ferry, N. Y.—*Horseshoe.*—July 14, 1868.—The rubber sole relieves the horse from the shocks and discomfort commonly experienced in traveling upon pavements. It also prevents slipping. One of the walls of the groove may be removable to facilitate the removing and replacing of the sole.

Claim.—1. A horseshoe, provided with a nail flange, D, and an India-rubber sole, substantially as described.

2. The clamps F F, for the purpose of readily securing and removing the India-rubber sole E, substantially as described.

80,034.—A. N. TOWNE, Chicago, Ill.—*Lock Nut.*—July 14, 1868.—The contiguous faces of the nut and washer are corrugated, to prevent the nut from being turned off by jars, concussions, or vibrations.

Claim.—The corrugated nut D and washer E, constructed as described, when used in combination with an elastic packing or washer.

80,035.—A. J. TRUXELL, Salem, Va.—*Lard Press and Sausage Stuffer.*—July 14, 1868.—The latch fastens the cup to the bench. The sausage meat is forced by the follower through the strainer

and into the skin or sack which is drawn over the spout.

Claim.—The combination of the removable cup E formed with a concave bottom and spout F, and provided with a perforated plate, C, with the bench A, lever C, follower D, and pivoted latch H, all constructed and operating as set forth.

80,036.—R. J. TRYON, La Crosse, Wis.—*Compound for Welding.*—July 14, 1868.—Bo:ax, sal-ammoniae, black oxide of manganese, prussiate of potash and red oxide of iron.

Claim.—The welding flux or compound, substantially as described.

80,037.—BAKER VAN AUSDALL, Keokuk, Iowa.—*Boot Sole.*—July 14, 1868; antedated July 6, 1868.

Claim.—As a new article of manufacture, a flexible wooden boot sole and heel, formed of independent sections of wood riveted to the leather inner sole, as herein described, for the purpose specified.

80,038.—ACHILLES J. VAWTER, Indianapolis, Ind.—*Office Bed.*—July 14, 1868; antedated July 10, 1868.—The construction of the hinge permits the shutter to be readily detached from the case when desired. The legs or supports for the outer ends of the shutter, when turned down, also serve to fasten it when closed.

Claim.—The case A, having a front, B, which is hinged at the bottom in the manner specified, the inner face of said front being provided with a bed, C, which is supported either in a horizontal or vertical manner, by means of the legs I I, the various parts being constructed and operating as specified.

80,039.—GEORGE WHARTON, Jerseyville, Ill.—*Gang Plow.*—July 14, 1868.—Devices to facilitate the raising and lowering of the plows, and adapt the machine to undulations and sloping surfaces.

Claim.—1. Constructing the axle of two parts, H I, connected by a joint, c, in combination with the two levers J J', all arranged and applied substantially in the manner as and for the purpose set forth.

2. The foot lever M, connected with one of the beams A, and to the post h of the axle, as shown, in combination with the shaft L^x, secured to the axle, and having the front ends of the beam A fitted loosely to it, all arranged to operate substantially as and for the purpose specified.

3. The treadle platform D, draught pole E, and the lever F, connected to the draught pole by chain b, all combined and arranged substantially as and for the purpose set forth.

80,040.—ANDREW WHELDEN, South Dennis, Mass.—*Lantern.*—July 14, 1868.—The gas burns at the edge of the deflector. The base has a register to regulate the admission of air, and the burner is inclosed within a jacket having a perforated top surmounted by the deflector. The arrangement reduces liability of casual extinguishment of the flame.

Claim.—The perforated base B and band F, in connection with the jacket D, provided with a perforated top, a, and the plate or deflector E, all being constructed, arranged, and applied to a lantern, substantially as and for the purpose set forth.

80,041.—ALBERT M. WHITE, Thompsonville, Conn.—*Railway Car Seat.*—July 14, 1868.—The grooves of the end frames or standards, and the pins on the ends of the back enable the back to be readily reversed.

Claim.—The studs a a' and grooves f f and g g, in combination with a car seat, substantially as described, and for the purposes herein set forth.

80,042.—HENRY G. WILLIAMS, Providence, R. I.—*Die and Plunger.*—July 14, 1868.—A method of forming tin and other metallic boxes, and covers for the same.

Claim.—The die A, when its upper inside edge is fluted or serrated as described, whereby the tin or other metal to be struck up is crimped evenly to prevent the uneven lapping and consequent breaking of the metal as herein set forth.

80,043.—THOMAS WILSON, Birmingham, England.—*Breech-Loading Fire-Arms.*—July 14, 1868.—The rotating handle or collar is employed for locking the closing plug prior to the discharge of the gun. The jointed catch or sere holds the hammer in cocked position.

Claim.—1. The combination, with the breech shoe or shoe cap, of the breech plug, and a spring-locking collar or handle, attached to but having a rotary movement independent of said plug, together with the self-engaging lugs, or their equivalents, for holding the collar to the breech shoe in the manner specified, so that when the breech plug is pushed up to close the breech, the said collar shall be first partially rotated in one direction by the action of the said lugs in entering the openings or recesses in which they are held, and then, by the action of its spring, rotated in the opposite direction, to effect the engagement of the lugs, and the consequent interlocking of the collar and breech shoe, substantially as set forth.

2. The rotating locking collar, with its lugs and inclosed spring, constructed and combined with the breech plug, upon which it is mounted in the manner specified, and arranged to operate in connection with the rear of the breech shoe or shoe cap and the beveled openings and annular space formed in said shoe for the reception of the lugs, substantially as and for the purposes set forth.

3. The combination, with the breech plug and sliding hammer, of a spring stop and guide, h², for guiding the said plug and hammer and for holding and releasing said hammer, substantially as shown and set forth.

4. The combination, with the slotted tubular breech plug and the spring stop and guide, h², of the inclosed sliding hammer and its jointed, catch and sere, both the said stop and the catch or sere being arranged so as to lie partly within the slot in the tubular breech plug, substantially as herein shown and set forth.

5. The safety slide or bolt v under the breech shoe or shoe cap, for preventing the accidental retraction of the detent or stop h², constructed and arranged to operate in connection with the locking handle or collar, in the manner shown and specified.

6. The combination and arrangement, with the rotating locking handle or collar, of the locking check bolt for preventing the movement of the trigger until the collar and the breech plug are securely fixed or locked in their places, substantially in the manner set forth.

7. The combination of the trigger check bolt, and the safety slide for locking the detent, with the sliding breech plug and its rotating locking handle or collar, under the arrangement and for operation as set forth.

80,044.—PETER WINNEGARD, Coldwater, Mich.—*Device for Sharpening Horseshoe Calks.*—July 14, 1868.—The square projection of the block is inserted in the hole of a common anvil, and the oblique opening receives the horseshoe whose calk is hammered upon the block.

Claim.—The block A, constructed substantially in the manner and for the purpose specified.

80,045.—CHARLES WRIGHT, Newark, N. J.—*Friction Clutch Pulley.*—July 14, 1868.—In the act of adjusting the set screw the eccentric is turned so as to bring the line of pressure between its pin and the screw to the point which best enables the ready and effective action of the combined leverage, thus maintaining the most favorable distance which would otherwise be constantly varying from wear.

Claim.—1. The set screw X, when employed in a friction clutch, substantially in the manner and for the purposes specified, the nut being in the stem of the block C.

2. The sliding arm E, link w, and eccentric, D, in combination with the adjustable block C, when constructed, combined, and arranged in the manner and for the purpose hereinabove set forth.

80,046.—HENRY W. ADAMS, Philadelphia, Pa.—*Kiln.*—July 21, 1868.—This invention consists of a covered air-tight kiln in which a powerful draught is produced by means of a jet of steam made to

draw alike from all parts of the kiln, together with a means of introducing large or small quantities of air and steam into the fireplaces so as to promote perfect combustion and impart a uniform degree of heat to all parts of the kiln.

Claim.—1. The peculiar arrangement of the numerous and narrow heat-distributing flues *y*, at right angles to and in combination with the covered fireplaces *C C*, for receiving, dividing, and conveying their heat underneath the entire bottom of the bricks, when set in the kiln to be burned, substantially as described.

2. The air flues *H H D D*, in combination with the openings *G G F F* into the fireplaces *C C*, substantially in the manner and for the purposes set forth.

3. The steam pipes *R S T T* in Fig. 1, and passages *F F* and flues *E E* in Fig. 2, in combination with the fireplaces *C C*, for the objects indicated, and substantially in the manner shown.

4. The arrangement of the pipes *p o² o², o¹ o¹, o³, and o*, in combination with a covered brick kiln, for exhausting the smoke and gaseous products of combustion and superheated steam, in an equal and uniform method, from all parts of the kiln, for the objects described, and substantially as represented.

5. The use of a jet of steam to create a draught at the top or end of the brick kiln, substantially as shown and for the ends proposed.

6. The combination and arrangement of the exhaust pipe *o*, when supplied with a jet of steam, the fireplaces *C C*, and with the air flues *H H D D*, and with the openings *G G F F*, and with the steam pipes *E E* in Fig. 2, when they severally supply those vehicles of heat to the bottom of the kiln, which the steam jet, issuing from *o*, pumps from its top, as herein substantially shown and described.

7. The construction and operation of the brick kiln, substantially as shown and explained, and for the purposes set forth.

80,047.—JAMES ALBERTSON and SAMPLE C. BYERS, Richmond, Ind., assignors to JAMES L. HAVEN and JAMES L. BRANSON, Cincinnati, Ohio.—*Hand Loom.*—July 21, 1868.—Outside the forward sprocket wheel is a compound crank to the wrist of one portion of which is connected a pitman having its opposite end pivoted to the batten. On the shaft which carries the rear sprocket wheel is a series of cams so arranged as to operate the treadles in regular order or in any order desired, so as to produce a variety of cloths.

Claim.—The combination of the driving shaft, having the sprocket wheel *B* mounted thereon, and having the batten connected thereto by pitmen *E*, with the cam shaft, having the sprocket wheel *C* and the cams *n* secured thereto, when said parts are all constructed and arranged to operate substantially as described.

80,048.—STEPHEN M. ALLEN, Woburn, Mass.—*Artificial Leather Belting.*—July 21, 1868.

Claim.—1. The attaching, cementing, gluing, stitching, or naiting together of sheets for artificial leather belting or banding made from pulped animal fiber, tanned or untanned, used alone or in combination with other vegetable fiber, or with other further combination with resinous or gelatinous substances.

2. Attaching, cementing, gluing, riveting, or stitching sheets or strips of artificial leather paper for belting, made from pulped animal fiber, tanned or untanned, alone or mixed in further combination with other pulped vegetable fiber, to sheets of common leather for belting, whether the sheets of leather are laid upon either one or both sides, or between sheets of artificial leather.

3. The combination of sheets of artificial leather for belting, with sheets of leather, canvas, cloth, wood, yarn, iron, or wire, when properly attached together for the purpose, by gluing, cementing, riveting, or stitching the same.

4. The overlapping and strengthening of joints in leather, artificial leather, or other belting, by the use of artificial leather sheets, set on and over the laps or joints in belting, by cementing, gluing, riveting, or stitching the same, substantially as within described.

5. A belting made of pulped artificial leather, as described, by combining sheets made of the same to the other substances named, or any of them, as de-

scribed, such as leather, canvas, cloth, wood, yarn, iron, or wire, properly set together in the manner and for the purposes substantially as described.

6. The application of artificial leather paper to veneer and increase the thickness and strength of leather belting by applying the same to the softer and thinner parts of leather belting, making them of uniform thickness, and nearly non-elastic either when applied outside or between strips of leather, and confined substantially as herein described.

80,049.—WILLIAM B. ALLYN, Boston, Mass.—*Key Board for Telegraph Instrument.*—July 21, 1868.—A separate key is provided for every character used, each key being so constructed that one depression will produce its respective letter or character complete.

Claim.—1. The wheels *E*, the uprights *D D*, one or two to each key, the roller *H*, when constructed and operating as herein shown and described.

2. The rod *M*, in combination with the arms *N* or their equivalents, substantially as described, for the purpose set forth.

80,050.—TRUMAN S. ANGEL, Watertown, N. Y.—*Machine for Sharpening Hop Poles.*—July 21, 1868.

Claim.—A tool for sharpening sticks, stakes, and poles, consisting of a hollow frustum of a cone, having inserted longitudinally in its shell conical rollers, and an adjustable oblique cutting knife, all constructed and arranged to operate substantially as described.

80,051.—PHILIPP BANTEL, New York, N. Y.—*Chronometer.*—July 21, 1868.—The propelling part of the gearing is so arranged as to obtain a very slow, steady, and constant initiatory movement, the instrument being designed to keep correct time for years, without adjustment, or regulating, or even winding up.

Claim.—1. The combination of the shafts *B* and *O*, one or both, and large gear wheel *D*, said parts being constructed, as described, with the ordinary clockwork of a chronometer, substantially as and for the purpose set forth.

2. The combination of the self-adjusting screw pulley *G* and stationary screw *H* with cord *C* and shaft *B*, substantially as herein shown and described, and for the purpose set forth.

3. The swiveled pulleys *I* and *K* in combination with the cord *C*, weight bar *J*, and pulley *L*, or its equivalent, substantially as herein shown and described, and for the purpose set forth.

80,052.—BENJAMIN F. BRATTAIN, Noblesville, Ind.—*Portable Fence.*—July 21, 1868.—The yoke is so constructed as to serve at once as a key and a hinge, and admits of each panel of the fence being used as a gate.

Claim.—The yoke herein described, when the same is constructed as aforesaid, in combination with a panel of fence, the rails of which are notched, as described and for the purpose specified.

80,053.—JOSEPH BRETT, Geneva, Ohio.—*Mode of Mulching Strawberry Beds.*—July 21, 1868.—Mulch is grown upon the ground in the fall, and when winter-killed, will fall upon and protect the plants, and serve as a covering for the earth during the spring.

Claim.—The mode of mulching strawberry beds by sowing thereon the seeds of plants, the stalks or blades of which are intended to serve as a mulch therefor, substantially as set forth.

80,054.—R. W. BROCKWAY and HENRY FREDERICK, Akron, Ohio.—*Fence.*—July 21, 1868.—Two uprights are fastened to a bed piece and between the uprights the ends of the rails are fastened. The upper ends of braces fit under cross-ties in the uprights.

Claim.—1. A crooked or angular rail fence, the joint of which rests upon a bed piece, *A*, with the uprights *C C* fastened at or near one end of the bed piece, while the long end of the bed piece projects into the hollow of the angle of the fence, substantially as shown and described.

2. The combination of the bed pieces *A*, uprights

C C, braces G H, and stubs or legs B B, substantially as and for the purposes set forth.

80,055.—EDMUND D. BROWN, Battle Creek, Mich.—*Pole for Vehicles.*—July 21, 1868.—The bow is made elastic, and so connected to the arm braces as to be readily adjusted to correspond with the coupling clips of any vehicle.

Claim.—The arrangement and combination of the spring bow C and slotted arm braces B with each other, and with an ordinary vehicle pole, A, substantially in the manner and for the purpose of adjustability, as set forth.

80,056.—JOHN DICKINSON BRUNTON, London, England.—*Machine for Sinking Shafts.*—July 21, 1868; patented in England January 5, 1867.—The parts are so arranged as to combine orbital and planetary motions, together with another spiral motion, which cause the cutters, as they revolve, to cut or split the face of the rock into a spiral form, having a pitch or angle of progress dependent, in some degree, on the nature of the rock acted on.

Claim.—The construction and application of machinery or apparatus for sinking shafts and pits, and for driving or excavating tunnels, galleries, or adits, wherein one or more cutting disks are caused to revolve on their own axis or axes, such axis or axes revolving round a center, which also revolves round another fixed center, substantially as hereinbefore described.

80,057.—LOUIS CHRISTOPH, Paris, France, WILLIAM HANKSWORTH, Gartness, North Britain, and GUSTAVUS PALMER HARDING, Chiswick, England.—*Apparatus for Drawing Metals.*—July 21, 1868; patented in England, April 10, 1862.—This invention consists in the employment of a hydrostatic or hydraulic cylinder and ram, the griper bars being secured to the end of the ram, while the draw plates are fitted into a suitable support or flange cast on the cylinder.

Claim.—The combination of the hydraulic or hydrostatic press, the collars or flanges K G thereof, and drawing apparatus, substantially as hereinbefore described.

80,058.—ZACHARIAH T. CLAGETT, Washington, D. C.—*Corn Planter.*—July 21, 1868.

Claim.—1. The diagonal shaft F and scraper F², in connection with the cog wheel E, constructed as described, the lever O, spring O', slide A², axle D, wheels D², H', D¹, C and H, and also the bar B, constructed as specified, Also, in connection with the wheels H' and H, I claim the support I, with lever K and catch K', and spring T attached, working in the manner and for the purpose described. Operating together with slide A² I claim slide R and lever S, arranged as and for the purpose set forth. In connection with the scraper F², the bow V, for the purpose set forth.

2. The arrangement of the arms L, constructed with wheels L², bars L³, wheels M, and cranks M¹, substantially as and for the purpose set forth.

2. The levers Q, with cords or chains, as described, in connection with the drill-teeth P¹, tube P², and corn-coverers P³, joined to bars P by a joint, as shown in drawings, and supports U, substantially as and for purposes set forth. In combination with lever O, the catches Q', arranged for the purpose set forth.

80,059.—A. M. CONNETT, Madison, Ind.—*Boring Machine.*—July 21, 1868.—The lower bar of the brace is formed with a rectangular section, and is connected with the crank at right angles, so that cutters or bits may be attached thereto, for cutting large circles in wood, &c.

Claim.—The locking-sleeve B, having the inner face of its under side beveled, to receive a bit D, in combination with the arm of a bit-stock, constructed to operate substantially as and for the purpose herein specified.

80,060.—GILES CRAMTON and PRATT A. SPICER, Marshall, Mich.—*Three Horse Equalizer.*—July 21, 1868.—The sheave is so constructed that when it is vibrating back and forth, by reason of the single horse in the middle, or the team of two outside get-

ting alternately a little ahead, the relative leverage is constantly maintained.

Claim.—Providing the sheave A with a polygonal or other suitably shaped shifting eye plug, said plug to be inserted in a position either concentric or eccentric, with the equalizing rims of the sheave, and perforated with either one or all of the pivot holes *i m n*, substantially as and for the purpose herein set forth.

80,061.—WILLIAM CRANDELL, Philadelphia, Pa.—*Shaft Coupling.*—July 21, 1868.—By arranging the bars or links nearer to the shaft than the screws or bolts, the latter can be tightened by a comparatively slight force.

Claim.—1. A coupling, composed of two halves, connected together on one side of the shaft by bars or links B and B', or their equivalents, and on the opposite side of the shaft by set screws or bolts, all substantially as set forth.

2. Arranging the said bars or links, or their equivalents, nearer to the shaft than the said screws or bolts, as and for the purpose set forth.

3. The bars B and B', imbedded in the coupling during the process of casting the same, as specified.

4. In combination with a gripping coupling, set screws F, applied to prevent the end play of the shafts, as set forth.

80,062.—EDWIN DAY, Chicago, Ill.—*Cutlery.*—July 21, 1868.—The tang is inserted in the handle and molten metal is poured in and fills the recesses left in the mold and handle, thus forming in a solid piece the bolster straps and the tie.

Claim.—The handle B, with the tang *a* inserted therein, and having the locking recess *e*, or its equivalent, with the molten metal cast on them, so as to form the bolsters *m*, straps *n*, and the cross-bar or tie *l*, of greater diameter than the slit in which the tang is inserted, all at one operation, substantially as described.

80,063.—ROBERT SEELEY EGBERT, Colfax, Cal.—*Manufacture of Ice.*—July 21, 1868.—A water pipe or pipes pierced with small holes, extend through a proper inclosure, through which perforations water drops in the form of spray, congealing as it falls.

Claim.—Forming artificial ice in houses or receptacles by spray, sprinkling or dropping water through a pipe or pipes, C, or vessels, pierced with holes *a a a*, or their equivalents, substantially as described.

80,064.—W. C. GAULT, Ruggles, Ohio.—*Stock Guard Gate.*—July 21, 1868.—As the water rises during a flood, the wooden weight will be elevated, and force a hook from a catch, when the gate will be released and fall down in the direction of the stream, to allow of the passage of drift wood, &c. As the flood subsides, the gate will be drawn back to a vertical position.

Claim.—The weight or float H, rope or chain G, lever F, and hook I, as arranged in combination with the gate A, substantially as and for the purpose set forth.

80,065.—ROBERT GEORGE, Mineral Point, Wis.—*Furnace for Roasting and Treating Ore.*—July 21, 1868.

Claim.—1. An oxidizing, desulphurizing, chlorifying, and disintegrating furnace, as shown in the drawings, and detailed in the specification.

2. A stirring machine, with all its parts, as illustrated and specified.

3. A water and heating apparatus, as illustrated, and for the purpose described.

4. The substitution of fire clay or porcelain tubes, or their equivalents, for the purpose of converting water into steam, and superheating the same.

5. The cooling of the stirring machine by air, steam or water, used separately or combined, in the manner and for the purpose as described and set forth.

80,066.—JOHN B. GIBSON, Cincinnati, Ohio.—*Valve Cock.*—July 21, 1868.—The valve stem is fitted in a screw-threaded cap, and terminates in a grooved collar encircled by a rubber band or ring. An upper

and lower collar on the valve is encircled by a rubber ring. A rubber disk is placed in a cavity in the bottom of the valve, and the latter is secured to the stem by a recessed screw.

Claim.—1. The rubber rings G and J, as arranged, in combination with the valve H, stem E, and cap D, as explained.

2. The arrangement of stem E, valve H, recessed screw N, and rubber disk L, as and for the purpose set forth.

80,067.—HENRY T. GOODLING, York, Pa.—*Hoisting Machine.*—July 21, 1868.—Designed more particularly for hoisting and loading logs.

Claim.—The construction of a hoisting machine, arranged with a central post B, turning cross head K, provided with pulleys I, windlass, and a pivoted side lever, L, to base of post B, combined substantially in the manner and for the purpose specified.

80,068.—MATTHEW GORMLEY, Wilna, N. Y.—*Machine for Cutting off Nails.*—July 21, 1868; ante-dated July 7, 1868.—Designed more particularly for cutting off the heads of horseshoe nails. The shank or bar is clamped in the jaws of a vise and provided with uprights bent over flanges, between which a cutting tool is arranged to slide across the opening in the said bar.

Claim.—The shank B, having arms H H, flanges C C, and opening E, in combination with the sliding cutter D, rods G G, and springs, all constructed, arranged, and operating substantially as and for the purpose specified.

80,069.—THOMAS J. HARRISON, New York, N. Y., assignor to himself and GEORGE ALLIN, same place.—*Machine for Bending Pipe.*—July 21, 1868.—A pair of bifurcated hand levers are pivoted upon stationary formers, and are provided with rollers in their forked ends, both formers and rollers being formed with semicircular recesses corresponding to the contour of the pipe to be bent.

Claim.—The arrangement herein described of the formers C C, rollers E E, and bifurcated levers D D on the platform A, in the manner substantially as and for the purposes described and set forth.

80,070.—MICHAEL HENDERSON, Detroit, Mich.—*Potato Digger.*—July 21, 1868.—The scoop is secured to the front ends of longitudinal bars provided with transverse runners placed underneath the same. A series of brooms attached to endless chains clean the potatoes and carry them to the rear end of the apparatus.

Claim.—1. The scoop A, connected with the bars J and B, provided with transverse runners O, and openings 4, when arranged and operating substantially as and for the purposes set forth.

2. The cylinders H, bars K, and belts I, when operated by belts F from pulleys D, substantially as described, and for the purposes specified.

3. The combination of the above named parts with frame G, bars K, brooms or brushes 3, secured to endless belts I, axle N, and wheels D, when constructed, arranged, and operating substantially as and for the purposes set forth.

80,071.—ROBERT HENEAGE, Buffalo, N. Y., assignor to himself and IRA R. AMSDEN.—*Insole for Boots and Shoes.*—July 21, 1868.—The air cushion consists of a flat India-rubber or flexible bag overlying the whole length and width of the stiffener, which latter forms a support or base, and is perforated to make it lighter and to render it easily attachable by means of cement to the cushion.

Claim.—1. An insole for boots and shoes, attached or otherwise, consisting of an air cushion or chamber with suitable attachments, as a new article of manufacture.

2. Constructing the sole with a perforated base plate or stiffener, *a*, an overlying air cushion *b*, and an outer covering *c*, the cushion being united with the plate by cement or glue that passes through the perforations and holds on the opposite side, the whole arranged as described, and operating substantially in the manner and for the purpose specified.

80,072.—MICHAEL HENNASY, Crawford, N. J., assignor to himself and JOHN ADAMS, same place.—*Claw Bar.*—July 21, 1868.—To an ordinary claw bar is attached a short claw bar by means of lips pivoted to a pin. On the opposite is a projection serving as a fulcrum.

Claim.—The claw bar B and fulcrum E, in combination with the claw bar A, substantially as and for the purpose specified.

80,073.—HIRAM HERRICK, Boston, Mass.—*Piano Forte.*—July 21, 1868.—The iron frame, sounding board, wrest-pin block, strings, and action are arranged in two separate cases, hinged together so as to enable the said frame, sounding board, and strings to be turned up or off the action in order to gain ready access to either of the same. With each string and its tuning pin are combined one or more auxiliary adjusters, to enable the string to be turned to a nicer degree than by its tuning pins.

Claim.—1. The improved arrangement of the sounding board, the "wrest-pin" block, and the bridges with respect to the iron frame and the strings, such sound boards, strings, wrest-pin block, and bridges, under such an arrangement, being placed underneath the iron frame and above the strings.

2. The combination of the two separate cases A B, hinged together, as described, with the action arranged on the lower one, and the sounding board and strings placed in the upper one, as set forth.

3. The combination of the auxiliary adjuster with the string, the tuning pin, and bridge.

4. The improved arrangement of the tuning pins with the strings and the wrest-pin block, or the same and the iron frame, the tuning pin, under such arrangement, having its head to extend from one side of the said block, and having the string applied to the part which projects from the other side of the block, the whole being substantially as set forth.

80,074.—JOHN A. HEYL, Boston, Mass., assignor to himself and JOHN H. WIGGINS, same place.—*Horseshoe.*—July 21, 1868.—The connector consists of two jaws which clasp the sides of the hoof and are provided with four catches, two of which are hinged together and extend under inclined edges in the recess of the toe, the other two catching in the heel recesses of the shoe. The catches are secured to the connector by a screw.

Claim.—1. The connector B, as described, that is, as consisting of the jaws and toe and heel catches, arranged, constructed, and combined substantially in manner and to operate with a hoof and with a shoe, constructed essentially as set forth.

2. The shoe as made or provided with toe and heel catch recesses to receive the catches of the jaws of the connector B, constructed as described.

3. The combination and arrangement of the standard *f* and its screw *g* with the shoe, provided with toe and heel recesses to receive the connector B, made substantially as described.

4. The combination of the standard *f* and its screw *g* with the shoe A and the connector B, made in manner and so as to operate together substantially as specified.

80,075.—JAMES MAZE KILNER, Chester, England.—*Apparatus for Towing Vessels.*—July 21, 1868; patented in England April 4, 1867.—A cleaver trunk extends down through the vessel from its upper deck through its bottom, the cleaver being suspended in the same by means of ropes, so that it may project beyond the keel, and serve to keep the tow chain free from contact with the keel and lower part of the hull.

Claim.—1. The combination and arrangement of the cleaver and its trunk with the hull of a vessel, so that the cleaver may be operated as described.

2. The cleaver, constructed as represented in Fig. 6, and as hereinbefore described.

3. The arrangement of the tow chain, viz, so as to be fastened to a vessel near or below its keel, as set forth.

4. The combination and arrangement of the tow chain and the cleaver of a vessel to be towed, such chain being passed through and out of the cleaver, as set forth.

80,076.—J. A. LAKIN, Thompsonville, Conn.—*Stove Pipe Drum.*—July 21, 1868.—A series of cylindrical conically-capped chambers are connected to the main flue by means of pipes which conduct the smoke and heat to the upper portion of said chambers, the smoke, &c., escaping through pipes opening near the bottom of the chambers again to the main flue.

Claim.—The arrangement of a number of radiating chambers A, connected to the main pipe by means of the pipes B and C, and operated by means of a damper D, the parts being combined and arranged together in the manner herein shown, and for the purpose set forth.

80,077.—CLEMENT LITTLEFIELD, Kennebunk, Me.—*Measuring Lumber.*—July 21, 1868.—The invention consists in adapting logarithms to a circular movable form or disk rotating around an iron disk.

Claim.—The application of logarithms to a circular movable form, with a double radius mathematically divided, so that one part works in conjunction with the other, substantially as and for the purposes specified.

80,078.—MILTON LOVE, CORTY, Pa.—*Machine for Saving Cream while Churning.*—July 21, 1868.—To the underside of the lid of the churn is attached a cylindrical piece of metal, perforated at the top. To the bottom of this is attached a ring having on its inside an inverted tunnel and with another ring at the bottom of the same.

Claim.—The combination of the air chamber *a a* and *b b* with the inverted tunnel *d d d*, and the ring *g g*, for the purposes herein mentioned.

80,079.—FREDERICK S. MACK, Galesburg, Ill.—*Floor Clamp.*—July 21, 1868.—The spring and slide are so arranged that the flooring may be clamped by the slide being forced against the flooring by the pressure of the lever on the roller, the spring forcing the slide back when the clutch is released.

Claim.—The arrangement of the coiled spring H, for forcing the slide or driver G back, and the roller g, for relieving the driver of friction when operated upon by the lever F in clamping the flooring, in the manner as herein shown and set forth.

80,080.—JOHN MARTIN, Philadelphia, Pa., assignor to himself and JACOB JAMISON, same place.—*Refrigerator.*—July 21, 1868.—A longitudinal V-shaped trough holds the ice, and the water is conducted to a closed vessel below. Boxes or dishes placed under the ventilators contain substances or chemicals for purifying or impregnating the air with gases.

Claim.—The ice box or refrigerator A, having the ice trough B arranged along its center, with an open space on each side, with the drip spout D located thereunder, and both connected with the reservoir G, and having the receptacles C, all arranged substantially as shown and described.

80,081.—JOHN MATHEIS, Ottawa, Ill.—*Machine for Punching Leather Straps for Fly Nets.*—July 21, 1868.—The pulley or drum is composed of cast iron covered with a rim of sheet brass, upon which the strap is placed. Holes are made in the strap by hollow punches attached to a reciprocating head or frame.

Claim.—1. The pulley D, and brass rim E, the hollow punches M M, the rod L, the pitman J, and the crank I, when combined with each other in a machine for punching straps for fly-nets, and constructed substantially as and for the purpose described in the foregoing specification.

2. The ratchet wheel O, the pawl P, the lever Q, the rod R, the crank H, the pawl S, and the eccentric T, when combined with each other in a machine for punching leather straps for fly-nets, substantially as and for the purpose described in the foregoing specification.

3. The elastic guide V, when applied to the machine for punching leather straps for fly-nets, substantially as and for the purpose described.

80,082.—FREDERICK B. MILES, Philadelphia, Pa., assignor to BEMENT & DOUGHERTY, same place.—*Valve Gear for Steam Hammers.*—July 21, 1868.—The parts are so arranged that such variable differ-

ential movements may be imparted to the valve from the lever that the valve will be operated quickly at each end of the stroke, and more slowly at the middle of the same, and that the quantity of steam used will be proportionate to the work required.

Claim.—The slotted lever G, arranged to slide and vibrate on an adjustable fulcrum, and constructed and operating in connection with the ram of a steam hammer, or with the piston-rod, or other reciprocating part of a steam hammer or engine, substantially as and for the purpose set forth.

80,083.—S. A. MILLARD, Clayville, N. Y.—*Machine for Rolling Hoe Blanks.*—July 21, 1868.—The rolls are provided with funnel-shaped dies into which the tongs are placed, and which serve as guides to adjust the blank laterally, so as to insure the passage of the shank properly between the dies.

Claim.—1. The construction of the projecting dies *o o*, together with their arrangement on the projecting portions of the revolving rolls B C, as described, said dies being for the purpose of spreading the blank laterally in the manner described.

2. The construction of the projecting dies *f f*, together with their arrangement on the projecting portions of the revolving rolls B C, as described, said dies being for the purpose of spreading the blank laterally and giving form to the rib on the surface of the hoe in the manner described.

3. The construction of the projecting dies *t t*, together with their arrangement on the revolving rolls B C, as described, said dies being for the purpose of spreading the metal to form the ears of the hoe, in the direction and in the manner described.

4. In combination with the rotary rolls B C, a set of plating dies *m m*², constructed as specified, the whole arranged to operate as described, for the purpose set forth.

5. The employment, in combination with a set of rotary dies, of adjusting guides, arranged on the face of the roll, and operating to effect the adjustment and retention of the blank, substantially as hereinbefore described.

80,084.—JOHN A. MOORE, Providence, R. I.—*Roofing Cement.*—July 21, 1868.

Claim.—The manufacture of a roofing cement, by mixing with coal tar, or other similar substance, alumina, plumbago, asbestos, carbon, silica, iron, lime, and magnesia, in the proportions substantially as described, in the manner and for the purposes specified, whether found in nature or prepared by art.

80,085.—MAURICE O'CONNELL, Boston, Mass.—*Apparatus for Checking Horses Attached to Vehicles.*—July 21, 1868.—An arrangement of gearing, in connection with a shaft, by which a check rein attached to the horse is brought into operation by means of a lever, to prevent a horse from running away.

Claim.—The combination and arrangement of the two gears 1 1, the two pinions 2 2, the shaft 4, the barrel 3, the yoke 5, and the slide 6, as applied to the two wheels and their axle, and as provided with a chain and hook, the whole being as and for the purpose specified.

80,086.—BARTHOLOMEW OERTLY and XAVIER FENDRICH, Washington, D. C.—*Composition for Coating Metals, &c.*—July 21, 1868.

Claim.—A composition for coating stone, brick, iron, or wood, or for floor tiles, or similar articles, composed of soluble glass and marble dust, substantially as described.

80,087.—JAMES T. PAGE, Rochester, N. Y.—*Scoops, Shovels, &c.*—July 21, 1868.—The scoop or shovel is made from a single piece of sheet metal, and formed by dies, so that the rear end constitutes a stiffened handle or a socket for the insertion of a wooden handle.

Claim.—The scoop A, or equivalent, made from a single sheet of metal, and combining with the blade *a* the tubular socket *b*, at the rear, constructed and arranged as described and for the purpose specified.

80,088.—JAMES H. PRENTICE, Ashtabula, Ohio.—*Lamp Extinguisher.*—July 21, 1868.—A cap or ex-

tinguisher is so arranged and connected with a weighted rod, that in the event of the lamp being tipped or turned to one side, the cap will be forced by a spring upon the tube and extinguish the flame.

Claim.—1. The pendulum E, disk *b*, in combination with the stem *a*, yoke D, and extinguisher C, substantially as and for the purpose set forth.

2. The screw pendulum E, stem *a*, and lever K, in combination with the yoke D, extinguisher C, spring I, and tube B, substantially as and for the purpose set forth.

80,089.—WILLIAM RALPH, Utica, N. Y.—*Curd Mill.*—July 21, 1868.—The curd is forced between the ribs or grate bars by the teeth on the cylinder, without grinding it or reducing it to paste.

Claim.—The box A, cylinder B, armed with teeth, as described, and semi-circular grate bars C, so arranged as to form the bottom of the box A, all in combination, as specified.

80,090.—GEORGE REHFUSS, Philadelphia, Pa., assignor to AMERICAN BUTTON HOLE OVERSEAMING and SEWING MACHINE COMPANY.—July 21, 1868.—The under side of a bent and slotted plate is cut away to form a recess, and at one end of the same is a spring so arranged as to fold the edge of the fabric for hemming the same.

Claim.—The within-described hemming device, consisting of the plate A and the spring *d*, constructed as shown, and arranged and operating substantially as and for the purpose herein set forth.

80,091.—S. B. REPLOGLE, Martinsburg, Pa.—*Bee Hive.*—July 21, 1868.—The triangular form enables the hive to be used with different sides up at different seasons of the year, so that the bees will be concentrated in the upper or narrower portion of the hive when the honey has been eaten from the center.

Claim.—1. A bee hive, consisting of a triangular box, having one side removable at pleasure, and otherwise constructed, substantially as described.

2. In combination with the above-described hive, the triangular comb frame B, made of bars having their inner edges beveled from each side to the center, as shown at Fig. 3.

80,092.—W. REYNOLDS SELFRIDGE, Greensburg, Ind.—*Ditching Machine.*—July 21, 1868.—The operative portions are connected to a frame suspended upon windlasses in front and rear, so as to admit of the scoop, &c., being adjusted centrally or at either end. The wallower consists of a horizontal wheel having spades attached to its periphery.

Claim.—1. In combination with the excavator E, the wallower or earth remover H, substantially as set forth.

2. The combined arrangement of the gravitating frame D, excavator E, conducting scoop G, wallower H, and screen O, with the frame A and windlasses K K', substantially in the manner and for the purpose specified.

80,093.—PATRICK M. SHEA, Chicopee, Mass.—*Attachment for Lamp Chimney.*—July 21, 1868.—A band of thin sheet metal is provided at one end with a slot, in which is fitted a stud having a thumb nut in the other end, by which the diameter of the band can be varied. Outwardly-projecting fingers are attached to the upper edges of the attachment as supports for a vessel to be heated.

Claim.—1. The combination and arrangement of the continuous band A, slotted at *a*, and having the stud *s* and thumb nut *s'*, fingers *f* extending outward, and small fingers *f'* extending radially inward, substantially as and for the purpose specified.

2. An attachment for the tops of lamp chimneys, composed of two or more jointed sections B, arranged so as to be adjustable in diameter, and having projecting fingers *f*, and the small fingers *f'*, extending radially inward, substantially as set forth.

80,094.—J. H. SKELLY, Aroma, Ill., assignor to himself and J. C. DANFORTH, same place.—*Cultivator.*—July 21, 1868.—The forward ends of the shovel beams are attached to arms at the top of the main frame by means of pivot rods and braces, the

object being to prevent the shovels from rising out of the ground when moved sidewise.

Claim.—1. The beam C, in combination with the pivot rod E, brace F, and arm D, the latter being arranged to swing with the beam C, and to travel on the track N by means of the roller M, substantially as shown and set forth.

2. The combination of the beam C, chain *e*, arm D, and the elbow lever H I, the latter being pivoted to the arm, and having a projecting nib for locking against its top, substantially as and for the purpose set forth.

80,095.—ASA T. SOULÉ Savannah, N. Y.—*Hay Rack.*—July 21, 1868.—The rack is constructed of straight beams or cross pieces, and secured to an ordinary wagon box by means of curved fingers and eye bolts.

Claim.—The crooked bolts *c c* and pins *c'*, in connection with the eye bolts *d*, box A, and rack B *b*, substantially as and for the purpose described.

89,096.—JOSEPH H. SPRINGER, Philadelphia, Pa., assignor to himself, JOHN M. HESS, and SMITH BOWEN.—*Steam Engine Governor.*—July 21, 1868.—The receiver is pivoted with a movable cover, and also with an outlet having an adjustable valve applied to it, for regulating the escape of fluid that is forced into the receiver by a supply pump, the parts being so constructed and connected with the throttle valve, and also with the slide valve rod, that, should the speed of the engine exceed or fall short of the prescribed limit, the fluid will be forced into the receiver faster, in one case, and slower in the other, than it escapes, and thus operate upon the throttle valve.

Claim.—1. The arrangement of the regulating discharge valve K, intermediate between the reservoir G and the receiver A, and in the relation specified to the supply pipes E of the force pump F, whereby the fluid or air which flows into the receiver is made to escape therefrom faster or slower than the supply, as the case may require, and pass back into the reservoir, to be used repeatedly, all substantially in the manner herein described.

2. The arrangement of the receiver A with reference to the connections of the throttle valve of the engine, central hollow column D H, intermediate valve K, pipes E E, valves *j j*, and force pump F, substantially as set forth.

80,097.—CHARLES STARRETT, Chicago, Ill., assignor to himself and EDWARD PRESCOTT, same place.—*Horse Rake.*—July 21, 1868.—Designed as an improvement upon the patent of A. H. Chaplin, of November 25, 1862. Solid wooden blocks are attached to the forward end of flat springs which are firmly fastened to the handles, by which the cutting or chafing of the teeth is prevented.

Claim.—The springs E E, applied as shown, in combination with solid wooden blocks D D, having each a rigid inclined face, the whole constructed and arranged to operate as and for the purpose set forth.

80,098.—REUBEN C. TURNER, Mendon, Mich.—*Machine for Cutting Leather Filling and for other Purposes.*—July 21, 1868.—A series of concave knives of different sizes are attached to a plate and used in connection with a roller, held in place by a spring, over which roller the leather to be operated upon passes.

Claim.—1. The roller E, when attached to the frame F, in connection with the concave knives C, plate D, screws B, frame A, the rod G, the set screws H, and the lugs I, when arranged and operating substantially as and for the purpose herein set forth.

2. The spring J, when operating as and for the purposes specified.

80,099.—ALFRED JOHN WALE, Philadelphia, Pa.—*Knitting Machine.*—July 21, 1868.—The thread guides and cams are so arranged in connection with a circular knitting machine, in which some of the needles project outwardly beyond the others, so that a supplementary thread or threads may be imbedded in the fabric to decrease its transverse elasticity and increase its density.

Claim.—The cylinder B, with its slides and its

needles, some of which project outward beyond the others, in combination with supplementary thread guides F and cams *d*, the whole being constructed, arranged, and operating substantially as and for the purpose described.

80,100.—JAMES T. WALKER, Albany, N. Y.—*Dish Cloth Holder.*—July 21, 1868.—The cloth is drawn through the ring by the sliding hook and held securely, the object of the device being to clean the inside of a jar, piteher, &c.

Claim.—The three rods *c c c*, the ring B, and grooved handle A, in combination with the sliding rod C, with the hook D, and loop E, the whole formed substantially as and in the manner shown and described, for the purpose set forth.

80,101.—SAMUEL GUY WALLIS, Waterford, Pa.—*Balm.*—July 21, 1868.—To a proper quantity of alcohol, containing capsicum, is added oil hemlock, oil cedar, oil sassafras, oil fireweed, oil pennyroyal, oil amber, oil rosemary, spirits terebinth, and tinctures of the following: camphor, opium, gunguaniacum, myrrh, colchicum, blood root, iodine; also, aqua ammonia and chloroform.

Claim.—The improved magic balm, when composed of the above ingredients in the proportions above mentioned, for the purposes set forth.

80,102.—ISAAC WELTY, Olney, Ill.—*Sulky Cultivator.*—July 21, 1868.—An arrangement of devices for adjusting the plows for different depths and widths of rows.

Claim.—1. In combination with the outer shovels or plows H J, the lateral braces H', rendered adjustable by means of the slots *h³* and bolts *h²*, in the manner shown and described, for the purpose set forth.

2. The combined arrangement, with the inner shovels G I S, of the perforations *e e'*, for the reception of their attaching eye bolts *g*, the pulleys *n n'*, for the reception of their elevating ropes or chains K, and the perforated bars T U U, as and for the purpose specified.

80,103.—JOHN WESTOVER, Taylor, Ill.—*Elevator.*—July 21, 1868.—The apparatus is designed for raising a wagon box or hay rack filled with grain, hay, &c., in the field, for building stacks, and for raising hay to the level of the bays, the whole being provided with adjustable wheels for ready transportation.

Claim.—1. The extension arms R¹ and R², in connection with any suitable hay rack or wagon box, when used for the purposes herein described and set forth.

2. The combination and arrangement of the frame A, platform B, standards C, provided with sheaves D and guide pulleys O, the side timbers E, pedestal K, wheels J, and pins L, the shaft F, drum G, pawl H, stop I, horizontal bars M, guides N, elevator ropes P, and drag ropes Q, in connection with the extension arms R¹ and R², when constructed, arranged, and operating substantially as described, and for the purposes herein set forth.

80,104.—JAMES G. WILBUR, Kilbourn City, Wis.—*Hop Pole.*—July 21, 1868.—Two or more poles are attached to a stationary post so that they may be easily removed and replaced. The diverging tops allow of exposure to the sun and air.

Claim.—1. A hop pole, consisting of a stationary post, A, with removable diverging poles B, mounted in foot staples *a*, and held in position by cross-boards E and pins *f* and *g*, substantially as herein described.

2. A hop pole, consisting of a stationary post, A, with removable diverging poles B, and removable upright pole D, mounted in foot staples *a b*, the former held in place by the cross-boards E, pins *f* and *g*, and staple *e*, substantially as herein described.

80,105.—JAMES M. WILLCOX, Glen Mills, Pa.—*Manufacture of Paper for Collars.*—July 21, 1868.

Claim.—1. The employment of strips, B, of stronger material, applied to the paper after it is couched and while it is soft, and imbedded therein by subsequent pressure, at proper distances asunder,

to impart greater strength to the required parts of the articles to be cut from the sheets or rolls.

2. Locally strengthening paper for collars by applying, either in the sheet or roll, strips of strong material, in such positions as to protect the ends of the fold.

80,106.—L. C. ABBOTT, S. D. TUTTLE, and M. L. HOLT, Eaton, Ohio.—*School Seat and Desk.*—July 21, 1868.—The seats and desks are attached to grooved standards by means of bolts, &c., in such a manner as to enable the parts to be put together without nails and screws, and readily taken apart.

Claim.—The standards A A, provided with grooves, substantially as described, arranged in combination with seat C, desk F, and shelf D, with these projections, operating as and for the purpose set forth.

80,107.—ONOFRIO ABBRUZZO, St. Margherita, Italy.—*Aerial Car.*—July 21, 1868; antedated July 15, 1868.—The body of the balloon is of the form of a spindle or "cigar shaped," and has a reservoir provided with two pumps attached at one side. Under the body are suspended wings or paddles provided with valves which are made to open when the wings make a forward motion and close when the wings return.

Claim.—1. The reservoir B and pumps *a b*, arranged in relation to the body A, so as to increase or decrease the pressure of gas therein, all substantially as and for the purpose described.

2. In arrangement with the car and safety-rocket discharge, the propeller D mounted on crank shaft *e* and applied to the body A, substantially as and for the purpose described.

3. In combination with the balloon, a breech-loading rocket chamber attachment, with safety guard, substantially as and for the purpose described.

4. The wings or oars F, having valves *g*, operated by the engine, all substantially as described, for the purpose described.

5. The combination of the conical or acutely-formed body A, propeller D, rocket chamber H, and wings F, substantially as described, for the purpose specified.

6. An inclined parachute, arranged to co-operate with the screw or rocket, as and for the purpose described.

80,108.—EDWIN R. ADDISON, Wheeling, W. Va.—*Machine for Making Nuts.*—July 21, 1868.—The dies in this machine are arranged circumferentially of the table or bed, which latter consists of a large hollow or chambered roller mounted horizontally in the frame, the punches being arranged radially above the table. The dies are provided with perforated bottoms actuated by suitable mechanism to discharge the finished nuts from the dies previous to their immersion, and are connected with the interior of the table by suitable perforations to allow of the discharge of the punchings.

Claim.—1. The combination of the several punches herein described, and the dies on the periphery of the wheel B with the cavity B¹, for the discharge of the punchings, all arranged and operating substantially as described.

2. The arrangement, in a die wheel or shaft, which rotates in a vertical plane of the cavity B¹, passages *b*, and dies *C c c'*, all substantially as set forth.

3. The combination of the disk O, having a cam periphery, *o¹*, and a friction roller, *o*, the radial arms P, notched disk Q, and pawl R, with the table B, substantially as and for the purpose specified.

80,109.—BENJAMIN F. ALLEN and J. R. RYERSON, St. Albans, Me.—*Fastening for Boots and Shoes.*—July 21, 1868.—The heel is hollow and made of metal with an opening on the front side. The adjustable bottom is secured by a staple driven through flanges in the inside of the heel.

Claim.—The heel, consisting of the drum C, the adjustable bottom K, with the staple *d*, for fastening on the heel, all constructed substantially in the manner described.

80,110.—THOMAS G. ARNOLD, New York, N. Y.—*Malt Kiln Tile.*—July 21, 1868.—The tiles are made

of malleable cast iron, strengthened on their under side by ribs crossing each other at right angles and uniting with a marginal ledge surrounding them, so as to be bolted together to form the floor.

Claim.—The cast-iron, malleable malt-kiln tiles, having a marginal ledge, and cross bars or ribs on their under sides, as a new article of manufacture, constructed substantially as hereinbefore set forth and for the purposes described.

80,111.—LEWIS J. ATWOOD, Waterbury, Conn., assignor to himself and HOLMES, BOOTH and HAYDENS, same place.—*Lamp.*—July 21, 1868.—The draught plate is arranged within the lower end of the glass chimney and is provided with a flame slot and springs, with a foraminous inclosure below the draught plate and within the chimney.

Claim.—1. The draught plate *e*, formed with a flame slot and springs around its edges, in combination with a foraminous casing, that extends from said draught plate to the coupling *g* or ratchet cap *d*, substantially as set forth.

2. The coupling *g*, removable from the wick tube *b*, and ratchet cap *d*, in combination with the foraminous casing *f*, draught plate *e*, spring *i* and chimney holder *l*, substantially as set forth, whereby the entire draught regulator and chimney can be removed from the wick tube or ratchet cap, and replaced, as specified.

3. The coupling *g*, concave elips 5, and notch 4, in combination with the wick tube *b*, and ratchet cap *d*, substantially as and for the purpose set forth.

4. The spring hooks *l*, (Figs. 1 and 2,) receiving and sustaining the chimney, and clamping said chimney both inside and outside, in combination with the draught plate *e* and spring *i*, as and for the purposes specified.

80,112.—EPHRAIM BALL and MILTON BALL, Canton, Ohio, assignor to JOHN F. SEIBERLING.—*Dropping Platform for Harvester.*—July 21, 1868.

Claim.—Combining a bail or rod with a tilting platform of a reaping machine, in such manner that when the front edge of the platform is elevated above the plane of the finger beam, said bail will simultaneously become elevated above the finger beam and platform, for the double purpose of arresting the falling grain and facilitating the discharge of the gavel, substantially as described.

80,113.—PHILIP BALLARD, Texas, Ohio.—*Drain Plow.*—July 21, 1868.—Adjustable wings are attached to the rear of the share so that they may be moved up after each cut and so as to push the ground raised by the plow back from the edge of the drain. The gauge wheels are arranged to be conveniently adjusted so that the plow may be run at any desired depth.

Claim.—1. The entters C and D, share B, and adjustable wings E, constructed and arranged substantially as herein shown and described, in combination with the beam A, as and for the purpose set forth.

2. The combination of the gauge wheels F, curved arms G, lever H, support I, and curved adjusting arm or bar J, with each other, and with the beam A, substantially as herein shown and described, and for the purpose set forth.

80,114.—SILAS BARKER, Hartford, Conn.—*Washing Machine.*—July 21, 1868.—A central partition divides the box into two water-tight compartments, in each of which is a washboard, the two being connected together at the top by means of bars.

Claim.—The double washboard G G, connected over the top of the partition E, when constructed and operating substantially as described.

80,115.—DAVID J. BARNETT, Albion, Ind.—*Saw-Gumming Device.*—July 21, 1868.—A sliding die post is provided with removable dies, and is operated by a cam, the saw being held between removable plates so that a circular or straight saw may be readily gummed by merely changing the die and plates.

Claim.—The saw-gumming device consisting of bed plate A, bed B, slide C, die block D, removable dies E, removable slotted plates H I, screw plates F G, and cam J, constructed, arranged, and operating substantially as represented and described.

80,116.—HENRY H. BARSTOW, Chicago, Ill.—*Nutmeg Grater.*—July 21, 1868.—The grater is supported upon springs, and the nutmeg, when to be grated, is attached to the end of a stem passing through a vertical slot in the ease.

Claim.—1. Supporting an abrading or grating plate, A, upon one or more springs, *b*, substantially as shown and described, in combination with the ease B, as and for the purpose set forth.

2. The stem or wire *m*, or other equivalent device, for holding the nutmeg or article to be grated, substantially as shown and described, in combination with grater A, springs *b*, all as and for the purpose set forth.

80,117.—DAVID S. BEALS, Adrian, Mich., assignor to himself and JOHN J. YOUNG, same place.—*Car Coupling.*—July 21, 1868.—The couplings consist of spring elutes provided with barbed ends so arranged that the ears will couple automatically when brought together. The elutes are opened by means of cams attached to vertical shafts.

Claim.—1. The combination of the hinged jaws or bars G G', H H', the spring draw bars I J, springs K L, and cams M, all constructed, arranged, and operating as described, for the purposes specified.

2. The combination, with the cams M, for operating the spring couplings G G' and H H', the arms *n n'*, for holding said cams in their different positions, and the pins Q R, and cam arms S, for returning the couplings to their closed position, as the ears separate, all arranged and operating substantially as described.

3. The buffers D, stems *d d'*, thimbles C, springs E, and rods F, all constructed and arranged substantially as described, and employed in combination with a self-locking ear coupling, for the purpose set forth.

80,118.—HENRY T. BEAM, Palestine, Ill.—*Plow.*—July 21, 1868.—The sheth or post is made of cast iron so formed as to allow of the convenient attachment thereto of the mold-board, share, landside, beam, and handle, at the same time allowing of the chilling of the same, where it is most exposed to wear. The cast-iron head on the front of the beam is so formed as to allow of any desired change from one side to the other of the point of draught, for vertical or lateral adjustment.

Claim.—1. The cast-iron sheth, made as shown and described, with scarfs formed thereon for the reception of the bar of the share and the landside, as seen at C and D, Fig. 1, and the mold board, as seen at Fig. 3, substantially as and for the purposes set forth and specified.

2. The share, as constructed by turning up a small triangular piece to the anterior part thereof, as seen at Fig. 7, which is an end view of the share at *l*, Fig. 2, which piece forms a support for the mold board B, and also welding on a small triangular piece on the top of the share, as seen at *r*, Figs. 1 and 3, which protects the anterior part of the sheth, substantially as and for the purposes shown and described.

3. The landside, formed of the part D of the share, and the cast iron anterior part C, all constructed and attached, as shown in Figs. 1, 2, and 3, and described, and for the purpose specified.

4. The cast-iron head on the front end of the beam, with its pins *m*, key *n*, clevis *o*, and groove *t*, all as shown and described, and for the purposes specified.

80,119.—C. BEATTY and G. BEATTY, Portsmouth, Va.—*Apparatus for Cutting Ice.*—July 21, 1868.—A reciprocating plane moves under a hopper in which is a block provided with a rod for pushing the ice against the plane. Under the hopper and below the plane is a spring for holding a tumbler into which the cut ice falls.

Claim.—The ease A, plane B, spring C, hopper D with cover *d*, block E with rod *e*, the whole being combined and arranged substantially as described.

80,120.—WILLIAM BERNER, Pottsville, Pa.—*Manufacture of Tile for Flooring, &c.*—July 21, 1868.—The ingredients in the white composition are calcined pebbles, alum clay, white potters' clay, china clay, and of the black composition, manganes,

calcined copper, and red potters' clay, all ground, pulverized, and thoroughly mixed.

Claim.—1. The mosaic inlaying of the tile, of whatever color or design they may be, each of the different parts being cast into a mold or molds at the proper time, so as to unite and form into a solid mass, substantially as and for the purposes above set forth.

2. The composition, both white and black, or whatever color may hereafter be given to it, one of which, when burned, partakes of the hardness of iron, substantially as and for the purposes above set forth.

80,121.—DANA BICKFORD, Boston, Mass.—*Knitting Machine.*—July 21, 1868.—The cam groove by which the needles are actuated is so arranged that the machine may be rotated in either direction, in connection with which is a cam or cams which may be made to slide for the purpose of adjustment.

Claim.—1. A longitudinally-grooved needle cylinder, in combination with a rotary cylinder, having an endless cam groove with two equal and similar bends, and two sliding cam pieces, one for each bend, and each supported in side bearings or walls, so that proper adjustments may be made to tighten or loosen the stitches, and yet which will permit the revolution of the machine in either direction, to knit either a tubular or straight fabric at will.

2. The combination, with the needle cylinder, of a ring nut and detents or projections *d*, for raising or lowering and sustaining in position the needle cylinder relatively to the cam cylinder, substantially as and for the purpose set forth.

3. The combination, in the same machine, of devices substantially such as described, for varying the cam groove, with devices substantially such as described for raising or lowering the needle cylinder.

80,122.—DANA BICKFORD, Boston, Mass.—*Afghan.*—July 21, 1868.

Claim.—An afghan, blanket, or similar article, composed of tubular knitted strips, united together edge to edge, and with the seam concealed by a knitted or other cord or welt, and the whole finished with a border or fringe, substantially as shown and described.

80,123.—SAMUEL T. BOND, Edenton, N. C.—*Compound for Destroying Pain.*—July 21, 1868.

The compound consists of chloroform, sulphate ether, spirits camphor, spirits ammonia, and oil origanum.

Claim.—The combining the ingredients named in the specification, substantially as therein described, or in any similar proportion to produce the same results.

80,124.—OLPHIA BONNEY, Jr., San Francisco, Cal.—*Harvester.*—July 21, 1868.—A device to be attached to a harvester for elevating the grain stalks which have been forced down upon or toward the ground by the wind or rain.

Claim.—1. A helper, of substantially a triangular form, having the upper inclined edge *c* and ribs *d*, for elevating the grain or stalks, as herein recited.

2. The wheel *j*, adjustable bar *k*, and box *l*, for the purpose set forth.

80,125.—SYLVESTER BOWERS, Penn Yan, N. Y.—*Broiler.*—July 21, 1868.—An annular dish-shaped rim, open at the bottom, is arranged within a metal band or hoop, and upon the same rests a grate. Inside the cover is a reflector.

Claim.—The hoop *A*, the annular rim *B*, the grate *D*, and the reflector *E*, all constructed and arranged substantially as herein shown and described and for the purpose set forth.

80,126.—GEORGE W. BRADFORD, Brooklyn, N. Y.—*Stove Pipe Suspender.*—July 21, 1868.—Designed to supersede the use of pieces of wire for supporting stove pipes.

Claim.—The flexible band *A*, provided at its ends with the slot and set screw, or other equivalent fastening, for securing the band on the stove pipe, and also provided with loops or eyes *f f*, at opposite sides, to receive wires, by which the stove pipe is suspended from the ceiling or other fixture, substantially as shown and described.

80,127.—SELAH S. BREWSTER, Manchester, Mich.—*Apparatus for Removing Boxes from Wagons.*—July 21, 1868.

Claim.—The described arrangement, in the frame of a building, of the shaft *D*, drums *C E*, and cords *D F*, all as herein shown for the purpose set forth.

80,128.—R. M. BROOKS, Griffin, Ga.—*Scrubbing Brush.*—July 21, 1868.—A water chamber and a sand chamber are so combined with a scrubbing brush that the water and sand will be discharged and sprinkled over the floor by the movement of the brush.

Claim.—The head *A*, of a brush when constructed as described, so as to form two chambers, *a* and *b*, for the purpose of holding sand and water, and a recess, *d*, for inserting the brush, substantially as and for the purposes herein set forth.

80,129.—ANDREW J. BROWN, New Castle, Del.—*Combined Wash Stand and Water Closet.*—July 21, 1868.

Claim.—The box *C*, divided into separate apartments, each having its appropriate lid or cover, with the central stool-pan *H*, having conical sides *h*, neck *h*¹, flaring saucer top *h*², stopper *h*³, constructed and arranged with the washstand *A*, having slide grooves and doors, all substantially as and for the purpose described and shown.

80,130.—GEORGE M. BULL, New Baltimore, N. Y.—*Tobacco Box.*—July 21, 1868.—A hinge strap has its ends soldered to the swaged edge of the cover and passes around a pivoting wire in the concavity of the swage in the hoop or body of the box.

Claim.—The hinge *D E*, constructed and connected with the swaged hoop *C* and cover *B*, substantially as herein shown and described, and for the purpose set forth.

80,131.—THOMAS L. BURK, Greensburg, Ind.—*Fence.*—July 21, 1868.—The posts are beveled on one side to receive the ends of the rails, which latter are also locked by nailing strips on the panels. A wire is fastened to the top of each panel.

Claim.—The arrangement of the notched rails *E*, strips *F*, beveled posts *A*, and wire *G*, all constructed, arranged, and operating substantially as and for the purposes set forth.

80,132.—HENRY A. BURR, Brooklyn, N. Y.—*Table for Compresses.*—July 21, 1868.—The table or platen of a compress is so constructed that with it cotton and other goods that have been previously pressed or put up in bales, can be again compressed without removing the hoops or bands from the bales.

Claim.—The combination of the bottom piece *A*, having the inclines *a a a*, with the bearing pieces *C C C*, having the inclines *e e e*, when the parts are constructed to operate substantially in the manner and for the purpose set forth.

80,133.—CHARLES W. CAHOON, Portland, Me.—*Lamp.*—July 21, 1868.—At a point on the interior of the chimney, where the deflector meets the same, is an interior shoulder, which is so formed as to receive and securely hold the outer edge of the deflector.

Claim.—1. In combination with a lamp burner, to which the chimney is held by interior chimney fastenings, a chimney having an interior shoulder, substantially as and for the purposes described.

2. In combination with a lamp burner, to which the chimney is secured by means of an interior shoulder, the horizontal joint *n*, as and for the purposes described.

3. A lamp chimney, as described, with an interior shoulder in the same, for the purpose of fastening it to the burner, substantially as set forth.

80,134.—WILLIAM CANTER, New York, assignor to SAMUEL BERNSTEIN and ALEXANDER BERNSTEIN, Brooklyn, N. Y.—*Machine for Manufacturing Chenille.*—July 21, 1868.—A circular knife is mounted on a shaft having movable bearings, so as to be raised and lowered at regular intervals. By shifting the endless belt or cord from one to another of the pulleys, a proper draught or tension may be maintained on the chenille as it is delivered, and it

is also drawn away and twisted uniformly. A portion of the coils of the silk, for a certain length at intervals, is left uncut.

Claim.—1. In chenille machines the alternate raising and sinking motion of the knife or cutter G, substantially as herein specified.

2. In chenille machines, the traversing twister herein described, having the belt or cord T running on the change pulleys R¹ R², &c., arranged to impart both the rotatory motion and the requisite draught or tension under all conditions, substantially as herein specified.

3. The alternate cut and uncut chenille Y Z, constructed substantially in the manner and for the purpose herein set forth.

SO,135.—JOSEPH F. CARROLL, South Boston, Mass.—*Artists' Stretching Frame.*—July 21, 1868.—A right and left-hand screw is applied to each of the corners of the frame, so as to move the sides simultaneously.

Claim.—Spreading or expanding artists' frames by a right and left-hand screw, substantially in the manner herein shown and described.

SO,136.—D. W. CASE, Garden City, Minn., assignor to himself and JOHN STILLEY SMITH.—*Water Wheel.*—July 21, 1868.—The gates are held open in any desired position by means of a pinion gearing in the teeth on the outer ring, to which the gates are attached.

Claim.—The fixed rim D, composed of a series of sockets or chambers, *d*, in combination with the gates E, provided with flanges *f*, and attached to the ring F, all arranged to operate in connection with the wheel B, pinion *g*, and the teeth *h* of the ring, substantially as shown and described.

SO,137.—L. CHANDOR, St. Petersburg, Russia, assignor to CASSIUS M. CLAY.—*Lamp.*—July 21, 1868.—Attached to a reservoir is a tube, in which is inserted an interior slotted tube, filled with cotton or other similar substance, and also inserting in the interior tube a tubular burner filled with cotton, for burning gasoline and other hydrocarbon fluids.

Claim.—1. In combination with the reservoir A, the tubes B, C, and G, constructed and arranged substantially as shown and described, for the purposes set forth.

2. The coupling *g*, removable from the wick tube *b*, and ratchet cap *d*, in combination with the foraminous casing *f*, draught plate *e*, spring *i*, and chimney holder *l*, substantially as set forth, whereby the entire draught regulator and chimney can be removed from the wick tube or ratchet cap, and replaced, as specified.

3. The coupling *g*, coneave clips 5, and notch 4, in combination with the wick tube *b* and ratchet cap *d*, substantially as and for the purposes set forth.

4. The spring hooks *l*, (Figs. 1 and 2,) receiving and sustaining the chimney, and clamping said chimney both inside and outside, in combination with the draught plate *e* and spring *i*, as and for the purposes specified.

SO,138.—JOSEPH CHASE, Ripley, Ohio.—*Bee Hive.*—July 21, 1868.—Designed for keeping the hive at a uniform temperature, and admitting the interior to be seen.

Claim.—A bee hive constructed with a double case, the exterior one being provided with a door, C, at each side, and the interior one being provided at each side with a glass plate, D, all being constructed and arranged in the manner substantially as and for the purpose set forth.

SO,139.—E. W. CLARK, Tallahassee, Fla.—*Double Buckle.*—July 21, 1868.—Two pieces form the bows and the ends of the buckle, and the other two the tongues, which are bent so as to form bearings for the ends of the bow.

Claim.—A double buckle, with double tongues for each end, formed of four pieces, arranged substantially as herein shown and described.

SO,140.—WILLIAM E. CLARKE, Attleborough, assignor to HENRY F. MARSH, Boston, Mass.—*Pen Rack.*—July 21, 1868.—A pen rack is attached to a

clasp made to spring on the neck of an ordinary inkstand.

Claim.—The device B, or its equivalent, for an adjustable pen rack, as and for the purposes specified.

SO,141.—HYMEN CLENDENEN, Beverly, Ohio.—*Saw-Filing Machine.*—July 21, 1868.—Above the pivoted frame is a horizontal guide way, provided with a pendent bar, so as to be adjusted vertically and at an inclination. On the guide way is fitted a slide provided with a plate, to which is attached an adjustable bar for keeping the file in a proper relative position with the saw teeth.

Claim.—The arrangement of the adjustable pivoted frame C, clamp base A, adjustable way G, slide K, plate L, and bars M, for holding the file, all constructed to operate in the manner and for the purpose substantially as herein set forth and shown.

SO,142.—C. H. CLEVELAND, Selma, Ala.—*Suspender.*—July 21, 1868.—To each of the shoulder straps is applied a metallic slide, on one of which is a snap catch, and on the other a hook, for increasing the bracing properties of the suspenders when necessary.

Claim.—A suspender or shoulder brace, composed of two single straps B B, each passing from the attaching strap on the side over the shoulder to the attaching strap on the reverse side of the body, when the shoulder straps are provided with the slides C and C', having a catch and hook *e* and *e'*, substantially as described, and for the purpose specified.

SO,143.—ZEBULON E. COFFIN, Boston, Mass., assignor to BOSTON MACHINE COMPANY.—*Hydrant.*—July 21, 1868.—The valve is made to close the water way at a point on a level with the top of the pipe, so that the water may be drawn, when the hydrant is not in use, much lower than when the common hydrant bend is used, thereby rendering the hydrant less liable to injury by frost.

Claim.—1. The combination of the base or bottom of the hydrant with the body of the hydrant, hook bolts, waste pipe or pipes, and waste valves, hydrant valves, and outside case, all constructed in the manner and for the purpose set forth.

2. The hook bolts L L, in combination with the body A and bowl C', having an annular projection, *a*, when the parts are constructed substantially in the manner and for the purpose set forth.

3. The nut G, in connection with the rod or valve stem K and body A, when the parts are constructed and arranged to operate substantially as described.

SO,144.—HENRY S. COLE, Pawtucket, R. I.—*Steam Generator.*—July 21, 1868.—Designed more particularly for boilers in which saline waters are used. Small jets of water are thrown through the perforated pipes upon the surface of the water to check the foam.

Claim.—The perforated pipe F, at or near the water line, substantially as described, for the purposes specified.

SO,145.—J. L. COLES AND D. H. COLES, New York, N. Y.—*Pencil Sharpener.*—July 21, 1868.—The side of the sharpener opposite to the cutter is rendered yielding, and is connected to a button so that by pressing the latter, the point of the pencil can be gradually worked down to the required sharpness.

Claim.—1. The arrangement, with the sharpening tube A, of the jaws *d*, at the receiving end thereof, and communicating with each other so as to act as a support and guide for the pencil while it is being sharpened, and also form a holder to protect its point while being carried, as set forth.

2. The button *b*, in combination with the movable side of the tube A, substantially as and for the purpose set forth.

SO,146.—JOHN C. CONKLIN, Yorktown, N. Y.—*Pick Axe.*—July 21, 1868.—A socket is provided for the insertion of the handle of pick axes.

Claim.—A pick axe D E, having a socket A, and shank C, substantially as described, and for the purpose set forth.

80,147.—C. M. COONEY, Washington, D. C.—*Perforated Bake Pan.*—July 21, 1868.

Claim.—A pan or vessel, perforated in its lower part or bottom with holes, and open or perforated with holes in its upper parts or sides, in combination with a smaller pan or vessel, substantially as and for the uses and purposes herein described.

80,148.—FREDERICK C. CURIE, Laneaster, Pa.—*Manufacture of Steel, and in Converting Iron Articles into Steel.*—July 21, 1868.—Cast malleable or malleableized iron is packed in a wrought-iron box in which is placed a compound consisting of pulverized charcoal, soda or soda ash, and rock salt. The articles to be converted are then sprinkled with prussiate of potash. The box being filled with alternate layers of the compound, and articles to be converted, is then hermetically sealed and placed in a furnace which is also sealed.

Claim.—Converting cast malleable or malleableized iron into steel by the process substantially as described.

80,149.—J. P. DAKE, Salem, Ohio.—*Apparatus for Evaporating Liquids.*—July 21, 1868.—A close cover is fitted upon an evaporating pan, so as to admit little or no air to the surface of the liquid, except through heated chambers or pipes arranged around or within the fire box, so as to obtain a strong current of dry heated air.

Claim.—1. The movable and close fitting cover A, when used upon the evaporating pan, tank, or kettle G, in combination with the hot-air chambers C D E, and the elevated flue or chimney F, as set forth and described.

2. The hot-air chambers C D E, when used in combination with the evaporating pan G, and the close fitting cover A, in the manner and for the purposes set forth and described.

80,150.—F. DAVISON, Richmond, Va.—*Nail Machine.*—July 21, 1868.—The machine is provided with an oscillating feeding apparatus, by which the plate, from which the nails are cut, feeds itself, and by its vibrating motion gives a proper taper to the nail, and also to the punch for making the head of the nail.

Claim.—1. The combination of the channeled plate holder M, slotted angular bar E, and vibrating arms N N, all constructed, arranged, and operating substantially as and for the purposes herein set forth.

2. The combination of the sliding inclines X X, adjusting screws f f, vibrating arms N N, and angular bar E, to adjust the plate at different angles, substantially as and for the purposes herein set forth.

3. The combination of the channeled plate holder M, slotted angular bar E, vibrating arms N N, and knives C c, to produce a wedge-shaped blank, in the manner specified.

80,151.—A. A. DENNETT, New Brunswick, N. J.—*Fishing Tackle.*—July 21, 1868.—The socket block is provided with a shank, which is pivoted to the bar that supports the hook, the latter being secured to the block by a screw, so that it can be readily attached at any time.

Claim.—1. The socket block D and the screw g in combination with the fishing tackle, substantially as shown and described.

2. Fastening or adjusting the hook in the fishing tackle represented, by a screw instead of a rivet, substantially as shown and described.

80,152.—LYMAN DERBY, New York, N. Y.—*Thill Coupling.*—July 21, 1868.—An elastic strap packing is combined with the thill iron and jack, so as to prevent accidental separation of the thill, and also to prevent rattling.

Claim.—The combination of the elastic safety strap H with the clip A and thill iron F, substantially as described, and operating as hereinbefore set forth.

80,153.—ALEXANDER DICKSON, Meadville, Pa.—*Uterine Supporter.*—July 21, 1868.

Claim.—A uterine supporter, constructed in five

parts, the same being joined together by the elastic bands C C C C, in combination with the pads B B and A, constructed as described for the purposes set forth.

80,154.—JACOB DOBBINS, Litchfield, Mich.—*Machine for Cutting Hoops for Barrels.*—July 21, 1868.—Two knives, inclined in opposite directions, cut a corner from each end of the board from which the hoops are cut before it reaches the knives for cutting the hoops. A beveled flange on the lower feed roller serves to bring the outer end of the board in contact with the cutter on the standard, to cut the bevel.

Claim.—The arrangement of the inclined knives I J and the flange f of the feed roller F, substantially as described, for the purpose specified.

80,155.—E. B. DRISKELL, Paris, Ill.—*Road Scraper.*—July 21, 1868.—The scraper is elevated from the ground, or brought in contact with the same, by bringing the bent arms of the axle to a vertical position, or depressing them through the agency of the handles.

Claim.—The combination of the axle F, having the bent arms I I, with the wheels H H, the handles J J, the pivoted draught pole A, and the scraper B, when said parts are constructed and connected, so as to operate together substantially in the manner and for the purposes set forth.

80,156.—JAMES K. DUGDALE, White Water, Ind.—*Washing Machine.*—July 21, 1868; antedated July 15, 1868.—By turning the knob the pins are moved back, the spring pressing them out and fastening the wash board to its position. A movable fluted board is held down upon the clothes by means of a spring bolt fitting in notches in the rod attached to the said board.

Claim.—1. The knob K and wire c, in combination with pins a and spring b, as and for the purpose specified.

2. The bolt g, in combination with spring i, notches f, and clothes holder L, as and for the purpose described.

80,157.—PIERRE DU RIEUX and EDOUARD ROETTER, Lille, France.—*Cylindrical Filtering Press.*—July 21, 1868.—The filtering chambers consist of a circular rim, the central portion of which is provided with a series of bars east with the rim, so as to form two series of chambers, the one composed of gratings and the other of hollow spaces between the gratings. On each side of the gratings are attached perforated metal plates over which is a filtering medium. Channels through the rims of the circular frames communicate with each other throughout the machine, and also with the spaces within and between the said frames.

Claim.—1. The construction and arrangement of the grated circular frames and end plates, and the mode of introducing the semi-liquid substance to the filtering chambers, through apertures made in the rims of each frame, the said apertures forming a continuous channel throughout the length of the press, in communication with each filtering chamber, substantially as described and represented.

2. In combination with the removable frames B and movable head A², the pivoted block D³ and central screw d, all constructed and arranged to operate in the manner and for the purpose substantially as herein set forth.

3. The arrangement of coeks H M, the latter having removable plug M', at the opposite ends of the channel formed by the spaces I¹ in the frames B, as herein shown and described, for the purpose specified.

4. The provision of each frame B with a channel, N, having a coek, G G¹, at its outer end, and a movable plug, N¹, at its opposite extremity, substantially as described.

5. The side supports C C' and cross bars D D¹, arranged as described, with relation to the stationary end piece A¹, movable piece A², and removable circular gratings B, substantially as represented.

80,158.—MILTON B. FRASER, Steuben, N. Y.—*Cheese Press.*—July 21, 1868.—A series of cheese

hoops, each furnished with a pressing follower, is arranged between an adjustable foot block and a screw, by which a large number of cheeses are pressed at one operation.

Claim.—1. The employment of a series of separated hoops, in combination with a series of removable bottoms $J J^1 J^2 J^3 J^4$, a series of removable followers, $K K^1 K^2 K^3 K^4$, and a screw or other press, the devices named being applied within and upon a frame, A, B B', or any equivalent frame, all substantially as and for the purpose described.

2. The combination of an adjustable piece, C, with said cheese hoops, their bottoms and their followers, and with the screw or other well known pressing device, and with a suitable frame, A, B B', substantially as and for the purpose specified.

3. The combination of the adjustable nut G, with the cheese hoops, their bottoms, their followers, and with the screw F, substantially as and for the purpose described.

80,159.—ADOLPH FALLER, New York, N. Y.—*Lounge, Bureau, and Table.*—July 21, 1868.

Claim.—The combined lounge, table, and bureau specified, the same being formed with the inclined cushioned end c against the bureau portion, with the table e above the bureau, and with draws in and below such lounge, substantially as set forth.

80,160.—R. A. FILKINS, North Adams, Mass.—*Steam Engine Globe Valve.*—July 21, 1868.—The valve is made in two sections fitted around a downwardly tapering stem, and of two fingers pivoted between the sections. The fingers catch under a shoulder of the stem, but when the valve is on its seat, they release the stem, and allow it to be forced down between the sections so as to spread them apart.

Claim.—1. A sectional valve, E, fitted around a stem, C, and provided with pivoted fingers, $d d$, substantially as herein shown and described, all made and operating as specified.

2. The valve E, when made in sections, as described, and when provided with swinging fingers, d , which work in grooves, $e e$, in combination with the conical reciprocating stem C, carrying the head e , all made and operating substantially as herein shown and described.

80,161.—WILLIAM T. FISHER, Roane County, Tenn.—*Shoemakers' Tool.*—July 21, 1868.—The jaws of a plier are provided on either side with projections for holding a punch, eyelet set, hammer, and nail cutter.

Claim.—Constructing the sides A A with jaws or projections, $b b'$ and $d d'$, for the purpose of combining with the pliers any suitable tool or device, substantially as described.

80,162.—LORENZO FULTON, Edinburg, Ind.—*Low Water Indicator for Steam Generator.*—July 21, 1868.—In addition to indicating the height of the water in the boiler by this device, the earcening of the boat will also be indicated, and, besides sounding an alarm at the time, will correctly record the same by means of a dial, index, and marking pencil.

Claim.—1. The combination, with a low water indicator or any equivalent therefor, of a marker, of any suitable form, and recording plate, or its equivalent, when all combined and arranged together, substantially as and for the purpose described.

2. The combination of the dial J, index K, pencil p , pawl n , and ratchet wheel m , whereby to register successively the occurrence of an inadequate amount of water in the steam generator, substantially as set forth.

3. The combination of the pipes A and B with the valve b , water space C, pipe D, vessel E, piston F, rod G, lever H, pawl n , ratchet wheel m , index K, and dial J, substantially as described.

4. The combination of the vessel E, having the ledge L, and the glass walls $e e$, with the piston F, substantially as described.

80,163.—C. R. GORGAS, Brooklyn, N. Y.—*Pessary.*—July 21, 1868.—An India-rubber bag or cap is provided with a rubber tube, which is to be distended

by a flat spiral spring, and inserted into the vagina by means of a peculiarly-formed instrument.

Claim.—1. The herein-described improved pessary, consisting of the wrapper A, provided with the tubular portion B and the spring C, substantially as and for the purpose described.

2. The improved inserting instrument, consisting of the parts b and e , provided with the pins a and a' , ratchet d , spring pawl e , and recess d , and otherwise arranged substantially as and for the purpose described.

3. The combination of the spring C with the inserting instrument D, substantially as described for the purpose specified.

4. The method herein described of inserting the spring C within the pessary, substantially as described, for the purpose specified.

80,164.—MICHAEL G. GROFF, Vogansville, Pa.—*Horse Power.*—July 21, 1868.—The parts are designed to be so arranged that the horse in pulling on one lever arm, also pushes, so that the same force applied to move the one pinion in pulling, exerts the same leverage on the other end of the shaft and pinion by pushing.

Claim.—1. The peculiar arrangement of the main wheel A and jaek O, with the horizontal or inclined shafts T B, having each two pinions, the gear connected by the shaft M, which is provided with universal joints, substantially combined in the manner and for the purpose specified.

2. In combination with my arrangement in the gearing aforesaid, the stationary platform, supported substantially in the manner specified.

2. Attaching the spokes or arms z on the outer circumference of a wheel O, which wheel has eogs on both sides, when said spokes or arms are so curved as to admit the free action of a pinion t , on each side of the face of said wheel, in the manner shown and for the purpose specified.

80,165.—GEORGE GUY, Bay City, Mich.—*Steam Generator.*—July 21, 1868.—A valve and seat are arranged on the crown sheet of the fire box and in the steam space of the boiler, and are operated by a weight. When the water falls to a dangerous point, the valves will be opened, one of which will discharge steam into the fire box, and the other will discharge steam into the atmosphere.

Claim.—1. The aperture i in the crown sheet n , and the valve J, when arranged and operated substantially as and for the purpose described.

2. In combination with the valve J, arranged as described, the valve k , substantially as and for the purpose set forth.

80,166.—EPHRAIM HACKETT, Concord, N. H., assignor to himself and R. WEST, same place.—*Chafe Iron.*—July 21, 1868.

Claim.—A chilled iron chafe-iron for vehicles, substantially as set forth.

80,167.—EMONS HAMLIN, Winchester, Mass., assignor to the MASON & HAMLIN ORGAN CO., Boston, Mass.—*Melodeon.*—July 21, 1868.—The regulator-valve or gate is operated by the bellows, and causes the orifice for the entrance of air to enlarge as the stress or intensity of the bellows spring decreases, thus effecting a uniform action in the tremolo.

Claim.—In combination with a tremolo attachment and an exhaust bellows, a regulator valve or gate, operating substantially as and for the purpose set forth.

80,168.—HENRY S. HANNEN, Philadelphia, Pa.—*Manufacture of White Lead.*—July 21, 1868.—Designed to avoid the inconveniences resulting from the use of heating coils within the chamber, and to bring the gas more intimately in contact with the lead.

Claim.—1. Subjecting metallic lead, after it has been treated in a chamber with acetic acid, to the action of carbonic acid gas, introduced near the bottom of the chamber, and at such a temperature that the proper degree of heat is maintained within the chamber without the use of heating apparatus.

2. Subjecting metallic lead, during the process of its conversion into carbonate of lead, to the action

of solutions of chloride of soda and carbonate of soda, substantially as and for the purpose described.

80,169.—SANDY HARRIS, Philadelphia, Pa.—*Weighing Scale.*—July 21, 1868.—The weighted platform rests on projections on a curved beam, through which latter extends a pointer. To the under side of the platform is fastened a rod having a hooked end which catches in a recess in a swinging frame below.

Claim.—1. The beam D, constructed substantially as described, in combination with the platform E.

2. The platform E, provided with the connecting rod *j*, in combination with the swinging frame or bail J, operating substantially as and for the purpose set forth.

3. The pedestal A, constructed substantially as and for the purpose described.

4. The platform E, beam D, pointer F, weight G, connecting rod *j*, frame or bail J, pedestal A, neck B, and plate L, all combined for the purpose of forming a responding scale.

80,170.—WILLIAM O. HARRISON, Chittenden, Vt.—*Harvester.*—July 21, 1868.—As the shaft is revolved, the cutter bar will receive reciprocating motion, so as to work easily in any position of the finger bar without exerting any strain on the connecting rod.

Claim.—The arrangement of the gear wheel G, constructed as described, hinged block *g*, extension *i*, bearing *h*, pinion *f*, and shaft H, pivoting the finger bar to the machine, all constructed and operating as herein described.

80,171.—ANDREW C. HARTSOCK, Douglas, Ill.—*Millstone Dress.*—July 21, 1868.—The dress consists of peculiarly-formed teeth, so that the grain will be cut and ground on the sides and edges of the same, instead of upon plain surfaces and straight or circular cutting edges.

Claim.—The millstone dress, composed of the distributing teeth A, grinding teeth B, circle furrows *a*, and short angular furrows *b*, constructed and arranged in relation to each other, in the manner and for the purpose substantially as described.

80,172.—MOSES M. HATCH, Portland, Me.—*Apple Corer.*—July 21, 1868; antedated July 8, 1868.—A scoop-shaped piece of metal is attached to the back of an ordinary knife.

Claim.—The corer *b*, when attached to the knife *a*, substantially as and for the purposes set forth.

80,173.—JOHN W. HAYES, Kittery, Me., assignor to himself and JOHN G. CROCKETT, Portsmouth, N. H.—*Governor.*—July 21, 1868.—The throttle valve is operated by means of a sleeve on the governor spindle, the sleeve having inclined planes and wings, and being free to revolve with the spindle within a cylindrical cup.

Claim.—1. In combination with a governor spindle, the sleeve K, when constructed with the inclined planes *m m* and wings *o o*, substantially as described.

2. The interior cylinder R, with its inclined bottom and the balls *p p*, arranged substantially as described, in combination with the sleeve K.
